- Symbiotic relations - Integration of living beings and the environment, generating systems aimed at promoting connection and interdependence with the environment and coexistence between humans, nature and other species, through the adoption of pluralistic and relational practices rooted in the territory.

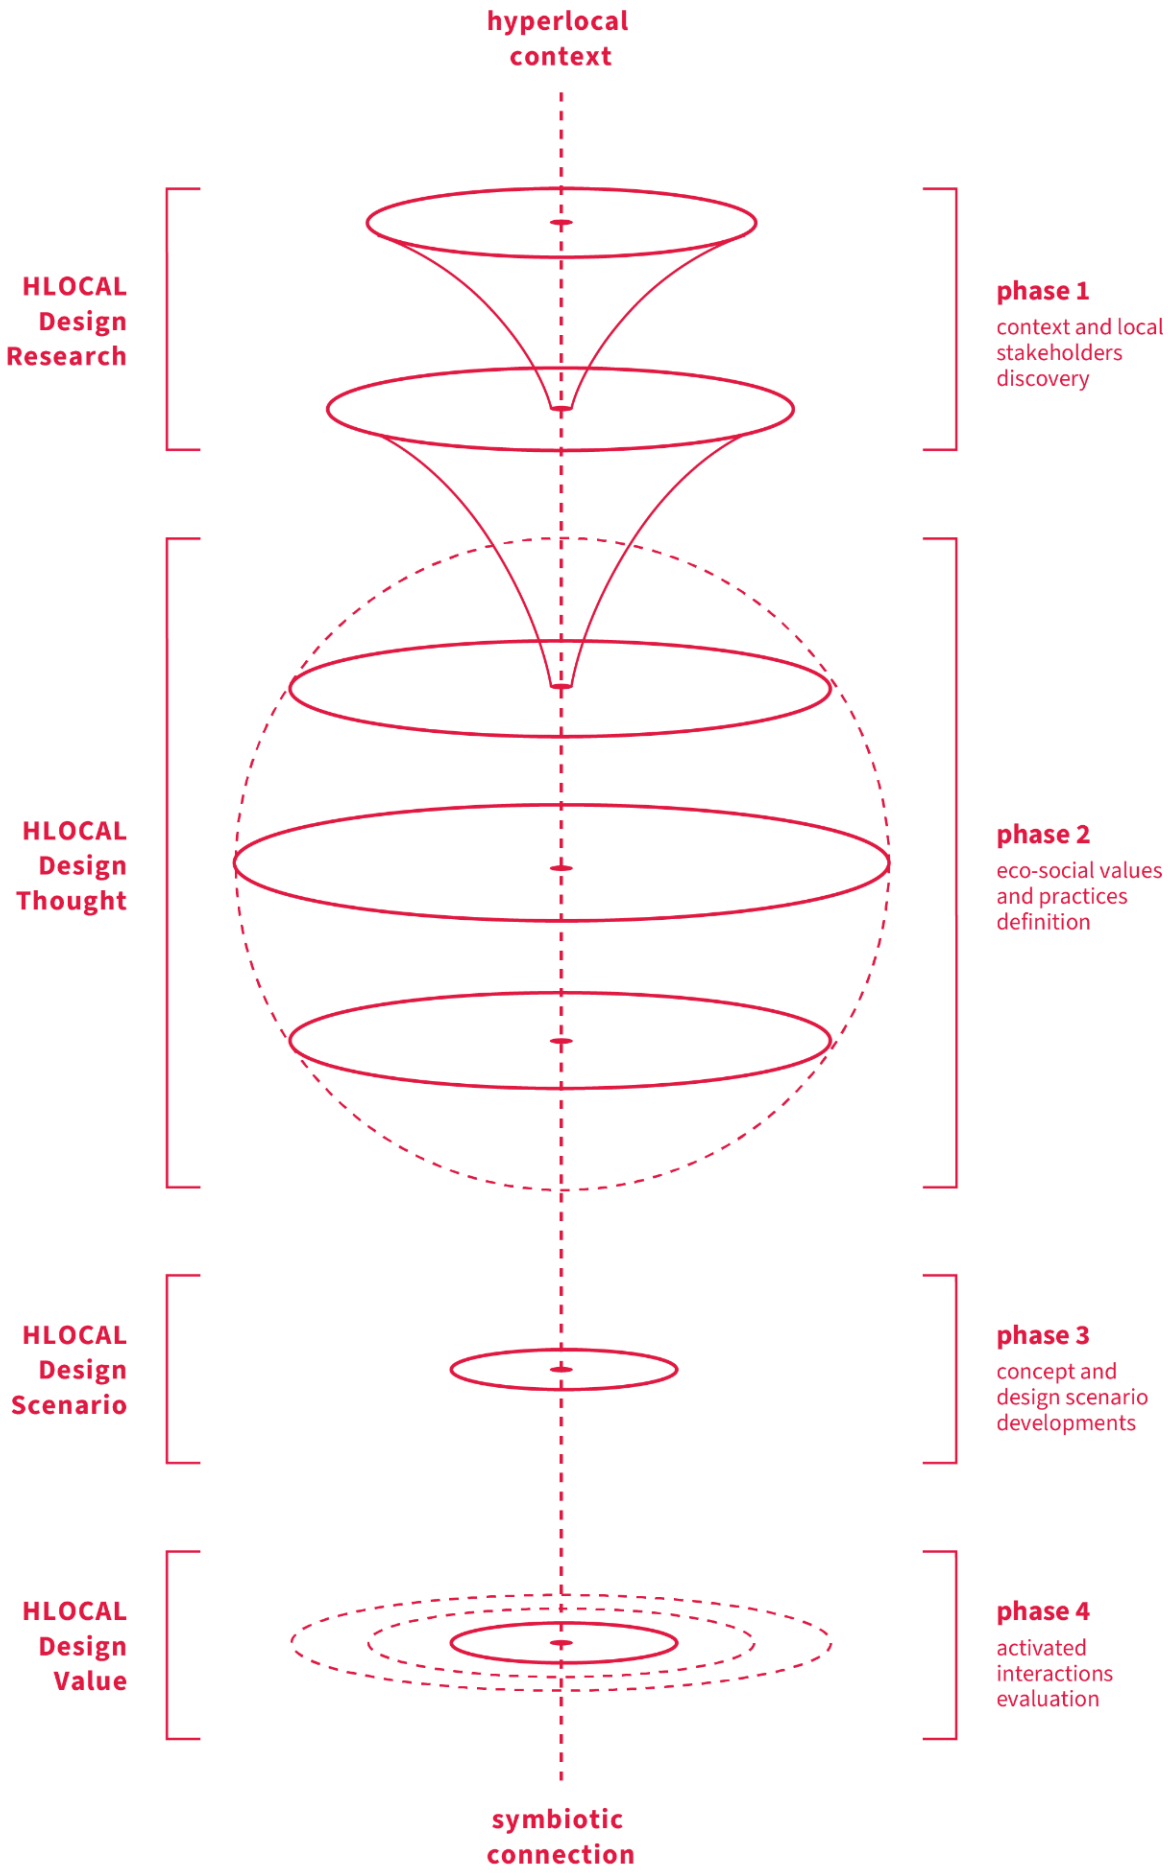

Figure 6. Conceptual diagram of Hyperlocal Ecologies Framework.

6. Discussion and Conclusions systemic innovation through rhizomatic relationship

This contribution emphasises the importance of orienting design education towards a hyper-contextual dimension. This can represent an opportunity for future experimentation for the discipline, as well as for the territory itself, and respond to the effects of the ecological disaster we are facing.
Starting from Papanek's thesis, on the social responsibility of the designer, many authors argue for the role of design as a non-neutral and democratic political agent (Monteiro, 2019; Manzini, 2015; Winner, 1979; Papanek 1971) as an activist practice (Fuad-Luke, 2013, Di Salvo, 2017), or even rhizomatic and cooperative.
This responsibility is connected to the intention and action itself of transformation that distinguishes design (Buchanan, 1985; Krippendorff, 2005). Our thesis, continuing in this direction, argues that what defines and identifies design is not the type of product, the form of the product, the production of goods (Celaschi, 2000). Rather, it is a process that allows us to explore what is most necessary for the maintenance of our contemporary condition overcome by climate change, technological evolution, extractive and destructive economic models of contexts (Maffei, 2024).
Thus, design is the action of shaping artefacts, products, services or product-services that can respond to the changing needs of the contemporary context, and/or imagine scenarios of use and systems of artefacts to keep the hyperlocal system and its intrinsic relationships alive.
How much more fragile, weak, and delicate a system is, how much more it can develop approaches and experiment ways to challenge this type of crisis. The case studies of the lagoon realities adopt critical attitudes to consumption by focusing on the development of new processes rather than new products, looking at open source, bottom-up processes, circularity of materials, social justice, and ecological transition.
This approach highlights how design practices can address global challenges and promote positive change through the ability to plan and produce desired outcomes (Mau, 2004). This idea emphasises the view that design is not confined to objects or spaces, but embraces the entire ecosystem of human interactions and eco-social solutions for the future.
This article proposes new research perspectives in the field of design, aiming at the rediscovery and enhancement of traditional knowledge systems and biocultural practices of territories (Fagnoni, Manfroni & Priola, 2024). The projects presented demonstrate an experimental approach that fosters a change of perspective. Through the artefacts and practices developed, strategies and tools of Hyperlocal design are outlined, highlighting the potential of this approach in guiding individuals and communities towards a positive change in the systems in which we live and in the future scenarios that we want to help build.
This paradigm shift is based on certain key principles. Firstly, the importance of rethinking production as an ecological system that allows for an experimental approach that includes the adoption of local materials and the recycling of natural waste. Secondly, the cultural and territorial heritage is enhanced through the valorisation of rituals, actions, products and craft practices and significant places. Finally, attention is drawn to the need to explore new forms of coexistence and symbiosis that respond to contemporary challenges (Fagnoni et al., 2024).
The research and educational experimentation perspectives that emerge from this work are based on socio-cultural values aimed at improving community adherence to restoration and protection. Aimed at motivating new actions, individual or collective, crucial for a more effective participation within the environmental and social protection process.
The hyperlocal approach, in this context, goes beyond merely meeting the needs of a specific place, it represents a more ambitious political and cultural perspective, which questions the future of life forms, the intrinsic value of places and the quality of coexistence. This approach promotes a conscious interaction with the complexity of social and environmental ecosystems,

recognising that design cannot prescind from the symbiotic coexistence of community and territory.
In its current phase, the research adopts an exploratory methodology aimed at analyzing experimental design trajectories that may inform future applications in everyday contexts. At this stage, the investigation is limited to eco-social dimensions, deliberately excluding economic and regulatory considerations, as well as questions of scalability and the negotiation between tradition and innovation.
Further empirical validation and the identification of measurable impacts are needed to substantiate the interdisciplinary potential of the approach. Future research may concentrate on the development of design strategies that foster critical perspectives, enhanced through comparative analysis with similar international initiatives and enriched by contributions from adjacent fields such as anthropology, social economy, and environmental sciences.

About the Authors:

Raffaella Fagnoni Full Professor of Design at Iuav University of Venice and Coordinator of the PhD in Design Sciences. Her research explores sustainable transition, circular innovation, design for the territory, environmental and social design, local heritage, and the reuse and recycling of waste materials.

Maria Manfroni Ph.D. student in Design Sciences at the Department of Project Cultures of Iuav University of Venice, Cycle XXXVIII. Her research topics mainly concern design in the social sphere,

specifically exploring the relationship between design for social innovation and the Third Sector in Italy.

Calogero Mattia Priola. Ph.D. student at deMIT, his research explores Biodesign practices promoting regenerative approaches. He investigates bio-fabrication, the use of living materials, and the relationship between design, alternative production systems, ecological systems, and local environmental contexts.

Author contribution statement: The contribution is the result of a common reflection of the authors and was carried out under the general supervision of Fagnoni R., who defined the main concept and coordinated the research activity. Manfroni M. and Priola C. M. were responsible for the conceptual and theoretical framing, collection and analysis of the presented case studies, after agreeing on the selection criteria and research methodology with Fagnoni R. All authors were responsible for writing the original draft as well as agreeing to the final publication.

Inter-sessions as governance in action.

How invisible moments of co-design are shaping institutional transformation.

Stéphanie Hémon[a]

a CY école de design, CY université, Transition Design Lab.
*stephanie.hemon@hotmail.com

ABSTRACT | To address social inequalities in urban transformation, cities increasingly involve stakeholders and users in projects through co-design. These methods use cross-sectoral and systemic approaches that continuously adapt to evolving needs.
In this context, the city of Nantes collaborates with a community of actors to create the "Nantes Cooperative of New Solidarities," which aims to strengthen local solidarity and reimagine urban governance through participatory practices.
While research on co-design emphasizes the designer's role in addressing project challenges, transforming practices, and influencing stakeholders, it often overlooks the critical relationship between the design team and project governance, particularly with decision-makers. This communication aims to improve co-design practices by examining in greater depth how designers and pilots are involved in these co-design moments, highlighting the 'inter 'session issues, and offering insights into the steering mechanisms to be implemented.
Our current action research (February 2024 to April 2025) examines how the co-design function creates new design spaces at the steering level and helps establish new institutional frameworks, mainly when the goal is to create a cooperative with heterogeneous players. We have observed challenges and legitimacy crises on all sides—within the steering, design, and community teams. Design plays a crucial role in strengthening community cohesion. However, it must also support the emerging entity formed by the co-design process that co-organizes the planning and steering. This paper contributes to the literature by identifying key tensions in co-design governance structures and proposing inter-sessions as a novel institutional mechanism for fostering generative collective governance. This signifies a shift from traditional consultancy practices that designers must consider in their co-design methodology, especially if they aim to make their intervention sustainable.

KEYWORDS | urban governance, collective action, co-design, collaborative learning, boundary objects.

1.Introduction

With social inequalities exacerbated by urban transformations, cities are increasingly prioritizing participatory approaches. Initiatives based on co-design aim to combine skills and perspectives to create innovative solutions tailored to local needs. In this context, the city of Nantes has launched a creative project to bring together a diverse community of stakeholders to co-design the "Nantes Cooperative of New Solidarities." The key objective of this project is rooted in the belief that developing new solidarities depends on cross-sector cooperation. Therefore, the project seeks to connect different spheres and foster the emergence of a community capable of generating groundbreaking solutions, where each stakeholder contributes according to their abilities while benefiting from the co-created services.

Many local governments are exploring innovative approaches through collaboration and cooperation (Coblence & Pallez, 2015). They are adopting co-design to develop new systems, infrastructures, or public services (Bason, 2014; La 27e region & Scherer, 2015; Trischler et al., 2019) to foster creative scenarios and public policies (Bason & Schneider, 2014) and to support the transformation of public action (Gwiazdzinski, 2015; Poudray, 2021).
In our case, the co-design involves creating an original cooperative. The aim is not to transition from public service to citizen service (Liénard, 2016) but to create a new form of collective action with yet-to-be-defined modalities.
From the beginning, the municipality recognized the importance of forming an initial community of various stakeholders to develop the project collaboratively. This early recruitment effort, conducted before involving external providers, demonstrates a keen insight: the need to unite a design community capable of co-designing and testing a beta version of the cooperative on a real-life scale.
This initiative has a dual ambition: to strengthen local solidarities and reinvent urban governance through innovative participatory practices.
While co-design has been extensively studied as a participatory design practice, its role in reshaping governance models and influencing strategic decision-making remains underexplored. This research investigates how co-design, particularly through inter-sessions, contributes to the emergence of new governance frameworks. By focusing on institutionalizing collaborative dynamics, we explore how co-design can transition from a project-based tool to a core component of urban governance.
To structure the approach, the local authority assembled a pilot team and hired a project facilitator to manage and coordinate the cooperative. It also chose to rely on the support of an external provider (a design team) for the methodological aspects and process evaluation. The pilot and design teams will work together in "co-designing the co-design" (Chamberlain & Partridge, 2017), which implies that the process is developed collectively. It emphasizes the dynamics of team interaction rather than focusing solely on the product or outcome. According to the authors, the goal is to transform practices, behaviors, and organizational culture. Based on the belief that everyone teaches and everyone learns, this process aims to co-create the object and establish a new way of working together as a team (Chamberlain & Partridge, 2017).

Yet, even when these mechanisms are intentionally designed to foster collaborative and

reflective practices, their effectiveness often remains constrained by deeper structural limitations. In this regard, Gwiazdzinski (2015) observes that the lack of dedicated structures for research development or foresight and the slow adoption of methodologies like project-based approaches considerably hampers transformation processes. These insights raise several questions regarding how such initiatives can be supported.
Do they require a specific structure, and how can that structure fit into existing organizational dynamics? Furthermore, what factors affect the project's sustainability and autonomy when support depends on external providers? Finally, how can we create institutional spaces or mechanisms that sustainably support these processes while integrating them into the existing systems of organizations?
Conducted from February 2024 to April 2025, our ongoing case study serves as action research (Avison et al., 1999). It provides us with essential tools to explore the co-design of a new form of collective action by employing various data sources (Baxter & Jack, 2008, p. 544; Muratovski, 2016). This data includes participant observations, notes from our ethnographic journal, and semi-structured interviews conducted with the teams. Our empirical contribution is descriptive, and this case was selected because it represents a municipality committed to engaging its stakeholders at the highest level of participation, as defined by Arnstein (1969).

Despite the growth of participatory methodologies and co-design, the literature mainly focuses on designers' roles in defining problems and transforming practices. In contrast, it rarely addresses the relational dynamics between design teams, project sponsors, and project governance. This gap raises questions about the organizational and communication levers required to foster an environment conducive to such transformations.
This article explores what occurs during the "inter-sessions" (Dubois, 2015, p. 164), where co-design is prepared and structured. The objective is to analyze how the co-design functions integrate into these preparatory moments and, by extension, into the future cooperative. Our study emphasizes the significance of a collaborative approach in these inter-sessions to introduce co-design practices and culture into the upcoming organization. This strategy aims to foster a horizontal dynamic within the pilot team, thus encouraging the long-term engagement of all stakeholders.

This study contributes to discussions on participatory urban governance by identifying inter-sessions as critical yet overlooked governance mechanisms. By analyzing tensions between institutional control and collaborative practices, we propose inter-sessions as a generative framework for sustainable co-design. The paper also introduces a concrete typology of inter-sessions and outlines the conditions under which they can develop into strategic tools for institutional transformation.
After presenting our methodological framework, we will analyze how the co-design inter-sessions serve as spaces for coordination and mediation, emphasizing their role as critical moments in the collaborative dynamic. We will then highlight how the cooperative's pre-configuration phase underscores the vital importance of generative collective governance that sustains practices, shares co-design expertise, and the essential functions necessary for its operation.

2.Methodology and posture

The formalized co-design framework, which brings together various stakeholders—such as associations, municipal services, residents, and businesses—is the foundation of this approach (see Figure 1). However, as Dubois (2015) emphasizes, the "inter-sessions," which include informal or intermediate phases such as preparation, informal exchanges,

and opportunities for reflection, play a critical yet often overlooked role in shaping the project's overall dynamics.

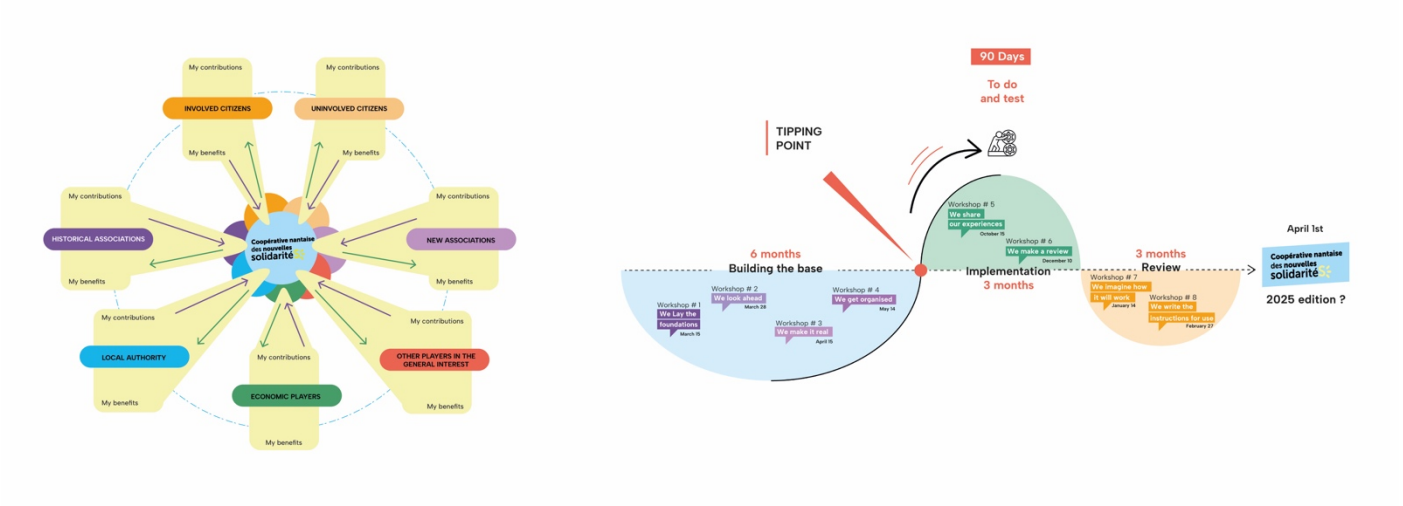

Figure 1. The cooperative's co-design approach.

Our methodology adopts a pragmatic approach to analyzing concrete situations and interactions to understand social dynamics and the justifications put forward by actors within their context (Barthe et al., 2014). We chose a qualitative case study framework to collect diverse data (Baxter & Jack, 2008; Muratovski, 2016), including photographs, transcripts, semi-structured interviews (Boutin, 2018), and an ethnographic journal enriched by reflections and discussions with the design team. Anchored in action research (Avison, 1999), our approach involves active participation in co-design workshops, "inter-sessions," and collective reflection activities (Bastien, 2007).

This iterative cycle of observation, action, and reflection aims to produce knowledge and foster practice transformation (Morrissette, 2013; Raîche-Savoie & Déméné, 2023). We aim to deepen the understanding of co-design situations at the steering level to enhance professional practices, encourage individual and collective empowerment, and support organizational change.

To guide our analysis, we developed a framework inspired by Chaudet (2012), who proposes methods for describing processes related to the evolution of organizational practices (Figure 2). This framework examines multiple dimensions of these processes, including human and non-human actants, actions, interactions, the instituting or de-instituting nature of situations, traces and memories, coordination practices, and their temporalities.

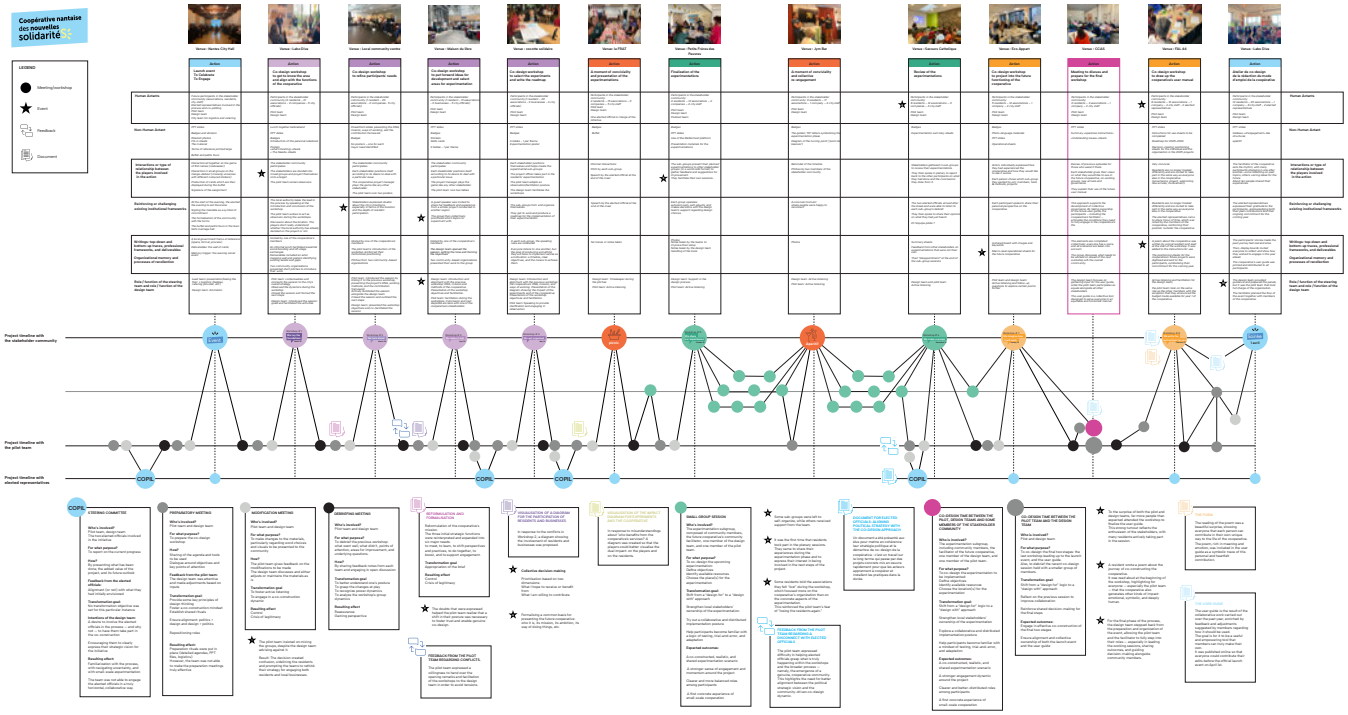

Figure 2. Inter-session analysis grid

2.1 Understanding mediation through the analysis grid

The analysis grid revealed how inter-sessions operated as mediating interfaces between actors, expertise, and levels of responsibility. By examining the configurations of actants, the nature of interactions, their instituting or de-instituting effects, and the traces they produced, we identified how these spaces facilitated the translation of strategic visions into actionable frameworks, the negotiation of roles and postures, and the reduction of misunderstandings between political, operational, and design cultures.
By **mediating functions**, we refer to the practices that enable translation between different professional languages, articulate strategic and operational levels, and align visions and expectations across diverse actors. These functions were central in fostering the process's collective appropriation and maintaining coherence across the project's various scales and rhythms.

The analysis highlighted three key mediating functions within the inter-sessions (see Figure 3): translating strategic language into operational terms, articulating between different professional cultures, and facilitating mutual understanding. These practices appear essential for sustaining shared governance dynamics, often supported by tools, artifacts, and facilitation postures.

Type of inter-session	Main objective	Transformation goal	Mediating function	Expected outcomes	Timeframe
Strategic Alignment	Framing the issues collectively Identifying points of tension	Clarifying and sharing strategic visions Adjusting the methodology to remain aligned with ambitions Reassessing objectives when necessary	Translating political intentions into concrete design frameworks Facilitating back-and-forth between strategy and action Bringing about a shared language between leadership and on-the-ground actors	Shared Strategic Visions A methodology realigned with the project's ambitions A strengthened cooperation dynamic between different levels of leadership	Pre experimentation Recurring
Co-design mediation	Promote acculturation to co-design: principles, timelines, tools Establish a shared posture toward exploration and experimentation	Clarify the differences between design, political, operational, and institutional cultures Legitimize expectations of quick results Encourage a shared understanding of "doing with" rather than "doing for"	Translate design logics into political language Facilitate acceptance of uncertainty as a driver of creativity	A better mutual understanding Stronger buy-in for co-design approaches A collective ability to navigate the grey areas of the project	Ongoing
Workshop preparation	Define the content and sequence of workshop activities Organize logistics Ensure alignment with the overall trajectory of the project	Align team members on intentions and individual roles Adjust or clarify roles based on context and evolving needs Anticipate potential reactions or points of resistance	Create a space for dialogue between design, politics, and the field Anticipate tensions and misunderstandings Manage differences in posture and positioning	Smooth and clear facilitation of the session A coherent and unified team posture during the workshops Collective ability to adapt if needed	Before each workshop
Collective debriefing	Analyze how the workshop unfolded Share impressions, observations, and points of attention Highlight gaps between intentions and what actually happened	Encourage a reflective posture Support mutual learning Cultivate a shared culture of reflexivity and experimentation	Horizontalize perspectives and interpretations Value all voices equally, regardless of role or status	Continuous improvement of collaborative practices Strengthened trust within the group Greater ability to recognize tensions without avoiding them	After each workshop
Planning Adjustment	Review and revise the initial schedule Recalibrate upcoming deadlines and project milestones Restore shared visibility for all stakeholders	Accept unforeseen changes collectively Co-prioritize upcoming actions based on available resources Establish a culture of agility and adaptability	Synchronize different timelines (political, operational, collective) Reduce tensions linked to time pressure Create space for collective prioritization	An adjusted and realistic plan Renewed commitment to shared and achievable objectives Increased transparency around individual and collective constraints	Recurring
Transmission & Documentation	Organize the archiving of outputs, decisions, and learnings Make both formal and informal knowledge generated through the experience transferable	Institutionalize learnings so they become actionable resources Build bridges between experimentation and long-term structural anchoring Make visible the value generated collectively over time	Create a shared, accessible, and transferable memory Acknowledge each person's contributions and give them lasting visibility Value lived experiences beyond the moment they occurred	A shared knowledge base, useful for new participants and future project phases Improved knowledge flow among all stakeholders A stronger sense of continuity and belonging within the collective	Ongoing

Figure 3. Inter-sessions typology

This typology not only categorizes the different formats of inter-sessions but also helps reveal the often-invisible work of co-design: the mediation, preparation, alignment, and learning activities that sustain the collective dynamic and contribute to embedding co-design into governance practices.

3. Inter-sessions in Co-Design: Spaces for coordination and mediation

These interstitial moments provide the pilot and external design teams with crucial opportunities to align their methodologies, frameworks, and facilitation strategies. However, fieldwork uncovers disparities and conflicts between public action and co-design professional cultures, resulting in a crisis of mutual legitimacy.

3.1 Tensions between professional cultures

These observations can be interpreted through our analysis grid: tensions and adjustments were evident in the interactions among actors, the instituting effects on role distribution, and the traces left by the decisions and tools created during these inter-sessions.

1. Variations in Mobilizing and Recruiting Stakeholders

The pilot team formed a community of 40 actors before the design team became involved. While the goal of ensuring diverse perspectives was achieved, this number proved too large for effective co-design. The design team faced challenges in profoundly

engaging with such a large group, mainly because of the time-consuming debriefing sessions with all participants. Furthermore, only a few participants were fully engaged by attending all the workshops. Some defended their absences by comparing themselves to others, while others thought their absence would not impact the group, ultimately undermining the continuity and coherence of contributions.
Another point of tension involved residents' roles, which were sometimes viewed as citizens and, at other times, as beneficiaries. This ambiguity sparked debates about their engagement levels and participation methods, necessitating adjustments to their involvement. The discussion centered on precarity and social isolation, complicating residents' integration into a group composed mainly of professionals. The pilot team advocated for their immediate inclusion on equal footing with professionals. In contrast, the design team proposed a more gradual approach that involved preliminary interviews and increased participation during experimentation. In the end, most residents participated in the experiment.

2. From pilots to co-creators

Another point of tension has arisen regarding the role of the pilot team. Our observations indicated that, at the beginning of the process, the pilot team prioritized maintaining control over this flagship initiative, adopting a highly institutional approach. This mindset was evident during team meetings, where it shaped the objectives and conduct of the workshops, as well as the choice of terminology and communication medium. This control was also noticeable in the co-design workshops. Although the design team suggested more horizontal interaction with the stakeholders, the pilot team, alternating between the roles of observer and facilitator, consistently intervened at the beginning and end of the sessions, reinforcing a hierarchical dynamic within the community.
This lack of coordination undermined the legitimacy of the design team by limiting its ability to establish a genuinely collaborative framework. It has also hindered the development of the pilot team's skills as an active participant in the co-construction process, especially in its areas of expertise (solidarity, citizen dialogue). These challenges emphasize the need to clarify each stakeholder’s expectations, roles, and skills during inter-sessions to reduce misunderstandings and optimize collaboration.

As anticipated for fostering a genuine community of players, the implementation phase marked a turning point for the pilot team. During this period, sub-groups were organized to implement their projects. Each designer supervised two sub-groups, facilitating the sessions, guiding the experiments, and supporting communication. The cooperative’s project facilitator also played a key role, actively participating in the experiments and strengthening coherence and networking among the participants.
Initially positioned as sponsors, the pilot team members gradually became more involved in the design process, contributing their professional expertise to the initiatives. Interviews confirmed that, after the implementation phase, the pilot team viewed its relationship with the design team as highly complementary.
The implementation sessions provided an inclusive framework that encouraged constructive dialogue, diverse contributions, and effective co-creation. Differences in approach were addressed by focusing on shared objectives, which fostered a sense of co-responsibility and helped consolidate a common foundation for action. The organization into small sub-groups transformed the inter-sessions into genuine co-design spaces (see Figure 2), reinforcing cooperation dynamics and cultivating a culture of collaboration among participants.

3.2 Mediation functions: Synchronizing timelines and aligning ambitions.

1. Synchronizing timelines and supporting motivation

Our analysis indicates that these inter-sessions functioned as coordination forums for both teams to address various aspects and overlapping timelines. Meetings primarily focused on short-term actions, such as organizing workshops, mobilizing efforts, and advancing experiments, while also considering the overall methodology and medium-term visions for collaborative development. Broader discussions on community-building processes were also essential. Although less frequent, interactions with policymakers and elected officials supported the process, with regular project updates ensuring transparency and alignment between political strategies and overall experimentation. The coexistence of diverse timelines and priorities created tensions, emphasizing the need for consistent dialogue to align stakeholder goals.

Indeed, as a pilot team member noted, "We need to keep everyone motivated: ourselves, the elected officials, and the community." The success of this cooperative depends on maintaining the motivation and engagement of all stakeholders: the community of actors, often hesitant due to an unclear process; the elected officials, navigating a complex context and eager for tangible results; and the two teams themselves, who sometimes experience moments of discouragement.

2. Mutual influence and adaptability

Unlike traditional consulting services, both teams embraced collaboration, necessitating mutual adjustment and influence.
On the one hand, the pilot team shaped the designers' approaches by sharing their political constraints, priorities, and professional frameworks while stressing the importance of inclusion, particularly regarding terminology and materials.
On the other hand, the design team took the time to explain the steps involved in building a community through co-design, extending the process by four months to address concerns about its duration. They also highlighted the importance of creating a safe environment and fostering collaborative relationships. Over time, the pilot team became more willing to delegate facilitation to ease stakeholder tensions regarding locations, funding, and resident involvement. By adopting a more participative approach and engaging other community members during the inter-sessions, the pilot team was able to redefine its role. This resulted in greater stakeholder alignment and encouraged a collective redefinition of roles and expectations. Design decisions were made collectively, as each stakeholder became co-responsible for the experiment's success.

3.3 Inter-sessions as Spaces of Governance

Beyond their role in coordination and mediation, inter-sessions progressively emerged as key governance spaces within the project. Initially framed as opportunities for alignment and operational planning, these moments became where the rules of engagement were defined, strategic directions were discussed and decided, and roles and responsibilities were negotiated and clarified between participants.
Rather than simply supporting the co-design process, these inter-sessions contributed directly to shaping the cooperative's governance model. They allowed for the collective elaboration of what Hatchuel et al. (2017) describe as a generative framework: not limited to selecting between predefined options but enabling the emergence of new alternatives through dialogue, experimentation, and shared reflection.

In this sense, governance was not a separate, formalized structure but a process embedded in the project's everyday life. It took place in these in-between moments where method, culture, and power dynamics were continuously negotiated and adjusted. This central role of inter-sessions as governance spaces also shaped how the future cooperative was prefigured.

Rather than designing governance as a separate, predefined architecture, the process became an arena for testing, negotiating, and gradually building the cooperative's operating principles and shared responsibilities.
In the next section, we explore how this prefiguration phase opened a space for experimentation, not only on what the cooperative could do but also on how it could work as a collective system.

4. Prefigure the cooperative: a generative form of collective action.

4.1 Facilitating a collective governance

Our analysis indicates that the governance of the future cooperative cannot be confined to transmitting information or serving a coordinating role. Like the inter-sessions that have shaped our overall approach, it must foster collective reflection, dialogue, and co-construction aimed at innovation and creating new forms of organization and action.
In French local authorities, the Steering Committee (COPIL) defines strategic orientations and validates key decisions, while the Technical Committee (COTECH) focuses on the project's operational implementation. These bodies aim to promote the 'public interest' (Duvernoy et al., 2014). However, as Hatchuel et al. (2017) point out, these traditional institutional forms are insufficient given contemporary innovation dynamics. Indeed, they depend on classic decision-making models that emphasize selecting pre-existing alternatives, whereas our context requires the ability to generate novel solutions. Hatchuel et al. (2017) suggest viewing the organization as a generative metabolism, meaning an evolving system capable of fostering collective creation dynamics, generating new forms of enterprises, and structuring supportive collectives.
These co-design spaces, known as 'arenas of debate' (Mollon, 2019), transcend the role of simple exchange venues; they are environments where differing opinions can be expressed, confronted, and transformed. As Darras (2017) highlights, a co-design mediator is essential in facilitating interactions and guiding group dynamics while translating various areas of expertise and managing conflicts using artifacts. These artifacts, designed to structure discussions, enable the identification of tensions and disagreements (Mollon, 2019). According to Darras (2017), the mediator's role goes beyond fostering a harmonious working environment; they must also prevent the re-emergence of implicit hierarchies to ensure a genuinely horizontal and democratic process (p. 150).
In this context, our study shows that the pilot team can no longer confine itself to the external sponsor and decision-maker role. It becomes a fully committed player in the collaborative process, adopting a facilitative stance that allows it to exploit available skills and influence mental models to support organizational change (Bijl-Brouwer & Malcom, 2020).
Therefore, in addition to establishing collaborative processes, governance must create a framework that ensures sustainable integration. A strong culture of co-design, supported by mediation and facilitation practices, is essential for embedding these collaborative

spaces into the cooperative's operations and ensuring their longevity. These practices should be integrated from the governance structuring phase onward to encourage collective learning and social innovation, making them a key lever for organizational development.

4.2 A collaborative learning environment.

Co-design should not be viewed solely as a methodological exercise. It must be integrated into the practical realities of the organization under development to serve as a genuine lever for organizational transformation grounded in a collective vision. (Manzini, 2016; Reunkrilerk, 2022).
The pre-configuration phase enables to anticipate how the future cooperative will be organized and operated while conceptualizing areas for interaction and coordination. The external design team must gradually share its expertise with stakeholders to enhance their autonomy and ensure the sustainability of the co-design process. Analysis of the interviews shows that the pilot team believes it has progressively developed its skills, transitioning from a traditional consultative approach to an experimental co-construction methodology. To ensure the sustainability of initiatives beyond the experimental phase, it is essential to open the inter-sessions to new stakeholders so they can participate in co-design at a more strategic level within the cooperative.
This openness is essential for initiating a gradual transformation and fostering a collaborative learning culture. The pre-configuration phase of the future cooperative involves stakeholders in co-producing the cooperative's 'instructions for use.' Engaging specific stakeholders in co-designing the instructions will help solidify the organizational culture toward greater collaboration and mutual learning (Chamberlain & Partridge, 2017; Coblence & Pallez, 2015; Poudray et al., 2019).
Identifying key skills is essential to the smooth running of these extended inter-sessions. As Dubois (2015, p. 165) argues, ensuring the sustainability of co-design systems requires the design team to adapt to the rotation of key players. Manzini (2015, p. 154) emphasizes that while everyone possesses an inherent ability to design and collaborate, these skills must be nurtured and maintained to prevent erosion. The collaborative transfer of knowledge depends on employing tools, practices, and expertise tailored to local dynamics and easily transferable.

This would allow a new committee to promote the co-design culture strategically. The co-design sessions between the pilot and design teams would shape this committee, serving as a learning space that gradually includes certain participants. This would ensure the sustainability of the approach for projects lacking a dedicated innovation structure.
These inter-sessions, open to various stakeholders, encourage tolerance, openness, and the development of learning capabilities while promoting a design culture. (Manzini, 2015, p. 161). However, the design team must ensure that the tools it implements reflect the whole structure and guarantee this openness.

4.3 The "usage guidelines" as an intermediary and boundary object

Reunkrilerk (2022) highlights organizations' challenges when adopting a co-design methodology without dedicated mediation. This process necessitates gradual adjustments to tailor mediation to organizational dynamics, relying on intermediary and boundary objects (Star & Griesemer, 1989) that structure interactions and promote the evolution of organizational cultures. These objects are not merely tools for conveying information but are dynamic artifacts that foster experimentation, negotiation, and co-

design adaptation. They play a crucial role in adopting new practices by structuring communication and decision-making (Reunkrilerk, 2022).
In this context, the cooperative's usage guidelines —the main deliverable of the approach—serve as a central tool: it formalizes a collective vision while stabilizing collaborative practices. Vinck (2012) identifies two significant effects of intermediate objects: a structuring effect that enhances participant coordination and an alignment effect that solidifies shared references. Jeantet (1998) also emphasizes their role as a catalyst for cooperation, offering a common framework for adapting collective practices. Reunkrilerk (2022) illustrates that these objects act as mediators, reshaping relationships between players and facilitating the adoption of new organizational practices. They can evolve into boundary objects, encouraging the standardization of practices while preserving the flexibility needed to adapt them.
In this way, the usage guidelines are not just an operational manual; they transform into a platform for dialogue where stakeholders can modify their practices and ensure alignment between the project's goals and its execution. For a boundary object to be effective, it must be stable and adaptable (Mark et al., 2007): it should be structured enough to ensure consistency while still being flexible to accommodate organizational dynamics. A rigid frame of reference may stifle innovation and reduce co-design to a standardized approach detached from local realities (Reunkrilerk, 2022).
From this perspective, Reunkrilerk (2022) and Catoir-Brisson (2022) highlight that mediation through design relies on tools and artifacts that improve communication and the adoption of new practices. This method reduces tensions, fosters participation, and integrates co-design into organizational structures over the long term.

Finally, the co-design of the instructions for use, acting as a strategic lever, which will take place during the last two workshops in the process and with the enlarged co-design committee, will reinforce co-design mediation and the creation of this generative collective governance.

4.4 Toward a model of generative co-governance

Our findings suggest that inter-sessions can evolve from logistical preparation spaces into strategic governance mechanisms. Initially framed as support moments, used to align agendas, distribute tasks, and report progress, they gradually transformed into arenas where the rules of engagement were negotiated, strategic choices were discussed, and responsibilities were collectively adjusted.
This evolution prefigures a shift toward generative co-governance: a flexible, evolving model in which governance is not predefined but emerges through collaborative practice. Unlike traditional structures that validate pre-set options, these inter-sessions allowed stakeholders to co-create new possibilities in real time, adapting decisions to the evolving context and needs.
In this model, governance is not external to the co-design process; it is one of its most active outcomes. These inter-sessions become critical infrastructures for institutional learning: they synchronize different timeframes, clarify roles, and progressively distribute authority. Co-design, in this sense, becomes not just a method but a way of governing, a logic of action embedded in organizational culture.
Through the co-production of boundary objects like usage guidelines and shared facilitation practices, inter-sessions help stabilize the emerging cooperative's internal governance. They institutionalize collective learning by embedding reflexivity and co-responsibility in daily operations. This illustrates how informal, iterative design practices reshape formal structures and explains why we argue that the future of public governance may depend significantly on what happens between workshops.

5.Conclusion

Our research highlights the importance of inter-sessions in co-design dynamics. Although this co-design project does not rely on physical infrastructure like an innovation laboratory, the pilot and design teams have created intermediate spaces to facilitate coordination and alignment. These spaces are crucial for shaping collaboration and reinforcing trust and cohesion among the teams, and, by extension, all participants involved.
However, grounded in an existing framework and a strong professional culture, these inter-sessions have faced resistance, making it challenging to shift perspectives. Our study also underscores the transformative potential of inter-sessions in co-design processes. Initially serving as logistical coordination points, these inter-sessions evolved into strategic arenas where roles were negotiated, trust was cultivated, and collective ownership was established. This progression illustrates the emergence of generative co-governance—a dynamic model where governance structures are not merely predefined but co-created through ongoing collaborative practices.
Inter-sessions have become pivotal in institutionalizing co-design within organizational frameworks by facilitating continuous dialogue and mutual learning. They serve as boundary mechanisms, bridging diverse professional cultures and synchronizing varying timelines and ambitions. This evolution represents a shift from viewing co-design as a project-specific tool to recognizing it as an embedded logic of action within institutional operations. For public organizations seeking sustainable transformation, acknowledging and nurturing these often-overlooked interstitial spaces is crucial. Inter-sessions are not just ancillary components of the design process; they are the arenas where institutions learn to govern collectively, adaptively, and innovatively. As such, co-design transcends the creation of services, redefining the processes through which decisions are made and governance is enacted.

Invitation to Serious Play: R/Evolutionary Thinking Cards – Creating Space for Emergence and New Ways of Being

Gabriela Karolak

Parsons School of Design | The New School

gabrielakarolak@gmail.com

ABSTRACT | The *Invitation to Serious Play* workshop reimagines sustainable, collaborative, and inclusive innovation practices through playful exploration. The session aims to reflect on and disrupt conventional innovation practices by applying the principles of Serious Play to encourage reflective creative, and systemic thinking. Participants will explore how innovators can prioritize sustainability, systems thinking, emergent thinking, while moving away from traditional, linear problem-solving approaches.

By engaging in interactive exercises using the *R|Evolutionary Thoughts* card deck, participants will reflect on their positionality, identify how their perspectives shape their work, and consider how these new perspectives can impact their innovation work. The activities promote ethical considerations and multi-sensory engagement, fostering an environment where diverse viewpoints are valued. This approach helps participants question normative assumptions and generate novel insights for tackling complex, systemic challenges.

The session encourages collective efforts toward rethinking innovation practices, emphasizing the importance of considering various scales, contexts, and viewpoints in creating sustainable systems. The goal is to engage participants in design-led, tactile exercises that prompt reflection on their positionality and facilitate the creation of artifacts that spark conversations and foster critical thinking for more inclusive innovation. The session is designed for 15–25 participants.

KEYWORDS | SUSTAINABILITY, EMERGENT THINKING, SERIOUS PLAY, SYSTEMIC DESIGN, INNOVATION

1. Introduction

In recent years, critiques of unsustainable modern practices have gained mainstream attention. From exploitative labor models and personal health negligence to unsustainable economic structures and exploitative environmental policies, contemporary systems prioritize machine-like efficiency, growth, and immediate profit at the expense of long-term viability (Yunkaporta, 2021). The focus on maximizing productivity often disregards the cyclical, fluid, and adaptive nature of living systems, favoring a standardized and linear approach that undermines both human and ecological well-being. This artificial divide between nature and culture falsely assumes that humans can rationally and systematically control all processes, reinforcing unsustainable approaches to innovation and problem-solving (Rees, 2020).

To move toward sustainability, we must redefine it beyond environmental concerns to include all living systems—human and non-human. This shift requires an epistemological change: rather than seeking to manage or control systems, we must learn from natural ecosystems and incorporate their fluid, adaptive, and emergent properties into our ways of thinking and working (brown, 2017).

Design-led research tools can facilitate this shift by encouraging new ways of seeing and questioning problem spaces. The prompts and exercises used in this workshop form a repository of activities that integrate Serious Play into critical innovation processes. This collection encourages alternative ideation approaches that prioritize inclusivity, ethics, and systemic thinking. By leveraging a format familiar in creative, educational, and consultancy settings—cards—this tool bridges traditional innovation methods with more radical, exploratory ways of thinking.

This workshop introduces Serious Play as a framework that disrupts conventional innovation methods, fostering systemic, holistic, and emergent approaches to creativity and ideation.

2. Serious Play as a Framework for Emergent Thinking

In biological systems, play is a crucial yet seemingly inconsequential activity that fosters learning and adaptation. Applying this concept to innovation—traditionally viewed as structured, goal-driven, and logical—offers a transformative approach to problem-solving. Serious Play transcends binary thinking, blending intuition with logic, structure with fluidity, and creativity with analysis. By removing traditional stakes and productivity pressures, participants can explore unconventional ideas and perspectives without the constraints of immediate feasibility.

Serious Play combines the freedom of uninhibited exploration with a reflective dimension that acknowledges the potential for valuable and viable solutions to emerge from seemingly unstructured activities. It challenges the assumption that innovation follows a linear trajectory, instead recognizing that breakthroughs often arise from unexpected connections beyond predefined project objectives.

Serious Play creates a space for emergence, where participants engage in hands-on, embodied exercises that challenge ingrained thought patterns. This approach is not about producing immediate, tangible outputs but about unlearning habitual ways of thinking and making room for novel insights.

3. Workshop Structure

This interactive engagement invites participants to engage with a custom-designed card deck, *R|Evolutionary Thoughts*. The deck serves as a prompt-based tool for reflection, exploration,

and creative engagement. The workshop follows a structured yet open-ended format:

1. **Introduction & Distribution of Cards (5 min)**: Participants receive a deck of cards containing prompts designed to disrupt conventional thinking and encourage embodied engagement.

2. **Individual & Group Reflection (10 min)**: Participants reflect on and respond to prompts through various mediums, including sketching, writing, and creating artifacts. The prompts challenge normative assumptions about human positionality, innovation, and systemic interdependencies.

3. **Review & Exchange (10 min)**: Participants share their responses, facilitating peer-to-peer learning and the emergence of new perspectives. Reviewing others' outputs allows for unexpected connections and insights.

4. **Facilitated Discussion & Reflection (5 min)**: The workshop concludes with a structured discussion on key takeaways, emphasizing the role of unlearning and emergent thinking in reshaping innovation practices.

Conclusion
By engaging in Serious Play, participants will experience the value of exploratory, non-judgmental creativity as a means of challenging dominant innovation paradigms. This workshop provides a novel tool for fostering fresh perspectives in innovation spaces, encouraging participants to rethink what it means to learn, unlearn, and create. Ultimately, the goal is to expand the boundaries of what is considered possible, realistic, and rational in innovation discourse—paving the way for more systemic, holistic, and sustainable approaches.

The workshop addresses power dynamics in innovation by encouraging participants to reflect on their positionality, challenge their established thinking patterns, and engage with diverse perspectives to foster more inclusive and equitable approaches to problem-solving.

Landscape Design for Urban Residual Spaces from a Humanistic Care Perspective --- Landscape Design of Conca dell'Incoronata

Chang Tang
Academy of Arts & Design, Tsinghua University
169888474@qq.com

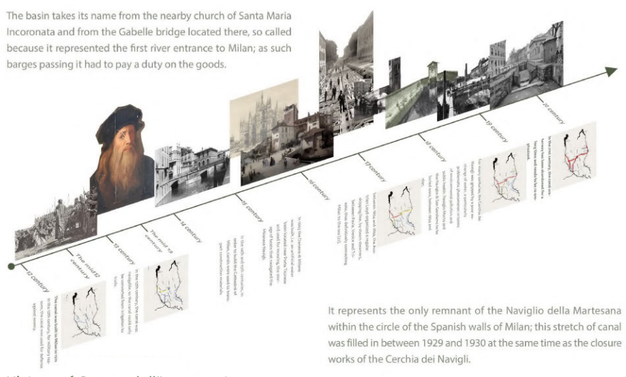
Abstract

This study explores the theory and practice of urban residual space landscape design from the perspective of humanistic care. By investigating the development of humanistic care theory and its application cases in landscape design, we reveal its spiritual essence and find ways to improve the landscape quality of residual urban spaces. Subsequently, specific solutions are proposed based on the different types and spatial characteristics of the residual urban space and considering the diverse needs of different user groups. This study provides a new perspective for effectively improving urban space utilization and creating a people-centered diversified urban landscape.

The design case is located in Conca dell'Incornata, which mainly consists of urban green spaces and canal waterway remnants. The design first considers the diverse needs of different user groups and their physical and mental needs at different times. The design takes into account the spatial characteristics of different parts of the site and the existing landscape resources, using elements that are easy to assemble and disassemble and are environmentally friendly. Through public participation, activity implantation, community platform construction, community gardening, flexible facility design, and sensory design, the functions and quality of the existing site will be improved.

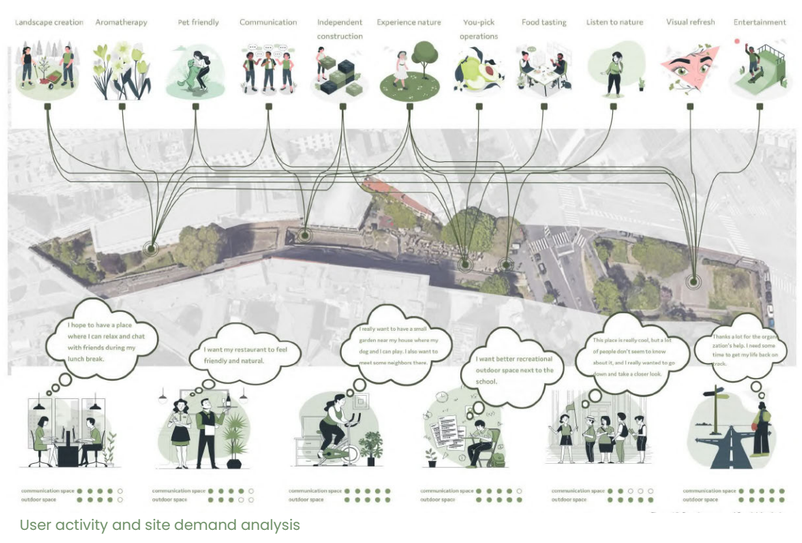
Background and Research

Milan, as an industrial and commercial center, has built a large number of public facilities to meet the needs of urban development. However, with changes in production methods and lifestyles, many of these facilities were abandoned. Furthermore, due to incomplete laws and regulations on urban spatial planning, many urban residual spaces remain underutilized during the city's rapid development.
Although Milan has many urban residual spaces, there are still groups and communities whose needs for urban space are neglected. Many spaces in the city do not effectively serve the needs of different groups, resulting in low efficiency of urban space utilization. The design aims to enhance attention to the material and spiritual needs of different users in different periods and encourage their participation in the construction and maintenance of the urban residual space landscape. This will ensure that the remaining urban space better meets the diverse needs of its users and reduces the waste of usable urban space.
In addition, the design explores sensory design, starting from a micro perspective and using landscape to awaken people's visual, auditory, taste, touch and smell systems, in order to bring a bit of fun to people's busy lives and make people aware that every tiny individual is cared for, and the city is not a cold machine.



History of Conca dell'Incoronata

Methodology and Tools



User activity and site demand analysis

PHASE 1

Observational Method
For on-site research, a one-week field observation was conducted to record visitor demographics, activity locations, and primary activities. Additionally, potential security and sanitation issues were identified, along with interactions between different user groups and any conflicts in site usage. In the online research component, social media platforms such as Instagram were analyzed to gather user impressions and notable activities related to the site from diverse demographic groups.

PHASE 2

Survey Method
Using a combination of paper and online questionnaires, the survey investigated the demographics of visitors to the "Conca dell'Incoronata," including age, gender, and identity. It quantified the proportion of different user groups, mapped their frequently visited spaces within the site, and identified the activities they engaged in. Furthermore, it assessed their needs and preferences for spatial improvements.

PHASE 3

Interview Method
Based on the demographic distribution obtained from the survey, in-depth interviews were conducted with users from different backgrounds on-site. These interviews provided deeper insights into their experiences, spatial perceptions, and specific needs. After synthesizing their feedback and suggestions, an initial design proposal was developed and presented to site users for further refinement based on their input.

Drawing on theories of residual space and Maslow's hierarchy of needs, the site optimization strategy is formulated from both psychological and material perspectives. Psychologically, the strategy enhances users' sense of belonging through public participation in landscape design, event integration, and the development of a community platform. Materially, it strengthens public engagement in environmental creation through co-governed landscapes, sensory landscapes, and flexible, adaptable facilities.

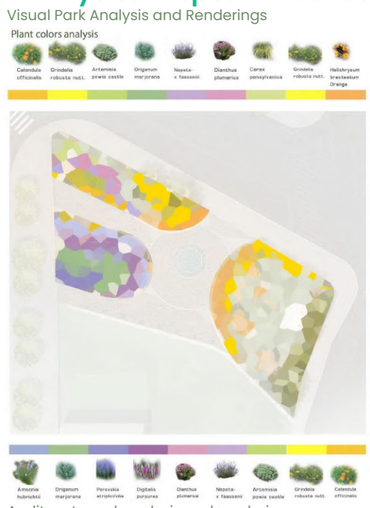
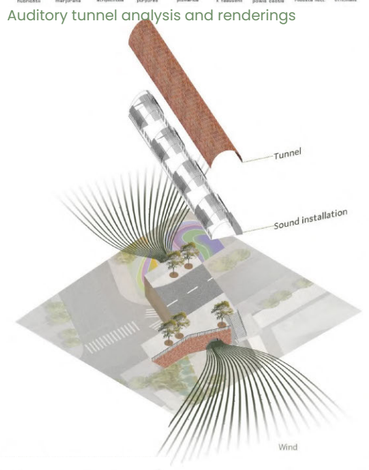
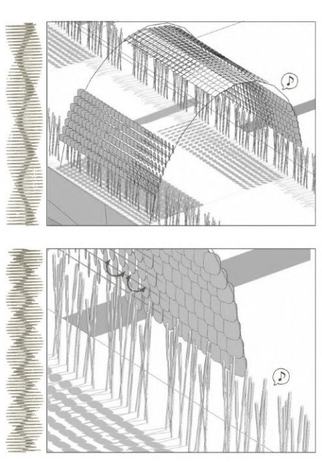
03 Physical Aspect---Sensory Landscape

Visual Park Analysis and Renderings

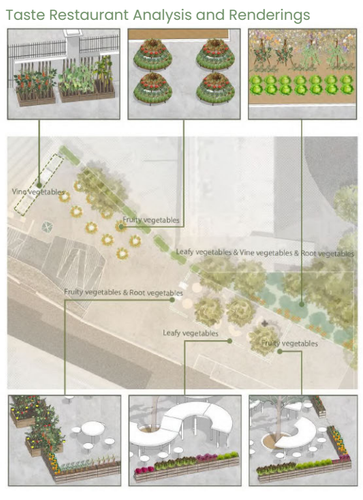


Auditory tunnel analysis and renderings





Taste Restaurant Analysis and Renderings



The study explores various design strategies within the physical environment to encourage community engagement with underutilized spaces. These strategies are categorized into three key components: co-governed landscapes, flexible facilities, and sensory landscapes.

The co-governed landscape consists of aromatic, edible, and ornamental plant areas, where plants can be adopted and managed by community residents and citizens. A dedicated social platform allows users to share and coordinate planting activities.

The flexible facilities include adjustable greenhouses in aromatic planting areas, modular tables and chairs in the taste restaurant, and combinable cubic furniture in the tactile corridor. These elements empower users to actively shape the space.

The sensory landscape enhances spatial perception through different sensory experiences: plant colors in the visual garden, wind speed in the auditory tunnel, plant flavors in the taste restaurant, natural textures in the tactile corridor, and plant fragrances in the olfactory garden. This approach not only stimulates the senses but also fosters a therapeutic and immersive spatial experience.

Ecological Activation in Participatory Temporary Urbanism: values and challenges from an Urban Regeneration case in Shanghai

Francesca Valsecchi*[a], Zijie Lin[b], Wentao Lu[a]

ABSTRACT | Urban regeneration is increasingly framed as a process of social renewal. Yet, gaps persist in translating policy frameworks into grassroots action. Grounded in more-than-human design theory and temporary urbanism, and drawing on an international collaboration project across seven pilot sites in Europe and China (2020–2025), the paper analyses how participatory temporary urbanism—a methodology combining community co-design and temporary use interventions—bridges this gap by fostering ecological urban regeneration in diverse metropolitan areas.
In the study, the importance of repurposing temporary spaces through meanwhile-use activation has been explored as an approach intrinsically linked to regenerative cities. The project scope emphasises the potential for transforming underutilised urban areas into vibrant community hubs through mission-oriented activation. The project developed more than 100 temporary-use practices, aiming for a range of missions, from circular practices and new capacities and skills to local identity and heritage.
The paper describes the shared co-benefit that society and the environment can draw from more-than-human approaches to urban regeneration, with a focus on Shanghai's

Xinhua pilot.
Through mixed methods, we explain how temporary uses—from biodiversity mapping to zero-waste hubs—catalyse long-term stewardship. The Shanghai case reveals a hybrid governance model (university-community partnerships) that enabled rapid prototyping but relied on informal agreements.
The paper presents a typology of ecological temporary uses that serves as a planning tool for communities engaged in participatory regeneration. It highlights innovative approaches to urban regeneration and emphasises the critical role of community engagement in fostering adaptable and inclusive urban environments. By centring Shanghai's Zero-Waste Action hub as a crucial case, we highlight how temporary urbanism can transform declining spaces into thriving socio-ecological systems, offering a replicable framework for cities navigating rapid urbanisation and ecological crises.

KEYWORDS | Urban ecology, participatory urbanism, urban regeneration, prototyping, ecological activation

1. Introduction: Urban regeneration and temporary uses

1.1 Participatory Urbanism Project Framework

Urban regeneration is a multifaceted process generally aimed at revitalising declining urban areas. It may or may not involve physical redevelopment, but it is increasingly connected to social renewal. As pointed out by the UN-Habitat report (UN-Habitat, 2021), *"Urban regeneration does not only transform the physical environment but is a new paradigm for urban life in which the principles of social inclusion, resilience, compactness, community participation, and socio-economic prosperity are the starting point for co-creating the city"*.
Under this premises, the paper discusses practices of open urban regeneration across European and Chinese cities in the framework of an international collaboration project (T-Factor "Unleashing future-facing urban hubs through culture and creativity-led strategies of transformative time", 2020-2025*)*, particularly highlighting how the model of participatory regeneration envisioned through the international collaboration has been applied to the Shanghai pilot case, and how it has generated forms of community participation and organisational model supportive of regenerative territorial development on the long-term timescale and in multi-stakeholders scenario (Wu et alii, 2024).
Based on Bishop & Williams (2012) notion of "temporary urbanism", the project puts forward the definition of "participatory temporary urbanism": urban regeneration can - and possibly it must - be a creative and collaborative process of shaping and crafting places during urban transition and redevelopment phases, as a laboratory for the future of cities and, consequently, of the Planet (Arniani et alii, 2024). This definition envisions regeneration processes sustained through community involvement and participatory practices, utilising tactical tools (such as co-design workshops and participatory actions) and strategic instruments (including the long-term activation of community planning and the stewardship of green spaces and ecological projects).
The project has developed an urban regeneration methodology and paradigm that deconstructs the rigid and deterministic approaches that have often characterised many urban renewals across Europe and beyond, generally based on heavy infrastructure intervention and top-down management; instead, it suggests that leveraging temporary uses offers a viable alternative to city-making at times of uncertainty and rapid change. Addressing challenges such as social and cultural deprivation, loss of green and public spaces, economic downturn, and spatial segregation, temporary interventions often address the problems that urban regeneration is tasked with solving, accelerating the pace of change and creating co-benefits. Temporary uses are context-dependent strategies that integrate universal principles with local realities to achieve comprehensive outcomes (Martelloni et al., 2023).
For four years, the project developed in six pilot areas across European cities *(*Milan, Amsterdam, Kaunas, Bilbao, Lisbon, London*)*. Parallel research and innovation efforts have also been

undertaken in three districts in Shanghai (Xinhua Community Design Centre, NICE 2035 neighbourhood and MeetU Lab). In their contextual and local differences, all the pilots have experimented with temporary uses to embrace long-term thinking and develop agile strategies for uncertain futures. The project adopted an action research approach to iteratively test participatory urbanism across the seven pilot sites. The methodology aligns with the project's goal of bridging academic research and community co-design. All the cities developed programs of participatory interventions, and they work independently and in synergy through many distributed, connected experiments around six thematic "regeneration missions", which articulate different axes of urban sustainability and development.

Figure 1. Six thematic missions of urban regeneration of the project

1.2 Ecological Activation of Participatory Communities

Among the hundreds of cases and interventions for temporary uses developed in the project, the paper focuses on practices in which participatory strategies are applied to the urban ecology framework and the potential of regenerative discourse for the city (https://hub.t-factor.eu/toolbox-per-themes/1/).
In the project, the regeneration mission has been defined as *"Greening, biodiversity and urban wilderness - Cities as living ecosystems",* aiming to explore ways for temporary uses to cultivate new understandings of humans' entanglements with urban nature and foster more collaborative and respectful relationships that allow people and nature to thrive together. This mission directly addresses the gap between the general awareness of the profound ecological crisis society is facing and the uneven sense of urgency to act in response to it. Cities become the testbeds for the shift towards an ecological society, both in their infrastructures and their inhabitants' mindsets (Douglas, 2018). This paradigm shift is compelling globally for European cities and their growing populations, as well as megacities scattered throughout the planet. Greening cities is related to their footprints and the impact on climate goals. Still, it also contributes to increasing ecological knowledge and raising the universal concept of "ecological citizenship" within the human scope and towards the more-than-human (Akama, 2020). Across Europe and China, the European Green Deal, the UN Convention on Biodiversity (UN, 2022), the World Bank (TWB Policy Brief, 2021) and the construction of Ecological Civilisation (Gare, 2021; Geall, 2018) represent comprehensive policies to enhance urban nature, biodiversity, and ecological affordances, from implementing green infrastructure strategies to biodiversity conservation, and how citizens can be involved in environmental stewardship.
Whilst these global-scale policy frameworks promote ecological transformation of society, gaps persist in grassroots implementation. Urban ecology scholars (Hanson, 2019 and Haskell, 2021) highlight the risk of "greenwashing" in regeneration, and they advocate for just sustainability (Gu

et al., 2021) that links ecological health to social equality and direct participation.

2. Urban Regeneration Through Ecological Participation as a Research Methodology

2.1 Ecology-driven temporary uses in urban regeneration

Having established the project's theoretical basis (Paragraph 1), we now analyse its ecological implementation (Paragraph 2), focusing on Shanghai as a critical case.
Practices of urban greening, rewilding, and engaging with biodiversity and ecological interventions are increasingly documented and demonstrate co-benefits for urban regeneration regarding the enduring quality of life for people and other organisms and the transformation of urban planning strategies towards more-than-human concerns (Zohar et al. 2014; Gatto, 2019). Ecologically-driven micro-regeneration contributes to understanding and restoring natural habitats and allows citizens to look at the city beyond the human scale and as an all-being ecosystem. At the implementation level, this process presents challenges: the competing demands for limited urban space are not exempt from pressure from commercial development over green infrastructure. Maintenance costs of green projects are significant and still rely mainly on inadequate public funding, which can lead to gradual degradation over time. Moreover, relational challenges are present: engaging and mobilising stakeholders, including local communities and administration, can prove difficult due to conflicting interests and priorities (Cipriani et al., 2024).
Ecological urban regeneration entails a cultural shift that involves an enhanced—if not radically new—perception of flora and fauna and their role in citizens' everyday lives and urban dynamics. Therefore, micro-regeneration with an "ecological mission" must incorporate intangible interventions, such as raising environmental awareness at all the stakeholders' levels, fostering frequent and deeper connections to nature, cultivating an aesthetic appreciation of the natural world among citizens, and integrating non-human elements into the local community (Tarsitano et al. 2021; Edwards et al. 2022).
This may involve engaging citizens with nature through collaborative forms of biodiversity mapping and monitoring, hands-on workshops, immersive observations and explorations, artistic interventions, educational programs, nature festivals and other types of public events - laying the ground for a culture that values and champions deeper connections and collaborative human-nature relationships. The project has experimented with the role of temporary uses as a strategy of micro-regeneration and an opportunity for capability-building among citizens to expand the notion of place encompassing non-human elements and create communities of practice and communities of places. As Zhu (2023) highlights, micro-regeneration impacts how people generally understand the notion of "public space" in China and beyond.
Across the seven cities involved in the project, more than 100 micro-regeneration projects have been experimented with, including forest schools, Wild Spot and ecological placemaking, nature-inspired public furniture, landscape festivals and public activities, DIY construction of pollinators' gardens, insect hotel and nature observation station, foraging and wild herbs cooking, etc. Drawing on the catalogue of implemented projects from the pilot cities, we created a matrix (Table 1) to define areas of intervention for temporary uses under the theme of ecological urban regeneration, serving as an interpretative and planning tool.

Table 1. Typology of Ecological Temporary Uses: Themes, Objectives, and Case Examples. Derived from cross-case analysis of 7 pilot sites (2020–2025).

Biodiversity mapping & monitoring	Developing creative and engaging forms for exploring and mapping biodiversity in urban regeneration areas, fostering the 'art of noticing' and appreciation of natural resources, promoting citizen science approaches, and creating do-it-yourself artefacts
Traditional green	Creating new green spaces or preserving/restoring existing ones, such as public

spaces and urban agriculture	gardens, green pockets, and vegetable gardens. These interventions can have environmental benefits (aesthetic and quality of the space) and social benefits (recreational spaces, relaxation, social interaction, and opportunities for increased nature-connectedness)
Urban wilderness areas	Establishing designated pockets of urban wilderness that exhibit characteristics of landscapes where human intervention is minimal or absent
Well-being hotspots	Testing spatial artefacts and place designs that promote well-being for individuals and other living organisms, employing nature-based solutions and exploring soundscapes and bio-acoustic environments
Hands-on workshops, Nature's festivals and events	Organising workshops, seminars, and other learning sessions on sustainability topics, such as environmental conservation, urban gardening, and green building practices, to equip individuals and communities with knowledge and tools for endorsing greening and biodiversity objectives; developing events that celebrate nature in the city and foster the ecological scale of urban environments
Community engagement and stewardship	Involving residents, local communities, and stakeholders in experimental activities of planning, development, maintenance, and governance of green spaces and ecological knowledge, fostering ownership, environmental stewardship, and collaborative care of green assets and infrastructure.
Ecological intervention in urban systems	Developing a systemic and relational notion of ecology and environment, in which not only the "planted" and "curated" green is taken into account, but also developing knowledge and skills that foster the appreciation of ecology as a web of life; composting, leave-no-trace, upcycling, reduce workshop and education.

The matrix suggests implementation areas where each city and context adapts to local stakeholders and partnership networks, and modulates according to specific contextual participation dynamics. Through international research, we can see that "participatory communities" differ widely in identity, forms of relationships, ways to build shared goals, and ways to determine everyday actions. Whilst the drive towards ecological forms of society may be universal, how regenerative and restorative territorial approaches are implemented is very contextual and strongly depends on the conditions of the regeneration project.
In some cities (Milan, Kaunas, Amsterdam), urban regeneration plans have created the conditions for ecological development, for instance, when they occur in metropolitan areas with a high percentage of green space or with specific biodiversity characteristics suitable for participatory conservation, maintenance, and engagement interventions. Another condition would be the existence of a "local stakeholder" already active in ecological matters, which could be the catalyst for further participatory initiatives. In these cases, the communities can express the intention to intervene in urban ecology subjects as the trigger of their participation and actions. In other cases, the ecological drive does not pre-exist in the participatory community (Shanghai). Nevertheless, the community has been very active and widely involved in the regeneration plan from the beginning of the project, through micro-scale participation in the process and in the governance of the space. The results are frequent, varied and multifaceted collaborative projects. This process stimulated the self-organisation of the mission of regeneration, thereby developing an emergent interest in ecological and sustainability topics, whether as a drive for community or space construction. Therefore, the territorial co-benefit between people and nature is relevant as an outcome of the regeneration practices.
While all sites embraced temporary uses for ecological regeneration, implementation diverged due to cultural, governance, and resource factors. These differences nevertheless position the Shanghai case as a unique outcome, composed not only of a series of regeneration activities but also of a broader community development framework.
Such uniqueness is grounded on Wang's (2021) insights regarding the balance of top-down and bottom-up approaches and structured according to the following factors:

A. Governance Models

a. Shanghai's hybrid approach (university + social enterprise) enabled rapid prototyping but relied on informal agreements.

B. Scale dimension
   a. Ecological intervention is a comprehensive initiative involving multiple communities and sub-projects, yet a fragmented resource system supports it.

C. Temporal Dimensions
   a. Articulating short-term, prompt, and continuous interventions creates a complex timeline that is sometimes hard to recognise as continuous.

2.2 Temporary uses and regeneration in the Shanghai pilot project

The Shanghai pilot is located in Xinhua CDC, a shared community space operated for over three years by the social organisation Big Fish through community activities' support and design (Figure 2). The space is managed under an agreement with the landlord and the local government, which retains ownership of the building while leaving the operation of the space to the organisation, in collaboration with universities, local stakeholders, and business partners. The space has a rich, diverse spatial layout and project operation functions. It was transformed from an abandoned building into a structured space with fixed functions and numerous idle spaces for temporary use.

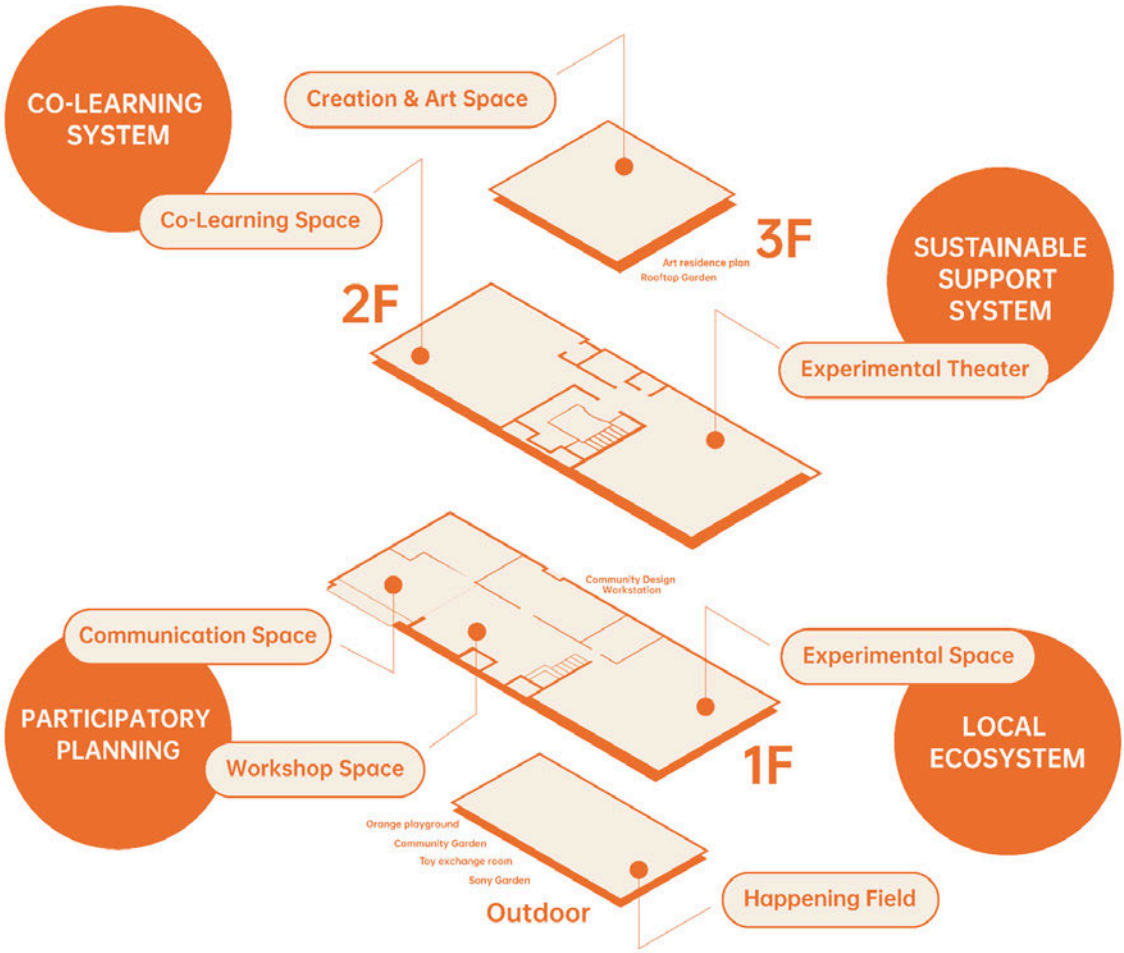

Figure 2. The diagram illustrates the spatial layout of Xinhua CDC, showing the different participatory interventions in regeneration. The space arrangement outlines the condition of community participation based on regular daily activities.

Whilst Big Fish takes charge of the space's general management, the daily operations are overseen directly by community members and promoters, thereby stimulating the space's vitality. A significant role of the social enterprise is to carry out community empowerment projects, organise professional training, share experiences, and take participatory actions to

enhance community residents' ability and awareness to participate in community construction, thereby injecting continuous impetus into the community's sustainable development.
The space's configuration presents ideal characteristics for defining temporary uses, and collaboration with the university has allowed the development of initiatives dedicated explicitly to citizens' ecological participation. This collaboration between the university, social enterprise, and public reflects the intellectual debate of "implementing Ecological Civilisation strategies" (Marinelli, 2018). It addresses the requirements of the Shanghai government's environmental master plan (SUPRI, 2021). Drawing from the categories of Table 1, the paper describes in detail the Shanghai pilot experiment; whilst the EU project concluded in 2024, the China pilot is still funded and running, providing the possibility of multi-temporal evaluation of the participatory intervention (Zohar et al. 2023), from the prompt uses to long-term implementation.
Different stakeholders have jointly initiated many ecological activities that have different temporal dimensions, not in "durability" and "length" but in the capacity to move from tactical intervention to strategic planning.
According to their temporal dimension, we classified the activities (Figure 3) into four kinds:

1. Periodic activities hosted by stakeholders during different festivals, such as Earth Day (prompt)
2. design courses that bring university students to direct interaction with citizens and participatory settings (temporary)
3. Community Gardens built and maintained by the self-organised residential groups, such as Seedling Buddies, Sony Permaculture Team, and an informal nature school (stable)
4. a hub project, Zero-Waste Action, joins all stakeholders' efforts to regenerate the community centre into an ecologically and socially friendly space (long-term)

Figure 3. Four kinds of temporary activities, from left to right and top to bottom: periodic activities (second-hand festival), design courses (temporary design in urban regeneration), community gardens (garden co-construction) and the Zero-Waste Action hub project.

3. Primary ecological outcome: Xinhua Zero Waste Project

The Shanghai pilot provides an example of spatial regeneration manifesting through participatory design methods, with ongoing small-scale and diverse initiatives that reinforced community ties. Over time, the community's strength enabled the motivation and implementation of a full-scale ecological intervention involving the whole community and multiple interventions, as described in Figure 4. Whilst the trigger of the ecology-related project came from the partnership between the university and the social enterprise, rather than a co-design process (like in Milan Expo are with

the collaboration with the elementary and middle schools in the area), pre-existing community ties eventually made it possible to collect a shared understanding of ecological relevance and to activate regeneration interventions related to people and nature as a consequence of the community's involvement in the regeneration process. Notably, it became a framework for other neighbourhoods and districts. The pilot program's development approach was compiled in the "Xinhua Practice" manual and has been extensively promoted and implemented across different communities in Shanghai. Under this framework, the regeneration of the Xilingjiazhai community in Huangpu District was carried out. Through a co-design process, a temporarily used space in the community was renovated into a community space for participatory activities.

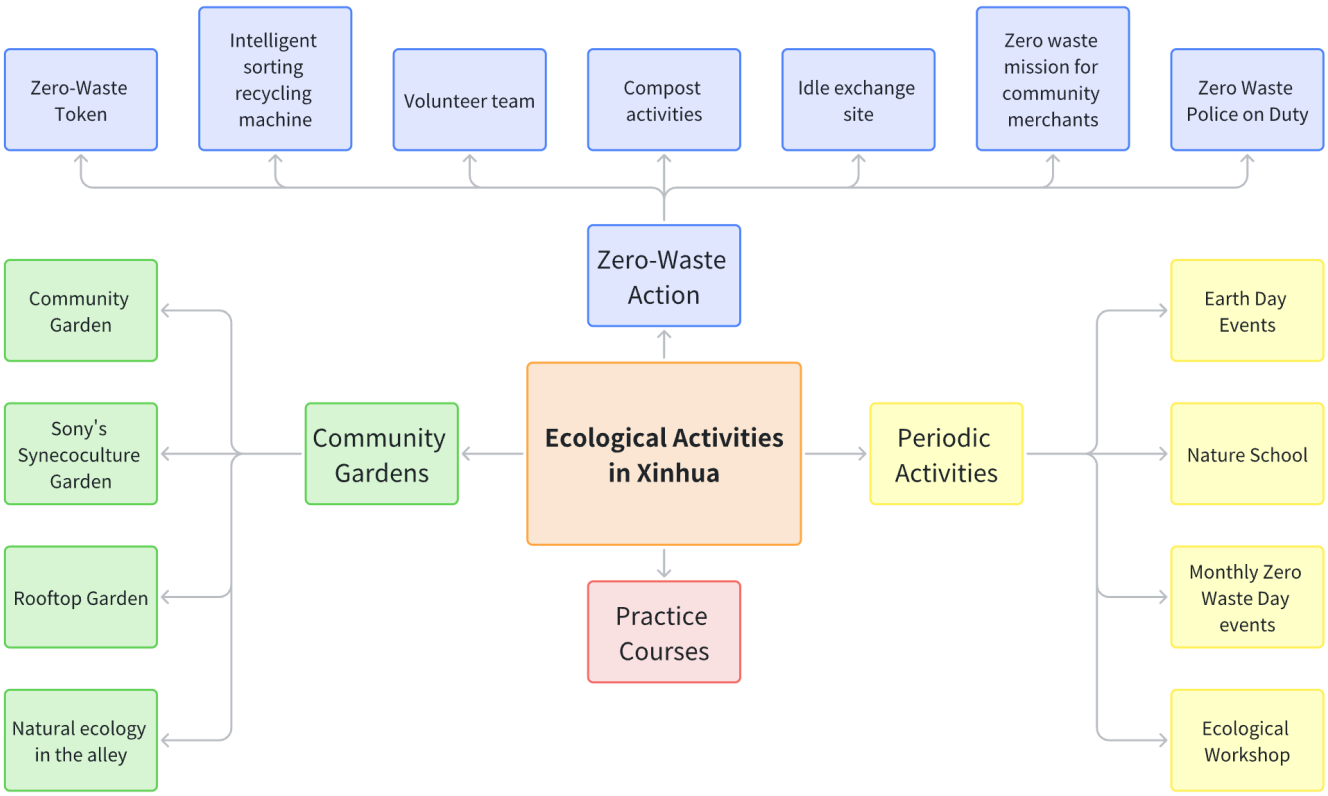

Figure 4. Xinhua Ecological Activities Framework at a Glance

As a hub of ecological projects in the area, the "Shanghai Xinhua Road Subdistrict Zero Waste Community Building Action" has a systemic, comprehensive structure that includes construction scenarios, activities, volunteer mechanisms, maintenance, and continuous planning and iteration. It is jointly designed by Xinhua community partners and supported by the Global Environment Facility Small Grants Program of the United Nations Development Program. With multiple practices and partners in the ecosystem, the project aims to build an innovative base for zero-waste communities in Shanghai, using the regeneration area as a pilot case. Therefore, we take it as a primary activity and outcome and explain the following details.

3.1 Construction of Core Zero-Waste Scenarios

The Zero Waste scenario is built around a human-nature lifecycle within the community. The circulation of idle goods, resources, and natural by-products, and the recycling stations, have undergone many iterations; every week, citizens and resident volunteers collect and organise unused items in the space and share their inventory on the community social platform, offering them for collection. More than 200 items are usually distributed each week. The scenario expanded to include a “zero-waste office park” as a platform for sharing idle items, with participants primarily from building management and office teams. This is an example of a participatory citizens' initiative that became integrated into the community's overall workflow and provided benefits and improvements to the organisation itself and, in a broader sense, to the

residential community of the neighbourhood.
The zero-waste community expanded into a team of the garden; they designed a lifecycle protocol for the garden activities, which include composting (collecting kitchen waste, garden scrap, and the urban greenery residual material such as branches and dried leaves), fabrication workshops for laser cutting and DIY construction of tools and garden furniture, and a community canteen.
This process generated a fascinating “citizen science” or grassroots data-collection experience for the residents, who were called upon, empowered, and trained to provide data for each community activity in Xinhua. This data collection went beyond “waste management” data; it included a lifecycle scenario for all activities, including the kitchen, garden, playground, coffee spot, etc. In this way, the “zero waste” concept is closely linked to an ecological and systems understanding of community resource cycles, and it has been developed autonomously from residents in different touchpoints (Figure 5).

Figure 5. Three examples of zero-waste implementation:
(a) Toy exchange house; (b) Idle material station; (c) Public recycling and upcycling station

3.2 Support of ecological projects in other residents’ communities

Temporary uses of the idle space have attracted members of neighbourhood circles and committees. A sub-district citizens group has reclaimed the second floor of the building as an extension of their operation. They established a rooftop garden built by residents, which includes gardening activities, learning sessions, and the maintenance of a beehive.
The convergence of different groups of independent citizens and their projects has allowed a proficuous sharing of knowledge and practices, further developing into a district-level alliance called “Fahuayuan Shared Planting Garden", which aims to complete the co-design activities of five other gardens in the district. The organisation of such initiatives is entirely grassroots and self-managed: almost 150 citizens were involved in the participatory process, with five external experts invited and a team of 30 volunteers regularly involved in program design, event planning, on-site execution, and other tasks.

Figure 6. Example Posters of Ecological Activities for the Community Garden

3.3 Grassroots Composting and Lifecycle

Composting is, of course, integral to the zero-waste project. After a one-year experimental phase that began with learning how to collect and upcycle dead autumn and winter leaves, a full composting protocol has been developed within the community. The community kitchen feeds the compost, and an open station has been installed for the neighbourhood to bring food scraps and other compostable materials. Fermented juice and topsoil are available to any citizens wishing to bring them home. The community experimented with different composting techniques, including DIY stations and testing various commercial solutions acquired or gifted. Most importantly, the hands-on prototyping and iteration process developed into an informal education and skill-set curriculum, made by the residents for the residents, involving guests and experts, and a programme of composting knowledge shared among the community.

Figure 7. Compost Buckets and Bins for use in the Community

3.4 Continuous exploration of other scenarios

In addition to the core scenarios of upcycling and recycling for managing common resources and goods, scattered actors and participants have also explored zero-waste-related experimental activities. Orange Sewing Shop is a shared sewing machine project initiated by a group of sewing enthusiasts. It uses second-hand clothes collected in the community to transform new items and reuse idle items. Born as a specific community of practice, the group is attracting the interest of visitors and passers-by, providing a platform for skill sharing and enhancement, and fostering strong bonds with dwellers and attendees who are not “members” or regular participants. This is an example of how the continuity of a participatory approach drives the spatial and temporal evolution of the place, providing emergent, unplanned regeneration opportunities.
On the other hand, the continuity of participation and the “hub” framework of the Zero Waste project also promote the establishment of more structured volunteer roles and enhance participation dynamics. While participation was mainly activity-based in the past, a challenge would have been maintaining a connection beyond social media. The community lacked a mechanism to retain participation and to support year-round training. The zero-waste project introduces a dynamic timeline for daily, weekly, and monthly territorial interventions, diversifying the type of participation and engagement. This dynamic allows people to contribute at the scale of the daily routine (e.g., composting), collaborate in weekly circles (e.g., sorting and distributing idle items), and enjoy the benefits of monthly public activities and learning sessions.
These can provide volunteers with more diverse and engaging participation paths.

Figure 8. Sewing activity organised by Orange Sewing Group

4. Discussion and Conclusions

4.1 The value of ecological activities

Ecological activities in the community mainly enhance and maintain the environmental system of the community space and construct community organisations.
From the perspective of spatial renewal, the most direct role of ecological activities is to establish and improve environmental infrastructure and to stimulate a sense of community embodied in urban ecology. Taking the project site as an example, community public lawns, vegetable gardens, Sony cooperative farming gardens, and rooftop gardens have been built through self-organisation by residents, construction by operators, donations and cooperation by third parties. Some spaces are idle, and this construction activity also allows for the flexible use of space. Some small and medium-sized idle spaces or ancillary spaces have been activated. For example, a grey space at the corner of the alley, an unused space at the building entrance, and an unused roof can host temporary uses and are available for the community to experiment in their territorial playground.
From the perspectives of community building and governance, ecological activities share the typical characteristics of community participatory activities and also have unique ones. They can stimulate the emergence and development of local self-organised practices across stakeholders. Local organisations and operating departments generally lack professional knowledge of ecological activities, and their organisational goals are more focused on platform construction and space operations than on developing a specific ecological topic. Cooperation with environmental organisations can promote more ecological activities, thereby completing spatial renewal and community design through territorial co-benefits. Local community design organisations are responsible for building the platform and providing professional community participatory knowledge. The space operation team integrates local resources for daily

infrastructure maintenance and ecological site planning. Ecological organisations offer professional expertise and organise and build communities related to issues. The three form a cooperative and complementary relationship. The University brings knowledge and resources and collaborates with multiple stakeholders, providing the opportunity to systematise the resources and the outcome of the participatory process.

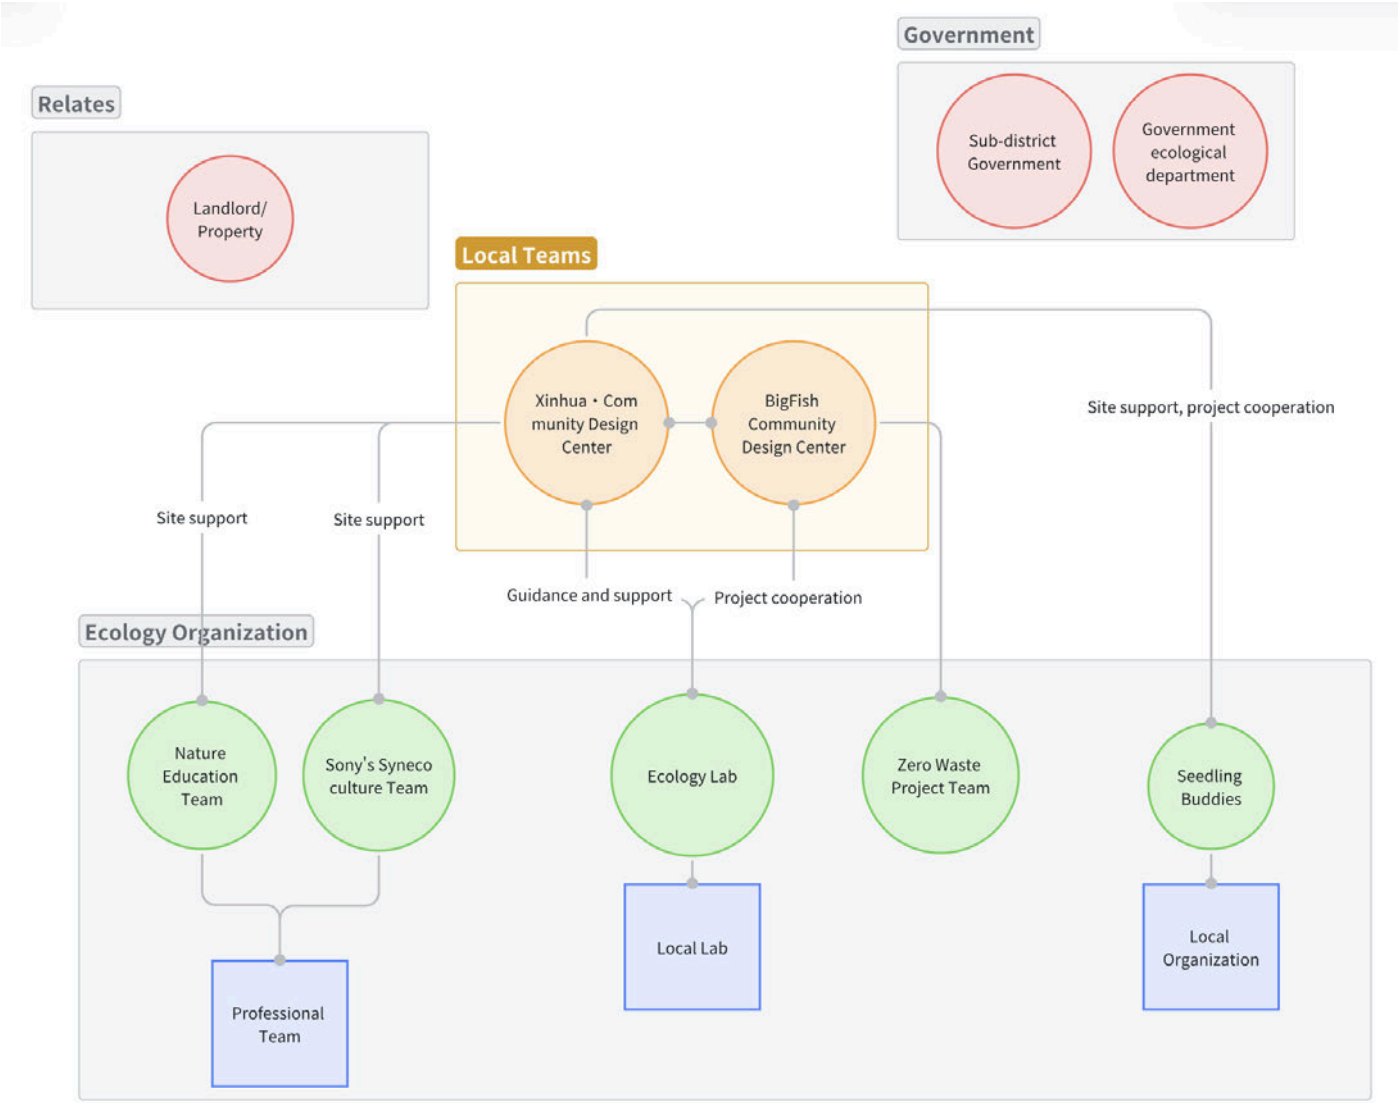

Figure 9. The Stakeholders Map of Xinhua Ecological Activities

Table 2. Examples of integrated activities of territorial regeneration across stakeholders.

Regular residency	The university team has a fixed workstation in the shared office project on the second floor and participates in community activities under a "daily residency" model. This helps the laboratory understand the local situation promptly and enables the laboratory's concepts and work ideas to be better integrated into the community.
Activity participation and co-creation	Through organising time-relevant activities (such as Earth Day and the Community Park Festival), the university team attracts local residents interested in urban renewal and urban ecological research to join the local team, continuously strengthening the community's participation in urban environmental construction and injecting new vitality into community building.

Course cooperation	The University develops context-based, community-led curricula that challenge students to work in real-world scenarios and leverage community development constraints as design opportunities. Different courses are introduced to extend the learning settings and modality to community participation, e.g., how to design and fabricate interactive artefacts to reconnect residents with urban nature, or how to generate communication strategies for the community (installations, workshops, graphics, and products) to engage in ecological topics and steward environmental and ecological regeneration of the spaces.
Networking and knowledge generation	The "Weaving Wording" project is a good example of multi-stakeholder collaboration in participatory design that renovates the traditional craft of cotton production and weaving (which is very important for the local and natural history of the area). It preserves oral history through storytelling while weaving. By exploring the local eco-history and culture, the residents' sense of belonging and cohesion is enhanced, and the in-depth regeneration of community spaces is further promoted.

4.2 Challenges and Reflection

Engaging citizens in urban ecology initiatives can be challenging, particularly for those who are not sensitised to or interested in these topics. Many are more willing to participate in simple community ecological activities, such as experience-making and daily care, rather than to sustain continuous engagement; nature has a slow rhythm, even amid the bustling dynamics of cities. Adaptation, regeneration, and growth must occur for green areas and biodiversity initiatives to thrive; they happen over time and despite planning or requirements for achievement. Failing to recognise this temporal dimension can lead to dashed expectations, weakness in citizens' engagement, and long-term fatigue or participation decay. Temporary uses offer an alternative to planning and favour small-scale initiatives that create shared benefits between people and spatial regeneration, giving more or less explicit voice to existing 'green' communities. It is indeed a slow process.
Improvement involves systematic monitoring and evaluation of the participation dynamics and the quality of the outcomes. Assessing the results and outcomes of temporary green interventions is significant for informing and influencing high-level decision-making and support, which means that participatory efforts may scale out and become relevant beyond the boundaries of the community that generated them. This frames temporary uses within the challenge of long-term management and planning, yet opens the possibility of grassroots governance of the commons and the generation of a participatory legacy.
This exploration of participatory experiments highlights innovative approaches to urban regeneration and emphasises the critical role in fostering adaptable and inclusive urban environments. By this analysis and the outcomes from the overall international research project T-Factor, we contribute to the discourse on sustainable urban practices and the transformative potential of collaborative design in environmentally conscious territorial development.

ABSTRACT | The collapse of the Soviet Union triggered an economic downturn that transformed the Naryn town of Kyrgyzstan, once an agro-industrial hub, into a town marked by closed factories, deteriorating infrastructure, and scattered, under-utilized industrial land. This decline has fragmented the town, diminished its vibrancy, and negatively affected its socio-economic fabric. The paper discusses selected results of the Naryn Urban Resilience Programme (NURP), a programme supported by Economic Cooperation and Development Division of the Swiss State Secretariat for Economic Affairs (SECO), with co-funding from the agencies of the Aga Khan

Development Network (AKDN) and advisory support from the United Nations Human Settlements Programme (UN-Habitat).

To identify and subsequently tackle social, economic, and environmental factors, NURP drew insights from Transition Design (Irwin, 2018) and applied an Integrated Habitat Assessment (IHA). Through granular risk perception studies and neighbourhood assessments a perpetual loop has been created in which planners, designers and decision makers can attain a shared understanding of multistakeholder possibilities and innovation. This was achieved by way of co-implementation with residents using approaches like tactical or acupuncture urbanism, where targeted, small-scale interventions spark further renovation efforts and resilience across the city.

NURP showcases opportunities for nature-based design solutions aimed at fostering a sense of ownership, inclusivity, and grassroots entrepreneurship. Besides, it serves as a case study to reveal the multilayered, deep-seated complexity of urban resilience programmes in a non-Western provincial context where an engaged citizenry is underdeveloped. This undermines the bottom-up approach and shifts the public discourse for sustainable and climate friendly resilient futures in favour of the upper echelons of power. The critical lens contributes to the emerging methodological awareness of a place-sensitive, situated, postcolonial approach to understanding and the implementation of participatory design.

KEYWORDS | NARYN, NURP, URBAN RESILIENCE, HABITAT ASSESSMENT, INNOVATION

1. Introduction

Naryn is an example of a remote post-Soviet mountain town that embodies a unique legacy and faces profound socio-economic and environmental challenges, increasing its vulnerability to external shocks. Naryn is a mid-sized, sliver-shaped mountain town in a river valley amidst the magnificent Tian Shan mountains of Kyrgyzstan. Snowy winters and climate-induced natural hazards from the surrounding mountains and the turbulent river are a regular feature of this town. Traditionally, it has been the home of nomadic herding tribes in the high mountain regions of Central Asia and an important node on the famous Silk Route bordering China. The town lies on the main trade route between China and Eurasia at the confluence of popular tourist routes leading to spectacular glacial lakes and hiking trails. The collapse of the Soviet Union triggered an economic downturn that profoundly impacted Naryn, transforming it from a thriving regional agro-industrial hub into a city marked by closed factories, deteriorating infrastructure, and scattered, under-utilized industrial land. This decline has fragmented the city, diminished its vibrancy, and negatively affected its socio-economic fabric, leaving it more vulnerable to external shocks, including economic crises and climate-related risks.

Figure 1. Naryn from the south (Wikipedia contributors, 2024)

The paper discusses selected results of the Naryn Urban Resilience Programme (NURP), a programme supported by the Economic Cooperation and Development Division of the Swiss State Secretariat for Economic Affairs (SECO), with co-funding from the agencies of the Aga Khan Development Network (AKDN) and advisory support from the United Nations Human Settlements Programme (UN-Habitat). The paper presents cases for nature-inspired design strategies adopted to foster inclusivity, promote grassroots entrepreneurship, and enhance participatory decision-making processes for sustainable and climate-resilient development. The paper focuses in particular on three key outcomes: institutional strengthening through capacity building and governance systems; improved resilience-informed planning via inclusive stakeholder engagement and knowledge-based assessments; and a realistic, long-term, evidence-based investment plan for sustainable growth (Table 1). These outcomes were validated through tangible initiatives, including resilient infrastructure construction, urban design recommendations, resilience-based enterprises, and economic opportunities, all emphasising risk mitigation, participatory decision-making, and long-term sustainability. The paper also discusses contributions of these outcomes to urban resilience in the context of post-colonial mountain towns.

Apart from the tangible outcomes, the paper seeks to shed light on the discursive limitations inherent in participatory design methodologies within the post-development and Transition Design paradigms when applied to non-Western provincial settings such as Naryn. Using Causal Layered Analysis (CLA) as a diagnostic tool (Inayatullah, 1998; 2008; 2017) for understanding emerging futures, the paper highlights two discursive barriers that NURP, as a participatory

project, faced in Naryn. At the level of "Myth/Metaphor," there exists a deeply embedded perception that the state is the sole agent of provision and development, disregarding the civic role of grassroots agency. At the level of "Worldview/Discourse," the dominant narrative across the community frames financial scarcity as the primary obstacle to development, overshadowing systemic issues of governance and participation. These constraints manifested in community disengagement and scepticism, and limited co-creation activities toward externally funded initiatives, complicating efforts to foster distributed ownership and long-term resilience. Consequently, critical questions emerge regarding viability of collaborative frameworks between external funders and local stakeholders, particularly in contexts where civic agency is historically underdeveloped. Furthermore, reconciling top-down governance structures with participatory design methodologies proves challenging, particularly when seeking to build resilient bottom-up transformation pathways.

Building on the above observations, the paper contributes to the emerging critique of participatory design's methodological limitations in provincial, post-colonial settings. It underscores the need for more situated and place-sensitive approaches to resilience and emerging futures. From a critical perspective, the paper hopes to stimulate discussion on the following question: How can designers and urban planners achieve participatory multistakeholder design outcomes in communities where short-term interests and gains for political purposes take priority over a systems-level approach for long-term sustainable solutions?

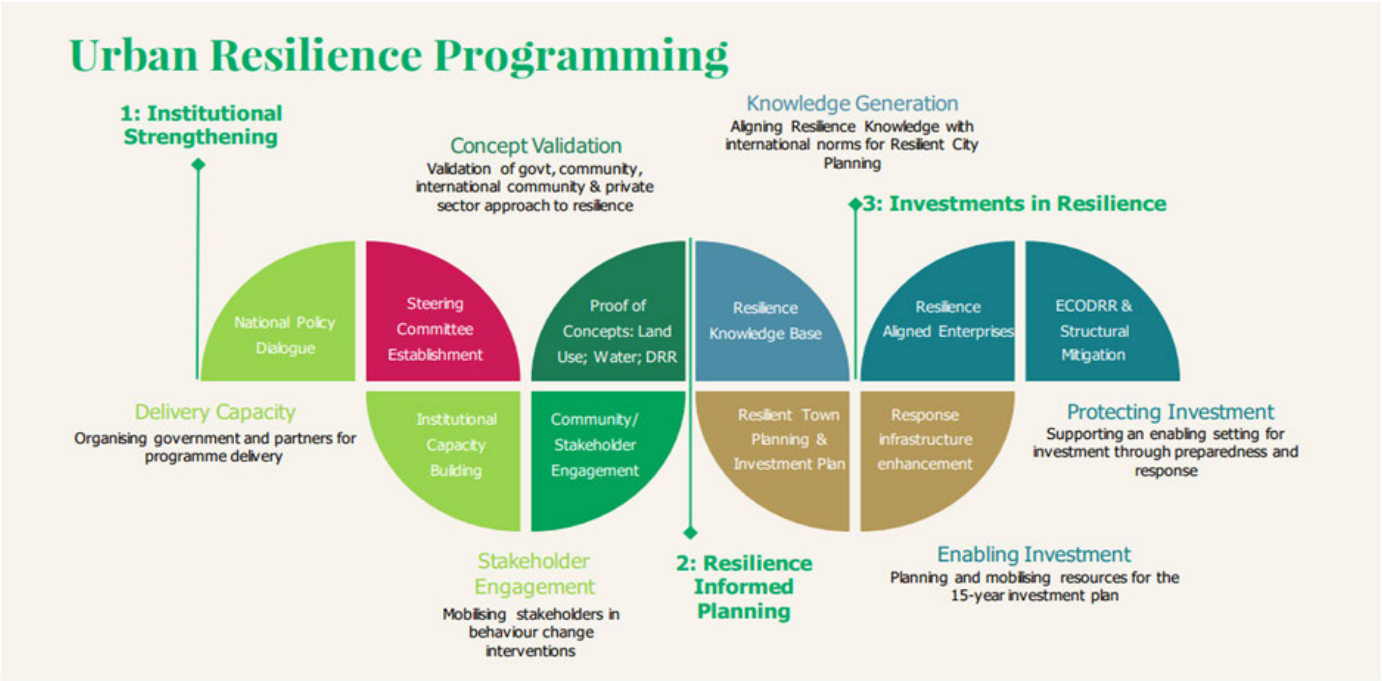

Table 1. Principal outcomes of NURP project activities

2. Theoretical grounding

In recent years, scholars have found the ontological view of moving beyond a monolithic vision of community development and design intervention for a rather bottom-up, inclusive, participatory, contextually relevant, interconnected approach more inclusive, sustainable, and ultimately resilient. Arturo Escobar's writing on pluriverse (2018) and relationality (2024) epitomises the efforts in this direction and offers a response to the longstanding deep-seated hegemony of value dichotomies and dualities (i.e., nature, human; body, mind; global north, global south; developed, underdeveloped, etc.) running deep in our understanding of structures of life, modernisation, and shared futures. Pluriverse and relationality offer an alternative framework to address, or at least alleviate, the contemporary crisis-ridden conditions, or "toxic loops" in Escobar's words, we are entangled in. Escobar's ideas provide essential insights into urban resilience and sustainability discussions, moving beyond monolithic community development visions toward inclusive, participatory, and contextually relevant socially resilient approaches.

The above outlook derives from decoloniality discourse and the critique of development metanarrative through the works of Escobar (1994), Rahnema (1991; 1997), Sachs (1999; 2000), Ferguson (1990), among others, since the 1990s as an attempt to dismantle the hierarchical order of the world or what Ferguson (ibid.) calls "development discourse fantasy". Sachs in his seminal work *Planet Dialectics* (1992, p.3) holds that "...the idea of development stands like a ruin in intellectual history, its shadow obscuring our vision." This line of reasoning, particularly Ferguson's focus on the discursive aspects of development, can be well traced back to Michel Foucault and his observations in *The Order of Things* (2012/1966) concerning the epistemic paradigms and hierarchies defining the principles of consensus and repudiation in science and social institutions. Ultimately, the critique underscores the need to rethink entrenched value systems underlying and orienting our concepts of progress and development. It advocates for alternative approaches that address systemic inequalities, and that envision more inclusive, distributed, and sustainable futures.

Contemporary design scholarship builds on critiques of development metanarratives and the hierarchies they stand for and perpetuate. The failure of unsustainable development under the spell of industrial capitalism (and colonialism) is captured in Tony Fry's notion of "defuturing" (2020). In simple terms, defuturing refers to "[t]he negation of world futures..." (ibid., p.10). The growing awareness concerning a world filled with looming doom has shifted design practices, moving from unsustainable and makeshift approaches to more sustainable and pluriversal futures. This emerging vision is well captured in Transition Design theory. As elaborated by Irwin (2018, p.968), Transition Design keeps in sight the larger picture that allows to (1) "visualise and map complex problems and their interconnections and interdependencies; (2) situate them

within large, spatiotemporal contexts; (3) identify and bridge stakeholder conflicts and leverage alignment; (4) facilitate stakeholder in the co-creation of visions of desirable futures; (5) identify leverage points in the large problem system in which to situate design interventions". Integrating a holistic perspective and prioritizing collaboration, Transition Design offers an effective framework for envisioning and delivering design innovation in complex settings. Despite the setbacks and challenges (see below), NURP demonstrated commitment to design principles in line with those of Transition Design.

Furthermore, NURP captured elements of the urban nexus concept (Lehmann, 2018), systems thinking (Arnold and Wade, 2015), and circular models (Thackara, 2015; Williams, 2021) to address the multifaceted challenges of sustainable urban development in Naryn. These practices collectively inform a systemic, cross-sectoral understanding of resilience, emphasising collaboration among diverse stakeholders. However, while offering a valuable alternative to conventional, siloed planning paradigms, their application within the provincial, post-socialist context of Naryn necessitates critical adaptation. The project's outcomes therefore not only showcase attempts at participatory, community-driven solutions but also offer critical insights that can help to interrogate the universalist assumptions embedded in the global circular models and design principles. From this perspective, NURP underscores the importance of place-sensitive, post-colonial approaches to sustainable transformation and emerging futures.

3. Methodology

Being informed by the participatory principles of Transition Design, NURP adopted the Integrated Habitat Assessment (IHA, Table 2) to study and assess hazards, demographic distribution, and the carrying capacity of the land to prioritise, strategize and implement town resilience interventions. IHA methodology was built upon AKDN's HVRA (Hazard Vulnerability Risk Assessment) methodology and analytics on Resilience indices such as Environmental Index and Integrated Habitat Index (Table 3). The methodology emphasises strong stakeholder engagement and consultation throughout the process to understand the current habitat-related challenges, gaps, and opportunities, to collect authentic data, and to validate assessment outcomes and endorse recommendations towards resilient planning. The assessment process was informed by a thorough literature review, desktop studies of national and international best practices and pre-defined methodologies. Further, field studies with a focus on geology, geo-botanicals, forestry, water management, infrastructure, climatic data as well as sample surveys for qualitative and quantitative data collection and triangulation were carried out to supplement secondary data.

In addition to the recommendations of the IHA, other considerations in selecting projects to serve as proofs of concept included the strategic plans of the Town Council, the Mayor and the Oblast

level administration, the long-term vision of AKDN and the overall alignment of all of which with the donor SECO's grant-making principles. This tripartite decision-making formed an integral part of the project's governance structure and ensured collective accountability and commitment to joint decisions. IHA results also served as the base referral document for resilient town development programming – with critical and cross-sectional analysis of various socio-economic and environmental factors – in Naryn. The findings were used by various decision-makers, policy-formulators, academia, community members and other key local stakeholders. In addition, the results of IHA contributed to developing the course content for the Certificate Programme in Urban Resilience through sensitization, awareness, training and capacity building. The intention was to create a multiplier effect for resilient planning and development during the implementation of NURP and beyond.

Table 2. Integrated Habitat Assessment - Methodology flowchart

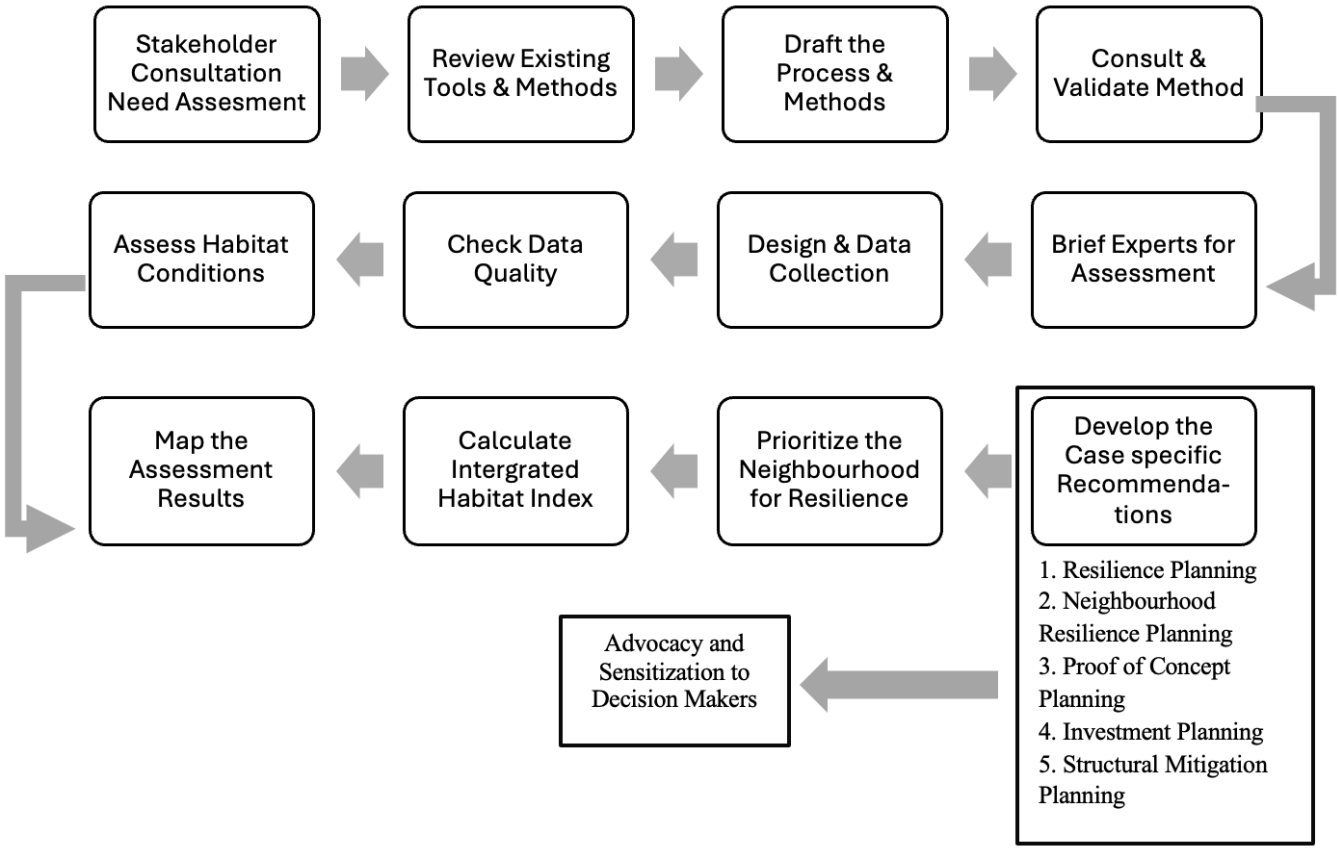

Table 3. Integrated Habit Index derived from Hazard Exposure, Demographic Sensitivity, Infrastructure, Services and Environmental indices

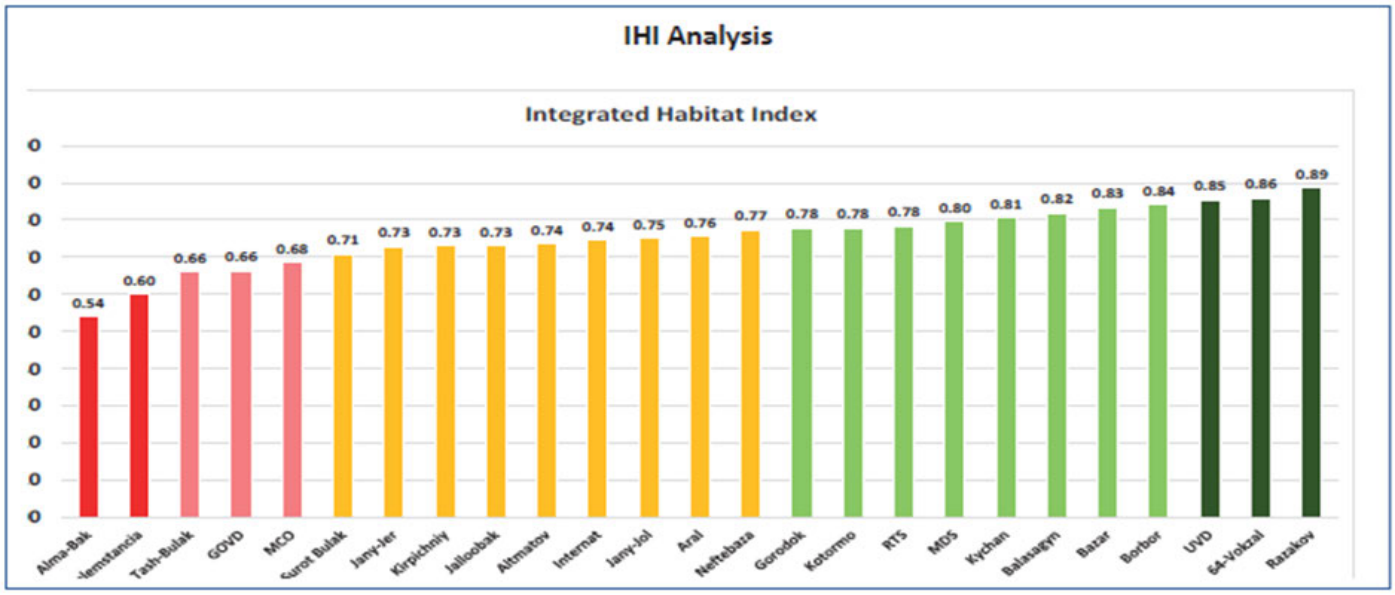


4. International case studies

4.1. Matam Urban Renewal, Conakry, Guinea

The renewal of Matam, a largely informal yet vibrant district in Conakry, Guinea, served as a reference case for NURP in terms of managing conflicting development approaches. City officials pursued a modernised image through large-scale and capital-intensive clearance and infrastructure upgrades, risking displacement of the local community. The residents, in contrast, demanded improvements that would preserve their homes, identity, and the right to shape the area's future.

UN-Habitat adopted a decolonised, context-sensitive, and inclusive planning approach to bridge the opposing visions. Rather than imposing solutions, it co-developed a community-driven framework grounded in local priorities. At its core was a set of design rules and negotiated incentives that fostered consensus among residents to improve their living environment. For instance, those who voluntarily contributed small portions of land for public use (street widening, setbacks, etc), would be granted formal land tenure, rights to vertical expansion and upgrading and access to investment opportunities.

The above approach repositioned the community as the primary agent of change while assigning the city the responsibility for upgrading infrastructure, public space, and facilities. The process fostered consensus-building, reduced resistance, and avoided forced evictions.

Ultimately, the proposed strategy demonstrated a hybrid planning model that transcended top-down imposition, rooted improvements in lived realities, and prioritised community agency (UN-Habitat 2022).

Figure 2. Community engagement activity

4.2. Khorog, Tajikistan

Another precedent for NURP was a resilience planning project in Khorog, Tajikistan, a city with a strong tradition of community collaboration. The project shifted the role of residents from passive recipients to active participants. Leveraging local organisational structures, the project fully involved the community in planning, from idea generation to decision-making. Community representatives played a key role in project prioritisation and capital investment planning with proposals valued equally alongside those of officials and technical experts. This inclusive

approach strengthened local ownership and ensured that community-driven solutions had a meaningful impact on the city's resilience strategy (UN-Habitat 2023).

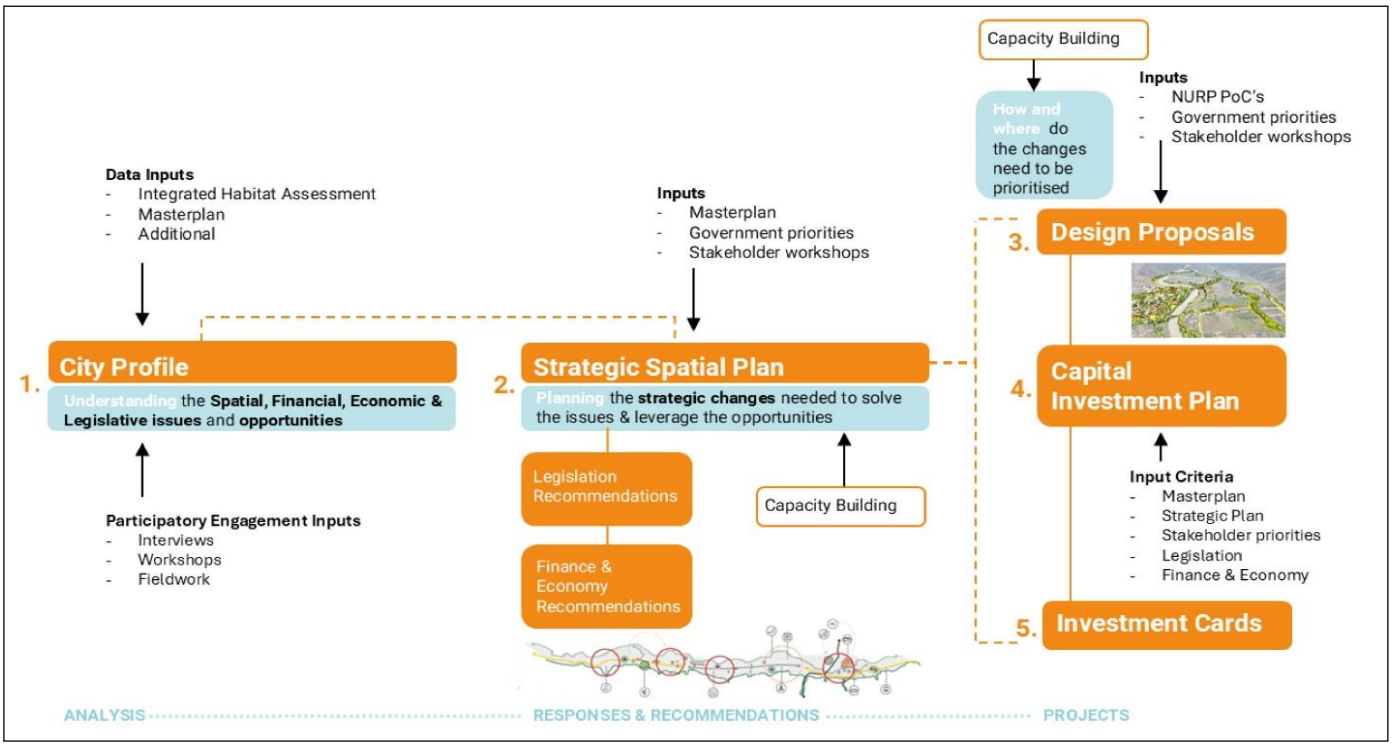
5. Initiatives and implementation

A series of interconnected activities were developed and implemented to achieve the project's three principal outcomes, of which three specific cases are presented below. The lessons learned from these interventions and the broader project outcomes offered valuable insights into connecting NURP to wider academic scholarship on urban resilience, participatory governance, and sustainable development.

5.1. Participatory strategic planning:

The UN-Habitat (2024) intervention in Naryn faced a fundamental challenge: reconciling the differing visions of the town's development held by government officials, young residents, and business representatives. While the government focused on economic revitalisation and administrative priorities, younger residents sought inclusive spaces for recreation, innovation, and social interaction, and business representatives prioritised economic growth and improved connectivity (see Table 4). These competing perspectives coupled with limited resources, socio-spatial inequalities, and the town's vulnerability to natural hazards underscored the complexity of creating a shared development vision.

Table 4. Process flow followed for project identification, prioritisation, planning and implementation of resilience projects



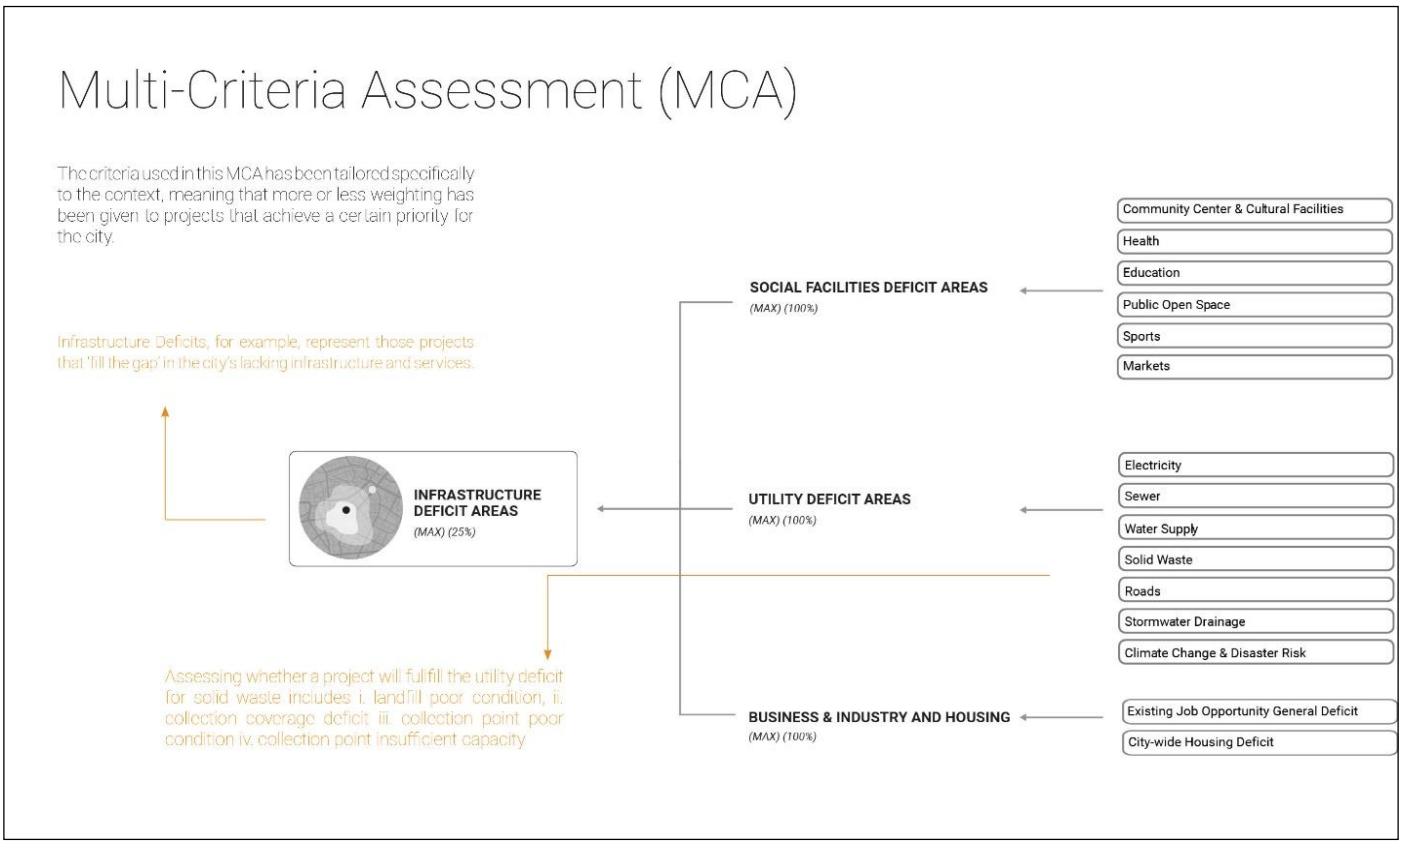
UN-Habitat, which partnered with NURP, approached this challenge by embedding community engagement at the core of its planning process, using the "My Neighbourhood"[1] framework to converge diverse stakeholders' interests towards clear city objectives: Compact, Connected, Vibrant, Inclusive and Resilient. Initial assessments and risk perception studies revealed the critical gaps in infrastructure, accessibility, and neighbourhood resilience. Through collaborative workshops, participants began to articulate their priorities. Emphasis on vibrant, multi-functional public spaces was balanced with the government's goals of infrastructure development and the business community's focus on economic potential.

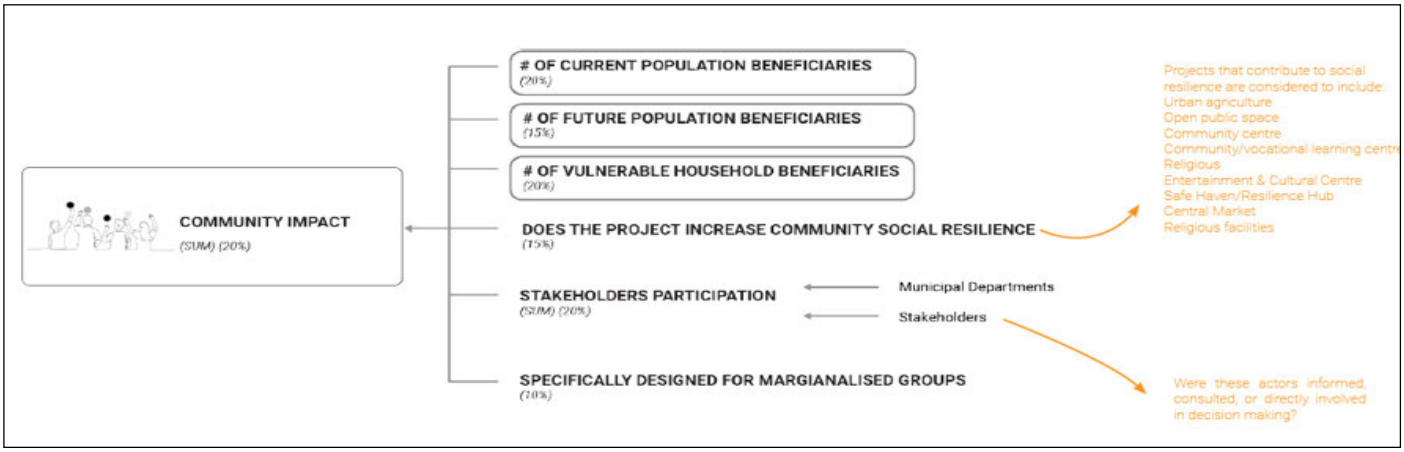
Demonstration projects, including the renovation of Jusaev Park and improvements on the Naryn Central Market, exemplified this co-production approach. Community members were actively involved in the design process, with women emphasising safety and accessibility, while youth contributed ideas for dynamic and engaging public spaces. These collaborative efforts yielded designs that reflected the community's diverse needs, while also promoting resilience and inclusivity.

[1] For more information see: https://unhabitat.org/my-neighbourhood

NURP and UN-Habitat also addressed the town's resource limitations by adopting a spatially-informed investment planning framework. The framework ensured the prioritisation of interconnected and complementary projects designed to generate transformative impacts across multiple scales (Table 5). Therefore, selected projects, such as mixed-use developments and infrastructure upgrades, were designed to be contextually relevant, with the potential to generate long-term socio-economic benefits. Legislative and policy recommendations further strengthened the institutional framework needed for implementation, while participatory governance created a sense of shared ownership and accountability among stakeholders.

Table 5. Illustration of MCA Process (UN-HABITAT, 2024)





By integrating the perspectives of government, residents, and businesses into a cohesive strategy, the project assessed the challenges of collating their varying perspectives on development and had to innovate strategies that would help overcome initial tensions and align divergent priorities. The process demonstrated how participatory planning can transform complex urban challenges into opportunities for collaboration, fostering a sustainable and resilient future for Naryn despite pushbacks and resistance to stepping away from colonial legacies.

5.2. Renovation of a Public Park

Table 6. Visualisation of the Jusaev park renovation (El Proekt LLC, 2024)

Naryn's acute shortage of public open spaces for recreation and social interaction was identified during habitat assessments. This was validated by the Mayor's Office, which requested NURP's support for the renovation of Jusaev park. This provided an opportunity for UN-Habitat's team to demonstrate how strategic recommendations can be translated into concrete and implementable actions at the neighbourhood scale.

The park (Table 6) was designed to be a catalyst for multidimensional change, driving urban renewal and bolstering the city's overall resilience. Though the design of the park was intentionally open-ended, offering a flexible framework that would invite creativity and collaboration among the city, the community, and other stakeholders, allowing the space to organically evolve in response to the community's needs and aspirations, adaptation of this concept by local designers still carried vestiges of colonial-era design accents.

- Institutional Framework

In an attempt to explore whether a motivated and engaged community is more effective than a reticent government in bringing about a resilient transformation, the park renovation offered an

opportunity to engage the community in the design process. The aim was to empower the community in decision-making, marking a clear shift away from prevailing top-down approaches. This was facilitated by collecting suggestions and ideas to create an inclusive space for the park's design, construction, and management. This allowed the project to embody a shared vision, creating a public space that reflects the collective identity and spirit of the local population and fostering a sense of ownership.

Stakeholder meetings, involving government, civil society, and the community (including the elderly, women, and youth), addressed key urban challenges, informing a master plan that established the conditions for creative use and adaptability of the spaces to meet the evolving needs of the local community. This philosophy was reflected in the multifunctionality and versatility of the proposed spaces and amenities, which were designed to be multi-generational, inclusive, climate-adaptive, culturally significant, and ecologically rich. It was also a reflection on whether community participation and inculcation of grassroot leadership could accelerate post-colonial transformation.

Figure 3. Community engagement activity

- Resilience and Sustainability

Consultations with the city's technical experts identified challenges in the city's parks, particularly regarding irrigation, winter functionality, and maintenance. In response, the park was developed as a green infrastructure integrating cost-effective nature-based solutions for stormwater management, energy efficiency, and biodiversity enhancement.

Key strategies included a sponge-city approach for stormwater and snowmelt retention, seamlessly incorporated into the landscape, i.e., biotope micro-forest, recreational lake. A gravity-based irrigation system further optimized water distribution, minimizing reliance on energy-intensive pumps and reducing long-term operational costs. Furthermore, the park's landscape design prioritises native vegetation, requiring minimal maintenance and irrigation while enhancing local biodiversity and reinforcing regional identity.

Figure 4. Visualisations of the park (UN-HABITAT 2024)

- Sustainable Investment

The park's viability extended beyond its design and aesthetics to encompass financial sustainability. For Jusaev Park, this would mean integrating a phased development and revenue-generation strategy into the spatial design to support maintenance and improvements. This includes revenues from seasonal festivals, pop-up markets, concerts, as well as cafés, restaurants, and kiosks that could be leased, co-financed or co-managed through public-private partnerships (PPP). These revenue streams would provide a consistent flow of funds, for reinvesting in the park's maintenance and further development.

5.3. Engaging residents in co-creation of public spaces and fundraising

NURP paid special attention to the capacity building for local government and residents by engaging them in learning about how to co-plan and co-develop public spaces using nature-based solutions (NBS). However, this ongoing institutional strengthening process has been challenging, particularly in reconciling diverse perceptions of urban greening and public space

development among residents and government officials. The town's existing green spaces – dominated by non-native species planted during the Soviet era – were poorly suited to Naryn's environmental conditions. This legacy exacerbated the town's vulnerability to climate risks while diminishing its urban character. To address these issues, the project team, in cooperation with SILK (Society for Innovations with Local Knowledge), launched a series of community-driven activities to build capacity and raise interest in urban greening using local flora. To fill the knowledge gap about landscape design and the ecological benefits of native plants, NURP developed a Kyrgyz Landscape Catalogue, a comprehensive guide featuring native species suited to the local climate. Residents and local governments have now begun using the catalogue to study sustainable landscape designing.

Discussions with local government representatives and residents revealed differing stakeholder preferences, with regional government officials initially favouring expensive concrete constructions, while residents and businesses have advocated for cost-effective, nature-based solutions using local materials. The project bridged these perspectives through continuous dialogue and knowledge-sharing, fostering consensus on resilience-informed planning. The integration of acupuncture urbanism by focusing on demonstration sites such as the Panoramic View in Tosh Bulak (a neighbourhood on the western periphery of the town) has shown how targeted interventions can generate broader socio-environmental benefits while strengthening community ownership of public spaces. This led the team to determine whether community ideation could contribute to spatial transformation in remote, post-socialist and -colonial mountain towns.

To ensure the sustainability of urban resilience efforts, NURP developed a structured investment framework that aligned with evidence-based planning principles. Training sessions on resource mobilisation and fundraising were planned to empower local stakeholders to attract funding and implement greening projects independently. The project also introduced evaluation tools to guide investment decisions, prioritising interventions that enhance resilience rather than vanity infrastructure projects. At its core, NURP has been an effort to lay the foundation for a long-term, locally driven urban resilience strategy. Despite the challenges and gaps in government and civic structures, progress was made by integrating scientific assessments with grassroots participation, revitalising public spaces and institutionalising resilience thinking.

6. Challenges and discussion

The design initiatives discussed above, notably the renovation plans for the park, demonstrate progress towards the project's expected outcomes. However, the implementation phase exposed structural and contextual challenges, particularly in carrying through an integrated approach to activities and tailoring design to Naryn's unique socio-cultural and environmental conditions. An

intractable obstacle emerged in the reluctance of key governmental actors to engage in capacity-building initiatives, which were often dismissed as resource-intensive and offering limited short-term gains. This resistance was exacerbated by a prevailing emphasis on high-cost, infrastructural "legacy" projects that diverged from the programme's resilience-oriented goals. In response, the programme adopted an adaptive delivery model – modifying content, reducing the duration of training modules, and emphasising early demonstrable impacts – to better align with local priorities. These measures were consistent with Transition Design principles, particularly those advocating systemic, long-term thinking and multi-actor co-creation. This necessitated localised adaptation of Western design methodologies, which are often inadequate for addressing contextual issues and variances in developing economies.

Moreover, the programme had to contend with a tendency among city officials viewing the initiative primarily as a funding mechanism for infrastructure projects, often overlooking its relevance to resilience. This caused a broader tension between top-down planning preferences and community-driven priorities. To address this, the programme developed an evidence-based evaluation tool for project selection, thereby reinforcing the importance of resilience-informed planning. This approach resonated with the discussion of applying acupuncture urbanism and nature-based solutions to generate sustainable, small-scale interventions, such as "pocket parks" and the Panoramic View in Tosh Bulak, to balance community aspirations with strategic goals.

Ultimately, the programme's success lay in fostering a participatory model for urban resilience that integrated local knowledge, institutional collaboration, and nature-inspired strategies. By grounding interventions in a contextually relevant, inclusive framework, NURP aligned with broader theoretical critiques of development paradigms, such as those proposed by Escobar's pluriverse and Irwin's Transition Design, advocating for dismantling hierarchical planning structures and embracing collaborative, systems-based approaches. The programme's outcomes demonstrated how integrating these principles into practice can transform urban spaces and governance, supporting sustainable and inclusive development in high-risk mountain settlements like Naryn.

7. Conclusion

A key insight from implementing the Naryn Urban Resilience Programme (NURP) is the imperative to move beyond rigid, externally imposed planning paradigms toward inclusive, context-sensitive strategies. Combining the Transition Design, systems thinking, and urban nexus methodological principles, NURP envisioned and implemented dialogic co-creation and small-scale interventions and made headway in navigating between local aspirations and strategic resilience goals. This adaptive, human-centric approach reframed urban space as a platform for socio-economic and environmental transformation.

Along the way, the persistent tensions across conflicting interests – such as the entrenched preference among governmental actors for symbolic, capital-intensive infrastructure – exposed the limitations of applying universal design frameworks without local adaptation. The use of evidence-based tools helped to recalibrate these priorities, but also underscored the need for more flexible, culturally responsive planning instruments.

Ultimately, the project demonstrated that urban resilience in provincial, post-socialist contexts requires more than technical solutions; it hinges on shifting institutional mindsets, fostering participatory governance, and embedding design thinking in local socio-political realities. These findings highlight the critical importance of place-sensitive, post-colonial frameworks for sustainable transformation, offering insights relevant not only for Naryn, but for other marginalised, climate-vulnerable regions confronting similar development constraints.

New urban commoning through community co-design

First Author: Ferry van de Mosselaer, Second Author: Pauline van den Berg
Affiliation Corresponding Author: Fontys University of Applied Sciences
E-mail Corresponding Author: f.vandemosselaer@fontys.nl

Abstract

This poster presents insights and reflections into an emergent co-design process on urban commoning in a novel experimental neighbourhood in Eindhoven that integrates social housing, mid-rent housing, and self-build housing to foster a diverse and cohesive community. In our research we consider commoning as a verb—an active process of sharing and caring—rather than a commons as a collective resource.

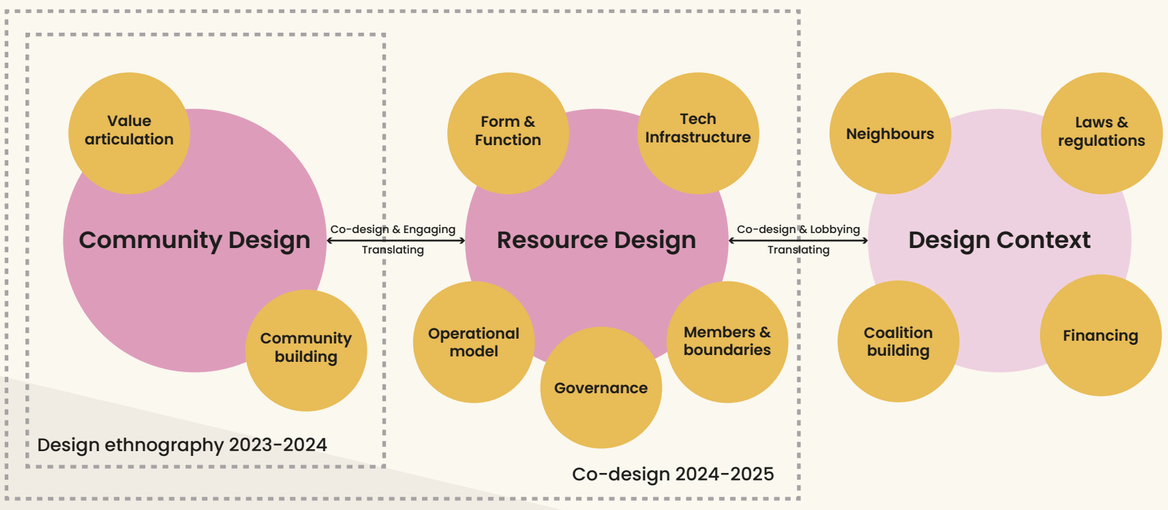
The co-design process started in 2023 and involves a close collaboration between academic design researchers and two designers-in-residence, who work together with residents, housing cooperatives, architects and the municipality to collectively give shape to the commoning process. Based on design ethnography and a series of interactive sessions, insights reveal that commoning is a polyvalent concept and that sharing and collectivity are already taking shape in various shapes and forms. Hence, in the design process we continue to build on existing networks and initiatives and facilitate the creation and strengthening of sharing and community building through a multi-modal ecosystem.

We critically examine the emergent methodology employed in this research and reflect how our research contributes to the broader debate on how participatory design can drive urban transformation, enabling resilient and inclusive communities through active engagement in the commoning process.

Research Objectives

1. To develop a **sharing community** [common] through co-design in the Buurtschap te Veld neighbourhood in Eindhoven
2. To develop a **scaleable co-design methodology** for co-designing new urban commons at neighbourhood level

Research Framework



2024-2025 Co-design

In the co-design process various tools and methods are adopted to explore and gradually design aspects of the future commons. Each tool addresses a selection and combination of aspects, aiming to translate and reiterate the articulated values and the community building activitities with the emergent co-design of the common. For every iteration the appropriate tools and methods are situationaly designed, applied and reflected upon in co-creation with the residents.

Methods & Tools

Asset mapping

Asset-mapping was conducted as a continuous exercise to map out what skills, items, services and knowledge available in the community that people are willing to share, as well as how they are spread over the neighbourhood clusters. This analogous map will be digitalized and made interactive and form a basis for a future sharing system.

SIM workshops

The SIM [Structured Interview Matrix] workshop was conducted to setup a dialogue among residents on the needs and limits of sharing in the community. Beyond the optimism on sharing, clearly a range of situations and things are considered odd, unsuitable or conditional.

Canvas sessions

Canvas sessions were facilitated to draw the possible systems, including player conditions, rules-of-the-game and places/platforms. A series of ‘items’ such as eggs, garden tools and a movie night were brought to table for residents to imagine possible systems for sharing.

Tastings

Residents will organize a series of ‘tastings’ to practice and test various forms of sharing among residents. The tastings are meant to enact and strengthen modes of sharing and ignite connections.

2023-2024 Design ethnography

Methods & Tools

Data collection was conducted between October 2023 and June 2024. Among the data collection methods are participatory observations, numerous conversations with residents, informal interviews with representatives of different committees and the neighbourhood council, a resident survey and analysis of digital communication channels.

Insights

1. The possibility and idea of sharing are important to many residents of Buurtschap te Veld. **Not only for practical reasons**, such as saving money or convenience, but also to make new social contacts and for sustainability reasons.
2. Although the concept of sharing has many different meanings, ranging from items such as tools or children's clothing and plants, to workshops where knowledge is shared, in all cases the '**getting to know each other**' among residents **forms the basis** for accessible sharing of items or knowledge.
3. It is believed that sharing occurs more naturally when there is **mutual trust and familiarity** between people.

Take aways

- Foster the creation of trust and familiarity among residents and stakeholders
- Make sure that all stakeholders are continuously involved and engaged throughout the process
- Engage a broader span of residents from different clusters/chambers in the community
- Expand on - or connect with – sharing networks and systems that are already in place.
- Put active and commitment residents in the driving seat
- Elaborate on what and how residents want to share, and under which conditions

ABSTRACT | The paper explores the development of CNC-fabricated modular MDF furniture designed to support adults, children and animals (pets) during emergencies. This response is driven by the growing frequency of climate-related disasters worldwide, as exemplified by the 2024 floods in Rio Grande do Sul, southern Brazil. These pieces of furniture were designed as a flat-pack solution, incorporating snap-fit joints and a dot-based assembly system for easy assembly and disassembly. They illustrate the relationship between material efficiency, digital fabrication, and urgent environmental and social contexts, aligning with the 'Regenerative City and Territorial Development' track by promoting resilient solutions for immediate post-disaster needs while enhancing ecological and social co-evolution. The paper's objective is to provide both theoretical and practical insights into how design and digital fabrication can assist affected communities in post-disaster environments. The methodology followed five key steps: (1) contextual analysis, (2) material and fabrication selection with open-source accessibility, (3) design development, (4) prototype iteration, and (5) final design. It began by examining the flood-affected areas to assess the current situation, the needs of adults, children and pets, and the availability of resources and fabrication methods. During the prototyping phase, various designs, materials and snap-fit joints were tested to optimize efficiency. In the final phase, design and details were refined. The concept of an "evolving project" is essential in disaster recovery as the needs of affected communities change over time. Consequently, two versions of the modular furniture were designed to accommodate these transitions: a

simplified version for the emergency phase (a bed without a headboard, transformable into a center table and an armchair) and a more complete version for the social reconstruction phase (a bed with a headboard, transformable into two armchairs). The simplified version is cost-effective, using just one MDF board, while the more comprehensive version offers added comfort, using one and one third boards. The results of the modular furniture offer significant advantages, especially in emergencies when time and resources are limited. The use of MDF and CNC fabrication allows for quick production, snap-fit joints and the dot-based assembly system ensures easy assembly and disassembly without screws, tools or literacy. The modular approach provides adaptable, affordable and efficient solutions, meeting both immediate and long-term needs for displaced humans and nonhumans. This design demonstrates the potential of modular furniture in disaster recovery, addressing both physical needs and emotional support to enhance well-being. Although this project was developed for Brazil, its use of simple, widely available materials, digital fabrication and the open-source project make it globally applicable. It serves as a model for future disaster responses, especially as climate-related natural disasters become more frequent. By focusing on inclusive design and multispecies needs, the paper examines how combining digital fabrication with environmental and social considerations can aid both immediate and long-term recovery efforts, offering effective solutions for the harsh conditions faced by displaced adults, children and pets worldwide.

KEYWORDS | DIGITAL FABRICATION, POST-DISASTER DESIGN, MULTISPECIES DESIGN, CNC-FABRICATED SNAP-FIT JOINTS, MODULAR FURNITURE

1. Introduction

The paper aligns with Track 04: Regenerative City and Territorial Development by exploring how design can help meet the urgent needs of both humans and animals after natural disasters, with a particular focus on modular furniture solutions fabricated using CNC technology for post-disaster environments. By integrating principles of regenerative design (Wahl, 2016), circular design (Ellen MacArthur Foundation, 2015), inclusive design (Krishnamurthy, 2019; Maisel et al., 2017) and multispecies design (Gatto & McCardle, 2019; Giaccardi & Redström, 2020), the paper highlights how digital fabrication, material availability and efficiency, along with consideration for animals (pets) and children, can promote ecological restoration and social co-evolution. Motivated by the increasing frequency of climate-related disasters worldwide, as exemplified by the 2024 floods in Rio Grande do Sul, southern Brazil, the research emphasizes the need for adaptable, resilient and cost-effective solutions that can meet immediate needs while supporting long-term recovery for displaced communities.

Regenerative design principles guided the project in creating systems that restore and renew natural and social environments, rather than merely mitigating damage (Wahl, 2016). The modular furniture design incorporates resource availability and efficiency through the use of MDF, a widely accessible and affordable material in many regions. Given MDF's affordability, availability, and scalability, it is a pragmatic choice for emergency solutions, particularly where cost and access to materials are crucial. MDF can be made with recycled and renewable materials, such as eucalyptus, and now some factories worldwide have developed technologies to recover MDF (Medium-Density Fiberboard) and HDF (High-Density Fiberboard) fibers for reuse (Unilin Panels, n.d.).

Rio Grande do Sul, in particular, is an important industrial hub in Brazil, home to 18,000 furniture factories that use MDF as their primary material (MOVERGS, n.d.). As a result, the state is also a major producer of MDF, ensuring its widespread availability. The MDF industry in Rio Grande do

Sul primarily relies on wood from reforestation efforts and is gradually incorporating recycled materials as sustainability practices evolve. The accessibility of MDF in the state, along with its extensive network of furniture factories, facilitates local production, promotes community self-sufficiency and resilience, and enables rapid deployment in post-disaster contexts.

In post-disaster scenarios, standard military field beds are often deployed due to their rapid assembly by volunteers, typically within seconds (Chad, 2023). In contrast, the proposed MDF modular furniture is comparatively heavier, features defined edges, requires a flat surface for stability, and involves a longer assembly and disassembly process—particularly challenging during the initial phase of crisis when individuals may be physically and emotionally overwhelmed. Nevertheless, while military field beds offer speed and practicality, they are frequently in limited supply, lack adaptability for longer-term recovery phases, and fail to address the emotional and multispecies needs of displaced populations.

Rio Grande do Sul is also a key hub for digital fabrication and CNC technology in Brazil, playing a vital role in driving innovation within the furniture manufacturing sector (Schreiber et al., 2024). The state's extensive use of CNC machines enables precise cutting, shaping, and material customization, enhancing production efficiency and minimizing waste and time (Kurmapu & Mishra, 2023). These modular pieces of furniture were designed as a flat-pack solution, allowing them to become completely flat for transportation and storage. By leveraging digital fabrication techniques, the project utilizes local manufacturing infrastructure to create adaptable, quick-to-cut and reusable modular furniture solutions.

Inclusive design principles (Krishnamurthy, 2019; Maisel et al., 2017) and multispecies design principles (Gatto & McCardle, 2019; Giaccardi & Redström, 2020) were embedded in the project to ensure that the modular furniture addressed the diverse needs of affected populations, both human and nonhuman. The pieces of furniture were CNC-fabricated with snap-fit joints, allowing for easy assembly and disassembly without screws or tools, and ensuring accessibility for users with varying physical and technical skills. In the dot-based assembly system, each joint features a specific number of dots that must be matched with the corresponding piece, similar to a children's game. This design guarantees that individuals without reading skills or formal education can assemble the pieces. Furthermore, the design also considers the cohabitation of adults, children, and animals (pets) in post-disaster settings, recognizing the importance of multispecies well-being in emergency responses.

Beyond its physical utility, the project contributes pedagogically through a "learning by doing" approach, enabling displaced individuals to participate in the construction of their own temporary environments. This method is rooted in experiential learning theories developed by John Dewey, Paulo Freire and David Kolb, who emphasized the transformative power of active engagement. Dewey (1938) argued that meaningful learning arises through direct interaction with the world, proposing that education should emerge from lived experience. Freire (1970) highlighted the emancipatory potential of participatory action, particularly for vulnerable and marginalized communities, asserting that knowledge is co-created through critical dialogue and reflection. Building on these foundations, Kolb (1984) developed the experiential learning cycle—a model composed of concrete experience, reflective observation, abstract conceptualization and active experimentation.

In this context, the act of assembling modular furniture becomes more than a practical necessity—it becomes a participatory act of recovery, fostering resilience, restoring agency and enabling emotional reengagement with one’s surroundings. The project also highlights the potential of open-source digital fabrication not only as a method for rapid, cost-effective production but as a means of democratizing access to design solutions. By promoting accessible, scalable and replicable systems, it offers dignified, adaptable and inclusive alternatives that respond to evolving post-disaster needs.

The concept of an “evolving project,” which incorporates multiple configurations—a simplified version for the emergency phase (a bed without a headboard, transformable into a center table and an armchair) and a more complete version for the social reconstruction phase (a bed with a headboard, transformable into two armchairs)—promotes inclusivity by accommodating the

varying priorities and constraints of both humans and nonhumans. Additionally, it optimizes resource use: the simplified version is cost-effective, requiring only one MDF board, while the more comprehensive version offers added comfort, using one and one-third boards. All of these methods align with regenerative design principles, meeting immediate needs while promoting long-term environmental and social well-being.

The results highlight how the CNC-fabricated modular MDF furniture can serve as a model for equitable territorial development by integrating environmental, social and technological considerations. While the project focuses on Brazil, its methodology and outcomes have global applicability, offering a model for aiding in confronting the challenges of climate change and promoting regenerative strategies for urban and territorial development.

2. Methodological Background: Rethinking Agency Beyond Anthropocentrism

Since the early 1980s, designers have used the concept of sustainability to address issues arising from the environmental crisis. While this has led to the development of systemic design approaches and methods aimed at reducing human impact on the planet, there has been little exploration of sustainability as a concept that goes beyond anthropocentrism (Gatto & McCardle, 2019). However, it is crucial to shift this view, which prioritizes human life, to a biocentric view that values all biological life, and ultimately, to an ecocentric view that recognizes the intrinsic value of the entire environment (Filho, 2023).

According to Forlano (2017), technological advancements are increasingly dissolving the traditional boundaries between nature and the artificial, human and animal, and human and machine. These developments highlight the emerging forms of agency of nonhumans in the world, whether in environmental or technological contexts. A growing body of social theory has emerged around concepts designed to understand this blurring of boundaries and to introduce hybrid, non-dual and relational ways of thinking.

The human-centered design methodology is a practice in which designers focus on human needs (Norman, 2013). Nevertheless, humankind is just one of many variables that shape our environments, and its agency is shaped through relational processes rather than being predetermined. As design shifts into the social sector and engages with complex socio-technical issues, it is essential to adopt a broader approach, such as posthuman design, which considers both human and nonhuman actors. Post-humanist and post-anthropocentric perspectives suggest that manufactured systems should be viewed as networks comprising diverse living beings and their relational dynamics in order to better understand planetary transitions (Gatto & McCardle, 2019). One area for exploration is rethinking humanity's relationship with other species and the environment, and proposing future scenarios for multispecies coexistence.

The term "multispecies" was introduced over a decade ago in the fields of biology and ecological sciences to describe the patterns of co-construction in environmental niches and wildlife management (De Ruiter et al., 2005). Its relatively recent inclusion in anthropology has led to new interpretations of the concept, enabling a reevaluation of how nonhuman agents engage with design and related processes. It also broadens the definition of sustainability, as considering environmental issues from nonhuman perspectives can result in outcomes that differ from those predicted by technocentric approaches. To engage with multispecies worlds and better understand environmental issues, designers must familiarize themselves with a variety of techniques that are not only procedural but also represent distinct ways of thinking, behaving and experiencing (Gatto & McCardle, 2019).

This paper shifts the focus from human-centered design to posthuman design, presenting a multispecies interpretation of the environmental contamination that includes both human and

nonhuman (animal) actors. It examines how designers can incorporate a multispecies approach to deepen our understanding of the agencies, dependencies and entanglements that emerge from contemporary design challenges (Forlano, 2017). This approach moves beyond anthropocentrism toward biocentrism, offering a posthuman perspective on the concept of the "user." It underscores the growing discourse of posthumanism and advocates for the inclusion of nonhuman lifeforms as active partners in design research—whether as informants, co-designers, or users. This inclusive approach addresses the needs not only of adults and children, but also of animals (pets) that have lost their homes and, consequently, their physical and emotional well-being.

3. Methodology

The paper explores the pressing challenges posed by climate emergencies, focusing on solutions that mitigate risks and provide rapid, effective support for affected populations, both human and nonhuman. Using the 2024 floods in Rio Grande do Sul, Brazil, as a case study, this project integrates a theoretical approach with practical prototyping to develop adaptable, user-centered furniture for post-disaster recovery. The methodology is outlined below.

3.1. Contextual Analysis: Climate Change and the Floods in Rio Grande do Sul

Between April and May of 2024, the state of Rio Grande do Sul experienced the second largest flood in its history. Intense and persistent rainfall over a span of just a few weeks severely impacted the valleys of the Taquari, Cai, Sinos and Antas rivers, along with the Serra Gaúcha and the Metropolitan Region of Porto Alegre. The torrential rains submerged urban areas, triggered landslides, and disrupted cities connections, leaving almost 90% of the state's municipalities with their urban infrastructure damaged. The effects were far-reaching: 497cities were affected, covering 15,778 km² of land. The floods resulted in the tragic loss of 181 lives, while over 2.3 million people were affected, with 580,000 displaced from their homes (ACNUR, 2024).

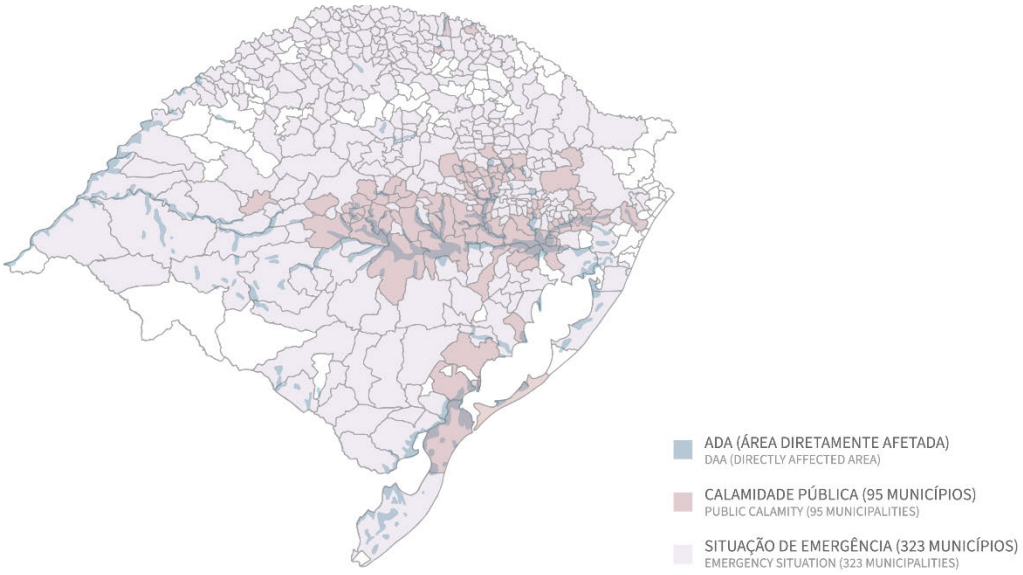

Figure 1. Map of the directly affected area (ADA) and municipalities impacted in the state of Rio Grande do Sul, based on: https://issuu.com/gauchazh/docs/avalia_o_dos_efeitos_e_impactos_das_inunda_es_no

A report by the World Weather Attribution (2024) highlights that part of the intensification of this phenomenon is linked to the influence of El Niño-Southern Oscillation (ENSO), which exacerbated the rainfall. While El Niño played a significant role, it must not be viewed in isolation; as a climatic phenomenon, it also responds to the alterations brought by climate change, which imposes a new rhythm to increasingly extreme events. The report concludes, "... climate change has doubled the probability of such events occurring and increased their intensity by 6-9%. For future projections, with a 2°C global temperature rise relative to the pre-industrial period, the probability of such events occurring would be once every 20-30 years, with a 4% increase in intensity compared to today" (Oliveira, 2024).

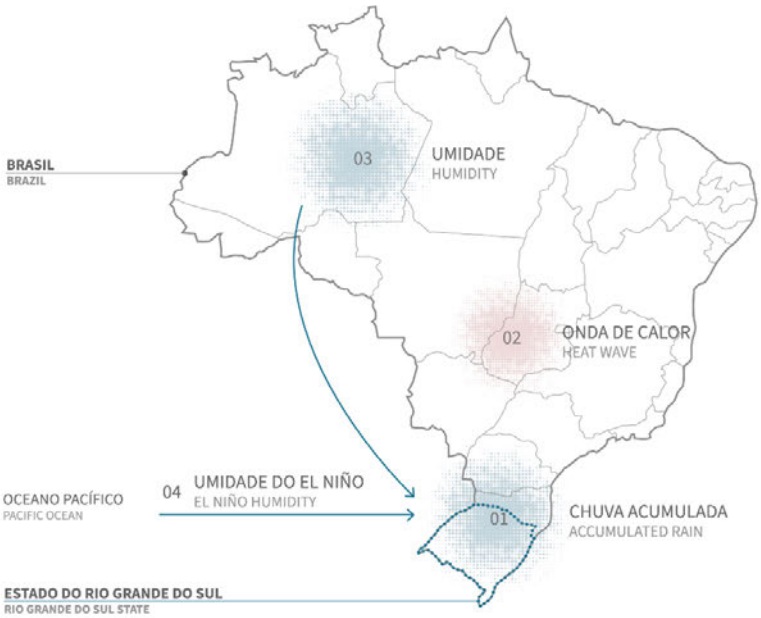

Figure 2. Map illustrating the combination of factors that led to the torrential rains in Rio Grande do Sul, based on: https://www.bbc.com/portuguese/articles/c90zxeqj342o

The intense rainfall in May 2024 that struck the state of Rio Grande do Sul caused the level of Lake Guaíba, in the metropolitan region of Porto Alegre, to increase to 5.35 meters, exceeding the flood threshold of 3 meters by 2.35 meters. This record-breaking rise left thousands of homes submerged across various neighborhoods in the capital and surrounding municipalities. The rapid elevation of the waters forced residents to evacuate their homes, taking only essential items, such as documents and a few pieces of clothing, while the majority of their belongings were left behind. The muddy and contaminated floodwaters that entered the homes caused widespread destruction, damaging furniture, appliances and other personal belongings. Upon returning to their homes after the waters receded, many residents faced scenes of devastation. For those whose homes remained standing, the difficult task of discarding almost everything affected by the flood awaited them, as the items were irreparably damaged due to contamination and prolonged exposure to water (Laboissière, 2024)

In this disaster, approximately 81,170 individuals sought refuge in 722 temporary shelters, which included schools, gymnasiums, churches and other public spaces adapted for emergency accommodation. Although initially conceived as a temporary solution, this measure, in many cases, extended for months. Currently, ten months after the event, around 950 people still remain in these improvised spaces (Secretaria de Desenvolvimento Social/RS, 2024). The setup of these shelters occurred rapidly and with limited resources. Emergency measures, such as mattresses placed on gymnasium floors and makeshift partitions, were common, as the displaced individuals sought ways to secure a minimum level of privacy (Pontes, 2024).

Figure 3. Photo by Diego Vara showing the flooded streets of Porto Alegre, Rio Grande do Sul (RS), https://g1.globo.com/rs/rio-grande-do-sul/noticia/2024/05/06/temporais-no-rs-veja-resgates-impressionantes-durante-as-chuvas.ghtml

Figure 4. Photo by William Fernando Marx Purper, showing the houses destroyed after the torrential rains, generously donated by the photographer.

It is essential to highlight that children are among the most vulnerable groups within displaced populations. A UNICEF report (2023) reveals an alarming statistic: between 2016 and 2021, approximately 47 million children were displaced worldwide, equivalent to

around 20,000 displacements per day. The impacts of this phenomenon are profound, as it not only disrupts their access to education, healthcare, and basic necessities but also increases their exposure to risks such as trafficking, exploitation, and abuse. Furthermore, the disruption of community and family ties intensifies these vulnerabilities, placing children in a cycle of displacement that compromises their long-term safety and well-being.
During the floods in Rio Grande do Sul, children accounted for approximately 25% of the population in temporary shelters.

Figure 5. Photo by Diego Vara showing adults and children from flooded areas taking shelter in a gym in Porto Alegre, RS, May 2024, https://www.reuters.com/world/americas/brazil-flooding-forces-plan-tent-cities-house-displaced-2024-05-16

In addition to the shelters provided for displaced people, animals were also accommodated in temporary facilities. During the disaster period, approximately 11,002 animals were temporarily sheltered with the aim of reuniting them with their owners, highlighting the emotional significance of human-animal bonds in the recovery process (Rodrigues, 2024). Mainly, these shelters for cats and dogs where made of pallets and covered with plastics, which brings issues related to their durability, security and hygiene. For example, pallet wood can accumulate dirt, feces and moisture, creating an ideal environment for fungi and bacteria to thrive, which can be harmful to the animals. Additionally, pallets may be unstable or contain nails and splinters that pose risks to them.

Figure 6. Photo by Rafa Neddermeyer of an animal shelter and another photo by Renan Mattos of a dog sleeping in a human shelter. First photo: https://agenciabrasil.ebc.com.br/geral/noticia/2024-05/animais-domesticos-continuam-sendo-resgatados-de-areas-alagadas-no-rs and second photo: https://images.app.goo.gl/q2K8cjrbnhyvYDxy9

In conclusion, emergency furniture needed to be designed that could initially function as beds for humans, keeping their mattresses off the ground, and also include storage for their belongings, as well as small spaces for pets (dogs and cats). After the initial emergency phase, the furniture could evolve and transform into other pieces suitable for both humans and animals.

3.2. Material and Fabrication Selection with Open-Source Accessibility

The region's furniture production activity influenced the material selection, with MDF panels identified as a readily available, low-cost, and scalable option. The abundance of MDF in Rio Grande do Sul, driven by the local industry, was a key factor. Initially, a combination of MDF and truck canvas was considered for added comfort, with the canvas used for soft parts in contact with the body. However, the truck canvas was rejected due to inconsistent supply and the cleaning processes that would delay production. MDF panels were ultimately chosen for their accessibility, uniformity, and compatibility with digital fabrication technologies.

The material and fabrication selection not only suited the region's characteristics but also made the project adaptable to disaster-affected areas worldwide. Initially developed as an open-source initiative for southern Brazil, the project allowed anyone to access, modify and build their own version. However, due to the chosen material and fabrication method, its scope expanded beyond the region, leading to design modifications and translations of the basic instructions into English. This ensured the prototype can be reproduced using any fabrication facility or Fab Lab worldwide.

3.3. Design Development

Four main principles guided the design development of the modular piece of furniture. The first was the concept of an “evolving project,” which was essential for addressing the changing needs of displaced individuals throughout different stages of disaster recovery: (1) Phase 1 – Emergency Furniture – Functioning as beds to provide immediate relief and (2) Phase 2 – Social Reconstruction – Transforming into social furniture (armchairs and center tables) to help people rebuild social connections.

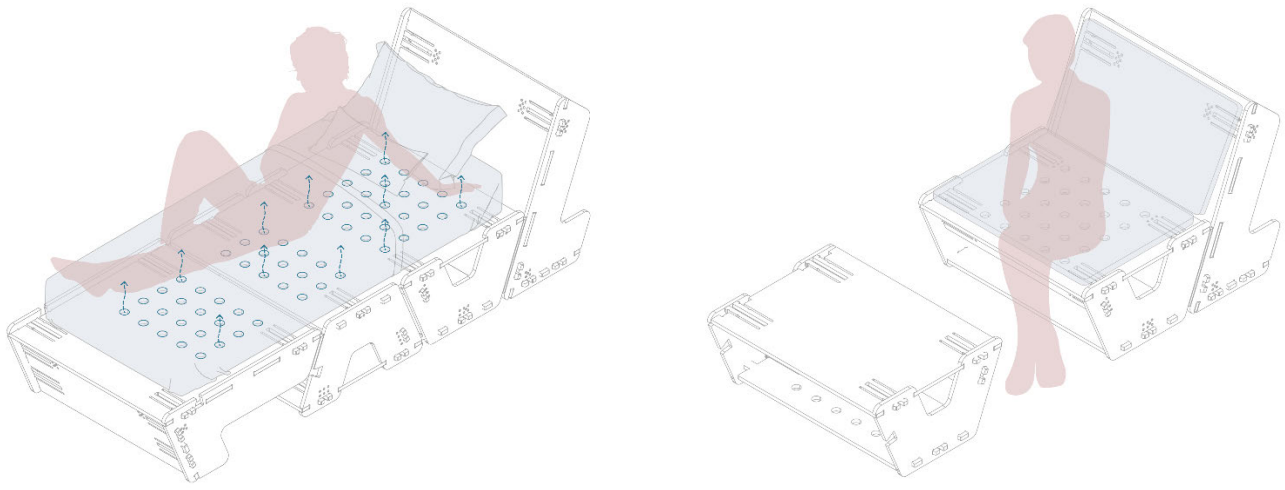

Figure 7. Diagrams of Phase 1 (bed) with ventilation holes for the mattress and Phase 2 (center table and armchair) with optional cushions.

Immediately after a disaster, priorities focus on survival, safety and basic necessities, requiring functional emergency solutions. However, as recovery progresses, the emphasis shifts toward rebuilding social structures and restoring a sense of normalcy. Designing modular furniture that adapts to these phases ensures that resources remain relevant beyond the initial crisis, providing long-term support for displaced individuals as they transition from emergency shelter to reconstructed communities. Thus, the design needed to prioritize multifunctionality, addressing not only physical comfort and practical needs but also emotional and psychological well-being at different stages of disaster recovery. This approach maximizes efficiency, minimizes waste and fosters resilience.

The second principle was inclusivity, taking into account the needs of both humans (adults and children) and animals (pets) during emergencies. An example of this is the inclusion of holes in the furniture that can serve as shelters for cats and dogs or as storage spaces. Other examples are presented in the Results section.

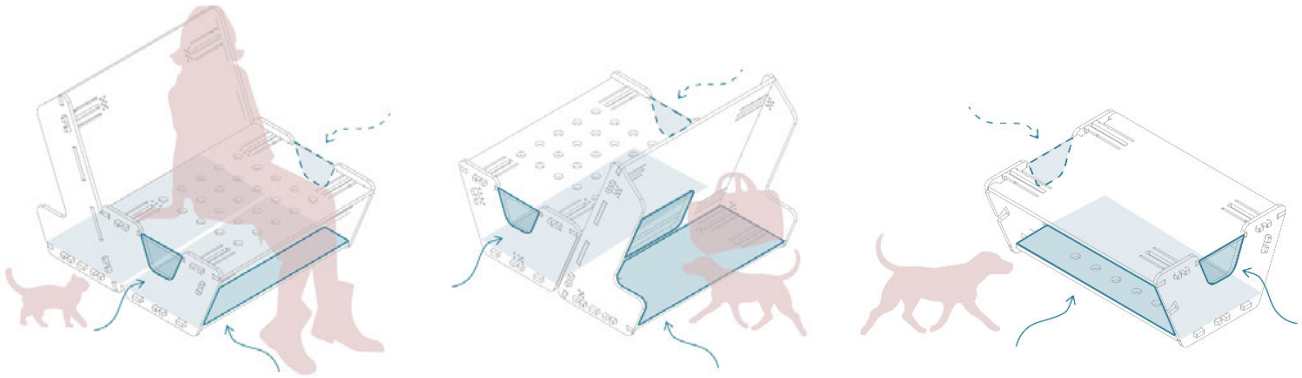

Figure 8. Diagrams of the armchair and table, featuring holes that function as shelters for cats and dogs or as storage spaces.

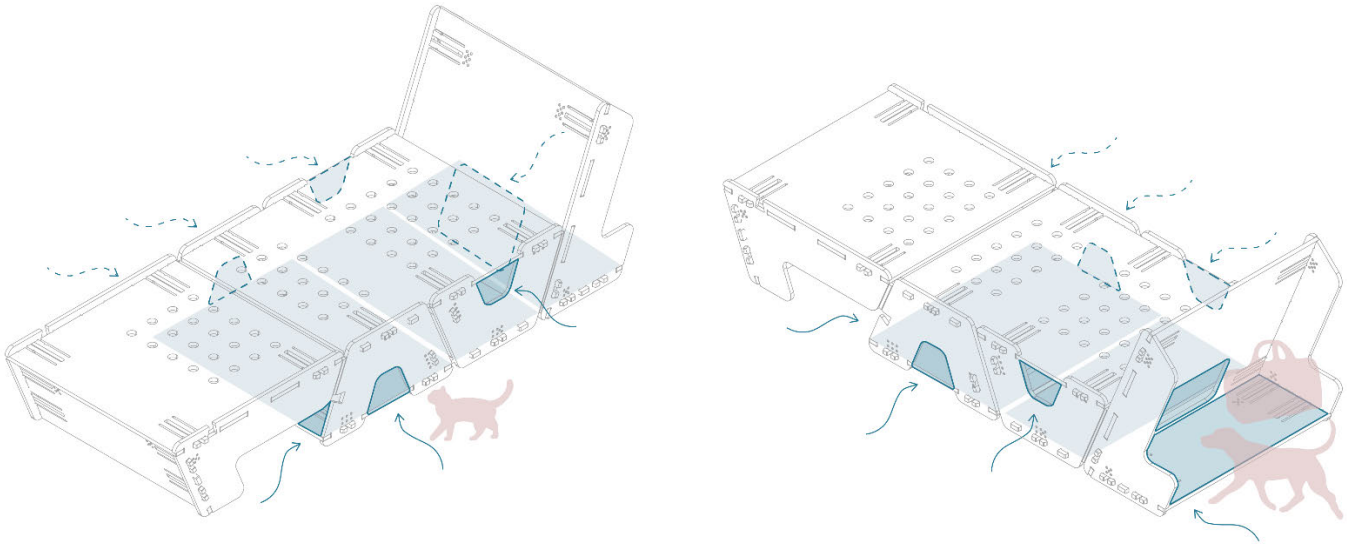

Figure 9. Diagrams of the bed featuring holes that function as shelters for cats and dogs or as storage spaces.

The third principle was that these modular pieces of furniture used only one material (15mm MDF) and were designed as a flat-pack solution, requiring no tools, screws or glue—an essential feature in emergencies when time and resources are limited. This design ensures ease of assembly, reassembly, storage, and transport. The pieces relied solely on CNC-fabricated snap-fit joints, which are commonly used in the industry for their simplicity, cost-effectiveness and efficiency in joining parts.

The fourth principle is that two versions were designed based on the availability of

resources: (1) a simplified version, using one MDF board to create a bed without a headboard, which can later be transformed into a center table and an armchair, and (2) a more comprehensive version, requiring one and one-third boards to create a bed with a headboard that later can be transformed into two armchairs. Thus, for three pieces of furniture, four whole boards are required. The simplified version is cost-effective, while the more comprehensive version provides greater comfort by using additional material.

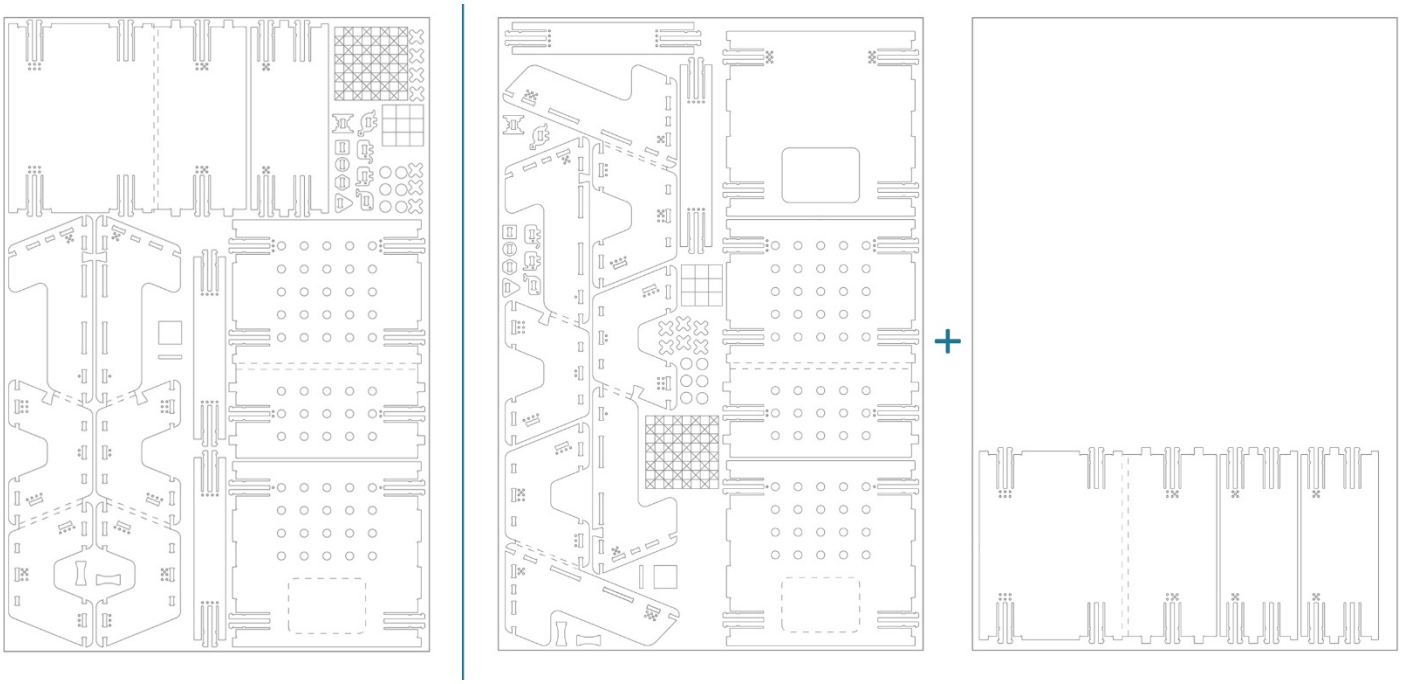

Figure 10. Drawings of the (1) simplified version using one MDF board and the (2) comprehensive version, requiring one and one-third boards.

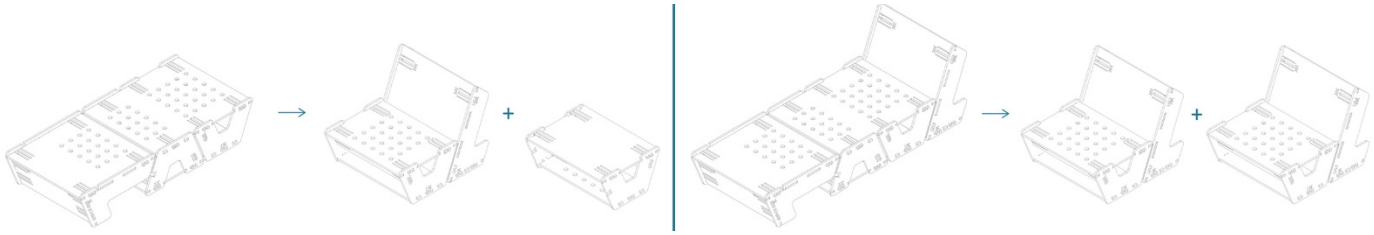

Figure 11. Drawings of the (1) simplified version and the (2) comprehensive version.

3.4. Prototype Iteration

A series of 1:5 scale models were created to anticipate potential challenges and facilitate iterative design adjustments, focusing on functionality, modularity and primary structural reliability. Different designs were tested to improve efficiency. Simultaneously, 1:1 scale tests were conducted to determine the correct fit for the joints, ensuring that each part connected easily, without being too tight or too loose. Three tests were performed with margin variations of 0.2, 0.3, and 0.5 mm to determine which margin provided the best fit. The 0.5 mm margin was incorporated into the design because it performed the best and can also accommodate potential variations in the 15mm MDF thickness from different suppliers. To address potential discrepancies in CNC machine tools across factories or Fab Labs in different countries, a test was included in the drawing to verify the fit before cutting all the pieces (see Figure 22). All these efforts ensured the integrity of the modular furniture's fabrication and assembly, guaranteeing consistency, universality and reproducibility worldwide.

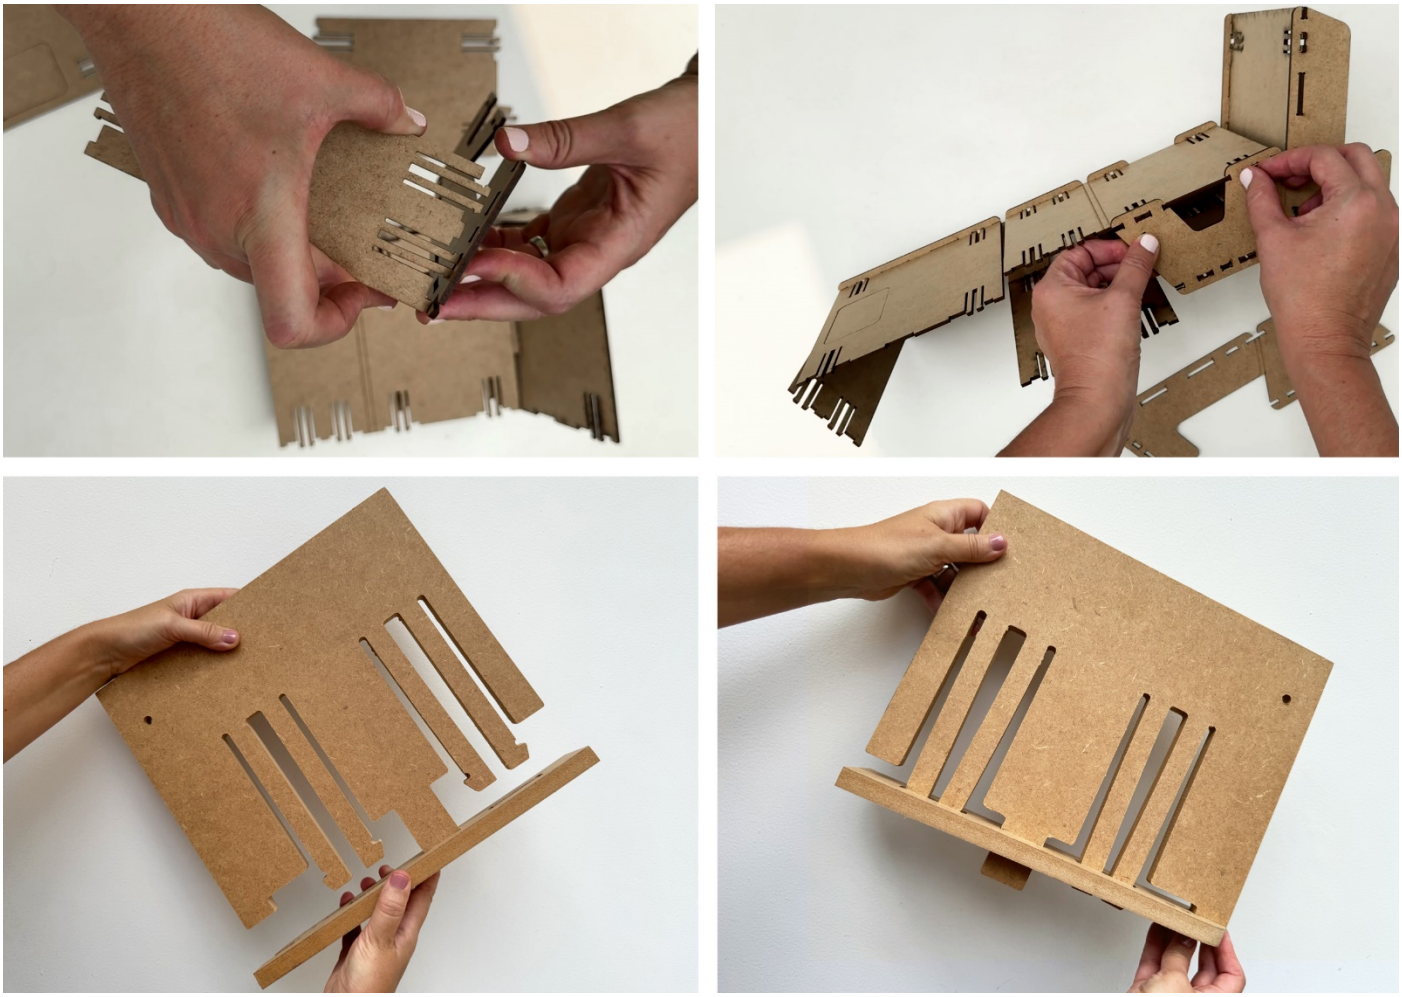

Figure 12. Photos of the 1:5 scale models and 1:1 scale tests.

3.5. Final Design

A full-scale prototype made from laminated 15mm MDF underwent physical testing to evaluate its performance, ease of assembly and structural reliability. Following this, details and dimensions were refined. In addition, during the final design phase, a comprehensive assembly manual containing diagrams was created to guide users on the simplest way to assemble and disassemble each module.

Figure 13. Photos by Flavio Sampaio showing the furniture assembly and testing process.

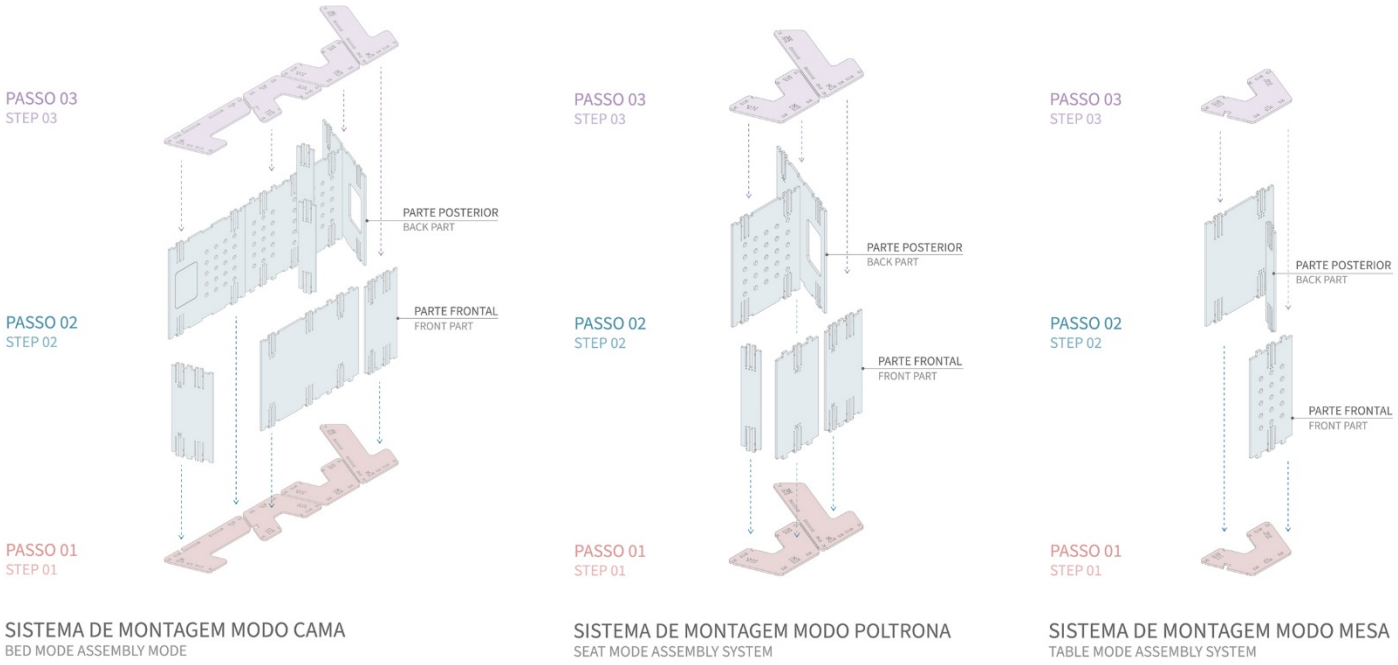

Figure 14. Examples of diagrams that guide users through the simplest way to assemble each module (bed, armchair, and center table).

4. Results

The results demonstrate the significant advantages of these modular furniture pieces, which are adaptable and can be transformed from single beds to armchairs and center tables.

Figure 15. Photo by Flavio Sampaio of the bed with the headboard.

Figure 16. Photo by Flavio Sampaio of the center table and armchair.

Figure 17. Photo by Flavio Sampaio of the disassembled pieces.

Figure 18. Flavio Sampaio capturing images of the pieces of furniture.

During the creation of this modular furniture, some insights emerged. One of them was the idea that, in the second phase, when the focus shifts toward rebuilding social structures (with beds transforming into armchairs and center tables), a game could be designed using materials that would otherwise be discarded, helping people gather and strengthen their bonds. Games are essential in fostering social connections and trust. They provide a space for collaboration and communication, and in times of crisis, they can help people reconnect, alleviate trauma, promote emotional well-being, and reinforce relationships, contributing to social cohesion (Sharma, 2019). In this context, the circles created for mattress ventilation were repurposed as pieces for games like tic-tac-toe and checkers. The empty spaces on the MDF board were also utilized to design new pieces and the bases for these games.

Figure 19. Photo by Flavio Sampaio of the tic-tac-toe and checkers game made from pieces that would otherwise be discarded and from the empty parts of the MDF board.

Another game, designed specifically for children, was also created. Children are especially affected by catastrophes, often experiencing trauma when displaced. They lose not only their homes but also their possessions, including toys, and may struggle to connect with their new environment (Osofsky & Osofsky, 2013). To make the modular furniture more inclusive and address the needs of this vulnerable group during disasters, its design was slightly modified to accommodate laminated MDF animals that children can use to play. These animals were designed to fit into the empty spaces of the MDF board and later be placed between the furniture joints, allowing children to engage with their environment in a constructive and comforting way. Although simple, these elements help children maintain a sense of normalcy, offering both entertainment and distraction, which are essential for their emotional recovery.

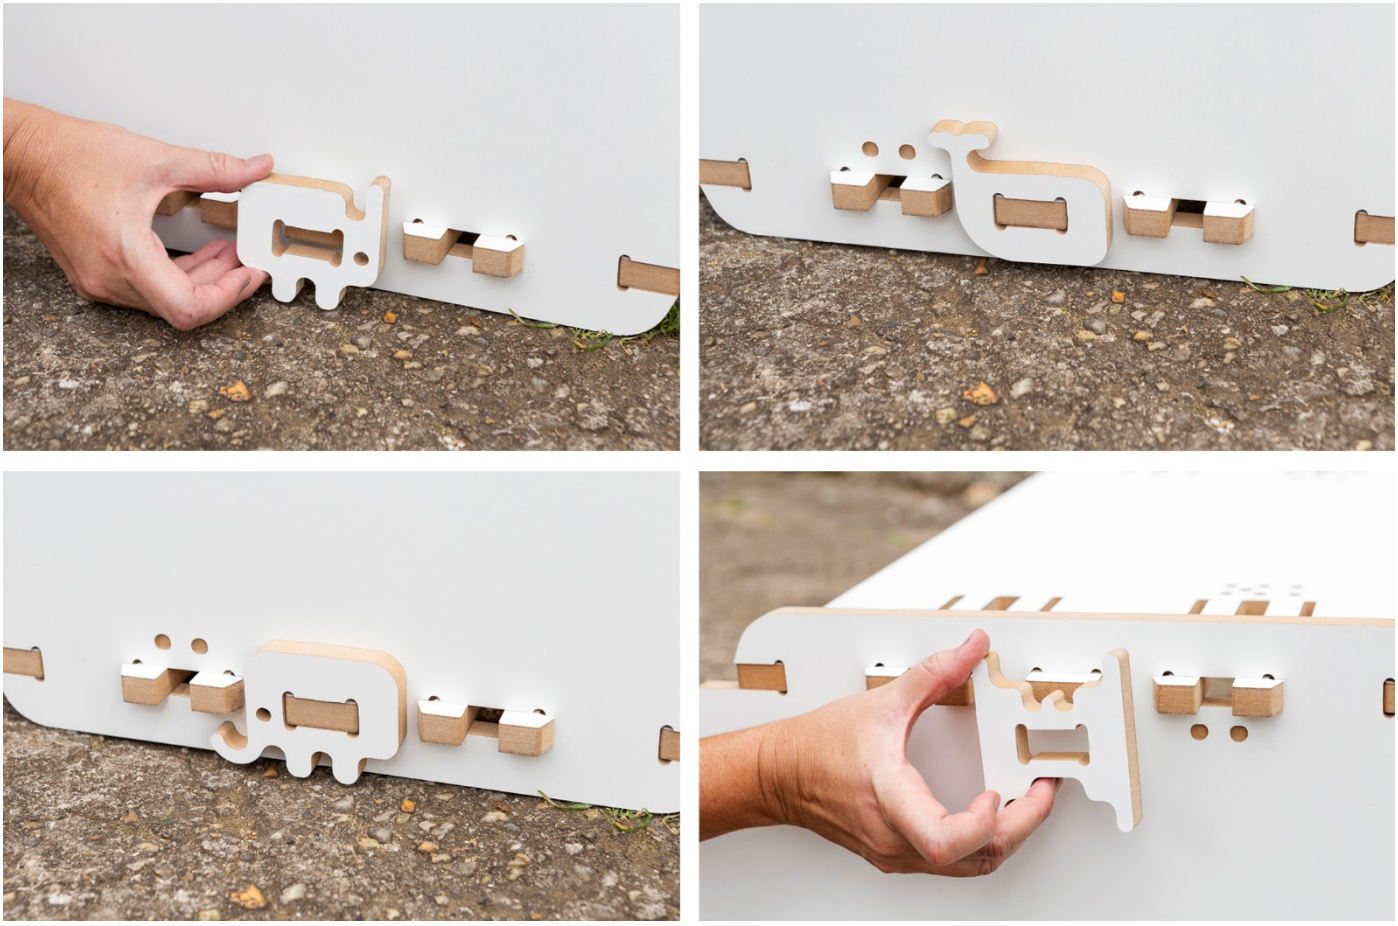

Figure 20. Photo by Flavio Sampaio of the piece of furniture being used as a game for children.

An additional insight was the creation of a dot-based assembly system that requires no prior knowledge. Each joint features a specific number of dots that must be matched with the corresponding piece, similar to a children's game. This system was developed to address the lack of formal education in many communities in Brazil, allowing individuals from diverse backgrounds, regardless of their education or cognitive abilities, to engage with and assemble the modular furniture independently.

The final insight concerns the snap-fit joints. These joints consist of a male and female component, with a cantilever hook that temporarily bends to allow the pieces to fit together, utilizing the material's elasticity. Once assembled, the pieces return to a stress-free state. The geometric design of the components determines the force required for assembly or disassembly, as well as whether the joint is separable (Robeller et al., 2014). During furniture assembly, it was observed that, due to the size of the furniture, the number of joints, and the need to simultaneously tension the cantilever hooks, the process

becomes easier if Hellermann cable ties or strong strings are used to hold the joints under tension. After assembly, these can be cut. This method simplifies the assembly process for two people without requiring significant physical strength.

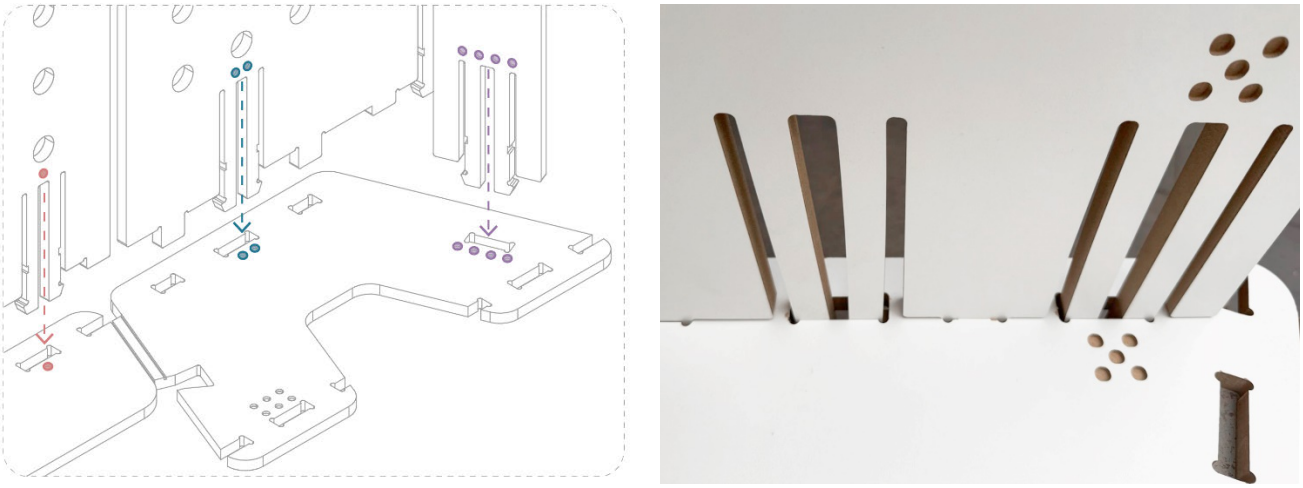

Figure 21. Diagram and photo of the dot-based assembly system.

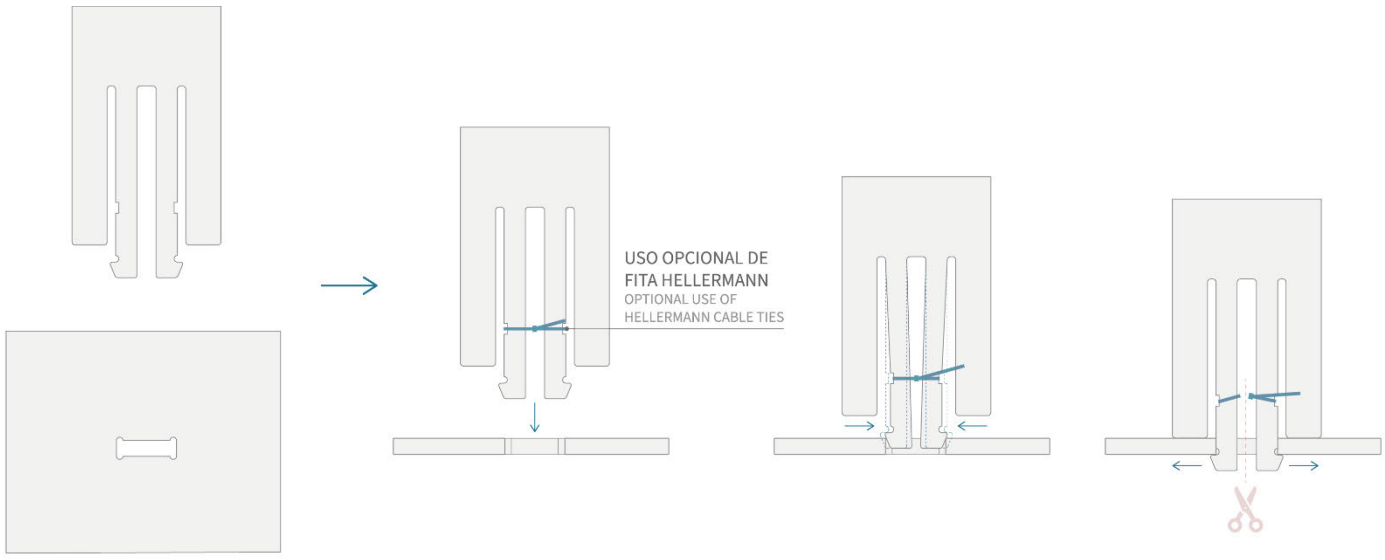

Figure 22. CNC-fabricated snap-fit joints with the option of using Hellermann cable ties or strong strings to facilitate assembly.

5. Discussion - From Local to Global: Addressing Displacement and Resilience Through Modular Furniture Design

The 2024 flood disaster in Rio Grande do Sul, Brazil, is part of a broader global trend in which climate change exacerbates the frequency and intensity of natural disasters. The consequences of these events are immeasurable, with millions of people worldwide being displaced from their homes as a result. The recurring disasters worldwide, year after year, place Brazil in a complex climate transformation scenario, gradually diminishing the exceptional nature of these events.

In the summer of 2021, Germany faced the worst flooding in decades, with the regions of Rhineland-Palatinate and North Rhine-Westphalia among the most affected. Torrential rains caused rivers to overflow and triggered landslides that buried homes and infrastructure, resulting in more than 180 deaths (BBC, 2021). In the United States, Hurricane Ida caused catastrophic flooding in Louisiana in 2021, affecting cities like New Orleans and forcing the evacuation of hundreds of thousands of people. The storm's remnants also triggered flooding in the northeastern part of the country, severely impacting New York and New Jersey (Santana & Reevesap, 2021). In September 2023, Libya was devastated by floods caused by Storm Daniel. The accumulated rainfall exceeded 400 mm in some regions, resulting in the collapse of two dams, and subjecting the city of Derna to the worst flood in its history. The disaster left approximately 6,000 people dead and displaced more than 40,000 (UNHCR, 2024). Monsoonal rains have also increased in intensity over the past few decades. In 2022, around 33 million people were displaced in Pakistan due to floods (UNHCR, 2022). Similarly, in June 2024, the Sylhet region in northeastern Bangladesh was affected by severe flooding, impacting more than 2 million people, including 772,000 children, and displacing 51,000 individuals who sought shelter in 1,685 relief centers (UNICEF, 2023a). All of these events, along with many others, highlight the increasing frequency and severity of floods in various contexts, emphasizing the urgent need for a response from both authorities and civil society to mitigate the impacts of climate change.

The perspective regarding the impact of climate change is tragic. According to a 2024 report by the UNHCR (2024), 90 million people live in countries exposed to high climate risks. In the last decade, climate-related disasters have caused around 220 million internal displacements, or approximately 60,000 displacements per day (IDMC, 2024). This scenario exposes the most critical and alarming aspect of the crisis, highlighting that climate emergencies are not merely environmental phenomena; rather, they ultimately reveal a humanitarian urgency.

In the glossary of the United Nations High Commissioner for Refugees -UNHCR report (2024), extreme climate events are classified into two categories: sudden-onset events and slow-onset events. Despite the evident cause-and-effect correlation between these two classifications, sudden-onset events require rapid responses, especially in the phase of sheltering affected populations. The sudden loss of assets, familiar environments and living conditions in such disasters often leaves individuals in shock and despair. Emergency measures are then needed, not only to ensure shelter and security but also to mitigate the psychological and social impacts. These impacts include the erosion of social bonds, displacement from homes, compromised access to essential services like healthcare and education, and separation from friends and pets. Thus, developing effective and adaptable solutions to meet both the immediate and long-term needs of displaced populations has become more urgent than ever.

Pets are often overlooked in disaster relief recovery plans, despite their crucial role in providing emotional support to displaced families. Studies show that Animal-Assisted Therapy (AAT) has been effective in treating Post-Traumatic Stress Disorder (PTSD). Research indicates that interaction with animals alleviates symptoms of anxiety, depression, and stress, while providing comfort and emotional stability. The presence of animals facilitates social reintegration and

promotes a sense of security (O'Haire, Guérin & Kirkham, 2015). Consequently, animals should be more systematically integrated into recovery plans, reflecting a biocentric perspective that acknowledges their significant role within human communities.

The modular MDF furniture project, originally conceived for Brazil, demonstrates its global applicability through the principles of modularity, material efficiency, and digital fabrication. It offers a viable solution for disaster relief, responding to the increasing frequency and severity of climate change-induced crises that exacerbate population vulnerability.

Figure 23. Photos showing the donated furniture and people interacting with it in Brazil.

3. Conclusion

The paper explores the creation of adaptable, effective, and affordable modular furniture to assist both humans and nonhumans during emergencies, particularly in response to the increasing frequency of climate-related disasters, as exemplified by the 2024 floods in Rio Grande do Sul, southern Brazil. The objective is to offer both theoretical and practical insights into how design and digital fabrication can aid affected communities in post-disaster environments.

The modular MDF furniture system, designed as a flat-pack solution for both emergency and social reconstruction phases, balances practicality, affordability and ease of assembly while supporting the emotional well-being of adults, children and animals. The use of snap-fit joints and a dot-based assembly system enables easy, tool-free assembly and disassembly, making it ideal for emergencies when resources and time are limited. MDF and CNC fabrication allows for quick production, transportation and storage. Two versions were developed: a simplified version for the emergency phase, using one MDF board, and a more comprehensive version for the recovery phase, using one and one-third boards. This project demonstrates the potential of scalable, open-source solutions in disaster response, illustrating how inclusive design and digital fabrication can meet both immediate and long-term needs, enhancing overall well-being.

The results demonstrate how MDF modular furniture, made from simple, widely available materials, can be quickly produced and deployed to aid displaced individuals across different geographical and cultural contexts. Although developed for Brazil, the use of open-source approach makes it applicable globally, offering a model for future disaster responses for both humans and nonhumans, particularly as climate-related natural

disasters increase. The significance of this research lies in its potential to inform future disaster relief strategies worldwide, emphasizing the need for inclusive design that considers the well-being of both humans and nonhumans in the aftermath of natural disasters.

Beyond its practical attributes, this research highlights the broader implications of design for emergency relief. By incorporating multispecies considerations, leveraging open-source methodologies, and utilizing digital fabrication, the project contributes to ongoing discussions in humanitarian design, environmental justice and community-driven resilience. It democratizes access to essential resources, particularly for vulnerable populations affected by climate change.

Despite its contributions, this research has some limitations. Prototype testing has not yet been carried out in diverse environmental and socio-cultural contexts, and long-term durability assessments are still pending. Further studies are needed to refine material selection and optimize structural performance over extended use. While MDF is cost-effective, its lack of water resistance is a notable limitation. Exploring alternative materials or protective finishes could improve durability, and considering region-specific materials would enhance adaptability. Additionally, while the design may provide emotional and psychological benefits for displaced populations, further empirical research is needed to confirm its long-term effectiveness in promoting well-being in post-disaster environments.

Building on these considerations, future research could begin by examining the long-term impact of the furniture on the emotional well-being of displaced individuals, particularly its role in fostering social networks and aiding community recovery. Complex games, beyond simple ones like tic-tac-toe and checkers, could be incorporated into the modular furniture and further investigated to help individuals access important information and aid in their recovery from traumatic experiences. Additionally, studies could explore advanced biomaterials and AI-driven design optimizations to enhance resilience and sustainability. Collaboration with NGOs, local governments and affected communities could provide critical insights for improving deployment strategies. Furthermore, investigating the integration of digital fabrication methods with local materials and craft traditions could offer valuable perspectives on hybrid design solutions that are both culturally appropriate and scalable.

Ultimately, the paper reinforces the role of design as a proactive tool in disaster response. By reimagining emergency furniture as an adaptable, inclusive and scalable system, it advocates for a paradigm shift in humanitarian aid—one that embraces open-source collaboration, affordable and accessible materials and fabrication strategies, and multispecies principles to foster more resilient futures.

Recasting the EU's Geographical Indication Regime as a Framework for Regenerative Design in Rural Italy

Samuel Maddox

Wentworth Institute of Technology
maddoxs@wit.edu

ABSTRACT | What roles might design play in developing more sustainable, contemporary ruralities? Can small towns and their traditional practices be preserved without compromising economic viability? These are the questions that form the foundation of this study abroad design-research studio based in Italy's Marche region and centered around placed-based food systems, also known as geographical indications. Through detailed and highly nuanced understandings of the processes, communities, and environments that make these EU-protected consumable goods unique, students in this course have been able to curate a set of protected and/or prized products ranging from cheese and wine to the elusive white truffle. Each of these *prodotti marchigiani*, with its unique spatial and programmatic needs, serves as a sort of "client" for a research-driven design project. In the course of this work, students explore questions of intangible heritage, regenerative agriculture, land management, ecological planning, adaptive reuse, multi-species design, refugee resettlement, and the impacts of tourism on small communities. By the end of the first iteration of this course in 2022, the studio had developed a set of product-centric, production-based transdisciplinary projects that together reveal the possibility of a more productive, livable, equitable, and sustainable future for the small cities, towns, and remote landscapes across the Marche region.

KEYWORDS | rural development, heritage, agroecology, transdisciplinary design

1. Introduction

The slow march of widespread population loss in the Italian countryside and the ensuing state-sponsored efforts to stave off the decline of rural towns and regions have been well documented in popular media over the past decade. Beyond flashy financial incentives and the doorbuster deals that made the One Euro Houses Project famous, Italy and much of the rest of Europe have had a system in place for more than 30 years to protect traditional life and commerce in the countryside: geographical indications (GI) (Bloom, 2022; Brancolini, 2021; Case a 1 Euro, n.d.). The European Union's GI regime is a legal framework adopted in 1992 to protect small-scale producers of heritage food and wine by certifying the production processes, quality controls, and geographic origins of specific products. Simply put, GI schemes grant small-to-medium-scale producers entry into the global food market by providing a substantial advantage over large-scale competitors through product differentiation (Crescenzi et al., 2022). That said, the GI regime is not only an economic bulwark against corporate consolidation and vertical integration typical of global agri-food markets. When considered through the lens of spatial planning, GI schemes can also serve as policy tools for fostering rural development, combating rural depopulation, preserving heritage landscapes, and ultimately developing more economically robust regions.

In recent years, researchers have begun to question the socioeconomic efficacy of these regulatory regimes that safeguard spatially embedded agricultural production and processing. Various analyses, both qualitative and quantitative, have demonstrated significant economic benefits for both individual producers as well as for GI-producing rural regions. Specifically, the data have shown increases in income, employment growth, and movement within local economies toward higher value-added sectors (Gerz & Dupont, 2006; Cei et al., 2018; Crescenzi et al., 2022). Even as this research may begin to reveal an economically viable agricultural alternative for rural inhabitants that enables differentiation without dispossession, individual GI schemes may still perpetuate social and environmental injustices, especially with regard to capital-labor relations and environmental stewardship (Norgaard & Collard, 2021). To that end, GI producers that already benefit from *de jure* institutional architectures at the supranational, national, and regional levels stand to benefit from greater care at the hyper-local level, at the scale of the space of production. This paper explores how transdisciplinary, systems-oriented design approaches (e.g., community-driven master planning, integrated operational facility architecture, contextually responsive programming, regenerative landscape management, and cooperative economics) could help reduce negative externalities associated with GI-producing enterprises while simultaneously improving their potential to sustain rural environments, economies, and communities.

It is precisely this hopeful yet cautious perspective of the EU's GI schemes that has provided a critical and theoretical foundation for a speculative, design-research architecture studio based in the heart of Italy's mostly rural Marche region. When considered through the lens of the architectural design studio, GI schemes with their prescriptive production processes offer students a unique opportunity to engage with ecological and economic systems thinking as a prerequisite to designing more holistic facilities, landscapes, and cultural centers associated with the production and enjoyment of heritage foods and wine. This design-research studio was first launched in the fall of 2022 when Wentworth Institute of Technology launched its study abroad program in Urbino, a Renaissance-era walled city nestled among the Apennine mountains of central Italy. Urbino is an undeniably rich environment for the study of architecture. It is the birthplace of the painter and architect Raphael and home to early and influential perspectival paintings such as the *Ideal City* (c. 1480-1490) and Piero della Francesca's *Flagellation of Christ* (c. 1455–1460). The city is the site of multiple built works by the mid-century modern architect Giancarlo de Carlo while also a paradigm of historic preservation, restoration, and reuse thanks to its designation as a UNESCO World Heritage site. Despite all this, the Marche remains a relatively undiscovered region that suffers from economic stagnation and decline, especially when compared to its neighbors, Tuscany and Emilia-Romagna (Blim & Goffi, 2018). This design-research studio, titled Prodotti Protetti(vi) and translated either as "Protected Products" or "Protective Products," posits that GIs and the design of their production spaces—if considered through a more holistic, systems-based, and ecological lens—could play a key role in protecting the small, rural communities that have preserved these products and traditions over the years.

2. Methods & Pedagogy

In terms of methodologies, the studio begins with a systematic literature review of landscape and urban theories, rural development, ethical tourism, and concerns and fears common in Italy today (e.g., depopulation, migration, heritage loss, etc.). Students also read, analyze, and synthesize research reports on the impacts of GI regimes around the world. Finally, the class familiarizes itself with the nomenclature and specifications of the designations common across Italy. These include *Denominazione di Origine Protetta* (DOP), or Protected Designation of Origin (PDO), which is among the strictest designations (e.g., Parmigiano Reggiano, Gorgonzola, Prosciutto di Parma, etc.). The DOP designation ensures that the entirety of the production process takes place in the specified geography using traditional methods and ingredients. *Indicazione Geografica Protetta* (IGP), or Protected Geographical Indication (PGI), is less strict. It mandates that "at least one of the stages of production, processing, or preparation takes place in the region" (European Commission, n.d., Geographical indications, para. 5). Though less well known, some common examples of IGP/PGI products include balsamic vinegar of Modena and Gragnano pasta. Specific to wine, *Denominazione di Origine Controllata* (DOC), translated as "Controlled Designation of Origin," was established in 1963 following the European Council's adoption of regulations to establish a common agricultural market. This highly restrictive designation, modeled after France's *appellation d'origine contrôlée* (AOC), regulates grape cultivation, production methods, aging times, and even maximum harvest yields (Rossi & Cortassa, 2021). Montepulciano d'Abruzzo and Prosecco are among the most commonly known wines bearing the DOC designation. This step, developing fluency and facility in the language of GIs, is critical. It is only through an intimate and nuanced understanding of the restrictions mandated by these designations that students can begin to reconceptualize the food and wine products at the center of their studio projects as "clients"—that is, precise, even picky, entities with unique histories, desires, and needs who become the focuses of architectural labor, innovation, and potential.

In the next phase of research, the class investigates all the GI products specific to the Marche, exploring conceptual possibilities (e.g., narrative, socioeconomic, ecological, etc.) and schematic potentials (e.g., spatial, material, circulative, etc.) rooted in the explicit desires, requirements, and prohibitions of the "client" (i.e., the GI product). Central to this work is the process of diagramming. To more effectively illustrate and explore the systems and communities that surround the products, students draw their way through a wide range of diagrams: actor-network diagrams to reveal social interactions and ecological systems, Sankey diagrams to understand material processing and waste, emergy diagrams (modeled after Howard T. Odum's work) to visualize the transformation of resources into goods, phenological diagrams to express time and cyclicality, and circulation diagrams to choreograph the movement of resources, product, labor, and tourists. (Odum, 1996). Taken in aggregate, these diagrams help shape the individual projects not only physically but also in terms of narrative and program development. In the final stages of conceptual development, student teams are asked to augment the program of each GI-producing facility to include spaces and activities that challenge the conventions of agrotourism. Added yet complementary programs—driven either internally by the ethics of the product itself or externally by the needs of the context—emerge organically through critical questions around topics like resource management, labor relations, cooperative ownership, circularity, migration, etc. These topical programmatic additions to the projects are vetted by the class for their synergy between product and place as well as appropriateness to community and context before being advanced as part of the creative output of the studio in its entirety.

Critically, students conduct this work—namely research, conceptual development, and schematic development—in small teams, routinely swapping collaborators and products in several rounds of research sprints. This accomplishes three goals: First, all students become familiar with all products under discussion. Second, students experience the working styles of multiple peers, laying a foundation for more intentional team development in the future. Third, each student invests their time and creative energy in nearly all products and potential production facilities. This approach to project development fosters a sense of multilateral investment in all projects, ultimately encouraging continued collaboration across and between project teams for the remainder of the semester.

3. Prodotti Marchigiani

The following speculative designs from the first iteration of this course illustrate the potential for complex project-based learning that can interweave social, ecological, and economic ambitions into architectural imaginaries when design and education embrace the periphery, both in terms of rural contexts at the literal fringe as well as factory-like environments typically treated as out of sight and, therefore, out of mind. Moreover, this work would not be possible without a transdisciplinary embrace of realms of knowledge, technical skillsets, and wicked problems that have historically existed on the periphery of architecture's assumed scope.

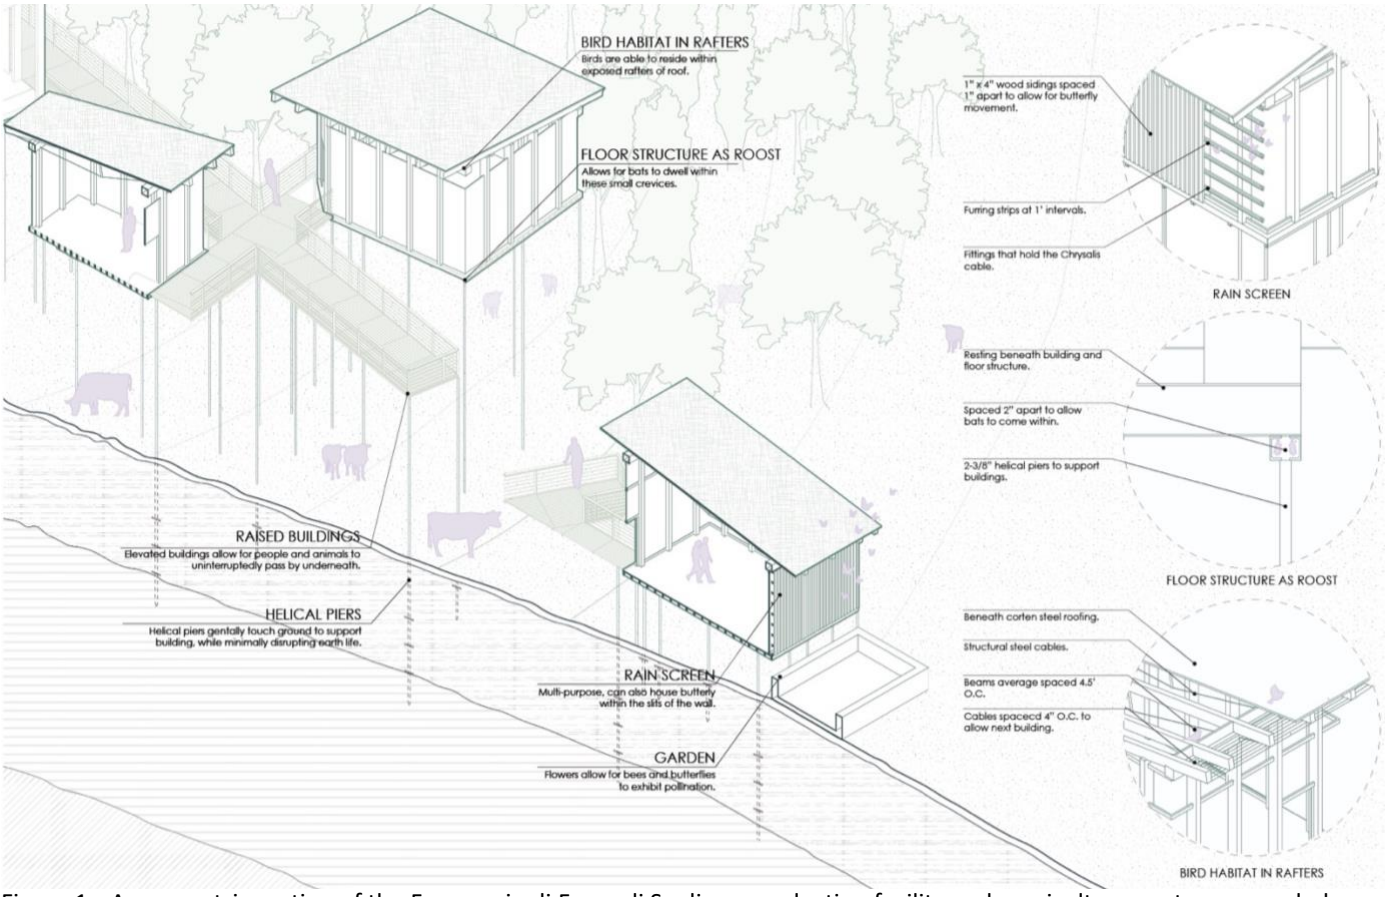

Figure 1. Axonometric section of the Formaggio di Fossa di Sogliano production facility and caseiculture center suspended above the dairy pasture. Detail callouts highlight novel habitat creation in the façade, eaves, and structure, which supports pollinator species typical to the montane grasslands of the Apennine mountains.

3.1. Formaggio di Fossa di Sogliano, DOP

One of the more unique cheeses of the Marche region is Formaggio di Fossa di Sogliano, DOP, a firm and pungent-smelling cheese that is traditionally sealed within a limestone cave to age for 2–3 months. This team proposed a caseiculture center, i.e., an educational cheesemaking facility focused on the specific ecologies of the Apennine mountains that fuel the production of this cheese. The stages of cheese production form a meandering path that guides visitors through the production process. All areas related to dairy processing seemingly float above the pasture, allowing ample grazing room below for cattle. Custom façade and eaves details of the elevated structures provide habitat for bats, bees, butterflies, and other pollinator populations typical to the area. The architecture here boldly broadcasts its ethic: respect place by touching the ground lightly. The only exception to this is the end of the path, which dives into the hillside, carving out a cool place for aging the product in its traditional pits and, later, ceremonially sampling it. Above all, this proposal insists that we question our present practices and reconsider our place—as humans, as consumers, and as makers—within the ecological communities all around us and to which, ultimately, we belong.

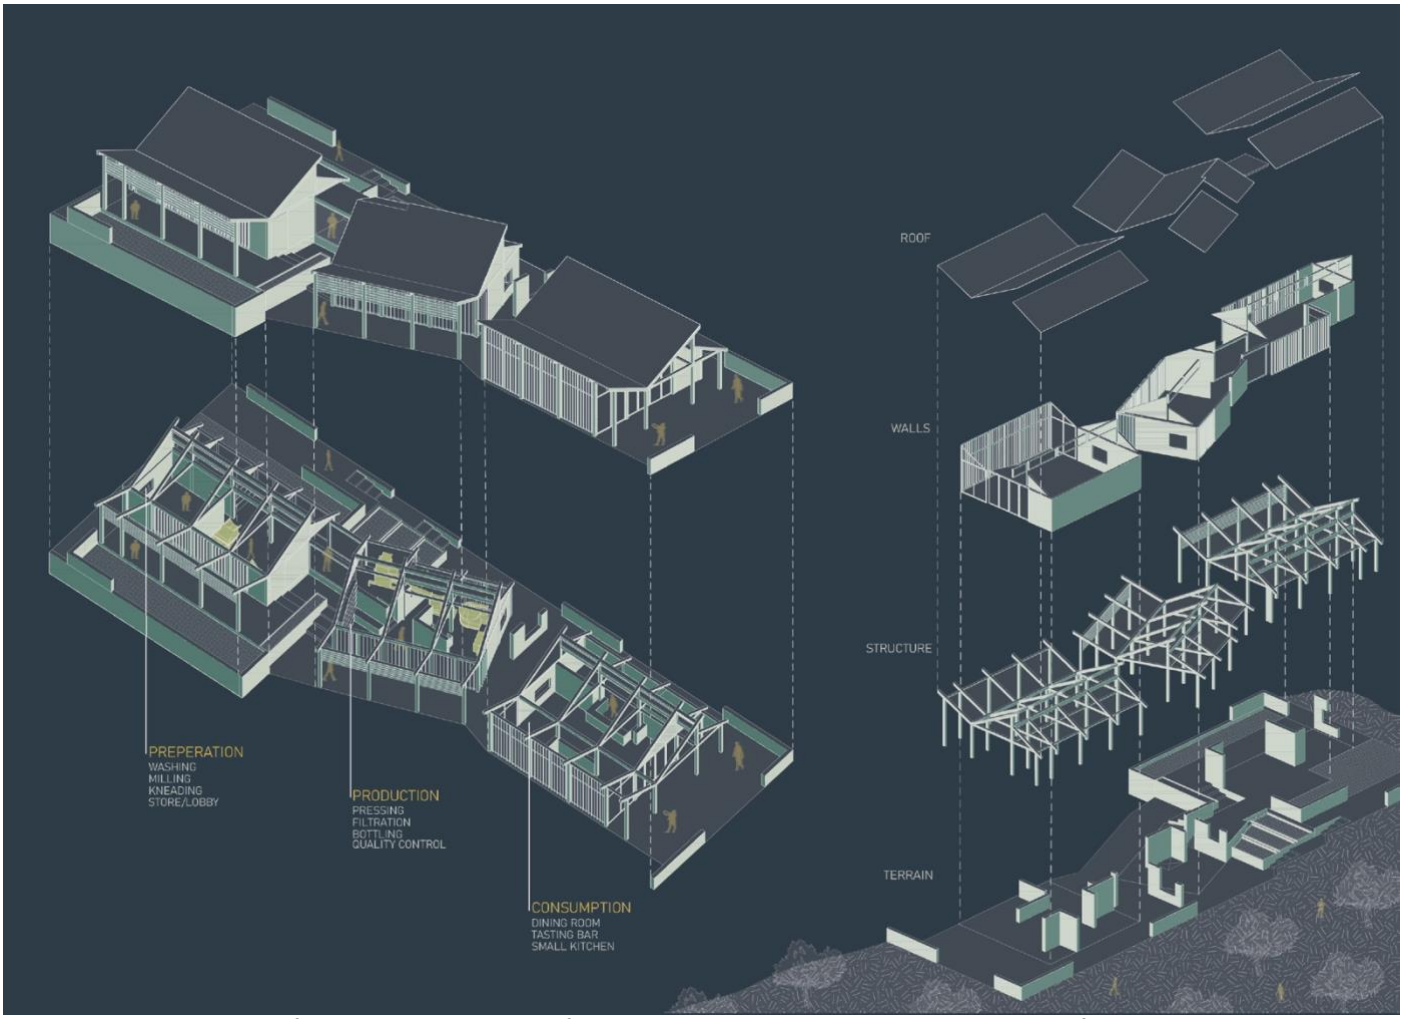

Figure 2. Exploded axon of the olive oil production facility reveals the organization and sequence of processing areas and structure, which are integrated among existing ruins on the site. Social and leisure zones are intentionally integrated into and along the workspaces to humanize the process and reinforce the dignity of laborers.

3.2. Olio extravergine di oliva Marche, IGP

This project focuses on the production of heritage olive oil in the Marche region as a means to create a more resilient local economy and community. The project, as proposed, can accommodate experiential agritourism with regular, short-stay lodging located throughout the orchard. In the event of a crisis, however, the complex can pivot to providing employment and housing opportunities for displaced communities. Ultimately the goal of this project is to design a system that spatially and socially intermingles labor and leisure and that, ultimately, enables the Marche to become more prepared, more compassionate, and more resilient in the inevitable event of future refugee resettlement efforts and migration crises resulting from anthropogenic climate change, global strife, and uneven international development. The project achieves resettlement through three methods of infill: rural, social, and urban. First, the rural infill involves the unbuilding of abandoned stone structures and the recycling of materials into a new olive oil production center. Second, the social infill involves the hosting of tourists and migrants on the grounds and intertwines those two communities in the olive harvest and oil production processes as well as the sharing of meals, resources, and social spaces in the worker housing. Finally, the urban infill occurs on a larger timescale as pop-up olive oil shops activate sleepy town centers around the Marche. With the introduction of each shop, refugees from the main olive oil facility are invited to lease to own the shop, each of which includes a modest apartment. These three methods of social impact architecture can help to carve a path forward for those seeking community, economic independence, and a place in the Marche to call home.

3.3. Rosso Conero, DOC

This proposal considers how to responsibly integrate a vineyard and vinification center into a set of overlapping, existing contexts: the suburban edges of the Commune di Camerano, the underutilized historic tunnels that weave below the old city of Camerano, and a warming global climate—an issue for wine producers throughout the region and, indeed, across much of the current wine-producing world. The design of the winery connects the vinification center to the historic tunnels which, purportedly, were used for storing Rosso Conero wine centuries ago. Vertical insertions into the areas of the tunnel system nearest to the surface provide daylighting to particular parts of the tunnel system to increase community use of the subterranean city, including use during the annual Rosso Conero festival. At the edges of the winery, tucked underneath a corner of one of the fields, an environmental educational center demonstrates how carbon dioxide (CO^2) generated as a byproduct of the fermentation process can be captured and converted into liquid CO^2 fertilizer, a crucial step toward decarbonizing the global wine industry.

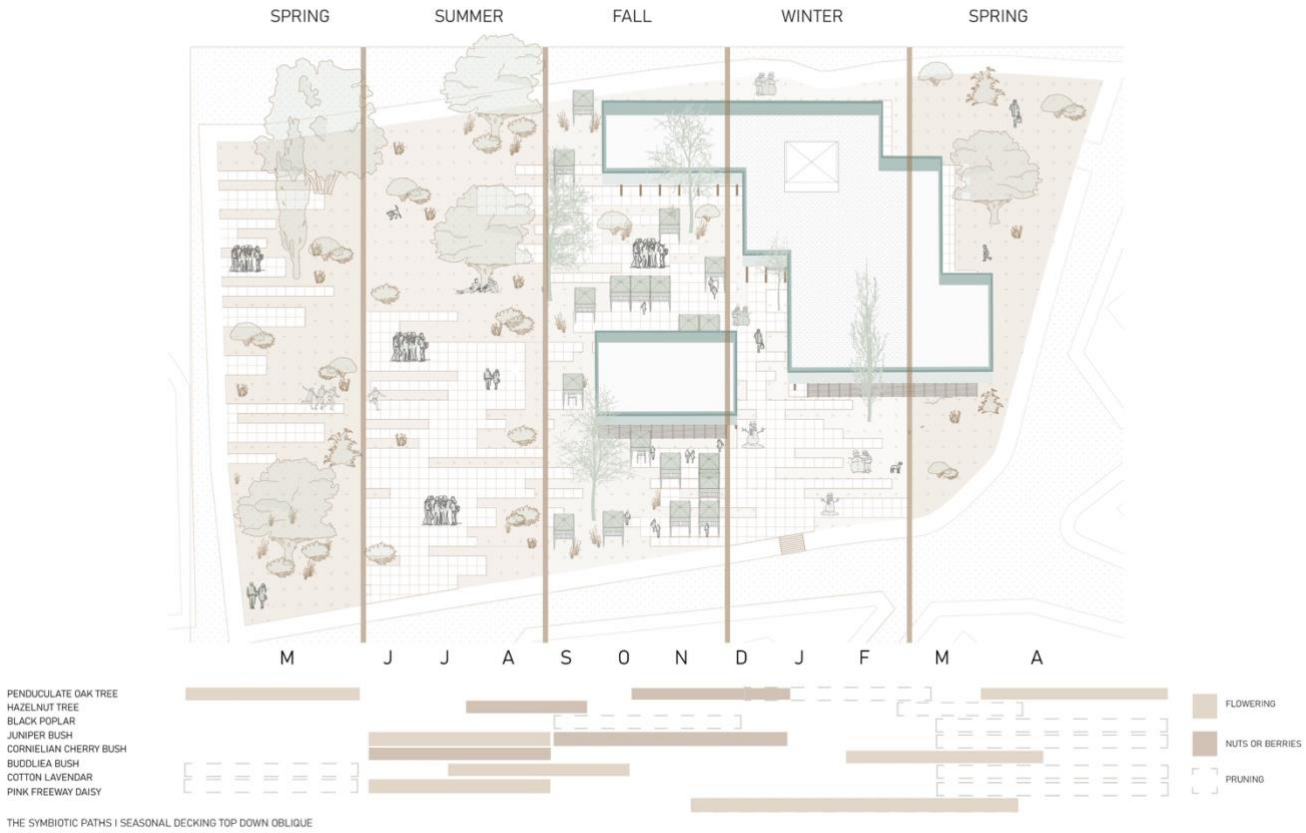

Figure 3. The white truffle research facility, located in the heart of Acqualagna, reinvents the classic central piazza by replacing the hardscape with a native landscape that can support truffle farming. A system of unitized, movable decking protects the truffles from harm during the growing season while simultaneously allowing locals to occupy the public space. During the autumn, when truffles are harvested, the decking gives way to the landscape, making room for the truffle hunt.

3.4. Tartufi Bianchi

The white truffle—though not a designated GI product—is a well-known and highly prized food. It grows underground among the roots of specific tree species (e.g., poplar, hazelnut, and oak), and its distinct flavor is used to add a powerful punch to pasta, risottos, and many other dishes. This project team identified that the astronomical value ascribed to the white truffle, as a commodity, is in tension with the ecological network of which the truffle is a part. Extractive attitudes toward harvesting undermine the public's appreciation and care for the extended environment of the *tartufo bianco*. Acqualagna, home to the Marche region's white truffle, is a small city surrounded by natural and agricultural landscapes; however, its urban fabric does not promote or reap all the

ecological benefits that it could. Botanist and author Peter Del Tredici writes about ways of finding the space between rural and urban and, ultimately, rejects the dichotomy. He questions the terms “native,” “exotic,” and “non-native,” pointing out how they promote divisions while failing to embrace or acknowledge the grey area (Riano, 2012). Socially and economically, the truffle is “native” to the urban environment; however, regarding the ecological fabric, it is a non-native species. The project aims to disrupt this dichotomy and embrace the grey area by planting trees with which the truffle has a symbiotic relationship in the urban fabric in order to re-integrate the truffle, ecologically speaking, into the socio-spatial fabric of Acqualagna.

This project also proposes the introduction of a truffle research center that would educate visitors on truffle cultivation at various scales—from the forest to the farm to the home garden. In addition to the research center, a newly planted “piazza” would be introduced to the site with movable units. With each season of the year, the movable piazza is rearranged in keeping with the needs of the truffle. During the summer, the paths multiply to protect truffles as they mature. In the fall, the decking thins out, allowing the community to harvest the crop as part of the annual National White Truffle Fair. From the piazza, passersby can glimpse the interior of the exhibitions, classrooms, research labs, and tree nursery found inside the lobby. The nursery would foster truffle-inoculated saplings that residents could plant on their property. Moreover, the movable path system of the planted piazza can be adopted by neighbors with adjoining properties in order to create communal spaces within the existing urban fabric. These shared spaces also allow community members to grow and harvest *tartufi bianchi* for personal use or as an additional income stream.

4. Discussion

Having recently concluded the second iteration of this studio, many successful strategies and methods were revisited, including rural-centric readings of urban and environmental theories, collaborative project development, deliberative team sorting, and flow- and network-based diagramming to understand production processes, ecological systems, and economic opportunity. However, two logistical aspects central to the studio brief continue to raise significant design-pedagogical questions: site inaccessibility and language barriers.

4.1. Limitations

First, given the geographical specificity of each product, the relative remoteness of most sites, and the limited means of mobility available to study-abroad students across the largely rural Marche region, most project sites remain practically inaccessible to student teams. This limitation poses serious questions about the authenticity with which projects can respond to, support, and honor local communities. Without a doubt, if a student team could easily visit a site, they would do so. In 2022, the white truffle team visited Acqualagna multiple times, including during the National White Truffle Fair. In 2025, the Formaggio di Fossa di Sogliano team visited and thoroughly documented their site in Fossombrone. Teams that could not visit their project sites relied on remote forms of observation and analysis, mainly mapping, diagramming, and collage, but also some interviews with topical experts. Overall, the non-site-visit teams employing a more para-local approach to site research tended to produce projects that emphasized systems (e.g., production, ecology, economy, labor, etc.) and abstracted contexts (e.g., landscape, markets, community, culture, etc.). Meanwhile, the site-visit teams employing direct observation engaged more thoroughly with the physical and spatial context of the site (e.g., materiality, topography, site approach, etc.) while still maintaining a clear focus on and command of relevant systems.

Secondly, though the projects have indeed yielded results, albeit hypothetical ones, which would appear to preserve intangible regional heritage, bolster rural communities, preserve habitat, tend to the land, etc., the authenticity and, thus, the ultimate efficacy of these socioeconomic and socioenvironmental design decisions have been limited due to language barriers. In rural Italy, English proficiency is often limited, and the students participating in this studio are not required

to learn Italian, nor do they have access to robust language-learning resources. As much as students endeavor to lead with empathy and regularly check their assumptions, the result of working across the language barrier has been a more top-down approach to planning and design. This inaccessibility of tacit, embedded social knowledge of place would almost certainly undermine core goals of the studio in any real-world context.

Figure 4. In 2025, the Formaggio di Fossa di Sogliano team chose to adapt an abandoned building on a bluff along the Metauro River as their main production facility after visiting the site in Fossombrone.

4.2. Conclusion

Despite these logistical shortcomings, this set of holistic rural design and development proposals—each crafted through iterative, ecosystemic research—has revealed a depth of empathy for local communities, laborers, and non-human species that goes well beyond that of most GI-producing enterprises and facilities. This deep sensitivity to and, indeed, profound care for place is a crucial first step for planners, developers, and designers who want to recenter community as core to successful and sustainable commercial development. This is especially true of rural areas, as they frequently suffer from human capital flight (or “brain drain”) due to the economic opportunities, amenities, and upward mobility, whether real or perceived, available in urbanized areas. Moreover, the disciplinary breadth and interdisciplinary complexity of each project—let alone that of the collective body of work explored in this studio—have modeled a sensitivity to context, both in terms of geographic specificity as well as environmental processes, that though not exactly requisite in the highly regulated realm of GIs is practically required to reduce the negative externalities that typify the production of consumable goods at a scale commensurate with the global food market. In summary, though the cottage industries that first instilled a sense of preciousness around would-be GI products are now rare, the globally commoditized identity of these artisanal consumables offers an opportunity for small communities, much like their funky cheeses and small-batch wines, to have purchase in an urbanizing world. The trick, this studio posits, is simple: The shapers of rural space and industry must recognize and respond to the complexity and uniqueness of the places of production as much as they do to that of the products. Constructing environments, growing economies, and building communities that mutually support one another is the only way to unlock the true and enduring value of product and place.

Promoting Regional Landscape Integration: A Generative Design of Wind Turbines Based on Local Culture

MS. Shi Yuan, MR. Xu Zhang
School of Design, Hunan University
1203616893@qq.com, erich010110@gmail.com

01 Abstract

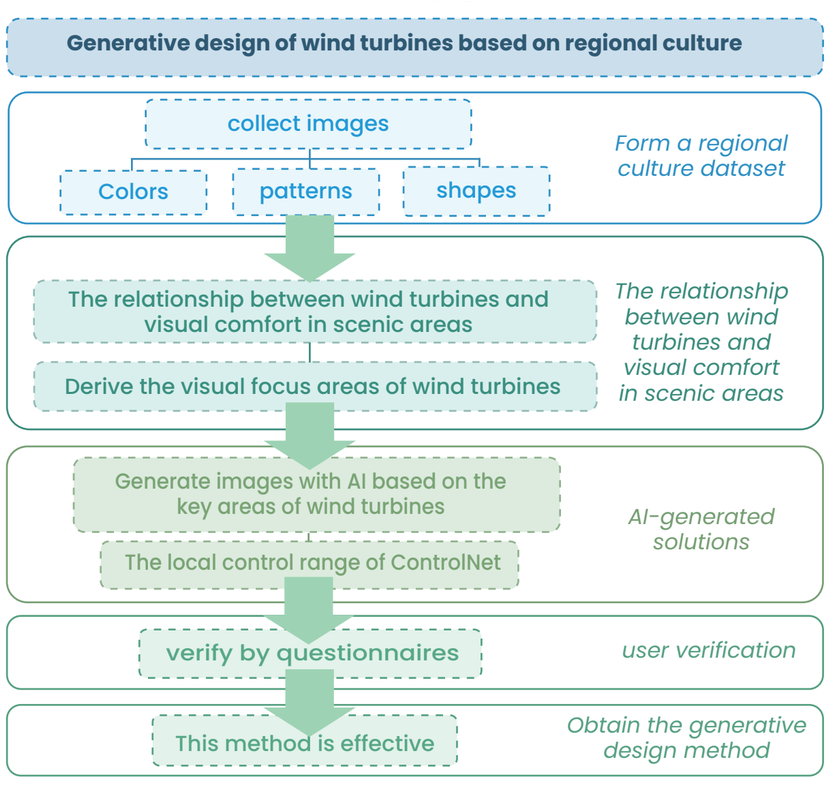
Objective: Wind turbines have become new landmarks in regional landscapes due to their massive size, but the homogenization of turbine designs has led to uniform scenery. To address this, this study introduces AIGC technology and proposes an efficient regionally adaptive aesthetic design method to enhance the integration of wind turbines with local landscapes.

Methods: Using the Houshuiquan Wind Farm in Taipusiqi, Inner Mongolia, as a case study, we systematically extracted local cultural elements and categorized them into three dimensions: color, pattern, and form, thereby constructing a cultural element application framework. Subsequently, we analyzed the relationship between wind turbines and the visual comfort of the surrounding landscape, identifying key ranges that align with local visual comfort standards. The refined cultural elements were then input into the AIGC model for training.

Results: The model-trained designs demonstrated significant improvements in both cultural alignment and visual comfort.

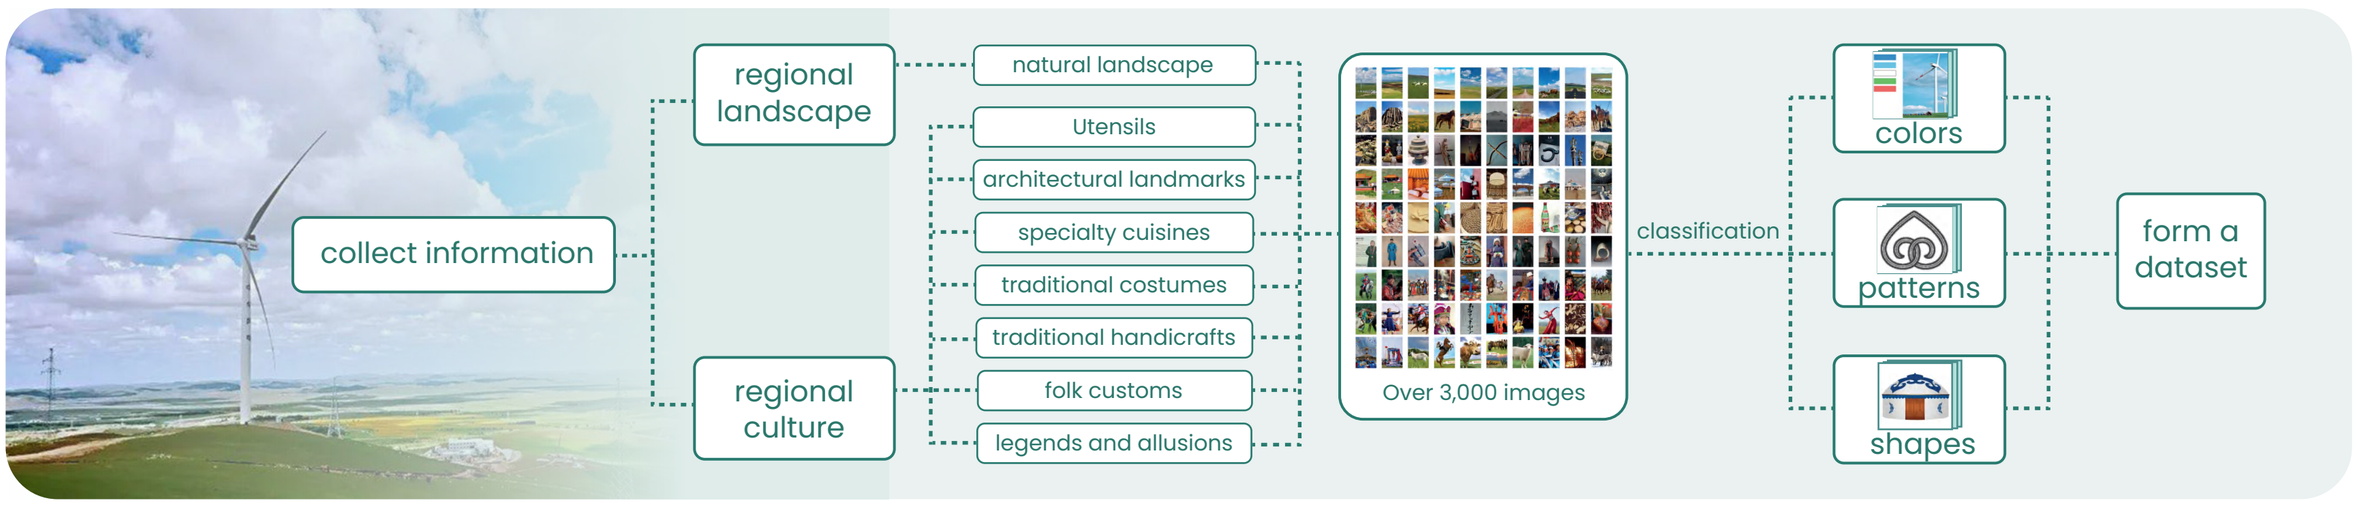
Conclusion: This study proposes a generative design approach for wind turbines based on regional culture, offering a new pathway for integrating wind energy with local landscapes and contributing to regional sustainable development.

02 Methodology and tools

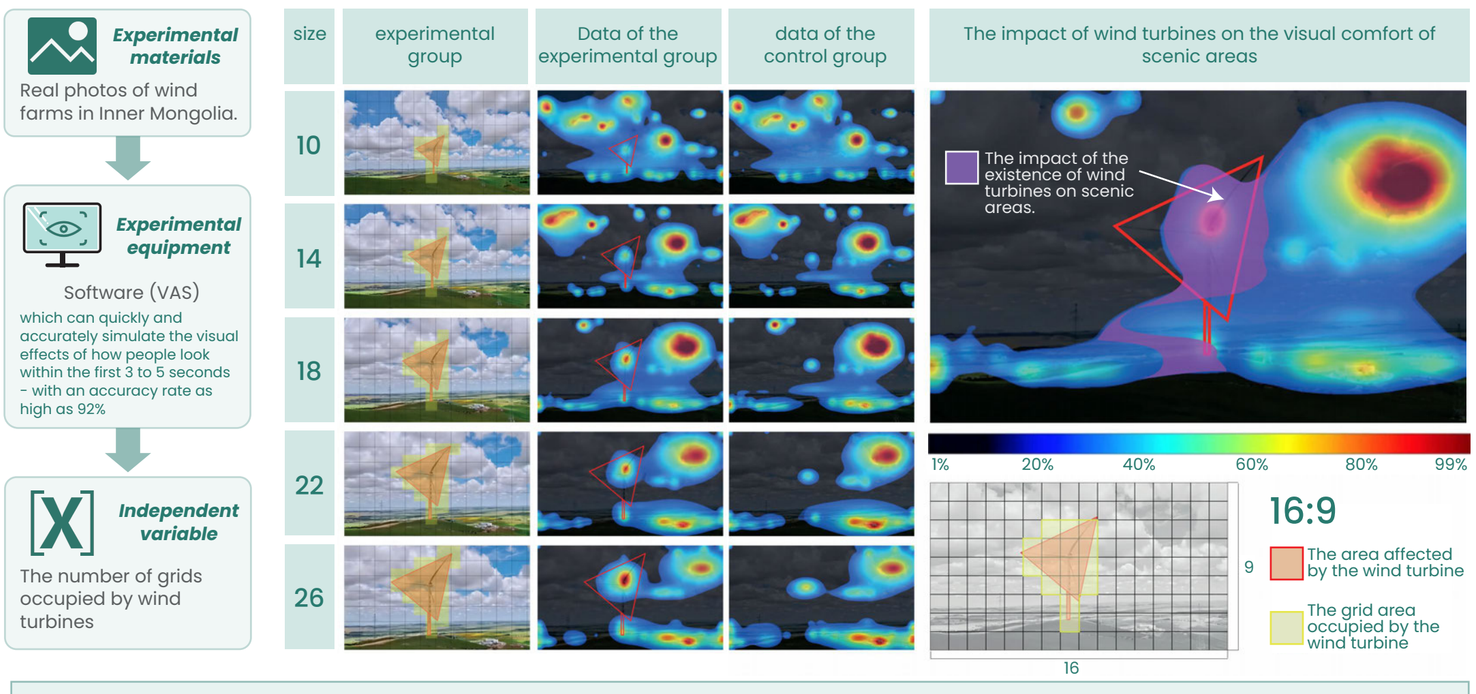


03 Research process

3.1 Methods for collecting, classifying and generating regional cultural elements.

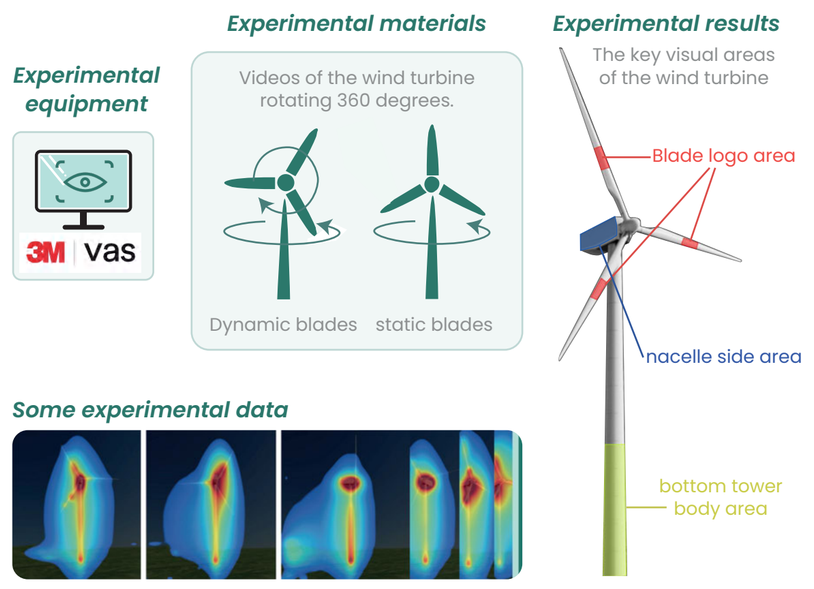


3.2 Establish the relationship between the visual comfort of wind turbines in scenic areas.



Results: When the number of grids occupied by the wind turbine reaches 18, the wind turbine changes from a secondary element to a primary element in the picture.The existence of the wind turbine has changed the distribution of visual attention in its surrounding areas.

3.3 The relationship between the visual responsiveness of wind turbines and the migration of elements to them.scenic areas.



3.4 Generation scheme and verification

3.4.1 scheme cases

3.4.2 user verification

Students majoring in design

Equipment
questionnaires tablets

73% *Questionnaire results*
Users believe that this plan reflects the local regional culture and promotes the integration of landscapes

04 Expected

- When the number of grids occupied by the wind turbine reaches 18, the wind turbine will change from a secondary element to a primary element in the picture.
- The existence of the wind turbine has changed the distribution of visual attention in the surrounding areas of the landscape.
- The key areas of the wind turbine on which tourists' sight focuses are mainly concentrated in three parts: the blade logo area, the nacelle cover area and the bottom tower body area.
- The scheme generated by the wind turbine generative method proposed in this study has achieved significant improvements in both cultural fit and visual comfort after being verified by users.

Promote the integration of regional landscapes
boost the development of the tourism industry
expand the application of other disruptive landmarks.

Reconnect with the Nearby: Smell-based storytelling in placemaking to enhance community connections

Guo Chen[a], Dr. John Fass*[a],

a University of the Arts London
a University of the Arts London
* j.fass@arts.ac.uk

ABSTRACT | The sense of smell, often regarded as a secondary sense (Shepherd, 2004), has increasingly been recognized in design for its profound influence on emotions (Ehrlichman & Bastone, 1992), memory (Obrist et al., 2014), and social interactions (Blomkvist & Hofer, 2021). Recent advancements in scent delivery and capture technologies have prompted discussions within the human-computer interaction (HCI) community regarding the integration of smell into design practices (Obrist et al., 2014). Additionally, smell evokes strong emotional responses, shapes the character of places, and conveys social meanings associated with people and their environments, making it significant in placemaking (Henshaw et al., 2017; Xiao, 2018). HCI researchers have explored how digital technologies can facilitate interactions between individuals and their environments, particularly through visual and auditory sensory interactions (Hespanhol, 2018). However, there remains a significant gap in the literature concerning the role of olfactory experiences in supporting urban residents' community awareness and exploration of their neighborhoods.

In this paper, we examine the potential of smell-based storytelling to foster community engagement and enhance local connections through creative design practice. The investigation focuses on two aspects: (1) an interactive installation designed to raise environmental awareness; and (2) a scent story map aimed at encouraging neighborhood exploration. We developed a scent installation and a prototype scent story map, both of which were co-created through a participatory process. Our findings suggest that integrating smell in placemaking enhances residents' engagement with their surroundings, fosters new sensory perspectives, and builds empathy through shared

smell related stories and experiences. Moreover, such a community engagement project strengthens connections between diverse community groups through collaborative processes. Ultimately, our research suggests that future studies could explore how a scent story map might function as a long-term participatory platform, enabling environmental rediscovery through smell, fostering connections among diverse groups, and reimagining shared community visions.

KEYWORDS | SCENT MAP, SMELLWALKING, STORYTELLING, DIGITAL PLACEMAKING, URBAN EXPLORATION, PARTICIPATORY DESIGN, SENSORY INTERACTION

1. Introduction

The sense of smell has increasingly been recognized in design for its profound influence on emotions (Ehrlichman & Bastone, 1992), memory (Obrist et al., 2014), and social interactions (Blomkvist & Hofer, 2021). In the HCI community, the use of scent for interaction and experience design is increasingly recognized for its unique link to emotions (Delplanque et al., 2017). In the urban context, the smell evokes strong emotions and conveys social meanings associated with people and places (Xiao, 2018). This design trend has inspired designers to use scent to enhance user sensory interactions and emotional connections (Maggioni, 2020).

As a practice of digital placemaking, this playful and reflective urban exploration is widely applied in examples like location-based games (2016) and immersive audio journeys (Sun, 2023). Consequently, maps have evolved from being purely functional tools for navigation into mediums that encourage exploration and interaction. However, these practices are predominantly guided by visual and audio perception, lacking the integration of multisensory (Hespanhol, 2018), particularly olfactory experiences, which are among the earliest senses tied to wayfinding (Jacobs et al., 2015; Vasilikou, 2016).

Through a scent story map, this study offers residents a new way to explore their neighborhood. It aims to provide a narrative urban experience that transcends visual, linguistic, and cultural barriers through olfactory empathy. By employing a participatory design approach, residents are invited to become active users, perceiving and collecting scents through smellwalking, mapping these scents, and collaboratively creating a map that incorporates digital storytelling to narrate personal stories. An interactive prototype was then designed and tested in the field to validate the concept and gather feedback. Finally, the study presents the first findings of a community engagement project exploring how smell-based storytelling can strengthen local connections and how a scent story map can serve as a long-term platform for future community building.

2. Related Work

2.1. Smell, Place and Storytelling

The sense of smell is one of the most complex human senses, significantly influencing emotions and memories (Obrist et al., 2014). Traditionally, smell has been often considered a minor sense compared to vision, hearing, and touch (Shepherd, 2004). However, designers are increasingly acknowledging the importance of smell across various design disciplines (Lupton and Lipps, 2018). In the HCI community, the application of scent in interaction and experience design has been growing steadily in recent years. From smell-enhanced technologies (Maggioni et al., 2020) to smell-based personal experiences (Brianza et al., 2022), the subjective nature of smell, which is deeply intertwined with personal storytelling (Obrist et al., 2014), holds significant relevance for smell experience research.

Most recently, at the smell-centered future workshop (Beşevli et al., 2024), scent was proposed to be applied in placemaking to enable social interaction. In urban studies, the relationship between smell and place has long been recognized (Porteous, 1985; McLane, 2013; Xiao, 2018). The term "smellscape" is used to describe the olfactory environment of a location as experienced by individuals at a specific moment in time. Research indicates that smells play a crucial role in shaping the character of places and building emotional connections between individuals and their environments (Xiao, Aletta & Radicchi, 2022). Therefore, there is an opportunity for design research to explore how to enhance community connections through smell-based storytelling.

2.2. Placemaking, Urban Exploration and Map

Placemaking, a concept that originated in the mid-20th century (Whyte, 2012), has evolved into a holistic approach that emphasizes fostering vibrant public spaces and building stronger community connections. Digital placemaking, which leverages digital technologies, introduces technological augmentations that enhance places with location-based content, fostering meaning co-created both virtually and onsite (Basaraba, 2023). However, digital placemaking historically relies heavily on visual perception (Hespanhol, 2018), which can overlook important sensory interactions with the physical environment. To address this, a growing number of initiatives have begun to engage different senses, incorporating audio, touch-based interfaces, and immersive environments that encourage physical movement (Hespanhol, 2018). Despite these advancements, the role of smell in placemaking remains underexplored.

As a practice of placemaking, the practice of playful and reflective wandering in the city has a rich history, from Jane Jacobs's Walk (Sung & Lee, 2015) to modern digital tours like location-based games (2016) and immersive audio journeys (Sun, 2023). Maps, rather than serving merely as tools for direction, also become mediums for immersive experiences, enabling people to navigate their surroundings with greater awareness and engagement (Fischler-Ruiz et al., 2021). While research suggests that humans possess scent-tracking abilities for navigation (Jacobs et al., 2015), traditional map information remains primarily visually oriented. Exploring how to integrate scent with maps to encourage new ways of experiencing the surrounding environment is a promising area for further investigation.

3. Project Concept

This research introduces an interactive and participatory platform designed to raise awareness and encourage local storytelling and exploration of Elephant and Castle area in London through multisensory experiences. The platform features two primary components: (1) a scent interactive installation showcasing scent jars accompanied by ambient sounds and abstract story overviews, and (2) a scent map application that guides users to corresponding locations while allowing them to listen to detailed narratives. Together, the physical installation and virtual map application together constitute a participatory platform (see Figure 1).

Our platform guides users to explore the area through smell-based storytelling, unfolding in the three phases. The scent installation is strategically placed in a community public center to attract attention, allowing users to interact while listening to abstract narratives (see Phase 1). The mobile application displays a map of these scent locations, where users can hear the full story at specific sites, akin to a clue and its treasure map (see Phase 2). Users can share their location-related stories through the application, or the toolkits placed with the installation (see Phase 3). Our project aims to encourage people to venture outdoors and engage with their real surroundings.

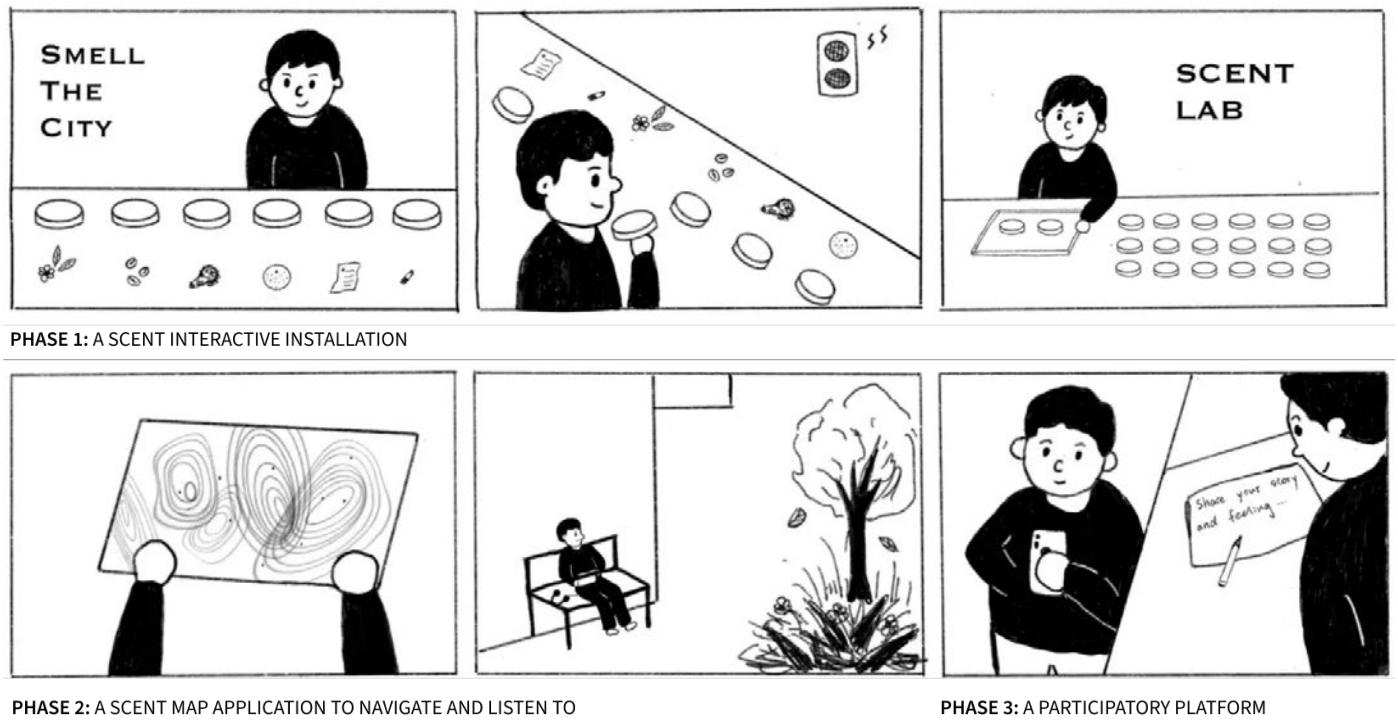

Figure 1. A diagram about the project concept; from Phase 1 Scent Installation to Phase 3 Participatory Platform

4. Smellwalking and Community Scent Collection

4.1. Research Methodology

The study aims to collaboratively collect location-based olfactory data for the Elephant and Castle community, establishing a unique olfactory identity for the area through personal narratives. To achieve this, we employed a combination of smellwalking and

digital storytelling, inviting residents to explore the neighborhood, document meaningful scents, and share personal narratives associated with those olfactory experiences. Smellwalking is a form of sense walking that allows for the investigation and analysis of how we understand and experience space (Adams & Askins, 2009). It provides a valuable method for gaining insights into people's everyday olfactory experiences and memories tied to geographic spaces and places (Henshaw, 2013). In parallel, digital storytelling (Wilson, 2021) was incorporated to allow participants to share personal narratives connected to specific scents and locations. Participants verbally described their experiences, stories, and emotions associated with smells and places, which were captured through audio recordings. This process preserved their voices, emotions, as well as the environmental sounds.

Preliminary research was conducted by initial fieldwork and context analysis to define the scope of smellwalking area. For example, based on the concept of the 15-minute city (Moreno, 2021), which encourages a return to local life, the walking area was set to extend approximately one kilometer from the Elephant and Castle station to Walworth Road and its surroundings. By incorporating investigations on historical and cultural contexts, as well as preliminary field observations and open interviews, we refined the walking route to cover indigenous areas, newly developed regions, and retail zones.

Two smellwalks were carried out, each with six participants from both the Indigenous area and the newly developed residential zone. The first walk was conducted on a sunny day, with the presence of wind amplifying participants' sensory perceptions. The second walk took place following rainfall, during which the damp conditions introduced additional olfactory elements to the urban environment. Both walks were scheduled in the afternoon, a period identified through field observations as the time of peak activity within the area.

Figure 2. The smellwalk route and collection of results of the first walk.

Information from the smellwalks was collected through a combination of direct participant interactions, such as post-it notes and collecting scent samples, along with audio recordings converted into notes. An essential aspect of smellwalking is the mapping, and representation of smells detected in each area (Henshaw, 2013). We collected samples of smell and labelled them on a physical map during the process where possible (see Figure 2).

4.2. Result and Discussion

Through these participatory smellwalks, 12 location-based stories involving 45 distinct scents were gathered from 12 participants. This demonstrates that olfactory perception in the environment is not singular but multifaceted. For the scents, based on scent sample and notes, and Henshaw's criteria (2017), the researchers documented the names, locations, collection methods, preservation techniques, and scent intensity (see Figure 3) of the scents. The positional and intensity data serve as the foundation for the design of the olfactory map. The feasibility of scent collection and preservation also informed the design of the scent-based interactive installation. Given the limitations of collection technologies, some scents were supplemented based on participants' descriptions rather than collected directly on-site.

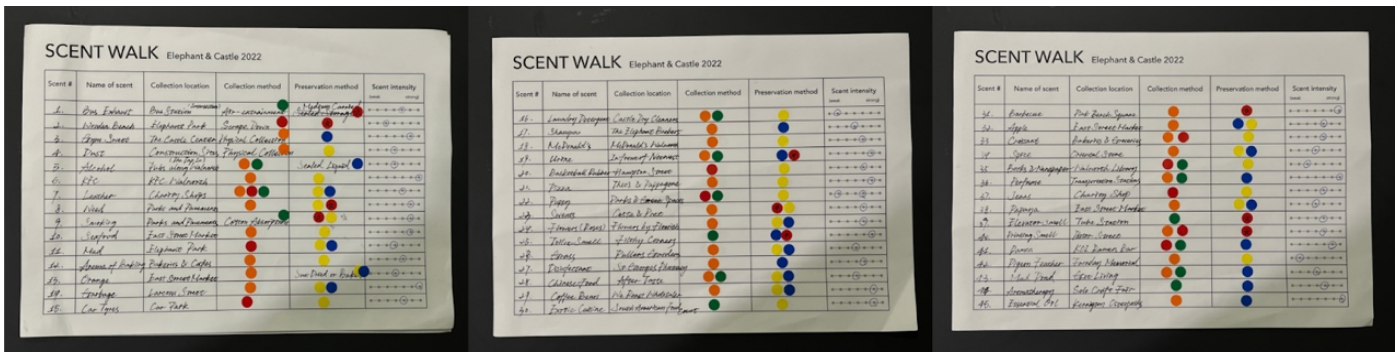

Figure 3. Scent documentation of names, locations, collection methods, preservation techniques, and scent intensity.

For the stories, drawing on the audio recordings and detailed notes, abstract ambient soundscapes and brief textual descriptions were created for each site (see Table 1). These auditory and textual complements were carefully designed to encapsulate the essence of each location, serving as enhancements to the olfactory experiences and deepening the audience's understanding and emotional connection to the smells.

Table 1. Notes about background soundscapes and textual descriptions.

Place	Scent	Sound	Title	Description Text
Construction Site	Soil, dust, oil	Construction, excavation	Transformation	The excavation, the emergence of new things, the vision of a brighter tomorrow?
Elephant and castle train station	Body sweat, newspaper, flower	Train arriving	A hug	A warm embrace through the thick fog, the humid air, and a memory-filled farewell.
Food Court	Spice, curry, pepper, onion	Talking with SA music	Grandma's kitchen	Good wine needs no bush. Through the magic tunnel, it's the place I miss the most.
Bodley Way Playground	Wet soil, wooden chair, wet plants, grass	Raindrop with wind	Rainy days	Escorted by moist foliage and untouched innocence, devouring the air avariciously.

Corner if the florist	Flowers, coffee, croissant, dog	Puppy bark	Puppy's day out	What trouble can a puppy have? It's a beautiful world out here!
Junction of a Chinese supermarket	Chinese spices, Chinese dim sum, roast duck	Picking with Jay music	After hours	A weary heart wrapped by the amber light and soothing aroma, I'm floating.
Bench in front of the library	Books, newspaper, leaves	Breeze	Goksel's inspiration	Caressing the pages within grasps, feeling the breeze across eyelashes, waiting for epiphany to touch.
Pink bench in the square	Beer, BBQ, fried food	Pub music	Friday night	Clinking glasses, intoxicated crowd, there is no moment like now.
Walworth road bus stop	Tobacco, waste gas, KFC	Busy road	Spare some change	Hands reaching out, hoax settling in, no one is a stranger.
Pink café alley	Bakery, sandwich, coffee, garbage, weed	Quiet cafe	Sunday morning	Sunlight cast mottled shadows through swaying leaves, Retrieving memories piece by piece.
Entrance to an NGO	Secondhand book, food, cigarettes	Wind with a distant train	Freedom	A taste of goodwill, a revisit of simplicity, in a place where shackles are no more.
East street market	Orange, apple, papaya, chips, seafood	Hawking	Haggle	Is it a brutal battle of words, or an elegant dance of tango? so vibrant and alive!

Our research revealed two intriguing findings. First, the same scent was perceived differently by participants, with varied atmospheres and roles in their storytelling. This indicates that people's perception of smell is deeply shaped by individual characteristics, habits, and life experiences (Henshaw, 2013). Second, our study highlighted the transient nature of local scents and the complexity of multi-scent environments in real-world settings. Storytelling emerged as a communication tool for providing context to these smells, enhancing both their expression and understanding.

5. Design of Scent Installation

5.1. Interactive and Product Design

As envisioned in the project concept, the interaction involves participants smelling scents to trigger the installation, which then plays the corresponding ambient sounds. Starting with a prototype, pressure sensors were implemented to detect when a scent jar is lifted. To enable the installation to play sounds for all 12 scents simultaneously, 4 control boards were used in conjunction with speakers, accommodating multiple users experiencing the installation at once. Once a participant picks up a scent jar, the ambient sound of the corresponding place is played, enhancing the understanding and associations related to the scent narrative.

For the placement of the installation, the treehouse in Elephant Park, a newly opened community public space, was selected to enhance community attention and participation. We initially explored various design concepts through sketches and ultimately decided on a box stand integrated into the treehouse's window display. The dimensions of the window were carefully measured to ensure the design fits harmoniously within its original context. Building upon the sketches, detailed drawings of each panel were created using AutoCAD for laser cutting. Considering aesthetics and consistency with the treehouse environment, wood was chosen as the primary material for the installation. This choice contributes to a warm and inviting atmosphere. Additionally, speakers were embedded within the wooden panels to enhance the overall integration of the installation.

5.2. Scent Storytelling Design

As revealed in the research, the olfactory narrative of a location encompasses multiple scents, and designing with this multiplicity is essential. While experiencing a single scent at a time can create a more linear and clear narrative, real-world experiences often involve the simultaneous perception of various scents that influence each other. To capture this complexity, we combined several scents into a single jar, fostering interactions between them and encouraging imaginative associations. Building upon the scents collected by research participants, we supplemented the collection and preservation of various scent types to address potential issues of degradation over time. We employed various techniques to ensure the scents remained vibrant and authentic: solvent extraction for plant materials, abrasive methods for solids, and adsorption for liquids and gases, contributing to a rich sensory experience.

In addition to the ambient sounds, inspired by the fragrance industry's scent displays (Ltd, D. G. V. U., 2020), we presented the scent-place stories alongside cards that the brief description and the collection date (see Figure 4). The textual descriptions were crafted from the original participants' contributions, enhancing their poetic quality to evoke imagination. The addition of sound and text offered a narrative context for the scents, enabling participants to engage multiple senses. This multisensory interaction fostered deeper empathy and reflection by situating the scents within specific contexts.

Figure 4. A scent jar with description card and a participant interacting with it.

6. Design of Scent Story Map

In line with the project concept, our research aims not to transform the environment's smellscape, but to encourage people to explore its original character. A digital scent map was provided to participants, showing the corresponding locations of the scent stories featured in the installation, allowing them to visit these places if intrigued by a particular smell or narrative (see Figure 5). Utilizing location-based technology, participants could immerse themselves in oral stories from residents as they approached each site. Along with text and audio to aid understanding, the visual map facilitates the "sniffing" process during the exploration. The scent visualizations are inspired by the categorization and representation methods from urban smellscapes (McLane, 2013). The 12 locations and corresponding scent distributions, collected during the research, are presented on the

map, providing details on the intensity and spread of each scent.

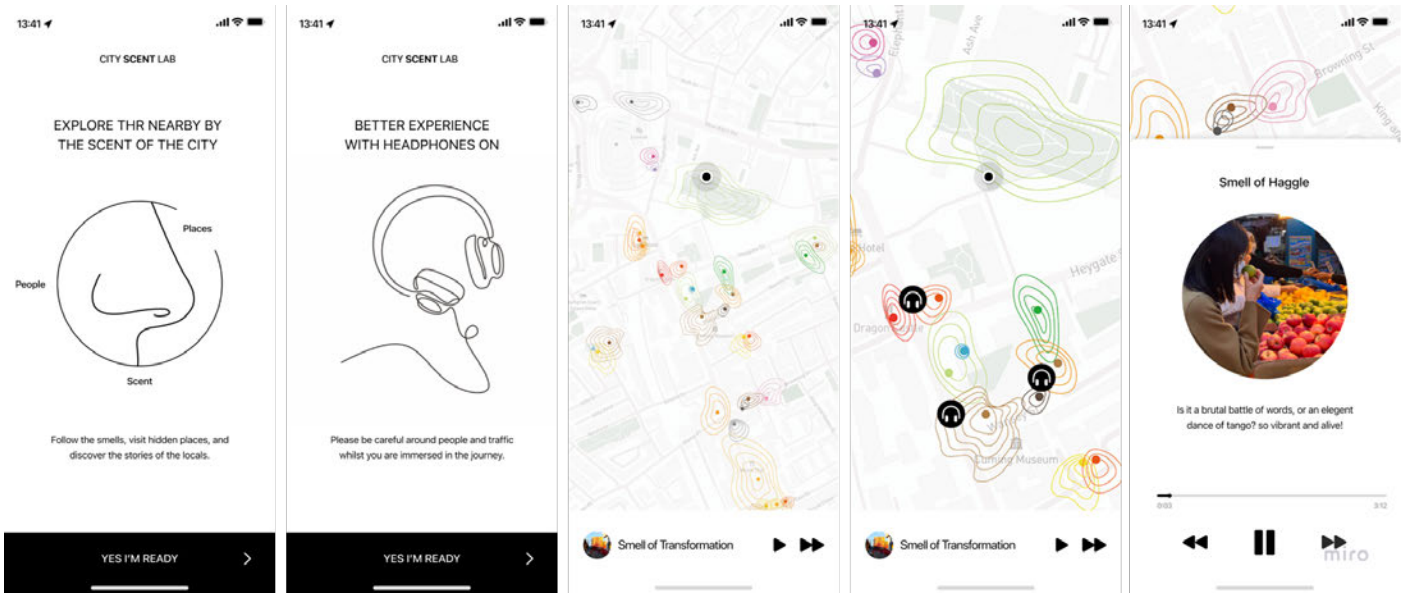

Figure 5. Scent story map application interface.

For prototyping, 3 of the 12 scent stories contributed immersive narrative audio through the storytelling workshop, which was incorporated into the scent journey. Created from the digital storytelling process (Wilson, 2021), we developed the script, recorded voice, and edited with music and ambient sounds with the story owners to refine the audio guide. Additionally, to enhance user engagement, extracted scent samples were hidden in the environment, waiting to be discovered (see Figure 6). This approach acted as a reward, encouraging people to explore further.

Figure 6. Scent samples were collected by a participant

7. User Study and Findings

The user study involved an interactive installation featuring 12 scent stories and an application prototype containing audio for three of those stories. The installation was placed in the community treehouse, which also served as the place for post-test feedback. During the exploration using the application prototype, I accompanied participants, helping to play audio according to the route to simulate the experience of

location-based audio content. The testing aimed to (1) determine whether users could understand and complete the interaction process, (2) evaluate users' comprehension and emotional response to the stories told through the scent installation, and (3) assess whether the scent experience enhanced their awareness, empathy, and connection to the neighborhood.

There were 10 residents participated in testing the installation, with the task of interacting with various scent jars and describing their understanding and feelings about the scent narratives. Of these, 3 had time to engage in the simulated scent story tour. Their task was to select a preferred scent, explore the neighborhood using the map, and listen to the accompanying narrate and provide feedback while experiencing the described scent in the physical environment. After testing, each user was invited to share their own scent story, inspired by the narratives they experienced, using cards and scent source materials provided on-site (see Figure 7). This test was not only aimed at assessing usability and experience but also became a process of placemaking and community participation.

Based on the testing results, all participants successfully completed the interaction process. Regarding the feedback on the scent installation, people appreciated the experience of sniffing the scents with sound and found the descriptive text on the cards to be poetic, sparking their imagination. However, some participants experienced a disconnect between the scent and what they expected based on the name or description, leading to a degree of interpretative difference. Given the subjective nature of the olfactory sense, this bias was inevitable, yet it also provided valuable insights for the research by offering additional perspectives. Interestingly, participants actively tried to discern the various scents within each jar. This not only demonstrated the appeal of revealing the "scent mysteries" during the map-based journey but also suggested that this curiosity could inspire further design directions in the field of olfactory interaction.

During the experience of the scent story map journey, participants reported that the audio stories were enjoyable, but they had difficulty finding locations based solely on scent visualization. They often relied on the base map, location descriptions in the stories, and their familiarity with the area. This highlights the necessity of retaining the neighborhood’s base map in the design for usability. Participants also engaged in finding the scents, attempting to locate each corresponding point on the map, prompting reflection on the interaction mechanism. Ultimately, the goal of the project is not merely to locate places and stories but to encourage participants to explore and wander, emphasizing personal experience. Therefore, balancing attractiveness and engagement while avoiding a purely checklist-style experience is a critical consideration for future development.

Participants were highly engaged in sharing their scent experiences. For instance, regarding the "Sunday Morning" story, a participant from South America described the aroma of handmade bread after Sunday prayers in his hometown. He even brought and shared his hometown bread with others. Despite his limited English skills, the participants held hands and experienced the prayer together. This shared perception of smells and emotions transcended language and cultural barriers, fostering connections among participants. This outcome validates both the testing and research goals. The findings confirm that smell-based storytelling can help with understanding and empathy, thereby enhancing local connections. Moreover, the study shows that olfactory perception and experience are subjective and deeply influenced by personal experiences. To address this subjectivity, a platform could be provided where participants share their feelings and stories as they engage with the scents, allowing for resonance among those with similar experiences and exchanges among those with differing perspectives.

Figure 7. Participants sharing feedback with their own stories

8. Conclusion and Future Work

In this paper, we have presented the potential of smell in placemaking by collaboratively collecting, crafting, and presenting 12 local smell stories with residents. We employed a hybrid approach of sense walking and digital storytelling, where audio narratives made abstract olfactory experiences more comprehensible, and visual mapping allowed the elusive nature of smells to be more traceable. Through this collaborative process, storytellers contributed stories during the walks, while audiences provided generative feedback, empathy and aspirations. Both storytellers and audiences noted that the experience strengthened their connections to the place and its people. Despite the increasing application of interactive technologies in environmental and placemaking contexts, the use of smell as a sense to interact with remains limited. This practice offers valuable insights into fostering connectivity and a sense of place through smell. However, the process does rely on the diverse capacities of people to express and share their experience through narratives. As such, providing a structure of location- and scent-based storytelling to handle this diversity will be a key consideration for our next step, ensuring comparability and coherence of the results.

In the future, our goal is to establish a platform in both physical (e.g., in-person workshops) and virtual spaces (e.g., an online scent map application) to ensure long-term operation and encourage broader community participation. Ultimately, we believe this research enriches existing technology-driven olfactory studies and provides a productive starting point for designing smell experiences that support placemaking and community engagement.

ABSTRACT | This 90-minute workshop invites 20 conference participants to co-design four multiplayer games that integrate design education with systems thinking to address human-nature interactions and sustainability.

Climate crises exacerbate socio-economic disparities and political tensions (Cannon et al., 2020; Willige, 2024), linking to global geopolitics (Ghosh, 2017). Design education must equip students—especially undergraduates, the majority of whom do not pursue postgraduate studies (All India Survey on Higher Education, 2024)—to engage with these complexities. However, teaching complex theoretical models like Life Cycle Analysis and the Circular Economy at Undergraduate level remains challenging. In these contexts, active learning can enhance comprehension and retention (Minnick et al., 2022). Zimmerman (2008, 2022) argues that games can offer opportunities for understanding complex systems by introducing participants to systems literacy through structured play. Through games, people can also learn to interact with, modify, and innovate within systems. This approach also strengthens students' ability to apply theoretical knowledge to practical contexts. The proposed workshop merges play-based active learning with systems thinking to demonstrate application of complex theories through active learning.

WORKSHOP STRUCTURE:

The session unfolds in two phases: a 60-minute design period followed by 30 minutes for play and feedback.

1. Introduction (20 minutes)

An overview of game-based learning and its relevance to teaching complex systems will be presented. Two game models will be introduced - a) Games with Narrative Co-creation (such as Dungeons and Dragons); b) Games that simulate real-life complex systems. In the former, players have greater agency and in the latter, systems dictate players' actions more. Key theoretical concepts will be discussed — such as Systems Thinking, Life Cycle Analysis, Tensions among key stakeholders and socio-ecological resilience.

2. Game Design Phase (45 minutes)

Participants, grouped into four teams, will receive toolkits that include case study prompts, a game mechanics template, and materials for prototyping. Each team will explore a specific prompt — such as life cycle analysis, ethics of eco-friendly alternatives, stakeholder tensions in sustainable design practices etc. These are chosen to illuminate complex socio-ecological systems and stimulate discussion on integrating theory with practice. The participants will be given the option of choosing between one of the two aforementioned game play models. This phase will divided as follows:

- Step 1: Concept Development (20 minutes) – Teams define their game's objective, target audience, and mechanics
- Step 2: Quick Prototyping (20 minutes) – Teams create a rough version of their game using provided materials, incorporating role-playing, strategy, or cooperative problem-solving elements.
- Step 3: Game Rules & Testing (10 minutes) – Teams refine game mechanics, ensuring clarity and feasibility.

3. Playtest & Discussion (25 minutes)

Phase 1 (15 minutes): Each group rotates to playtest at least one other team's game while providing structured feedback in templates provided. The templates will include questions pertaining to engagement of players, simulation of real-life complex systems, player agency etc.

Phase 2 (10 minutes): A concluding discussion will synthesize insights on applying game-based learning in design education and potential adaptations for different classroom settings. Participants take back a methodology for active learning that can equip future professionals to navigate and address global environmental challenges responsibly and creatively.

About the Authors:

Lakshmi Srinivasan is a design educator, researcher, and practitioner with 8+ years of experience in industry and academia. She has a background from the University of Sheffield. Her work spans design research, interdisciplinary approaches to global challenges, including inequality, decolonial practice, climate change, and sustainable development. She has mentored for the JSPF scholarship, and has presented her work in over 13 notable international conferences such as the Include 2022, the Association of Architectural Educators (2023)„ GWO etc. Lakshmi currently resides in India and is passionate about inclusive design education, critical pedagogy, mental health awareness. She also enjoys calligraphy and writing poetry.

Khushboo Jogani brings 20 years of experience in product design, ranging from luxury lifestyle to industrial products. She believes that "design is about seeing the invisible and making the impossible inevitable," combining aesthetics, functionality, and marketability. Her teaching philosophy emphasizes the ongoing cycle of unlearning and relearning, creating a dynamic environment where design thinking evolves. Khushboo encourages students to critically reassess their

understanding and prepare them to become visionary thinkers ready for future challenges. Her approach is both pragmatic and innovative, focusing on designs that are aesthetically pleasing and socially impactful while being business-savvy.

Reimagining homes: How regenerative retrofitting can foster sustainability, Ecological Citizenship, and resilient communities

Luke Gooding[a*], Nick Gant[b], Rob Phillips[c]

ABSTRACT | Retrofitting residential houses is still an underutilised option for addressing the climate crisis and meeting the growing demand for more sustainable housing. While energy efficiency is a significant focus of many retrofit efforts, popular techniques often overlook the broader ecological and social dimensions of sustainability, such as the reduction of embodied carbon and the enhancement of connections between people and the environment. Concurrently, fostering Ecological Citizenship, where individuals actively engage in environmental stewardship and contribute to community resilience, is critical in addressing systemic challenges like biodiversity loss, social inequality, and climate adaptation. This article investigates how regenerative retrofitting, an emerging approach to retrofit design, can bridge this gap by transforming homes into active agents of ecological renewal. By incorporating nature-based solutions, circular material strategies, and participatory design practices, regenerative retrofitting not only mitigates carbon emissions but also nurtures a deeper sense of environmental responsibility among residents. Through a case study of the *Wildhouse* project in Brighton, this work explores how one initiative integrates retrofit practices with the principles of Ecological Citizenship and sustainable living. By examining the project's design, its mechanisms to facilitate human (as) nature connections, and its mission to define more tangible links between the homes of people and other forms of nature the research demonstrates how regenerative retrofits can reframe housing as a locus for ecological restoration and as a route to tackle some societal issues. In doing so, it highlights the potential for scaling such interventions to

create more resilient, nature-integrated urban environments that contribute positively to environmental sustainability, social equity, and long-term climate resilience. Furthermore, the research emphasises how regenerative retrofitting can influence housing policy, urban planning, and broader systemic change, offering a holistic approach to sustainability that addresses both the physical and social fabric of cities. Through its exploration of the intersection between retrofit design, ecological engagement, and community empowerment, this work contributes valuable insights into how residential retrofitting can play a pivotal role in advancing both ecological and social sustainability in urban settings. The future research directions informed by Wildhouse offer space for further exploration of the long-term, wide-ranging impacts of regenerative retrofitting in social housing. By addressing questions about the agency of domestic objects, spaces and interactions as route to ecological citizenship, economic viability, institutional barriers, community engagement, health outcomes, and climate adaptation, future work can deepen our understanding of how regenerative design can be implemented on a large scale, ensuring that it contributes to both ecological restoration and social well-being for generations to come.

KEYWORDS | regenerative retrofit, ecological citizenship, reciprocity in design

1. Introduction

Retrofitting domestic properties is a crucial yet underutilised strategy for tackling the climate crisis and advancing sustainable urban living. While retrofit initiatives increasingly target energy efficiency, through insulation, solar panels, and heat pumps, they often neglect broader environmental impacts such as embodied carbon, biodiversity, and community involvement. To fully realise their potential, retrofits must be reframed as regenerative interventions that strengthen both ecological systems and social well-being (Fawcett & Killip, 2019; Pomponi & Moncaster, 2017).

Regenerative retrofitting, as presented in this paper, is a concept that draws on existing literature around sustainability and environmental design but is reinterpreted through the lenses of biophilic design, regeneration, and ecological citizenship. While these concepts have been discussed separately in the literature (Reed, 2007; Beatley, 2011), we propose a specific, integrated approach that combines them within the context of retrofitting. This approach goes beyond technical upgrades by embedding principles of the circular economy (Mang & Reed, 2012), biophilic design (Kellert & Calabrese, 2015), and participatory processes (Middlemiss & Parrish, 2010). It emphasises the use of natural and reused materials, integration of green infrastructure like living walls and roofs (Mang & Reed, 2012), and the design of adaptive, climate-responsive spaces. These interventions not only reduce environmental impact but also support mental health, indoor air quality, and stronger community ties (Beatley, 2011).

At the heart of this transformation lies the concept of Ecological Citizenship, a model of active environmental responsibility where individuals and communities participate in sustainable practices, from material choices to local ecological restoration (Light, 2006). Engaging citizens in the retrofit process fosters a sense of ownership and connection to place, helping to embed long-term pro-environmental behaviours. This is particularly important in social housing, where residents are disproportionately affected by climate change yet often excluded from

sustainability solutions (Shaw, 2012).

The Wildhouse project in Brighton exemplifies this approach. By combining bio-based materials, passive design, and resident co-design in a social housing context, it repositions retrofit as a collaborative and regenerative act. This case study highlights how such models can scale across different urban contexts, shaping housing policy that is both environmentally and socially just (Smith & Stirling, 2018; Rydin, 2013). Ultimately, this paper argues that regenerative retrofitting, rooted in biophilic design and ecological citizenship, offers a powerful strategy for transforming homes into active agents of sustainability. By integrating nature, reducing embodied carbon, and involving communities, retrofitting becomes more than a technical fix—it becomes a catalyst for ecological and social regeneration in cities (Hill & Mazzucato, 2024).

2. Underlying themes

2.1. The need for retrofit

The built environment is a major contributor to climate change, accounting for almost 40% of worldwide energy-related carbon emissions (Huang et al., 2024). Historically, sustainability initiatives in this industry have focused on operating energy (used for heating, cooling, and lighting). Embodied carbon, which includes emissions from material extraction, production, transportation, and construction, is a frequently underestimated aspect of a building's total environmental effect (Pomponi & Moncaster, 2017). The necessity of decreasing emissions has prompted greater focus on retrofitting existing housing stock, as the bulk of structures that will be in use by 2050 have already been built (Ürge-Vorsatz *et al.,* 2020). Unlike new construction, which allows for the use of energy-efficient designs and materials from the start, existing buildings pose a unique challenge in balancing historical preservation, affordability, practicality, and carbon reduction (Fawcett & Killip, 2019). Despite general agreement on the need for retrofitting, adoption rates remain low due to financial, regulatory, and logistical hurdles (Killip, 2013). Many property owners and landlords may not have access to the required financing or incentives to implement full retrofitting measures, especially when the initial expenses are seen as excessively expensive (Galvin, 2014). Furthermore, retrofit programs have frequently been fragmented, with an emphasis on operational efficiency rather than overall sustainability, limiting their capacity to bring broader environmental and social benefits. For retrofitting to be truly transformative, it must evolve beyond technical energy upgrades and be reframed as an opportunity for ecological and social regeneration (Dixon and Eames, 2013).

2.2 The importance of sustainable retrofitting

While conventional retrofit approaches have primarily aimed at reducing energy consumption, there is growing recognition that these strategies must also address embodied carbon, material circularity, and ecological impact (Cabeza *et al.,* 2014). Traditional retrofitting methods often rely on industrially produced, high-carbon materials, which can reduce operational energy use but contribute significantly to lifecycle emissions (Chastas *et al.,* 2016). For example, the widespread use of cement-based insulation materials or synthetic polymer window frames may improve energy efficiency but simultaneously increase embodied carbon and environmental

degradation (Pomponi & Moncaster, 2017). A shift towards sustainable retrofit materials and approaches is essential. Bio-based and reclaimed materials, such as timber, hempcrete, mycelium insulation, and straw bale, offer significant carbon sequestration potential and can be sourced from local, circular supply chains (Wilkinson & Remøy, 2018). Research suggests that adopting a circular economy approach to retrofitting, where materials are reused and repurposed rather than disposed of, could reduce the built environment's carbon footprint by as much as 50% by 2050 (Gallego-Schmid *et al.,* 2020). Beyond material choices, sustainable retrofitting also requires nature-based solutions, such as green roofs, passive cooling strategies, and water recycling systems, which enhance biodiversity, improve urban resilience, and promote ecosystem services (Franco *et al.,* 2023). However, for these approaches to gain traction, policy interventions and financial incentives must support their adoption. Government-backed retrofit grants, low-interest loans, and carbon taxation schemes could accelerate market transformation, while new building regulations that consider both operational and embodied carbon would ensure that retrofit efforts align with long-term sustainability objectives. The transition towards sustainable retrofitting requires not only technical advancements but also a cultural and behavioural shift towards ecological responsibility (Seyfang & Smith, 2007).

2.3 The role of ecological Citizenship

One of the core barriers to widespread retrofit adoption is the lack of quality engagement with residents and communities. Retrofitting is often implemented via top-down decision-making processes, where tenants and homeowners are passive recipients rather than active participants (Walker *et al.,* 2014). Research has shown that sustainability initiatives are more likely to succeed and have lasting impact when individuals feel a sense of ownership and agency over environmental decision-making (Middlemiss, 2010). This underscores the requirement to cultivate ecological citizenship, where people are actively participating in sustainability efforts at both individual and community levels. As such, ecological citizenship extends beyond legal or economic incentives to encompass civic responsibilities that support long-term environmental resilience (Light, 2006). Citizens who engage in sustainability initiatives, such as energy-efficient home retrofits, material recycling programs, and urban rewilding, lean towards developing stronger pro-environmental values and behaviours (Stern, 2000). Plus, studies indicate that when individuals co-design their living environments, they are more likely to adopt sustainable habits, such as energy conservation, waste reduction, and responsible consumption (Janda, 2011). This participatory approach not only enhances individual sustainability efforts but also works towards fostering collective action, which is critical for addressing systemic environmental challenges (Seyfang, 2010). By embedding community-driven approaches into retrofitting initiatives, policymakers and urban planners could ensure that sustainability measures extend beyond technical interventions and become embedded in everyday habits and life. This aligns with social justice principles, as marginalised communities, who are often most affected by climate change, can have greater agency in shaping their living environments (Shaw, 2012).

2.4 Nature connectedness and the built environment

Another critical but often overlooked dimension of retrofitting is its potential to reconnect people with nature. Urbanisation has led to an increased disconnection from natural

systems, contributing to both environmental apathy and declining mental well-being. Research has detailed that exposure to nature enhances psychological well-being, fosters pro-environmental behaviour, and increases resilience to climate-related stressors (Heilmayr and Miller, 2021). Biophilic design principles for instance, which integrate natural elements into built environments, have been demonstrated to improve indoor air quality, thermal comfort, and occupant satisfaction (Kellert & Calabrese, 2015). Measures such as green walls, daylight optimisation, natural ventilation, and biodiversity corridors, as such not only enhance human well-being but also contribute to broader ecological benefits, such as pollinator habitats, urban cooling, and improved stormwater management (Beatley, 2011). These interventions can be particularly transformative in social housing contexts, where residents often lack access to green spaces but could benefit most from healthier living environments (Wells & Lekies, 2006). Retrofitting with nature-connectedness in mind offers a powerful means of addressing both climate adaptation and human well-being. When combined with community participation, these approaches reinforce Ecological Citizenship, making sustainability an active and experiential practice rather than a passive policy goal (Kibert, 2016).

2.5 Regenerative retrofitting as a holistic solution

Regenerative retrofitting redefines the role of buildings within natural and social systems, shifting from a model that merely reduces environmental harm to one that actively restores ecosystems and strengthens community resilience (Mang & Reed, 2012). Table 1 outlines the elements of regeneratige retrofit, and the way in which the Wildhouse project attends to these areas.

Table 1: Regenerative retrofit themes and the Wildhouse approach.

Elements	Description
Circular Economy & Biodiversity	Regenerative retrofitting integrates circular economy principles and biodiversity restoration, creating built environments that contribute positively to both ecological systems and social well-being. The Wildhouse case study explores how these principles manifest in practice.
Materials, Nature, and Engagement	By emphasising the use of low-carbon, bio-based, and reclaimed materials, regenerative retrofitting goes beyond technical solutions to address deeper systemic transformations. The Wildhouse project serves as a test case for exploring how materials, nature, and community engagement foster sustainable urban living.
Low-Carbon, Bio-Based Materials	The use of low-carbon, bio-based, and reclaimed materials reduces embodied carbon and promotes circularity in the construction sector. These materials enhance thermal performance and occupant health, as demonstrated in the Wildhouse retrofit.

Nature-Based Solutions	Nature-based solutions, such as green roofs, rain gardens, permeable surfaces, and passive ventilation systems, improve climate resilience and create habitats for biodiversity. The Wildhouse project demonstrates how these solutions are integrated into retrofit projects.
Health and Pro-Environmental Behaviour	Nature-based interventions improve physical and mental health, foster pro-environmental behaviours, and enhance social sustainability. The Wildhouse case study explores how these outcomes manifest in a residential retrofit context.
Community Participation and Co-Design	Grounding retrofitting in co-design and community participation ensures contextually appropriate solutions and fosters a sense of ownership and environmental stewardship. The Wildhouse project is guided by participatory processes, central to evaluating the social impacts of the retrofit.
Sustainability and Social Cohesion	Participatory sustainability initiatives, like the co-design approach at Wildhouse, lead to long-term engagement, increased pro-environmental behaviours, and strengthened social cohesion. This hypothesis is explored through the community's involvement in the retrofit.
Social and Ecological Equity	Integrating participatory governance with ecological design ensures that sustainability transitions are both inclusive and empowering, aligning ecological restoration with social equity. The Wildhouse project investigates how this integration affects the residents' experience.
Transforming Housing	Regenerative retrofitting transforms housing into sites of ecological regeneration and social transformation, positioning homes as active contributors to climate resilience and community well-being. This hypothesis is tested by examining how the Wildhouse retrofit creates new roles for domestic properties.

2.6 Approach: Advancing the role of regenerative retrofitting

Despite the clear advantages, the integration of nature-based solutions into retrofit projects remains inconsistent, largely due to fragmented policy support and a lack of standardized design guidance. To build a stronger case for their inclusion in regulatory frameworks and incentive schemes, it is crucial to demonstrate the multi-functional benefits of nature-based retrofit interventions through pilot projects and evidence-based research.

One of the most transformative aspects of regenerative retrofitting is its ability to actively engage communities in co-creating sustainable housing solutions. Historically, retrofitting has been a top-down process, with interventions imposed on buildings and residents with little to no meaningful involvement. In contrast, a regenerative approach positions residents as key stakeholders in shaping their living environments. Recognizing the importance of participatory design, this approach fosters long-term engagement, strengthens social cohesion, and cultivates a deeper sense of ecological responsibility. Community-led retrofit initiatives not

only enhance the social impact of sustainability transitions but also provide invaluable insights into context-specific design adaptations, ensuring that interventions are both functionally effective and culturally relevant.

For regenerative retrofit approaches to move beyond theory and into widespread implementation, robust case studies are essential to demonstrate their feasibility and scalability. This is where experimental projects like Wildhouse play a critical role. By applying regenerative principles to real-world retrofit scenarios, these projects offer a platform for testing innovative materials, assessing ecological impacts, and refining participatory engagement models. The insights derived from such case studies can guide broader policy and industry transitions, paving the way for the integration of regenerative principles into mainstream housing retrofit strategies. As the urgency of climate action grows, it is vital to shift beyond conventional retrofit models and adopt approaches that are not only sustainable but truly regenerative. Scaling up regenerative retrofitting requires concerted efforts across research, industry, and policy, supported by real-world examples that clearly demonstrate the tangible benefits of these approaches. The Wildhouse project, as an active case study, exemplifies this shift by showing how homes can become agents of ecological and social regeneration, rather than simply energy consumers.

The authors of this study are embedded design researchers actively involved in the Wildhouse project. In our roles, we serve as facilitators of participatory processes, observers, and contributors to the co-design of retrofit elements. Our engagement with other designers in this space has been central to ensuring that the retrofit interventions are reflective of the aspirations of a regenerative retrofit approach. This process has included running design workshops, conducting informal interviews, and engaging in material prototyping and speculative design exercises.

3. Wildhouse

The *Wildhouse* project (Gant, Eldridge, Tooze, 2024) in Brighton represents an approach to regenerative retrofitting, demonstrating how housing can move beyond energy efficiency and carbon reduction to actively contribute to ecological and social regeneration. Situated within the Brighton and Lewes Downs UNESCO Biosphere Reserve, *Wildhouse* challenges the dominant extractivist model of construction, offering an alternative vision where homes function as dynamic interfaces between people and the natural world. By embedding regenerative design principles within an urban social housing context, the project showcases how ecological restoration and community participation can be integrated into the retrofit process.

Figure 1. The WildHouse retrofit of the Brighton Waste House, mixed species and sized timber cladding and dye garden for the development of wood stains, dyes and paints for the house. Images Nick Gant.

Unlike conventional retrofitting approaches that prioritise technical efficiency, *Wildhouse* looks to imagine housing as a living system inextricably linked to the landscapes from which its materials are sourced. The project is installed in the established Brighton *Wastehouse* (Baker-Brown, *et al.,* 2013). The *Wastehouse* was built by community volunteers and local trainee tradespeople and is constructed from the waste that other building sites throw away. The new Wildhouse regenerative retrofit further enhances Wastehouse's circular economy credentials by providing insight into the possibilities of turning an ordinary home into an immersive, interactive space that fosters ecological awareness and agency among its residents. It challenges the assumption that regenerative design is a luxury reserved for high-end architecture or niche communities, instead advocating for its widespread adoption within social housing. At its core, *Wildhouse* seeks to redefine retrofitting as an inclusive and participatory process, ensuring that the benefits of nature-first design are accessible to all.

A central feature of *Wildhouse* is its commitment to using Making Nature Principles (MNP) (Gant & Laffiansyah, 2020) where the design and making methods seek to more clearly define how and where materials may provide landscape improvement and the potential for increased diversity. These materials not only store carbon but also improve indoor air quality and foster healthier living environments and (it is hoped) those of other forms of nature. The relationship between the domestic space and the landscape from where the house is sourced is deliberately enhanced and amplified through the design of the objects as an 'Ecology of Things' [EoT] (Gant, *et al.,* 2024).

Figure 2. Mixed species timber kitchen and rammed chalk wall with chalk ammonite listening device. This image documents a co-design experiment with residents, showcasing a mixed-species timber kitchen and a rammed chalk wall integrated with a chalk ammonite listening device. The device beams live sounds from the chalk 'dew pond' located at the South Downs Waterhall rewilding site, creating an immersive connection between the domestic space and the surrounding landscape. This sensory experience invites reflection on materiality, local ecology, and the potential of integrating natural elements into the home. Image: Nick Gant.

Objects and interactions within the space use both digital and material means to enhance this connectivity. For example, a rammed chalk wall is linked to a chalk dew pond dug into the South Downs chalkland that provides a thriving habitat for nature. By using hydrophones connected to an ammonite 'telephone' in the house users can hear the live sounds of activity below the surface of the pond. An orthodox array of kitchen cupboards demonstrates how mixed species, ages, and dimensions of wood, sourced from more diverse, less monocultured woodlands can provide both an aesthetic benefit resulting from better woodland management (Gant, *et al.,* 2024). Open a kitchen door and it also provides a chorus of birdsong sourced from the same healthy, woodland as the materials. By demonstrating the viability of nature-based, circular solutions within a real-world housing context, *Wildhouse* signposts practices that could be (re) interpreted across the social housing sector. The project highlights how regenerative design is not simply an aesthetic or ideological choice but a practical strategy for reducing carbon emissions, conserving resources, and creating healthier, more resilient living environments. Moreover, it provides tangible, everyday interactions and a more relatable environment through which to propagate Ecological Citizenship and proposes more direct engagement between people and the wider environment that may benefit from regenerative retrofitting.

Figure 3. Augmented reality kitchen and binoculars. In this co-speculative design experiment, augmented reality technology and binoculars offer residents access to moving images and sounds from a woodland environment benefiting from rotational timber resource management. This interaction enables a deeper engagement with the sustainable practices behind the materials used in the retrofit, sparking discussion about ecological systems and the role of timber management in housing design. The image illustrates how technology can be used to provoke thought on environmental connections within the home. Image: Nick Gant.

Unlike top-down retrofitting schemes that impose solutions on residents, *Wildhouse* actively involves stakeholders in shaping the living environment. Through co-design workshops, residents, service providers and suppliers collaborate with designers, ecologists, and material innovators to envision homes that reflect their values and aspirations. These workshops explore how regenerative resources, objects, and interfaces can forge meaningful, educational, and joyful relationships between people and nature, ensuring that sustainability is not only practical but also desirable.

Wildhouse serves as a testbed for exploring the feasibility of integrating regenerative design into mainstream housing policy and supply chains. Through collaborations with local councils and other key stakeholders, the project generates critical insights into the economic, ecological, and social viability of regenerative retrofitting. It raises fundamental questions about the accessibility of regenerative materials and design processes, challenging the assumption that such approaches are only viable within high-end, bespoke architectural projects.

One of the project's key research inquiries is whether nature-prioritised products and materials can be integrated into mass social housing supply chains, or whether they remain confined to the margins of design culture. Additionally, *Wildhouse* examines how social housing providers can leverage regenerative resourcing methods to meet

legislative requirements for carbon reduction, local employment, and biodiversity net gain. By aligning ecological regeneration with pressing policy and economic considerations, *Wildhouse* positions regenerative retrofitting as a practical, future-proofing systemic opportunity. Through its participatory approach, the project seeks to cultivate a community of practice around regenerative design, engaging social housing tenants, policymakers, and industry stakeholders in a shared vision for ecological living. It also produces critical insights into the desirability, feasibility, and real-world impact of regenerative housing, generating data that can inform future policy and investment decisions.

Figure 4. Wild House work in progress of regenerative retrofit. Image Nick Gant.

4. Implications for Ecological Citizenship and retrofit

One of the most profound contributions that Wildhouse aims to make is its ability to embed ecological citizenship directly into the everyday lives of homeowners and residents. Traditional sustainability initiatives often frame environmental responsibility as abstract, distant actions, such as reducing emissions or supporting biodiversity through conservation efforts, that can feel detached from daily life. Wildhouse, however, seeks to bridge this gap by demonstrating that Ecological Citizenship can be cultivated through direct, material interactions within the home. By situating regenerative design within social housing, the project ensures that ecological engagement is not confined to a privileged few but is made accessible to a wide and diverse range of residents, many of whom may have had limited exposure to sustainability practices. This approach is particularly significant because it goes beyond the typical “green” design elements seen in conventional housing. Instead of relying solely on energy-efficient technologies or superficial sustainability measures, Wildhouse creates an immersive, sensorial

experience within the home. For example, the use of locally sourced, natural materials and the integration of nature-based solutions like green walls and rain gardens allow residents to experience and interact with the ecosystems that sustain them. This tangible connection shifts sustainability from a passive awareness of environmental issues to active participation, where residents are encouraged to see themselves as part of a larger ecological system. It fosters a sense of stewardship and a long-term commitment to ecological principles, turning sustainable living into a lived, everyday practice.

In addition to cultivating ecological responsibility, the project also empowers residents by involving them directly in the design process. The co-design and participatory elements of Wildhouse challenge the traditional top-down approach to social housing retrofits, which often exclude residents from the decision-making process. By positioning residents as active participants, Wildhouse ensures that the design of their homes is informed by their lived experiences and needs. This inclusive approach helps to create a sense of ownership, encouraging residents to take personal responsibility for sustainable living practices. More importantly, it promotes a deeper, more meaningful engagement with the space they inhabit, transforming their homes into dynamic ecosystems that support both human and non-human life.

Beyond its impact on residents, Wildhouse reimagines what regenerative retrofitting can achieve. Instead of solely focusing on energy efficiency, it broadens the scope to actively restore ecosystems, enhance biodiversity, and create spaces that support human well-being. By looking at retrofitting from this expanded perspective, the project offers valuable insights for housing policy and urban sustainability. If adopted at scale, regenerative retrofitting could shift the construction industry away from its traditional linear, extractive model towards a more circular, place-based approach. This approach would not only reduce the environmental footprint of buildings but also offer opportunities for new economic and social value, such as local material supply chains, community-driven innovation, and nature-based employment opportunities. In doing so, it shows how regenerative retrofitting can be a driver of both ecological and social transformation.

Moreover, Wildhouse directly addresses the common misconception that regenerative design is too costly or impractical for widespread adoption, particularly within social housing. The project demonstrates that regenerative retrofitting can be both economically viable and socially beneficial when framed as an investment in long-term resilience, rather than as a mere upfront cost. By working closely with local authorities and social housing providers, Wildhouse aims to show that ecological restoration can be aligned with existing policy frameworks, such as Local Nature Recovery Strategies (LNRS) and Biodiversity Net Gain (BNG). This alignment not only makes regenerative retrofitting more accessible but also proves that ecological sustainability can be integrated into mainstream housing strategies without compromising affordability or social equity.

However, scaling regenerative retrofitting requires overcoming significant institutional inertia, shifting industry habits, and fostering collaboration across sectors. Traditional procurement processes often prioritise short-term cost savings over long-term ecological benefits, limiting the scope for sustainable interventions. Wildhouse highlights the need for a new approach to procurement—one that considers the full lifecycle impacts of materials and demonstrates how regenerative design can create social and environmental co-benefits. By engaging policymakers, housing providers, and supply chain actors in the design and implementation process, the project offers a practical pathway for integrating regenerative practices into mainstream housing strategies.

Rather than positioning Wildhouse as a generalisable model, we frame it as a situated

experiment in regenerative design practice. Through the co-design process, the project reveals how residents engage with and commit to more sustainable futures. The insights gained from these situated experiences offer a deeper understanding of how people interact with their homes, perceive their built environments, and shape them in ways that align with ecological principles. This approach makes the implications of regenerative retrofitting more tangible, grounded in the specific context and experiences of the residents, and helps illustrate how design can actively support the cultivation of Ecological Citizenship. Ultimately, Wildhouse serves as a valuable case study that underscores the potential of regenerative retrofitting to transform homes into active agents of ecological and social regeneration, grounded in the lived realities of the people who inhabit them.

Table 2. Implication of regenerative retrofit- informed by *Wildhouse*

	Implications of Regenerative Retrofitting
Ecological Citizenship	Regenerative retrofitting could foster deeper connections between people and their environment by integrating nature into everyday living, encouraging stewardship and sustainable behaviours.
Beyond Energy Efficiency	Unlike conventional retrofitting, which focuses on reducing energy use, regenerative approaches could enhance biodiversity, restore ecosystems, and promote circular material flows.
Scalability & Policy Influence	Demonstrating successful regenerative retrofits could inform housing policy, influencing large-scale implementation and regulatory support for nature-based solutions.
Social Housing & Equity	Regenerative retrofits could ensure that sustainable, nature-integrated design is accessible to all, reducing the gap between eco-conscious housing and social housing sectors.
Community-Led Design	Engaging residents in co-design processes could lead to more contextually relevant solutions, fostering a sense of ownership and long-term commitment to sustainable practices.
Holistic Well-Being	By incorporating natural materials, biophilic design, and ecosystem services, regenerative retrofitting could improve mental and physical health outcomes for urban populations.
Future-Proofing Urban Spaces	As climate resilience becomes critical, regenerative retrofits could provide adaptive, low-impact solutions that benefit both people and the planet.

5. Informing the future

Informed by this discussion and the *Wildhouse* project, a primary area for future research could involve understanding how the principles of ecological citizenship evolve over time when residents are embedded in regenerative living environments. While *Wildhouse*

introduces this concept in a tangible way, long-term studies are needed to assess the depth and sustainability of ecological engagement as well as the impacts of resourcing in the (resourcing) landscape. Research could track how residents' relationships with nature develop, moving from abstract awareness of environmental issues to active engagement with the environment. This could include further studies into how the scale and demand for social housing may stimulate disruptive models for better landscape management and resourcing and the potential for the delivery of Biodiversity-Net-Gain through social housing resourcing models itself rather than landscaping and offsetting. By examining the social dynamics of communities living in regenerative homes and their appreciation (or not) of more ‘natural’ interactions, researchers could identify key drivers of long-term behavioral shifts, informing strategies for fostering wider Ecological Citizenship beyond the boundaries of the individual home. However, the long-term ecological benefits of such interventions need to be accurately assessed. Future research could track changes in local biodiversity and ecosystem health as a result of regenerative retrofitting. This would involve long-term ecological monitoring, looking at factors such as wildlife populations and air quality over time. Understanding the broader ecological impacts of these designs, and comparing them with more traditional approaches, could build a compelling case for adopting regenerative practices at a larger scale, influencing urban planning and policy frameworks.

One critical challenge to scaling regenerative retrofitting is economic viability, particularly in social housing contexts. The initial perceptions of high costs often hinder the uptake of nature-based solutions. However, as presented here, regenerative retrofitting could offer long-term savings in terms of maintenance and energy use, if framed as an investment in resilience and better programmed and collaborative use of landscape resources that are undermanaged. Future research could delve deeper into the financial models that would make regenerative retrofitting economically feasible at scale. Additionally, research could explore alternative funding mechanisms, such as community-based financing and agribusiness models, to make these practices more accessible to low-income and marginalised communities.

Figure 4. Wild House - Materials and resource site sample book. Image Nick Gant.

As noted above, institutional inertia within the construction and housing sectors presents a significant barrier to scaling regenerative retrofitting. Future research could further highlight mechanisms to overcome the institutional barriers that inhibit the adoption of these practices. This includes examining procurement processes, regulatory frameworks, data-sharing, collaborative stockpiling and the lack of joined-up mindset of industry stakeholders who may prioritise short-term cost and speed over long-term ecological and social benefits. Research could investigate new models for policy and procurement that 'value' regenerative design, highlighting successful case studies where such models have been implemented. Additionally, exploring how these frameworks can be integrated into existing urban policies, such as those relating to climate resilience and biodiversity, could provide a pathway for shifting industry norms and institutional behaviors towards more sustainable practices.

On a broader scale, future research could explore how regenerative retrofitting practices can be adapted to different cultural and geographical contexts. *Wildhouse's* impact could be more widely understood by comparing how similar principles of ecological design are implemented in various global regions. Cross-cultural research could highlight region-specific challenges, from climate considerations to local construction practices, providing a more nuanced understanding of how regenerative retrofitting can be adapted and scaled across diverse contexts. This transnational exchange of knowledge could play a critical role in shaping global standards for regenerative housing and fostering international collaboration on sustainability initiatives.

6. Conclusion

Regenerative retrofitting represents a transformative shift in how we approach sustainable housing, offering a solution that looks to extend beyond energy efficiency and carbon reduction to actively contribute to ecological and social regeneration. By integrating nature-based solutions, circular material strategies, and participatory design, regenerative retrofitting offers a redefinition of the role of buildings within natural systems, transforming them from passive structures into active participants in ecological renewal. This approach forefronts the use of bio-based materials, promotes potential pathways to biodiversity, and fosters a tangible connection between residents and their ecosystem. Regenerative retrofitting also opens pathways to Ecological Citizenship by engaging communities in the design and implementation and even long-term monitoring of their environment and the broader ecosystems they inhabit. This participatory approach not only improves the physical infrastructure but also provides a route to strengthen social cohesion, hopefully encouraging long-term commitment to sustainability and environmental stewardship. By moving beyond conventional retrofit models that prioritise operational efficiency, regenerative retrofitting highlights the importance of embodied carbon reduction, biodiversity enhancement, and the creation of resilient, nature-integrated urban environments.

Additionally, regenerative retrofitting attends to practical and scalable solutions to the pressing challenges of climate change, biodiversity loss, and social inequality where it is needed most. By generating a demonstration that sustainable housing can be both affordable and accessible, this approach challenges traditional notions of retrofitting as only open to the able-to-pay and instead paves the way for its widespread adoption in social housing and beyond. The *Wildhouse* project signals how regenerative retrofitting might be implemented within social housing, offering a model that blends ecological restoration with community empowerment. Ultimately, regenerative retrofitting has the potential to catalyse a broader cultural and policy shift towards more sustainable, resilient, and community-centred urban living. This model presents an opportunity to bridge the gap between environmental responsibility and social equity, creating spaces that contribute positively to both human well-being and ecological restoration.

Acknowledgments: The Wild House was made possible with the input of Nick Gant, Alice Eldridge, Grant Smith and Soundcamp, Evan Reinhold, Miles Hobden, James Tooze, James McAdam, Duncan Baker-Brown, Jim Wilson and all the makers, resourcing sites and our network experts who contributed. The project was funded by UKRI EPSRC / Ecological Citizenship Network and Forestry Commission Innovation Grant and in collaboration with UNESCO Brighton and Lewes Downs Biopshere region / Living Coast .

About the Authors:

Dr. Luke Gooding is a researcher exploring how people connect to place through the built environment, ecological citizenship, and community-led climate action. His work supports low-carbon transitions by fostering collaboration across design, policy, and technology for more sustainable, inclusive futures.

Dr. Nick Gant is an award winning, multi-disciplinary designer and published academic whose research and design consultancy impacts on global, industrial companies, international NGOs as well as governing bodies and civic communities in the UK and overseas. He has helped over 50 organisations develop their sustainability agendas through design research embodied within tangible and acclaimed products and platforms, spaces and places. He routinely delivers workshops and presentations of research internationally and has been invited to present findings to The Department of Communities and Local Government, The Cabinet Office, The House of Lords, The Rural Commission, The Deputy Prime Minister and Home Office Minister (2016), The European Institutes of Culture, The British Council and The World Crafts Council and The Alliance for Sustainability leadership in Education. Nick has managed over 30 funded research projects that support social and sustainable design knowledge exchange between industry and academia with (not exhaustive) PUMA, ICI, Veolia, The Forestry Commission, The NHS, Philips and Ineos.

Dr. Rob Phillips Principal investigator of the Ecological Citizen(s) network +, Senior tutor at the Royal College of Art, Design Futures programme, Designer and Author of seminal work in 'Engaging Design' new forms of citizenship with EPFL.

1. INTRDOUCTION

KeyWords: Space Syntax;Ancient City of PingYao;PiaoHao Museum;Spatial Form;Functional Transformation.

Traditional architectural spaces preserve urban history, exemplified by Shanxi's Jin merchant culture and Pingyao's PiaoHao draft banks. Existing studies focus on qualitative spatial-commercial links but neglect quantitative spatial-visitor dynamics.
This research employs Space Syntax to analyze the PiaoHao Museum's spatial-function interplay, aiming to optimize heritage conservation and integrate historical spaces into modern urban contexts.

2.LITERATURE REVIEW

Space Syntax Theory: Space Syntax analyzes spatial organization and socio-cultural linkages through quantitative methods. It reveals how architectural/urban forms align with socio-economic factors, enabling predictive insights for conserving and optimizing traditional spaces.

Application of Space Syntax in Traditional Architectural Space : Space Syntax reveals socio-spatial hierarchies in global cases. China's research highlights practical applications but limited exploration in museum adaptation. This study bridges gaps via quantitative analysis of Shanxi's PiaoHao spatial evolution.

3.METHODOLOGY

①Space Syntax Analysis → ②Spatial Segmentation → ③Visitor Behavior Observation

4.RESEARCH CONCENT

PiaoHao Spatial Typologies: Commercial-Residential Transformation.

Using Space Syntax and Depthmap, this research analyzes Pingyao's Rishengchang and Weifenghou PianHao. Historical museum comparisons reveal commercial-residential zoning and axial layout impacts on visitor flow, relecting Jin merchant ethics.Quantitative insights propose conservation strategies for adaptive reuse and cultural continuity.

5.RESULTS AND DISCUSSION

PiaoHao spatial layouts in Pingyao reflect socio-cultural logic: Commercial adaptations prioritize open business operations, while residential conversions emphasize privacy, isolation, and functional segregation.

ABSTRACT |
Rethinking urban spaces for local communities in dense city centres is crucial but complex. High-density areas often favour commercial and infrastructural needs over community spaces, limiting areas for social interaction, greenery, and sustainable mobility. Transforming such spaces to support local needs fosters community identity, well-being, and inclusivity but demands creative, conflict-free solutions that navigate regulatory and financial constraints while respecting cultural diversity. This paper presents a 2.5-year research project applying placemaking and participatory design to co-create shared ownership of a school-front area in Budapest.
School fronts, just like liminal spaces, are "at the boundary of two dominant spaces, which is not fully part of either" (Dale and Burrell, 2008: 238), functions of school front areas are not easily defined just like their ownership by a specific group and these are the spaces where anything can happen (Turner, 1974 cited by Shortt, 2015). The research aims to explore how social design might facilitate children's physical and mental safety regarding the inclusivity of public places through placemaking. It has been conducted by a Hungarian design university in collaboration with external experts of different disciplines, such as pedagogy, child participation, environmental psychology, road traffic and public transport as well as the local municipality as decision makers. The paper illustrates a participatory design process, using methods (cognitive mapping, persona building, brainstorming ect) that actively engage students (age group 10-13) and school teachers in developing inclusive safe school zones tailored to the needs and perspectives of young people as well as other user groups. By collaborating in the design process, children learned about inclusivity, safety, and accessibility in urban planning. This approach not only encouraged the development of safe, child-friendly spaces but also educated participants in a non-formal way on the value of public spaces that are inclusive and responsive to diverse needs (Freeman & Tranter, 2011; Ellery & Ellery, 2019).

Results show that the educational potential of this approach is significant, as it introduces for children an early understanding of urban planning and the principles of safe, inclusive design. By working together with designers, urban planners, and decision makers, students gained insight into the challenges and possibilities of transforming urban spaces, experimenting critical thinking, cooperative design and creativity.

KEYWORDS | URBAN PLACEMAKING, PARTICIPATION, INCLUSIVE SPACES, SCHOOL ZONES, SHARED OWNERSHIP

1. Introduction

Urbanisation has led to the rapid development of densely populated cities around the world, creating a complex set of challenges and opportunities for residents, urban planners and policy makers. While cities serve as hubs of economic activity, cultural exchange and technological innovation, they also bring with them significant challenges in terms of environmental sustainability, infrastructure congestion, housing affordability and social inequalities. Among these concerns, the issue of common ownership of public spaces and boundaries remains a critical but still underexplored issue in contemporary urban studies. The challenges of densely populated cities are evident at different scales, from global metropolises such as Tokyo, New York and Hong Kong, to medium-sized capitals such as Paris and Barcelona, and even smaller urban environments such as Valletta. As public spaces are transformed into sites of economic activity and tourism, their function as inclusive, community-centred environments is increasingly under threat. The resulting fragmentation of ownership over public spaces not only reflects socio-economic inequalities, but also contributes to a wider sense of isolation and alienation among residents. Without a strong sense of belonging, the participation of citizens in urban community maintenance and development efforts is reduced, adding to issues of neglect and spatial exclusion.

This paper examines the dynamics of shared ownership in bounded spaces, with a particular focus on a case study in Budapest. Through a three-year interdisciplinary research project, the paper explores how placemaking and participatory design can increase children's physical and mental visibility and safety in public spaces, particularly in school front areas. Involving students, teachers, parents and local residents, the research seeks to understand how urban design can promote inclusion, strengthen communities and foster a sense of belonging in urban boundary spaces. The results of the study contribute to the broader discourse on urban spatial justice, emphasising the need for participatory planning strategies that prioritise community-led interventions over commercial and regulatory constraints. Ultimately, promoting shared ownership in dense urban environments requires a reassessment of how public spaces are designed, managed and experienced, ensuring that they remain accessible, adaptable and representative of the diverse communities they serve.

2. Dense cities of our age

2.1. Scale-neutral challenges

The comparison of the effects of urban and rural environments has been a much discussed area of research (Verheij 1996, Verheij et al. 2008, Bernhard et al. 2013, Ma et al. 2020). Among the myriad challenges of metropolitan life are air and noise pollution, congestion, unprocessable stimuli, crime, alienation, the emergence of cumulative social problems (homelessness, poverty, etc.) and the decline of green spaces (Marsell 1988, cited in Dúll 2017). When mapping the impact of these issues, the connections between the environment and communities is an important aspect. They are deeply intertwined and therefore in constant discourse and shaping process. By bringing together people, infrastructure, and resources these close, dense cities face even more specific challenges connected to the areas of traffic, housing, environmental sustainability, public health, infrastructure and social inequality. Housing affordability for example remains a central concern among these cities, with extremely high real estate prices pushing lower-income residents to the margins or into inadequate housing conditions.
High-density can look rewarding for citizens, however it has its downsides as well. There is a high risk that communities will become isolated, the vertical and compact nature of high-density living can limit spontaneous social interactions and reduce access to

shared public spaces, which are essential for building community ties. Therefore cities need a good strategy for fostering inclusivity, participatory actions and accessible urban spaces for all (Lydon & Garcia 2015; Hamdi 2004). Placemaking is an approach that has become an often used tool for highlighting the importance of participation, when it comes to how to involve the local community in shaping their environment (Silberberg et al. 2013). In order to transform scale-neutral challenges - including affordability and access - into opportunities, a certain shift is needed in moving from top-down executive planning to community-based, bottom-up engagement to enhance community empowerment and urban renewal.

Public transport systems, though often highly developed, struggle to accommodate the daily influx of commuters, resulting in severe overcrowding and long wait times. Additionally, environmental issues, including air pollution and urban heat islands, exacerbate the already challenging living conditions. The phenomenon brings different aspects of challenges in different contexts of not only huge metropolitans (with 7+ million habitats) like Hong Kong, Tokyo, New York and London but also medium sized capitals (with 2-3 million habitats) as well such as Paris and Barcelona or even smaller cities (less than 10.000 habitats) like Valletta.

In metropolitan areas such as Hong Kong, Tokyo, Mumbai, New York City, São Paulo, and London, the consequences of high-density urban living are widespread and multifaceted. For instance, Tokyo's density necessitates strict seismic safety regulations due to the constant risk of earthquakes, yet the city's density creates spatial and social pressures (Sorensen 2002). Similarly, New York City faces the dual threats of climate change and aging infrastructure, making urban management even more challenging. These happenings are leading to seek out solutions to a more resilient and inclusive urban setup, therefore participatory planning and community-driven approaches became critical tools for change. These programs - such as “Rebuild by Design” - are aiming to highlight the voice of the community in the urban planning discourse, while demonstrating the power and possibilities of inclusive governance (Rosenzweig et al. 2011). Traffic congestion and pollution are ongoing problems, and the city faces increasing risks from climate change, particularly due to rising sea levels and extreme weather events (Rosenzweig et al. 2011). Amongst many cities, the example of Hong Kong illustrates the limited land availability leading to extreme vertical urbanisation (Yeh & Yuen 2011) which affects social connections negatively (Dúll 2009). The already mentioned challenge of lacking affordable housing led to the development of informal settlements in Mumbai. Additionally, Mumbai also experiences frequent flooding during monsoon seasons due to poor drainage infrastructure (Gupta 2009). One of São Paulo’s primary challenges is urban sprawl, creating both overcrowded areas and inefficient land use (Caldeira 2000).

In Paris and Barcelona, density poses specific problems and advantages which can be addressed by urban planning in medium-sized cities. Although these cities have historical advantages and moderate urban forms, they are also facing the same issues of housing unaffordability, high rents, and overcrowding that characterize the larger metropolises. In Paris, limited space, zoning restrictions, and the lack of available land present a challenge regarding the provision of affordable housing. Tourism is also a major issue in Barcelona, which increases congestion, while the need for short-term rental properties for tourists worsens the housing shortage for locals. Both cities also face the issue of density versus the environment. The problem of the urban heat islands is growing due to underprovision of green spaces, while the whole infrastructure does not adapt fast enough to the increasing needs of people and visitors. These problems show that new urban policies are needed to address important issues of equity, sustainability, and environmental sustainability as population increases, to which placemaking can bring solutions

including inclusive zoning policies, public place protection, regaining local spaces and co-designing new and improved neighbourhood amenities (Touati-Morel 2015, Staricco & Vitale Brovarone 2022).

Small towns, even if they are more manageable in size, cannot hide from the pressures of high-density life. Cities such Valletta are facing severe land shortages and rapid population growth, adding to the challenges of overcrowding and limited public space. These small cities, often unable to replicate the infrastructure and governance models of larger metropolises, are finding it difficult to properly address these problems. In many of these areas, informal urbanisation leads to the development of slums or substandard housing, where lower income groups face poor living conditions. In addition, the lack of accessible public spaces and community facilities contributes to a growing sense of socio-economic segregation. Moreover, the environmental stress resulting from overcrowding puts enormous pressure on resources such as water, sanitation and energy (Thake & Hall 1993). These cases represent that exclusionary dynamics may show up not only in larger cities, but small towns struggling with the realisation of real inclusiveness. Predefined participatory frameworks might help to avoid such deadends and design to fit for local contexts, with the inclusion of marginalized communities as well in order to foster the real sense of shared place and work against any form of segregation.

The very extensive urban challenges of our days may vary regarding their contexts and scales, however their impact is always greatly formed by the nature of the participatory action. The many recent cases show that urban complexity can only be tackled by incorporating participation and a special attention to inclusiveness in order to create more resilient urban environments.

2.2. Towards shared ownership of boundary spaces

Besides the above mentioned several challenges of highly dense urban environments, the sense of ownership over public spaces among local residents is often weakened due to overcrowding, extreme diversity of users, and commercial pressures. The competition for space limits the ability of local communities to use public areas for social and cultural activities. Moreover, public spaces in modern, dense cities serve multiple functions, serving not only local communities but also tourists, commuters transforming public spaces into commercialised zones (Mehta 2014). Besides tourists and investors, we also have to be aware of underrepresented, marginalised or even sometimes invisible groups (such as elderly people, children, migrants, homeless people), who might be a minority according to the user population but still have the need for informal gatherings and open space usage (Chuang & Chen 2022). As a result, many residents can feel disconnected from these spaces, perceiving them as areas of temporary occupation rather than as extensions of their own neighborhoods: they do not have the opportunity to shape and use these areas freely. When public spaces are designed primarily to accommodate economic or aesthetic interests rather than the everyday needs of the local population, they lose their capacity to foster a sense of belonging and ownership. This lack of emotional and social attachment reduces civic engagement and the willingness to contribute to the maintenance and protection of these spaces (Wood, Frank & Giles-Corti 2010).

The fragmentation of ownership over public spaces is also linked to socio-economic inequalities and cultural differences in urban populations. In many densely populated cities, particularly in developing economies, rapid urbanisation has led to an uneven distribution of well-maintained public spaces. While wealthier communities have access to exclusive parks and recreational areas, lower-income residents rely on overcrowded and underfunded public infrastructure. This inequality not only creates tensions over the

use of space, but also reinforces social divisions, and public spaces become sites of exclusion rather than inclusion. Moreover, in politically charged environments, public spaces have become the site of social movements and protests, further challenging their role as neutral and inclusive urban public spaces.

The challenges as well as the opportunities of shared ownership are concentrated in the boundary spaces of urban environments. Liminal spaces play a crucial role in shaping how people perceive and relate to urban public spaces, especially in highly populated cities. These spatial elements influence access, inclusion and a sense of belonging, and ultimately whether residents feel a sense of ownership of shared spaces. Boundaries - be they physical, social or symbolic - define the edges of urban public spaces, while liminal spaces act as transitional zones where multiple groups and activities meet.Together, they mediate the connections between individuals and the built environment, shaping patterns of usage and social interaction (Tavakoli et al. 2023).

Visible and invisible boundaries define the limits of public and semi-public spaces. Physical barriers such as fences, controlled entry points or security infrastructure can restrict access and fragment public spaces, reducing the sense of ownership among certain groups. In highly densely populated cities, commercial interests or privatisation often lead to the closure of once public spaces, reinforcing social divisions. However, boundaries also serve positive functions: clear spatial definitions can create identity and a sense of security, helping local communities to maintain a connection with particular urban spaces. For example, parks with defined boundaries and locally managed public spaces often strengthen social connections and sense of ownership. Boundary spaces - such as alleys, transport hubs, sidewalks and squares - serve as meeting points where different urban activities and social groups come together. These spaces can either reinforce exclusion or provide opportunities for informal ownership and community building. In densely populated cities, liminal spaces are often sites of informal economies and spontaneous social interactions, allowing different populations to engage with the city on their own terms. However, if liminal spaces become too commercialised or highly regulated, they can lose their inclusiveness, reducing the ability of residents to feel a sense of common ownership (Magnusson, 2005; Mayo, 2011; Tonkiss, 2013).

We can see therefore, that highly dense cities worldwide face a range of challenges, including housing affordability, infrastructure strain, environmental degradation, and socio-economic inequalities as well as the challenges of shared ownership. Addressing this challenge requires policies that put community participation at the forefront of urban planning and public space management. Governments and urban planners need to adopt inclusive design principles which allow flexible and multifunctional spaces, ensuring that different groups can coexist without conflict. Initiatives such as participatory urban planning, community programmes and regulations that limit excessive commercialisation can help to restore a sense of ownership among local residents (Flores, 2013.). By fostering closer links between people and their urban environment, cities can transform public spaces into real community values, rather than areas of competing interests. The design and management of urban borders and boundary areas have a significant impact on whether public spaces remain inclusive or become contested areas. If boundaries are too rigid, they can lead to exclusion and social fragmentation, while spaces that are too flexible may not be stable and support long-term community engagement. Successful public spaces often strike a balance between the two - while maintaining defined boundaries, they also allow for flexible, boundary zones that encourage informal use. Cities that prioritise adaptive urban design, such as pedestrian-friendly streetscapes and permeable public spaces, create environments where diverse users can coexist while fostering a sense of local ownership (Gehl, 2013; Speck, 2018).

3. A case study for sensing ownership

3.1 Background

School fronts, just like liminal spaces, are “at the boundary of two dominant spaces, which is not fully part of either” (Dale and Burrell, 2008: 238), functions of school front areas are not easily defined just like their ownership by a specific group (students, teachers, parents, drivers, locals ect.) and these are the spaces where anything can happen (Turner, 1974 cited by Shortt, 2015). The paper presents the latest methodology of a 3-year research project applying placemaking and participatory design to prepare and co-create the sense of shared ownership of a school-front area in Budapest, with the aim to explore how social design might facilitate children's physical and mental visibility and safety regarding the inclusivity of public places through placemaking.

The interdisciplinary R&D project is developed and led by a Budapest based design university and was conducted in cooperation with the Centre for Budapest Transport, the Institute for People-Environment Transaction of Eötvös Lóránd University and the Municipality of the 7th district of Budapest (Erzsébetváros). Since its beginning, the project involved several schools of the district, focusing on the involvement by different methods for different user groups: the main target group of the participation are (1) students aged 12-13 (by participatory design workshops), followed by (2) their teachers (by interviews and forums), (3) other students of the school community (by interactive posters and questionnaires) (4) their parents (by questionnaires) and (5) the habitats of the close area (by online questionnaires). The first phase of the research project (conducted in 2022-23) was already introduced by the research team, and resulted in a co-design installation, placed on the street in front of the involved school. Based on the results and lessons of the first phase, the research continued by the grant of Erzsébetváros and the involvement of a new school. The paper will introduce the second collaboration and its methods supporting the sense of shared ownership among the involved community.

The second collaboration started in the beginning of 2024, focused on the question: How social design might facilitate children's physical and mental safety and visibility regarding the inclusivity of public places through placemaking? Although the main structure of the previous phase was applied in the second one as well, a bigger emphasis was placed on the involvement of children: while during the first phase four different schools were involved in the research, the second phase involved only one school but with much more engagement. The main steps of the second collaboration started with (1) an initial research, followed by (2) problem mapping and (3) participatory design workshops, (4) validation and (5) finalisation.

3.2 Research process

The initial research used traditional research methods, such as outdoor observation with dense description, interviews with the teachers of the school, and questionnaires for the students and their parents. This part of the research aimed to better understand the mobility and space usage habits of the above mentioned groups, focusing on the school-front area. The initial research explored the general routines of school days, the general physical conditions as well as the rules and habits connected to the school-front area, the children's habits regarding their journeys to and from school, and their favorite and most used spots in the neighborhood.

The problem mapping workshops included five occasions (45 minutes each) for 20 students from 7th grade aiming to move away from the traditional educational setting towards a more collaborative, dialogue based process. To foster this calm environment,

these exercises were playful and encouraged open communication. Since it was key to understand the needs of the young students, to build mutual trust and to share understanding of the research aims as well as to explain their role in the process, the very first session was dedicated to getting to know each other in a playful way, involving mainly movements instead of verbal methods. During the second workshop, the students created a common cognitive map (Altman et al. 1978) about the urban environment of their school. They had to involve not only its physical conditions (with parking sports, green areas, traffic lights and so on) but also they had to place their emotions (fear, happiness, loneliness, togetherness etc.) on this commonly created map to help the researchers to understand the advantages and limitations of the place in its fullness. By cognitive mapping, the research team gained a deeper understanding of how familiar the children are with the neighborhood, what functions they can identify, and what their emotional connection to this environment is (Fig. 1).

Figure 1. Cognitive mapping with the students of Baross Gábor Primary School. Photo by Ádám Gábor Teket. 2024.02.08.

During the third workshop, we asked students to create “personas” with the aim to understand the habits of primary users of the school front area (especially through the experiences of the students). In the first round we ask them to list as many user groups as possible: they listed students, teachers, elderly people, parents, smaller siblings, drivers, locals, dog owners, students from the neighbouring secondary school, bikers and walkers. After creating this list we asked the students to vote and categorise independently the groups into primary and secondary users. After the students developed four personas of

the collectively picked four primary user groups (teachers, parents, drivers and students from the neighbouring secondary school), matched them with both internal and external characteristics (Fig. 2).

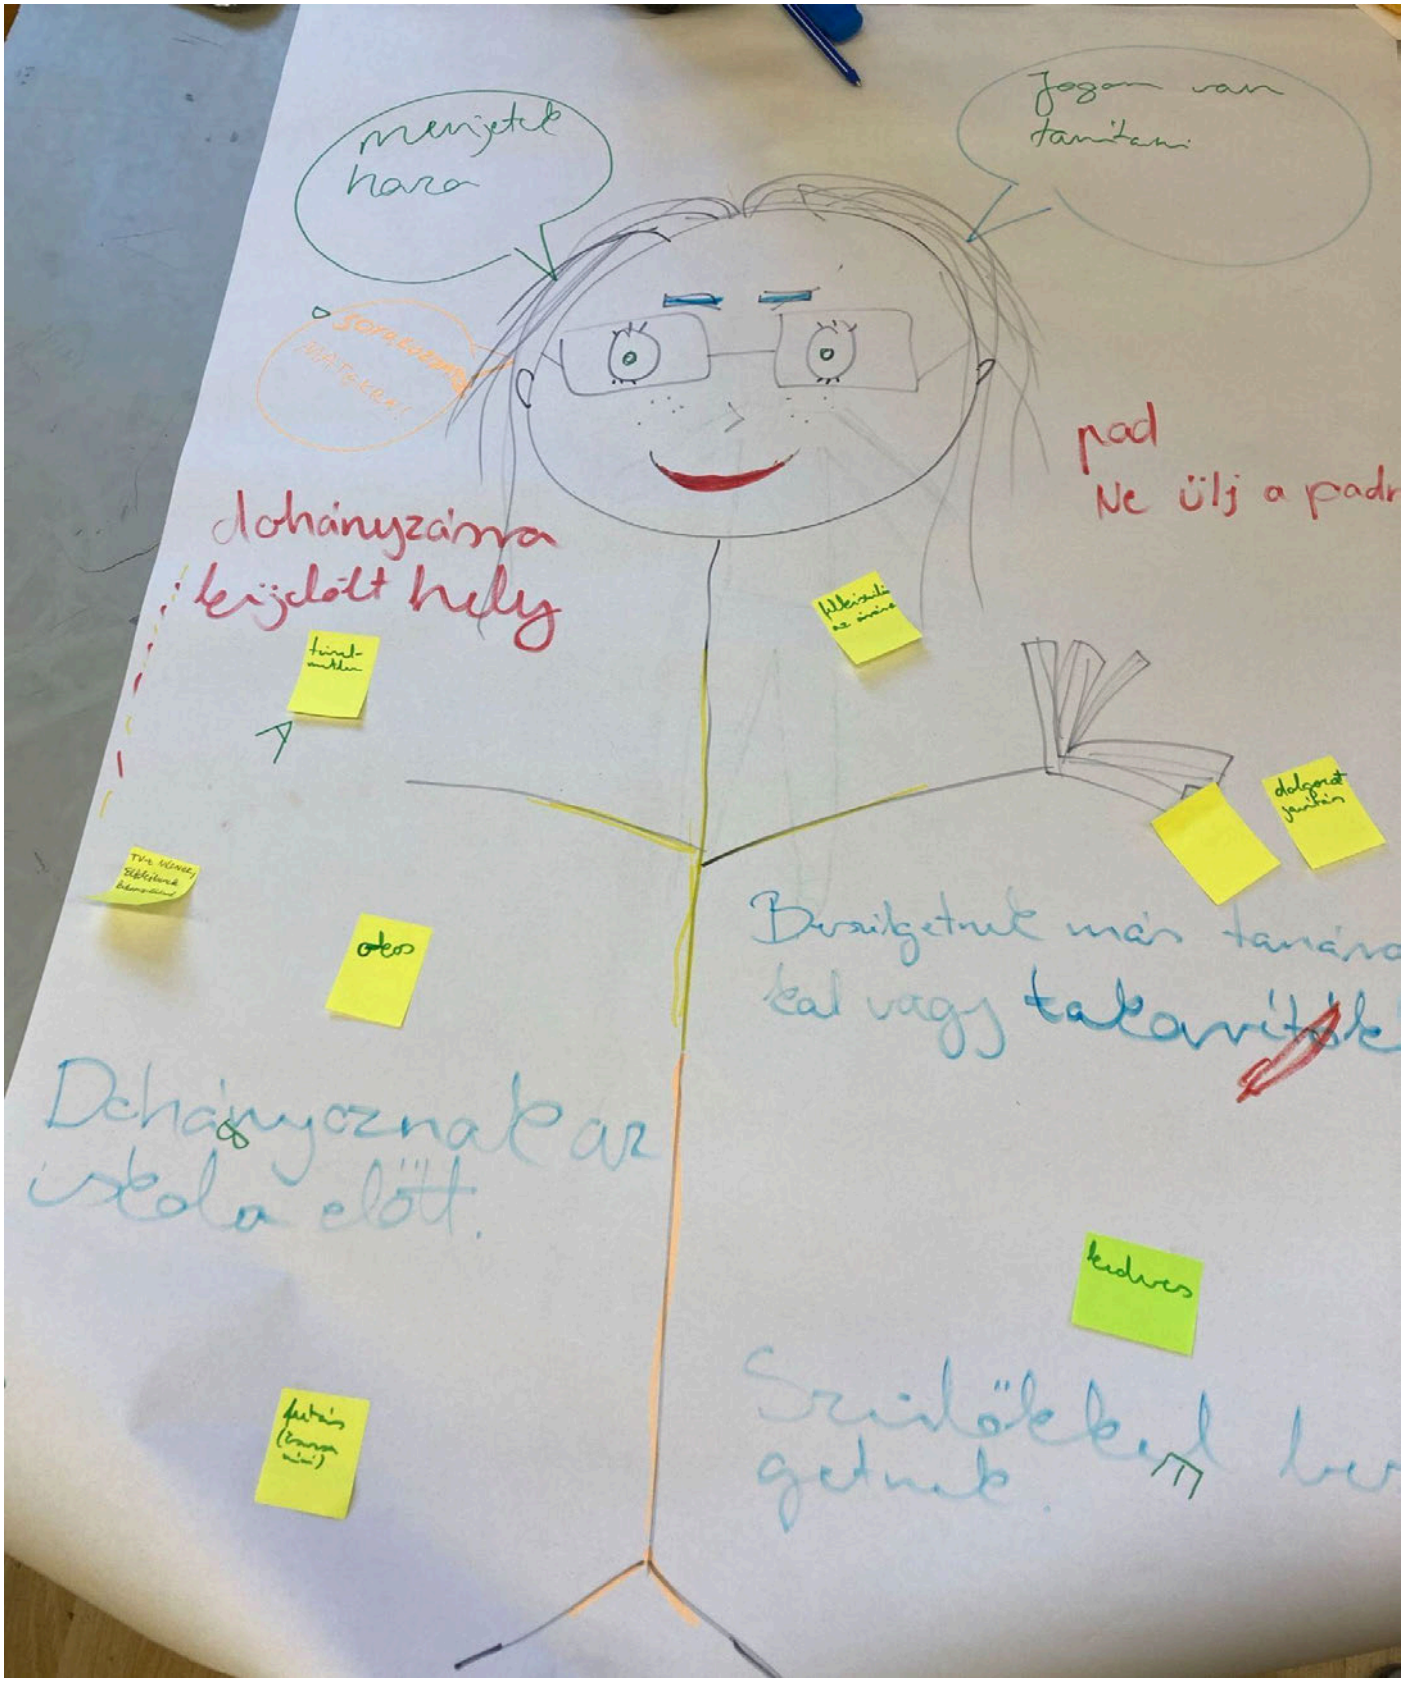

Figure 2. One of the personas created by the students of Baross Gábor Primary School. Photo by Ádám Gábor Teket. 2024.02.14.

As for the fourth session, the focus was on the children's needs. To gain a deeper understanding of what are the characteristics of their desired space and what are the main functional needs, a collaborative collage was created to identify the main functions and envisioned elements. During the last occasion of the problem-mapping phase, the children took a short walk around the neighborhood, critically examining the spaces, their functions and the current conditions, as well as in a playful way we tested together parking spots replaced by imaginary, community functions (Fig. 3).

Figure 3. Testing the parking spots and creating imaginary functions with the students of Baross Gábor Primary School. Photo by Ádám Gábor Teket. 2024.02.28.

After the thorough problem mapping the next phase was the participatory design workshops. As a very first step the researchers introduced for the students eight optional design principles, each based on the analysis of the problem mapping workshops. Students were asked to vote independently on three principles which they believed were the most important ones. Based on the independent votes, the class agreed on three main design principles to follow:

1. This is a place that is inclusive of others as well.
2. This is a place where we can release tension.
3. This is a place that helps us to calm down and feel safe. (Fig. 4)

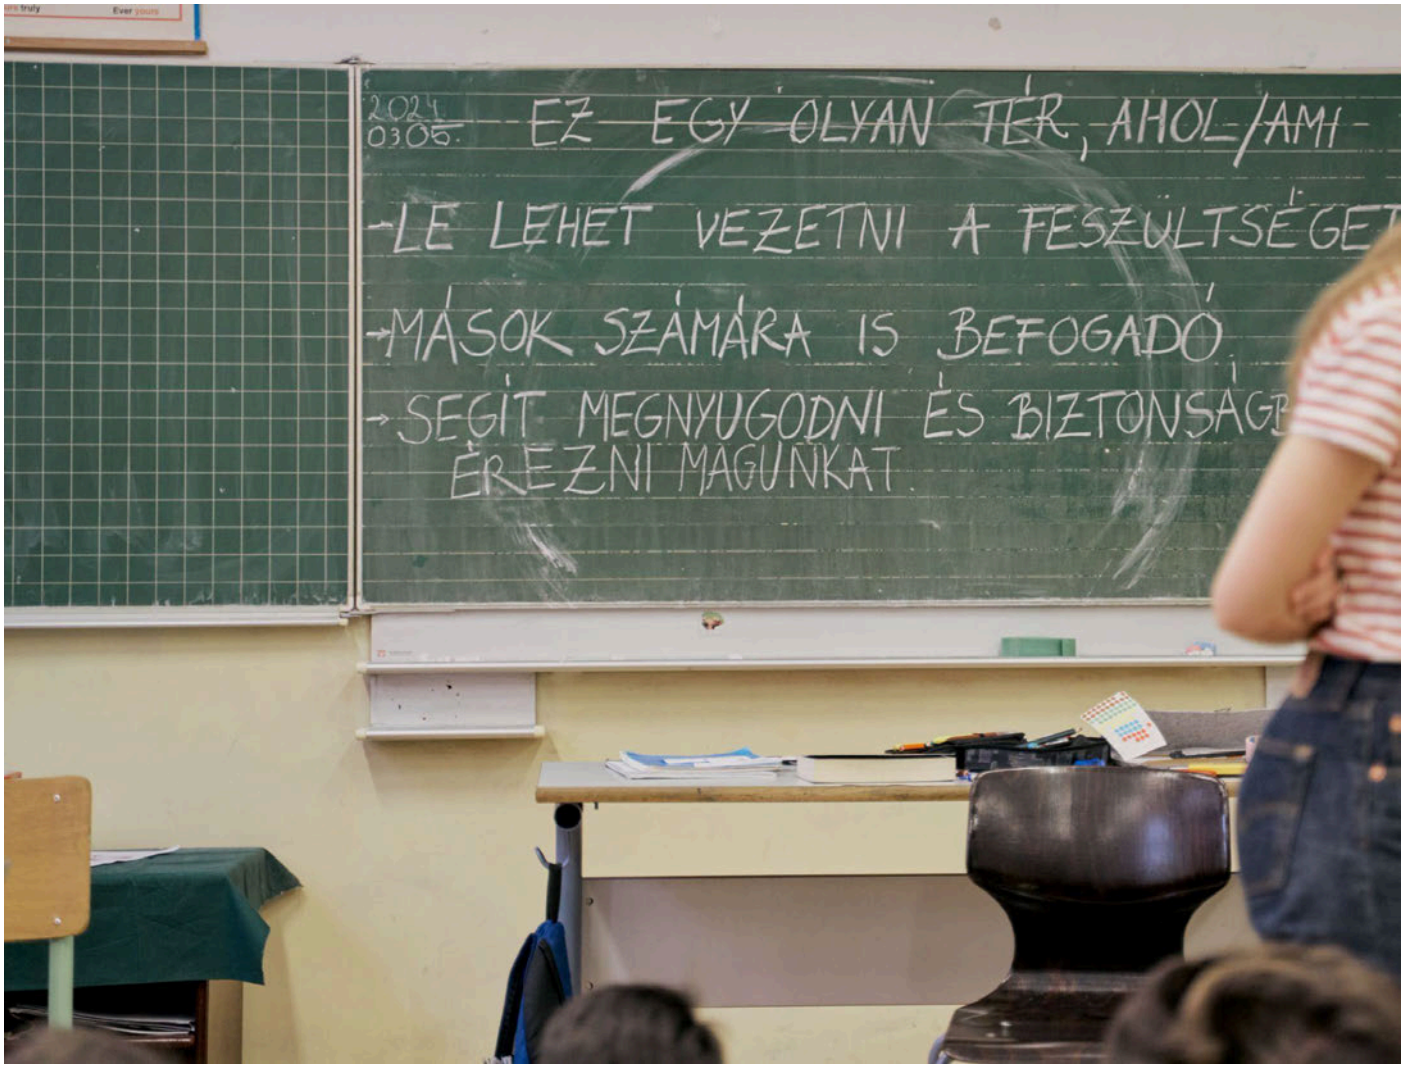

Figure 4. Design principles chosen by the children. Photo by Noémi Szécsi. 2024.03.07.

After deciding on design principles, students gathered into smaller groups, picked among previously collected functional needs (such as sitting, chatting, eating, relaxing, playing ect.) and started to brainstorm about and model small-scale interventions into the school front area (Fig.5).

Figure 5. Co-design workshop with the students of Baross Gábor Primary School. Photo by Noémi Szécsi. 2024.03.07.

Based on the inputs and results of the problem mapping and participatory design workshops, two different concepts were prepared by an external architect: one version occupied two parking spots and involved lively colours and few sitting surfaces, while the other occupied four parking spots with less vibrant colours and more sitting (and thus waiting) opportunities.

During the validation phase, the two concepts were introduced for the school community in different forms. First of all, the involved class participated in a validating workshop, allowing them to contribute with additional ideas and critiques to the proposed designs (Fig. 6).

Figure 6. Validation workshop at Baross Gábor Primary School. Photo by Noémi Szécsi. 2024.04.08.

For the other students of the school a large validation poster was created and placed on the corridor of the school for one week, offering an indirect way to give feedback. The poster introduced the concepts and asked for opinions in different playful ways (Fig. 7).

Figure 7. Detail of the interactive poster placed at the school. Photo by Gábor Ádám Teket. 2024.04.15.

Regarding the teachers, the research team introduced the project findings and the two

concepts through an interactive presentation. The occasion turned out to be a fruitful discussion, and raised valid questions about the responsibility for students spending time in the soon-to-be-formed space after school. Based on the feedback, the final design concept has been developed and handed over to the representatives of Erzsébetváros in order to prepare the installation, which should start in spring 2025. Until the beginning of 2025, the municipality collected feedback from residents through an online questionnaire to understand if locals are satisfied with the design concept and to find out their concerns as well.

4. Results

During the research, we collected qualitative data through observations, questionnaires, interviews as well as problem mapping and participatory design workshops aiming to understand if social design can facilitate the development of sensing shared ownership. The examinations and the co-creational workshops resulted in a deeper understanding of the challenges children face in the specific urban environment of school front areas. We have learnt (just like in our previous research phase) that the involved students face a high level of placelessness: there is no dedicated place for them to gather and socialise after school or to wait for each other. And even more, they feel unwanted in this environment (based on the personas of drivers, teachers and neighbour students) resulting in them being unable to develop an ownership of this place.

Based on both the process and the outcomes, we could recognise the benefits of participatory design methods resulting in intangible outcomes. According to the observations as well as the feedback of the children, the sense of shared ownership developed among the students: during several activities aiming to collect all the stakeholders of the school front area, students listed themself among the first user groups while also recognised other users, furthermore even stakeholders whom they cannot see in the neighborhood, like the local municipality. There were several activities which supported the development of shared ownership: (1) by the collaborative work and honest communication they felt their real role as stakeholders, (2) by persona building they could emphasise other users' point of views and (3) by taking part in the design process they could understand the limitations of "adult world". A good illustration for this last aspect was the validation workshop, where they accepted the decision that we cannot implement a trampoline into the middle of the road, but instead we could keep the metaphor of their desired "magic gate" which takes away all their struggles.

(1) The collaborative work and honest communication was the foundation of making the students real stakeholders in the process. By emphasizing the fact that their ideas will be recognised in the final designs made them enthusiastic about the workshops and they felt that they are not only heard, but their thoughts are valuable for the project. It was a new perspective for them, that they can be involved in an ideation as agents of change. They had no previous knowledge that it is possible to actively engage in designing their own built environment and not only passively use it. As a result the design process became a transparent action laying down a groundwork for an inclusive and yet playful and enjoyable process. Making the children feel important opened them up, and this way we managed to collect many useful thoughts and ideas through their empowerment

(2) The persona building exercise highlighted the fact that the children are aware of the many other users of the space. They could easily step into the shoes of others, including the teachers, passers-by, drivers and locals. The task was enabling them to empathise with the other stakeholders, think through their needs and desires regarding that area, and to walk through the complex challenges they face on a day to day basis. The task was a also a good tool for not only examine them individually, but to learn more about

their complex relations. This step resulted as a key step in the process, because the children started their ideation from a more holistic point of view, being more considerate to the others' needs. The task made them realise that although they are frequent users of the space, there is a diverse community who also have certain necessities regarding that area. It served as an important pillar before the design process, so that their ideas come from a more inclusive place, with a better understanding of shared ownership.

(3) By involving the children in the design process it was important to show them it's real circumstances and make it possible for them to have a glance in the so called "adult world", where the decisions are largely affected by regulations. Throughout the process they were encouraged to think freely and share their unfiltered thoughts, so that their original ideas and true motivations could be integrated in the design, but at the same time they received constant feedback on feasibility. It was essential to explain to them, that every decision in the design is going through a reality check, meaning the policy regulations, budget limitations, safety regulations or spatial limitations. In order to not to break down their enthusiasm, the process took time to explain where were their ideas used or how they were translated into the design. There is a good example that illustrates this challenge: the students really wanted to have a trampoline in front of the school, but due to many regulations it was not possible to realise, however their need for playfulness was an important aspect for the final design. The 'magic gate' - which is an element designed by the children to make their homework disappear - is also something that represents, how children feel the liminality of the school front and was kept as a reminder to create a design, which offers a space for transformation and relief. These steps introduced the reality of urban planning to the children in a transparent way, and the negotiations developed their sense of agency and imagination through an empowering process.

We could also understand that it is not simply the participation in the design process that brings the sense of ownership but the message it delivers. It had prior importance to find a relevant environment and a shared motivation: we decided to focus on a special and yet undervalued urban environment which is used by the children on an everyday basis but misses to serve its main functions: to navigate students physically and mentally between the inside and outside. Finding and discussing these important needs, children found their role and by that motivation to engage in a shared cause. Also participatory design process gave enough opportunity to be honest and give agency: since we treated students as partners, they acted like one: they gave us space to explain the physical and regulatory limitations of the environment and the reasons why we cannot install some desired elements in the middle of the street. Also there were several occasions when we handed over the decision making to the students in different forms (through voting, feedback and a big-scale interactive validation poster for the whole school community where even the more silent students got the chance to leave us their comments and criticisms). Since the children also articulated their new ideas according to the size and setup of the installation, it means that the participatory process successfully involved the students in the design process: they started to feel engagement, ownership and control.

5. Conclusions

According to the outcomes, we could also identify several limitations and obstacles connected to the aim of the project, highlighting systemic issues such as the general placelessness of the students and the challenges of bringing together diverse needs of place users. The project had no chance and capacity to be involved in the discussion with local residents: acknowledging the strong need for parking spots in the densely built neighbourhood, the offered concept (using 2-4 parking spots) might get into conflict with

the general need of local car owners. Even the researchers introduced the design concept and its background for the local representatives and by that, they could reach a common understanding about the benefits of the planned implementation, still the municipality reaches out to the locals only through online questionnaires instead of an offline forum, community design workshop or any kind of active participational form. Also we had to understand that by a paper formed questionnaire we cannot reach out effectively towards parents. Moving forward, the research aims to integrate involving additional stakeholders more directly and focusing on more diverse groups of users besides children.

Based on these limitations we can also see that for future research directions it would be beneficial to develop and test a same detailed methodology for other place users as well as to bring these different groups of users together aiming to find their shared motivations and needs. Connected to this it would be also fruitful to involve university students from the design and theory field to not only develop methodology and proper space development but also to raise awareness on the possibilities of participatory approaches amond the next designer generations.

ABSTRACT | The concept of 'smart cities' has been around for years, yet in some cases its influence is questionable at best, focusing mainly on lighting solutions, garbage disposal or parking issues. As in other vistas of urban design, the socio-cultural aspects of urban communities and their changing needs have been left out of the contemporary debate. This is in part due to the tendency of the smart city paradigm, to focus primarily on territorial development strategies aimed at increasing efficiency and improving living conditions as well as urban management. Due to the model's reliance on data-driven technological mapping, gaps in knowledge are created which may lead to insufficient or irrelevant interpretation and neglect of the complexity of urban dynamics. As Foucault and his successors in critical theory remarked, no data is objective, and therefore we need to archaeologically decipher its power relations. When focusing on urban social design, the process needs to start with representing the daily reality of the lives of marginalised communities in the urban environment. Following these micro-narratives will ensure a broader rethinking of the social, political and economic inequality faced by residents who are not included in the data.

As we know, cartography or mapping design is political at its core, based on power relations, techniques of control and rearrangement of the urban sphere. The challenge of urban mapping, then, calls for counter-cartography. I.e., a redesign of mapping tools that will help us redesign a better understanding of the urban environment. We offer to redefine urban mapping by using graphic design practices as a discipline rooted in symbolism and semantics, with a deeper understanding of socio-cultural sensitivities and differences. Counter-cartography is an approach that creates alternative maps that expose

marginalised issues by challenging dominant cartographic narratives. Actions are taken to reveal invisible or missing realities by satisfying additional platforms or opposing hegemonic cartography. Through counter-cartography, diverse voices and experiences can be brought together to create maps that reflect urban life's diverse realities. The purpose of this approach is to challenge the normative narratives perpetuated by traditional mapping practices and to provide a more nuanced understanding of spatial dynamics.

By combining graphic design with counter cartography, smart city initiatives can be transformed from mere data collection into powerful narratives that could help in the creation of more equal and inclusive futures. Through the use of symbols and visual storytelling, maps can convey multifaceted social meanings that resonate deeply with local communities. By using visual elements that are clear to a wider range of users, links can be developed to the data represented. The use of counter-cartography encourages residents to engage with and interpret data by emphasising culturally relevant symbols and accessible design, enabling them to actively participate in discussions regarding their urban environment.

KEYWORDS | social design, design justice, social cartography, counter-cartography, geo-design

1. Introduction

> *To claim the right to the city in the sense I mean it here is to claim some kind of shaping power over the processes of urbanization, over the ways in which our cities are made and remade, and to do so in a fundamental and radical way. From their very inception, cities have arisen through the geographical and social concentration of a surplus product. Urbanization has always been, therefore, a class phenomenon of some sort, since surpluses have been extracted from somewhere and from somebody, while control over the use of the surplus typically lies in the hands of a few* (Harvey, 2012: 5).

> *A common feature of almost all cities — regardless of global location, economic viability and stage of development — is that the people who still use city space in great numbers have been increasingly poorly treated* (Gehl, 2010: 3).

> *Revolutionary events generally take place in the street. Doesn't this show that the disorder of the street engenders another kind of order? The urban space of the street is a place for talk, given over as much to the exchange of words and signs as it is to the exchange of things. A place where speech becomes writing. A place where speech can become "savage" and, by escaping rules and institutions, inscribe itself on walls* (Lefebvre, 2003: 19).

As these quotes illustrate, the city square has long been a focal point for the struggle over the right to the city. It serves as a space where marginalized groups can make their voices heard, share ideas, and challenge the dominant power structures that shape urban life. However, as Lefebvre notes, the process of translating this revolutionary potential into meaningful social and political change is often long and arduous.

One key factor in this struggle is the structural power of the urban landscape itself. As Foucault's work on knowledge and discourse highlights, the control of information and the strategic distribution of populations within the city have been crucial tools for maintaining the status quo. Statistical data on the movements and characteristics of urban residents can be used to monitor, regulate, and discipline marginalized communities.

In response to these dynamics, critical cartography has emerged as an important tool for resisting dominant power structures and advocating for a more just and inclusive right to the city.

By creating alternative maps that foreground the experiences and perspectives of excluded and marginalized groups, critical cartographers seek to challenge the dominant representations of urban space and make visible the hidden layers of power and inequality that shape city life.

This work takes on heightened urgency in our current digital age, where the proliferation of data and virtual representations of the city can further entrench existing power imbalances. In a post-truth era, the ability to control and shape the narrative around urban space becomes increasingly critical. By mapping the lived realities of marginalized communities and making their experiences visible within the digital landscape, critical cartography offers a powerful means of influencing the discourse around the right to the city and advocating for more just and equitable urban futures.

In this context, "The Counter Cartography" makes a vital contribution to the field of critical urban studies. By presenting innovative mapping methodologies that foreground the voices and experiences of undocumented West African migrants in Tel Aviv, the article demonstrates the potential of critical cartography to challenge dominant representations of the city and create a more inclusive and empowering vision of urban life. Through the strategic use of graphic design and visual symbology, the maps featured in the article create a universally legible lexicon that allows marginalized communities to represent their own experiences and challenge dominant narratives about the city.

In doing so, the article highlights the crucial role that critical cartography can play in the ongoing struggle for a more just and equitable right to the city. By making visible the invisible layers of power and exclusion that shape urban life, and by providing marginalised communities with the tools to represent their own experiences, counter-cartography emerges as a powerful form of activism and a catalyst for social change. As such, "The Counter Cartography" opens up new avenues for research and praxis at the intersection of urban studies, cartography, and social justice, paving the way for more inclusive and empowering visions of the city in the digital age.

2. From Visual Culture to Critical Social Cartography

In our current reality, the importance and the deeply rooted link between data, citizenship and their graphic representation couldn’t be more present. From the navigation, and route suggested to us through designated apps, through the maps we relate to our present in the urban space, to the ways monetary and judicial privileges and fines are organised - we all pass through visual-digital screens. This research examines how graphic design, as a discipline rooted in symbolism and semantics, can transform urban cartographic practices. We argue that the semiotic foundation of graphic design offers unique possibilities for representing marginalised urban narratives that are often overlooked in traditional and somewhat conservative smart city approaches which tend to focus on specific applications of the urban landscape. The theoretical framework we develop here combines critical design practices with counter-cartographic methodologies to create more inclusive forms of urban representation.

Indeed, due to the limited nature of this publication, we do not wish to delve into the history of visual representation or the various theories of semiotics, symbolisms and visual metaphors. We base our assumptions on our ever-growing dependency on the visual to understand our reality, communicate with others and navigate between the virtual and material realities around us (Topelberg and Ventura, 2024). In a complex reality where the line between truth and falsehood and between professional and amateur production of visual representations, we need a critical understanding of our surroundings.

Drawing on semiotics and visual culture theory, graphic design creates what Kostelnick and Hassett (2003) term "visual rhetoric", i.e., systems of representation that communicate complex social meanings through carefully constructed visual elements. As such, the exclusion of women from street signs attests to the ideological control over social norms and conventions. In our research, we build on this understanding to examine how visual elements can serve as tools for social justice in urban mapping. The semiotic approach operates on multiple levels: at the denotative level, symbols directly represent physical or spatial information, while at the connotative level, these elements carry deeper cultural and political meanings that can challenge existing power structures.

While visual culture theoreticians deal with the issues of power and representation, the

equivalent in cartography has yet to make a similar leap. Indeed, this has been linked to urban design through social initiatives such as public participation or place-making but has not yet influenced the various practices of urban cartography. Current smart city paradigms, while technologically advanced, often fail to capture crucial socio-cultural aspects of urban communities. As Berg et al. (2016) and Piazzoni (2023) demonstrate, data-driven systems excel at managing infrastructure but struggle to represent less quantifiable aspects of urban life. This limitation becomes particularly apparent when examining what we identify as parallel urban realities: the visible city, managed through formal data collection, and the invisible city, comprising marginalised communities and unofficial or “transparent” activities (Liodaki et al., 2024; MacLeavy et al., 2012). This tendency to ‘clean’ the digital urban facade, offering a neat representation of digital movements and spheres of residents is but another facade used to camouflage and bolster power relations and control in the urban landscape. In other words, these are new systems to keep maintaining the same attitude towards the right to the city, or lack of it.

While local communities and local representation have been discussed at length in both urban design and visual culture respectfully, we believe the deeper practices of community management lie in cartography. This falls well within the classic post-Marxist approach to power relations, as this layer of data management remains hidden from most, under a nice sheen of the new and newer digital platforms of movement and management in the urban landscape. Therefore, we turn to critical cartography which provides important theoretical foundations for addressing these limitations. Following Crampton & Krygier (2006), we approach maps not as neutral documents, but as rich visual texts embedded with power relations and cultural assumptions. Building on this, our research develops what Pavlovskaya (2018) terms "participatory mapping" - practices that actively involve communities in representing their spatial experiences. As previously mentioned, we want to offer an innovative approach to urban representation composed of two major theoretical spheres of knowledge - critical cartography and social design.

Critical cartography, emerging from the broader critical turn in the social sciences, fundamentally challenges the presumed objectivity of maps. While cartography traditionally combines technical expertise from the exact sciences with visual representation principles, its seeming objectivity is shaped by political, social, and cultural viewpoints embedded in visual choices (Edoardo Boria, 2020; Farinelli, 1992; Pickles, 2004). This inherent subjectivity has led to profound criticism, particularly regarding cartography's role in producing and protecting colonial, imperialist, and patriarchal geographies (Akerman, 2017; Cohen & Duggan, 2021).

The critical cartographic approach shifts its focus from maps’ neutrality to their functioning as an ideological tool, emphasizing that mapping is inherently a political process shaped by social context, purpose, and influence (Liodaki et al., 2024). Maps, as scientific, cultural, and political artifacts, require critical examination through ontological questions about the existence or non-existence of territorial entities, aiming to highlight spatial conflicts and power relations (Elwood, 2006; Kwan, 2004; Sheppard, 2005).

One significant development within critical cartography is autonomous cartography, which produces auto-spatial mapping as a tool for understanding how hybrid spaces evolve into spatial systems connected by a non-geographic fabric, including the virtual and digital realms (Pickerill & Chatterton, 2006). This approach operates on principles such as reciprocity, voluntary assistance, and self-organization, positioned between individual liberty and collective organization. These systems are based on relationships across various spaces beyond the purely geographical, including virtual communities and digital networks (Pickerill, 2007).

This evolution echoes the development of place-making practices, where both approaches emphasise bottom-up processes and the importance of local knowledge validation. Contemporary critical cartography has expanded to address modern urban challenges, particularly within smart cities and digital mapping technologies. Scholars like Crampton, 2011 and Pavlovskaya, 2018 examine how digital cartographic practices can either perpetuate or challenge existing power relations, leading to what we might term 'digital critical cartography' - a particularly relevant approach when examining how smart city technologies, while promising efficiency, often reinforce existing social hierarchies through their mapping practices.

The development of visual language for counter-cartography involves constructing entire meaning systems that can represent complex social realities. Through our work with typography, colour theory, and visual hierarchy, we explore what (Tufte, 1987) describes as "layers of reading" - where different levels of information become accessible to different audiences while

maintaining spatial data integrity. Traditional cartographic symbols often fail to capture the dynamic nature of unofficial urban activities, leading to what Wood (2010) terms "cartographic silences." Our research responds to these limitations by developing alternative mapping practices that, as Peluso (1995a) argues, can serve as tools for social justice and community empowerment.

Fricker (2007) identifies two forms of what she terms 'epistemic injustice'. The first is "testimonial injustice" and it "occurs when prejudice causes a hearer to give a deflated level of credibility to a speaker's word" (Fricker, 2007: 1). The second type is "hermeneutical injustice", which "occurs at a prior stage when a gap in collective interpretive resources puts someone at an unfair disadvantage when it comes to making sense of their social experiences" (Fricker, 2007: 1). While historically, designers did not deal with justice, in the last few decades they tend to deal with the first, although the second runs deeper with more practical implications to individuals and communities (Guersenzweig et al., 2025). This notion of professionals - graphic or urban designers and planners - needing to take responsibility and change the status of communities in the city runs hand in hand with the essence of the 'right to the city' (Lefebvre, 2003; Harvey, 2012).

Contemporary smart city paradigms, despite their technological advancements, frequently overlook critical socio-cultural dimensions of urban existence. Research suggests that data-driven systems excel in infrastructure management yet struggle to encapsulate the lived realities of marginalised communities (Berg et al., 2016; Piazzoni, 2023). This deficiency underscores the necessity of addressing the dichotomy between the visible city—managed through formal data collection—and the invisible city, encompassing unofficial activities and communities existing beyond formal recognition (Liodaki et al., 2024; MacLeavy et al., 2012).

Critical cartography provides a foundational theory for this analysis, directing attention to maps as cultural artifacts embedded with power relations (Crampton & Krygier, 2018). This study develops participatory mapping practices that engage communities in articulating their spatial experiences (Pavlovskaya, 2018). Constructing visual languages for counter-cartography effectively endeavours to articulate complex social realities while responding to the "cartographic silences" identified by Wood (2010). Moreover, in alignment with Foucauldian frameworks of power-knowledge relations, this research recognises that design choices in cartography actively shape spatial realities rather than merely depicting them (Dalton & Stallmann, 2018). This insight culminates in the adoption of "thick mapping," facilitating a connection between quantitative data and qualitative lived experiences (Presner et al., 2014). The overarching objective is to forge innovative cartographic languages capable of representing urban complexities without compromising the dignity or safety of marginalised communities.

Following Foucault's framework of power-knowledge relations, we recognise that design choices in cartographic representation actively produce spatial realities rather than merely representing them (Dalton & Stallmann, 2018). In other words, designers, for various reasons, historically focused on reproducing these power relations instead of offering alternatives (Guersenzvaig, 2021). This understanding leads us to develop what Presner et al. (2014) call "thick mapping," where visual design serves as a bridge between quantitative data and lived experience. This approach extends beyond traditional cartographic methods by incorporating multiple layers of meaning - from statistical data to personal narratives, from official urban planning to informal spatial practices. Through careful consideration of visual systems and symbolic representation, our work aims to create new cartographic languages that can represent urban complexity without compromising the safety or dignity of marginalised communities and urban phenomena. These new visual languages operate on multiple levels: they document both formal and informal spatial practices while simultaneously challenging dominant power structures; they validate unofficial uses of space and overlooked urban phenomena, whether intentionally or unintentionally excluded; and they create platforms for alternative narratives and hidden urban dynamics to emerge and be understood. By integrating critical cartography with social design principles, we establish a methodology that is both analytically rigorous and socially transformative. The common denominator is twofold - a value-oriented and ideological approach to represent the unrepresented and excluded (both communities and urban phenomena) and a sociocultural approach that recognises the complexity of urban space not just through its official manifestations, but through its full spectrum of uses, practices, and dynamics that shape our immediate urban landscape.

The difference between mapping recognized communities and undocumented migrant workers reveals not a quantitative difference but a fundamental incomparability. Official city

residents are represented in countless databases: property tax records, education and health systems, tax payments, employment records, and movement through space. This excess representation creates a situation where there is effectively almost no knowledge gap about them—they are already "over-included" in urban control systems.

In contrast, undocumented West African migrant workers are entirely absent from these systems. They have no registration in public systems, no bank accounts (as one participant noted: "unlike the Eritreans, we don't have bank accounts, all our money is on us"), and they do not appear in official housing records. Thus, they are de facto excluded from the 'right to the city'. Knowledge about them can only be gathered through them directly or through their informal work pathways.

This incomparability fundamentally changes the meaning of mapping. For registered residents, participatory mapping is a means to influence existing representation. For undocumented communities, it is a primary act of visibility that carries risks of exposure and enforcement. The "ghetto by choice" described by participants illustrates this—a space imposed on them through exclusion, but also one the community appropriates as a safety zone against control mechanisms.

Counter-cartography is therefore not merely a participatory mapping practice but a political strategy developing a visual language that preserves deliberate ambiguity and cartographic autonomy. It expresses the inherent tension between the need for visibility and the need for anonymity, emphasizing that the question is not just "how to map?" but "whether to map at all?" and "in whose service does mapping stand?"

3. The Case of West African migrant workers in Tel Aviv

Tel Aviv's urban landscape exemplifies a complex interplay of intersecting realities that rarely engage with one another. While the city promotes itself as a global, liberal and progressive "smart city," focused on technological innovation and urban efficiency, it concurrently accommodates communities that actively resist documentation and visibility. Among these, undocumented West African migrants present a nuanced case of urban navigation and spatial practice characterised by their unrecognised status. This is a socio-cultural agenda highlighted by the ever-growing real-estate prices, heralding a ‘rich-only’ urban environment excluding all social communities that are deemed unwanted and irrelevant to this economic sphere. This is added to an already problematic cultural view of ‘us-against-them’ becoming even more acute following the unending Israel-Hamas War that started in October 2023. This is added to the heavy hand of local police targeting non-Jewish citizens as a clearly cut agenda developed by the extreme right current government.

In contrast to migrants from Eritrea and Sudan, who benefit from collective protection status within Israel, West African migrants traverse the urban environment without acknowledgement or documentation, leading to unique patterns of movement and spatial knowledge that evade conventional urban mapping techniques. While they wish to remain invisible for obvious reasons, the local government shifted between an external ignorance approach and the Faucauldian need for controlling daily realities, resulting in a mixture of neglect and harassment. This experience challenges established cartographic conventions and incites critical inquiries regarding how communities seeking to remain unrecorded can assert their presence and articulate their needs within urban discourse.

Our methodological framework combines two distinct yet complementary approaches: critical design practices and counter-cartographic methodologies. Critical design methodologies challenge conventional design thinking by questioning established power structures and promoting social change through design interventions. Following Harley's (1989) deconstructivist approach, we treat maps not as objective representations but as texts that require reading 'between the lines' to expose distortions and contradictions that challenge their apparent accuracy. This approach aligns with post-structuralist influences, which argue that reality can only be fully understood through a comprehensive and unified view of the whole (Caquard & Cartwright, 2014).

Geo-design offers a dynamic methodological paradigm that transcends traditional overlay mapping. Following Steinitz's framework, it provides a practical approach rooted in iterative models and interdisciplinary collaboration. Unlike Simon's classic approach to design as problem-solving, currently shifting towards artificial intelligence and data collection, Steinitz emphasises

stakeholder engagement and bottom-up knowledge production (Steinitz, 2012). The socially oriented graphic design approach we employ provides a crucial advantage over traditional cartographic methods through its established expertise in creating clear, universally understood visual systems that aren't necessarily derived from mapping conventions. This expertise in developing inclusive visual languages allows us to create new symbolic systems that can represent urban phenomena and community experiences without being constrained by traditional cartographic conventions.

These methodological approaches are particularly relevant when examining West African migrants in Tel Aviv, a community that emerged within broader geopolitical and socio-economic shifts since the 1990s. While exact numbers are challenging to verify due to their undocumented status, community organisations estimate between 2,000-3,000 West-African migrants currently residing in Tel Aviv, primarily concentrated in the city's southern neighbourhoods (Cohen, 2021). These communities have become integral to Tel Aviv's 'secondary labour market' (Kemp, 2003), primarily in cleaning services, low-echelon roles in restaurants, delivery services, construction, and day labour (locally termed 'chik-chak' work).

Our research methodology stemmed primarily from the collaboration with Taore, a key community member from the Ivory Coast, who agreed to be identified and guide the research process. This research facilitator provided French translation and served as a cultural mediator, establishing trust and creating connections between us and other community members. Through this trusted intermediary, we engaged with a broader network of participants over eighteen months (2023-2024). Our methodology included:

- In-depth interviews with 25 community members, facilitated and translated when necessary
- participatory mapping workshops using Tel Aviv city maps as a basis for semi-structured interviews, incorporating participants' auto-ethnographic mapping
- Visual documentation of spatial practices, guided by participants' comfort levels and safety concerns

The presence of a community member as a research facilitator enabled us to build trust while maintaining rigorous ethical standards, bridging both linguistic and cultural gaps in our research process.

4. Phase One: Community-Based Visual Literacy

This initial phase centres on cultivating 'community visual literacy' - a concept that encompasses both the ability to read and interpret spatial representations and the capacity to create meaningful visual narratives of lived experiences. As Baylen and Lucas (2014) demonstrate in their comprehensive review of visual literacy research, this ability goes beyond basic interpretation to include active creation and critical engagement with visual representations. Mitchell (2002) further emphasises that visual literacy involves not just seeing but understanding and critically evaluating visual messages within specific social contexts. To implement this approach, we developed a participatory mapping methodology that transformed official cartographic representations into tools for community expression. The process began with printed municipal maps of Tel Aviv, which we specifically selected from the city's non-commercial English-language cartographic materials, ensuring neutrality and accessibility. These maps, complete with street names and city boundaries, served as a foundational canvas for participants to document their urban experiences. Through a structured yet flexible framework, participants were asked to respond to five fundamental questions:

1. Where do you live?
2. Where do you work?
3. How do you travel from home to work?
4. What areas do you enjoy exploring in the city after work hours?
5. What areas make you feel unsafe, and where would you avoid spending time?

As mentioned, Traore, a key informant who is himself an undocumented migrant worker from Côte d'Ivoire, living in Tel-Aviv for 15 years and married to an Israeli citizen, helped us in our empirical research. Participants, working with Traore, marked their responses using a coded identification system that revealed their country of origin, age, and primary occupation in the city.

As Harper (2002) notes, such collaborative approaches allow marginalised groups to develop distinct ways of seeing and representing their social realities that challenge dominant visual narratives.

The methodological framework combined visual ethnography with critical mapping techniques, enabling what Dennis (2006) describes as a process where communities learn to both interpret official spatial representations and create alternative visualisations that better reflect their lived experiences. Through ethnographic mapping, we sought to understand how individuals and communities communicate, navigate, and relate to their urban surroundings, including spatial organisation of territory and practices of surveillance (Kuznar and Werner, 2001). The method proved particularly effective in understanding chosen locations, preferred sites, routes, navigation patterns, and areas of avoidance within the socio-cultural urban landscape (Oliver-Velez et al., 2002; Parkin et al., 2021).

Our approach effectively transformed the municipal map platform from a potential surveillance tool into a collaborative platform for spatial storytelling, where participants could negotiate their visibility and invisibility within the urban landscape. The printed municipal maps served as a foundational canvas, allowing participants to engage with a familiar geographic representation while simultaneously creating layers of intentional ambiguity. This practice aligns with Lefebvre's (1968) concept of 'the right to the city', particularly his emphasis on the right to participation and appropriation of urban space. Through these layered representations, participants exercise what Lefebvre terms 'spatial practice' - how people generate, use, and perceive space. Their selective revealing and concealing of information represent not just a protective measure, but an act of spatial appropriation and agentic ability (Gell, 2003), transforming the official representation of space into what Lefebvre calls 'lived space' (*l'espace vécu*) - the space where inhabitants seek to change and appropriate the pre-existing spatial order.

This methodological approach underscores the significance of strategic opacity in spatial mapping. Participants could mark their movements, work locations, and comfort zones while maintaining a level of protection through their selective and nuanced annotations. The exercise highlighted the need for visual tools that can transcend language barriers and protect individual anonymity, transforming the official city map into a dialogic platform for marginalised voices. Furthermore, this method helped us highlight the gaps and links between the planned or designed space and the lived space relating to a designated community. The coded annotations—revealing only nationality, age, and occupation—created a subtle yet powerful method of participation that balanced the participants' desire for visibility with their need for safety in the urban landscape.

Figure 1. An example of participant mapping

The annotated map (fig. 1) shows how participants marked areas rather than specific geographical points, creating intentionally ambiguous spatial narratives. This particular participant's markings reveal how urban space is conceptualised in terms of general territories rather than precise locations. By indicating broad areas instead of specific points, the mapping technique completely nullifies surveillance possibilities while maintaining a rich discussion of urban space usage. This method not only ensures participant protection through strategic ambiguity but also reveals how undocumented migrants experience and conceptualise urban space as interconnected territories rather than discrete locations. Through this practice, participants developed a new symbolic language for auto-ethnographic urban mapping, creating alternative ways of representing and understanding city spaces.

5. Phase Two: Development of Collective Visual Representation

Building upon the individual mapping process of Phase One, the second phase focused on transforming personal spatial narratives into collective visual representations. Working with the same group of 25 participants, we developed a methodological process that would preserve the richness of individual experiences while creating a comprehensive community-based spatial understanding. The process began with a careful analysis of the intuitive marking patterns that emerged from Phase One's maps. We observed consistent symbolic patterns in how participants naturally chose to represent their spatial experiences: X marks for uncomfortable spaces, check marks (✓) for comfortable areas, circles for living spaces that indicated zones rather than specific addresses, and lines for movement patterns. These organic marking choices formed the foundation of our graphic design decisions. Using Adobe Illustrator, we translated these intuitive community-generated symbols into a standardised visual system that preserved the participants' original spatial language while creating a cohesive collective representation. This transformation of intuitive markings into a formal visual system embodies social design's core principle: empowerment through participatory practice. Rather than imposing visual conventions, the process creates new interpretative resources emerging directly from community knowledge, addressing Fricker's (2007) concept of hermeneutical injustice through design.

The abstraction process aligns with critical cartography's emphasis on challenging dominant mapping conventions. By stripping away traditional geographic markers and replacing them with community-generated symbols, we created what Wood (2010) terms 'counter-maps' - representations that challenge official spatial narratives. The use of clear graphic symbols in counter-cartography is particularly significant as it serves to make visible alternative spatial claims and narratives. While traditional cartography often employs complex symbology that can obscure or intimidate non-expert readers, counter-cartography deliberately uses accessible visual language to democratise spatial representation.

The graphic maps created a safe space for participants to discuss their spatial experiences freely. As one participant noted, 'you are close to your roots here,' while another emphasised how 'we all look and feel alike in this place.' The abstracted visual representation encouraged participants to move beyond geographic specifics to broader discussions of community and belonging. This was evident in comments such as 'living in the community is easier because of the large cultural differences' and 'the community and the group you live with helps you if you need money.'

The mapping process revealed a clear cognitive division between *'their* Tel Aviv' and *'our* Tel Aviv'. This spatial dichotomy was powerfully illustrated when participants discussed areas of comfort versus areas of discomfort, noting that 'unlike the Eritreans, we don't have bank accounts, all the money is on us,' which reinforces the need 'to be around people you know and receive protection' from your community. The intentional ambiguity of our mapping system allowed participants to articulate these sensitive aspects of their urban experience, such as the observation that 'rental payments here are by person, not by apartment,' without compromising their safety.

When discussing areas marked on the maps, participants frequently connected spatial practices to community support networks. This was particularly evident in their description of residential choices, with one participant explaining that 'you can find everything you need from home here.' The graphic representation also facilitated discussions about institutional relationships, with participants noting that while they 'pay taxes to the municipality without requesting services,' their primary concern was about broader issues of recognition and rights.

A particularly significant insight emerged through the graphic maps when participants referred to their residential areas as a 'ghetto by choice' - a term that appeared repeatedly in interviews. As one participant explained, 'The state controls the ghetto it created,' reflecting a complex understanding of how institutional power shapes urban spaces. This framing reveals how communities transform imposed spatial limitations into chosen zones of safety and solidarity. Notably, while participants were hesitant to engage deeply with the printed municipal maps, viewing them as representations of official authority, they responded much more openly to our graphic representations. The abstract visual language allowed them to move beyond the city's official narrative and articulate their own spatial experiences and community dynamics.

While the municipal maps represented *'their* Tel Aviv' - a space of institutional power and surveillance - our graphic maps enabled discussions of *'our* Tel Aviv' - a space of community networks and survival strategies.

These collective maps were deliberately stripped of street names and traditional geographic markers, presenting instead a clean, minimal representation of Tel Aviv's urban grid. The visual layout emphasised the transformation from geographic precision to symbolic representation. This design choice was crucial in shifting the focus from specific locations to broader patterns of spatial use and perception. Through this process, we created a visual language that serves both as a research tool and a form of community empowerment, enabling critical discussion of urban space without compromising participant safety. The graphic symbols, directly informed by participants' marking choices in earlier exercises, maintain a simple, intuitive visual language. Map A highlights areas identified as comfortable, while Map B shows zones perceived as uncomfortable.

Figure 2. presents the aggregation of data from the individual cognitive maps created by participants onto a single, text-free map that we designed in Adobe Illustrator. This visual synthesis, performed by our research team, aimed to clearly present the collective spatial knowledge of the West African migrant community back to them.

6. Phase Three: Integrating Community-Generated Spatial Knowledge into GIS

In the third phase of our research methodology, we focused on the technical process of integrating the community-generated spatial knowledge, as captured in the hand-drawn cognitive maps from Phase One, into the formally structured layers of Geographic Information Systems (GIS). This phase aimed to explore the feasibility and implications of incorporating alternative spatial narratives into the dominant urban mapping technologies, as a means of operationalising the principles of counter-cartography. This phase aimed to explore the feasibility and implications of incorporating alternative spatial narratives into the dominant urban mapping

technologies, as a means of operationalising the principles of counter-cartography. In this process, we set out key objectives:

1. Demonstrating the technical possibility of translating symbolic, intentionally ambiguous cognitive maps into the specified, data-driven language of GIS.
2. Investigating how integrating marginalised communities' spatial knowledge into GIS might challenge the power dynamics embedded in these systems and offer a more inclusive, bottom-up approach to urban mapping.
3. Contributing a concrete methodological example to the theoretical discourse on counter-cartography, illustrating how it can be applied within smart city technologies and urban planning practices.

Following these assertions, we developed and followed several key methodological steps. First, digitisation, whereas the hand-drawn cognitive maps were carefully digitised using ArcGIS software, with special attention given to preserving the original symbolic representations and intentional ambiguity. This involved creating custom icons, lines, and polygons that accurately translated the participants' visual language into digital form.

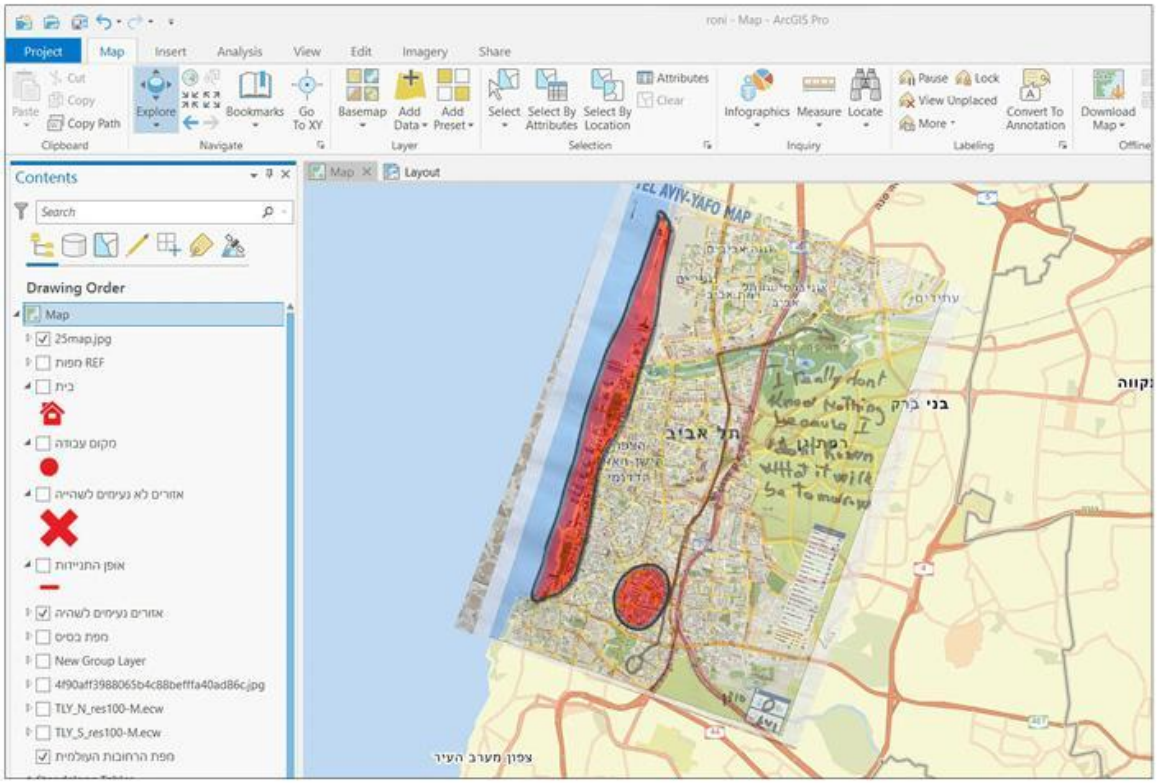

Figure 3. An illustration of the process of individually anchoring the hand-drawn cognitive maps within the GIS software. This methodological step enables the integration of the community's spatial knowledge, as captured in the participatory mapping workshops, into the formal structure of the digital cartographic platform

Second, is semiotic development, whereas a custom symbology was devised within the GIS platform to represent the various elements of the community's spatial knowledge, such as areas of comfort/discomfort, mobility patterns, and social networks. This visual language prioritised the protection of participant anonymity and the representation of collective experiences over precise geographic accuracy. The adaptation of GIS through community-generated symbology demonstrates how social design can transform surveillance tools into democratic platforms for community representation. This intervention shows Design's capacity to bridge technological systems with community-based spatial knowledge.

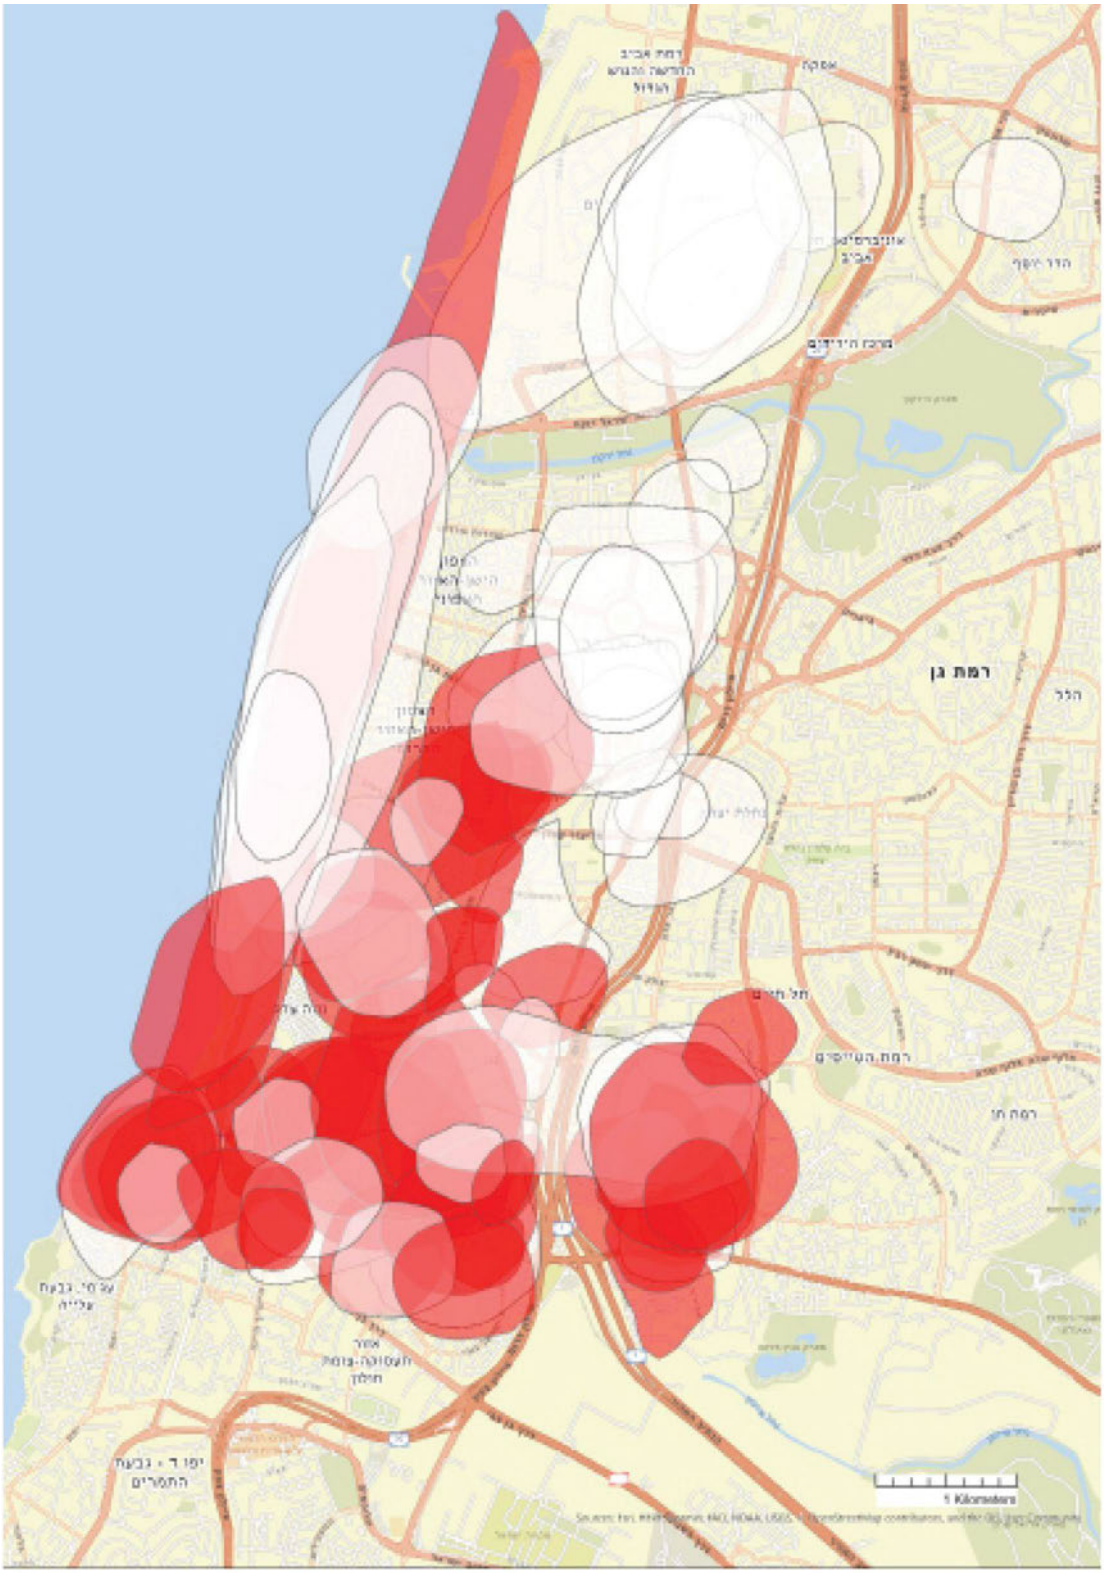

Figure 4. The map demonstrates the development of a custom symbology within the GIS platform to represent the community's spatial knowledge. The map employs red circles to denote areas of discomfort and white shapes to indicate spaces of comfort, alignining with the key mentioned in the methodology. The size of the symbols corresponds to the relative importance of each area in the collective spatial experience, while their abstract nature prioritises anonymity over precise geographic representation.

Third, layer creation, where multiple visual layers were created within the GIS, each representing a different aspect of the community's spatial understanding. These layers were designed to capture the complexity and dynamism of the participants' urban experiences, rather than presenting a static, univocal map. The technical possibilities and limitations of integrating these community-generated layers into the existing municipal GIS were explored, to identify

potential challenges and opportunities for subverting traditional power structures.

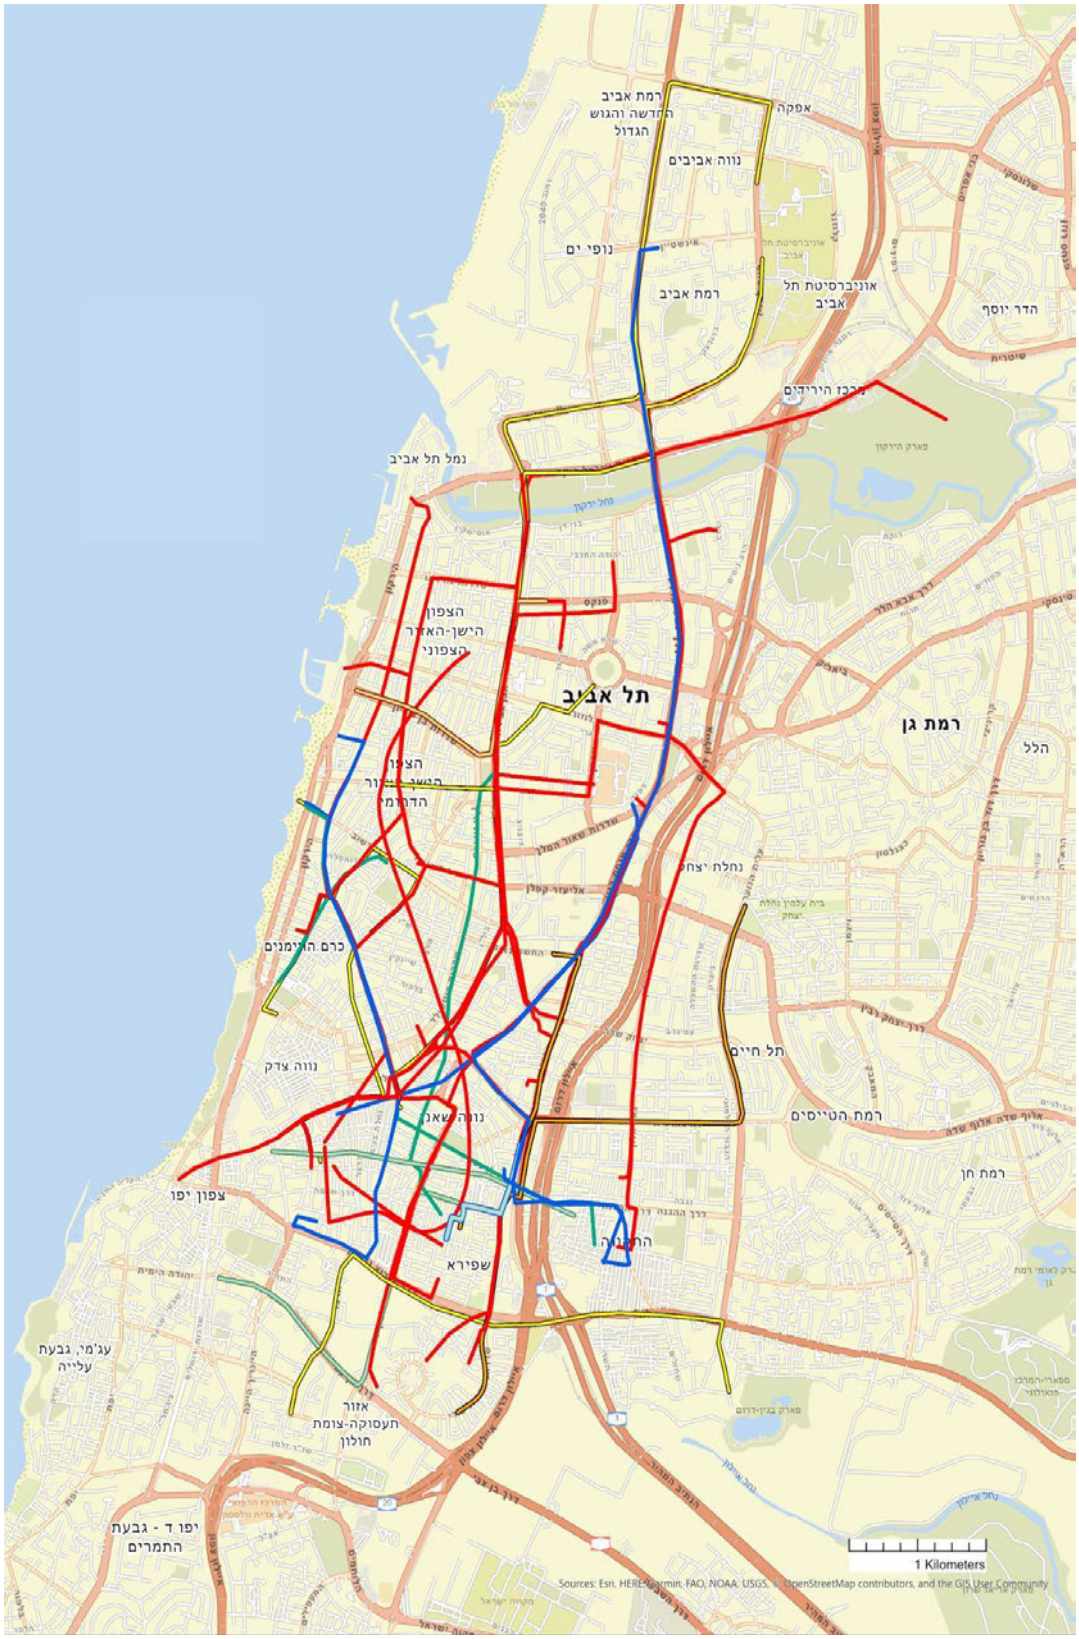

Figure 5. The map presents a visualisation of mobility data derived from the participatory mapping exercises conducted in the first phase of the research. The map does not indicate the specific destinations or origins of the participants' movements but rather highlights the main transportation routes and modes used by the West African community members in Tel Aviv.

This map (fig. 5) illustrates a key stage in developing a counter-cartographic approach to urban mapping, focusing on the mobility patterns and routes of a marginalised community. The colour-coded network of lines represents different modes of movement through the city, with red indicating bus routes, blue signifying electric bicycle paths, green denoting pedestrian walkways,

and yellow representing private vehicle roads. This map serves as a proof-of-concept for integrating community-generated data into formal GIS platforms, demonstrating the potential of counter-cartography as a tool for inclusive urban planning and development. By rendering visible the spatial practices of a marginalised community, this approach challenges the limitations of traditional cartographic methods, which often prioritise official data sources and top-down perspectives. Moreover, the visualisation of these mobility patterns provides a foundation for further analysis and intervention. Urban planners and policymakers can use this information to identify areas of need, optimise transportation networks, and allocate resources more equitably and responsively.

In this way, Figure 5 exemplifies the transformative potential of counter-cartography as a means of fostering more inclusive, participatory, and socially just approaches to urban governance. By centring the spatial knowledge and practices of marginalised communities, this method paves the way for a more nuanced, contextualised understanding of the city, ultimately contributing to developing more equitable and liveable urban environments for all residents.

A significant outcome of this phase was the successful integration of the community's presence into the GIS system in a manner that preserves the privacy of the community within a tool that is fundamentally designed around precise geographic coordinates. By developing a custom symbology and layering system that prioritised collective experiences and intentional ambiguity over geographic specificity, the research team could subvert the surveillance capabilities inherent in conventional GIS and create a space for the community's narratives to be represented on their terms. The images provided offer a glimpse into this process, showing how the GIS platform was adapted to accommodate the unique visual language and spatial knowledge of the West African migrant community. The resulting maps, while not intended for direct use by the participants themselves, serve as a powerful proof-of-concept for the potential of counter-cartography to challenge the hegemonic narratives embedded in urban mapping technologies.

7. Conclusions

This research demonstrates the transformative potential of integrating critical cartography with social design principles. The case study of West African migrants in Tel Aviv illustrates how intentionally designed symbolic systems can advance transformative urban representation. This visual methodology contrasts with the technological determinism of smart city initiatives, demonstrating how graphic design can transform digital mapping into a platform for community empowerment.

By developing "protective cartography," we challenge traditional notions of visual rhetoric while prioritising the safety and empowerment of marginalised communities. The approach proposed in this research is strategically important in two ways. First, following Bourdieu's famous ‘poison apple’ for social change, we believe that practical, daily change can occur only through the official platforms used by designers and planners. Second, adding a layer of social design to a field traditionally governed by urban planners, designers and engineers is crucial. By doing so we not only shift the focus on communities from only dealing (in the best scenarios) with public participation to visual representation in urban mapping. Therefore, we do not deal solely with practical solutions, but with a strategic redefinition of the role and responsibilities designers have in their communities.

Therefore, our methodology addresses "hermeneutical injustice" by creating new interpretive resources that give voice to marginalised spatial experiences. Through community-generated symbols and strategic visual opacity, we bridge "cartographic silences" and enact "thick mapping" that captures the complex nature of urban space. This potential tool must be added to current efforts to include local communities in urban planning and design. Aside from hearing their needs, we need to translate the urban language into understandable practices, thus this could be an important step forward.

In establishing graphic design as a crucial methodology for social justice in urban mapping, we show that effective spatial representation lies in the power of visual language to reveal, protect, and empower marginalised urban communities. By foregrounding the voices of those excluded from the map, we open up new possibilities for reimagining the city as a more just, inclusive, and equitable space.

The current research focused on developing an innovative methodology for counter-

cartography with West African migrant workers in Tel Aviv, stemming from an ideologic stance of working directly with communities rendered invisible by institutional knowledge systems. At this stage, the maps have not been formally presented to local authorities or urban planning bodies, but rather served as a theoretical-research foundation. Future research will need to address the challenge of integrating this knowledge into urban planning systems without compromising the autonomy and security of the documented communities. Currently, Jerusalem municipality if the only one to integrate a designated role of 'neighborhood planner', a person living within the community and mediating between residents and formal institutions. This is a positive direction, one which can integrate our suggested model when working with invisible communities. However, while extremely important, the full implications of our model demand further research.

The transformative potential of counter-cartography lies in its ability to challenge authorities' monopoly over spatial knowledge-production and to confront the hegemonic governmental paradigm that views mapping primarily as a tool for management and control. Following Peluso (1995), we suggest that working with local authorities in this context requires a fundamental transformation in their perceived role—from bodies that render communities visible according to political and bureaucratic needs, to partners who recognize communities' right to determine their own modes of representation. While parallel models of placemaking and tactical urbanism have created an impact around the world, the shift has yet to be unfolded in the Israeli context due to various socio-political and economic reasons.

The theoretical framework of "multiple geographies" enables us to propose a substantial epistemological shift to authorities—from a homogeneous and hierarchical conception of urban space to a heterogeneous vision that acknowledges the simultaneous existence of multiple spatial realities. Rather than implementing traditional GIS tools that flatten complexities, we propose hybrid platforms that enable marginalized communities to generate autonomous knowledge layers that preserve the ambivalence they require. The descriptive dimension of "ghetto by choice" that emerged in our research exemplifies how migrant communities develop complex spatial practices that refuse to be included in binary representation systems of visibility/absence or legality/illegality.

To incorporate counter-maps into urban decision-making processes, new types of collaborations must be developed that recognize the epistemological complexity of revealing the invisible. Migrant workers constitute an economic and social driving force operating in the marginal shadows of the city, and any urban planning that fails to account for their presence is based on a partial understanding of contemporary socio-cultural urban space. We propose two models for future collaborations:

- Hybrid Forum for Urban Planning: Development of an institutional framework that combines urban planners, government bodies, researchers (preferably, social designers, local or community-based urban designers. Urban anthropologists), and mediating agents from marginalized communities. These mediators, such as Traore in our research, would bridge institutional and community knowledge, using counter-cartography tools to represent knowledge in ways that do not endanger communities, yet echo the classic professional knowledge. In this model, communities maintain autonomy in representing their knowledge, while urban planners gain cognitive recognition of invisible spatial layers.
- Economic and Resource Recognition: Exposing the spatial knowledge of marginalized communities carries significant economic implications. In Tel Aviv, migrant workers constitute a substantial economic engine operating in the shadow of the formal economy. Recognizing their contribution means not only including them in urban representation systems but also allocating urban resources (infrastructure, services, public spaces) more equitably to meet their needs. Developing economic models based on recognition of informal economies will enable more inclusive urban planning that creates value for all city residents.

Full implementation of this approach will require local authorities to adopt what might be termed an "epistemology of deliberate non-knowledge" (see Mills, 2007)—an approach that not only respects communities' right to maintain spaces of ambiguity, but recognizes this data as an important addition to urban processes. Such transformation is not merely technical but marks a paradigmatic shift in how authorities understand their role in urban reality—from monopolistic producers of spatial knowledge to partners in constructing heterogeneous representations that respect the autonomy and uniqueness of marginalized communities.

Through these collaborations, counter-cartography can evolve from a research tool to a transformative practice, enabling urban planning that recognizes the multiple layers of urban

experience. Acknowledging communities and phenomena existing in the shadows of the city is not merely a matter of social justice but also the basis for more precise urban planning, founded on a deeper understanding of the forces shaping urban space.

About the Authors:

Roni Mero (PhD candidate) is a researcher focusing on counter-mapping and social cartography at the Faculty of Urban Planning at the Technion. Her academic work combines graphic design, critical cartography, and social justice in urban space. Alongside her academic pursuits, Mero is a radical artist active both in Israel and internationally, using art as a tool to amplify marginalized voices and challenge power systems that shape urban environments. Her current research focuses on developing a visual language that enables undocumented communities to participate in spatial discourse while maintaining the autonomy and anonymity essential to them.

Jonathan Ventura (Associate Professor, PhD) is a design researcher and design anthropologist by training. Jonathan is the Director of The Unit for History and Philosophy of Art, Design and Technology at Shenkar: Engineering. Design. Art. Jonathan is also a Research Fellow at the Helen Hamlyn Centre for Design, Royal College of Art, London and an international supervisor at the Doctorate School at MOME University in Budapest. Jonathan also heads the high-school baccalaureate in design for the Israeli Ministry of Education. He specializes in design theory, design anthropology, and social and cultural design. Jonathan is also the co-founder and co-director of the international Social Design Network (www.socialdesignnetwork.org). His latest book, titled *Introduction to Design Theory,* was co-authored by Prof. Michelle Gal and published by Routledge in 2023. His latest article co-authored by Dr. Noam Topelberg, titled *Decoding Visual Culture*, was published in *Visual Studies* in 2024.

ABSTRACT | Social innovation has emerged as a critical methodology for addressing global social challenges (Melece, 2015) and has been increasingly integrated into rural revitalization strategies, serving as a key driver for sustainable development and inclusive growth in rural areas (Castro-Arce & Vanclay, 2020). Currently, diverse spatial practices—including land art festivals, historical village renovations, eco-agricultural landscapes, and digital virtual experiences—have been implemented across rural regions worldwide, demonstrating complex interactions among geographical, cultural, ecological, and technological dimensions.

Originating from urban sociology, scene theory represents a novel paradigm for urban studies, positing that urban spaces are not merely physical environments but also "scenes" (Clark, 2013) constituted by cultural symbols, social interactions, and shared values—encompassing cultural values, lifestyles, and emotional experiences. Building on this theoretical foundation, this study adapts and extends urban "scene theory" to rural spatial research. From a social innovation perspective and incorporating emerging digital-virtual scenes, we propose an expanded "scene creation " theoretical model for future rural spaces. Through case study analysis, this model is applied to examine diverse rural practices and conceptual proposals across international contexts. The research

ultimately validates the applicability and guiding significance of the "scene creation " model in rural spatial transformation, while offering actionable strategies and reflections for rural revitalization in the digital era.

KEYWORDS | SCENE CREATION, SOCIAL INNOVATION, RURAL REVITALIZATION, RURAL SPACE

1. Introduction

With the rapid advancement of industrialization and urbanization, rural areas are facing a range of challenges, including imbalanced urban-rural development, inadequate infrastructure and population outmigration. These issues have further exacerbated complex challenges such as ecological degradation, rural hollowing, and cultural fragmentation. In recent years, social innovation has been introduced as a new development strategy for rural revitalization. By reconfiguring resources and constructing social networks, it has driven innovative development in rural areas across various domains, including service provision, employment opportunities, cultural activities, and ecological sustainability (Aldea Partanen, 2011; André et al., 2013; Copus et al., 2017; Dodd & Franke, 2011; Lindberg & Berg Jansson, 2016; Martinelli, 2013). This approach seeks to alleviate the "vicious cycle" of rural development from multiple perspectives (Christmann, 2017). Thus, social innovation is emerging as a crucial driver for promoting inclusive growth and sustainable development in rural areas (Castro-Arce & Vanclay, 2020) and has become an important research lens in rural practice.

1.1. The Interconnection of Internal and External Systems in Rural Social Innovation

Social innovation involves the adjustment and reorganization of existing elements in new contexts, akin to "new combinations" (Gillwald, 2000). As Schumpeter (1934) pointed out, innovation is not an isolated "flash of inspiration" but is achieved through continuous dialogue, interaction, and the recombination of resources. This type of innovation is rooted in the creative configuration of existing assets, encompassing diverse dimensions ranging from social capital to historical heritage, and from traditional crafts to cutting-edge technologies (Manzini, 2015). Furthermore, Copus et al. (2017) emphasize that social innovation not only relies on the participation of local resources but also requires interconnectedness across geographical and organizational boundaries. This is achieved through meaningful interactions with broader environments (Bosworth et al., 2016). Such interactions necessitate the establishment of networks and cross-boundary relationships within geographical spaces (Bock, 2016). As Warren (1967) highlighted, the key to influencing rural areas and their well-being lies in the interaction between internal elements and external environments. Rural areas are never independent; rather, they exist based on spatial and functional interdependencies (Davoudi & Stead, 2002; Potter et al., 2004). Therefore, Social innovation drives the bidirectional flow of rural resources and social capital by reconnecting the internal and external dimensions of rural society (Land, 2022). Consequently, the drivers of rural social innovation include both local (internal) resources and the close linkages with external environments (cities or other rural areas).

1.2. Multi-Stakeholder Participation in Rural Social Innovation

Social innovation not only provides new products, services, and methods but also mobilizes

relevant actors in novel ways, fostering cross-organizational and cross-sectoral collaboration (Moulaert et al., 2013; Nicholls et al., 2015). Rural areas are often regarded as small-scale communities of social life, where characterized by unique cohesion, sociability (Tönnies, 1955; Reimer, 1997; Hillyard, 2007), and expansive spatial fields, which create favorable conditions for unlocking the potential of social innovation. In rural social innovation practices, interdisciplinary stakeholders from government, enterprises and the private sector collaborate (Howaldt et al., 2018; Neumeier, 2012; Ziegler, 2017). These participants span different spatial and geographical contexts (Polman et al., 2017; Kluvankova et al., 2018), and together with residents form a diverse network of participants. Thus, Social innovation is not only related to local resources and spatial domains; the diverse participation of cross-regional entities marks the beginning of urban-rural interaction. As Neumeier (2012, p. 65) notes, social innovation is "a co-evolutionary learning process occurring within hybrid networks of human and non-human actors." Therefore, rural social innovation involves intricate relationships among local resources, spatial fields, and multi-stakeholder networks.

1.3. Cultural and Ecological Carriers in Rural Social Innovation

Rural areas encompass not only the physical spaces of residential settlements but also cultural significance and natural ecological domains, forming a complex integration of cultural and ecological resources. Traditional villages, as unique cultural spaces, are endowed with profound cultural connotations and emotional value by residents. As Chen (2015) notes, rural culture reflects not only reverence for and adaptation to nature, but also deep emotional ties to family and homeland, as well as the steadfast preservation of traditional customs. This unique cultural heritage provides intrinsic motivation for the sustainable development of rural areas. Consequently, the concept of social innovation has long been applied in the field of rural cultural heritage (Wang, 2009). China’s rural revitalization strategy emphasizes the protection of historical sites, natural landscapes, cultural environments, and intangible cultural heritage. Rural historical buildings, as important carriers of village culture (Chueng Nain et al., 2015), are particularly significant in contemporary society for their preservation, revitalization, and adaptive reuse (Cheng et al., 2020). Fu et al. (2021) have demonstrated a close relationship between the spatial patterns of traditional villages and local culture. Traditional architecture, as a witness to rural daily life, preserves unique socio-cultural memories of the region (Yue et al., 2023). In the European Union, rural innovation primarily focuses on the valorization of environmental protection and the diversification of economic foundations, a trend evident in rural tourism, bio-agriculture, and heritage-related initiatives (Borrup, 2006; Markusen, 2006). Nurdiani et al. (2020) propose creating creative economic spaces by leveraging local cultural resources, thereby improving regional conditions, optimizing spatial layouts, and enhancing the quality of the physical environment, ultimately generating economic value for communities. Social innovation plays a crucial role in integrating the inheritance of traditional cultural heritage with cultural tourism development. Through innovative spatial utilization and quality enhancement strategies, it effectively promotes tourism revitalization, achieving a symbiotic integration of traditional preservation mechanisms and modern development, and driving the revitalization

and sustainable development of traditional villages (Li et al., 2024).

Furthermore, social innovation serves not only as a new pathway for revitalizing traditional rural cultural spaces but also as a driving force for ecological landscapes and modern agricultural development. Through business model design (e.g., cooperative mechanisms) and technological innovation (e.g., soil remediation techniques), it promotes sustainable rural development. By combining technology and aesthetics, rural spaces are upgraded into multifunctional areas that integrate economic, ecological, and cultural roles. Social innovation also plays a crucial role in fostering residents' sense of identity and belonging to rural areas. To strengthen rural residents' sense of belonging and prevent population outmigration, social innovation practices in rural areas have been increasingly implemented (Aldea-Partanen, 2011; André et al., 2013; Copus et al., 2017). For instance, Portugal has promoted socially inclusive rural development through cross-sectoral art clusters, while Finland has facilitated the social integration of unemployed youth through art training programs in social living labs (André et al., 2013; Aldea-Partanen, 2011).

In conclusion, social innovation in rural spaces encompasses critical theoretical perspectives, including the interplay of internal and external systems, multi-stakeholder participation, and cultural-ecological carriers. These dimensions interact across geographical, cultural, ecological, and technological layers, forming a complex, interdisciplinary research domain. Similarly, scene theory—emerging as a novel paradigm in urban sociology—redefines urban spaces not merely as physical environments but as "scenes" shaped by cultural symbols, social interactions, and shared values. These scenes encapsulate cultural significance, lifestyles, and emotional experiences. Recognizing the conceptual synergy and potential correlations among these theories, this study proposes a "rural scene creation model" that integrates core elements of sociological scene theory with a social innovation perspective. Through case study methodology, the constructed model serves as an analytical lens to examine differentiated rural practices and conceptual proposals across global contexts. By systematically extracting operational logic from these cases, the research validates the model's applicability in rural spatial transformation while generating actionable strategies for digital-era rural revitalization.

2. Theoretical Support

2.1. Research on Scene Theory in Sociology

The term "scene" originally stems from the field of cinema, referring to an artistic expression that conveys specific information and emotions to audiences through elements such as dialogue, settings, props, music, costumes, and actors. From the 1950s to the 1980s, scholars like Erving Goffman and Joshua Meyrowitz introduced the concept of "Situation" into sociological research. They conceptualized it as a composite entity based on physical spatial dimensions and face-to-face social interactions, emphasizing that it is not merely a spatial concept but also an information system. In the 1990s, with the rise of cultural-creative industries and high-tech sectors in urban centers, scholars from the New Chicago School, including Terry Nichols Clark and Daniel Silver, integrated the concept of "Scenes" into urban sociological studies, pioneering a new paradigm for analyzing urban

development dynamics. This theoretical advancement transcended traditional dimensions of urban research focused on natural and social attributes, expanding into new layers of locational cultural consumption practices (Wu, 2022). The theory emphasizes the synergistic interaction between hardware facilities (physical infrastructure) and software systems (cultural consciousness) within specific spaces. In other words, the theory not only addresses the layout and functional characteristics of physical spaces but also prioritizes the exploration of underlying cultural values, lifestyles, and emotional experiences (Li et al., 2024). Later applied extensively to urban renewal, policy planning, and commercial strategies, scene theory emphasizes the strategic recombination of facilities and cultural symbols while considering the needs of specific cultural consumer groups. Scene theory comprises five core elements (Clark & Silver, 2016):

- Neighborhood communities;
- Physical structures;
- Diverse groups of people;
- Specific combinations；
- Cultural values (legitimacy, theatricality, and authenticity);

These elements form the theoretical foundation and source of this study

2.2. Extending Scene Theory to Rural Contexts with Virtual Scenarios

In recent years, with the development of rural cultural tourism under China's rural revitalization policies, rural cultural symbols and folkloric spiritual essence have garnered widespread attention. Scene theory has gradually expanded into rural studies, particularly in research areas such as rural public cultural spaces and traditional village tourism development. Wang (2023) suggests that scene creation may provide new pathways for the transformation and upgrading of traditional village cultural spaces, reshaping their cultural styles and aesthetic characteristics to achieve sustainable development. As an analytical tool, scenes bridge social structures and individual behaviors, reflecting the historical context and daily life practices of rural societies. Li et al. (2024) applied scene theory to evaluate the spatial quality of cultural and tourism resources in traditional villages, offering a scientific theoretical framework for the integrated development of rural cultural tourism, dynamic heritage inheritance, and sustainable utilization. Chen and Yan (2023) further utilized scene theory to enhance the cultural value of rural intangible cultural heritage towns, establishing systematic and clear pathways for cultural value elevation. Compared to urban scenes, rural scenes exhibit greater diversity due to their unique regional cultural continuities and geographical resource characteristics.

In 2014, Robert Scoble proposed that scenes also encompass multidimensional spaces such as cyberspace and virtual reality. With advancements in digital technologies, cultural space production has entered a virtualized phase, driving the emergence of immersive scene creation that combines virtual reality and real-world imagery through AI-assisted systems (Sirazhiden, 2020). Cutting-edge technologies are increasingly being applied in smart rural construction. For instance, high-precision scanning and AI modeling technologies enable millimeter-level replication of cultural heritage and rural landscapes. In Changyang Tujia

Village, Hubei Province, XR technology has been utilized to create virtual scenes featuring representative traditional cultural elements, allowing users to experience characteristic architecture and folk performances across temporal and spatial dimensions via wearable devices. These developments indicate that virtual scene creation enabled by digital technologies will become a critical frontier in the evolution of scene theory. Therefore, rural areas may transform into an innovative testing ground for "hybrid physical-digital environments", where tradition and technology can coexist in harmony.

2.3. Social Innovation-Driven Framework for Rural Scene Creation

In current practices of scene creation, excessive emphasis on cultural consumption often leads to an imbalance among cultural values, short-term interests, and sustainable development. For instance, the superficial extraction of cultural symbols and the application of standardized commercialization models risk cultural homogenization and disrupt heritage continuity. Furthermore, the marginalization of indigenous participation fractures original neighborhood networks, reducing residents to passive bystanders. These challenges are particularly pronounced in rural areas with significant differentiation, where balancing cultural vitality and social equity remains a critical concern during spatial transformation. As a driving force for inclusive growth and sustainable rural development, social innovation offers a perspective that comprehensively considers the rural spatial system (both internal and external), multi-stakeholder participation, and cultural ecological carriers.

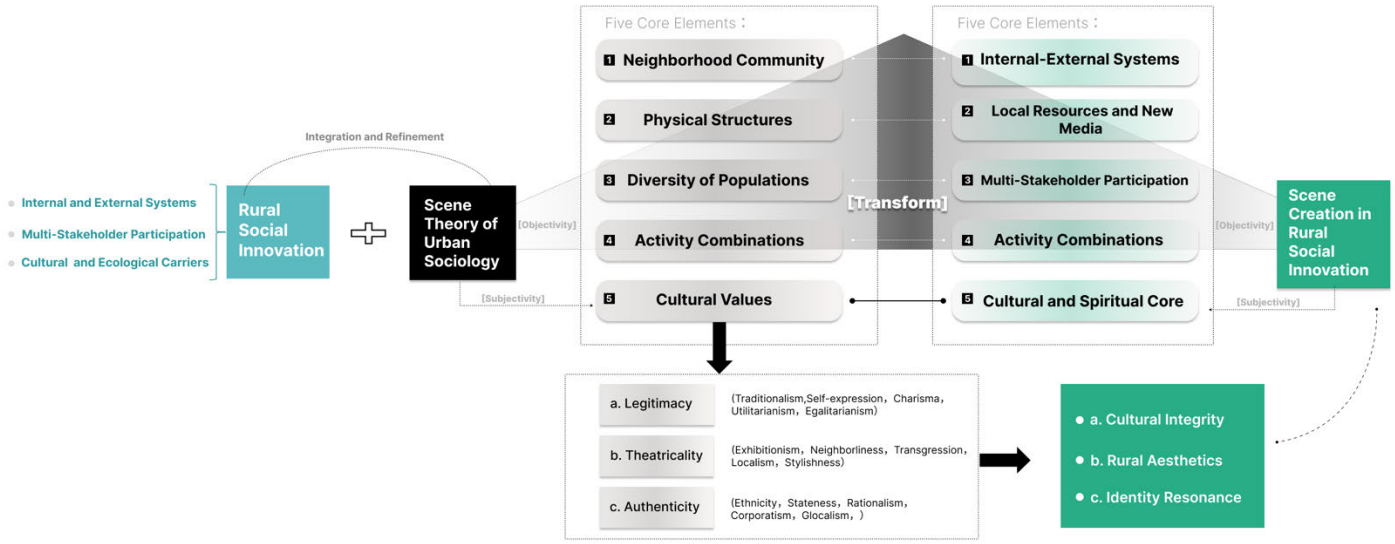

Figure 1. Theoretical model of rural spatial scene creation（figure from: Author drawing）

Therefore, guided by this perspective, this study adapts and expands the urban sociological "scene theory" framework to propose a theoretical model for rural scene creation (Figure 1). The model comprises five fundamental dimensions:

- Neighborhood Communities: Corresponding to rural internal-external systems, such as urban-rural industrial collaboration networks and smart virtual communities.
- Physical Structures: Integrating local resources (land, historical buildings, ecological features) with new media.

- Diverse Groups of people: Encompassing residents, external actors, government entities, and online community participants.
- Activity Assemblages: Featuring scene-based activities such as traditional folk events and inclusive social practices.
- Cultural Values: Extending rural cultural essence through principles of Authenticity, Theatricality, and Legitimacy—manifested through three dimensions: cultural integrity, rural aesthetics, and identity resonance.

These five dimensions constitute the core framework for rural scene creation.

3. Research Analysis

This study employs a case analysis approach, selecting exemplary rural practice cases and conceptual proposals from domestic and international contexts. These cases encompass five distinct scenario orientations: natural, cultural, ecological, and digital dimensions. Using the constructed "rural scene creation" theoretical model (as shown in Figure 1) as analytical and evaluative dimensions, the research further validates the model's applicability in rural spatial contexts. Through systematic extraction of patterns and operational logics from the cases, the study refines and expands the theoretical model by identifying sub-dimensional elements and actionable strategies for practical implementation.

Figure 2. Case Analysis （figure from: Author drawing）

3.1. Reconstructing Land-Based Natural Living Scenes through Artistic Media: The Echigo-Tsumari Art Triennale in Japan

The Echigo-Tsumari region is in the central-northern part of Honshu Island, Japan, covering an area of 760 square kilometers and including one city, one village, and four towns. In the 1970s, with significant changes in social and industrial structures, the region faced challenges such as continuous decline in agriculture and population hollowing out (Wang et al., 2022). Once an important rice production area and a place for people to live in Japan, the region has left behind a large number of abandoned terraced fields and

empty houses. In response to these abandoned cultural heritages, the art curator Kitagawa encouraged artists to create within the local environment, revitalizing these cultural legacies that once integrated people and land through the power of art. Thus, he initiated the first "Echigo-Tsumari Art Triennale" in 2000, which has been held every three years since then. The main creative directions include the integration and transformation of art and rural landscapes, as well as the functional and artistic transformation of vacant old houses and abandoned school buildings. Currently, the Echigo-Tsumari Triennale has been recognized by the United Nations World Tourism Organization (UNWTO) as a global demonstration case for "Sustainable Tourism in 2030", achieving rural innovation through five-sense experiences, regional culture, global connections, and cross-border cooperation.

The Echigo-Tsumari Art Triennale uses farmland as its stage, aiming to connect people with nature and achieve an artistic reconstruction of the natural living scenes of the land. The "scene creation " model framework for rural areas, mainly includes the following five-dimensional analysis. **(1) Internal-External Systems:** The art festival gathers artists from different regions outside the rural area to the inside, promoting continuous resource renewal within the rural area. The number of visitors from outside the rural area has increased from 163,000 in the first year in 2000 (Liu, 2009) to 540,000 in 2018, which greatly expanded the boundaries of the original rural community. In 2018, 56% of the participants were local residents, forming a co-creation model of hosts and guests, which stimulated the vitality of the rural area. A large number of young volunteers have been attracted to the rural area, effectively alleviating the problem of rural hollowing. **(2) Local resources and new media:** Artists make full use of local characteristic resources for creation. For example, in the "Empty House Project", Mexican artist Damiane Ortega chose an abandoned textile factory as the physical carrier, with the concept of connecting heaven and earth through fabrics and placed three-dimensional woven patterns and floating balls in the original physical space, attempting to evoke the memory of the local old industry through interlaced geometric patterns. Chinese architect Ma Yansong and his team MAD Architects utilized the traditional wooden framework of a century-old local house and extended a light and soft semi-transparent device - "Wild Bubble" outside. The bubble can host various functions such as performances, ceremonies, and gatherings. The local natural environment and traditional architectural structure are reflected in the new semi-transparent space, creating a scene of dialogue between humans and nature in a fusion of old and new, and a blend of reality and illusion. The team also renovated the 20-year-old Seikan Tunnel scenic tunnel. MAD installed water-drop-shaped mirrors on the original tunnel walls and used the color changes of lights to connect the external natural scenery with the internal cave in a surreal atmosphere, creating an immersive journey in a dreamlike state. In addition, Japanese artist Akiko Imai's work "For All the Lost Windows" in the fields, with white curtains and frames swaying in the wind, attracts visitors to feel the rhythm of the rural fields. The changing seasons of nature will bring different views to this window. Russian artist Ilya Kabakov's work "Terraced Fields" sets up human-shaped silhouettes on the terraced fields of the hills, representing each process of farming. The overlapping of text and patterns is like a "memory picture book", showing the living scenes that once existed on this land. **(3) Multi-Stakeholder Participation:** Local residents actively participate in the art festival activities, such as joining the volunteer team, managing restaurants, dormitories, and exhibition spaces, and organizing tourist tours. Visitors from outside the area participate in local farming activities, and enterprise organizers assist in the distribution of local products, forming a collaborative model of "government - artist - villagers - enterprises", and building a network scene of multi-party collaboration. For example, during the two busy farming seasons of rice planting and harvesting each year, a large number of previously abandoned rice fields will be claimed by outsiders, and people from all walks of life in the city participate in farming activities.

Figure 3. The figure depict scenes from the Echigo-Tsumari region in Japan, featuring artworks including Damian Ortega's textile factory transformation, 'Wild Bubbles', 'Time Tunnel' (Kiyotsu Gorge renovation), 'For Lots of Lost Windows', and 'Terraced Fields'. (figure from: Network)

Participants can receive some precious rice as "labor dividends", while the rice grown by local residents is redesigned and packaged by the art festival organizers and distributed to various restaurants. With the collaboration of artists, villagers, art festival organizers, and the government, the Echigo-Tsumari region has gradually regained vitality and formed a unique industrial combination and spatial scene. **(4) Activity combinations:** During the art festival, activities such as the Earth Environment Symposium, Art and Architecture Summer Camp, and Art Theater (including drama, dance, and concerts) are held, reviving rural areas through the power of art and promoting in-depth thinking about the relationships between humans and nature, and between humans. **(5) Cultural and spiritual core:** The artworks and their presentation methods not only do not disrupt the natural environment and original ecology of the countryside but also fully communicate with local villagers

during the intervention process, respecting their opinions and needs. It is more like a collaborative creation with the local residents. Neither the operation of art nor business has disturbed the residents' living order, reflecting the consideration of cultural identity in the process of scene creation.

3.2. Activating Historical Contexts through Architectural Acupuncture: The Renovation and Intangible Cultural Heritage Revitalization of Ancient Villages in Songyang County, Zhejiang Province, China

Situated in Lishui City, southwestern Zhejiang Province, Songyang County spans 1,406 km² and was established in 199 AD during the Eastern Han Dynasty, boasting over 1800 years of history. Its mountainous ancient villages preserve intact agrarian civilization and historical architecture. However, due to its remote inland location and relatively isolated geographical conditions, the region faces challenges of population loss and economic decline. Since 2014, Songyang has implemented systematic rural revitalization initiatives such as the "Old House Rescue Initiative." The county's renovation approach is through the adaptive reuse of small-scale public buildings. This strategy not only perpetuates historical contextual scenes but also activates the self-regeneration of ancient settlements—a methodology now recognized as the "Songyang Model." Today, the Zhejiang Provincial Institute of Urban-Rural Planning and Design employs digital technologies to create virtual environments, conducting 3D scanning and modeling of over 100 historical structures. The development of the "Ancient Villages of Songyang" digital twin system—integrated with the digital Old House Rescue platform, Tuyou Songyang digital interface, and other multi-platform tools—pioneers new paradigms for the digital conservation and utilization of traditional villages.

The villages in Songyang County have continued the historical and cultural scene in the countryside through site-specific architectural renovations and the construction of online digital platforms. According to the "scene creation" model framework for rural areas, the analysis mainly includes the following five dimensions. **(1) Internal-External Systems:** The cultural consumption spaces such as renovated guesthouses, museums, and experience workshops have attracted a large number of external urban visitors for tourism and short-term residence. The old buildings that were abandoned during the urbanization process have been transformed into new public spaces shared by both industry and culture. In addition, external tourists can also visit Songyang in a virtual digital space through VR and digital navigation technologies. The number of external visitors has increased by 65% year-on-year, achieving long-distance interaction between urban and rural areas, and the community boundary has extended from the physical level to the virtual space across time and space. **(2) Local resources and new media:** Designers rely on local architectural carriers to explore the representative cultural and industrial resources of the area and activate the development of the village through spatial renewal. Architect Xu Tiantian and her team, DnA Architects, have carried out "architectural acupuncture" - focusing on the renovation of characteristic spaces scattered throughout the village to unlock the key "acupoints" for rural development. For example, the Agricultural Museum in Pingtian Village, Sidu Township, is a renovation of the ancestral hall area in the existing spatial texture of the ancient village, turning it into a public cultural area of the village to showcase the agricultural culture and bamboo handicrafts of

Pingtian Village. During the renovation process, the rough texture of the original rammed earth walls was fully retained, allowing the new structure to better integrate into the original village texture. At the same time, traditional materials such as Mingwa were used in an interlaced arrangement on the roof, creating a fresh light and spatial atmosphere. Another example is the "Weave" Art Museum designed by Team Bldg, where the designers conducted detailed measurements of the surrounding old houses. To respond to the local traditional weaving techniques, the designers used aluminum grilles to weave a layer of "skin" on the existing building carrier that changes with the weather. This interlaced facade like "yarn" creates a light and transparent architectural volume, allowing the new scene to integrate into the local architectural complex with the characteristics of traditional culture. In addition, Songyang County's abundant bamboo forest resources also provide physical carriers for renovations, such as the Bamboo Forest Theater in Hengkeng Village, which is located at an altitude of 1,080 meters. The theater is woven from locally grown bamboo, and its form changes with the metabolism of the bamboo grove, forming a vibrant cultural space together with local drama performers.

Figure 4: The figure shows the architectural acupuncture scenes in Songyang, including the Agricultural Museum in Pingtian Village, the "Weave" Art Museum, the Bamboo Theater and the Brown Sugar Workshop (figure from: Network).

(3) Multi-Stakeholder Participation: In addition to the guidance of architects, the "Songyang Model" also involves a large number of local villagers in the construction process. For example, when DnA Architects renovated the sugar workshop, the local village director and villagers were jointly responsible for building the stove. In the later operation, enterprises and local villagers participated together. Some voluntarily cleaned the alleys, some brought crops to the restaurant as ingredients, and some demonstrated the process

of peeling radishes and grinding tofu to visitors in the agricultural museum, forming a co-prosperity development model of "government guidance + collective participation + market investment + villagers' shareholding". **(4) Activity combinations:** The sugar workshop was expanded into a theater space, combining sugar production and performance production, becoming a public cultural exchange place in the village. Visitors can experience the seasonal sugar-making activities and the inheritance of the sugar-making craft. The Bamboo Forest Theatre provides villagers with diverse activity spaces. Traditional village sacrificial activities, local high-pitched opera performances, and leisure camping for tourists have all been rejuvenated through the theatre. **(5) Cultural spirit core:** In the sugar factory, the space for sugar production has transformed into a stage theatre. The steam rising from the earth stoves during sugar boiling, combined with the workers moving among them, preserves the traditional craftsmanship as a whole through performance. Spotlights illuminate these "dancers" in the space, converting the production process of traditional craftsmanship into an entertaining performance, condensing and replicating the aesthetic of rural culture. Moreover, compared to the overly commercialized renovations in traditional rural space transformations that are detached from the daily lives of local villagers, the renovation in Songyang County not only retains and activates the local traditional industries, showcasing the processing and production of local specialty products to tourists, but also closely relies on the existing architectural space carriers of ancient villages, embodying the authentic transmission of culture.

3.3. Driving Resilient ecological Landscape Scenes through Technological Innovation: Agricultural Innovation and Hybrid Circular Landscapes in Dutch Rural Areas

The Netherlands is the world's second-largest exporter of agricultural products. However, due to its scarcity of land and rural resources, its agricultural technology has become highly intensive. Its development direction has shifted from single agricultural development to multi-objective landscape construction, vigorously promoting sustainable agriculture and services to create resilient landscape scenes. In recent years, the Netherlands has adopted various innovative measures in digital rural construction. For instance, in the farmlands of Flevoland Province, the Grow project was launched, where artist Daan Roosegaarde and his studio created an innovative agricultural art project through interdisciplinary experiments. The core of this project lies in integrating photobiological technology with agricultural production to explore new paths for sustainable rural agriculture. Additionally, North Holland has explored new landscape scenarios for circular agriculture within the existing framework of polders, peat meadows, and reclaimed land. For example, in the fertile polder landscape of Kop van Noord-Holland, high-yield farmland and horticultural agriculture are developed for the global market. The originally monotonous and empty farmland has gradually transformed into a differentiated landscape featuring a combination of mixed forms and functions, including large-scale precision production by drones and high-tech farmers. In the peat meadow area of Laag-Holland, extensive dairy farming is carried out. In the reclaimed land areas, both farming and vegetable cultivation are conducted, responding to the demand of nearby urban consumers for regional healthy food through short-chain measures, and gradually evolving into water-based urban landscapes close to the city.

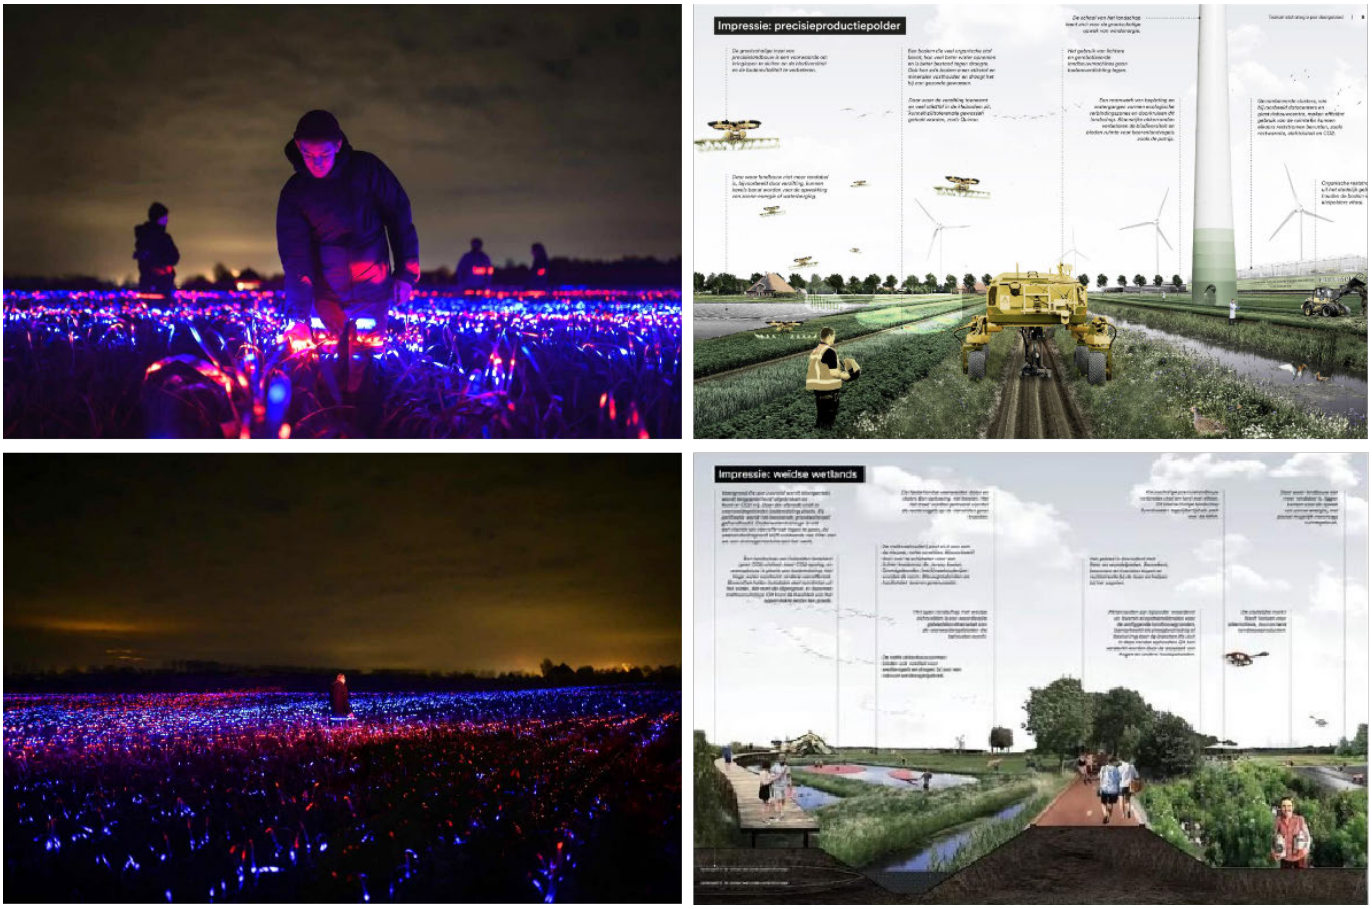

Figure 5. The figure showcase innovative agriculture and circular landscapes in the Dutch countryside. (figure from: Network)

The innovation of technology has greatly driven the resilient ecological agricultural landscape scene in the Dutch countryside. According to the rural "scene creation" model framework, the analysis mainly includes the following five dimensions. **(1) Internal-External Systems:** In North Holland circular agriculture, the functional update of the original landscape and the activation of soil biotechnology have created a clever interweaving of raw materials, energy, water and waste circulation between cities and rural areas. For example, organic waste and waste flows from cities are ingeniously utilized in the polder landscape, where some organic matter keeps the sandy clay of the polder vibrant. The circular agriculture in the countryside provides food for big cities like Amsterdam, while cities provide green residual flows to the farmland to maintain soil fertility and health. **(2) Local resources and new media:** In the Grow project, a two-hectare local farmland is fully utilized as the carrier, combining photobiology technology with agricultural production. The project uses red, blue and ultraviolet LED lighting systems to precisely intervene in the light of crops, promoting plant growth and reducing pesticide use by 50%. At the same time, it combines technology and art to reshape the agricultural landscape. In addition, the circular agriculture in North Holland fully utilizes the original landscape framework such as polders and peat meadows, and selects appropriate biotechnologies and landscape spaces based on their physical characteristics, making full use of the soil sustainability, biodiversity and high-quality productivity of the region. **(3) Multi-stakeholder participation:** The circular agriculture region in North Holland not only provides new crop planting opportunities for farmers, such as the biodiversity farmers in Laag-Holland, but also becomes a water-based landscape space, with a network of walking and cycling paths

scattered throughout, attracting urban people for ecological experiences. Urban tourists and residents can directly purchase green crops from farmers and help with the harvest during their visits. **(4) Activity combinations:** The Grow project breaks through the single production activity of agriculture and endows farmland with multiple roles such as energy production, cultural education and leisure recreation. At the same time, it attracts tourists to experience the "dancing farmland". The water-based landscape in the North Holland circular agriculture project not only protects biodiversity through wetland vegetation, but also serves as a leisure trail to attract tourists, achieving the generation of production, ecological recreation and harvesting and purchasing activities. **(5) Cultural and spiritual core:** The polder landscape is a historical rural landscape with Dutch characteristics. Through technological innovation, a model of joint farming by machines and high-tech farmers has been created. On the one hand, it preserves the regional characteristic farming culture in its original form. On the other hand, the participation of technology enables the development of the complex traditional scene in a legitimate way in modern society. Interdisciplinary art and agriculture projects transform agricultural scenes into dynamic light and shadow art, dramatically showcasing the aesthetic features of agricultural culture. The innovative path of the Dutch countryside proves that the agricultural landscape in the countryside is not only a production space, but also a testing ground for technology.

3.4. Empowering Digital Scenes through Installation Technology: Selected Installation Designs from Various Regions

From the perspective of elements in rural spatial scene creation, digital technologies have significantly empowered diverse immersive scenarios within rural spaces. **Local resources and new media:** In this series of digital scenario cases, the inherent physical resources within rural spaces are fully utilized, acquiring enhanced narrative and functional dimensions through digital media empowerment. For instance, teamLab's digital interpretation of the original bamboo forest environment in Japan represents a profound exploration of spatial atmosphere within physical spaces, skillfully integrated with historical narratives embedded in the locale. Another exemplary case is Tsinghua University's light art installation "Warmth", which thoughtfully preserves traditional weaving techniques. Through meticulous research into local pine forests, birch bark materials, and regional tree bark painting crafts, the project ultimately adopted the intangible cultural heritage craft of "Shoubian Hongliu" (hand-woven red willow) from Xikou Village in Arxan for creative expression. Building upon this foundation, the installation achieves a harmonious integration with modern light and shadow technologies, ultimately depicting a heartwarming scene of family embrace intertwined with the joy of mountain wilderness. Furthermore, the "Ladder-Party Theater" in Aiyuan Town, Jiangxi Province demonstrates innovative spatial adaptation by incorporating dual-functional elements - everyday ladders transform into agricultural drying racks during harvest seasons. This theatrical space actively revitalizes quotidian objects through performative reinterpretation, essentially curating living scenarios that bridge rural production and cultural practice. **Activity Combination:** Digital scenarios inherently represent an experimental combination of cutting-edge activities that attract visitors and encourage social media engagement. These innovative settings not only enhance the richness of visitor experiences

but also empower local residents through novel technological applications, creating new forms of entertainment and enriching their daily life experiences. **Cultural and Spiritual Core:** Digital technologies have emerged as a novel medium for expressing rural aesthetics. When traditional village spaces integrate modern light-shadow technologies - exemplified by Tsinghua University's art installations and Japan's teamLab exhibitions - the cultural narratives and spatial characteristics embedded within these environments gain more holistic articulation through digital means. Meanwhile, innovative applications like the mobile AR system at Saitama Municipal Japanese House Garden demonstrate sensory visualization, enabling visitors to directly perceive the essence of springtime vitality and chromatic radiance. This approach also represents an immersive expansion of existing spatial stylistic expressions.

4. Discussion

From the analysis of various types of cases in different regions, it can be seen that the "scene creation" theoretical model is applicable and instructive in the rural space. Each relatively successful rural revitalization case involves the consideration and deployment of five core elements. Table 1 presents a horizontal comparison and summary of the above three relatively complete rural practice cases, from which some commonalities in rural space transformation can be observed. First, these practices are all greatly expanding the boundaries of rural communities and promoting exchanges between the internal and external systems of the countryside. Whether it is the Echigo-Tsumari Art Triennale in Japan or the rural stay

Table 1. Comparative Table of Horizontal Case Studies on Scene Creation.

Five Elements of Scene Creation / Cases	Internal-External Systems	Local resources and new media:	Multi-Stakeholder Participation	Activity Combinations	Cultural and Spiritual Core	Scene Type
Echigo-Tsumari Art Triennale, Japan	Host and guest co-creation broadens the boundaries of the art community	Revitalizing abandoned houses, land art	Artist community - Indigenous people - Business - Tourists	Seminars, summer camps, art theaters	Rural aesthetics, cultural identity	Land+ Art
Historical Villages in Songyang County, China	The online and offline cultural context space shared by hosts and guests	Architectural acupuncture, cultural context industry	Government - enterprises - villagers - tourists	Intangible cultural heritage theaters, sacrificial ceremonies, cultural activities	Cultural aesthetics, authentic expression	Architecture + Culture
Innovative Rural Landscapes in the Netherlands	Sustainable ecological closed loop in urban and rural areas	Polder landscape, ecological technology	Government - Artist - Farmer - Tourist	Ecological rest and recreation experiences	Technical resilience, agricultural aesthetics	Technology + Agricultural

experience in Songyang County, China, they are all attracting external resources to join the local network by creating local characteristic attractions, forming a new pattern of urban-rural symbiosis. It can be seen that the countryside and the city are inseparable, and the countryside seems to be a complementary coupling body to the city. Therefore, the "internal and external systems of the countryside" element seems to be the boundary that the "scene creation" can reach. Secondly, local resources are the decisive factors in determining the design direction and scene type of each rural area. From the cases, it can be seen that each rural scene fully relies on existing resource carriers, including hard resources such as land, buildings, and farmland, as well as soft resources such as industries, customs, traditions, and technologies. Through the combination of resources and emerging creative media by artists, designers and other creative workers, the process of scene creation is completed. From the cases of cutting-edge digital installations, it can be seen that digital technology has transformed local resources into immersive experience fields. The vast rural space provides an experimental stage for this, and this will also be an important form of expression in future scenarios. Furthermore, the hollowing out of rural space after the urbanization process is a common challenge currently faced by rural spaces, and guiding people to return to rural land is the direction that the above cases are striving for. By creating more diverse productive types

and experience opportunities, a richer combination of activities is created to attract diverse participants to join the new space. Finally, the cultural and spiritual core of the countryside is also the driving force that distinguishes the future development of the countryside from that of the city.

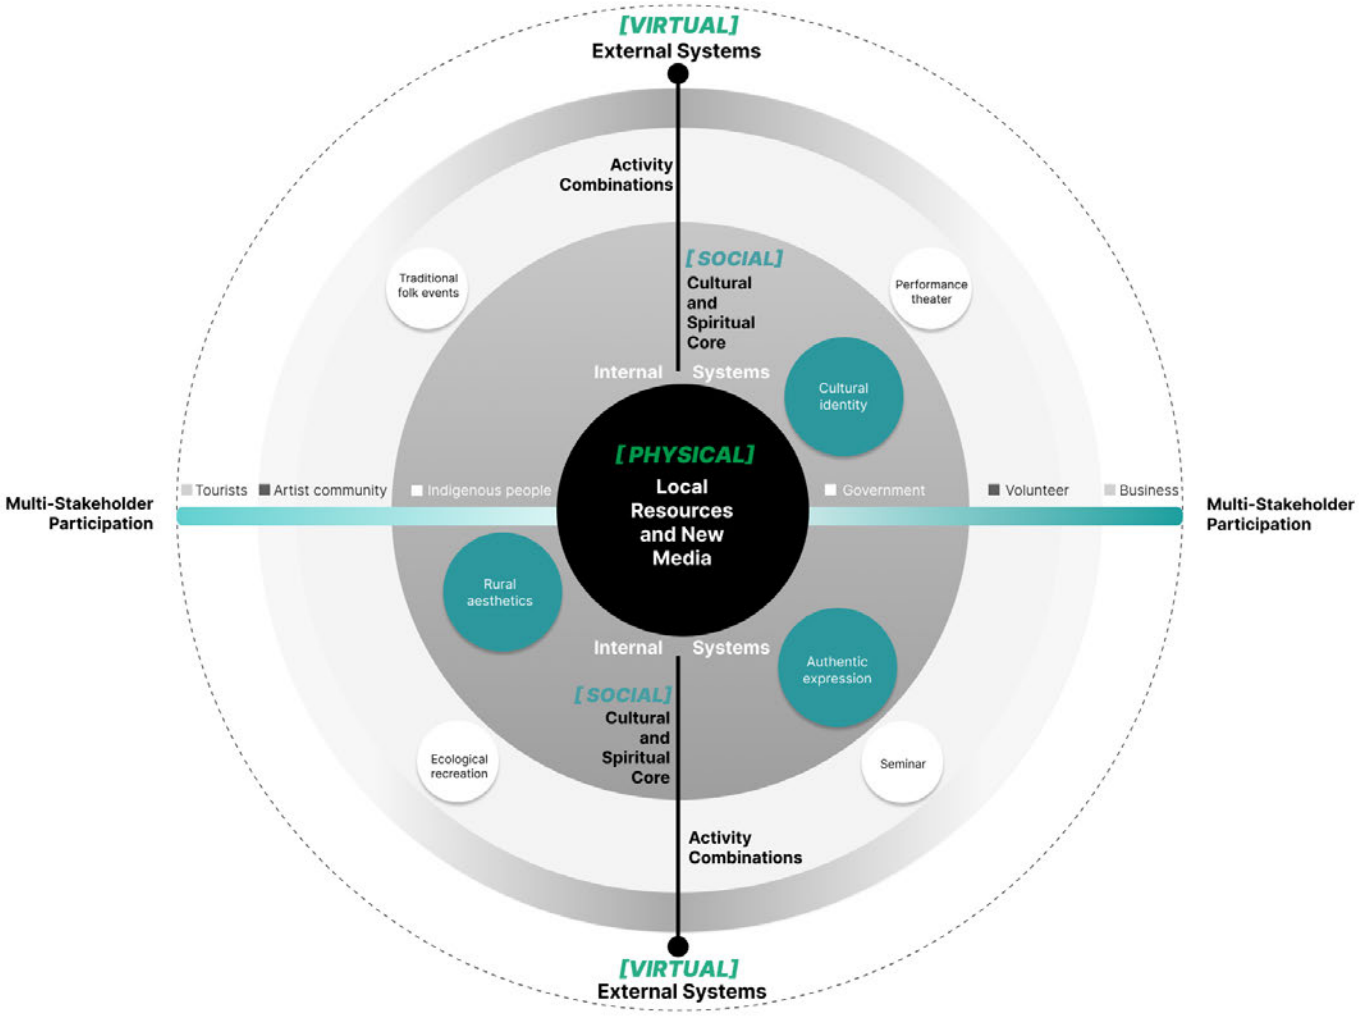

Figure 7. The system framework of "scene creation" elements from the perspective of social innovation (figure from: Author drawing)

On the other hand, the coordinated role of the five elements of scene creation achieves the completeness and vitality of scene creation. From the cases, it can be seen that the combination of the "local resources and new media" element and the "cultural and spiritual core" element plays a key role, with the former being like the design means and the latter being the design goal. In the Songyang Brown Sugar Workshop, the inheritance of traditional sugar-making culture and motion aesthetics is expressed by the designer through the designed "stage" space medium. Secondly, the combined effect of the "local resources and new media" element, the "diversified participation subjects" element, and the "activity combination" element represents the necessary conditions for the generation of stories in the scene - location, characters, and events. Designers or creative workers create "location" scenes from the originally lost and desolate land resources or idle building spaces, and various participants

continue to narrate the stories of the scenes, including local residents, artists, tourists, enterprises, etc., forming multi-level "story characters ". Moreover, cultural value elements serve as the lifeblood of all other elements in the scene creation process, integrating fading rural memories into the scene beyond the constraints of time and space. This cultural value not only enhances villagers' cultural identity but also attracts the attention of external personnel through the design of scene creation, further highlighting and expressing the authenticity of rural aesthetics and culture. Thus, it can be seen that the "scene creation" theoretical model holds significant guiding value for the transformation process of rural spaces with local characteristic resources. The interaction among various elements can endow scene creation with lasting vitality (as shown in Figure 7).

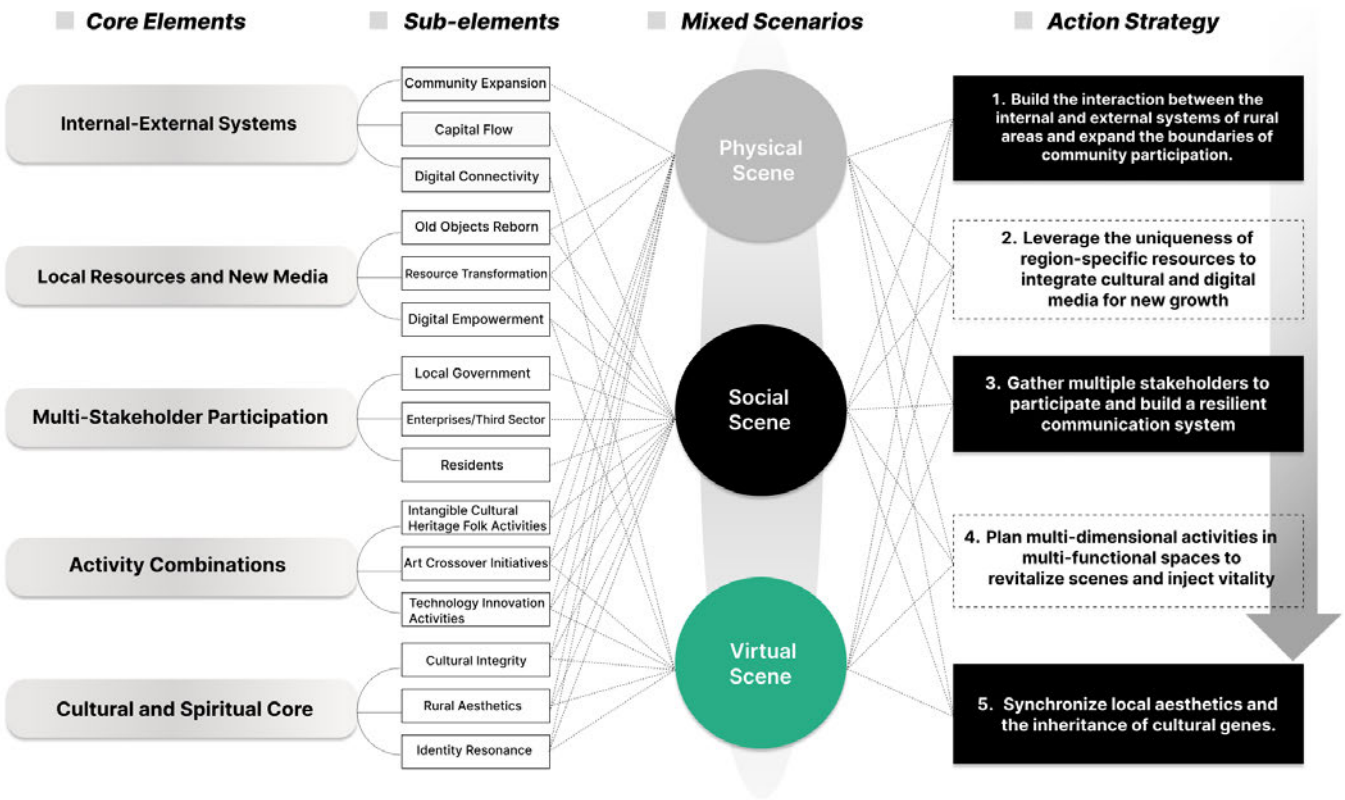

Figure 8. The theoretical model and action strategy system for rural "scene creation." (figure from: Author drawing)

Based on the theoretical model of rural scene creation and the logical factors extracted from the case, the action strategies for future rural space scene creation were constructed (as shown in Figure 8). Under the guidance of the core five elements of "scene creation", different sub-elements were derived to target specific application scenarios. The circular interaction mechanism of these scenes promoted the transformation of rural space from "physical existence" to "meaning production", achieving the integration of rural physical, social and virtual scenes, and thus obtaining the action strategies in the process of innovative rural scene creation. First, it is necessary to Build the interaction between the internal and external systems of rural areas and use digital technology to dynamically expand the boundaries of community participation. Secondly, decode the regional resource code and transform the physical space into a mixed reality field carrying cultural memory. Utilize the uniqueness of region-specific resources to integrate cultural and digital media innovations. In addition, multiple stakeholders' participation should be integrated to build a resilient network ecosystem and stimulate the

original driving force of life innovation through narrative interpretation and event occurrence. Plan multi-dimensional activities in multi-functional spaces to activate scene revival and vitality. Finally, by synchronizing rural aesthetics and the continuation of cultural DNA, a complete rural spiritual culture can be cultivated.

5. Conclusion

This research constructs a theoretical model of "scene creation" in future rural spaces through literature review and theoretical research. By analyzing and extracting the logic of five different scene-oriented cases, including natural, cultural, ecological, and digital, it provides action strategies and thoughts for rural revitalization and other practical activities in the digital age. From the perspective of social innovation, scene creation reconfigures and designs the five elements of the scene, endowing rural spaces with vitality. This shift enables the focus to move from merely physical spaces to mixed scenes that incorporate cultural and digital virtual elements. The theoretical model and action strategy system of rural scene creation aim to promote the transformation of rural areas from "physical existence" to "meaning production", achieving the activation and value enhancement of rural spaces. This study initially extends the core of social innovation theory and scene theory to rural spaces and attempts to verify the universal applicability of the theoretical model through typical cases. However, due to the limited sample size of case analysis, there are certain limitations. As the influence of digital technology on rural scene creation and the application of the theoretical model in practice continue to develop, the specific contents of the five elements of the scene will also change further. This is a topic worthy of further exploration in the future.

The Mixture of Nature and Culture in Social Context and Artistic Research

Hanny Wijaya; Yang Zhiqian

hannywijaya@hifa.edu.cn; yangzhiqian@hifa.edu.cn

Abstract

Nature was and continues to be the first teacher of humanity, it serves as a compass for all sciences. Since we live amid globalization, there is also an escalation of cultural contact that promotes mutual understanding worldwide. The perpetual conduct of research on nature and culture promises to advance our knowledge of development worldwide and to inform culturally sensitive programs and applications. Focusing on the connection between nature and culture, we applied the Empirical approach and Practice-based research as the main methods. Through the artistic project "Nature or/and Culture", we aimed to encourage students to develop ideas and create artworks that are inspired by the mixture of nature and culture. Students experimented with various elements of nature while introducing cultural elements or contexts into their ideation process. They worked collaboratively and interdisciplinarily to generate their design solution and represent contemporary life and issues in society. The outcomes of the project demonstrated the integration between nature and culture with contemporary aesthetic conception and ideation, whilst at the same time representing the connection between contemporary culture and technology.

Keywords: Nature, Culture, Social Issues, Practice-based, Participatory Art

Overview

As a great source of inspiration, nature has served mankind for thousands of years. Nowadays, the common practice of art and design inspired by nature are usually associated with a sequence of efforts to understand, synthesise, and imitate any natural object or phenomenon either tangible or intangible form, which allows us to obtain improved insights into nature (Katiyar, Goel, Hawi, & Goel, 2021). Often seen as opposite ideas (Borghini, 2019), 'nature' and 'culture' are defined variously. Some people see 'culture' as consisting of humans and their products and 'nature' as comprising whatever is unaffected by humans, whereas others see a mixture of 'nature-culture' that integrates humans, other animals, and plants (Simberloff, 2018). The notion of this mixture has inextricably intertwined histories of postmodernism and poststructuralism (Haraway, 1999). Thus, design based on nature is not a new concept since mankind has always looked to the natural world for inspiration (Conrad, Lofthouse, & Escobar-Tello, 2016).

Following the initial concept of 'nature-culture', we attempted to do a small-scale experiment regarding the topic through an art and design project at university. As educators, we would like to reflect on how our students, as the young generation, interpreted the notion and how they implemented their knowledge into artworks or artefacts. It was essential for students to put their perceptions into artistic practice since art could inspire conversations and help them to rethink and analyse their experiences (Herman, 2016). We applied practice-based and empirical methods to our students and let them do various artistic experiments in the "Nature or/and Culture" project. We aimed to assist and give them opportunities to observe, investigate, analyse, create, and implement their knowledge through the artistic project.

The experiment was conducted in the classroom and lasted for two weeks. Students started to do initial research and gather knowledge through field observation and literature review. They had to work in groups, constantly discussed, and exchanged ideas related to the topic. The main challenge was that students could not bring up art and design ideas related to the context of biomimicry, biomimetics, or sustainable design, instead, they had to connect the idea of nature with contemporary culture. Since the experiment focused on students' perceptions of 'nature-culture', it was important to understand their initial hypothesis and how it worked in their context. In general, students came up with fascinating interpretations regarding the mixture of 'nature-culture' and how they would like to implement the knowledge into their artworks. Afterwards, students had to finalise their concepts, produce their artwork, and present the concepts based on the creative process, Figure 1, from research to final work with satisfactory outcomes.

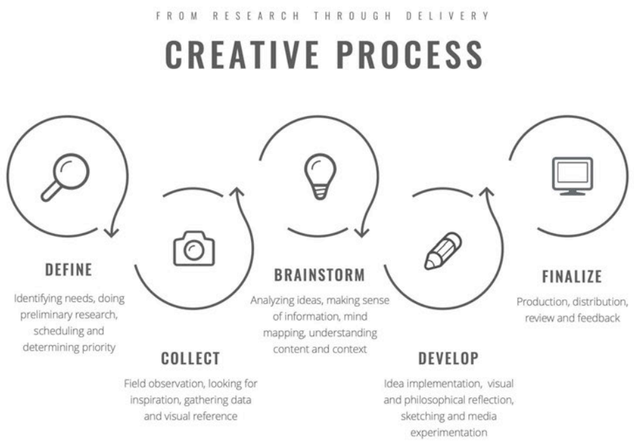

Figure 1

The "Irreversible"

During the artistic project, we originally experimented with a total of five groups of students. However, because of the space limitation, we would only discuss artwork from one group of students in this research. "Irreversible", the artwork that we found very distinctive, focused on online communities, especially the negative view on IoT (Internet of Things) and the dark side of its users or Netizens (Citizens of the Net), Figure 2. Instead of focusing on traditional or ancient cultures, the group decided on contemporary culture, especially the Internet world and its global network.

Figure 2. The "Irreversible" artwork

Figure 3. The spider's web in nature

For this experimental project, the group did not discuss the perspective of the dark web from a criminology viewpoint. Instead, following the initial brief and empirical method, students focused on their daily life experiences as avid users of the Internet. The students, as digital natives, considered themselves as part of the active Internet communities. While the development of the Internet provides users with resources and convenience, it also has a negative impact on human psychology. There is a close relationship between the use of the Internet and users' mental health such as anxiety and depression, fickleness, emotional influence, panic, insecurity, paranoia, cyber violence, overconsumption, blind obedience, crime, violent tendencies, and culture shock (Gao, Wu, Wang, Bi, & Du, 2021). These negative user psychology, especially anxiety and depression, emotional influence, and cyber violence, are quite common and have become essential social issues nowadays.

As a global platform, the Internet is a network of networks that allows users to connect and develop within its society. Students explicitly used the word "web" and "network" to relate the notion with the spider's web. They connected the Internet culture with the nature of the spider's web, which we discussed together during the research process. Further explanation of their concept focused on the characteristics of the spider's web, for example: it was beautifully connected, the nearly invisible thin thread, dangerous in nature, Figure 3. Students used the object as a metaphor to reflect the context of websites in the Internet world. The beautiful connection of the Internet entices users to join its global networks and causes an addictive experience. Current studies have found that those who used the Internet more often were more likely to experience anxiety and discomfort compared to when such users did not use the Internet. The nearly invisible thin thread of the spider's web could represent the netizens and their identities. The Internet society is considered an "invisible" community since they only connect globally through the network. This situation may cause emotional influence and insecurities within the Internet global society since there are possibilities of fake identities or communities. The invisible nature of the Internet can be dangerous due to the lack of supervision from the authorities. In addition, the spider's web itself is a structure that is generally meant to catch prey, which means it is dangerous in nature. This characteristic may represent the danger of cyber violence on the Internet, especially on social media platforms. Netizens can become either victims or perpetrators on the Internet since it is very easy to attack other people with violent words and use extreme views and language online. Research has found that online bullying and harassment, including threats or unwelcome and inappropriate sexual remarks transmitted through social media, are common among adolescents (Gao, Wu, Wang, Bi, & Du, 2021).

Figure 4. The main structure of "Irreversible" artwork

Figure 5. Participatory elements of the artwork

Based on the notions, students developed their ideation through the context of a spider's web as a metaphor for the Internet. While the object of the spider's web itself was denotatively presented, the context of the Internet's negative impact was connotatively displayed through the artwork. Students aimed to convey their main message related to the danger of the Internet if users use it without caution. They managed to imitate the visual form of a spider's web using black threads and materials to symbolise the dark side of the Internet and aesthetically design the structure of the "dark web" as installation artwork, Figure 4. Students also prepared a set of white golf balls and a black marker in a box next to their web structure. They encouraged the audience to write random words, either positive or negative, on the golf ball and throw them to the web structure, Figure 5. The main purpose was to encourage the audience to participate in the activity and become part of the artwork. The artwork was considered participatory art, since it allowed the audience for her/his creativity to be used in the here and now, just like the students, as artists, use their creativity in preparing the creative moment (Almenberg, 2010). The act of writing and throwing the golf ball to the structure was to imitate the acts of writing comments and throwing it to social media, which later could either encourage positivity or bring harm to the Internet communities. Students would like to remind the audience that once they write or send texts, words, or pictures on the Internet, it would be very hard to take them back. Thus, any actions that we take always have consequences and they will be regrettably irreversible.

Conclusion

Through the project and experiment, we managed to obtain satisfactory outcomes and reflected on the experiment positively. Students enjoyed the whole process of research and implemented their knowledge into their artwork. They were expected to associate and create a mixture of nature and culture while implementing the knowledge collaboratively through practice-based research. The method of participatory art positively supported their methods, strengthened their concept, and conveyed their message directly to the audience. We hope that students will be able to apply their experience in this project to their future research and encourage them to be more confident in implementing their theoretical and practical knowledge.

Acknowledgment

We wish to thank our master students from School of Innovation at Hubei Institute of Fine Arts, China, who participated and shared their insights with us. We also would like to thank our home institutions who supported us during the process of this project and experiment.

Transformation of the Public Realm in the Context of Regenerative Cities: Case Study of Shared Space Street Design on Campus of University

Xi Chen *[a,b], Sari Yamamoto *[c]

a Doctoral Program in Design, University of Tsukuba, Japan
b College of Design and Innovation, Fujian Jiangxia University, China

ABSTRACT | The current model of urban development with unlimited expansion has resulted in a shortage and uneven distribution of public space, which has become a major challenge for sustainable urban development (Banerjee, 2001; Jacobs, 1961). The concept of regenerative cities has shifted from car-dependent urban planning to a people-oriented urban planning model by adopting an innovative nature-centered approach (Schurig & Turan, 2022). Based on existing urban regeneration research and practice, the incremental transformation of the public realm is recognized as an important strategy that can contribute to sustainable urban development and social inclusion (Nakajima & Murayama, 2024; UrbanNext, 2024).

Shared Space aiming to achieve spatial and democratic quality could be a design approach that triggers a virtuous transformation (Shared Space, 2005). It promotes a more positive public realm through the street layout and design, enhances human interaction and mutual understanding, and shapes a more pleasant and positive public realm (Hamilton-Baillie, 2008; Kaparias & Wang, 2020). This design approach intervenes in the built environment to optimize the connectivity of the traveling environment (Karndacharuk et al., 2014, 2016), which can reduce dependence on the automobile to achieve a regenerative vision.

This study focuses on the effectiveness of paving design for Shared Space to improve automobile-dominated built environments, particularly in university districts and campuses. We selected a campus street as a prototype and proposed 25 pavement design schemes regarding angle, size, color, brightness difference, and material. According to different modes of travel, first-person perspective CG videos were produced at the walking speed of an average adult (about 1.5m/s) and the driving speed allowed in Shared Space (about 20 km/h). Based on this, two experiments were conducted, and the participants were students aged 20-40 from different countries and regions. They were asked to watch the CG videos and fill in the questionnaire (scale) to evaluate all the design schemes.

The study results show that colored non-asphalt pavement designs perform well regarding safety, comfort indicators, and compatibility with the built environment. Its design features are mainly based on the same tone with slight brightness differences, using cobblestone, square bricks, and interlocking blocks as materials. At the same time, pedestrians rated these designs well regarding ease of walking, related to their perceived comfort and priority. In addition, we found significant differences between pedestrians' and drivers' perceptions of the paving designs regarding safety and attractiveness, clarifying that pavement designs of Shared Space positively improve strict functional separation and the built environment of a car-dominated.

It cannot be ignored that appropriate design interventions have been proven through experiments, evaluations, and participant feedback to improve the user experience of the public realm, enhance social interaction and spatial connectivity, and provide people with a safer and more comfortable travel experience. We believe that Shared Space effectively transform the public realm and gradually achieves urban regeneration goals, which offer new ideas for reconciling the past, present, and future while promoting urban resilience and social inclusiveness.

KEYWORDS | Public Realm, Regenerative Vision, Shared Space, Pavement design, Design intervention

1. Introduction

The global trend of urbanization is accelerating, with 68% of the world's population expected to live in cities by 2050 (UN, 2018). Modern urban planning and design are largely car-oriented, with a large amount of urban land occupied by cars (Jacobs, 1961). This trend has not only changed the urban landscape but also fragmented cities into different functional zones, such as residential areas and business districts, by constructing high-rise buildings and wide roads (UrbanNext, 2024). Unsustainable expansion has resulted in a shortage and an inequitable distribution of public spaces (Banerjee, 2001; Jacobs, 1961), compelling us to reconsider urban design principles (Schurig & Turan, 2022).

In the face of these challenges, the key to urban transformation does not rely on new technologies but on renewing the streets (Sadik-Khan & Solomonow, 2016). Streets not only transportation but also physical activities, relieve stress and enhance their well-being (Khateeb & Shawket, 2022). However, the segregation of transport infrastructure has weakened the social function of streets, making it challenging for them to provide high-quality public spaces. 'An attractive and accessible street will stimulate people to walk and cycle to their destinations, reducing vehicle traffic and pollution' (Anvari, 2014; DfT, 2007). To improve public life on streets, many countries have implemented regulations to reduce traffic volume and speed, thereby integrating the Shared Space concept into urban street planning (Hamilton-Baillie, 2008; Furchtlehner, 2019). Shared Space has been shown to increase interaction between traffic participants by replacing traditional traffic signs and elements with informal social rules (Clarke et al., 2006; Methorst, 2007), while utilizing a well-defined street layout and facilities to guide road user behavior (Batista, 2022; Shared Space, 2005, 2008).

Previous studies have also shown that Shared Spaces can provide an effective compromise for transport participants (Batista, 2022; Methorst, 2007). By optimizing street layout and facilities, the dominance of motor vehicles is reduced, thereby improving the comfort and experience of pedestrians (Kaparias et al., 2012; Kaparias & Wang, 2020). It has also been confirmed by other research that the paving design of Shared Space also has a significant impact on driver perception, mainly in the form of reduced driving speeds. However, the effect of pavement design on pedestrian perception and walking behavior has not been fully studied. In addition, the application and study of Shared Space in university districts or campuses remain limited. Therefore, this study explores the effect of Shared Space paving design on improving the car-oriented built environment, especially interventions involving university districts and campus environments. We evaluated different kinds of paving design schemes through experiments and investigated and analyzed the perceptions of pedestrians and drivers to verify the impact of paving design on walking behavior and its role in promoting the vitality of public spaces.

2. Literature review

2.1. Regeneration of the public realm

Cities have undergone numerous significant structural changes, and their complexity and dynamism reflect the many processes of physical, social, environmental, and economic transformation (Roberts & Sykes, 2000). In the early 1960s, the concept of urban public space was cited by scholars such as Lewis Mumford and Jane Jacobs (Nadal, 2000). They criticized large-scale renovation plans from different perspectives and advocated for small and flexible plans.

In the 1970s and 1980s, urban planners, researchers, and government entities began to explore innovative approaches to creating urban space. Small-scale

and incremental ‘neighborhood renewal’ gradually replaced large-scale and radical redevelopment. In 1974, the local government of Rotterdam launched the ‘Building for the Neighborhood’ (bouwen voor de buurt) program aimed to renovate and upgrade the old city. This initiative led to the development of increasingly well-designed residential areas, giving the old city a new look and providing a successful example of urban regeneration and revitalization for many European countries (Ariënne & Paul, 2014; Van Melik & Lawton, 2011). In 1982, Spanish architect Manuel de Sola Morales proposed small-scale interventions in run-down areas of Barcelona. This approach, known as ‘urban acupuncture’, has since become a model for sustainable urban transformation by triggering local improvements to promote overall urban development (Hemingway & Alejandro, 2022).

Entering the 1990s, reshaping the urban public realm became an integral part of many urban renewal strategies. It was recognized to improve the living environment, enhance the city's image, and improve the quality of life for city residents. In 1999, the British report ‘Towards Urban Regeneration’ clearly proposed that urban design centered on public space is a ‘dynamic development strategy,’ which was subsequently implemented in the urban regeneration process of London. Since then, the British government has increased its investment in traffic improvements, shared streets, pedestrianization, and urban landscapes, thereby significantly improving the quality of urban public spaces (Yang, Z., & Yu, D. Y., 2018). Barcelona, a paradigm of urban renewal, initiated the Superblock renovation and renewal plan in 2015 to address issues such as the excessive occupation of urban street space by motor vehicles and the diminished vitality of street space. The optimized road network has been transformed into three types of road space, including shared streets featuring a curb-less design (Muzzini, & Torres, 2023).

2.2. Research on Shared Space

In the late 1960s, the Delft Planning Department conducted pioneering experiments based on the ‘Woonerf’ concept. These experiments involved removing standardized traffic control elements such as signs, markings, and curbs, thereby integrating traffic flow with residential activities to enhance the vitality of public space (Karndacharuk et al., 2014). In 1976, the success of the ‘Woonerf’ led the Dutch government to officially introduce corresponding guidelines and regulations, which influenced the design of residential streets in the UK, Switzerland, Denmark, and Germany. Subsequently, the application of mixed traffic modes in non-residential areas has increased, evolving into the ‘Shared Space’ concept, which was actively promoted by Dutch traffic engineer Hans Monderman (Hamilton-Baillie, 2004). Hans Monderman's practices have not only achieved remarkable success but also garnered significant attention from the international community and academia (Ben-Joseph, 1995; Clarke et al., 2006; Hamilton-Baillie, 2008). The concept of Shared Space was subsequently incorporated into the ‘Interreg IIIB North Sea’ (2000-2006), leading to the implementation of pilot projects in Belgium, Denmark, Germany, the Netherlands, and the UK (Karndacharuk et al., 2014; Shared Space, 2005, 2008).

In the 2000s, Shared Spaces were applied to many urban streets in the UK, with the redesigned Exhibition Road in London being one of the most well-known projects (Batista, 2022; Jayakody et al., 2018). Several studies have examined the transformed Exhibition Road in London, revealing that streets with Shared Space elements significantly enhance the pedestrian experience by increasing their confidence (Kaparias et al., 2012; Karndacharuk et al., 2013; Kaparias et al., 2020; Ruiz-Apilanez et al., 2017). In particular, designing a level surface without obstacles facilitates unimpeded movement for pedestrians (Jayakody et al., 2018; Karndacharuk et al., 2016; Ruiz-Apilanez et al., 2017). Additionally, streets with Shared Space elements help to increase eye contact between pedestrians and drivers, thereby influencing driving behavior (Toyoshige, et al., 2011; Yoshiki & Hashimoto, 2014). Paving designs contribute to the creation of a low-speed traffic environment, and white diagonal interlocking block pavements have been shown to have a significant impact on driving speed (Ozaki et al., 2017). Therefore, some researchers argue that the 'Shared Space' concept offers a viable compromise. The integrated traffic space increases social interaction and reflects equal road rights (Kaparias et al., 2023; Methorst, 2007), while a well-designed street layout along with appropriate street facilities can substantially enhance public space safety, accessibility, and overall spatial quality (Batista, 2022; Kaparias & Wang, 2020, 2016; Shared Space, 2005, 2008).

Most practical and theoretical research on Shared Spaces has focused on residential areas and commercial streets. Limited studies have examined the implementation of Shared Space in university districts and campuses, with notable examples including Skvallertorget Square in Norrköping, Sweden, the Sonnenfelsplatz intersection in Graz, Austria, the Adelphi quarter at the university of central Lancashire in Preston, UK, and the Rengerslaan around NHL Stenden University in Leeuwarden, the Netherlands. Against the backdrop of accelerated social development, universities have become integral components of urban landscapes as cultural centers or in conjunction with science and technology centers, engaging them in wider discussions and urban regeneration practices (Melhuish, 2015). As cities around the world have experienced a 'flurry of [HE] building activity in cities around the world' (Van Heur, 2010). It is necessary to pay more attention to the revitalization of university districts and the built environment of campuses to gain experience to shape a new urban future.

3. Methodology

3.1. Prototyping

This study selected a six-meter-wide two-way street within the university district of Fuzhou, China, as a prototype, as shown in Figure 1(a). Following the principles of Shared Space, we developed a 3D model by using SketchUp Pro (2020 version). In this virtual street environment, there is no physical separation between pedestrians and motor vehicles, i.e., no curbs, road signs, or dedicated lanes for

specific modes of transportation. The CG videos are generated from a first-person perspective and played at both the walking speed of an average adult (about 1.5 m/s) and the permitted driving speed in Shared Space (about 20 km/h). The experimental stimuli comprised 25 different paving designs that were applied to the level surface of the prototype street. To align with the landscape and functional requirements, permeable pavement materials commonly used in Shared Space projects were employed, including interlocking blocks, cobblestones, concrete, and square bricks. Considering the natural properties of these materials and their compatibility with the built environment, the study utilized red, yellow, and blue from the Munsell system as primary colors. In addition, parameters such as pavement width, angle, brightness difference, and size were carefully considered to ensure the rationality and validity of the experiment.

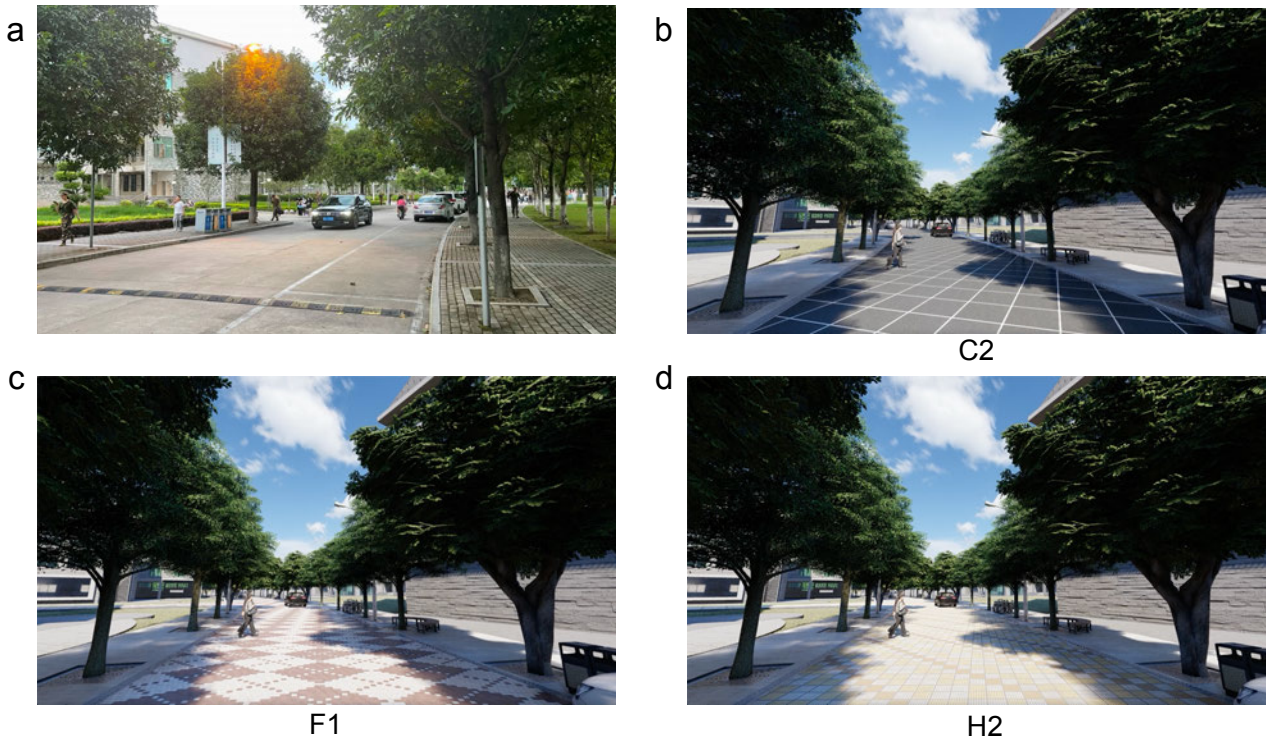

Figure 1. Prototype street and pavement design schemes used for the experiments. (a) The campus street of Fujian Jiangxia University, China. (b) The Interlocking block pavement design. (c) The cobblestone pavement design. (d) The Square brick pavement design.

It is important to note that the campus street used as a prototype serves pedestrians, drivers, and some cyclists in actual circumstances; however, cyclists were not included in the evaluation scope of this study. Cycling experiences involve numerous physical factors, particularly higher vibration levels than driving and walking, which cannot be accurately replicated through visual simulation alone. Given that the study focuses on investigating users' perceptions of pavement design in visual terms, the user group was restricted to pedestrians and drivers to ensure the validity of experimental results.

3.2. Experimental design

Stimuli were evaluated using a 7-point Likert scale, where 1 represented the most negative and 7 represented the most positive response. By reviewing relevant

research and audit tools, we identified 19 adjective pairs serving as indicators for the pedestrian experiment. Among them, 14 adjective pairs were used to evaluate the overall impression of the built environment, such as safe-dangerous, comfortable-uncomfortable, attractive-unattractive, aesthetic-nonaesthetic, neat-messy, compatible-incompatible, etc. Moreover, 5 adjective pairs were introduced to evaluate Shared Space, such as easy eye contact-difficult eye contact, with priority-without priority, easy walking-difficult walking, etc. Meanwhile, the scale and questions employed in the driver experiment were slightly modified from those used in the pedestrian experiment to investigate driving behavior in Shared Space. To facilitate comprehension and minimize potential biases and misunderstandings, the questionnaire was provided in English and Japanese, and each adjective pair was explained verbally before the stimulus was evaluated. For example, in the evaluation indicator “Safety-dangerous”, 1 point was interpreted as extremely dangerous and 7 points as extremely safe.

Furthermore, considering the primary user groups for the prototype, we recruited 109 students from various countries and regions at the University of Tsukuba to participate in our experiments. Participants were aged between 20 and 40, with 56% male and 44% female. The pedestrian experiment (n=54) consisted of 18 Japanese students, 19 Chinese students, and 17 Non-Asian students. The driver experiment (n=55), which included 19 Japanese students, 20 Chinese students, and 16 Non-Asian students.

3.3 Procedure

The two experiments were conducted separately in a controlled laboratory setting at the University of Tsukuba, with the following procedures. First, we provided participants with detailed explanations regarding the experiment's purpose, procedure, method, and the background of the Shared Space concept. After obtaining the participants' permission, the experiment commenced.

- The total experience time for each participant was 1 hour.
- The CG videos viewed by each participant were played in a random order.
- Participants were asked to watch the CG videos while walking as pedestrians and sitting in a chair as drivers.
- The duration of each CG video for the pedestrian was 30 seconds; the duration of each CG video for the driver was 1 minute.
- Allowed to stop when participants felt tired and take a 5-minute break before continuing.
- Participants were asked to complete questionnaires evaluating each stimulus.

Finally, we conducted brief interviews with each participant to collect more detailed feedback on the design schemes, which will serve as a reference for future optimization of the paving design.

4. Results and Discussion

4.1. Perceptual analysis of pedestrians

Micro-level urban design qualities and improvements to the street environment can provide a more pleasant and comfortable experience (Cambra, P et al., 2022). To create a more pleasant, comfortable, and inclusive travel environment, this section presents the perceived impact of Shared Space paving designs on pedestrian comfort and compatibility.

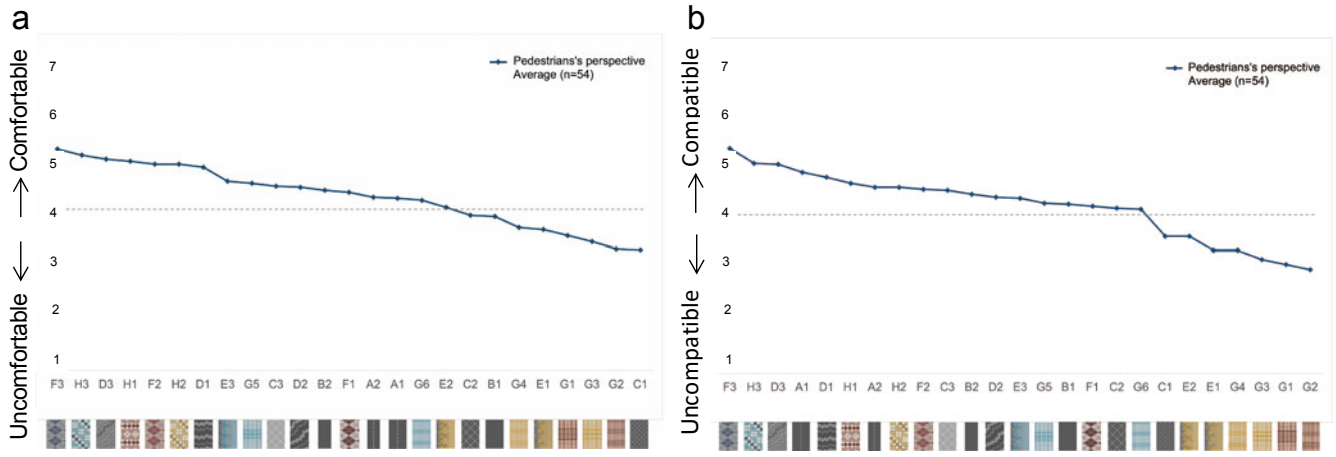

Figure 2. (a) The perceived comfort of pedestrians. (b) The perceived compatibility of pedestrians.

Figure 2(a) shows the scores for each pavement design in terms of perceived pedestrian comfort. Designs such as the blue cobblestone design (F3) and the blue square brick design (H3) scored 5.07 and 5.00, respectively, indicating that these designs make pedestrians feel a high level of comfort. The grey interlocking block design (D3), the red square brick design (H3), and the red cobblestone design (F2) also received high ratings from pedestrians, adding to the comfort of the travel environment. The blue concrete design (G5), the dark grey interlocking blocks with a 45-degree lines (D2), and dark red cobblestone design (F1), etc., scored between 4.00 and 5.00, which means that pedestrians' evaluation of their comfort was more positive. However, the asphalt paver with diagonal lines design (C1) and the red concrete design (G2) received lower scores of 3.22 and 3.24, indicating that these designs make pedestrians feel uncomfortable.

Figure 2(b) shows the scores of each pavement design in terms of pedestrian perceived compatibility. The blue cobblestone design (F3) and the blue square brick design (H3) scored 5.17 and 4.89, respectively, indicating that pedestrians perceive these designs as highly integrated with the built environment. It is worth noting that, unlike the comfort evaluation, the 6-meter asphalt paver with a central line (A1), and the 4-meter asphalt paver (A2) received more positive evaluations from pedestrians. Second, the asphalt with diagonal lines design (C3), the interlocking blocks with a 45-degree lines (D2), etc., scored 4.40 and 4.30, respectively, indicating that the pedestrians perceived the comfort level as average. In contrast, the red concrete design (G2) and (G1) scored 2.93 and 3.02, respectively, with lower scores indicating that these designs are incongruous with the street environment.

The above results show that color, material, and brightness design parameters play an important role in improving pedestrian walking comfort. These design parameters also affect the perception of the integration of the design with the built environment. In addition, the results of the correlation analysis show the intrinsic links between each evaluation indicator. Specifically, there is a positive correlation between walking ease and comfort (r= 0.9238, p<0.001), as shown in Figure 3(a). It shows that, to some extent, increasing pedestrian perceived comfort may help improve their perception of the walking ease of the built environment. It is also worth noting that there is a positive correlation between attractiveness and priority (r=0.9105, p<0.001), as shown in Figure 3(b). This suggests that, to some extent, improving pedestrian attractiveness can help improve their perception of the walkability of the built environment. These statistically significant correlations provide data support for this study.

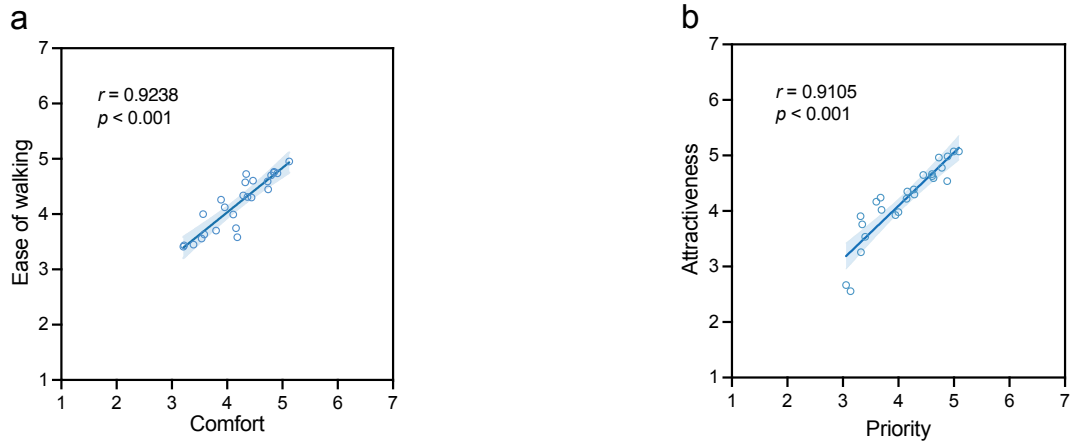

Figure 3. (a) The correlation between ease of walking and comfort. (b) The correlation between attractiveness and priority.

4.2. Perceptual analysis of drivers

To ensure a comfortable experience for pedestrians in Shared Space, this study also investigated the impact of 25 different pavement designs on driver perception, particularly driving speed.

The scores of driving speed for each pavement design are shown in Figure 4(a). The 6-meter-wide asphalt with a central line (A1) and the 4-meter-wide asphalt pavement (A2) received the highest ratings from drivers, at 5.22 and 4.67, respectively. This indicates that drivers considered these designs suitable for high-speed driving. Designs ranging from the 6-meter asphalt design without a white center line (B1) to the blue concrete design (G6) received ratings between 4.00 and 3.00, suggesting these designs had a slight influence on driving speed. In contrast, the red square brick design (H1) and the red cobblestone design (F2) received lower scores of 2.42 and 2.62, indicating that these designs attracted drivers' attention and prompted them to voluntarily reduce their speed. Notably, although the red concrete design (G2) received the lowest ratings, at 2.40. This design was perceived by pedestrians as uncomfortable and incompatible, which similarly affects drivers' perception, resulting in lower speeds. Furthermore, the results of the correlation analysis revealed there was a positive correlation between driving speed and ease of driving (r = 0.7137, p < 0.001), as shown in

Figure 4(b). This suggests that influencing drivers' driving speed may help alter their behavior in Shared Space.

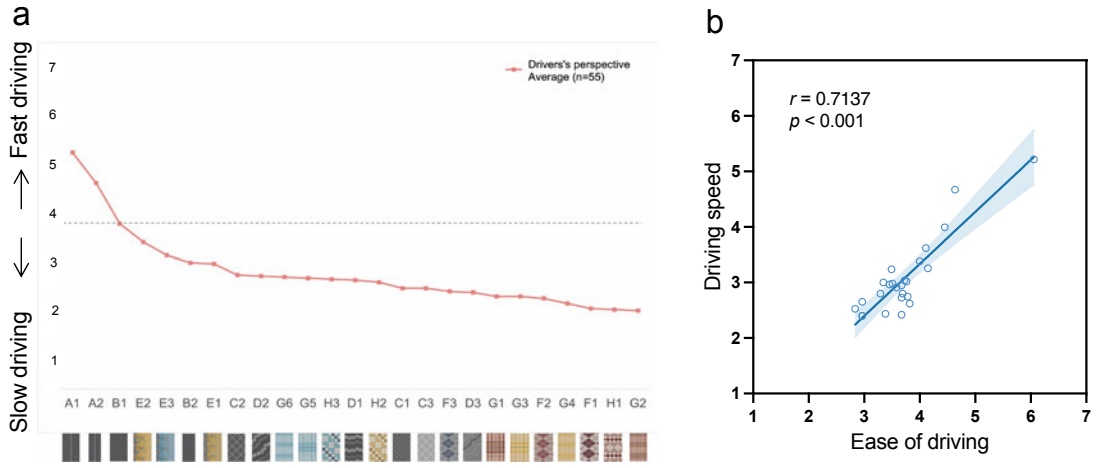

Figure 4. (a) The perceived driving speed of drivers. (b) The correlation between driving speed and ease of driving.

4.3. Perceptual analysis between pedestrians and drivers

The physical characteristics of the street environment directly affect the safety, comfort, and attractiveness of pedestrians (Saelens & Handy, 2008), pedestrian attractiveness and safety should be given priority in the practice of people-oriented public realm renewal (Basu et al., 2022). Therefore, in addition to understanding the impact of pavement design on pedestrian comfort and its compatibility with the built environment, it is also important to understand the perceptions of safety and attractiveness of different traffic participants. This section presents the perceptions of safety and attractiveness from the perspectives of both pedestrians and drivers.

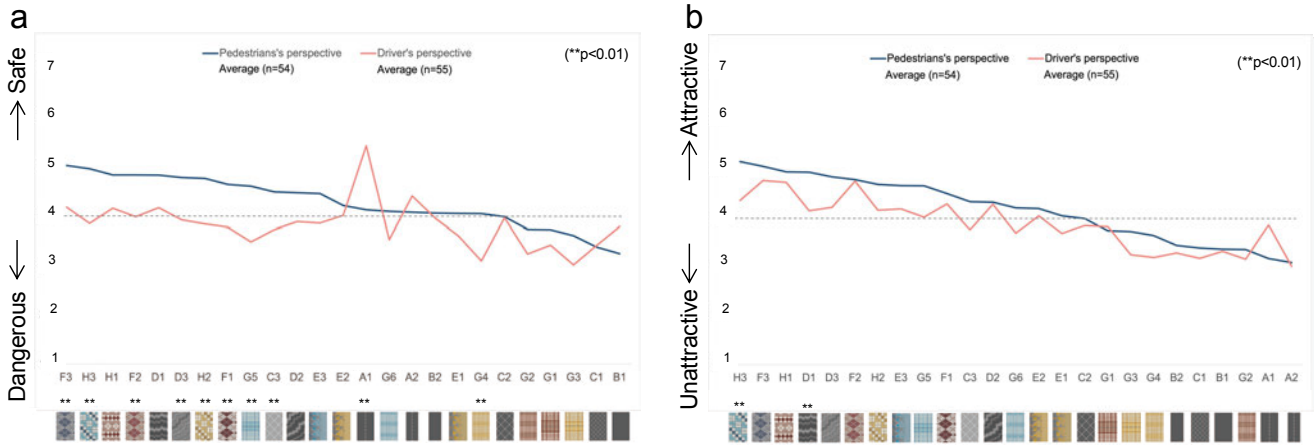

Figure 5. (a) The comparison of the safety for pedestrians and drivers.(b) The comparison of the attractiveness for pedestrians and drivers

Figure 5(a) shows the perceived safety scores of pedestrians and drivers for different stimuli. Pedestrians rated the blue cobblestone design (F3) as the highest, scoring at 5.00. Moreover, the blue square brick design (H3) and the red square brick design (H1), and the red cobblestone design (F2) also received high scores. However, the 6-meter asphalt design without a white center line (B1) scored the lowest at 3.22, followed by the asphalt paver with diagonal lines design (C1). On the other hand, drivers considered the 6-meter asphalt paver with a

central line (A1) to be better than the other designs, scoring at 5.38, while both the large yellow concrete design (G3) and the small yellow concrete design (G4) were rated the lowest, around 3.00.

The statistical analysis further revealed significant differences in the perceived safety between pedestrians and drivers. Specifically, the 6-meter asphalt paver with a central line (A1) scored the greatest difference ($p<0.01$). Additionally, designs with slight differences in brightness, including the blue square brick design (H3), red cobblestone design (F2), blue cobblestone design (F3), and the grey interlocking block design (D3), also scored relatively high ($p<0.01$). These findings suggest that these paving designs can improve the perception of safety for pedestrians compared to traditional asphalt pavements while also influencing drivers' perception of risk.

Figure 5(b) shows the perceived attractiveness scores of different stimuli for both pedestrians and drivers. The blue square brick design (H3) achieved a score of 5.11, while the blue cobblestone design (F3) and red square brick design (H1) also received high scores. However, the 4-meter asphalt paver with central lines (A2) received the lowest score at 3.10, followed closely by the 6-meter asphalt paver with a central line (A1). From the drivers' perspective, the red square brick design (H1) and red, blue cobblestone design (F2 and F3) were rated significantly higher compared to other designs, scoring at 4.73 and 4.67, respectively. In contrast, the red concrete design (G2), the asphalt paver with diagonal lines (C1), and the 4-meter asphalt paver (A2) performed the worst.

The statistical analysis further revealed significant differences in the perceived attractiveness between pedestrians and drivers. Specifically, the difference in ratings between the blue square brick design (H3) and the grey interlocking block design (D3), with slight differences in brightness, was statistically significant ($p<0.01$). Moreover, there was also a difference in ratings between the two for the 6-meter asphalt paver with a central line (A1) down the middle, but it was not statistically significant. Overall, the differences in the attractiveness ratings of the same paving designs for pedestrians and drivers are generally small. For example, red cobblestones design (F2) and red square bricks design (H1) are highly rated by both groups, indicating that these paving designs can achieve a relative balance between the walking and driving environments.

4.4. Discussion

The research results show that the paving design of Shared Space can effectively improve the car-oriented built environment and promote the vitality of urban public spaces by creating a safe, comfortable, and attractive travel environment. The following is a specific discussion of the experimental results.

The results of the pedestrian experiment show that colored non-asphalt pavement designs, represented by blue cobblestone design (F3), blue square

brick design (H3), and red square brick design (H1), provide a safe, comfortable, and non-intrusive travel environment for pedestrians. However, warm-toned concrete design (G2) and (G3) scored lower across multiple dimensions, indicating that these designs fail to enhance street space quality and walking attractiveness. In contrast, traditional asphalt pavement (A1) and (A2), etc., performed well in terms of street space quality but poorly in walkability and visual appeal, indicating that they were difficult to meet the needs of pedestrian activities in mixed traffic environments. In addition, the asphalt with diagonal lines (C1) and (C2) also scored low across multiple dimensions and did not provide an optimal travel environment for pedestrians. These findings suggest that rich visual effects created through color and material play a crucial role in mixed-traffic street environments, thereby enhancing pedestrians' sense of safety and walking experience (Chen & Yamamoto, 2024; Parkin & Smithies, 2012; Ruiz-Apilánez et al., 2017).

On the other hand, driver experiment results also confirmed that colored non-asphalt pavement designs affect drivers' perceptions, primarily manifested as reduced driving speeds. This finding supports previous studies, which indicated that non-asphalt pavement designs make it difficult for drivers to distinguish between sidewalks and lanes, leading them to perceive the environment as more “dangerous,” “uncomfortable,” and “interesting” (Ozaki et al., 2017; Yamamoto et al., 2024). Additionally, compared to red cobblestone design (F2) and red square bricks (H1), red concrete design (G2) and yellow concrete design (G4) also resulted in a significant reduction in driving speed, which may be attributed to increased visual complexity and reduced spatial clarity. However, warm-toned concrete designs also exhibit issues related to poor comfort and safety, which may lead to excessive deceleration by drivers, thereby negatively impacting traffic flow efficiency.

The study also compared the perceptions of pedestrians and drivers on the pavement design of Shared Space and found differences in their perceptions of safety and attractiveness. In terms of safety, pedestrians and drivers had very different opinions about the 6-metre-wide asphalt with a central white line (A1) and the non-asphalt pavement designs, such as the blue cobblestones design (F3) and the red square bricks design (H1). Pedestrians tended to perceive non-asphalt pavement designs as offering higher safety, while drivers perceived these designs as less safe, possibly because the visual complexity of the non-asphalt paving designs made it difficult to predict the safety of the road. Regarding attractiveness, pedestrians and drivers gave similar ratings to most pavement designs, with only a few designs showing differences in perception. This consistency is encouraging for the concept of Shared Spaces. Place identity is enhanced through colored non-asphalt pavement designs, which not only arouse drivers' attention and vigilance, but also create a unique sense of place to attract more people to participate in public spaces (Batista, 2022; Karndacharuk et al., 2013), thus strengthening social interaction and mutual understanding (Hamilton-Baillie, 2008).

Take it together, colored non-asphalt pavement designs play an important role in balancing and regulating the behavior of traffic participants. The main features of these designs are using materials with rich textures, such as cobblestones, square bricks, and interlocking blocks, followed by the same tones and slightly different brightness, as shown in Figure 5. In addition to great permeability, such pavement designs have improved thermal comfort conditions in outdoor urban spaces, particularly the cobblestone made from natural granite (Faragallah & Ragheb, 2022). Furthermore, light-colored pavements are more effective than dark asphalt pavements in reducing surface temperature increases due to their higher solar reflectivity (Doulos et al., 2004; Senevirathne et al., 2021). Although this study has not yet conducted a quantitative assessment of the thermal performance of colored non-asphalt paving designs, existing research findings support their potential application in mitigating the urban heat island effect. This provides directional insights for street space design and optimization under urban regeneration strategies.

Therefore, this can be used as an effective strategy to optimize Shared Spaces to enhance pedestrian comfort, improve environmental recognition, and promote inclusivity and sustainability in the public realm. However, asphalt designs fail to improve the perceived safety and comfort of pedestrians in Shared Spaces and lack visual appeal. That means they do not provide an inclusive environment for different traffic participants and are therefore not appropriate for Shared Spaces or similar mixed traffic systems. These findings provide theoretical support and design suggestions for optimizing mixed traffic systems like Shared Space, thereby demonstrating that Shared Spaces are crucial for promoting the vitality of the public realm and serve as a model for creating sustainable cities (Jayakody et al., 2018; Talen, 1999).

Figure 6. (a) The cobblestone pavement design. (b) The square brick pavement design.

5. Conclusion

This study systematically assessed the impact of Shared Space paving designs on pedestrian perception and confirmed the significant positive effect of colored non-asphalt paving designs in enhancing walkability in mixed traffic systems. Furthermore, the essential characteristics of safe and aesthetically pleasing non-asphalt pavement designs were identified by comparing the perceptions of

pedestrians and drivers. These characteristics not only enhance the safety and comfort of the walking environment but also improve the spatial quality and visual appeal, creating a sense of place that is different from traditional roads. A sense of place encourages people to engage with public spaces and promotes social interaction, thereby effectively improving the strictly functionally segregated, car-oriented built environment. Moreover, our findings provide empirical support for regenerating public spaces in university districts and campuses. By investigating the perceptions of specific user groups, it is demonstrated that design interventions can be made more inclusive, thereby improving user experience and well-being. Due to the limitations of the experimental method, the perceptions of cyclists have not been investigated, which would be an important direction for future research. In addition, we will further explore the mechanisms by which Shared Space paving design parameters influence the perceptions and behaviors of transport participants. This will provide urban designers and policymakers with more actionable and evidence-based design guidelines, ultimately contributing to more vibrant, inclusive, and sustainable urban renewal.

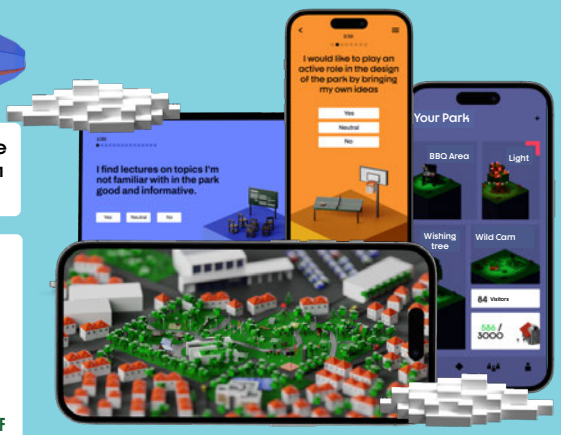
Co-creative park design: Sustainable and participatory concepts for urban green spaces

Prof. Mathias Hassenstein, Marius Meyer, Jared Fiedler, Hakan Selek
Prof. Mathias Hassenstein
hassenstein@dhbw-ravensburg.de

YOUR PARK

Multiple user surveys ensure maximum compliance with the interests of residents.



ABSTRACT

The project investigates co-creative design processes to promote regenerative urban development. It brings people together to engage and communicate on public/community issues. The interactive concept for redesigning urban green spaces demonstrates how design can successfully combine citizen dreams, technology and ecological responsability. The example of an interactive concept for redesigning urban green spaces shows how design can combine technology and ecological responsibility.

RESEARCH OBJECTIVES

- **Promoting regenerative urban development:** Researching approaches to restore ecological systems in urban areas.
- **Rethink human-nature interactions:** Exploring strategies which create benefits for both: ecosystem and urban living
- **Advancing multidisciplinarity in design:** Integrating insights from ecology, social sciences and technology.
- **Strengthen citizen participation:** Development of tools and methods that enable people to actively contribute to urban planning.

Regenerative urban development e.g. tranforming motion energy to electric

METHOLOGY AND TOOLS

- **Participatory design approach:** Use of surveys, environmental studies, workshops and interactive tools (e.g. park configurator) to collect and prioritize citizens' ideas and wishes.
- **3D visualization and app development:** Creation of digital simulations to illustrate design options.
- **Iterative co-design processes:** Iterations between citizen feedback and expert assessments to improve proposals.

Graphics balance concrete and abstract with a generic style, avoiding polarizing details to enhance creative co-design.

EXPECTED/OBTAINED RESULTS

- Development of a modifiable, generic model for regenerative urban parks.
- Improving ecological diversity in urban spaces.
- Increase social engagement and environmental awareness of citizens.
- Creating a replicable framework for other cities
- Creating identity, social cohesion through participation, well-being because participation, responsible use of facilities

RESEARCH PROCESS

- **Problem definition:** Identification of urban challenges through interviews with citizens and stakeholders (e.g. city administrations).
- **Tool development:** Design of an interactive configurator that gives citizens the opportunity to virtually design park and urban spaces.
- **Workshops and tests:** Implementation of workshops to evaluate and adapt the tools based on real feedback.
- **Analysis phase:** Evaluation of collected data, weighting of proposals and transfer into concrete design concepts.
- **Implementation:** Proposals are implemented in cooperation with city administrations and ecologists.

Urban-Rural Interconnected Development: Regional Models of Social Innovation Design Practice

Xuya Jiang*[a], Meiqin Sun[b], An Sui [c]

a b c School of Design, Jiangnan University
*xuya196@cumt.edu.cn

ABSTRACT | Urban–rural integration and coordinated development play an important role in mitigating imbalances in the mobility of resources between urban and rural areas. (Woods, 2007; Bedini and Bronzini, 2016; Yan J. etal. 2018). The process of social innovation is the formation of collaborative organizations through the interaction and cooperation of different entities. Its cooperative attributes and interactivity make it possible to promote urban-rural integration. Therefore, taking the development of urban-rural linkages as the goal of social innovation design, the existing internal and external resources can be creatively restructured (Manzini, 2014), and internal momentum can be stimulated through internal and external cooperation to achieve the development goal of urban-rural linkages.

This paper illustrates the specific role of social innovation design in urban-rural integration to the design audience: make the connection happen, inducing resource reorganization, and promoting systemic circulation.Through three typical case studies from China, we identified three basic models of social innovation design to promote urban-rural connectivity (industry, culture, ecology) and their corresponding integration paths of 'Finding connection by design, maintaining connection dynamics in design, and strength of connection by design'.Sustainable development between regions is promoted by shaping connections in the three dimensions of production-life-ecology.

As these case studies show, using social innovation design as a key leverage point for

connecting urban and rural areas can help us rethink sustainable development in urban and rural areas and re-examine the interactions between isolated elements and complex systems. At the same time, urban-rural integration expands the application space for social innovation design, offering a broader and more practical context for design to engage deeply in social development, also coaching us (as designers) to think in a more long-term and systemic way about the significance of innovation projects in regional development.

KEYWORDS | Urban-rural development, Social innovation design, Sustainable development, Design practice, Urban-rural interconnection

1. Introduction

In 1950, the world was predominantly rural, as global urbanization level was 30%. By 2050, the scenario is projected to reverse, as urbanization level is expected to reach 70% (UN 2018). While this has helped to promote industrial agglomeration and economic growth, rapid urbanization has led to a widening urban–rural gap and factor mobility imbalances (Jiang and Xie, 2024). In some developing countries, the urban–rural dichotomy is evident in the simultaneous expansion of urban industries and the decline of rural agriculture, leading to a persistent, unidirectional flow of resources toward urban and posing challenges to sustainable socioeconomic development (Guo and Liu, 2019; Ravallion and Chen, 2007). In this context, the interaction between urban and rural areas requires a dynamic and systematic reevaluation, with urban–rural integrated development emerging as a potential strategy to address the growing disparity. Social Innovation, as a way of reorganizing resources and restructuring social relations (The Young Foundation), may become an effective new idea in the study of urban-rural integration development. This integration also expands the scope of social innovation design, creating broader opportunities for design to engage deeply in social development. In this paper, we introduce the functionality of social innovation in the process of urban-rural development to the design audience through the practice of social innovation design, illustrating how design practices can actively contribute to the process of urban–rural integration. The first part of this paper outlines the research question by examining urban-rural integration and social innovation design. The second part presents three representative case studies, emphasizing the design patterns and pathways highlighted within these examples. The third part, based on the synthesis of multiple case studies, investigates the potential of design to foster sustainable regional development by shaping industry-culture-environment connections. Additionally, evaluating the effectiveness of social innovation design across different dimensions may lead to divergent conclusions. In the discussion section, we address this situation through an objective assessment, analyzing the limitations of the examples and proposing directions for future research. The contribution ends with conclusions that summarize what is previously stated.

1.1. Social Innovation and Social Innovation Design

The practice of social innovation is highly localized. When existing structures and policies can no longer solve some of the most pressing problems we currently face, social innovation is born to address complex issues and become the focus of attention. Projects are initiated through voluntary cooperation and interaction between local residents and stakeholder groups to propose practical solutions. These solutions challenge traditional mainstream models and break through traditional oppositions between public and private, local and external, consumption and production, needs and desires (Manzini, 2014), thereby creating new social relationships or modes of cooperation. In other words, these innovations are not only beneficial to society, but also enhance the driving force for social change.

In the 21st century, social innovation and design activities are closely intertwined, with social innovation acting as both the driving force and the objective of design efforts. Social innovation design necessitates the development of a new framework for understanding the impact and role of design in human society. Ezio Manzini defines social innovation design as 'all activities that professional design can carry out in order to activate, maintain and guide society towards sustainable development.' As highlighted in this definition, social innovation design is a vast field that emerges from the intersection of various social innovation phenomena and contemporary professional design practices (Brown and Wyatt, 2010; Tang, 2017). The process of social innovation design involves a socio-technical transformation driven by societal change, aiming for social transformation. "Make things happen, listen to feedback, and guide action" is the role of the design community in the process of social innovation design (Manzini, 2016). Designers play the role of insight providers in the early stages and of guides during the project.

1.2. Social innovation design and urban-rural integration

Urban-rural integration development refers to the bidirectional flow of factors between urban and rural areas, encompassing the organic integration and coordinated development of resources, population, industry, society, and other aspects. Research on urban-rural integrated development has gone through an evolutionary process from theoretical exploration to mechanism analysis. Early theories, such as Howard's (1898) concept of the "idyllic city," emphasized the complementary advantages of urban and rural areas. This idea was further developed through Geddes' (1915) "regional planning" and Mumford's (1961) theory of decentralized urban layouts. Building on these foundations, urban–rural relationships have shifted from simple, unidirectional exchanges to dynamic and increasingly complex networks of interdependence (Davoudi and Stead, 2002). Contemporary research primarily focuses on three aspects. First are spatial action mechanisms, encompassing urban-led regional restructuring (Mason, 2011), rural functional transformation (Andersson, 2012), and the strategic role of urban–rural junction zones (Peng et al. 2022). Second are factor mobility mechanisms, including cross-domain interactions involving population (Nilsson, 2014), industry (Mitchell, 2013), and land use (Lu et al. 2019). Third are frameworks for sustainable development, with global initiatives such as the UN's SDG 11 and the New Urban Agenda (2016) promoting inclusive, smart, and resilient urban–rural models (Gupta et al. 2015; Sharifi, 2019). Current research trends, on the other hand, show a more humanistic approach. Nevertheless, existing international literature on urban–rural relations remain largely concentrated at the macro level, focusing on policy coordination (Ganning, 2013), territorial planning, spatial pattern analysis, and meso-level ecological networks. In contrast, limited attention has been paid to the role of the design discipline in advancing integrated urban–rural development.

The connection between urban and rural areas relies on 'something happening' to drive integration, with social innovation design serving as a key leverage point for fostering urban-rural connectivity. The establishment of the project is facilitated through the interaction and cooperation of different entities, which promotes the reorganization of resources and the occurrence of connections, and consolidates the connections through continuous updating and improvement (Thorpe and Manzini, 2018). In this process, the collaborative nature and sustainability of social innovation design align with the overarching goal of urban-rural integration. Therefore, the goal of social innovation design is rooted in urban-rural integration, positioning it as an effective tool for narrowing the urban-rural gap and offering a tangible pathway to achieve this integration. Simultaneously, urban-rural integration creates opportunities for the application of social innovation design, presenting a broader practical context for design's involvement in social development. In the process of social innovation design, participants can perceive the internal trends of social change through design and follow these trends to provide better development guidance. The relationship between these two concepts is mutually reinforcing. This study aims to demonstrate how design can activate urban–rural resource flows, enhance community resilience, offer innovative pathways for integration practices, and bridge theoretical research with practical application. The following three case studies analyzed the specific modes of action and development possibilities of social innovation design in the context of urban-rural integration.

2. Social Innovation Design: Three Cases

To analyze the role of social innovation design in urban-rural integration, we have provided three cases of ongoing projects, so that innovative activities may produce more lasting and transformative results (Table. 1). These examples come from China, and they were selected for three reasons. First, the participants in the project all include designer groups and identify themselves as social innovation design projects. Second, they all use the countryside as the project site, and new connections have been created as a result of the project (during the case study process, we found that social innovations initiated in rural China will actively consider urban factors, while those initiated in cities will not actively connect with the countryside). Third, they clearly demonstrate three different models of how social innovation design can promote the bridging of urban-rural relationships. Our analysis did not involve ranking or scoring the outcomes of these projects. Instead, by analyzing the process of social innovation design, we identified and compared the pathways that facilitated urban-rural connections. Specifically, we interpreted the changes brought about by design across the three levels of 'production, life, ecology'.

Table 1. Case basics.

Rural type	Rural	Project title	Project period	Initiator	Key actors
Production dimension	Tieniu Village	Citrus Brand	2010-present	Designer	Designer + Local +Government + Enterprise + NGO
Life dimension	Suishi Village	Suishi public song fest	2022-present	university	University+Government +Designer + Local
Ecological dimension	Moon Bay Village	The 318-Tourist Route	2016-present	Government	Government +Designer + Local

2.1. Production dimension – interconnection of industrial structure: Tieniu village citrus brand

This social innovation design project was launched in Tieniu Village, Chengdu, in 2010. Tieniu's citrus industry accounts for 70% of the local villagers' livelihood. The production and processing of citrus are well-established in Tieniu Village, and the citrus industry chain has become the foundation for the design team to drive innovation and build a brand centered

around the "ecology of citrus." The team followed a systematic development route that went from ‘product sales (Ugly-Beauty Agan)’ to ‘village-enterprise joint ventures (Ugly-Beauty Tieniu)’ to ‘ecological planting (Fruit Farmers)’ to ‘professional service organizations (Tahoe Organic)’. They initially developed agriculture (primary industry) based on ecological planting, followed by extensive research and development of value-added products from the ecological rake orange (secondary industry), and then expanded into the tertiary industry through opening restaurants, hosting events, and offering user experiences (Figure 1). Social innovation has truly taken root in this process. The industrial chain gradually transformed from its initial simple form to a deeper processing level and a wider sales market. The relationship between urban and rural areas has become closer due to the complexity of the extended industrial chain. The spillover effects of capital, talent, technology and other factor resources have begun to emerge. Today, growth-oriented social innovation experiments continue to take place in Tieniu Village.

Figure 1. Social innovation activities in Tieniu Village
Copyright Tieniu Village Organisation

2.2. Life dimension – Interconnection of cultural activities: Suishi public song fest

The urbanization process in China has created a special urban community called “countryside in the city”. It refers to a natural village within an urban planning area that is surrounded, semi-surrounded or connected to a built-up area. Suishi Village is located in Panyu District, Guangzhou City, and is a typical “urban village”. Although it is geographically closely connected to the city, it maintains a distance from the city in terms of life and the

economy. This estrangement affects the governance of society as a whole. Starting in 2022, teachers and students from the Social Innovation Design Center at the School of Industrial Design, Guangzhou Academy of Fine Arts, initiated a series of public song fest, using singing—a highly participatory public cultural activity—as a starting point for "something happening," based on long-term research and engagement. The fest aimed to foster interaction between urban and rural residents (Figure 2). Through these music meetings, a rich artistic landscape and diverse cultural activities have developed, continuing the establishment of a public cultural community centered around Suishi Village. This form of cultural interaction transcends the boundaries of economic, cultural, and governance subsystems, facilitating the integration of these subsystems, and ultimately contributing to the formation of an extensive urban-rural system that bridges spatial and temporal distances.

Figure 2. Singing activities in Suishi Village
Copyright the Social Innovation Design Center at the School of Industrial Design, Guangzhou Academy of Fine Arts

2.3. Ecological dimension – interconnection of the landscape: the 318-tourist route in moon bay village

The village of Moon Bay is located in a river bay called Moon, which is formed by the confluence of dozens of small streams. The local government and the design team discovered the ecological advantages of this area, and used them as the basis for reshaping the concept of the Moon Bay area and initiating social innovation design practices. The project covers the villages along the river bay within a 10-kilometer radius, so that the villages around Moon Bay form a whole and work together to build an ecological corridor along the river. The designers selected important landscape nodes for design and

transformation (Figure 3). At the same time, driving routes from surrounding cities to the village were planned, linking scenic spots along the highway and establishing the "318" highway tourist attraction. The interconnection of urban and rural environments and landscapes was facilitated through the dynamic transformation of the scenery. In this project, leveraging the ecological advantages, various participants—including villagers, consumers, new residents, cooperative villages, and emerging businesses—were interconnected to promote local tourism, fostering connections at both economic and cultural levels. Using the "one river and one line" as a medium, a foundational connection was first established within the rural area, and then the region's brand effect was harnessed to attract urban resources, facilitating value co-creation and sharing. This process ultimately achieved a seamless interconnection between urban and rural areas.

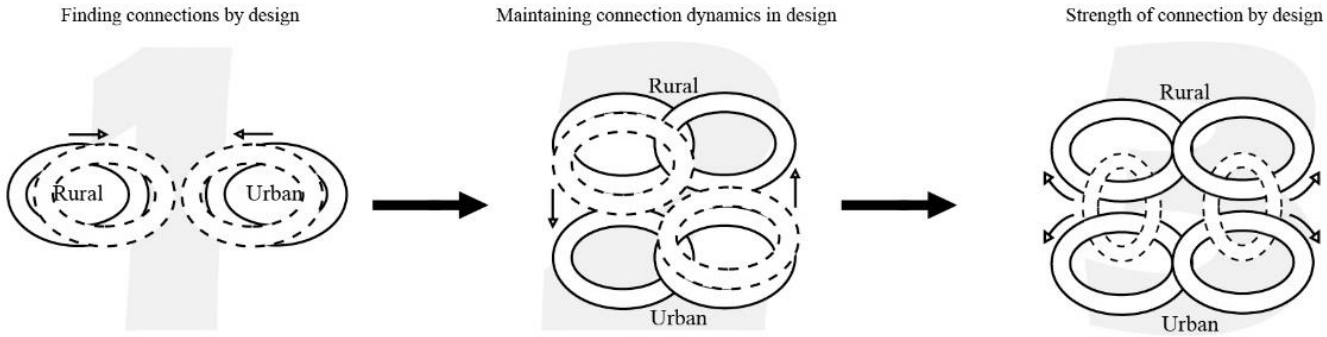

Figure 4. The path of urban-rural integration through social innovation design

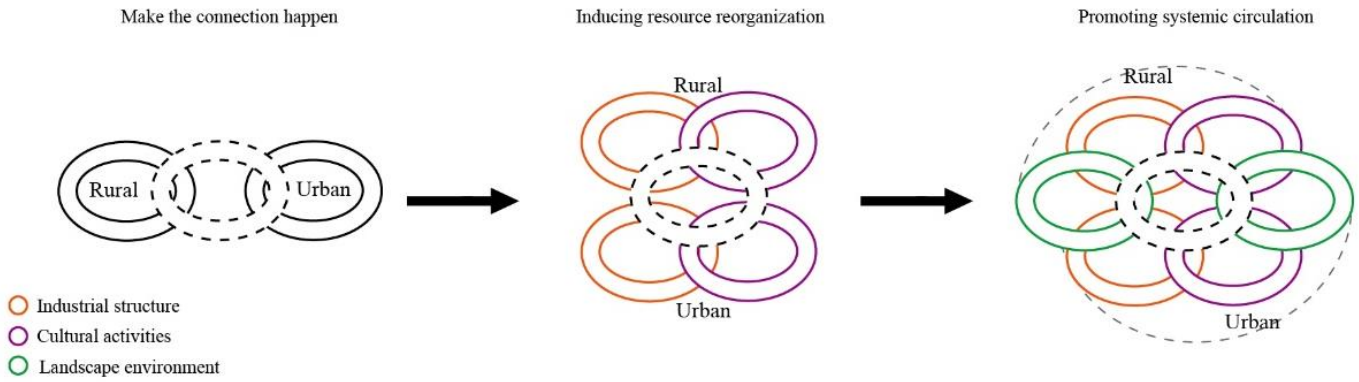

Figure 5. The role of social innovation design in urban-rural integration

3. Conclusion and Discussion

These three examples illustrate three basic models of how social innovation design can promote urban-rural integration: interconnection of industrial structure, interconnection of cultural activities, and interconnection of the landscape. Through a comprehensive analysis of these models, we have confirmed that in the context of modernization, social innovation design is closely intertwined with urban-rural development. Social innovation design is the medium that "makes connections happen". It can explore, create, and expand opportunities for integration between urban and rural areas (Hoggart and Paniagua, 2001). At the same time, social innovation design acts as a powerful tool for ensuring the sustainability of these connections throughout the integration process. It plays a pivotal role in guiding, planning, and integrating resources effectively. Thus, we propose an integration path consisting of three key stages: Finding connection by design, maintaining connection dynamics in design, and strength of connection by design (Figure 4). Additionally, we define the specific role of social innovation design in urban-rural integration as 'make the connection happen, inducing resource reorganization, and promoting systemic circulation (Figure 5). This framework aims to guide the practice of social innovation design within the context of urban-rural development. In this process, designers must not fall into the trap of one-dimensional design. Urban and rural construction is a systematic and long-term project. Although the three typical cases above are social innovation designs that cut in from different single dimensions, they are still continuing to develop, and the process of continuous optimization in the follow-up has driven the intersection and integration of the other two dimensions, as shown in Figure 5. Interestingly, the power of government cannot be ignored in social innovation design programs in rural China. Government support is a fundamental condition for the sustainability and scaling of social innovations in both urban and rural contexts.

This study was based on a Chinese case study, which was not globally applicable but

revealed the potential of social innovation design in restructuring urban–rural relations. The study found that prevailing practices were mostly from a rural perspective, emphasizing the attractiveness of rural resources to urban areas. Greater attention is needed to explore how urban-based social innovation can actively contribute to rural development—for example, through knowledge transfer or capital infusion. Underlying shifts in power relations and cultural contexts exert a profound influence on this process. Examples showed that sustainable innovation design often balances the tension between urban-rural areas by reshaping local discourse (e.g. villagers' participation in decision-making) and cultural translation (e.g. modernization of traditional skills). In this process, the key role of design is to build communication interfaces - facilitating the translation of needs and value consensus among different groups (e.g., villagers, designers, and government) through specific methods such as visualization tools and collaboration platforms.

Future research should further investigate: (1) mechanisms of innovation driven jointly by urban and rural actors; (2) the influence of power structure adjustments on the sustainability of innovation; (3) the tension between standardization and local specificity in cultural translation. These insights offer policymakers a novel framework for “flexible intervention,” whereby systemic transformation is coordinated with micro-level practices through design.

Walking towards the Pluriverse: Rethinking Design Education through Relational and Situated Creative Practices

ABSTRACT | Starting from the premise that we cannot face a crisis with the same categories that generated it, this investigation seeks to contribute to the exploration of new conceptual and creative horizons that support the transition towards a world where many worlds fit–the pluriverse.

Drawing on the contributions of various feminist and decolonial theorists and practitioners – as well as a study conducted in an academic institution – we would like to advocate for *situated creative practices* that can actively contribute to confronting the "civilizational crisis" we are experiencing; that is, a crisis in the civilizational model that is no longer generating the conditions to maintain life (Escobar, 2020). The reference to "situation" has a double connotation: on the one hand, it refers to creative interventions in specific places and times, paying special attention to the geographical and historical particularities of a certain context and, on the other, it refers to practices in which the practitioner positions herself critically with respect to the context in which she intervenes, a crucial notion in feminist (Haraway, 2013; Lugonés, 2003) and decolonial theories (Vázquez, 2020). We wish to argue that such approach can be a way of developing a *relational design practice* (Escobar, Osterweil & Sharma, 2024), allowing designers to be more sensitive and attuned with the communities with whom they work with and the natural environment where they operate, including a consideration for the more-than-human agents involved (De la Cadena & Blazer, 2018).

In order to begin illustrating the practical horizons for this framework, we will present a design practice conducted with undergraduate students in the Collserola mountain, a natural ecosystem in the edge of Barcelona. Through walking, sensory mapping, exploration with AI, and prototyping, participants explored the interplay between embodied experiences, memory, future speculation, and design. Walking the park fostered sensory engagement, shaping students' understanding of the site, its history and its inhabitants (human and more-than-human). This informed the development of projects addressing environmental concerns and promoting sustainable practices through reimagined spaces or objects, envisioning alternative futures and challenging existing norms. The methodology encouraged non-canonical reflection, urging students to move beyond conformistic approaches while fostering future-oriented critical thinking. The practice yielded valuable insights for design education and its potential in becoming a practice that can actively contribute to (sustainable) transition processes on two counts: firstly, by showing how integrating walking and sensory mapping into design processes can challenge space determinism, and secondly by demonstrating the potential of speculative design and future studies to foster alternative imagination and address pressing issues like climate change, promoting planetary awareness.

By further advancing on a specific framework for design (situated creative practices) and presenting a particular experience (workshop with design students in Collserola), through this paper we wish to highlight the potential –and limitations– that design practice and pedagogy may have in contributing to the emergence of other, more just worlds.

KEYWORDS | Pluriverse, Situated creative practices, Walking methodology, Speculative thinking, Design and/for sustainability.

1. Introduction

This paper stems from acknowledging that we cannot address contemporary crises using the same categories that originated them. The myriad of social crises we are faced with today can be seen as the expression of a rather simple –but all the more difficult to resolve– new condition: we no longer know how we can thrive together, as human and more-than-human inhabitants, on a damaged planet (Tsing, 2017). This becomes particularly relevant when confronted with a *civilisational crisis*, that is, a socio-ecological crisis in a civilisational model that is no longer generating the conditions to sustain life (Escobar, 2020). This crisis is manifested in different contexts (environment, economy, society, etc.) and has direct consequences like the acceleration and intensification of climate change, a massive increase in social inequality, an ongoing deregulation of the labour-market, the rise of populism and mistrust in (political) institutions or the allure of xenophobic movements. In all these instances it seems that we no longer have a place where we can live decently together, and care about inhabiting a shared world (Latour, 2018). The myriad of societal issues we are faced with today can be framed as what is referred to in theories of change as *wicked problems*, or high-complexity and deeply interconnected issues that cannot be addressed from a unique standpoint; a radically new orientation to recompose our relationship to others and the world is at stake. That is why this paper is backdropped by the work of Escobar (2011), De la Cadena & Blaser (2018), Demaria and other scholars and practitioners, who have been advancing an alternative framework to the paradigm of 'development', under the umbrella notion of *pluriverse*.

A concept first taken from the Zapatista movement in Chiapas (Mexico) -under the dictum 'a world where many worlds fit'-, the pluriverse represents perspectives that enact multiple worlds, ones that bring to the forefront the *buen vivir*[1], communal forms of living and the interdependence of all human and more-than-human entities. The pluriverse could therefore be framed within post-development and de-growth theories and movements, and strives to explore and develop (multiple) alternatives to an Eurocentric perspective on (sustainable) development (Kaul et al, 2022). In doing so, it represents a resistance to an universalist vision proposed by modern science, suggesting instead to expand the field of the possible for the emergence of new worlds: worlds where human life is in harmony with the life of the planet, where everyone has the conditions to live with dignity and where diverse ways of life are accepted and supported. Escobar has already advanced an agenda of 'Designs for the Pluriverse' (2018), where he discusses the potential of design (broadly understood) in becoming a pluriversal practice –that is, one that does not attempt to propose universalist solutions, but instead allows for different ways of life (with their corresponding epistemologies and ontologies) to emerge. We see this framing (of the pluriverse) as a useful lens to understand —from a systemic perspective— the challenges we face in an increasingly strained planet and design's potential role(s) in driving or triggering just and sustainable transitions.

After introducing some concepts and notions related to the pluriverse –and aiming to contribute more concrete examples and approaches within design practice and education– we will present a pedagogical exercise developed with a group of undergraduate design students in Barcelona, explain its results and discuss both its process and outcomes. In doing this, we aim to advance the ongoing discussion on the need for a *redirective design practice* (Fry, 2008), with a clear conceptual grounding (the pluriverse) and a first example of concrete practice (case study).

2. Theoretical Framework

2.1. Designing Relationally

A base premise for 'the pluriverse' is understanding that everything exists in a deep level of relationality and interdependence. This ought to be understood in contraposition to the paradigm of ontological dualism championed by the modern-colonial matrix of power (Escobar, 2018), which sees the human as separated from the territory, culture opposed to nature and where human beings (or a very particular group of white, male, wealthy individuals based in the global north) decide the fate of the rest of the world and its multiple life forms. We might then consider new "designing practices based on the insight that the world does not exist 'out there', separate from us, but that we co-construct it with every one of our actions. (…) Such designing might become a force in transitions to the pluriverse, with a multiplicity of others and all living forms." (Escobar, Osterweil & Sharma, 2024). Such understanding of designing demands designers to engage with concrete natural and/or human-made environments, as well as the different human and more-

[1] The term 'buen vivir' (roughly translated as *living well*) has its roots in South American indigenous cosmologies and it represents a critique to a unique idea of wellbeing based on (national) development and growth. Instead, at the centre of *buen vivir* stands a drive for a harmonious living of humans with their natural environment, the valorisation of other forms of (non-scientific) knowledge and ways of wellbeing that are not based (solely) on material elements (Gudynas, 2015).

than-human entities living in them, as opposed to engaging with the real from a distance with a false pretense of scientific objectivity (Lugonés, 2003).

2.2. On Situated Creative Practices

In order to further advance on design's potential roles in these processes, we would like to bring forth a particular perspective from the arts (fine arts, design, architecture), in which practitioners and researchers take on specific 'situated' approaches, in order to contribute to pluriversal agendas and transitions. The reference to 'situated' has a twofold connotation: on one side, it refers to creative interventions implemented in a specific place and time (and that would not make sense elsewhere) and, on the other side, it refers to practices in which the creative practitioner critically positions her or himself, a crucial notion within feminist (Haraway, 2020) and decolonial (Mignolo, 2011) theories. Such framing on Situated Creative Practices (SiCP) manifests a will to re-evaluate creative practices -and their learning structures-, at the same time as enabling practitioners' potential for making an impact in their direct social environment.

When speaking about the site and time-specific dimension of such practices, it is important to acknowledge the influence of approaches advanced since the 1960's within the fields of art, architecture, design and pedagogy. A common trait in these experiences is the articulation of a 'social' perspective (Bishop, 2005), calling for a renewed -social, political, environmental, cultural- responsibility of practitioners towards the contexts where they operate. The practices resulting from such processes can be framed as a sort of 'creative activism' and usually materialize via concrete interventions in specific historic-geographical contexts.

On the other hand, regarding the critical positioning of the practitioners, such approach is built upon the premise that knowledge is not the same everywhere or for everyone (Kaethler & Calderón Salazar, 2020), and that the only way to oppose the globalizing force of modernity is by critically identifying our place of enunciation, that is, the onto-epistemic place from where we operate. It follows that "a positioned self cannot assume to be the center of the world, a positioned self is always conscious of the radical plurality of worlds and histories around her" (Vázquez, 2020). Tim Ingold also challenges the concept of a global environment as a unifying force, arguing instead that it represents the culmination of human separation from the world (2010). This separation stems from our tendency to observe events from a distance, rather than actively experiencing them, locally. The Nasa indigenous peoples of south-west Colombia have brought forward the notion of *walking the word*, as a practice that allows them to ground their ideas and collectively –and constantly– negotiate them through walking (Calderón Salazar, 2021); such approach allows us to envision some strategies (e.g. walking) to advance in ever more situated practices.

2.3. Pilgrimage, Wander and Walk

> "But the *dérive* includes both this letting-go and its necessary contradiction: the domination of psychogeographical variations by the knowledge and calculation of their possibilities." (Debord, 1981)

Our globalized lives tend to numb our senses, disengage from our surroundings and damage the environment. In this sense, the notion of localness isn't simply a narrower view; it represents an engaged, perceptual interaction with the components of our

inhabited world, not a detached observation. Subtle interventions like walking (Certeau, 1984) and more proactive initiatives like tactical urbanism (Lydon and Garcia, 2015) showcase the potential of citizens to creatively shape their urban spaces. Building on this, Catalan psychiatrist Francesc Tosquelles (1947) emphasized the cognitive power of walking, suggesting that it is not the head that counts, but the feet. He advocated for collecting the intuitions gathered through walking, viewing it as a cultural heritage inscribed in both natural landscapes and the anatomy of the places we traverse.

On another side, Guy Debord and the situationists began practicing the *dérive* (drifting), which involves aimlessly and unstructurally exploring cities, guided not by typical reasons like work or leisure, but by the inherent allure of the surroundings and their psychological and creative impacts (1981). This concept, although akin to the *flâneur*, is shaped by urban studies, particularly the work of Henri Lefebvre (as cited by Evans, 2013) on *The Right to the City*. Such approach also corresponds to feminist (and) decolonial theories like that of Maria Lugonés, who argued for a situated practice of engaged theorizing, under the figure of *the streetwalker theorist*: “done as a pedestrian, *una callejera*, *en compañía*, in the midst of company, and obliterating the theory/practice distinction, this theorizing seeks out, puts out, entrusts, invokes, rehearses, performs, considers, and enacts tactical-strategic practices of resistant/emancipatory sense making" (2003).

Finally, Michel de Certeau reminds us that walking serves as an intervention in space, leaving no physical marks (1984) while inviting the city and nature to co-create experiences. It necessitates a deliberate slowing down, fostering appreciation of our surroundings and the value of time (Bruscato Portella, 2024a). As an act of exploration and imagination, walking becomes the foundation for a new design approach, one which denotes the subjective visceral inner happenings of the individual. From this experiential standpoint, our understanding deepens as we immerse ourselves in the world, seeking knowledge and meaning. It is through this attentive engagement, inherent in the act of dwelling, that the world progressively reveals itself to us (Ingold, 2010, pp. 214-216).

2.4. Speculative Design for Transitioning to the Pluriverse

Speculative design is an approach where designers create products or objects linked to imagined scenarios of how things might be (Dunne and Raby. 2013, p. 2). These scenarios can occur in the future, alternative pasts, or even present situations. It requires people to suspend their disbelief and allow their imaginations to wander. Designers and scholars Anthony Dunne and Fiona Raby draw an analogy to thought experiments, showing the shared ability of both approaches to explore possibilities through imagination. This allows us to “step outside reality for a moment to try something out” (2013, p. 80). This analogy has become widely accepted in the field of design and even extends to the realm of art. Within the realm of design, the speculative design approaches serve to promote critical reflection among individuals. This reflection can not only generate new perspectives on current realities but also encourage people to envision their desired future. Such acts of imagination contribute to public discourse on contemporary issues like emerging technologies, climate change, and capitalism (Dunne and Raby, 2013).

However, Howell et al. draw attention to the Eurocentric foundations of the speculative design theories. They provide a critical perspective, emphasizing that the cone's depiction of time as purely linear and progressive neglects alternative viewpoints (as cited by Carey et al., 2022). The speculative design method, as a result, may overlook the social, political, and environmental contexts necessary for these artifacts to emerge, along with

their broader implications. This perspective underscores the need for a more nuanced design process, advocating for a shift towards a more plural, inclusive and life-centered approach. In searching for such alternative practices, we posit the possibility of speculative design experiments that serve as triggers for transitioning to the pluriverse. This would imply applying the ideas of a situated creative practice presented before and using the potential of speculative thinking (enabled by the 'what if' question, Figure 1) to open up the possibility of imagining and collectively building other worlds. The following section will present a case study of a pedagogical practice that one of the authors of this paper led with a group of undergraduate design students in the Collserola mountain, a natural ecosystem on the edge of Barcelona.

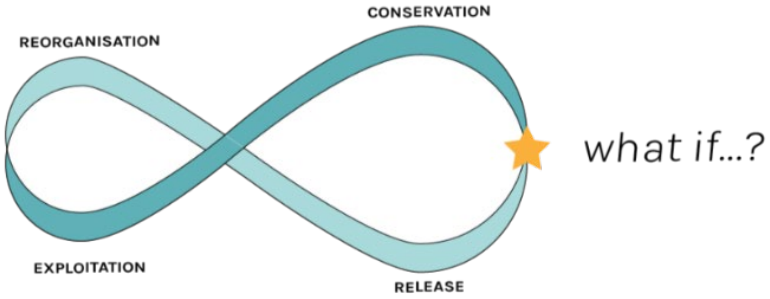

Figure 1. The diagram is an adaptation from the "adaptive cycle", considering the potential of speculative thinking to unleash the possibility of alternatives. Adapted from Holling et al., 2002.

3. Case Study: A pedagogical design approach at a park in Barcelona

The workshop "Take the Memory Out for a Future Walk" (Bruscato Portella, 2024b) made use of an interdisciplinary methodology to design new responses to urgent current challenges, fostering a deep interconnection with nature and all living organisms. The main question posed to the students was: "How might you envision the future of the Collserola Park?". The proposal was designed for a group of 25 people, aged between 17 and 23 years, during the Projects I course in the Bachelor in Design at EINA University School of Design and Art of Barcelona in 2022. The methodology was delivered by one of the authors of this research in five sessions, each lasting three hours and 30 minutes, for a total of 18 hours and 30 minutes.

The pedagogical approach started at a chosen area in the Serra de Collserola Natural Park and continued in the university's classroom, which is located next to one of the park's entrances. This geographic advantage was an opportunity for students to deeply engage with the nature around them and its challenges. This park, spanning 8,000 hectares in Barcelona, is a vital ecological haven under pressure from urbanization and recreational activities. Despite its biodiversity and scenic value, human impact—ranging from soil erosion and waste generation to wildlife disturbance—threatens its sustainability. Traditional awareness campaigns have proven insufficient in driving behavioral change (Abrahamse and Matthies, 2018). Instead, design and speculative thinking may have the potential to unleash radical new ways of thinking in relation to the natural environments that we inhabit, and all the beings that we share them with.

The main purpose of this pedagogical experience was to present an interdisciplinary methodology to design new responses to urgent challenges related to sustainability and the connection between nature and the different –human and more-than-human– entities inhabiting the Park. It is also aimed at:

- **Stimulate critical reflection**: Encourage students to reflect on the park's historical memory and envision its future possibilities amidst climate change and other uncertainties.
- **Embrace embodied methodologies**: Integrate walking and sensory cartography as design tools to enhance spatial, contextual, and proprioceptive awareness, placing students as active citizens and actors in the territory.
- **Promote a sustainable city, connected with nature**: Address and explore the perceptual breadth of space and cultivate a deeper appreciation for immediate natural spaces, to generate responsible stewardship for the environment.
- **Challenge with speculative design and future thinking**: Introduce students to methods for imagining alternative futures, urging them to embrace uncertainties and generate flexible design solutions.
- **Explore artificial intelligence's creative potential**: Introduce and experiment with artificial intelligence (AI) tools like Dall-e and Midjourney to enhance future visioning and design exploration.

By analyzing the outcomes, we unveil the power of a grounded sensory exploration (through walking) and speculative design in reimagining living spaces and fostering critical engagement with the non-human world.

4. Methodology

This didactic experience consisted of walking around the park and carrying out different conceptual actions subsequently, all within a period of 21 days, from November 22nd to December 13th, 2022. Classes were dedicated to a set of activities that allowed students to practice and acquire the competences of the subject, being the last one the final presentation. These phases or creative actions are detailed below in four pedagogical activities (followed in chronological order): 1) sensory walks and cartographies, 2) speculating on possible futures, 3) brainstorming with AI, and 4) drawings and materialization.

The pedagogical methodology (Table 1) weaved together art, design, ecology, earth science, and technology. Through dedicated walks within chosen territories, students drew sensory cartographies that captured the spatial essence. Engaging with AI tools, they then generated diverse future hypotheses and design possibilities. These explorations resulted in proposals that ranged from spaces and maps to relational objects in face of climate emergency, all informed by the affective encounters with the site. The methodology encouraged non-canonical reflection, urging students to move beyond conformistic approaches while fostering future-oriented critical thinking.

Table 1. Case Study Pedagogical Methodology.

Session	Activity	Learning Objectives
Session 1	Introduction	• Introduce the project brief and subject matter • Overview theory of speculative design and design references
Session 2	Sensory Walks and Cartographies	• Embark on slow, intentional and contemplative explorations within the park through walking • Foster sensory engagement, shape students' understanding

		of the site, its history and its inhabitants (human and more-than-human) • Translate experiences into hand-drawn cartographies to capture spatial features, affective memories, observations • Identify and highlighted issues and concerns to promote action
Session 3	Speculating on Possible Futures	• Introduce a taxonomy of uncertainty through thought-provoking questions to anticipate and imagine the park in upcoming years
Session 4	Brainstorming with AI	• Discuss ethical considerations of AI tools • Explore how AI could be used to enhance each student's design process or avoid hitting creative blocks
Session 5	Drawings and Materialization	• Formalize concepts through detailed drawn models and prototypes resonating with chosen scenario • Debate results collaboratively

The first situated activity consisted of inviting students to embark on contemplative explorations within the territory of the park. By interacting *in situ*, students were encouraged to wander meditatively and immersively, engaging in mindful observation, recording sounds, making sketches, taking pictures, and reflecting on the space's past, present, and potential future. This situation provided a "direct experience (body and mind) of the place, where the spatial and sensorial stimuli are retained directly by the student without direct interference" (Espinheira-Gomes, 2022, p. 21). Back in the classroom, students made hand-drawn sensory cartographies, identifying and highlighting various issues and concerns within the park (Figure 2). These included: distribution of drinking water, waste collection practices, noise pollution sources, soil sedimentation patterns, differences in day and night lighting, views accessible from various points, and even services deemed lacking in the area, such as sustainability-driven educational centers. Additionally, certain maps pinpointed the presence and location of specific animal and plant species within the park's ecosystems.

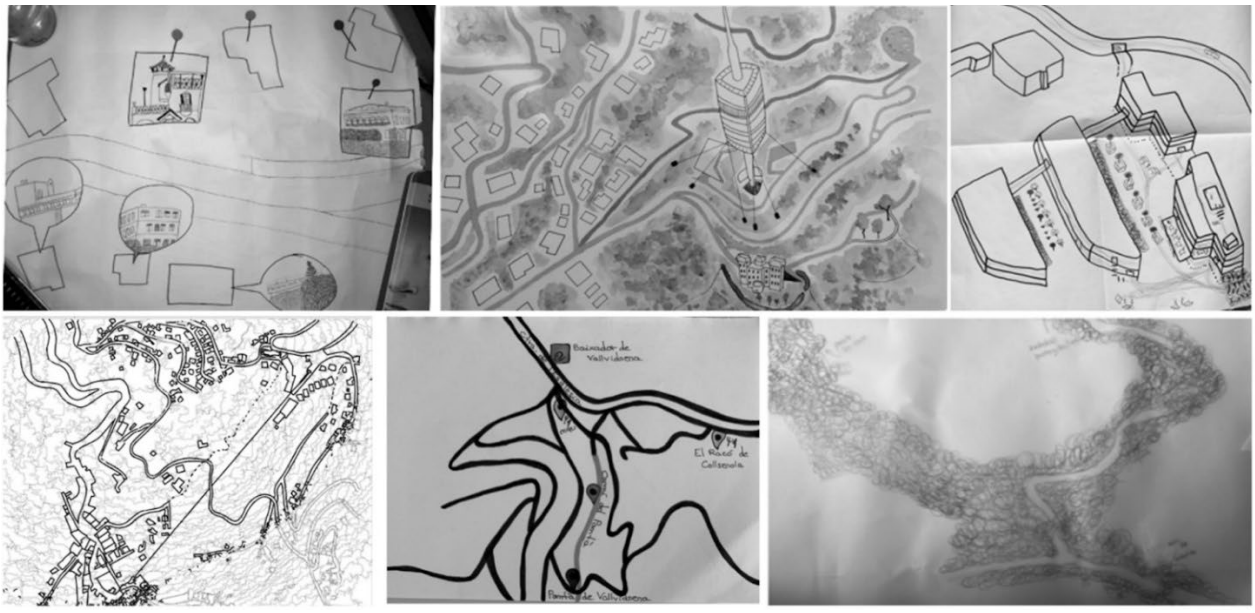

Figure 2. Examples of sensory mappings by the students.

In a second phase, we embraced a "possibilist" mindset to stimulate students in ways of being with uncertainty (Ichioka and Pawlyn, 2021, p. 15). Within uncertainty, students could see an opening to a pluriverse of possibilities, a "world where many worlds fit" (Escobar, 2018, p. xvi). These possibilities emerged from co-creative processes of futuring, in which all students participated as separate but intertwined roots of the human-nature ecosystem comprising the park. By referring to a framework designed by the researchers, they put together themes, opportunities and scenarios for the areas walked during the previous practice, guided away from certainty/uncertainty binaries and toward relational, pluriversal readings, acknowledging uncertainty as a fundamental condition of ethical cross-cultural partnerships, building their own "what if...?" hypothesis, and opening space for a pluriverse of possible futures ignited by imagination and agency (Table 2).

In a [...?] future		**There's a [...?]**		**Related to [...?]**		
Beautiful	Black	Building	Monument	Animals	Superstitions	Imagination
Brilliant	Fun	Instrument	History	Cities	Ground	Justice
Creative	Queer	Device	Organization	Climate change	Science	Leisure
Decolonized	Reactionary	Disaster	Toy	Death	Space	Love
Just	Resistant	Festival	Product	Economy	Music	Residue
Fast	Sad	Flag	Public service	Education	Spirituality	Ocean
Feminist	Selfish	Food	Ritual	Energy	Home	Creation
Solidary	Intelligent	Game	Song	Natural environment	Transport	Feminism
Global	Sustainable	Piece	Route	Family	Dialogue	Heritage
Green	Exciting	Invention	Tattoo	Agriculture	War	Experimentation
Technological	Volatile	Work	Tool	Genetics	Walk	Seasonality
Cheerful	Wild	Kit	Video	Governance	Food	Territory
Innovative	Wise	Manual	Clothes	Health	Water	Listen
Happy	Hot	Machine	Public space	Identity	Art	Touch
Open	Mystical	Map	Archive	Neighborhood	Childhood	Mountain
Affectionate		Mask	Place	Roots	Cure	Culture
				Elderly	Migration	Urbanism
					Furniture	Agriculture

These first possibilities of interaction were further explored formally using Generative AI's potential to test its limits and possibilities of image generation tools such as Dall-E and Midjourney, while enabling students to conceptualize or visualize their hypothesis Our goal was not to replace drawing, model making, computer-aided design (CAD), rendering or any of the other conventional disciplinary design skills; instead, we wanted to critically inquire how AI could be used to enhance students' individual design process, or explore how it could be used to avoid hitting creative blocks. After discussing the ethical considerations and creative possibilities, students engaged in simple demonstrations of prompting to generate visual narratives, evoke sensations and engage in playful form exploration. Students embraced AI exploration in diverse ways. Some used the generated images as a form-finding tool to expedite or augment their existing process. Others sought to envision future projections for their chosen intervention sites. Still others discovered that the AI-generated outputs nudged them in unexpected design directions.

Notably, while most of the students found AI tools valuable, some preferred their usual working methods such as drawing or 3D modeling, suggesting personal preferences and existing skillsets that may not align with every digital tool. Finally, after explorations with AI tools, the students returned to hands-on work, elaborating drawings and 3D models of their proposals.

Ultimately, it is also important to highlight that the element of uncertainty was a persistent factor in this methodology, due to our inability to fully control the outcomes of each of the workshop activities, leading to unexpected results. This lack of predictability provided a fertile ground for speculative thinking, creative exploration and empirical learning, benefiting both the instructor and the students.

5. Results

In total, 25 projects ranged from experimental sculptures and sound devices to proposals for buildings, repurposed spaces, and urban furniture for the community. Each proposal was rooted in the students' affective and sensitive experience gathered during their exploration in the park, while simultaneously aiming to generate ethical and sustainable contributions for both humans and non-humans inhabiting the area. Several students explored different formulations for the concept of "memory" through their proposals. Some aimed to capture and preserve elements of the present or past, ensuring they stay alive even 100 years into the future. Others tackled present-day issues and challenges, offering concrete solutions with an eye towards improving the park's state for future generations.

To evaluate the effectiveness of our pedagogy, we analyzed the student projects with an emphasis on both individual and collective processes and outcomes, and the relational impact within the Collserola Park natural surroundings and community. Focusing on ecologic consciousness, experimentation, and agency, we looked for indicators of how students navigated uncertainty as a "fundamental condition of ethical partnership" (Archer-Martin and Stokes, 2023). Where the workshop was most successful in enhancing planetary thinking and agency was in relation to climate change, and in producing outcomes that were socio-culturally restorative, ecologically regenerative, or both. This became clear, through the design of a speculative public installation that visualized sea-level rise in Barcelona through an interactive 3D viewer (Figure 3) and raise awareness on the environmental impacts that this situation creates. Another example is the inclusivity of humans and non-humans materialized in a multifunctional fountain at Vallvidrera Reservoir (Figure 4) to cater both humans and animals in a future of water scarcity, blending functional, regenerative and resilient design.

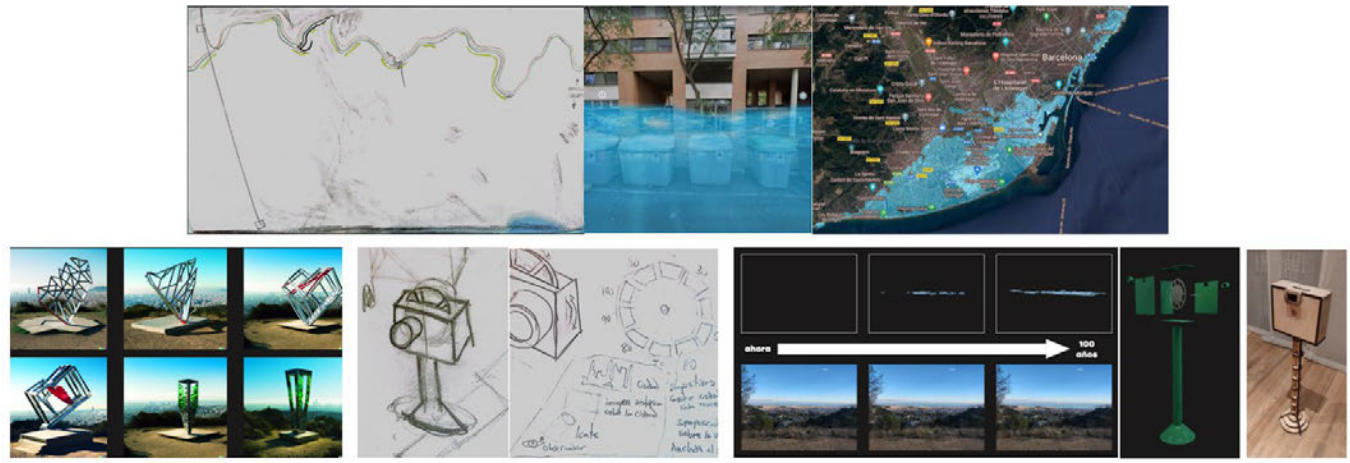

Figure 3. Project from student Pedro Figueroa. Hypothesis of Barcelona's flood and research with AI tool Dall-e: “Photograph of a large, polygonal methacrylate object inspired by the potential self-destruction of civilization, situated on a hill overlooking Barcelona in the background”; drawings and model for Bygone Waters project. From the binoculars, users would see the water levels over Barcelona and could change the number of years to see the flooding progress. 2022.

Figure 4. Project from student Carolina Abelleyro. Expectation and reality comparison; fountain which is not accessible to animals in the Vallvidrera Reservoir; map with walking paths and animals; research with Midjourney with prompt “A fountain where people, earth animals and birds can drink, and animals can bath integrated in the middle of the forest”; mock-up of the fountain for humans and non-humans. 2022.

Where our pedagogy initially appeared less successful was in demonstrating engagement with local community or natural resources knowledge through the project. Many of the works did not explicitly engage with –or include– local materials from the area, nor representations of the natural flora or local communities. One of the few exceptions was the aforementioned fountain, as well as another circular design project that proposed a light installation for poorly lit pathways where neighbors circulate, recycling discarded plastic bottles while connecting with situated historical context (Figure 5). One reason for the low local engagement might be that students were in their first semester, therefore at an initial phase of their design education, where notions of recycling, sustainability or community engagement are not yet present in their creative process mindset. Students, therefore, were not fully ready or equipped with the tools necessary for creating solid regenerative and ethical work. This may point to a broader deficit in the design curriculum that should be considered by educators, but may also indicate that indirect ecological and situated learning can take place with these

kinds of pedagogies. Ultimately, this revealed a misguided assumption that sustainable use of materials and community engagement should be taken for granted in the design process of undergraduate students, encouraging educators to think of explicit strategies to enhance these approaches in the students through didactic and pedagogical exercises.

Figure 5. Project from students Elisabeth Boix and Martí Forcada. The surprising unrelation between Google Maps and the two cartographies that illustrate the memories and routes taken by students in the Collserola; photographic research (1897-2022); speculations with AI tool Dall-e with prompt "Light stairs forest gravel plastic concrete"; Process and final model of the Calloway lamp. 2022.

6. Discussion

As western academia and conventional pedagogical approaches often discourage students from explicitly introducing both subjectivity and alterity into their work (Archer-Martin and Stokes, 2023, p. 192), this research posits the value of a situated perspective in design. This implies acknowledging that a disengagement from the concrete does not result in scientific objectivity (Lugonés, 2003) and our (research and creative) practices can be enriched by understanding our positionality and the relation with *others* (including more-than-human actors). This approach equips aspiring designers with skills to envision possibilities that intentionally adopt diverse positions and perspectives on self, others and the world (Bruscato Portella, 2024a). Moreover, it might advance discussions around the influence of the ecological crisis in the future of the design profession, to act agentically and to discover possibilities within constraints. Such approach might be understood as a condition for *designing relationally*, as it leads to practices that are embedded within the context that they operate and acknowledge the acute interdependence of all the actors involved.

The presented pedagogy shows the value of incorporating walking and drawing experiences, exploring experiential futures and speculative thinking into design education and research. On one hand, the fact of beginning the process by engaging directly with the territory in 'wanderings' or 'dérives' allowed for a grounded experience that attuned students' sensibilities to the different stimuli present in the park –something that would have been rather difficult to achieve with a more archive or documentation-based approach. On the other hand, this experience demonstrates how these approaches can

stimulate creative thinking, foster deeper and embodied understanding of space, and encourage exploration of alternative, potentially more sustainable or disruptive futures. This could be evidenced by the ways in which the *Framework model for speculative hypothesis generation* (Table 2) enabled the design of scenarios that went beyond a straightforward 'solution', triggering instead other ways of thinking about our relation to the natural environment. By prompting students to move beyond conventional interpretations of space and engage with sensory mapping and speculative design, this project pushes against rigid design practices, encouraging the consideration of both human and non-human needs. This led to more inclusive and speculative design solutions, challenging spatial determinism.

7. Final Considerations

In this paper, we have attempted to contribute to the ongoing discussions on the responsibility of design in an increasingly strained (socially, ecologically, culturally, etc.) planet. We have done so by advancing on a specific framework for design (situated creative practices) that may represent a starting point for *designing relationally* and by sharing and discussing a particular experience with design students in Barcelona. In that sense, we find it important to disclaim the potential impact and shortcomings of our framing through one concrete example: one of the desired outcomes of the experience with the students was a change of mindset (or transitioning to another way of thinking and acting within the world), which cannot by its very nature be achieved in the short term. The workshop did, however, inspire action and stimulate new perspectives and immediate reflections on the issues at stake. This can be summarized by a comment of one of the participating students: "I can see more and more clearly the need to create spaces of connection with nature. I start from the selfish future situation that has destroyed the forests and has become completely urban. Because just as in the forest you can hear the sound of the wind before it arrives, we must be able to see our reality, before there is no return" (Student Zaira Soler, 2022). So as much as we cannot assess the effective transition to more sustainable scenarios, the proposed projects served as seeds or triggers that highlight the potential that design practice and pedagogy may have in contributing to the emergence of other, more just worlds.

WHY ARE THE WORKING ENVIRONMENTS ON INTERNATIONAL AIRPORTS AMONG THE LEAST INCLUSIVE PLACES TO WORK AND SOME POSSIBLE SOLUTIONS FOR IMPROVEMENT

ABSTRACT | Working is a fundamental aspect for the social participation and inclusion of people with visible (e.g. motor, visual) and invisible (e.g. autism, chronic pain) disabilities (1). However, for this to happen, the working environment must be inclusive (2) and unfortunately, this is not the case of workplaces such as airports. On one hand, there are regulations in place in some countries, such as Canada, that are supposed to enable such accessibility (3). These regulations, however, do not consider the different needs and specific scenarios that people with disabilities may face. On the other hand, the airport as a workplace is an interesting and rich environment due the wide variety of job opportunities. However, most airports are still not adapted for people with disabilities. For example, an airport employee usually must walk significant long distances through environments difficult to navigate and full of sensory stimuli such as Duty-Free shops. The main objective of this research project is to provide recommendations to the federal government of Canada on the norms of accessibility on employment at international airports. In addition, we aim to identify job opportunities as well as airport facility-related obstacles and

facilitators for people with visible and invisible disabilities. Semi-directed interviews (n=24) are being conducted with personnel from the airport, airlines, customs, and security at 3 Canadian international airports (4-5). An evaluation of the accessibility of the physical environment of the 3 airports is being done by applying the Rick Hansen Foundation Accessibility Certificate (RHFAC). The preliminary results of the 3 airports targeted for this project will be presented at the Cumulus conference in Nantes 2025. Two important findings have emerged so far, i) the need for comprehensive education on disabilities in the different sectors of the airport working environment; and ii) the urgency of rethinking the basic design of airports to make them more accessible.

KEYWORDS | PEOPLE WITH DISSABILITIES, ACCESSIBILITY, AIRPORT, WORKING ENVIRONNMENT, CANADA

1. Introduction

Having a job is very important for social participation, as employees are contributing members of society. Moreover, it provides a feeling of being productive and fulfilled. Earning money also contributes to the individuals financially independence. Unfortunately, people with disabilities face numerous barriers in finding employment. Poor health and fear of losing disability benefits are major obstacles (Stolarczyk, 2023). Discriminatory attitudes from employers, lack of information about rights and opportunities, and workplace adaptation issues also hinder employment (Okutayeva et al., 2024). Many employers hold stereotypes about people with disabilities, often assuming they are less capable, less productive, or need more support than they actually do. These pervasive stigmas might not always be explicit but can impede job access. For example, employers might worry that a person with a disability will require too many accommodations or that they won't fit into the workplace culture. These assumptions can lead to fewer opportunities for people with disabilities, even if their qualifications and abilities match the job requirements. Other barriers include concerns about disclosing disabilities, and lack of accommodations (Gewurtz et al., 2016). Employers perceive workplace adaptation and transportation access as significant challenges (Paušić et al., 2021). As a result, people with disabilities may face challenges in accessing physical areas of the workplace (e.g., offices, restrooms, break rooms, meeting spaces) due to inadequate ramps, doorways, or elevators. In some cases, the layout or equipment may not be adaptable for wheelchair users, people with mobility challenges, or individuals with other physical impairments. Even seemingly minor barriers, such as the height of a counter or the location of storage, can create significant challenges for employees with disabilities. Additionally, lower education levels among people with disabilities further limit job opportunities (Sozańska, 2013). All these elements create great insecurity, due to potential health issues and the fear of losing disability benefits (Stolarczyk, 2023). Nevertheless, while health problems make traditional full-time jobs difficult, contingent and part-time work can enable employment for some (Schur, 2003). Facilitators for employment include reasonable work conditions, adjustments, and accommodations (Colom Toldrá &

Santos, 2013). To improve employment prospects, focus should be on equal education, unbiased hiring processes, and ongoing disability management in the workplace (Kicherova & Lozovaya, 2022; Colom Toldrá & Santos, 2013). However, when looking for workplaces for people with disabilities, an airport is probably one of the most challenging environments. Working in an airport demands adaptability due to the 24/7 nature of air travel. Employees often work in shifts, including nights, weekends, and holidays. Dealing with irritated passengers facing flight delays or cancellations requires exceptional patience and diplomacy. Moreover, employees must adhere to strict regulations, policies, and security measures to maintain the airport's integrity, often facing pressure from tight deadlines and crowded terminals. Regulations like EU Regulation 1107/2006 require airports to ensure accessibility (Raman, 2011; Wood, 2022). Some airports in countries with a long inclusive tradition (e.g. Sweden, Denmark, New England) have established and implemented advisory committees and accessibility features to go beyond minimum requirements, respectively (Burke & Welbes, 2018).

However, inconsistencies in accessibility features and services persist across airports (Gotti et al., 2024). Barriers include complex navigation, limited communication, and inadequate staff training (Gotti et al., 2024; Kwan, 2010). To improve accessibility, airports should consider adjusting workstations for various disabilities (Polak-Sopinska et al., 2017) and adopt universal accessibility standards (Kwan, 2010). While progress has been made, achieving full equality for disabled workers will require ongoing effort and commitment from the aviation sector (Wood, 2022; Toffin, 1998). Despite the huge variety of different jobs opportunities that an airport may offer, most of them are still not adapted for people with disabilities. For example, an airport employee usually must walk significant long distances through environments difficult to navigate and full of sensory stimuli such as the Duty-Free shops.

The main objective of this research project is to provide recommendations to the federal government of Canada on the norms of accessibility regarding employment at international airports. In addition, we aim to identify job opportunities as well as airport facility-related obstacles and facilitators for people with visible and invisible disabilities.

2. Methodology

Semi-directed interviews (n=24) are being conducted with personnel from the airport, airlines, customs, and security at three Canadian international airports. The name and location of the airports, the airline, and the agencies involved in this project cannot be disclosed due to confidentiality agreements. It is, however, possible to mention that there were three international airports of different sizes located in different provinces in Canada and that representatives of the different agencies involved in air travel were interviewed.

An evaluation of the accessibility of the physical environment of the 3 airports was done applying the Rick Hansen Foundation Accessibility Certificate (RHFAC). The Rick Hansen Foundation Accessibility Certification (RHFAC) tool is a standardized assessment instrument designed to measure, evaluate, and certify the accessibility of built environments. Developed by the Rick Hansen Foundation, this tool is evidence-based and assesses how well buildings, public spaces, and infrastructures meet the needs of individuals with diverse physical, sensory, and cognitive disabilities (Rick Hansen Foundation, 2022). The tool aims to promote inclusion by identifying not only existing barriers but also opportunities for improvement to achieve a high level of universal accessibility. The RHFAC is a systematic assessment tool that evaluates accessibility across

multiple dimensions, including building entrances, pathways, elevators, restrooms, accessible parking spaces, and adapted signage. Each dimension is examined using specific and detailed criteria outlined in an evaluation grid. For instance, entrances must allow unobstructed access for individuals using wheelchairs, while pathways are assessed for their width, presence of ramps, or slip-resistant surfaces. Additionally, the tool evaluates lighting, visual contrasts, and signage quality to ensure infrastructures are intuitive and user-friendly for individuals with visual or cognitive impairments. What distinguishes the RHFAC tool from other evaluation approaches is its scoring system, which provides an overall accessibility score reflecting the built environment's accessibility level. A building that meets the established standards may receive official certification, with levels ranging from minimal compliance to excellence in accessibility. This score is complemented by specific recommendations, enabling infrastructure managers to make targeted improvements.

3. Preliminary results

Of the three airports targeted for this project will be presented at the Cumulus conference in Nantes 2025. The results are presented in two sections: the semi-directed interviews and the RHFAC results.

3.1 Semi-directed interviews.

Our findings have been classified into different themes. Since the research is still in progress, we will only present three themes, namely: improvements in facilities, barriers within the type of work, and non-physical barriers.

I. Physical improvements in facilities: There was a genuine concern and effort on the part of the three targeted airports to try to make the work and customer areas more accessible. Unfortunately, many airports have been built at different stages, to which new areas has been added as air traffic has increased significantly over the last 50 years. Therefore, the newer parts of the airport are considerably more accessible, excluding the walking distance which is a constant barrier at all airports. Conversely, the older facilities, despite renovation works, still present some accessibility problems, such as narrow paths or long walking distances.

> *"So, we have really removed as many physical barriers as we possibly can. There's some, you know, in older terminals because we can't physically change certain aspects of it, but we have tried to, you know, make pathways as usable as possible." P14.*

In terms of job adaptations at the airline for PWD, there is an effort to accommodate workers in some positions.

> *"... there are people I work with that have disabilities. I can think of at least 3 colleagues with visual disabilities, and they have been accommodated by (the airline). There are modifications that are made, there is openness to make accommodations. It is quite empowering to see, is quite lovely to see because they are able to successfully do their job." P13*

II. Barriers within the type of work: we asked the participants if they believed that people with disabilities would be able to fill their positions, with the current state of accessibility practices.

The answers were generally negative, especially with regards to physical disabilities. The airline agent commented:

> *"In my role it would be a little difficult, I have to be able to push a wheelchair, walk long distances up to ten thousand steps a day. I would say my position is a physical job. One also must use the radio for example and so if you have a hearing impairment for example that might be challenging." P12.*

Among the participants were several agents from different agencies working at the airport. Some of them have to carry a firearm with them. This makes a very important difference from other job positions as the person has to be able to use the weapon effectively for their own safety and the safety of those around them. This limits many people with disabilities.

> *"Well, it depends on the disability, right? If it's a physical disability, it's gonna be a big challenge because this job, you're a (...) officer. You have to be able to do a lot of physical things. You have to be able to lift. You have to be able to run. You have to be able to shoot a firearm. You have to be able to engage in controlled defense tactics, if you're dealing with a subject that becomes combative, right?" P11*

III. Non-physical barriers: we also asked what other barriers existed in the work they performed for people with disabilities. One officer mentioned regarding the language barriers:

> *"So, language is gonna be the number one kind of barrier. Our officers do what they can with the communication, you know, unofficially they'll try to communicate if they can, you know, Google Translate, you know, on the computer, they'll try to communicate in the language of the traveler." P11.*

With regards to an overview of the different services offered by the airport, one participant commented as follows.

> *"I think the biggest challenge is, you know, I don't want to say communication barriers, but the empathy piece that's missing, like, sometimes depends on who is helping you. Some people are nicer than others, so, it's that inconsistent service." P14.*

3.2 Rick Hansen Foundation Accessibility Certificate (RHFAC)

Concerning the analysis of the data, we obtained from the RHFAC is currently being analyzed. In order to provide an idea of what has been made, in this section we will present only some examples of certain aspects of the three airports that were evaluated, but not all of them.

a) Entrances and Circulation Areas Identified Issues:

- Non-motorized doors: Most doors leading to restricted areas are not motorized, posing significant barriers for employees with physical disabilities. These heavy doors, combined with unsuitable handles, complicate access to workspaces.
- Cluttered corridors: Some hallways, measuring less than 1.2 meters, fail to meet universal accessibility standards. Additionally, stored items such as carts or technical equipment further restrict movement.
- Strengths: Circulation areas appear well-defined and segmented, facilitating orientation. However, their width and the lack of equipment adapted to the needs of individuals with reduced

mobility require adjustments.
● Improvements Needed: Automating main and secondary doors is essential to ensure effortless access. Clear protocols to prevent hallway clutter should be implemented, such as designated storage areas for carts.
Accessibility Score: 6/10

b) Workstations Identified Issues:
● Work surface heights: Counters and fixed surfaces are often unsuitable for employees in wheelchairs, forcing them into uncomfortable postures.
● Insufficient space under desks: Lack of adequate clearance beneath work surfaces prevents optimal use by individuals with mobility aids.
● Strengths: Workstations are well organized and equipped for routine tasks. However, they fail to accommodate the specific needs of employees with disabilities. ● Improvements Needed: Adjustable-height work surfaces would provide greater flexibility.

c) Inadequate Equipment Identified Issues:
● Fixed, non-adjustable computer monitors and telephones lacking accessibility features (e.g., voice commands or compatibility with hearing aids).
● Strengths: Technological equipment is present and functional. However, its design does not adhere to universal accessibility principles.
● Improvements Needed: Investment in adjustable monitors and telephones compatible with hearing aids would enhance inclusivity. For instance, telephone headsets with voice commands would benefit employees with visual or motor impairments.
Accessibility Score: 5/10

d) Signage and Wayfinding Identified Issues:
● Lack of tactile markers: Common areas and restricted zones lack tactile strips or differentiated textures to guide individuals with visual impairments.
● Insufficient visual contrast: Signage, often difficult to read, lacks adequate contrast between text and background.
● Lack of audio and visual announcements: Important announcements, such as safety alerts, are not delivered in multiple formats, excluding individuals who are hard of hearing or visually impaired.
● Strengths: Marked and labelled areas are a positive initiative. However, their design does not account for multisensory accessibility principles.
● Improvements Needed: Adding tactile strips for wayfinding and enhancing visual contrast on existing signage should be priorities. For instance, signs should use contrasting colors, such as white on black, with large-format characters. Announcements should always include subtitles or visual signals.
Accessibility Score: 4/10

e) Evacuation Plans Identified Issues:
● Non-accessible emergency stairwells: Absence of evacuation chairs or lifting platforms in emergency stairwells, making exits inaccessible for employees with reduced mobility.

● Lack of refuge areas: Buildings lack designated safe zones where individuals with reduced mobility can wait for assistance. General Comments:
● Strengths: Multiple emergency stairwells are an asset, but their accessibility is limited.
● Improvements Needed: Installing evacuation chairs or lifting platforms in stairwells is essential. For example, automated wheelchair descent systems could significantly improve safety. Creating refuge areas equipped with emergency communication systems would also secure individuals with reduced mobility.
Accessibility Score: 3/10

4. Discussion

As it was mentioned before, this research project aims to determine what are the job opportunities as well as the obstacles and facilitators for people with visible and invisible disabilities at airport facilities. As the preliminary results suggest, there is growing recognition of the need for inclusive design in airports and regular and comprehensive disabilities awareness training for current and potential workers. Emphasis should be placed on taking into account a range of disabilities beyond physical impairments (Gotti et al., 2024). In accordance with the literature that we can find on this subject, many challenges include inconsistent accessibility features, complex navigation, and limited communication (Gotti et al., 2024). To address these issues, researchers advocate for adopting a biopsychosocial model of disability, redistributing power in design relationships, and facilitating user empowerment (Webb & Williams, 2018). Inclusive design should consider factors such as signage, visual contrast, and materials (Smith & Dropkin, 2012). Studies highlight the importance of staff training, improved infrastructure, and enhanced communication to create seamless travel experiences for passengers with disabilities (Koech et al., 2024). Similar principles apply to educational institutions, where inclusive design should address diverse needs beyond physical accessibility. Ultimately, inclusive design aims to extend active participation in daily life, work, and social contexts (Langdon et al., 2008). In the following paragraphs, we will discuss the main elements considered to have inclusive working environments at the airports, such as education, physical environment and potential job positions. Education. Currently, many airport environments can be challenging for people with disabilities due to both physical barriers (like inaccessible workstations, counters, or bathrooms) and attitudinal barriers (such as lack of understanding or awareness about how to support employees with disabilities). Therefore, in order to create more inclusive workplaces in airports, there needs to be:

• Comprehensive Training Programs: Employees in all airport sectors (from ground staff to security to customer service) should receive disability awareness training. This training should cover both the practical aspects of supporting colleagues with disabilities (such as offering assistance when needed or adjusting work practices) and the more nuanced aspects of respecting and empowering people with different abilities.

• Cultural Shifts in Leadership and Management: Educating airport management and leadership is essential to make inclusive hiring and workplace policies a priority. Leaders need to not only foster an inclusive culture but also be role models for positive attitudes towards disability in the workplace.

• Recruitment and Retention Strategies: Airports should develop strategies specifically aimed at recruiting employees with disabilities. This includes creating mentorship programs, offering reasonable accommodations, and providing career development opportunities that are accessible to everyone, regardless of ability.

• Intersectionality and Accessibility: Educational initiatives should go beyond the traditional understanding of disability to incorporate the diverse range of conditions, including mental health issues, neurodiversity, and chronic illnesses. Airports must be prepared to support employees across this full spectrum. By focusing on education and building awareness, airports can cultivate an environment where people with disabilities not only have the opportunity to work but can thrive within their roles, ensuring a more diverse and dynamic workforce. Physical environment.

Moreover, passenger-centered accessibility is often a focus, while employee working environments are equally important, yet often overlooked. Rethinking airport design with accessibility in mind can involve several key aspects:

• Physical Accessibility for Employees: This includes ensuring that all areas of the airport (from office spaces to staff rooms, storage areas, break rooms, and other facilities) are designed with universal access in mind. Features like adjustable-height desks, accessible restroom facilities, wide doorways, ramps, and even assistive technologies like screen readers and voice-activated devices can make a big difference in enabling employees with disabilities to work comfortably and effectively.

• Workstation Customization: Rethinking airport design also means considering how each individual workstation or task space can be adapted to meet specific needs. This could include tactile signage, voice-controlled systems, or adaptable furniture that can accommodate different physical needs, like adjustable desks for wheelchair users or ergonomic setups for those with repetitive strain injuries.

• Mobility and Transportation Access: Employees who have mobility impairments need to be able to move easily between various parts of the airport. Airports often require staff to cover long distances, and accessible shuttle buses or pathways, automatic doors, and elevators are critical in ensuring that everyone can do their job without physical barriers. Additionally, employee parking spaces should be appropriately designated for people with disabilities.

• Emergency Evacuation Plans: An often-overlooked aspect of design is the ability to evacuate employees with disabilities in case of an emergency. Airports need to create emergency protocols that specifically address how people with physical or cognitive impairments will be safely evacuated during an emergency. This requires the inclusion of accessible escape routes, adequate signage, and specially trained emergency response teams.

• Collaboration with Experts: Rethinking airport design for inclusivity should not only come from architects and airport planners but also from people with disabilities themselves. Involving disability advocacy groups and consulting with disabled employees helps to identify and eliminate overlooked barriers in the work environment. Both points emphasize that creating a truly inclusive airport environment requires thoughtful design at both the educational and physical levels. Education helps to remove the stigma and fosters understanding, while redesigned spaces help to remove physical barriers that might prevent employees from reaching their full potential.

Potential job positions

Airports, being large, dynamic workplaces, offer a range of job opportunities that can be made accessible and inclusive, provided that reasonable accommodations are in place. Here are only a few examples of job opportunities for people with disabilities in airports, categorized by different types of roles and departments. This section of the discussion was completed in part during the interviews and complemented with additional information that the research team collected regarding the organizational structure of some international airports:

Customer Service and Passenger Assistance. Many airports have dedicated positions aimed at helping passengers with disabilities, which can be a great fit for individuals with disabilities who are willing to assist others.

• Passenger Assistance Officer: This role involves helping passengers with mobility impairments or other disabilities navigate the airport. Tasks might include assisting with boarding, navigating security checkpoints, providing directions, or helping with luggage. Employees in this role might be stationed at check-in counters, security, or boarding gates.

• Customer Service Representative: Airports need customer service staff at ticket counters, lounges, and information desks to assist all passengers, including those with disabilities. These roles often require good communication skills and the ability to handle various requests or concerns, such as providing information about accessible facilities or helping with special accommodations.

Assisting passengers with security and safety, unfortunately at times when a firearm is needed, many people with different conditions are excluded, such as people with motor impairments or sensory condition that affects their ability to ensure the safety of others in the event of an incident. That being said, with the appropriate training and accommodations, some people with disabilities, other than the ones mentioned before, could be trained to handle various security and safety-related positions within the airport.

• Security Officer: While this job may seem physically demanding, certain roles within airport security, such as screening passengers or luggage, can be adapted to accommodate people with disabilities. For example, there may be positions in scanning or surveillance monitoring where an individual could use accessible technology or equipment from a seated position.

• Security Support Roles: Individuals with disabilities may also work in roles such as managing security systems, reviewing surveillance footage, or even handling administrative tasks within the security department.

Ground Operations and Maintenance Ground operations involve a wide variety of tasks related to the physical aspects of airport function, many of which can be adapted to suit employees with different disabilities.
• Aircraft Service Roles: There may be positions related to maintaining and servicing aircraft in which people with disabilities could be trained to work. For example, administrative roles within the maintenance department or positions that involve coordinating schedules, inventory, or communication could be accessible.

Administrative and Office-Based Jobs Airports need a wide range of office-based professionals in roles that often don't require physical labor but rather administrative, organizational, and managerial skills.
• Human Resources (HR) Personnel: In HR departments, individuals with disabilities can perform a variety of roles, from recruitment to employee support and development. People with disabilities can also work in diversity and inclusion roles, helping to ensure the airport's recruitment processes are accessible and inclusive.

• Data Entry and Administrative Support: Many airports need people to handle data entry, records management, and general administrative tasks. These roles often involve working with software systems to track flight schedules, passenger information, or baggage handling, which can be easily adapted to individuals with mobility impairments or other disabilities.

• IT and Technical Support: Airports rely on a large network of computers and technology for their day-to-day operations. IT support and network management roles are ideal for people with technical skills, especially those who have disabilities that don't impact their ability to work with technology. These roles often involve troubleshooting, providing technical support to other departments, and maintaining the airport's computer systems.

• Marketing and Public Relations: Airports have marketing departments that handle communications, public relations, social media, and advertising. People with disabilities who have skills in writing, graphic design, video editing, social media management, or marketing can easily contribute to these roles.

Airports typically have a variety of retail outlets, restaurants, and concessions that require staff to interact with customers, manage stock, and ensure that operations are running smoothly.
• Retail Assistant: This can involve roles such as cashier, sales associate, or store manager. People with disabilities who are comfortable working in a customer-facing position or in the back end (stocking, organizing, inventory management) can easily adapt to these roles with the right accommodations.

• Restaurant Staff (Including Management): People with disabilities can work in various roles within restaurants and food concessions, such as waitstaff, kitchen staff, or even in management. Many airports are focusing on making their food services more inclusive, both for staff and customers, by providing accessible kitchen spaces and customer service training for employees.

Aviation-Related Roles In the aviation industry, there are specialized roles that individuals with disabilities can pursue, depending on their interests and training.

• Flight Dispatcher: Flight dispatchers are responsible for flight planning, tracking aircraft, and ensuring safe operations. These roles are often office-based and involve high levels of organization and technical knowledge, which can be done by individuals with disabilities who can work in office environments.

• Air Traffic Control Support Roles: Although becoming an air traffic controller requires extensive training and certain physical abilities, there are other support roles in the air traffic control environment, such as monitoring radar systems, scheduling, or coordinating between departments. These roles may be more accessible for people with disabilities who can work with technology and coordinate data.

Specialized and Advisory Roles People with disabilities often bring unique perspectives to problem-solving, which can be particularly valuable in roles focused on improving accessibility and inclusive design.

• Accessibility Specialist: Airports are increasingly focusing on improving accessibility for passengers and staff with disabilities. Accessibility specialists work on ensuring that facilities, policies, and services meet the needs of people with disabilities. This could involve auditing facilities, consulting on new designs, or recommending changes to improve accessibility.

• Disability Inclusion Officer: Many large organizations, including airports, are creating roles focused on fostering diversity and inclusion. A Disability Inclusion Officer or similar position would be responsible for advocating for people with disabilities in the workplace, ensuring that hiring, accommodations, and workplace culture are inclusive. This role could be ideal for individuals with disabilities who have an interest in promoting equal opportunities and a more inclusive work environment.

5. Conclusion

Creating an inclusive airport working environment requires dismantling the multiple and multidimensional systemic barriers faced by people with disabilities. This transformation calls for action on several dimensions: organizational culture, regulatory framework and infrastructure development. First, employers need to become more aware of disability-related issues, both in terms of their attitudes and their policies. They must go beyond strict compliance with the rules, to adopt a genuinely inclusive mindset. Second, government policies and advocacy groups can provide more robust support for raising awareness of disability rights and creating meaningful incentive for employers to hire people with disabilities. Finally, greater investments in workplace accessibility, such as designing inclusive workspaces and providing technology that meets the needs of disabled employees, will go a long way in breaking down these barriers to employment. Ultimately, creating an inclusive workforce means recognizing that the barriers faced by people with disabilities are not the result of their limitations, but of systemic constraints in society. Addressing these issues at both the individual and organizational levels can help create more equitable opportunities for everyone. Finally, for the

potential job positions, the key is ensuring that accommodations are available, whether that's physical adaptations to workspaces (e.g., ramps, adjustable desks, ergonomic furniture), adaptive technology (screen readers, voice-activated software, hearing aids), or flexible work arrangements (e.g., flexible hours, remote work). By implementing such features, airports can contribute to the development of inclusive spaces where every worker can thrive. Airports are increasingly recognizing the value of building a diverse and inclusive workforce and are making significant strides in hiring people with disabilities. Many airports are working to implement inclusive hiring practices, disability awareness training for staff, and partnerships with organizations that specialize in employment for people with disabilities. Ultimately, the types of jobs available for people with disabilities in airports are vast, and the opportunities will continue to grow as airports become more committed to creating inclusive, accessible environments. This commitment not only advances workplace inclusion for people with disabilities but also enriches the aviation sector through the unique perspectives and innovative solutions that emerge from a truly diverse workforce. Results dissemination plan: This research project findings will be disseminated to the federal government of Canada, our partners (airports, disability groups) and the scientific community (de-identified data) using presentations, written reports, social media and scientific articles.

FUTURES DESIGN: A COURSE FOR SOCIAL INNOVATION THROUGH SPECULATIVE DESIGN.

López Jiménez, Eusebio

Escola d'Art i Superior de Disseny de Castelló (EASD Castelló)

elopezj@easdcastello.org

ABSTRACT | Speculative design rises as an emerging discipline that, rather than solving problems in a traditional way, proposes alternative futures to make visible and reflect on current social, environmental, and technological issues. According to Dunne and Raby (2013), this practice challenges established norms and conceptualizes the future as a moldable entity shaped by our present actions.

In this context, the elective course "Futures Design" at EASD Castelló fosters experimentation and critical reflection through the creation of prototypes and narratives that address structural social issues, with the aim of stimulating creative thinking, co-creation, and debate around social and environmental problems.

KEYWORDS | SOCIAL INNOVATION, SPECULATIVE DESIGN, FUTURES DESIGN, SOCIAL DESIGN

1. Introduction

The role of the designer has evolved to encompass more than simply solving problems by stylizing the form of objects. In today's world, issues are not merely functional but also emotional, social, and political (Guixé, 2013). Speculative design proposes unreal future scenarios—whether possible or not—which are often dystopian. The future is not a distant and strange realm beyond our reach; it is shaped and defined by our desires, our dreams, and depends on the actions we take in the present. Therefore, the future is concrete, tangible, moldable, open, capable of being designed, and not singular but multiple.

Anthony Dunne and Fiona Raby (2013) presented speculative design as a discipline linked to the exploration of possible futures—a means to question and reflect on the implications of emerging technologies, sociocultural changes, and contemporary issues in the present. This approach departs from the conventional idea of design as “problem solving.” In this new perspective, designers are invited to propose and create new artifacts and narratives that challenge established perceptions and norms. In their book *Speculative Everything*, Dunne and Raby propose that speculative design is not a tool for guessing or predicting the future, but rather for drawing alternative futures—concrete possibilities that serve as starting points for discussion and reflection, thereby opening the debate on current issues. The design and prototyping of diegetic objects (speculative artifacts) within narrative scenarios serve as vehicles to embody visions of these proposed alternative futures.

Speculative design opens doors to social innovation by generating new perspectives and awareness of complex and emerging structural social problems. In doing so, it challenges current dominant narratives and encourages critical reflection to inspire significant and original changes in the face of social challenges.

At the EASD Castelló, for the past three academic years, an elective course has been offered to fourth-year design students—transversal to all specializations—in which speculative design is put into practice. In this course, futures design is used to speak, manifest, make explicit, and denounce some of the current structural issues. The overarching goal of the course, “Futures Design,” is social innovation.

We work with a methodology that embraces experimentation and provocation as tools to question and challenge the status quo of a current issue (chosen by each working group). We use Joseph Voros’s Cone of Futures as a strategic foresight tool to propose futures with multiple ramifications. In doing so, the students build a narrative and design and produce diegetic prototypes that help tell this story. The project concludes with a real exhibition/installation within the school.

Some of the objectives of the course are to awaken and develop critical, analytical, and holistic thinking; to promote forums and debates for reasoned defense of ideas and values; to foster empathy; to develop critical creativity to anticipate various issues; and to encourage co-creation and collaboration.

Novel methodologies, such as those used in speculative design, go beyond merely imagining possible futures or scenarios, allowing us to make visible, analyze, and ciriticize the social, cultural, political, and environmental issues that influence our way of life. Dunne and Raby (2013) support this idea precisely: fostering alternative scenarios to provoke critical reflection on society. On the other hand, Sterling (2015) employs the concept of "design fiction" to explore the overlap between technology and culture. Denouncing social tensions and promoting debates around social innovation are aspects championed by collectives such as Superflux (Bleecker, 2009).

In the UK, the London College of Communication offers a postgraduate course titled MA Design for Social Innovation and Sustainable Futures. This postgraduate program at UAL (University of the Arts London) adopts an interdisciplinary approach that seeks to hybridize social innovation, sustainability, and design. It equips students to address and generate solutions for complex social problems through design.

In the USA, this discipline is somewhat more widespread and integrated into the curriculum. For example, in the article *Designing the Future of Everything*, the CCA (California College of the Arts) describes collaborations between its students and major companies such as Samsung, Lenovo, or Google, who worked on design projects that explore possible futures for various aspects of human life. These projects also considered sustainability and social well-being. Topics included the evolution of homes for new generations, hybrid work, and future social networking. In New York, the Parsons School of Design offers programs that integrate Futures Design and Social Innovation into their curriculum. Its Certificate in Future Studies and Speculative Design focuses on developing students' skills to create representations of both desirable and undesirable futures using specific theories and methods. In this way, students learn to apply this knowledge to influence project development and company direction. These studies last one academic semester. Additionally, Parsons offers a Master's in Design for Social Innovation and Sustainable Futures, which reflects the school's commitment to providing quality training that anticipates and shapes possible futures, integrating social innovation and sustainability into professional practices.

In Ontario, Canada, the OCAD University offers the Social Innovation Design Pathway for students interested in using design as a tool to solve social issues. The program enables students to address social challenges that directly impact the community. Students acquire skills in creating balanced and sustainable solutions to improve daily life, working with concepts such as equity, environmental sustainability, and responsibility. Collaborative

projects with an emphasis on critical thinking facilitate the development of these programs, aligned with an ethical approach to design.

In Spain, design schools such as ESDI Ramon Llull (Barcelona) include courses in their curricula—such as Futures and Narratives Design; Design and Innovation; Ecodesign versus Sustainability; Systemic Design and Circular Economy; and Comprehensive Design Management—in the third year. ESDI offers programs that approach futures design by developing proposals that analyze social, technological, and environmental trends. The focus is on speculative design and the search for innovative solutions to improve future quality of life. However, in our country, these disciplines and methodologies are not yet well established.

This study poses the questions of whether the new course implemented at EASD Castelló is valuable for the students, based on the results obtained, and whether the school's faculty is receptive to this type of course, and considers it important to include in the design curriculum.

2. Formatting rules

2.1. General Guidelines

METHODOLOGY

In 2022, the Escola d'Art i Disseny de Castelló (EASD Castelló) introduced the "Futures Design" course as an elective transversal to all the disciplines offered at the school (from graphic design, to interior design, product design, and fashion degrees). The topics covered have been very varied, although social innovation has always been the central theme. In the last two editions, the incorporation of AI as a tool in projects has marked a turning point in the short life of this course.

Based on the work and ideas of Dunne and Raby, the course engages in a dialogue with topics of current interest such as sustainability, ethics, and technology (including the emergence of AI in our world), thereby challenging the dominant vision of progress and the future in our developed society. These actions invite a critical reflection on our present actions, which will have an impact on the future. According to the authors, this approach allows us to explore areas where social issues become visible and enables participants to adopt new ways of thinking and acting.

The course defines a number of competencies that students are expected to acquire, as well as learning outcomes which are detailed in the corresponding teaching guide. The objectives are as follows:

1. Prepare students for social and global challenges
   Speculative and critical design are not only useful tools to anticipate possible changes but they also allow us to challenge current social models and the status quo, and to propose creative solutions (Dunne & Raby, 2013). This forms the basis of the course.

2. Foster autonomous, critical, and creative thinking
   Students learn to tackle the complex, everyday problems that surround us, moving beyond a focus on functional design solutions. In this regard, social innovation is a key component of speculative design, which should aim to transform social structures in a more equitable and sustainable way (Mulgan, 2010).

3. Collaborate on interdisciplinary projects
   Futures Design is a multidisciplinary course. This approach encourages collaboration among students from different backgrounds, allowing issues to be explored and addressed from various perspectives. Manzini (2015) highlights the importance of interdisciplinary collaboration in addressing today's social challenges, as it leads to more inclusive and impactful solutions.

4. Develop competencies for social innovation and sustainability
   As mentioned above, social innovation is the ultimate goal of the course, in line with Phills, Deiglmeier and Miller's(2008) view that social innovation should focus on making a positive impact on communities, improving their well-being, and fostering long-term social change. Design must be a driver of social change and sustainability in contemporary society, as Sharpe (2013) asserts.

5. Boost creativity and applied research
   Koskinen et al. (2011) affirm that creativity is fostered through applied research in design, allowing students to explore the future through research and prototyping, thereby developing innovation and problem-solving skills in changing contexts.

6. Foster empathy
   Fostering empathy among students is crucial to developing their ability to understand the realities and needs of different groups. This enables them to design ethical and inclusive speculative solutions to emerging social issues. Tim Brown, CEO of IDEO, states that "empathy is essential to understanding the people for whom you are designing" (Brown, 2009). This underscores the importance of developing the capacity to put oneself in another's place—a key element in creating ethical and inclusive solutions.

Typically, graphic design project courses apply the Double Diamond methodology proposed by the Design Council. However, in this elective course, the methodology is a combination of various foresight, speculative, and participatory techniques designed to provide students with a comprehensive, critical, and reflective perspective on the future in a creative manner. In doing so, it becomes possible to propose futures that are more sustainable, inclusive, and resilient.

Foresight, according to Godet (2006), allows us to explore, identify, and evaluate emerging trends and their impact on the future by proposing various scenarios and strategic actions to address them. Identifying potential vulnerabilities that indicate shifts in current trends helps students anticipate how these changes may evolve into alternative scenarios, enabling them to visualize and anticipate possible futures and make present decisions that will influence them (Godet, 2006).

The construction of future scenarios plays a crucial role in speculative design. According to Dunne and Raby (2023), this not only serves to explore the future but also promotes reflection on the values and social implications of anticipated changes. It enables the creation of hypothetical, speculative narratives by combining variables and uncertainties, allowing students to visualize futures—utopian or dystopian. This open critical perspective departs from the linear view of a single future and opens the door to proposing multiple and complex futures. It also fosters critical reflection on our present decisions and their medium- to long-term implications (a point of personal interest). The use of Voros's Cone and Wheel of Futures is one of the key tools employed.

The backcasting process, as defined by Robinson (2004), is also part of the methodology. It involves starting from a desired future and working backwards to identify the steps necessary to achieve it. In other words, students are asked to analyze the present, think about the future, and conduct a historical review from the past to understand why a certain situation exists.

The course also emphasizes participation and collaboration, particularly in its second half. Manzini (2015) asserts that social innovation is key to designing sustainable futures emphasizing the need for active participation of communities and future generations in design processes. The formation of multidisciplinary teams comprising students from various design disciplines (graphic, product, interiors, fashion, and soon, illustration) emphasizes the inclusion of diverse voices and perspectives. This multiplicity enriches the project by incorporating different values and needs into future scenarios, promoting inclusive and equitable solutions, and fostering a sense of empathy among group members—a factor I consider crucial in design education.

Finally, as a complement the methodology implemented over the years, the development of diegetic objects and the construction of prototypes—as suggested by Bleecker (2009)—are

useful tools both for forecasting and for stimulating critical and reflective thinking about the possible futures which the students are creating. The prototypes and artifacts trigger debate on the chosen themes, inviting students and the entire educational community to reflect on the social, ethical, and cultural implications of the design proposals. This is achieved by communicating and exhibiting each group's work in various ways within the EASD Castelló building, thereby involving the broader school community in the debate.

DEVELOPMENT

The course content is addressed individually and autonomously during the first half, while the second half is carried out in multidisciplinary teams dedicated to project development. The structure is divided into two main parts:

A1. Content

- Artificial intelligence applied to design. Introduction to AI: Midjourney and ChatGPT. Ethics and responsibility of the design professional.
- Design research. Crisis, society, and design policies. Types of design research: Ezio Manzini. Emerging design. Critical and speculative design. Modes of criticism. Co-design.
- Projecting the future. The Cone of Futures. The Wheel of Futures. Applied methodologies.

A2. Project

- Topic selection
- Mapping
- Backcasting
- Scenario
- Diegetic object
- Production, assembly, and communication

The first part is highly attractive and stimulating for students, particularly through learning tools such as ChatGPT and Midjourney. AI is becoming a fundamental resource in design, even despite the opposing voices that have emerged upon its introduction (some of which I have experienced firsthand), as it allows for the rapid and precise generation of text and images (Radford et al., 2018).

In the design research section, Manzini's approach provides a key perspective on the capacity of design to contribute to social and environmental change and innovation through co-creation and citizen participation. This prepares the ground for the final group project, making explicit the benefits of this working method. In this context, Manzini, drawing on the

pioneering studies of Christopher Frayling, describes the three categories of design research: *For Design, About Design,* and *Through Design.* To help students assimilate these categories and identify them in any project—including their future final degree projects—case studies of various design projects are analyzed.

Moving into futures design, the conceptual model of the Cone of Futures, proposed by Joseph Voros (2000) (and based on authors such as Hancock and Ogilvy), is used as a visual representation in the future proposal that students develop for their final project. It examines the possibilities of probable, plausible, possible, and preferable futures. This tool graphically represents uncertainty and the breadth of long-term scenarios, facilitating reflection on various potential paths from the perspectives of design and foresight.

The Wheel of Futures, proposed by Jerome C. Glenn, helps visualize more clearly the consequences of events, ideas, or trends by identifying first-, second-, and third-order effects—both positive and negative. Its radial and centrifugal representation is extremely useful for gaining an overall perspective.

Possible topics and their future scenarios are first developed individually and then defended in front of classmates. Once the groups are formed, the students meet to discuss and debate which of the proposed topics is most suitable to develop collaboratively as a final project.

Each group begins to develop and build a future around the chosen subject, constructing the narrative arc of the story they wish to tell. The planning and design of the diegetic object(s) to be integrated into this story is a crucial element of the project and encourages significant engagement from all group members.

Evaluation

There are two types of activities which are evaluated in the course (using an evaluation rubric): an individual component (accounting for 35% of the final grade, covering the content) and a group project (worth 55% of the final grade). The remaining 10% of the grade is determined by peer assessment. This component is given great importance, instilling an extra sense of responsibility in the students as they become active contributors to the course's final results. If the peer assessment score does not exceed a 5, a final exam must be taken in order to pass the course.

The final group project allows each student to develop and apply all the knowledge acquired during their undergraduate studies, enriching the project and enhancing the complexity of the chosen topic.

RESULTS

Below are two projects undertaken by students in the course—one from the first year of implementation and the second from the most recent academic year.

Project 1 (2022): Neurotypical Extinction (Figure 1)

Students: Elisa Giustacchini (Erasmus), Victoria Monleón Beltrán, Luna Ramírez Alcoceba, and Isabel Salas Pérez

"Neurotypical Extinction is a multidisciplinary speculative design project. It presents a plausible future in which an imaginary world is created in which, due to increased levels of environmental pollution (a black swan event), there is an exponential growth in the population of people with Autism Spectrum Disorder (ASD). Within this envisioned space, various diegetic objects have been created to narrate and construct this future world, addressing the needs and preferences of a person with ASD in the year 2100, in which a neurotypical individual would have much more difficulty adapting. The work invites reflection on how, currently, citizens with ASD currently have to adapt to our society and the challenges this entails. The aim is to generate empathy towards these individuals," as the authors of the project state.

Project 2 (2025): Roots of the Future (Figure 2)

Students: Pablo Bermejo, Laura Calvo, Noemí Rodríguez, Aymé Rodríguez, and Mercé Ros

"This study addresses the issue of urban transformation and the loss of green spaces, focusing on Mediterranean cities such as Valencia, where rapid urbanization and climate change have significantly impacted the ecological and social environment. The disappearance of the Huerta Valenciana and unplanned urban expansion have exacerbated phenomena such as urban heat islands, increased flooding, and biodiversity loss. Through a historical analysis and current research, the project identifies the environmental, social, economic, and public health implications resulting from the scarcity of green areas. It proposes viable solutions—such as reintroducing vegetation and improving urban design—to mitigate the effects of climate change and enhance urban quality of life. Furthermore, it highlights the relevance of these approaches for building resilient cities in the context of global warming," the authors say.

The uniqueness of this project lies in the fact that it emerged as a consequence of the devastating flood disaster that struck Valencia and its metropolitan area on October 28, 2024—resulting in 222 fatalities, 4 missing persons, 75 affected municipalities, and billions of euros in damages, along with an indelible psychological impact on the affected population. The indignation and frustration of those affected, and of the wider population, due to the incompetence and abdication of responsibilities by politicians at both regional and central levels, led to several mass demonstrations demanding accountability and the resignation of top officials.

The project was presented through a small installation in the form of a cube—simulating a house, a place of refuge—on the first floor of the school. The exhibition featured graphics, text and images created using ChatGPT and Midjourney, an editorial product, and 3D-printed objects that served as the diegetic elements to tell the story they had created.

DISCUSSION

The incorporation of novel and unconventional studies in art and design schools has been well received by the entire educational community, both faculty and students. At EASD Castelló, the introduction of new electives in an academic year is subject to voting and approval by the school's faculty. A preliminary proposal for the course is prepared, outlining its objectives, the competencies to be acquired by the students, the learning outcomes, and the evaluation criteria, with an argument for the benefits it brings to the teaching and learning process. These proposals are then evaluated, voted on, and approved by the school's teaching staff. *Futures Design* was unanimously approved the first time it was submitted.

At the end of each semester, quality surveys are administered to students in each course to detect deficiencies, gaps, and limitations in order to improve and provide quality public education. If an elective does not receive a good rating from the students and fails to meet minimum requirements, it is discontinued in the following academic year. In the case of this elective, the survey results have consistently been very positive, ensuring its continuation in the 2025–2026 academic year.

This course also serves as a space for collaboration among students from the different specializations offered at the school. The formation of multidisciplinary teams—with diverse approaches and perspectives—provides significant enrichment for the students (as reflected in surveys and personal comments, particularly in an independent survey I conducted aside from the official one administered by our institution). I strive to establish a relationship with my students based on closeness and trust, presenting myself as an accessible person who can help them achieve certain goals, rather than as an authoritarian figure in a hierarchical structure. This approach creates an ideal environment for gathering honest feedback directly from the students, which is essential for identifying and improving aspects that may be lacking, ensuring that the knowledge, attitudes, and skills they acquire are of quality and value.

Quantitative surveys conducted with both students and faculty indicate that students have very positively appreciated the novel approach of the course—even if they initially found it challenging to visualize future scenarios and to adapt to a methodology different from the conventional Double Diamond (Design Council) used in most project courses. Over 80% of the class values the opportunity to work with peers from different specializations, as it provides them with completely different perspectives (one of the course's objectives). As suggested

improvements, students indicated in the surveys that they would like to see extended time dedicated to AI or a longer period for project development.

Among the faculty, with a 60% participation rate, the results are also positive. About 63.2% were aware of the existence of the course, and 96.3% consider such transversal courses interesting and valuable for our students. While half of the faculty is familiar with design fiction, the other half is not; nearly 20% learned about the course through student feedback, and importantly, over 96% believe it is essential to incorporate social aspects into the curriculum.

CONCLUSIONS

In light of the results obtained, we can conclude that the implementation of the “Futures Design” course at EASD Castelló has proven to be highly satisfactory for both students and faculty. The surveys reflect that, despite the initial challenges in adapting to unconventional methodologies—as opposed to traditional approaches such as the Double Diamond—the students value the innovative and interdisciplinary nature of the course very positively, particularly appreciating the enrichment derived from working with peers from different specializations. Likewise, the majority of the faculty members recognize the importance of integrating social aspects into the curriculum, and see these transversal courses as key to developing critical thinking and fostering innovation in design. Although areas for improvement have been identified—such as extending the time dedicated to emerging topics like artificial intelligence and project development—these findings underscore the transformative potential of the course and its significant contribution to the comprehensive education of future designers.

AIGC-integrated Platforms and Interior Design Workflow

First Author: Yuji Li, Second Author: Ziyuan Yang
Affiliation: Department of Environmental Design, Tsinghua University, Beijing, China
E-mail Corresponding Author: liyuji24@mails.tsinghua.edu.cn

Introduction

- Since interior design has a complex process that demands significant time, effort, and expertise, the pursuit of design automation has never ceased. The evolution of interior design has been shaped by technological advancements from hand-drawing to Computer-Aided Design (CAD) and now Artificial Intelligence Generated Content (AIGC).
- While AIGC has enhanced efficiency and visualization, its application remains limited to text, image and video generation, lacking full integration into the design workflow.
- Current research focuses on AIGC as an assistive tool but has yet to explore its potential to automate and redefine design processes. With rapid AI advancements, AIGC is poised to evolve into an integrated platform capable of learning, analyzing, and generating designs autonomously. This transformation could fundamentally reshape interior design workflow, shifting AI from a supporting tool to an active creative agent, bringing automated design closer to reality.

Methods

The methodology consists of four key components: **literature analysis**, **case study** about 3 periods, **technical feasibility analysis**, and **conceptual framework development**.

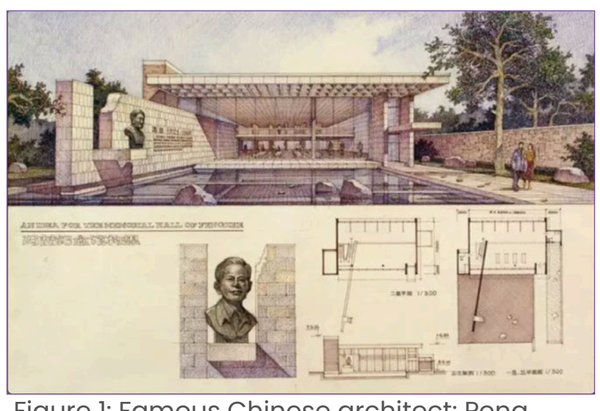

Figure 1: Famous Chinese architect: Peng Yigang hand-drawing design works

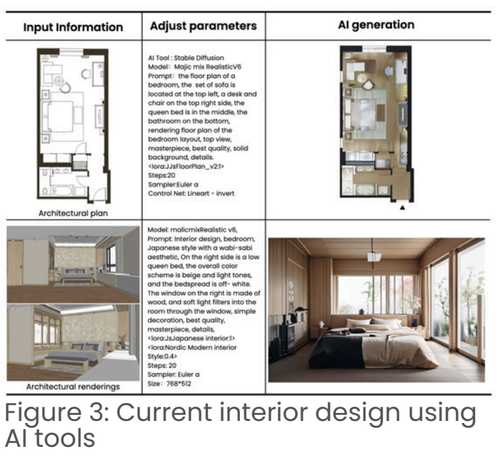

Figure 3: Current interior design using AI tools

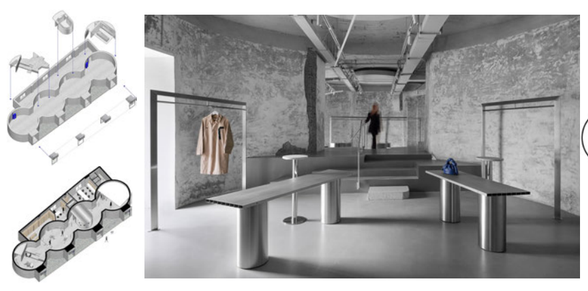

Figure 2: Interior design that use computers to model and render

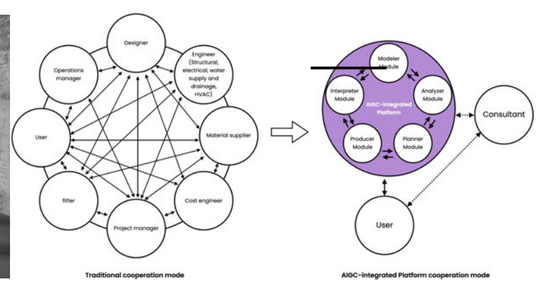

Figure 4: The comparison of traditional collaboration mode and future AIGC-integrated platform collaboration mode.

Discussion

This study aims to **propose the construction of AIGC-integrated platform** to realize automated design process.

- **Principal findings**: The AIGC-integrated platform enhances design automation by combining real-time feedback and intelligent recommendations, redefining workflows, human-AI collaboration, industry structures.
- **Limitations**: While promising, its implementation faces technical challenges such as computational demands, data integration and standardization, as well as ethical concerns including data privacy, fairness, and the evolving role of designers.

Conclusion

- This study explores the potential of an **AIGC-integrated platform** in interior design, outlining its functional requirements and proposing a **conceptual framework** composed of **interpreter, modeler, analyzer, planner, and producer modules** to enable **end-to-end automation** from design generation to operation.
- The platform fundamentally **transforming workflows** in interior design. Moreover, the **role of designers is being redefined**, as AI increasingly assumes creative tasks. Designers will evolve into **creative contributors**, who expand AI's learning database, **implementers**, responsible for translating AI-generated designs into reality, and **consultants**, facilitating user-AI interactions.
- This shift will make design services more **personalized and adaptive**, accelerating the transition to **intelligent automation**. However, achieving a **sustainable and equitable** AIGC adoption requires balancing **technological advancements with ethical considerations**, ensuring fairness, transparency, and meaningful human involvement throughout its development.

Results

The following **results** are obtained:

Key Finding 1: Explore the **characteristics** that the future AIGC-integrated platform should achieve: universality and intuitive interaction, dynamic information capture and real-time update, automated generation and multi-party collaboration, compatibility and scalability, ethics and data security.

Characteristics of AIGC-integrated Platform	• Universality and intuitive interaction
	• Dynamic information capture and real-time update
	• Automated generation and multi-party collaboration
	• Compatibility and scalability
	• Ethics and data security

Figure 5: The characteristics of AIGC-integrated platform.

Key Finding 2: Based on the above assumptions, the basic **conceptual framework** (interpreter module - modeler module - analyzer module - planner module - producer module) and operation mode of the AIGC integration platform are proposed.

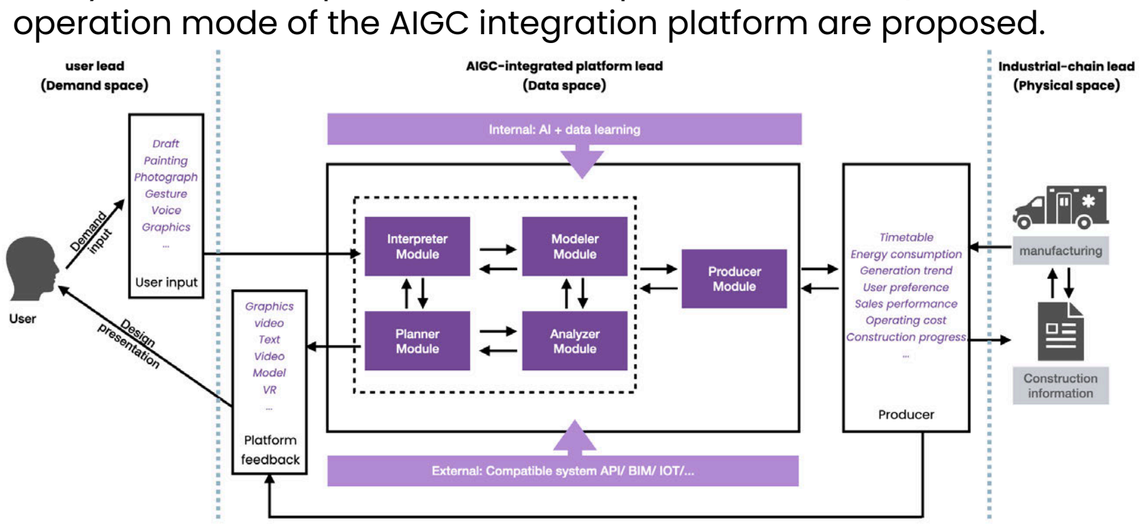

Figure 6: The conceptual framework of AIGC-integrated Platform.

Key Finding 3: The application of the AIGC-integrated platform has redefined the role of designers, as creative work is increasingly undertaken by AI, making humans no longer the central focus of design tasks. **The role of designers** is divided into **three** categories:

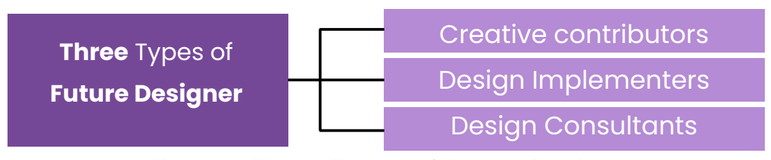

Figure7: Three Types of Future Designer

- **Creative contributors:** Expanding AI learning databases and driving creative exploration.
- **Design Implementers:** Responsible for the practical implementation and technical refinement of AI-generated designs.
- **Design Consultants:** Assisting users in interacting with AIGC-generated platform and optimizing the generated designs.

a new frontier for design

Algoprax, a serious game to bridge the gap between A.I. and practice

Samuel Danzon-Chambaud
frog, part of Capgemini Invent
samuel.danzon-chambaud@frog.co

Abstract:

In this research-through-design project, a serious game, *Algoprax*, is developed to start bridging the **gap between practice and A.I. use**. Indeed, in many domains today (e.g., journalism, policymaking), mismatches between the way professionals usually get on with their job and how they use A.I. can be observed.

Building on **Engeström**'s (1987) Cultural-historical activity theory, *Algoprax* addresses A.I. issues spanning across four areas (i.e., tools, community, rules, division of labor). It aims at triggering stimulating conversations between players, so they identify frictions that relate to this gap, then start acting on it. For instance, insights collected during the play can be leveraged to set up A.I. norms and policies, like the codes of conduct mentioned in the EU's A.I. Act. *Algoprax* can also be used to improve participants' **A.I. literacy skills**.

Algoprax was evaluated among the author's expert colleagues to assess its strengths and limitations regarding industry deployment. It is seen as being efficient for revealing frictions between practice and A.I. use, as well as for educating participants. That said, it fared slightly lower when it comes to being perceived as a catalyst for change. Real-world testing would help improve the game's evaluation.

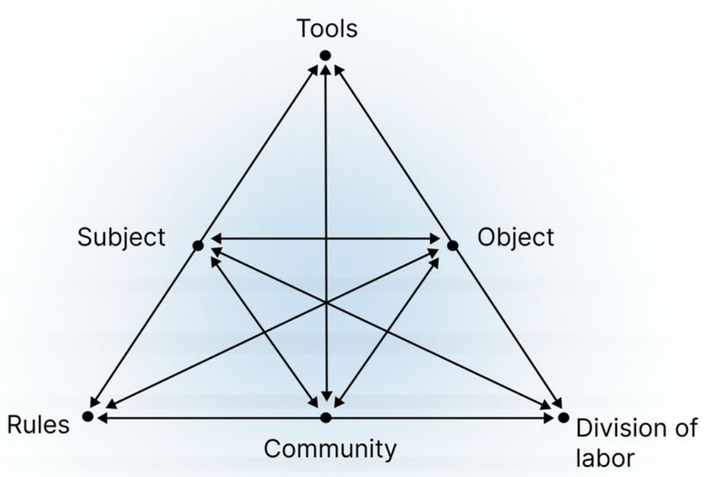

Figure. *Algoprax* builds on Engeström's model of an **activity system**. In this representation, each node mediates the activity's realization and are connected to each other.

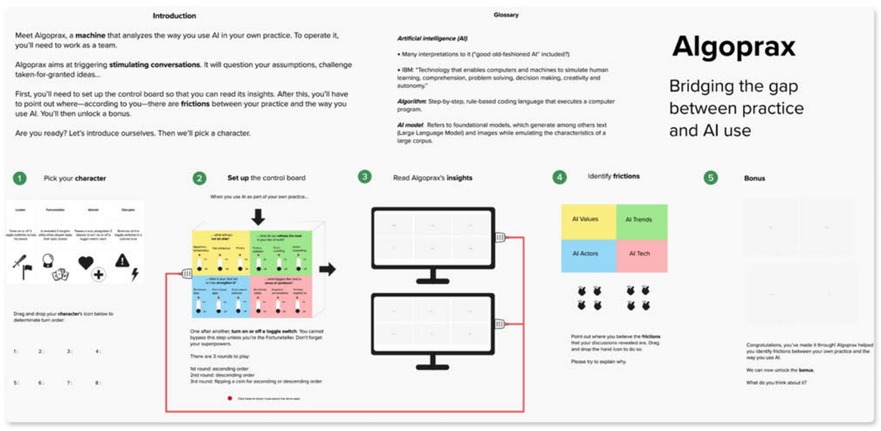
Reference. Engeström, Yrjö. 1987. Learning by Expanding: *An Activity-Theoretical Approach to Developmental Research*. Helsinki: Orienta-Konsultit.

Deliverables: Scientific preprint, virtual prototype, news article

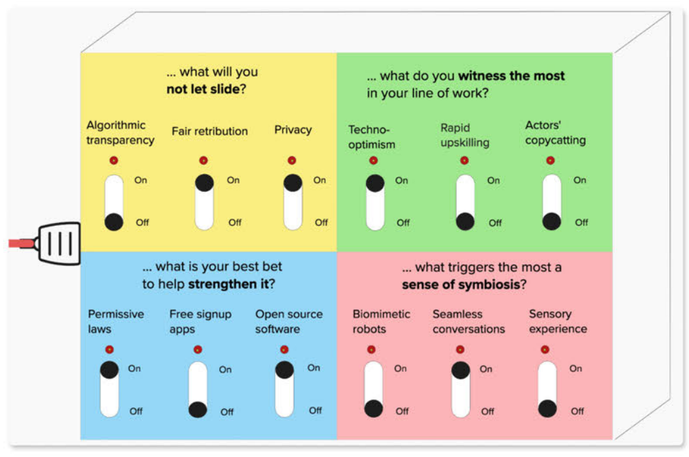
Storyboard of *Algoprax*'s game mechanics



Overview

The game's virtual board looks like that of a physical boardgame. At the top, *Algoprax* is introduced as a **fictitious machine** that players need to operate. A glossary also explains A.I.'s most frequent technical terms.

The machine part can easily be spotted in the bottom center of the board. During the play, participants turn on or off (one at a time) toggle switches on a control board, depending on whether they agree with a statement. *Algoprax*'s own interpretation will then be displayed on two screens.

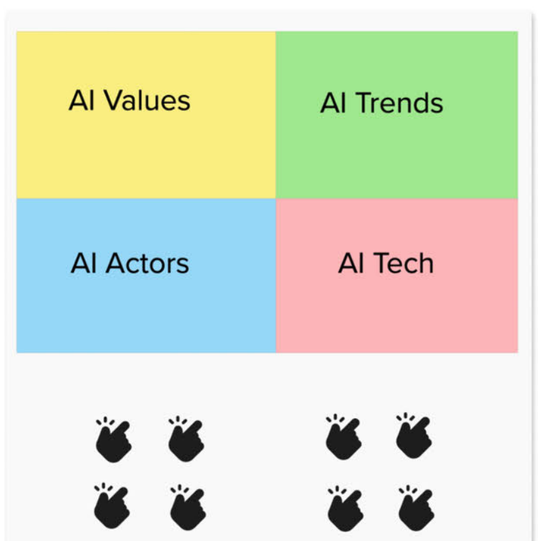


2. Setting up the control board

Algoprax's control board is divided in four colored areas, each with a question that pertains to the gap between practice and A.I. use. Under the question, three toggle switches can be turned on or off, depending on whether players agree with a statement. This reflects considerations mentioned in philosophical and sociological assumptions.

In each of the three rounds (with turn order set evenly), players have to **turn on or off a toggle switch**, even if this undoes another player's move. They also make use of their character's superpower. Initially, all the switches are turned off.

The goal is to **stir up conversations** among participants.



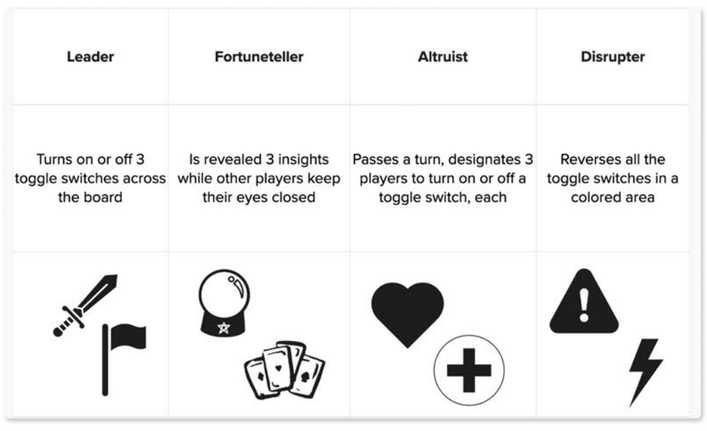
4. Identifying frictions

Following their exchanges, players are asked to identify where they believe **there is the most fictions** between practice and A.I. use.

They each move a finger into one of four colored areas, which reflect the themes already covered.

They try to voice their opinion while doing so.

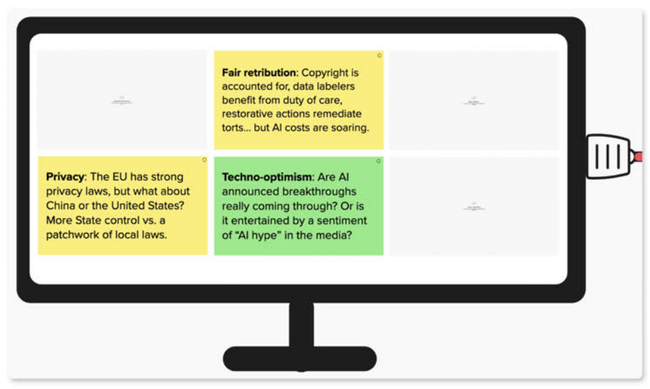
- Approximate length: 1.5 hour
- Number of players: 4 to 8
- Involves a moderator and a "scribe" to note down participants' exchanges (also possible to record without a scribe if workshop held online)



1. Picking a character

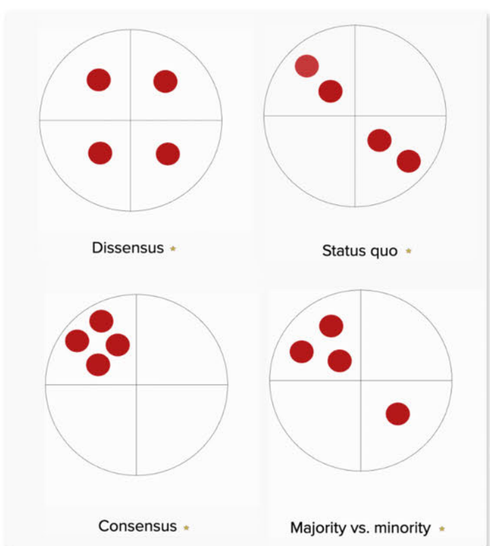
Before operating *Algoprax*, participants select a character. Each yields a "superpower" that can only be played once:

- the **Leader** turns on or off three toggle switches at once;
- the **Fortuneteller** asks the moderator to reveal three of *Algoprax*'s interpretations (while other players keep their eyes closed);
- the **Altruist** passes a turn and designates three players to turn on or off one toggle switch each;
- the **Disrupter** reverses all the switches in a colored area.



3. Reading insights

Once the control board is set, for each toggle switch, *Algoprax*'s interpretation is displayed as a **card on a screen**. Each card bears a text that startle participants so it triggers discussions between them.



5. Revealing bonus

To give participants the sentiment of closing the game—and also to reward them for their efforts—a **bonus is revealed** at the end of the play.

It takes the form of a diagram thought of by two of the author's colleagues. It provides a situational analysis (i.e., *dissensus*, *status quo*, *consensus*, *minority versus majority*) based on the fingers' positioning.

Participants share their thoughts before leaving the game.

Bridging the Gap in Understanding AI Service Terms and Conditions

Youngseong Kim, Leerang Lim

Royal College of Art

10053446@network.rca.ac.uk

ABSTRACT | As AI technologies integrate into various industries, they are reshaping user interactions—often without users' full awareness. Unlike traditional digital services, AI systems operate on vast, dynamic datasets, yielding unpredictable outcomes even for their creators. This unpredictability has sparked global debates on ethical and regulatory standards, especially regarding transparency and user consent. Despite AI's prevalence, many users remain unclear about its functionalities, data practices, and broader implications, frequently placing implicit trust in service providers.

A major challenge in AI governance is the complexity of Terms and Conditions (T&Cs) that regulate data collection and consent processes. Users often view these T&Cs as mere legal formalities, while providers fail to design them for optimal user engagement. This issue is critical in AI services, where ongoing consent is essential for continuous data processing.

This study uses a mixed-methods approach to assess and improve the accessibility of AI-related T&Cs. It involved a comparative analysis of existing agreements, development of a new framework incorporating Privacy by Design (PbD), Human-Centered AI (HCAI), and Explainable AI (XAI) principles, and a user study with 104 participants. Findings reveal that structured layouts, visual aids, and simplified language greatly enhance clarity, transparency, and usability, turning T&Cs into effective trust-building tools.

KEYWORDS | Human-Centered AI (HCAI), Privacy by Design (PbD), Explainable AI (XAI), User Consent and Transparency, Terms and Conditions (T&Cs)

1. Introduction

The advent of Artificial Intelligence (AI) has revolutionized modern services through personalized experiences and efficient data processing, yet it introduces significant privacy challenges. While AI systems leverage user data to enhance service quality and engagement, they face critical issues regarding data misuse, unclear management practices, and consent.

Terms and Conditions (T&Cs) currently serve as the primary framework for regulating AI data usage and building user trust. These agreements establish legal parameters by defining service boundaries and outlining rights and responsibilities. However, traditional T&Cs often fail in their fundamental purpose: helping users understand service terms. Many organizations treat these agreements as mere legal formalities rather than opportunities for meaningful user engagement. This challenge is particularly acute in AI services due to their "black box" nature and complex data networks. Users frequently encounter lengthy, technical documents that obscure rather than clarify data usage practices. This leads to passive consent without genuine understanding, creating a gap between perceived transparency and actual user awareness.

Several frameworks offer potential solutions, including Privacy by Design (PbD), Human-Centered AI (HCAI), and Explainable AI (XAI). These structured approaches enhance T&Cs through improved transparency and user awareness. When integrated effectively, these principles help users better understand data usage while maintaining compliance with evolving regulations like GDPR.

Looking ahead, T&Cs must evolve beyond their current form to address AI systems' unique challenges. Rather than serving as passive agreements, they should transform into transparent frameworks that empower users to make informed decisions about their data.

2. Understanding Design Ethics in AI

2.1. The Evolution and Relevance of Design Ethics in the Digital Age

Design ethics has evolved from its formal inception to become a crucial framework for addressing modern challenges, particularly in digital technology. Founded on principles of responsibility, inclusivity, and sustainability, it provides essential guidance for tackling issues of privacy, transparency, and user autonomy.

The field emerged from the understanding that design actively shapes society rather than being neutral. Victor Papanek's seminal work "Design for the Real World" (1971) redefined design as a moral endeavor, emphasizing societal and ecological responsibility. His vision has expanded to address contemporary concerns including data sovereignty and AI ethics.

These principles extend beyond physical products to encompass systems and processes that influence social behavior. This broader perspective is particularly relevant for AI and digital services, where ethical considerations around privacy, algorithmic transparency,

and equitable access are paramount.

2.2. Differences Between AI Services and Traditional Computing Systems

The shift from human-computer interaction to human-AI interaction introduces additional complexity. AI systems employ opaque, bottom-up learning methods, creating a "black box" effect that makes it difficult for users to understand how their data is processed. This lack of transparency hinders informed decision-making when accepting T&Cs.

AI services require massive datasets to function effectively, unlike traditional systems that need minimal personal data. This dependency raises significant privacy concerns, especially when T&Cs fail to adequately disclose data collection methods and usage purposes. The situation is further complicated by ethical issues such as algorithmic bias and non-transparent decision-making processes.

2.3. The Relationship Between Privacy, Intellectual Property (IP), and Design Ethics

The development and deployment of AI technologies face IP concerns which focus on who owns datasets and how training data consent is managed. Design ethics requires systems to transparently disclose data practices and user rights concerning both inputs and outputs.

Design ethics establishes a framework which manages the competing interests involved. AI design that follows ethical principles prioritizes fairness and accessibility and maintains accountability standards while upholding both user autonomy and societal values. Interfaces need to enable users to make informed decisions through clear presentations of privacy impacts and intellectual property limits.

Embedding privacy safeguards and intellectual property considerations into AI development minimizes system abuse while building user trust through ethical engagement.

3. Challenges in Ethical T&Cs for AI Services

3.1. Challenges of Terms and Conditions

T&C documents are often written in dense legal language, prioritizing legal protection over user understanding. This complexity leaves users unclear about their rights and obligations, undermining the purpose of T&C as tools for transparency and trust (Krumay & Klar, 2020). Users encounter T&C agreements frequently, leading to a dismissive attitude where they consent without reading or understanding the terms (Laird, 2022). This routine acceptance diminishes informed consent and disconnects users from the document's intended purpose.

Privacy literacy also varies significantly among individuals, influenced by cognitive abilities and personality traits. Users with lower crystallized intelligence often struggle with complex privacy policies, particularly in AI services, where "black box" systems obscure how data is collected and processed (Sindermann et al., 2021). The opaque nature and vague definitions of AI-driven T&C further erode trust, as service providers often conceal intentions like data monetization, making it harder for users to navigate these terms effectively.

3.2. Ethical Dilemmas in Balancing Corporate Interests and User Rights

Service providers frequently present themselves as neutral intermediaries within their Terms and Conditions (T&Cs), thereby eschewing accountability for the ethical and legal ramifications of their AI systems. As elucidated in Consent for All: Revealing the Hidden Complexity of Terms and Conditions, this ostensible neutrality not only undermines transparency but also reallocates significant risks, particularly intellectual property (IP) issues, onto the user. A critical concern emerges when providers train their AI models using works produced by artists or content creators without securing proper licenses or obtaining explicit consent. Consequently, users may inadvertently utilize AI-generated outputs that infringe upon IP rights, thus navigating a legally ambiguous terrain. Although providers benefit from enhancing their AI capabilities through such practices, they typically deflect responsibility for potential IP infringements, effectively transferring the legal burden to the user.

Furthermore, the opacity of T&Cs exacerbates this issue, as these documents seldom disclose the provenance of training data or articulate the attendant legal risks. To redress these challenges, it is imperative that service providers reformulate T&Cs to assume responsibility for ensuring compliance with IP laws and to transparently communicate any indemnification provisions or limitations on usage. Such measures are essential to fostering a more balanced and equitable digital ecosystem.

4. Designing Transparent and Accessible T&Cs

4.1. The Importance of PbD, XAI, and HCAI in T&Cs Design

Developing Terms and Conditions (T&Cs) for AI services which focus on users needs a framework that puts privacy protection along with transparent operations and accessible information at the forefront. Three essential principles guide this process: The three guiding principles essential to developing user-centric Terms and Conditions for AI services are Privacy by Design (PbD), Explainable AI (XAI), and Human-Centered AI (HCAI). Privacy by Design (PbD) requires system architects to integrate privacy protections which manage data collection and sharing processes while complying with rules such as GDPR and CCPA. XAI enables transparency through clear explanations of AI system operations and data handling that users can easily access. This process leads to informed user consent while reducing worries about hidden data activities. HCAI works to make AI systems reflect human values while creating understandable T&Cs for users regardless of their technical expertise. These integrated principles establish strong T&Cs which build user trust while safeguarding rights and fulfilling ethical standards and regulatory obligations. A holistic strategy delivers fairness while establishing a durable base for

reliable AI engagements.

4.2. Combining Design Ethics Principles with Practical UX Design Framework

The proposed thesis framework combines Jesse James Garrett's Elements of User Experience with Privacy by Design (PbD), Human-Centered AI (HCAI), and Explainable AI (XAI) principles to develop transparent and user-centered Terms and Conditions (T&Cs) that adhere to design ethics standards.

1. **Strategic Alignment**: The revised terms of use were structured to enhance user trust by clearly communicating
- Data privacy policies, user rights, and AI system transparency.
- The mechanisms behind AI-generated outcomes based on user input.
- User control over personal data and interactions with the system.
2. **Scope and Structure**
- Users were given the ability to pre-set their level of understanding before navigating the terms, allowing for progressive disclosure and simplification of legal content.
- Readability was optimized by adjusting content to a medium-to-low difficulty level, measured using the SMOG readability index, to reduce cognitive burden and improve comprehension.
3. **Layout and Interaction Design**
- A redesigned navigation system incorporated visual aids, including icons, to enhance engagement and facilitate information retrieval.
- Headings and key sections were highlighted and spaced with larger margins to improve readability and quick reference.

5. Case Study

5.1. Methods

A comparative analysis of user interactions with the original and revised versions was conducted to assess improvements in comprehension, satisfaction, and trust. The redesign process was guided by core principles from Privacy by Design (PbD), Human-Centered AI (HCAI), and Explainable AI (XAI) to enhance accessibility and transparency.

5.2. Research Design

This study employed a mixed-methods approach to evaluate user perceptions of AI-related Terms and Conditions (T&Cs) and assess the effectiveness of a redesigned, user-centered framework. The research was conducted in three key phases: (1) Evaluation of existing AI T&Cs, (2) Development of an enhanced framework, and (3) User testing through a structured survey.

1. **Evaluation of Existing AI T&Cs**

   A comparative analysis(Table 1) was conducted on the T&Cs of five major AI platforms to identify common usability barriers, lack of transparency, and engagement issues. The analysis focused on readability, structure, visual presentation, and content comprehensiveness, with particular attention to how AI services disclose data collection, user rights, and consent mechanisms.

Table 1. An analysis of T&Cs from five AI platforms by framework

	OpenAI ChatGPT	Midjourney	Google Gemini	MS Azure	IBM Watsons
Contents	OpenAI emphasizes user-focused design by promoting data privacy and control over content (PbD), aligning AI systems with human values through clear documentation (HCAI), and offering general service documentation while lacking detailed model-level explanations (XAI)	MidJourney supports user creativity by providing artistic tools that augment human work without replacing it (HCAI), includes basic data privacy terms but with limited PbD formalization, and offers outputs with minimal transparency regarding underlying model decisions (XAI).	Google Gemini integrates user control over data to ensure data protection (PbD), prioritizes human well-being and collaborative input to refine AI models (HCAI), and strongly focuses on AI interpretability to explain decision-making processes clearly (XAI).	Azure explicitly adopts Privacy by Design with robust user data controls (PbD), emphasizes fairness, transparency, and removing biases in AI systems (HCAI), and incorporates detailed explanations of AI outputs to support interpretability (XAI).	IBM embeds Privacy by Design in its AI services with strong user data controls (PbD), develops AI systems to augment human decision-making and prioritize assistance over replacement (HCAI), and highlights Explainable AI principles to ensure users can trace and interpret decision-making in its Watson services (XAI).
SMOG*	14.39	15.72	19.53	18.50	21.24
Layout	Minimalist with clear sectioning and sufficient spacing for readability. A neutral background ensures focus remains on the text. The layout is simple and professional.	Clean, sparse, and distraction-free. Sections are segmented with concise headers, designed for a straightforward, scrollable format.	Incorporates Google's Material Design principles, with ample white space, bold headings, and collapsible sections (accordion-style) to organize content. This layout facilitates easier navigation of lengthy documents.	Professional and corporate, designed with enterprise users in mind. Features large headers and drop-down menus for segmenting dense content. Hyperlinks to related documents are used for further depth.	Structured and formal, catering to enterprise customers. The layout uses clear sections, bulleted lists, and headings for improved readability.
Elements	The T&Cs prioritize clarity and professionalism but lack engaging features like visual aids or interactive tools. The absence of icons and diagrams limits user engagement.	While the simplicity aids readability, the lack of icons, diagrams, or interactive tools limits the page's ability to visually communicate complex terms or engage users.	The T&Cs integrate expandable menus and visual navigation aids, improving user interaction and comprehension. However, the lack of diagrams limits the visual explanation of complex terms.	The T&Cs include drop-down menus for improved navigability and hyperlinks for additional resources. The use of subtle icons adds a professional touch but does not strongly engage users visually.	The T&Cs prioritize precision and clarity with structured formatting, such as headers and bullet points. However, the lack of interactive or visually engaging features limits accessibility for non-enterprise users.
Text	Heavily legal and text-based, with a focus on clarity. Sections are clearly divided by headings and subheadings, but minimal use of bold or highlighted text reduces emphasis on key points.	Concise and simple, with brief descriptions of each point. Occasional bold text is used for emphasis, but overall typography is plain and functional.	Well-organized with clean fonts. Key sections and phrases are emphasized using bold text or color highlights, improving scannability.	Highly detailed and technical. Large, bold headers and smaller subheadings create a clear hierarchy, aiding navigation. Text is dense but structured for enterprise-level clarity.	Detailed and technical, targeting professional users. Headers and bullet points are extensively employed to break down dense content.

Icons/Images	None observed.	None observed.	Rarely included. Minimal icons for navigation.	Rarely included Minimal icons are used to categorize documents.	None observed.

2. **Development of the Enhanced Framework**

   Based on the insights from Phase 1, a user-centered framework was developed. The framework was designed to simplify legal language, incorporate visual aids and structured layouts, and introduce adaptive elements tailored to different user literacy levels. (Figure 1)

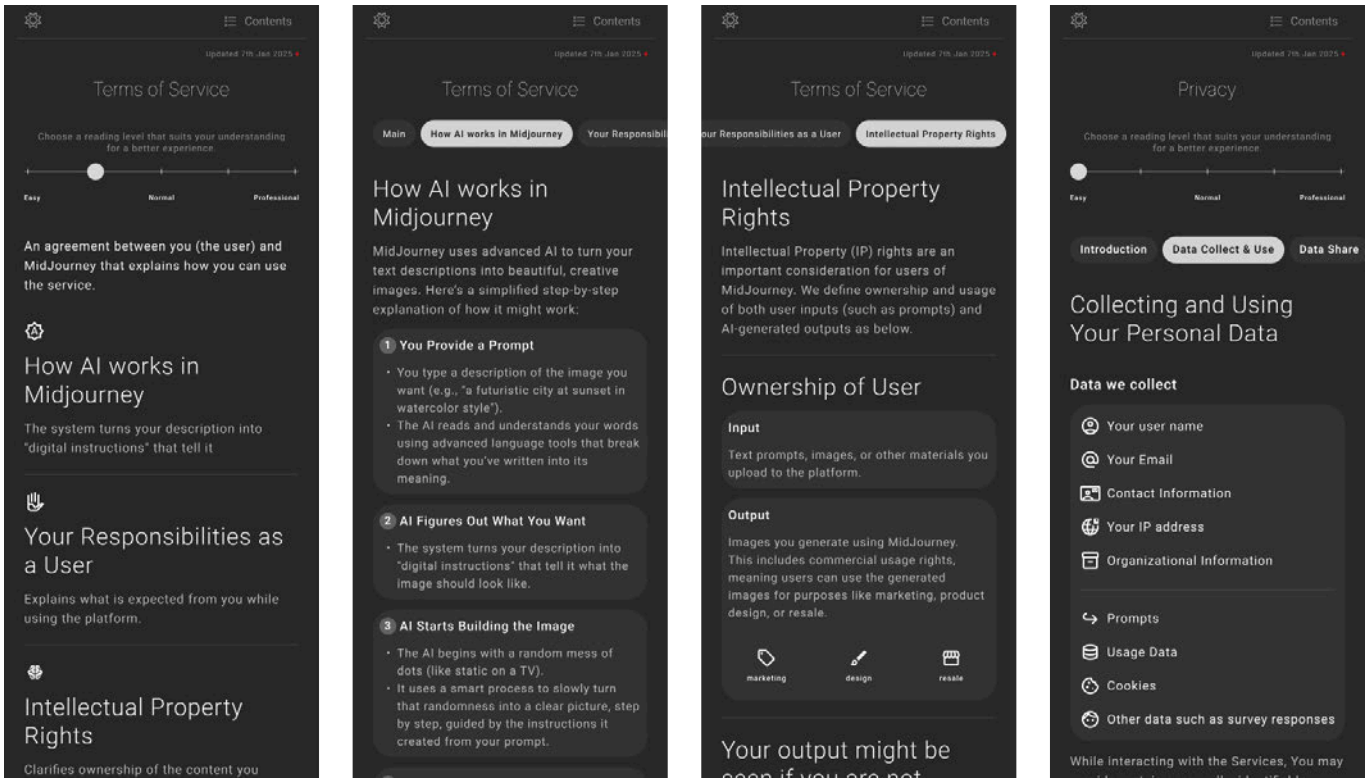

Figure 1.Redesigned T&Cs of Midjourney

3. **User Testing and Survey**

   To assess the effectiveness of the redesigned T&Cs, a structured survey was conducted with 104 participants from diverse backgrounds, including varying levels of AI familiarity. The survey measured user comprehension, engagement, and trust in the redesigned T&Cs compared to conventional versions.

5.3. Participants and Procedure

A total of 104 participants from diverse backgrounds took part in the study. Each individual was allotted 15 minutes to review both the original and redesigned T&Cs before completing a survey that measured understanding, engagement, and trust levels. The

survey combined quantitative rating scales and open-ended feedback to capture detailed insights into user perceptions.

5.4. Measures

Participants were presented with both the original and redesigned T&Cs and asked to evaluate them based on:

- Clarity: Ease of understanding legal and AI-related terms.
- Transparency: Perceived openness in data practices and AI decision-making.
- Engagement: Effectiveness of visual aids and structured layouts.
- Usability: Overall ease of navigation and accessibility.
- Cognitive Load: The mental effort required to process the document.

  A 5-point Likert scale (1 = Very Poor, 5 = Excellent) was used to quantify responses, supplemented by qualitative feedback to capture user insights.

Quantitative data were analyzed using descriptive statistics to compare user ratings of the original vs. redesigned T&Cs. Thematic analysis was applied to qualitative responses to identify common patterns related to user experience, trust, and perceived barriers to comprehension.

5.5. Results

The findings indicate that the redesigned Terms and Conditions (T&Cs) significantly enhanced the user experience across key dimensions, including clarity, usability, engagement, and cognitive load reduction.

1. Clarity and Accessibility

   The redesigned T&Cs significantly improved clarity and ease of understanding, achieving a mean rating of 4.12 (SD = 0.82) compared to 3.13 (SD = 1.24) for the original version. Participants identified clear section headings, simplified language, and structured layouts as key factors contributing to this improvement. Additionally, 43.3% of respondents highlighted "clear visual design and layout" as the most helpful aspect in improving comprehension.

2. The addition of icons, diagrams, and highlighted sections played a crucial role in enhancing user understanding. 49% of respondents found visual aids "very helpful," while 44.2% rated them "extremely helpful." These enhancements reduced cognitive load, improved information retention, and facilitated

navigation. Furthermore, 64.4% of participants reported a notably better reading experience (Figure 2).

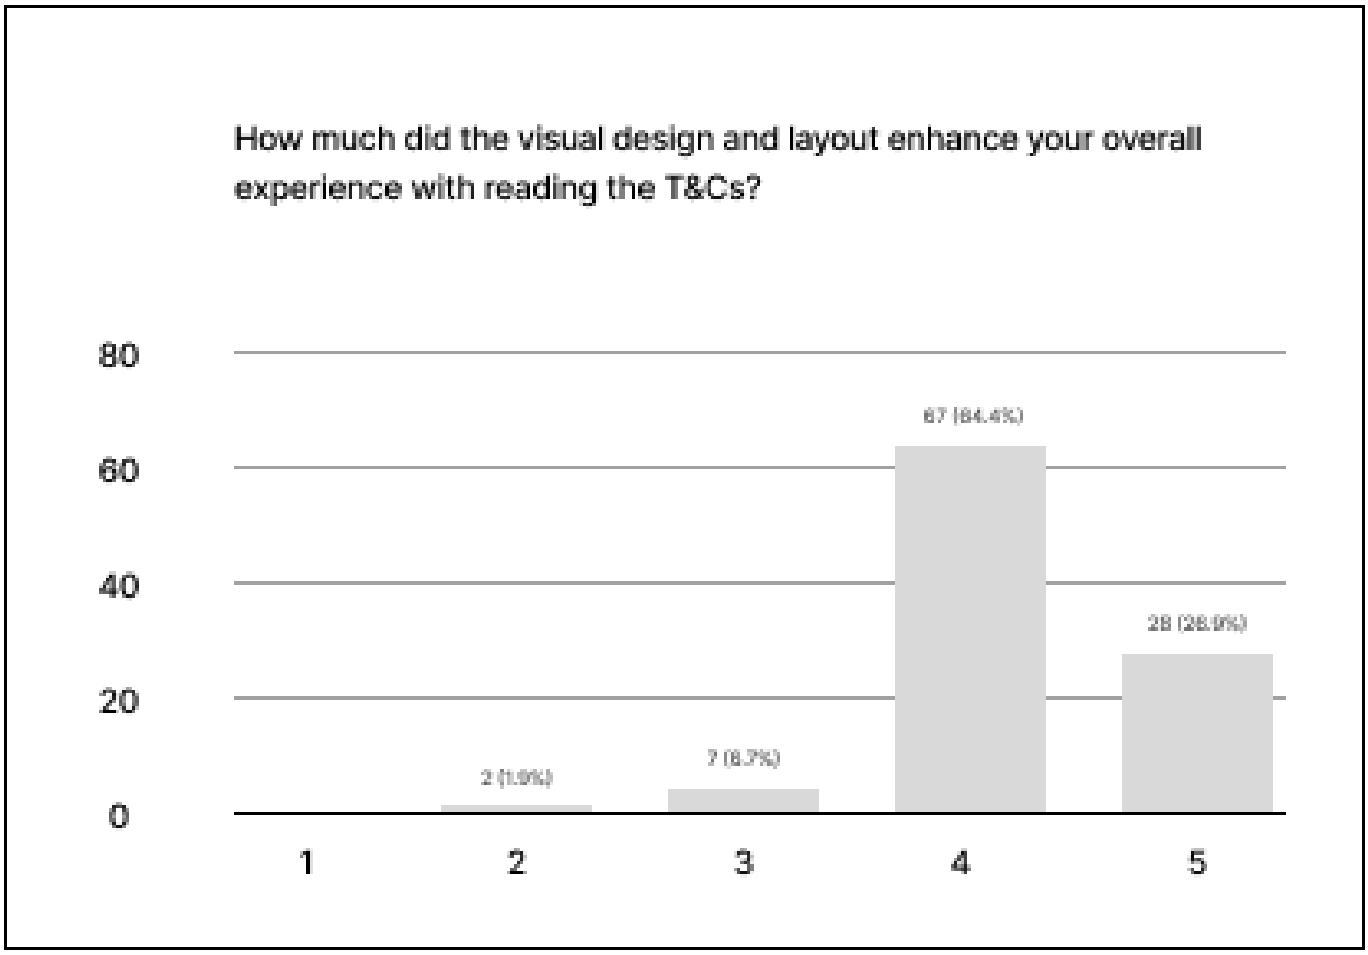

Figure 2.Impact of Visual Design and Layout on User Experience with T&Cs

3. Usability and User Satisfaction

   User ratings for usability(figure 3) also showed substantial improvement, with the redesigned T&Cs receiving a mean score of 3.63 (SD = 1.30) compared to 2.90 for the original version. Participants appreciated the logical structure, improved readability, and user-friendly flow of information, particularly the balance between simplicity and comprehensiveness.

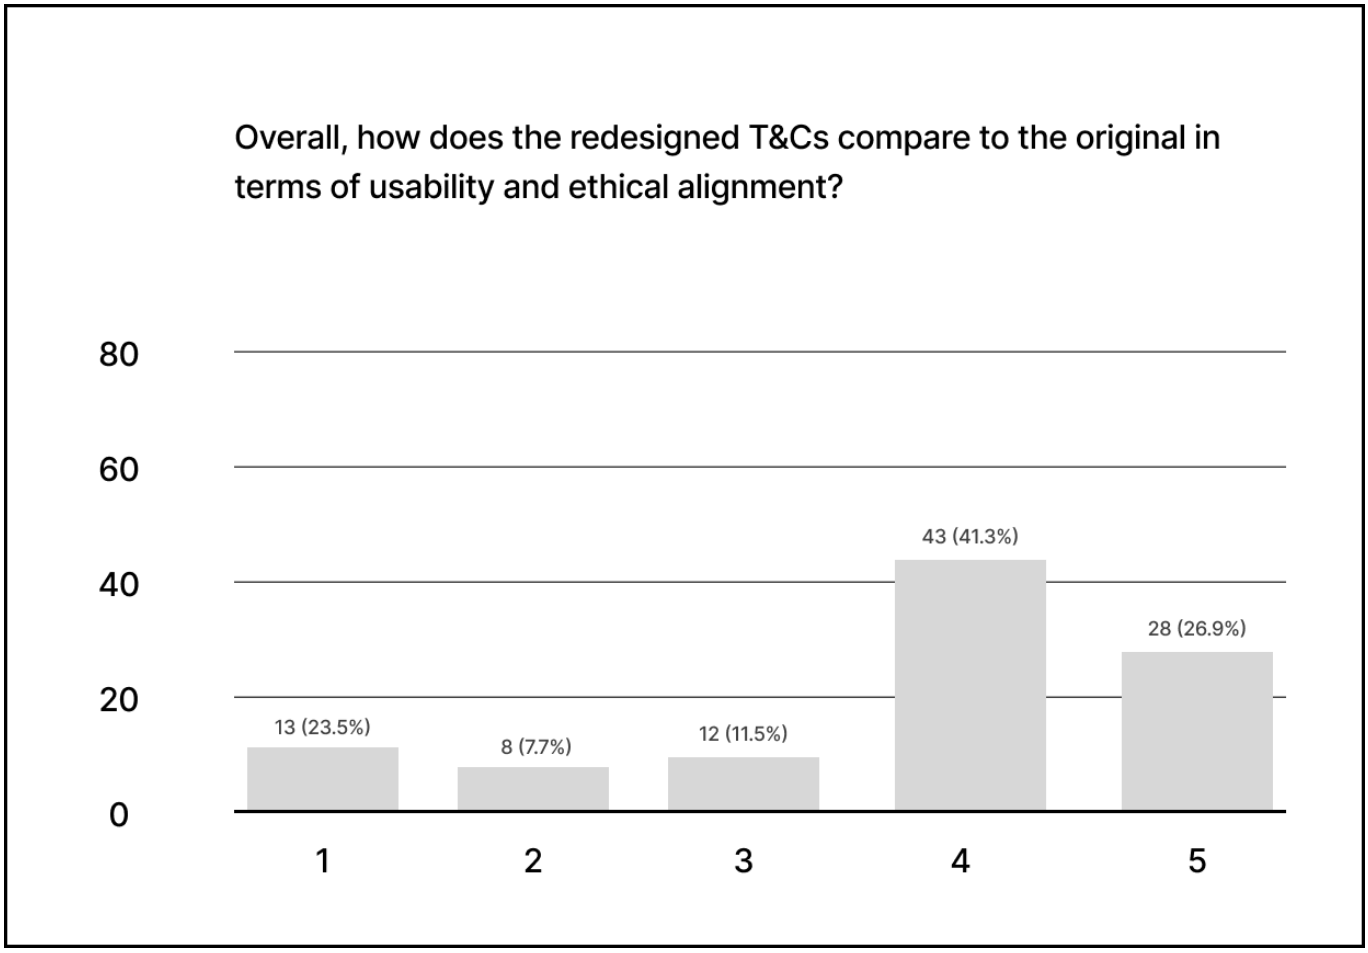

Figure 3. Comparison of Usability and Ethical Alignment Between Original and Redesigned T&Cs

4. Cognitive Load Reduction

   The redesigned T&Cs effectively reduced cognitive strain, receiving a mean score of 4.16 (SD = 0.62) compared to 3.20 for the original version. The integration of structured layouts and customizable elements minimized the mental effort required for users to navigate and comprehend key terms.

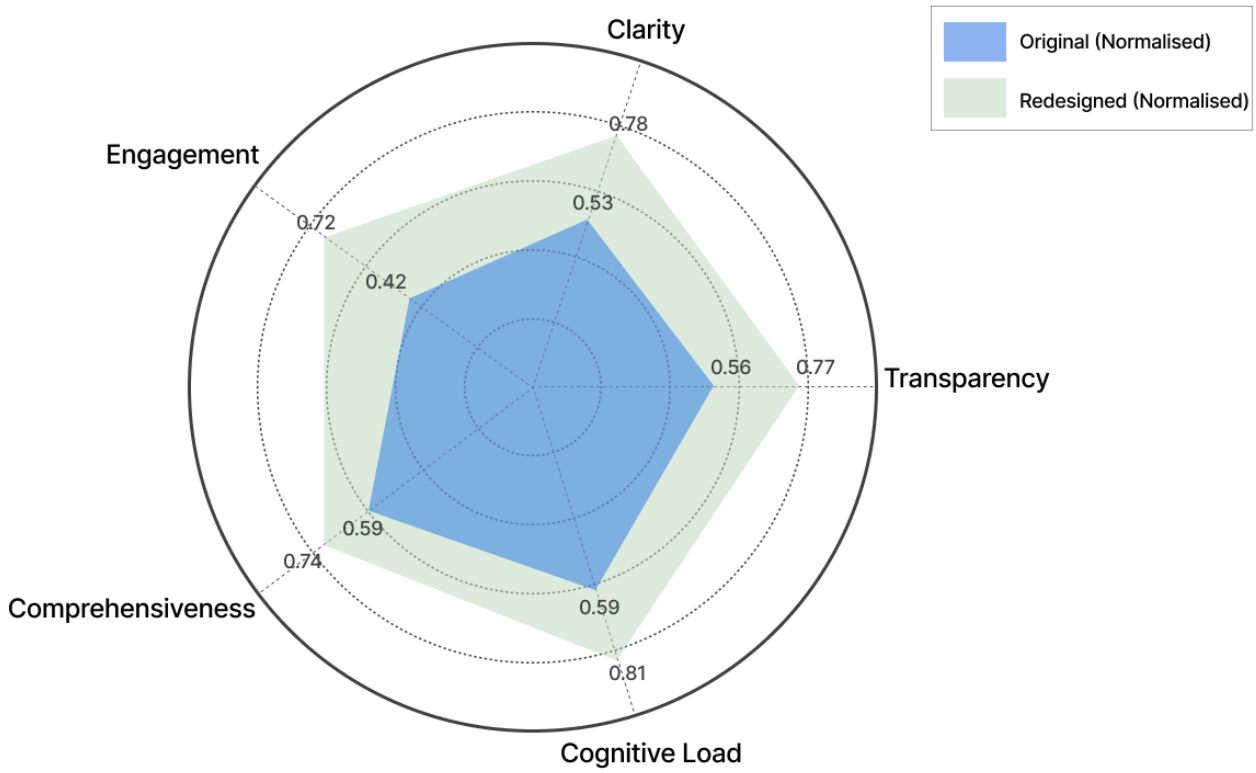

Figure 4. Comparison of original and redesigned T&Cs (Normalised)

These findings(Figure 4) underscore the importance of user-centered design in AI service agreements, ensuring that policies are clear, accessible, and easy to engage with while fostering trust and transparency in digital governance.

6. Discussion

While the framework provides a foundation for human-centered T&Cs, it is not without challenges. One significant issue is the dynamic nature of AI systems, which makes it difficult to keep terms and conditions (T&Cs) updated to accurately reflect evolving functionalities and features. Additionally, the redesigned Terms and Conditions (T&Cs) didn't incorporate every standard element normally found in such agreements. The document prioritized enhancing clarity and user engagement but as a result some legal and technical details were not fully included which impacted the overall completeness. Future iterations need to investigate solutions that maintain complete contractual information while ensuring documents remain readable for users.

7. Future Directions

7.1. Empowering Users Through Optimised Terms

Service providers need to move away from unilateral communication systems towards approaches that prioritize cooperation and openness. Providers who allow users to tailor their terms of use can show legal information through formats that people can easily access and understand. Through this method organizations gain user trust alongside the

promotion of ethical design practices and fairness in digital platforms. The spread of AI services requires immediate attention to digital literacy disparities. Personalized legal documents which AI-driven adaptive Terms and Conditions generate match each user's comprehension level through simplified presentation. The adaptive methodology minimizes complex legal language so users stay informed and empowered which leads to a more equitable digital ecosystem centered around user needs.

7.2.Regulating Human-Centered T&Cs in AI Services

Regulations for AI services must extend past content rules to also focus on information presentation and verification methods. User interfaces need to utilize straightforward language together with visual emphasis on critical details and verification systems to ensure users understand information. GDPR and CCPA regulations address compliance but frequently ignore UX elements which affect user comprehension. Implementing UX guidelines for T&Cs closes the comprehension gap so users provide truly informed consent.

8. Conclusion

The research establishes an initial roadmap to improve how transparent and accessible AI service standards and results can be. This proposed framework connects user experience with AI ethics through structured T&Cs design which empowers users and maintains compliance with legal and ethical standards. The framework builds trust and engagement which aligns with legal standards and deals with broader ethical issues present in the evolving digital AI space.
This research supports the creation of transparent and accountable AI systems and joins existing studies that focus on designing AI technologies centered around human needs. The research shows how vital it is to build AI systems which focus on user comprehension together with ethical accountability and genuine consent throughout AI technology evolution.

COMMUNICATION DESIGN EDUCATION FOR THE AI ERA: OBSERVATIONS FOR A RESPONSIBLE COLLABORATION WITH COMPUTATIONAL PARTNERS.

Marco Quaggiotto*[a]

a Politecnico di Milano, Department of Design
*marco.quaggiotto@polimi.it

ABSTRACT | The exponential evolution of artificial intelligence (AI) over the past 30 years has rapidly transformed it from an academic pursuit into a widely accessible technology with far-reaching effects across industries and creative practices alike. In this paper, while recognizing the inherent uncertainties of forecasting such rapid technological evolution, we aim to present a review of quantitative industry metrics and qualitative expert insights to provide the design community with a grounded basis for debate on the formative and professional shifts driven by AI.
Methodologically, the study employs a meta-review strategy, analyzing key industry reports, scholarly articles, and commentaries published over the past half-decade. From the thematic analysis of the collected sources, we extract recurring macro themes and contextualize general AI developments within the specific challenges and opportunities of Communication Design. The analysis unfolds in a structured progression: starting with an overview of the rapid evolution of AI technologies, it then explores the core characteristics of AI—particularly the shift toward generative models and example-based learning—and finally scrutinizes the practical challenges of control and collaboration between human designers and AI systems.
The first observation establishes AI's rapidly evolving role, bolstered by growing academic output, increased economic investments, and accelerated technological scaling. The second considers AI's rapid trajectory and the historical precedents for such a transformation, drawing parallels to earlier technological revolutions in design. The third observation analyzes AI's focus on pattern recognition and its tendency to reinforce the hegemonic perspective, posing risks of stereotyping and cultural convergence in visual

representation, challenging diversity and inclusivity in design. The fourth observation reflects on control, noting challenges designers face both in guiding AI toward nuanced creative intentions, and in training new models. The fifth observation reflects on the profound restructuring of design workflows as AI assumes roles traditionally held by designers, reflecting on the need for designers to take an active role in guiding these tools to ensure innovation and originality and on the skills and competences needed to steer intrinsically AI's imitative nature.
As a final contribution, the paper presents a hypothesis for education in design developed at the School of Design of Politecnico di Milano in the Communication Design degree program, advocating for an adaptive approach in design curricula, bridging humanistic insight with technological literacy to meet the demands of an AI-integrated creative landscape. The hypothesis presents a dual approach to design education founded on visual cultural literacy alongside technical expertise to equip future designers to critically engage with and direct AI technologies. This reflection aims to contribute to ongoing discourse on AI's implications within design, underscoring the responsibility of institutions like Politecnico di Milano to prepare future designers through updated pedagogical and professional frameworks in response to these technological transformations.

KEYWORDS | ARTIFICIAL INTELLIGENCE, COMMUNICATION DESIGN, DESIGN EDUCATION, DESIGN ETHICS

1. Introduction

In the past five years, advancements in Artificial Intelligence (AI) technologies have transformed what was primarily an academic research endeavor into a widely accessible technology, with tangible impact across various industrial sectors and a significant impact on practice and education in the discipline of communication design.

In the context of design research and related disciplines, the intersection of artificial intelligence and graphic design is an active area, with studies focusing on different aspects of its impact, such as its transformative potential (Stoimenova and Price, 2020; Song et al., 2022; Guzman and Lewis, 2020); its impact on creative methodologies and production practices (Serra and Miralles, 2021); its ethical and cultural issues and role of human oversight (Zhang et al., 2021; Gunkel, 2012); and the evolving role of the designer (Kwon et al., 2023; Afolabi et al., 2024).

In such a rapidly evolving context, while predicting the medium to long-term impact on visual and graphic design disciplines is a complex task subject to risks of oversimplification, this contribution aims to gather some observations on the current state, the emerging directions, the elements that seem to be critical elements for an informed discussion. With this aim, this paper presents a review that combines quantitative industry metrics with qualitative expert insights to examine the traits of current AI trends and their impact on design. The objective is to provide a founded base for debate in the design community with regard to the current and future formative and professional context.
While we acknowledge that even with a clear understanding of current technological developments, the implications of these changes with respect to the adjustments needed in didactics and education remain uncertain, we feel that defining a clearer picture of the current scenario can help reflect on the dimensions of change, if not on its specific modalities.

2. Methodology

This contribution is based on an analysis and meta-review of the main industry reports, commentaries, and literature addressing developments in AI in the last 5 years to provide a quantitative glimpse into the evolution of AI technologies, while also incorporating expert opinions to offer qualitative depth. From the collected literature, observations were extracted through thematic analysis in order to identify recurring macro themes and relate general commentaries to the disciplinary context of Communication Design.

The observations identified follow a structured progression, beginning with a broad technological perspective on AI, with limited reference to the disciplinary context, before gradually examining aspects critical to the context of Communication Design. While Artificial Intelligence is introduced in general terms, the primary focus is on Generative AI, and the mechanisms through which Machine Learning algorithms generate content.
The observations progress from the current state of AI (3.1, 3.2), through its fundamental characteristics (3.3), to its practical challenges (3.4), and finally its implications for design education and practice (3.5).
At the end of the contribution we share a first hypothesis, grounded in the available evidence, that represents an approach being tested at the School of Design of Politecnico di Milano in the Communication Design degree program, to frame and address such shifts in design practices.

3. Observations

3.1 A Context of Rapid Evolution

The starting observation, certainly obvious but not without relevant consequences, is that AI technologies not only represent a central reality in the current technological, cultural, and social landscape but also constitute a field characterized by continuous and rapid evolution. Data from industry reports and academic literature describe a context not only of growth that manifests across multiple interconnected dimensions but also of acceleration.

In the academic sphere, we see a remarkable intensification of scholarly attention and resource allocation. Publication volume on arXiv, an open-access platform for sharing scientific research, demonstrates exponential growth, doubling approximately every 23 months (Krenn et al., 2023), while citation patterns reveal AI-related works have increased from 5% to 20% of all computer science citations within a decade (Maslej et al., 2024). This academic expansion has catalyzed substantial institutional responses, evidenced by initiatives such as Horizon Europe's €95.5 billion allocation for 2021-2027 and a global tripling of AI-focused degree programs since 2017. Higher education institutions across both technological and humanistic disciplines have systematically integrated AI-specific curricula, responding to the growing demand for expertise in this rapidly evolving field (Maslej et al., 2024).

The industrial sphere presents an even more dramatic transformation. Industrial adoption of Artificial Intelligence demonstrates remarkable expansion across multiple indicators. Patent activity, predominantly driven by American and Chinese multinationals, has increased 31-fold since 2010 (Maslej et al., 2024), while organizational integration has reached significant levels, with 42% of large organizations having implemented AI solutions and an additional 40% actively exploring implementation (Alex Singla et al., 2024). This industrial momentum is particularly evident in design-adjacent sectors, where

generative AI investments witnessed an eight-fold increase in 2022, accumulating $25.2 billion in funding distributed among the companies pioneering advanced AI models and tools, such as OpenAI, Anthropic, Hugging Face, and Inflection. The expansion extends beyond corporate boundaries, encompassing both established technology companies—exemplified by Google's biannual doubling of internal AI projects (Young, 2018)—and the open-source community, where GitHub's AI-related projects have grown from 845 in 2011 to approximately 1.8 million in 2023, accompanied by a tripling of community engagement between 2022 and 2023 (Maslej et al., 2024).

The technological infrastructure supporting Artificial Intelligence has experienced unprecedented growth, with computational resources—such as processing power, specialized hardware, and data storage—allocated to AI training expanding at an annual rate of 400-500% over the past decade. This growth trajectory has remained consistent across various model architectures, particularly in generative systems including Large Language Models, image synthesis, and multimodal systems (Sevilla & Roldán, 2024). The convergence of expanding computational capacity, enhanced algorithmic efficiency (Ho et al., 2024), and sustained investment (Cottier et al., 2024) has facilitated the development of increasingly sophisticated models.
This increased sophistication can be observed in two main areas: dataset size and model complexity. Datasets—the collections of examples AI models use to learn—have grown significantly, reaching sizes of 2 trillion tokens (individual pieces of text, such as words or fragments) for language models, and 3 billion images for visual systems (Villalobos et al., 2024). At the same time, the complexity of these models has grown rapidly, with the number of parameters—the internal adjustable settings that determine how a model processes information—doubling every 8 months for language models and every 12 months for image recognition models since 2018 (Villalobos, 2022).

The practical ramifications of this technological acceleration manifest in quantifiable performance metrics. AI systems have progressively surpassed human capabilities across multiple cognitive domains: image classification (2015), simple text comprehension (2017), visual reasoning (2020), and text-based logical inference (2021) (Maslej et al., 2024). The pace of advancement has been so rapid that established evaluation frameworks (e.g. ImageNet, SQuAD, SuperGLUE) have become insufficient as benchmarking tools, compelling the development of more sophisticated evaluation methodologies, which themselves struggle to present meaningful challenges to rapidly evolving AI systems (Chollet et al., 2024).

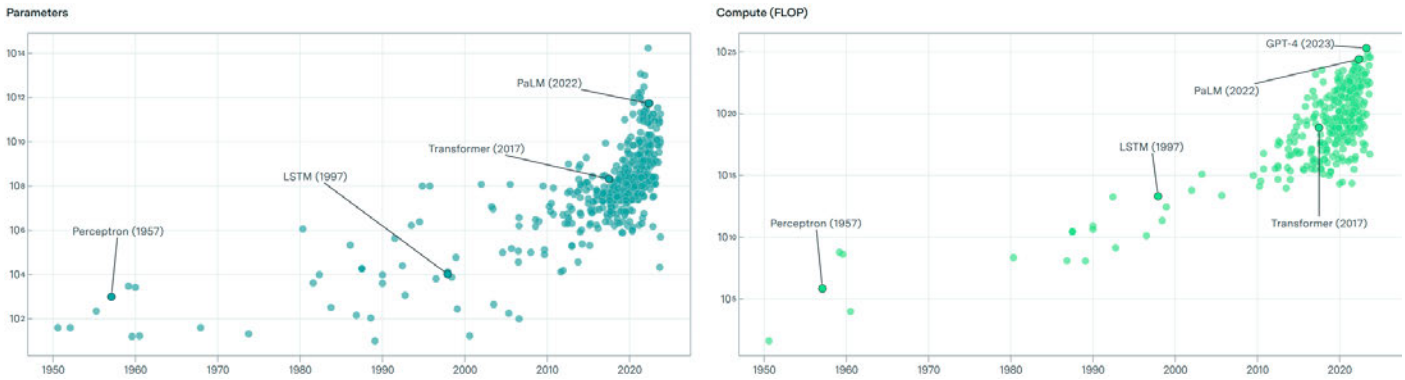

Figure 1: Exponential growth over time of number of parameters and computational resources employed in the training of AI systems (Villalobos, 2022; Sevilla & Roldán, 2024).

3.2 The Unabated Acceleration of AI

A corollary to this first observation, emerging from the analysis of key metrics, is that this acceleration shows no signs of slowing. In other words, if Artificial Intelligence indeed represents a paradigmatic shift, we are currently witnessing its preliminary phases rather than a completed transformation.
Like the advent of the Internet in 1995 or the mobile revolution of 2007, we are likely at the dawn of a transformative change. We begin to view, with skepticism, the first websites, the first applications, the first smartphones, questioning their true purpose and whether the surrounding enthusiasm is justified. As in these previous cases, we cannot predict the outcomes of this evolution or whether it will succeed. However, if AI proves to be an authentic paradigm change, it is plausible that its impact will be at least as profound and pervasive, if not greater, compared to previous technological revolutions (World Economic Forum, 2023).

Empirical evidence of this transformation can be observed in businesses' initial adoption of AI-enabled tools, their integration into production processes, and the use of generative models for increasingly complex tasks (Alex Singla et al., 2024). However, the rapid pace of these changes makes reliable predictions about future developments difficult.
In the specific context of Communication Design, the first quadrimester of 2024 has seen the introduction of over twenty advanced generative AI models by major sector players. Models such as Midjourney 6, Stable Diffusion 3, and Imagen 3 for image generation, Gemini Pro 1.5, Claude 3, ChatGPT-4o, and LLaMA 3 for multimodal tasks, Sora and VideoFX for video generation, along with Suno 3 and Stable Audio 2 for sound and audio generation, are the new models defining the state of the art in generative AI in 2024, and which will likely be obsolete by year's end.

Figure 2: "A hyper-realistic image of Harry Potter" as rendered by various versions of MidJourney.

Activities previously considered exclusively human domain, such as the generation of images, texts, videos, sounds, 3D models, and interfaces, are now beginning to be

executed with increasing sophistication by AI models, opening new opportunities and challenges. While the results in some of these tasks are still crude, the extremely rapid evolution of text-to-image models offers a paradigmatic example of how quickly this technology is progressing, and how soon we might see results that today seem beyond AI's capabilities. While Midjourney's first release in February 2022 produced rudimentary, barely recognizable images at small dimensions, unsuitable for professional use, version 6 (released in December 2023) has not only reached a level of quality capable of generating photorealistic images but has also progressively provided users with a series of tools and parameters useful for guiding image generation in specific directions. This rapid improvement does not constitute an isolated case but rather reflects a broader trend in the AI industry, eloquently represented by one of Silicon Valley's mantras according to which current models, however miraculous, are often presented as "the dumbest model any of you will ever have to use" (Altman, 2024).

With monthly frequency, increasingly sophisticated models redefine the boundaries of possibility in AI, rendering previous versions obsolete in a rapid cycle of advancement. In this context, the possibility of AI systems reaching human-level capabilities across a broad range of tasks has moved from science fiction to very concrete possibility, where several industry leaders, including Dario Amodei (CEO of Anthropic), Shane Legg (co-founder of Google DeepMind), and Jensen Huang (CEO of Nvidia), have suggested that these capabilities could emerge within the next five years (Amodei, 2024; Legg, 2024; Nellis, 2024). While speculations about the impact that reaching such a milestone could have are beyond the scope of this contribution, it is likely that, in such a scenario, concerns regarding the future of Communication Design might become secondary.

3.3 Learning from Examples

The third thematic cluster—crucial for communication design—focuses on how contemporary AI systems learn. Unlike traditional software, which follows rules explicitly coded by programmers, today's AI models acquire their abilities by studying large collections of examples (an "example-based learning" approach). This data-driven method represents a substantial departure from earlier algorithmic practice and is widely regarded as a paradigm shift within computational science.
While conventional algorithmic systems operate within predefined parameters and are particularly suited to tasks characterized by well-delineated and invariable rules, such as processing queries on complex data structures or analyzing formal systems, AI systems are capable of addressing more complex and nuanced tasks, such as image recognition and text translation. This capacity for adaptation and learning makes such systems particularly suitable for tasks requiring a high degree of flexibility and considerable generalization capability.
Within generative AI, this example-based approach most often takes the form of supervised learning, where—at a high level—models ingest vast collections of paired examples (an input such as a caption and the corresponding output, such as an image). Beginning with no innate skill, the system progressively infers the statistical relationships linking each input to its output and progressively develops a predictive model that can extend those learned patterns to new situations: identifying previously unseen objects, translating unfamiliar sentences, or generating fresh visuals from textual prompts.

This observation, apparently trivial, carries two corollaries. The first is that the nature of Artificial Intelligence systems is inherently tied to pattern identification and replication: it is essentially a mimetic process, where the computational apparatus acquires, through examples, the ability to imitate human behavior. The famous "Turing test," originally termed "imitation game" in the 1956 publication by Alan Turing (1956), proposes to replace the question "can machines think?" with a more empirically approachable issue:

"can machines exhibit intelligent behavior indistinguishable from human behavior?" In other words, it configures itself as an imitation test: it quantifies the effectiveness with which an artificial system manages to replicate human behavior and whether such replication proves sufficient to elude human discernment.
While the original Turing test was to be conducted through written conversation, today it's possible to conceive variants of the test applicable to a multiplicity of tasks: from image generation to language translation, to video production. In each of these domains, the fundamental question remains unchanged: is the produced simulation sophisticated enough to deceive a human observer?
The answer to this question is, increasingly often, affirmative. If some version of the Turing test in its original formulation has plausibly been surpassed without fanfare in recent years (Mitchell, 2024; Jones & Bergen, 2025), in the realm of visual communication, the most recent generative systems are capable of producing images that are substantially indistinguishable, and paradoxically even more convincing than real images.
As early as 2021, in a study where participants were asked to distinguish between real faces and AI-generated faces, the average accuracy was only 48.2%, substantially equivalent to random choice (Nightingale & Farid, 2022). In a subsequent study from 2023, the five faces most often judged as human were all AI-generated, while only one of the five faces most often judged as AI was actually AI-generated (Miller et al., 2023).
In light of recent progress in image generation systems (Flux, MidJourney, and Stable Diffusion), video (Sora, Runway), texts (ChatGPT, Claude, Gemini), and other types of content, it is realistic to admit the human observer's defeat regarding the ability to distinguish between AI-generated and real content. If for some type of content such a transition hasn't already occurred, it's reasonable to suppose it will happen in the very near future.
In the words of Microsoft's Chief Scientific Officer, Eric Horvitz, humanity finds itself at the beginning of a transition toward what he terms a "post-epistemic" context, a scenario characterized by a growing, if not insurmountable, difficulty in discerning between reality and fiction, with significant repercussions for the foundations of democracy, mechanisms of social trust, and communication paradigms in their entirety (Horvitz, 2022).
The initial manifestations of such phenomena are already before us. In reference to the journalistic context, in March 2024, shortly before the writing of this article, a network of websites dubbed CopyCop was identified, responsible for the dissemination of over 19,000 articles in English and French. Such content, originally sourced from authoritative journalistic sources, was "rewritten" by Artificial Intelligence systems with the intent of introducing elements of disinformation within substantially truthful news (Atherton, 2024).
In the social media realm, simultaneously, we observe the emergence of phenomena characterized by the exploitation of content designed to elicit specific emotional responses, such as anger, nostalgia, and indignation, to amplify engagement and increase profits through advertising strategies or other forms of monetization. Despite the extremism and low verisimilitude of this content often making it easily identifiable, sometimes becoming objects of derision among younger generations, their impact on older audiences (hence the colloquial designation "boomer traps") is steadily increasing, and the prospect of their evolution toward increasingly sophisticated forms raises significant concerns regarding the risk of growing dissemination of polarizing and manipulative content.
In general, the primary concern does not lie so much in the possibility of creating content indistinguishable from authentic content, but rather in the fact that the process of diffusion and industrialization of these practices may enable anyone to generate unlimited quantities of images and texts, automatically and at negligible costs, opening problematic scenarios regarding our ability to navigate an increasingly unreliable information context.

The second corollary is the observation that, in this mimetic process, the frequency of representation of a particular pattern in the training dataset is directly proportional to its prevalence in generation processes. Without appropriate precautions, in other words, artificial intelligences are subject to a phenomenon known in literature as "dataset bias" that leads AI models to replicate and amplify patterns present in training data. This means that due to the intrinsic nature of the learning modalities on which they are based, artificial intelligences do not configure themselves as inclusive tools, nor even neutral ones, but tend instead to represent the majority, the dominant form, the prevalent model, excluding minorities, marginal forms, alternative models (Mehrabi et al., 2021). In the design context, this tendency manifests through the communicative form of stereotype and prejudice, triggering a feedback cycle that reiterates and amplifies the dominant perspective, promoting a communicative monoculture (Bianchi et al., 2023).
The repercussions of this mechanism manifest in various ways: in facial recognition models that struggle to recognize faces of people with dark skin (Johnson & Johnson, 2023), in automatic translation models that translate in sexist or racist ways, in text generation models that produce discriminatory or offensive content. More insidiously, such effects also manifest in image generation models, visual representations that reflect prevalent aesthetic canons, traditional gender roles, and consolidated behavioral models, thus marginalizing alternative expressive forms, divergent visions, and critical perspectives (Anand et al., 2023; Naik & Nushi, 2023; Wan et al., 2024).
The probable large-scale diffusion of AI-generated content, predicted for the coming years, raises problematic scenarios in relation to the already complex issue of employing stereotypes in visual and textual content, and their role in perpetuating and reinforcing models of discrimination and inequality (Bucchetti, 2021). The risk is that of further exacerbating the gap between dominant visions and alternative visions, between consolidated forms of communication and emerging forms of communication, between hegemonic cultures and subaltern cultures, proposing a worldview where all Indians are old with beards and turbans, all women are models, all poor people are black (Turk, 2023).

Figure 3: 100 images generate using Midjourney with the prompt: “A Nigerian person” (Turk, 2023)

This intrinsically reactionary nature of generative artificial intelligences manifests both on

the representational plane and on the linguistic plane. Generative artificial intelligences, if left alone, through a sort of "cultural convergence" mechanism tend to converge toward rather recognizable styles, characterized by a "glossy" aesthetic that is simultaneously curated and homogeneous, reflecting dominant aesthetic canons inspired by the worlds of fashion, cinema, and advertising. A world made of saturated colors, marked lights and shadows, symmetrical compositions, young and attractive subjects, urban and minimalist settings, design objects and technology, reassuring poses and gestures, neutral and smiling expressions.
Regarding visual languages and styles, as with content, generative artificial intelligences are not machines for invention, but for imitation. Autonomously, they do not contribute to evolving the state of the art, do not give life to aesthetic experimentation or new forms of expression, except in cases where malfunction and glitch become an integral part of the creative process. While the deformed aesthetic of early GANs, the confusions due to mixed training processes, generation errors due to dataset artifacts, or model malfunctions have found recognition in artistic and experimental contexts (Klingemann, 2018; Obvious, 2018), the high-quality and realistic content generation capabilities of recent models have found lukewarm interest in the same contexts, which prefer to work through experimentation in training processes, dataset manipulation, creation of new models, where there is space for error, for the unexpected, for the unanticipated. Left to itself, AI innovates only when it doesn't function properly.

3.4Control and Collaboration

The fourth observation is that to overcome this highly imitative nature, it is necessary for the designer to be able to manage and control the generation process. Although this observation is also evident, the difficulty in controlling the generation process is still one of the main challenges limiting a more widespread and conscious use of generative artificial intelligences. While it is relatively easy to obtain a high-quality graphic/visual product from a generative model, it is extremely complex to obtain a result that reflects the designer's intentions, or even just to intervene in the generation process to modify the result in a controlled way. As assistants, generative artificial intelligences are comparable to talented designers and illustrators who don't speak our language, don't share our cultural references, and refuse to intervene iteratively on a project, preferring to produce results autonomously and independently.

The reasons underlying this difficulty are multiple and concern both the intrinsic nature of Artificial Intelligence models and the modes of interaction between designer and generative systems.
From a technical perspective, Artificial Intelligence models are notoriously difficult to interpret (Gilpin et al., 2018) and, beyond an understanding in terms of general generative principles, the reasons behind a particular generation process are often unpredictable and difficult to interpret. Context sensitivity, the tendency to produce different results from similar inputs, and opacity regarding internal generation processes make generative processes particularly complex to decipher and, consequently, difficult to predict, especially in scenarios that significantly deviate from the original training context.
From a semantic and cultural perspective, the context in which generative artificial intelligences operate does not correspond to that of users, and our knowledge of the world is not necessarily shared by AI (Prabhakaran et al., 2022). This can lead to results, sometimes amusing, sometimes disturbing, where Artificial Intelligence ignores key elements of context, producing results that do not reflect our intentions. If AI doesn't know that Waldo is a character notoriously difficult to find in a children's book, it might generate images where Waldo is clearly visible, or similarly, if AI doesn't know that Mother Teresa

was a religious figure known for her charity, it might misinterpret a request to generate an image of Mother Teresa fighting against poverty, producing images where Mother Teresa is depicted as a superhero fighting against an army of poor people.

Figure 4: generated image from the prompt: “A photo of Mother Theresa fighting poverty”

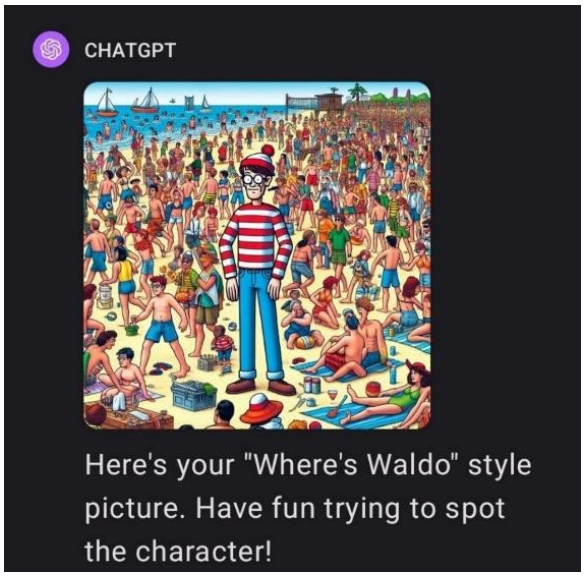

Figure 5: generated image from the prompt: “make a ‘Where's Waldo?’ picture”

Finally, regarding communication and collaboration modes with the user, control systems often prove inflexible. This difficulty in dialoguing with generative systems, well-known in the sector and subject of countless studies aimed at developing tools and methodologies to address it (Zhang et al., 2023), forces (for now) human designers to learn specific languages and interaction modalities to extract from artificial systems results that approach their intentions, in a process that is anything but immediate and intuitive. Training process anomalies, such as the presence of descriptions like "4k," "award winning," "trending on ArtStation" or "featured on Behance" in the captions of images present in the training dataset, are used as "magic words" that can be employed to induce the model to generate high-quality images. Image-specific area generation operations (inpainting) are used to apply corrections or modifications to problems in generation processes. Upscaling models are used to increase the resolution of generated images. Generation operations starting from images recompose collages of generated images to obtain more coherent results (Oppenlaender, 2022).
In contrast to the common perception of an automated and autonomous process where artificial intelligence models generate output independently from a textual description, the operational reality of generative AI proves significantly more complex. In the context of producing high-quality images, sector professionals confront a process that requires specialized competencies and may involve generating hundreds of images with different prompts and parameters, followed by a process of selection, combination, layering, manual editing, regeneration, and refinement that can require numerous iterations, the employment of multiple models and tools, and considerable time investment.
Depending on objectives and context, these control-seeking operations can occur at different levels, requiring more or less advanced competencies, more or less in-depth technical knowledge (Cotroneo & Hutson, 2023). Whether control occurs through accurate definition of the textual input guiding generation (prompt engineering), through integration of control models within the generative model (spatial conditioning), through adaptation of pre-trained models with specific objectives (fine-tuning), through selection and manipulation of training data (dataset curation), through modification of generation models (model hacking), the designer must be able to intervene in the generation process so that the model serves the designer and not vice versa.

Regardless of the level of technical depth, controlling generation processes requires a thorough understanding of the mechanisms underlying Artificial Intelligence systems, the modalities through which these can be influenced, and the consequences that can derive from such interventions. This knowledge, which requires a non-trivial level of technical competence, becomes fundamental, with the development of generative Artificial Intelligence technologies, to enable conscious use of these technologies, and to enable profitable and responsible use of the same.

Alongside these significant difficulties in controlling the generation process, if designers were to then venture into creating new models, they would face additional challenges related to controlling the learning process, which adds further ethical and design considerations to the already significant technical and methodological difficulties. If controlling the generation process requires a thorough understanding of the mechanisms underlying Artificial Intelligence systems, the modalities through which these can be influenced, and the consequences that can derive from such interventions, controlling the learning process requires an analogous understanding of the mechanisms underlying training mechanisms, the modalities through which these can be influenced, and the consequences that can derive from such interventions.
The typology of data to which they are exposed, the quality and quantity of this data, the modality of labeling and filtering, the selection and manipulation of training data, the definition of objectives and evaluation metrics, the choice of models and algorithms, the definition of parameters and hyperparameters, the evaluation and selection of models, the management of biases and distortions, are all elements that require specific competence and ethical awareness that go well beyond the technical competencies required for using pre-trained models (Whang et al., 2021).
The omission or underestimation of one or more of these elements can result in AI systems that uncritically replicate patterns and relationships present in training data, potentially amplifying discriminatory, racist, sexist, or otherwise problematic characteristics. The experience of the Tay chatbot, developed by Microsoft in 2016 and withdrawn after a few hours due to racist and offensive behaviors (Schwartz, 2019), highlights the intrinsic complexity in preventing harmful behaviors by Artificial Intelligence systems, and emphasizes the responsibility of designers not only in the model development phase but also in defining operational contexts and ethical limits within which AI must operate.

These difficulties in controlling generative models, which will certainly find solutions or mitigations in the future, do not imply that these technologies cannot be used to realize high-quality projects with great impact. On the contrary, the conscious and competent use of these technologies has already led to the emergence of new expressive modalities, new forms of communication that have contributed to the renewal of the creative and design landscape. They emphasize, however, the necessity for designers to possess not only technological competencies but also knowledge in terms of visual culture and language that allows them to understand the tool's potential, imagine the result, and be able to guide the process.
From a technical perspective, it becomes fundamental that designers acquire a solid understanding of the mechanisms and fundamental principles of Machine Learning processes, in order to be able to choose and manage the most adequate tools based on their objectives. At the same time, understanding the cultural context, visual culture, and reference terminology proves equally crucial, especially when operating in areas where content generation is closely tied to semantic and cultural interpretations.
Language, elevated to a primary tool for controlling and guiding the creative process, reveals the mastery of artistic, stylistic, and linguistic references, along with the ability to

express oneself in perceptual and semantic, cinematic and photographic, typographic and compositional terms, which allow steering the model in the desired direction. The designer's cultural and visual repertoire becomes the lexicon for dialoguing with AI.

3.5 Impact on Practices and Education

The final thematic cluster emerging from the analysis of AI discourse refers to the impact on technologies on the profession and practice. While in Communication Design the most visible current applications are tools for image generation or background removal, AI technologies have the potential to radically transform the modalities of production and consumption of visual and textual content, as well as communication and design processes. Artificial Intelligence represents not merely a new tool, but a new paradigm that demands critical analysis and redefinition of professional boundaries and competencies.
While on one hand AI relieves designers from operational tasks, such as background removal, photo retouching, and image cataloging, on the other hand we are already observing the first signals of a deeper restructuring of creative processes, with the emergence of tools where the design process itself becomes AI-assisted, requiring designers to assume a role as curator and art director, delegating part of the design solution exploration activities to autonomous models (Adeleye, 2024).

This transformation is not unique to design. In medicine, for instance, AI systems are demonstrating unprecedented diagnostic capabilities, particularly with complex pathologies like neoplasms. Recent studies (Donnelly et al., 2024; McKinney et al., 2020) show these systems achieving precision comparable to, or exceeding, human capabilities, enabling significantly earlier diagnoses than traditional methods.
A famous 2019 article in the British Journal of Radiology posed the question that many fields now face: "Will Machine Learning end the viability of radiology as a thriving medical specialty?" (Chan & Siegel, 2019). Their conclusion suggested that while AI systems would not replace radiologists, the field would need to adapt to a new paradigm where AI becomes an essential tool.
This reflection extends across professional domains, from law to journalism, from engineering to medicine: how will Artificial Intelligence transform our working practices, and what competencies will be necessary to adapt to this evolution?

Despite a tendency toward exceptionalism, Design too is called to a serious and urgent reflection on the competencies and knowledge necessary to face not so much the current technological context, but the future of exponential growth that seems to await us. In the university and advanced education context, the question is even more urgent: how to prepare new generations of designers for potential future scenarios? What competencies to transmit to students enrolled in 2024, who at the end of their educational path will find themselves operating in a professional context radically different from the current one? Once again, the answer goes beyond updating study programs with the introduction of new technologies and requires a collective reflection on how Artificial Intelligence interacts with design disciplines.

4. Discussion: responsible collaboration with AI

4.1 Culture and Code: A Tentative Direction for AI in Design Education

At this point, after five observations, we risk a hypothesis. Politecnico di Milano, one of the top universities in Europe by number of students and by ranking (QS Ranking, 2025), has offered, since 2003, a bachelor's degree and a master's degree in Communication Design. The approach to design that characterizes the course is a Polytechnic approach, which

combines human sciences and technology in the formation of professionals capable of managing visual and multimedia communication processes consciously and critically. The hypothesis we make for a responsible collaboration with AI is articulated in these two areas.

Regarding the human sciences dimension, the progressive delegation of operational tasks to AI systems is shifting the designer's role toward creative direction, curation, and guidance of the design process. In this context of increasing automation and tool autonomy, a deep understanding of visual cultures and imagery becomes crucial. This knowledge enables designers not only to maintain an active role in guiding generative models but also to conceive and communicate design visions effectively to both human and non-human collaborators. This evolution demands careful attention to ethical responsibilities. Designers must ensure that automation neither perpetuates biases nor reinforces stereotypes, while preserving diversity in visual culture. Although AI collaboration can enrich creative processes, designers retain full, non-delegable responsibility for their own choices and those of artificial collaborators, toward clients, users, and society.

Regarding the technological dimension, to avoid being relegated to a passive role as tool users, it is necessary for designers to acquire a deep understanding of emerging technologies (Torrisi, 2017). Such knowledge is fundamental not only to direct and coordinate artificial junior designers but aims to redefine the perception of Artificial Intelligence: not a static software, but a fluid and malleable process, in which it is possible to intervene to experiment, and to construct one's own tools. This ability to intervene at the technical level, by modifying photocomposition processes, printing procedures, photographic reproduction techniques, has always constituted a fundamental element of a critical design culture, aware of the tool's impact in the creative process and capable of imagining solutions that go beyond the consolidated repertoire. In the AI context, where the default mode is copy, imitation, replication, and stereotype, the ability to tamper with the tool, to exploit its limits and weaknesses, becomes crucial to overcome the conception of the tool as mere automation and liberate the creative and critical dimension proper to design.

4.2 First steps at Politecnico di Milano

At the School of Design of Politecnico di Milano, in the Communication Design degree, the first steps have been taken in the direction traced by this hypothesis. Beyond various types of experimentation with generative AI tools in bachelor's and master's degree design laboratories, the educational offering has been enriched by teachings including "Visual Cultures and Iconographic Systems" in the first year of the bachelor's degree and "Digital Image Culture" in the first year of the master's degree course, with the objective of contributing to providing the critical, cultural, and interpretative competencies necessary to face the new design context. Parallel to this, in the context of advanced educational paths (Politecnico di Milano, 2025), the "Computational Visual Design" course has been activated experimentally through which students have been called to confront the technological dimension of design. Specifically, the course proposes to provide the conceptual and technical tools to address communication design in computational terms, providing conceptualization, modeling, and abstraction competencies useful for facing design in a context where Artificial Intelligence is an integral part of the creative process.

In the research context, the relationship between communication and AI develops along

multiple trajectories, encompassing critical analysis of technologies and practices, experimentation in specific applications, and exploration of new expressive modalities, with ethics and responsibility as common threads. This diversity is reflected in recent master's research projects ranging from analyses of gender bias in generative model training datasets (Bazzan, 2022), to studies of AI adoption in independent publishing (Cozza, 2024), to mappings of AI as a design support tool (Bruno, 2023), highlighting the need for critical examination of algorithmic stereotype reproduction and the designer's role in mitigating biases through dataset curation and interpretation, while raising questions about authorship, originality, and editorial responsibility.
More experimental directions of research have explored technical aspects of AI development, moving beyond pre-trained models to systems tailored for specific design needs. Examples include GAN training from curated datasets for automated visual asset generation in brand design (Urietti, 2023) and fine-tuned diffusion models for representing complex territories like Po Valley, integrating photography with AI to create new representational paradigms (Pennacchioni, 2024). These projects explore AI not merely as an efficiency tool but as a medium for investigating novel forms of representation.

5. Conclusions

While these initiatives represent a promising beginning, they are intentionally provisional: they should be seen as an initial reflection intended to spark further experimentation. Curricular structures will need to be validated through evidence-based evaluation and ongoing dialogue with students, faculty, and external partners. At this stage, we do not feel it is yet appropriate to present detailed proposals, beyond the invitation to keep cultural and technical dimensions in view together, in order to avoid both technocratic reductionism and self-referential drifts.
Forecasting the future remains challenging: we might be significantly underestimating the transformative impact of exponential growth on Communication Design, or developments in generative Artificial Intelligence may be approaching a plateau. Regardless of the path AI takes, successfully navigating this transformation requires both deep cultural literacy and technical fluency to help designers maintain their role as conscious mediators of communication, capable of guiding AI tools while remaining mindful of their broader societal impact. The future of design education lies in the introduction of new tools, but in fostering professionals who can critically engage with technologies while maintaining the ethical and cultural awareness essential to responsible design practice.

CRITICAL MAKING AND GAME DESIGN IN THE CLASSROOM: A PEDAGOGICAL APPROACH TO EMBEDDED VALUES IN DESIGN.

Juan de la Rosa [a,b] *,

a. University of Illinois at Urbana-Champaign
b. Universidad Nacional de Colombia
*juanad2@illinois.edu

ABSTRACT | Scholarly approaches to design, like critical making (DiSalvo, 2014) and critical design (Dunne, 2008; Raby, 2008) have been establishing an open ground for reflective conversations about social structures and practices over the last 20 years. These practices are recognizable for their high level of discussion and deeply academic approach and have provided design researchers the opportunity to use *research through design* (Frayling, 1993) as a practice of tangible-criticism and analysis of cultural and social aspects. Unfortunately, these practices are rarely discussed in undergraduate programs, since they do not represent a professional tool for the development of young designers. Nevertheless, looking into the periphery of what is considered as viable or desirable might provide designers with a powerful tool of analysis of the underlying or unexpressed values of the system, and a way to brings those values into the conversation.

This paper presents an experience in which critical design, ethics, and experimental game design were introduced in the classroom, presenting the notion of the tangible spaces of the game and their ability to allow user enacting social rules, and practices and experience different perspectives of complex social issues as a mechanism of reflection. Through a process of reflective action, the paper introduces a framework of analysis of games as objects of enactment and self-experience. Using games not only as boundary objects (Bowker and Star, 1999; Rhinow, Köppen and Meinel, 2012) but as conversational probes (Galey and Ruecker, 2010) that can be used in common design practices to reflect, discuss, or map values and intentions (de la Rosa, 2022).

KEYWORDS | Critical design, Game design, Embedded values, Ethics, Design pedagogy

1. Introduction

Over the years design programs have evolved from the craft-paradigm that focuses on aesthetics and the study of the form, to more robust programs that include basic research, user and huma-oriented views, and project-based approaches (Muratovski, 2016). And even though some of them have included ethics and critical thinking as part of their practice or in some cases as part of the curriculum, it might still be seen as an emerging conversation in the field and in the classroom. This paper presents a theory-based argument that discusses the introduction of initial reflections over ethical principles of design and critical making in the classroom, and how these conversations can lead to design projects and professional practice.

It is clear than design disciplines carry a big role in society, as they seek to investigate the near future as an unraveling reality. According to Simon (1969), the sciences of the artificial (as he denominated design), investigate the way the constructed world comes to existence, and therefore, they look from a systemic perspective at the gaps in our human experience of the world, the preferable structure of that system, and the different tangible actions that can change one into the other. As Nelson and Stolterman (2003) described it, design experiments with the not-yet-existing, what is on the verge of existence of the artificial world, giving form to artefacts as well as to relationships.

The argument implies that design does more than to configure (or give shape to) the artefacts around us, but it also prefigures (or predetermines its role in) the relationships that those artefacts will carry. This idea relates also to the work of Latour (1992) and Akrich (1992) on how technical objects are '*prescribed*' with functions or affordances, and how those carry a delegated agency into the system where they are deployed. This *script* represents an intention as well as a worldview, of what is desirable or acceptable, and the constrains or barriers it imposes (Norman, 2013) and what is the role that the artefact should contain. Those *politics* imbued in the artefacts are unavoidable, and have been studied thoroughly, from the arguments presented by Langdon Winner (1980) regarding the politics of the artifacts, to the seminal work in systems design of Helen Nissenbaum and Batya Friedman (1996) discussing how the values embedded in artefacts through the design process remain active as people interact with them, creating biases in those interactions.

This latter scholar work has recently also impacted game design research, as it has addressed a critical reflection on how the nature of social simulation of games might present and area of research as well as an opportunity for designers to address social issues or explore possible social repercussions of their work. As Flanagan & Nissenbaum (2014) discuss, values can be seen as an active element of games, as they are part of the set of rules and constrains of the game and are constantly encouraged or penalized over the actions of the game. The simulation of a context and the social rules create a favorable environment for experimentation of boundaries and value-alignment of the players/users with the proposed system.

Romero (Brathwaite & Sharp, 2010) has also incorporated this reflection in her scholar work, leading to the design of games like *Train*, where players are carried through the experience of following orders and complying with the rules of the game to find out a nefarious final goal of the game. A critical position that invites users to explore cognitive and emotional responses to value-systems and possible dissonances between action and consciousness.

Flanagan, Belman, Nissenbaum, & Diamond (2007), extended their practice to the classroom, and involved design students in the analysis of possible embedded values in different common games, and how those values might affect the gamers experience or perception. Furthermore, students had the opportunity to participate in scholar research and reflect in the possible repercussions of their professional practice beyond game design, including how values are imbued in the artefact's through the design process, sometimes without a clear understanding of those involved in the process.

Reviewing this idea through the lens presented by Verbeek (2011), where designers might be seen as responsible for making '*morality tangible*' in the objects being designed; therefore, there is

a need to consider which morals are imbued into the design process and how those values are becoming tangible in the result. Furthermore, to evaluate if the scripted values and morals in the objects being design are indeed affecting individuals, communities or the techno-social systems where they exist.

The experience presented in this paper is based on an experimental design course, where design students are included in faculty research and practice with an ethical approach to what it means to be a graphic designer in a globalized world, where our actions can affect people beyond our frameworks and models of what is being designed.

2. Case Study: Ethics of a Designer in a Global Economy (EDGE)

2.1. A curricular approach to ethics

The course EDGE is an experimental approach from the Graphic Design program of the University of Illinois at Urbana-Champaign, where faculty members are invited to involve students in an academic conversation that intersects faculty's research interests and a reflection over the ethics of design. It is described in the pensum as "A studio course that presents complex problems and addresses ethical issues in graphic design, including social and environmental issues…"

This is a 16-week studio course, with two sessions of 160 minutes every week. Its flexible approach not only gives extreme freedom to the faculty members who are teaching it but encourages a critical reflection over the role of design. This principle presented a great opportunity to explore the topic of embedded values in design and the possible ethical questions that might emerge from this, including the responsibility of designers in possible unintended consequences, the power of design from a systemic perspective and the limits of the profession.

On this context, the class was presented with the idea of games as both a cultural tool of assimilation and a simulated environment where ideas can be introduced or discussed outside the real world, and the notion of embedded values as part of my scholar research. The definition of games has been a longstanding question both in cultural studies and in scholar research (Flanagan, 2009; Romero, 2009) as they carry the ability to create exploratory realities, phenomenon described by Johan Huizinga as the "magic circle" in his 1938 Homo Ludens (Rodriguez, 2006) and present a different cultural framework to discuss values and actions.

A clear reference is the work of Elizabeth Magie in the design of "The Landlord Game" as a critical device to discuss social norms, economic models and ethics. In what we might consider today as a boundary object, Magie presented two simulations of different economic models for players to experience, hoping that they were able to become more analytical of the dangers of capitalism and monopolies (Pilon, 2015). The game was later redesign by Charles Darrow, who created a competitive experience of exhilarating buying frenzy that masked the overall feeling of mistrust and betrayal that Magie intended, leading to the birth of "Monopoly".

More recently, scholars like Brenda Romero and Mary Flanagan (2014) have presented seminal work in the field of game design, where they have explored how the contextual simulation of complex social issues might introduce players to ethical dilemmas that might pass underdiscussed in our society merely because the subjects are normalized or based on cultural biases or misconceptions.

Introducing students to this topic also relates to the idea of "Critical making" or "critical design" (DiSalvo, 2014), where designers go farther than communicating a personal opinion on a complex subject, and explore their ability to produce tangible artefacts (either visual or physical) that can explore a complex subject in a reflective way, *scripting* a question rather than an answer, and designing games as "boundary objects" to spark conversations among players.

2.2. The design project (pedagogic approach)

Based on the theoretical framework presented above the exercise was presented as an 8-week project were students needed to explore one socially complex topic from a systemic perspective. The students were then presented with scholar discussions about game design, embedded values and critical design, as references to the project, making an emphasis on two main aspects. First, that values and politics are always embedded in the work designers do, and second, that using prototypes and games can help us test design hypothesis, since the context and rules of the game might present an ideal infrastructure for collective scenario-making and reenacting. So, users can get a real glimpse of a scenario but also step on the shoes of other stakeholders. Therefore, a class of 16 students (mostly junior or third-year) were asked to form small groups (2 to 4 students) and stablish an initial conversation based on a Popular Media Scan. For that, each student was asked to bring an informed argument about a complex social issue that they wanted to introduce to the class. Each group then worked as a focal group where topics were discussed and filtered to reach one subject that all members find relevant for their project.

After that, the group was asked to conduct secondary research on the systemic causes and consequences of the issue they selected, focusing especially on the social dynamics behind it and the different perspectives or worldviews that could make that a "wicked problem" (Rittel and Webber, 1973). The main objective here was to recognize how human intentions and decisions, as well as the context in which they occur, could be the actual cause of many of those issues.

Based on the report presented, student groups were presented with a UCD framework that extended the idea of the "Hero Journey", adding different layers to the model and a sense of balance and variability that explored affordances and constrains in different layers (Figure 1).

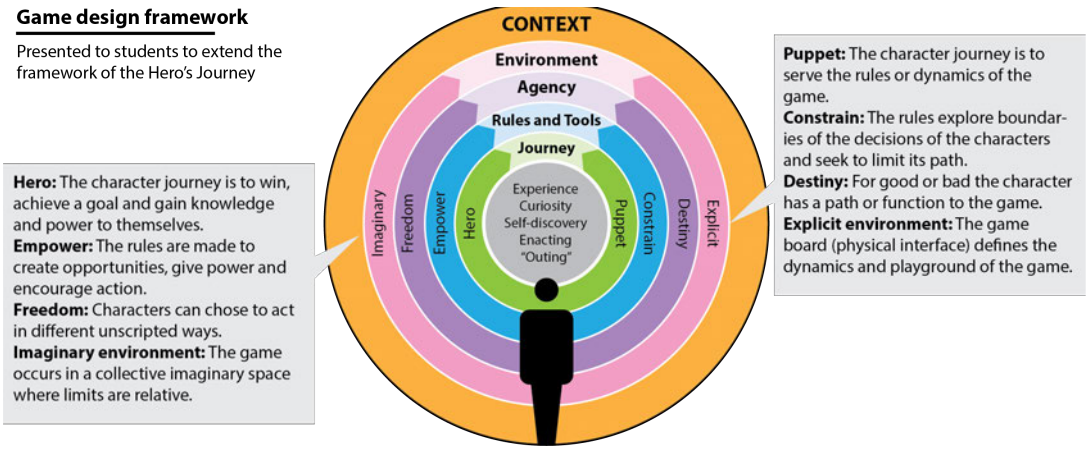

Figure 1. Expanding on the idea of the hero's journey a framework of analysis for the game was presented to the students to categorize affordance and constrains in different levels. The journey is defined as one of self-discovery through enacting outside your own skin.

First, recognizing that in the journey, the narrative of the hero implies a balance between their ability to make decisions and the limits on the narrative that can turn the hero into a puppet. This balance is framed under the "rules and tools" of the game that are there to create opportunities and empower decision-making or to create barriers to the ability of the hero to act, which defines a third layer, that is the overall "agency" permitted by the game, where the players move between the freedom and a pre-scripted destiny that is imposed. Finally, a fourth layer that determines the environment in which this game is played; from an imaginary world defined by the players to a completely determined board where even moves and positions might be based on a closed grid.

All these layers of interaction most exist inside a socio-cultural context, were decisions and actions should make sense, and the role of the game is to lead the actions to uncover that underlying context and rules from a different perspective.

At the end, 7 games were designed with the following subjects and reflections:

Table 1. Games presented.

Name of the game	**Topic**	**Argument**	**Category**
Artifaction	AI in art	Artists and designers are in a constant war to defend art production as the soul and reflection of society. Players must join forces to defend pieces of art as they see the historic significance they carry.	Tabletop RPG
Green Gambit	Sustainable energy	The search for green or sustainable energy might be populated with a lot of deception. Players must deceive others on their ability to apply sustainable energy and prevent global warming.	Cards bluffing
Ocean Defenders	Ocean pollution	Fight to win and clean your ocean the fastest, as you realize that a non-collective approach might lead to disaster. Players must decide if they work together or alone to reach their goal.	Strategy dices
Roots to riches	Sustainable farming	Be sustainable or grow, that is the dilemma. Players are asked to grow their sustainable farming practices to realize that industrial farming might be a consequence of growth.	Tabletop strategy
Price crunch	Production and demand	Be a consumer or a producer and try to avoid inflation in a global economy. Uncover the complexity of free markets and the little agency of consumers as you play the game.	Economic game
Wargames	Decision-making in complex situations	Who is the bad guy and who is the good one. Roll the dices and face complex dilemmas, make tough decisions and face the consequences, then explore the context in which others decided.	Decision-making
Fragment	Infrastructure as a tool for segregation	Build roads and schools, empower your community as you dominate the board. Discover how infrastructure has been used to break and colonize communities	City building

As seen in table 1, each game presented a complex social dilemma where either human intention or social context have made it very hard to address and find solutions. Therefore, players are intentionally set up in a place where they should follow the logic of the game or fight against it, always with a reflection and a discovery as part of the goals of the game.

Defining this structure offer the student a project where they can explore how designed environments can introduce rules and constrains that can alter human behavior and decision-making, as well as to recognize how the game's narrative can lead players into a realization moment when they can discover personal biases or view another perspective of a complex social issue.

2.3. The games

In the final stage, groups started the interaction design process based on their research of the issue they selected and game objectives, then started ideating possible forms of gamification of those dynamics that could create the proper scenarios of interaction for the users (gamers).

Due to the complexity that comes from designing for human interactions, groups created complex paper prototypes to test with users. The prototypes used paper cards quickly drawn and modified, and permitted students review and make quick changes in the process; some also included tokens and elements from other games repurposed to support the interactions (Figure 2). This prototyping process proved to be very successful, to the point that students requested a second iteration of the testing process later in the course.

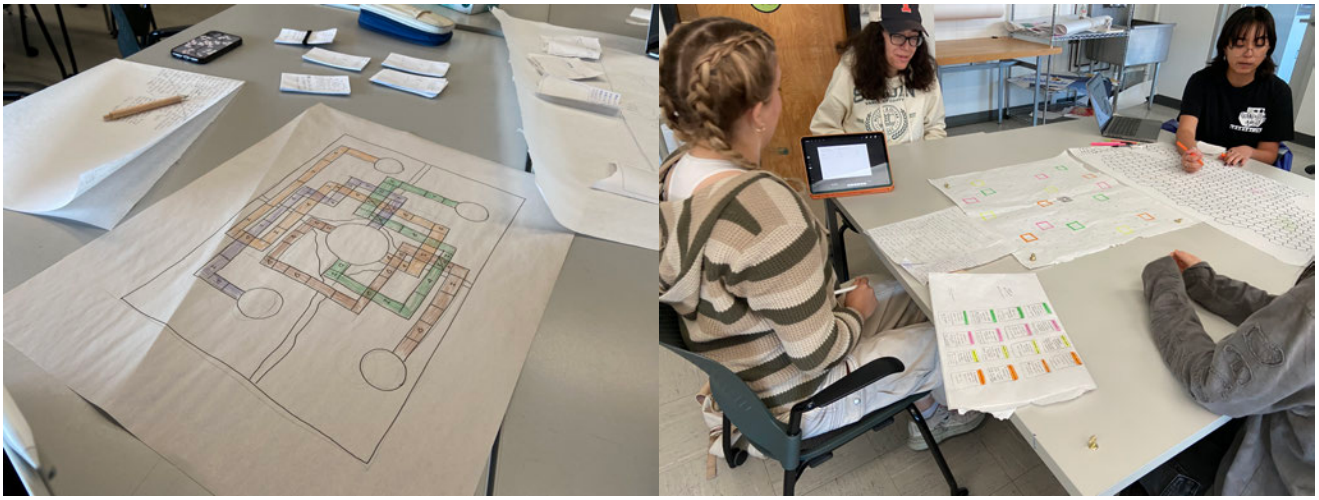

Figure 2. Paper prototyping phase where students tested the intended rules and interactions of the games.

Once the students finished the prototyping phase, they started the visual design of all the elements of the game. Including boards, physical elements, rules of the game, and all functional and aesthetical elements required. Encouraging a process of prototyping and testing as an initial phase helps students recognize that visual design, especially when working with human interaction, does not start as a visual practice, but as a reflective practice over the use of tangible artefacts. In that sense, the use of visual software in the sketching phase becomes non recommended, since it might promote a "sunk cost fallacy" and limit flexibility and adaptability that are more important in the process.

The results of the project were fully finished games with all their parts, instructions and packaging (Figure 3) and were finally tested by other students to recognize if the critical side of the project remained appreciable to the final user and if the games sparked a reflection about human intentions and decision-making in different situations, especially when the rules of the system might determine our actions. Two interesting examples of that dilemma can be seeing in the games "Roots to riches" and "Game of War" (Figure 4). In the first one, players are asked to stablish a sustainable farming business, but through the game, the system keeps asking them to grow, and provide different paths for that, until players realize that through the rush of the game, they have forgotten the values of the game and moved into industrialized farming. In "Game of War", four character with different levels of power and agency in a war conflict: a president, a general, a soldier and the parents of a soldier, are given private considerations for their decisions and asked to act accordingly in the game, despite the damage it could bring for others. When the game has reached a level of development, players are asked to exchange characters, so they can recognize the reasons for their decisions and how complex change might be.

Figure 3. Final results included 3D printing of pieces, packaging of the game, and full instructions.

Figure 4. Students playing the Game of War and Roots to Riches, two of the presented games.

Other games, like "Fragment", asked players to protect and grow their communities by building public infrastructure, through the game players soon realize that the public infrastructure can be weaponized, like the example of overpasses given by Langdon Winner (1980) or the case of the highway system in the south of Chicago. All these games have something in common, the goal for students was not to produce a functional product, but to recognize how values can be actively incorporated in the design process and the potential use of design to create scenario-based simulations using gamification and value-oriented design as tools for critical thinking and raising awareness over highly delicate issues.

Addressing these issues had clearly an effect on the students. First, they followed a critical path as a mental process. At the beginning they only brought a basic idea informed by some initial research, but as they advanced into the design of interactions and politics of their games, they quickly started asking more complex questions about the subject. Initially as a reflection over our own views and biases on the subject, recognizing even counter arguments to their own believes. Over the course of the weeks, students came to conclusions over the subject's invisible rules and values, and the inevitability of some relationships inside systems that are embedded with certain values. Second, students became more aware of the responsibility of their role in the design of daily objects, since many of them recognized through the game an ability to influence the way people see those complex issues; from creating new frameworks for decision-making or constructing intentional social contexts that could alter the conversation, to lead people into recognizing the consequences of their own decisions.

As this process became more academic, as possible outcome to their work, students were given the option to submit a poster to a research conference. Even though it is evident that these were not examples of structured research, the idea was that some students could explore the possibility of continuing their academic process through a more scholar path. As a result, one of the groups got accepted for a poster but decided not to present in the conference. Some of them reported to see this path as too far from their current reality.

The pedagogic approach presented for this project seeks to change the focus of the process for students, so they can recognize their responsibility as professional designers, their agency in producing social change, the power of design as a research tool and the importance of embedded values and politics in the design process. At the end, students reported having fun in the process but also recognizing the importance of their roles and

the responsibility that comes with it.

3. Discussion

Although game design has been both a professional field and a topic for design education for many years, the approach in many cases remain, similar to must design topics in formal education, limited to the extent of the commercial or industry use, seeing it as a problem of interaction, product or graphics. And although, this approach is necessary for young, learning designers, since it leads to the understanding of best practices and industry standards, it might not be enough in the process of preparing critical and ethical leaders for the field of design. For that purpose, we might need designers who are capable of understanding the responsibility that comes with the role of configuring our artificial reality, prefiguring human practices, and imbuing our socio-technical system with unchecked values.

In this particular case, designers where able to experience different tools for design that can be used in their professional practice, like performing a prototyping process, testing those prototypes with users and collecting qualitative information from that interaction, as well as elements of both interaction and experience design. They also learned more experimental approaches, like the use of prototypes as conversational objects that can sparked critical reflections over complex issues. But more importantly, they explored the ethics of their profession, and the sense of professional responsibility that should come with the job.

Students reported a sense of achievement with their projects and the fact that the games were "...actually fun to play!", as well as because they were able to see people (users) interacting with their ideas. They also stablished far more complex analysis about their subjects at the end of the process, increasing the scope of their view and the depth of their observation.

Donald Norman has recently included this wide view of both the structure of the system as well as the long-term consequences of our actions as principles for what he calls "Humanity-Centered Design" (2023). Expressing something that the scholar community has been addressing over the last 40 years, on how there is a need for a larger view into the future for the design fields, a view that as Irwin, Kossoff and Tonkinwise (2015) stated, sees sustainability as the only "preferred future" of us all, and defines it as a principle for design field to use as a framework.

This definition of leadership goes beyond the idea of project management or MBA tools, it is not a managerial approach for designers, since it is not about 'managing' resources, but instead, as thought-leaders who really understand the deep impact that design practices could have in socio-technical systems and how much awareness of the responsible actions and limits of design is required in our contemporary world.

Educators must find tools in their scholar work to bring those conversations into the classroom and expose students to deeper conversations about their future roles and responsibilities. Game design presents a perfect field to explore these subjects, since it can create a full simulation of social practices and explore in a very experimental way how agency, decision-making process, norms and rules, and rhetorics of goals and objectives can define behaviors and the construction of mental models.

Game design as critical making presents a perfect platform for researchers to understand and question users, a boundary object to explore possible solutions and individual perspectives and a great example for young, non-scholar design students that can reflect on their practice and limits as they have fun exploring critical scenarios.

ABSTRACT | The application of Artificial Intelligence Generated Content (AIGC) in global fashion design has grown rapidly, yet it has also revealed significant cultural bias. Through qualitative and quantitative analysis, this study examines the performance disparities of existing AIGC models across different cultural contexts, highlighting how training data dominated by Western cultural references has led to insufficient or distorted representations of non-Western fashion aesthetics and styles. Based on these findings, the study proposes a theoretical framework centered on diverse cultural datasets, cross-cultural adaptive generation algorithms, and dynamic optimization mechanisms, aiming to explore the inclusivity and adaptability of AIGC models within a global cultural context. The paper concludes by discussing the potential theoretical implications of this framework and offering new directions for future research and practice, further examining the possibilities for AIGC models to more authentically represent cultural diversity.

KEYWORDS | CULTURAL BIAS, AIGC, GLOBAL FASHION DESIGN, INCLUSIVE FRAMWORK, CROSS-CULTURAL ADAPTATION

1. Introduction

Artificial Intelligence Generated Content (AIGC) technologies, such as DALL-E and MidJourney, have seen rapid adoption in the field of fashion design in recent years. By generating images from textual inputs, these tools offer designers highly efficient visual creative support. However, the current training data for these models predominantly reflects Western cultural contexts, revealing significant limitations when addressing non-Western cultural elements. This cultural bias stems not only from imbalanced foundational data but also potentially exacerbates issues of cultural appropriation and visual style homogenization. This study seeks to uncover the root causes of cultural bias within AIGC models and proposes an inclusivity framework aimed at enhancing the applicability of these technologies in diverse global cultural contexts. This framework not only shapes the central structure of this study but also provides a directional guide for future related research.

2. Literature Review

Barthes (1967) argued that clothing is not only a physical product but also a cultural symbol. However, with the application of AIGC technologies in fashion design, issues of cultural bias have become increasingly prominent, particularly the influence of Western-centrism. Ramsey et al. (2025) observed that many public datasets, such as DeepFashion and Polyvore, are heavily populated with Western high-fashion imagery, resulting in a global imbalance in design elements. Similarly, Malobola et al. (2022) highlighted that the lack of representation in datasets makes it challenging for AIGC to accurately reflect African styles, further exacerbating cultural bias.

To address these issues, researchers have proposed various strategies. Wu et al. (2024) and Xie (2024) advocated for the use of multimodal learning and culturally diverse datasets to enhance cultural representation, enabling a more comprehensive capture of design elements from different cultural contexts. Mantri (2023) integrated large language models with diffusion models to optimize text generation strategies and ensure cultural diversity in generated content. Huang (2023), through the FIRST dataset, provided rich textual descriptions and diverse fashion categories to promote cultural inclusivity in AIGC for fashion design. Gabriel (2023) and Ali (2024) explored the use of multilingual models to address semantic and grammatical cultural differences, helping to mitigate bias. Zhang (2024) introduced the Logical-GLM model, which generates more logically structured textual instructions, allowing AIGC to more accurately reflect multicultural perspectives in the generation process.

3. Research Methodology

3.1. Research Design

This study employs an experimental research approach to systematically investigate how AIGC models represent cultural elements and the potential biases therein. By selecting representative AIGC tools and cultural elements, standardized prompts are constructed to generate images. These images are then evaluated to analyze variations in model performance across different cultural contexts.

3.2. Data Sources, Sample Selection, and Cultural Element Setting

To ensure the representativeness and reliability of the findings, this research selects three widely-used text-to-image tools, covering both international and domestic platforms: DALL-E (USA: OpenAI), Stable Diffusion (UK: Stability AI), and Dreamina (China: ByteDance). These tools were chosen for their high quality of image generation, large user bases, and diverse application scenarios, providing a broad spectrum of generated image samples for subsequent experiments.

In terms of sample selection, this study focuses on clothing styles from China, the UK, the US, Africa, and India—five distinct cultural traditions—to assess how AIGC models handle different cultural symbols and identify potential biases. Chinese fashion elements include motifs (dragons, phoenixes, auspicious clouds), qipao, brocade, and characteristic color schemes (Chinese red, blue-and-white porcelain patterns). British fashion elements cover Victorian styles, Scottish tartans, and classic color combinations (red-and-green tartans). American fashion elements feature denim, the Stars and Stripes, and Hollywood-inspired styles. African fashion elements include iconic garments such as Agbada and Dashiki, as well as African wax prints and vibrant colors. Indian fashion elements encompass sarees, churidars, Bollywood-inspired designs, and paisley patterns and colors. These culturally distinctive elements serve as a robust testbed to evaluate the models' capacity for cross-cultural design generation.

A standardized prompt structure is used to ensure comparability of outputs across different AIGC tools. Each prompt specifies the type of garment, cultural elements, colors, materials, and intended occasion, with cultural elements being the sole variable. A typical prompt might be: "Design a modern [garment type] that incorporates [cultural elements], with [colors/materials], suitable for [intended occasion]." This standardized approach minimizes noise from variations in prompt wording, allowing for more precise evaluation of the performance of different cultural elements in the generated results.

3.3. Experimental Procedure

In the experiment, each prompt is used to generate three images from each of the three selected AIGC tools, ensuring data representativeness. For platforms that allow parameter adjustments (e.g. Stable Diffusion), key parameters such as resolution, style strength, and CFG scale are kept consistent. For platforms with fixed default settings (e.g. DALL-E), the internal model characteristics are documented to minimize the impact of technical differences. All generated images are archived systematically according to "tool–prompt–cultural element" categories, with generation parameters recorded. This ensures data traceability and a systematic approach to analysis.

Figure 1. From left to right, the experimental results consist of text-generated images produced by DALL-E, Stable Diffusion, and Dreamina. The recorded data includes information on the tools used, prompts, cultural elements, generation parameters, and the generated images.

3.4. Analytical Methods

1. Quantitative Evaluation

To comprehensively evaluate the performance of different AIGC tools in cultural representation, stylistic diversity, and visual aesthetics, this study uses a quantitative evaluation approach that combines rating scales with statistical analysis. The creation of data recording tables ensures that subsequent analysis accurately reflects the tools' performance in handling diverse cultural elements.

- **Evaluation Metrics and Data Recording**
  To ensure objectivity, this study establishes three core evaluation dimensions: accuracy of cultural elements, aesthetic appeal, and stylistic consistency. Three experts with backgrounds in fashion design or cultural studies independently score each generated image. A five-point scale is used, with 1 being the lowest and 5 the highest. The specific evaluation dimensions are as follows:

Table 1. Scoring Dimensions for AIGC-Generated Images

Scoring Dimensions	Description	Score Range (1–5)
Cultural Accuracy	Assesses how faithfully the generated image reflects the cultural elements specified in the prompt (e.g., garment Pattern, color schemes, embroidery, or motifs)	1 (Very Low) – 5 (Very High)
Aesthetic Quality	Evaluates the overall aesthetic appeal, including garment design, color harmony, and detail richness	1 (Very Low) – 5 (Very High)
Style Consistency	Measures the consistency and variety of images generated under the same cultural theme across different AIGC tools	1 (Very Low) – 5 (Very High)

Each AIGC tool generates three sets of images for the same prompt, and the scores from all experts are recorded. All scoring data is stored in standardized tables, with the mean and variance calculated for each dimension to evaluate the overall performance of each tool.

- **Data Analysis Methods**
  In this study, scoring data is analyzed using mean calculations and variance analysis. First, the mean scores of each AIGC tool under different cultural themes are calculated to assess their overall capabilities in cultural representation and stylistic expression. Second, variance analysis is performed to examine scoring differences among tools under the same cultural theme. This further helps determine whether certain tools exhibit bias or inconsistent performance when handling specific cultural elements. This approach enables the identification of potential cultural biases in the generation process.

Table 2. Mean Calculation Statistics

AIGC Tools	Cultural Theme	Cultural Accuracy Mean	Aesthetic Quality Mean	Style Consistency Mean
DALL-E	China	2.11	2.44	2.67
Stable Diffusion	China	3.11	2.67	2.89
Dreamina	China	4.67	4.78	5
DALL-E	UK	3.67	3.22	3.44
Stable Diffusion	UK	4.56	4.44	4.56
Dreamina	UK	3	2.44	2.78
DALL-E	USA	4.78	3.67	4.67
Stable Diffusion	USA	3.89	2.89	3.67
Dreamina	USA	4.22	3.89	4.33
DALL-E	India	3.44	2.78	3.33
Stable Diffusion	India	3.33	3.22	3.56
Dreamina	India	4.11	4.67	4.56
DALL-E	Africa	2.89	3.44	2.67
Stable Diffusion	Africa	3.33	3.56	3.56
Dreamina	Africa	3.11	3.33	2.89

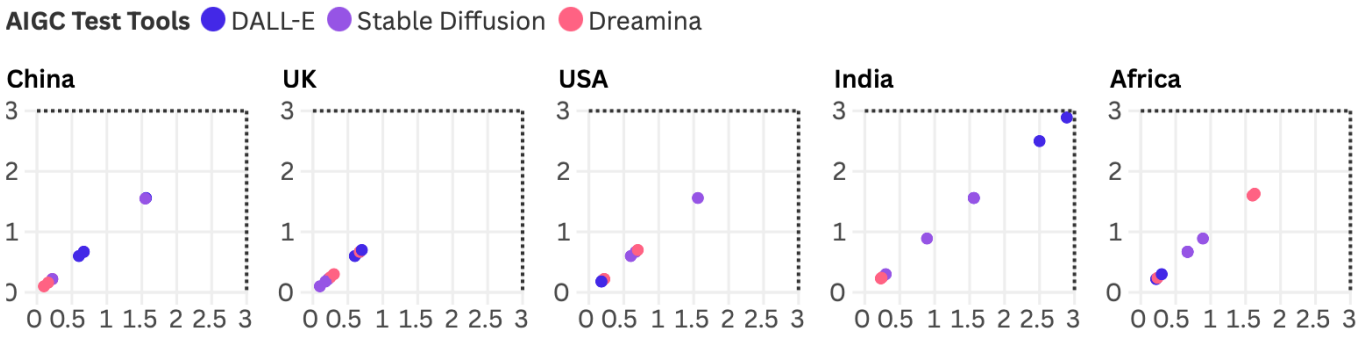

Figure 2. Variance Calculation Visualization. A smaller variance value, closer to the origin, indicates that the corresponding tool exhibits less bias in the given cultural context.

The mean calculations clearly illustrate the differences among various AIGC tools in their ability to represent distinct cultural backgrounds. For instance, Dreamina scored significantly higher in the Chinese cultural context, while DALL-E and Stable Diffusion demonstrated more consistent performance in the American and British cultural contexts. Variance analysis further highlights the preference differences of these tools when dealing with cultural elements. Specifically, Dreamina, developed by ByteDance, showed the lowest performance in the Chinese cultural bias test, whereas the British-developed Stable Diffusion scored higher for Chinese cultural elements. Meanwhile, Dreamina performed relatively evenly in Indian and African cultural bias tests. Stable Diffusion, despite being developed in the UK, recorded its lowest score in the British cultural bias test, while the US-developed DALL-E achieved the best performance in the American cultural bias test.

The results also reveal that the three AIGC tools displayed stronger inclusivity when handling Western mainstream fashion cultures, particularly British and American contexts. This indicates that these tools have a relatively accurate understanding of Western cultural elements, as reflected in bias coefficients that consistently remain within a range of 0 to 1, signifying low cultural bias. However, the performance across other cultural contexts—such as Chinese, Indian, and African—varied more significantly.

2. Qualitative Analysis

This study employs content analysis to qualitatively understand the visual details in AIGC-generated images, analyzing each tool's cultural representation and potential biases.

- **Content Categorization and Classification**
  Drawing on existing cultural theories and design analysis frameworks, this study organizes and classifies key visual elements from the generated images. The resulting classifications help quantify specific characteristics of bias or stylistic differences. The classification list is as follows:

Table 3. AIGC Content Analysis Framework

Visual Element	Cultural Feature Matching	Bias Potential	Description
Silhouette	√/×	Low / Medium / High	Whether the generated garment's shape matches the typical silhouettes of the target culture.
Color Palette	√/×	Low / Medium / High	Whether the output uses traditional colors from the specified culture in a logical and appropriate manner.
Patterns & Motifs	√/×	Low / Medium / High	Whether the motifs are faithfully reproduced from cultural prototypes and whether any misuse occurs.
Accessories & Embellishments	√/×	Low / Medium / High	Whether decorative elements are accurately portrayed from the target culture.
Stylistic Attribution	√/×	Low / Medium / High	Whether the AIGC output's style aligns with the prompt's cultural characteristics and whether there is stylistic confusion.

A checkmark (✓) indicates that the cultural feature is matched, while a cross (×) indicates that it is not. The potential for bias is assessed as "Low," "Medium," or "High" to reflect the degree of deviation.

- **Deviation Types and Cultural Bias Analysis**

Bias in Recognizing Cultural Elements

The study found that AIGC tools have varying levels of understanding of traditional clothing styles across different cultural backgrounds, particularly when it comes to specialized local fashion terminology. For example, the traditional Indian churidar, a uniquely designed tight-fitting trouser style, was misrepresented in test results as harem pants, bell-bottoms, or loose trousers, failing to reflect its original design features. Similar issues were noted with African garments such as Agbada and Dashiki. These discrepancies suggest that certain cultural fashion elements are not widely represented in global datasets, causing AIGC tools to struggle with accurately identifying these cultural symbols. In contrast, for widely recognized garments like Chinese hanfu and qipao, as well as Indian sarees, the tools produced more accurate results. This suggests that these elements are better established in the global fashion lexicon, leading to fewer biases. When it came to American stars-and-stripes motifs, Chinese red color schemes, and British tartans, the three tools performed consistently and accurately, showing virtually no bias.

Misuse of Cultural Symbols

Another observed issue was the misuse of cultural symbols in the generated outputs, particularly in garment construction and pattern design. For instance, DALL-E's interpretation of Chinese hanfu tended toward Japanese kimono styles, with notable differences in silhouette and collar design. Similarly, Stable Diffusion applied Western cutting techniques to the bustier section of hanfu. Patterns and motifs also demonstrated inconsistencies: dragon-phoenix motifs generated by Western tools often resembled Western dragons, differing significantly from traditional Chinese designs. Such cases highlight how AIGC tools, influenced by predominantly Western training data, may misinterpret deeply rooted cultural elements.

Homogenization of Styles

Beyond the misuse of symbols, the results also revealed a tendency toward stylistic convergence across different cultural contexts. For example, Dreamina, when generating Chinese, British, and Indian attire, showed some variation in color and silhouette but ultimately presented a similar overall style. The generated clothing often reflected a modern runway aesthetic, overshadowing the unique stylistic nuances of each cultural tradition. This indicates that Dreamina has limited adaptability to diverse cultural settings, often imposing a globalized design aesthetic on its outputs. Consequently, the resulting garments lacked the stylistic diversity inherent to their cultural origins.

Building on the content categorization and bias analysis, combined with quantitative scoring, this study will further delve into the psychological origins of cultural bias. It will propose strategies to enhance the cultural inclusivity of AIGC tools.

4. Analysis of the Causes of Cultural Bias in AIGC Design

Liu (2023) identified four main factors contributing to cultural bias: cultural assumptions, research tools, interpretive bias, and sample selection. Based on these factors, the cultural bias observed in AIGC tools can be summarized as follows:

4.1.Sample Selection: Cultural Bias in Training Data

AIGC models often rely on training datasets with imbalanced cultural representation. Western mainstream AIGC tools, such as DALL·E, MidJourney, and Stable Diffusion, primarily draw from U.S. and European internet data (e.g., Reddit, Pinterest), while Chinese AIGC tools rely on local Chinese-language resources (e.g., Baidu, Douyin). This imbalance in data sources causes models to favor dominant cultural styles when generating content related to non-mainstream cultures.

4.2. Research Tools: Influence of Algorithms and Pre-trained Models

AIGC models frequently use CLIP-based architectures to interpret text-image relationships. If dataset labels like “hanfu” are inaccurately associated with the corresponding images, the model may produce results that reflect these inaccuracies. For instance, if “hanfu” is linked to Western theatrical costumes or Japanese kimono styles, the generated images will reflect those biases. Additionally, when generating traditional Asian attire, some models fail to fully capture the rich tailoring, patterns, and materials unique to those garments, resulting in outputs that do not accurately reflect the intended cultural characteristics.

4.3. Interpretive Bias: Human Adjustments During Training

AIGC companies often fine-tune model outputs to meet market demands. For example, tools developed in the U.S. may prioritize Western aesthetic preferences, while those from China may be tailored more closely to domestic market expectations. While these adjustments improve user satisfaction, they can lead to oversimplified portrayals of traditional attire, making it challenging for the models to accurately reflect the historical and stylistic richness of such garments.

4.4. Cultural Assumptions: Influence of User Interaction and Feedback

The outputs of AIGC models are often shaped by user behavior and feedback. Western users’ preferences may lead models to present Chinese attire in ways that align more closely with Western mainstream aesthetic trends, potentially undermining the authenticity of traditional cultural details. This cultural assumption reinforces existing biases in AIGC models, steering the generated results toward expectations aligned with

Western markets, rather than accurately representing the unique characteristics of the target culture.

5. Global Inclusive Fashion Design Framework (GIFD-AIGC)

To address the cultural biases present in AIGC-generated global fashion design, this study proposes the Global Inclusive Fashion Design Framework (GIFD-AIGC). The framework consists of three core modules: data, algorithms, and design. Together, these modules form a multi-layered, dynamically optimized global cultural adaptation system.

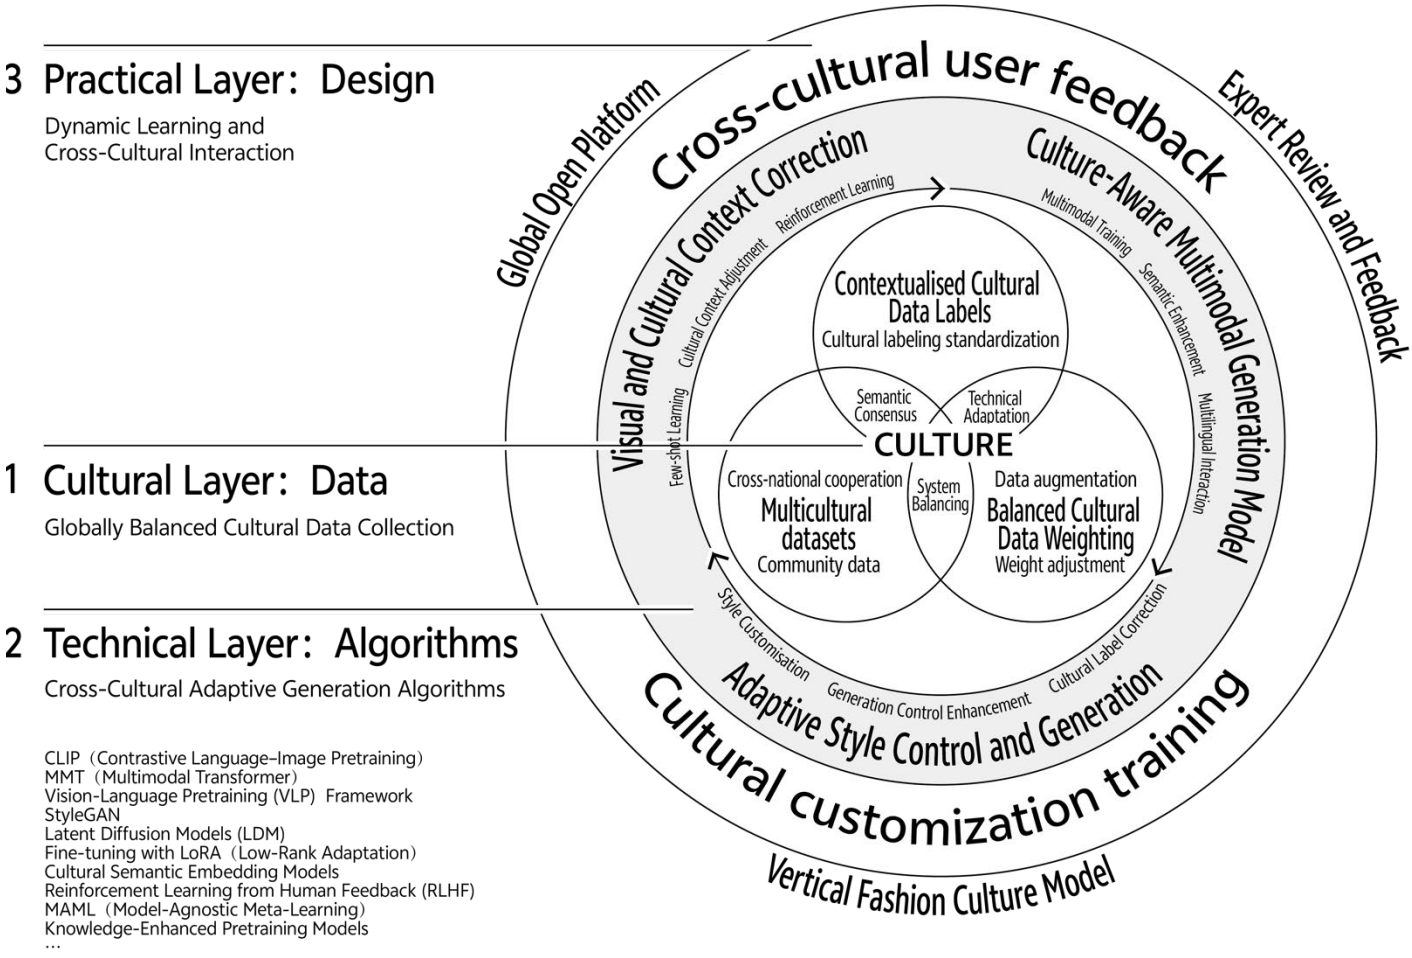

Figure 3. Global Inclusive Fashion Design Framework. Culture is the core of the entire framework, with the construction of a globally diverse cultural dataset as its foundation. Relevant algorithms and models provide technical support, while user practices and dynamic interactions serve fashion design applications.

5.1. Data as Foundations

At the data level, the framework focuses on building a diverse cultural dataset, standardizing cultural labels, employing data augmentation, and adjusting dataset weights to ensure diversity and balance. Collaborations with global museums and cultural institutions provide access to traditional clothing, patterns, and colors from various regions, which are integrated

into the dataset. Data augmentation techniques broaden the dataset's scope, enhancing the model's generalization capabilities.

5.2. Algorithmic as Guidance

On the algorithmic side, the framework adopts cross-cultural adaptation techniques using culturally-aware multimodal generative models, visual and cultural context corrections, and adaptive style controls. By leveraging multimodal learning and integrating large language models (LLMs) with latent diffusion models, the framework refines textual prompts to produce fashion styles that better represent multiple cultures, thereby reducing cultural bias. Visual and cultural context adjustments further align generated content with appropriate cultural backgrounds, avoiding misuse or stereotypes.

5.3. Design as Practices

For design practices, the framework incorporates cross-cultural user feedback and cultural customization training to enhance the model's dynamic learning capabilities and cross-cultural adaptability. Expert reviews and feedback from global users help refine generation outcomes. Additionally, user-driven customization training allows for the creation of designs tailored to specific cultural contexts. The continuous feedback loop embedded in the framework ensures ongoing optimization, enabling the model to maintain cultural inclusivity and adaptability in changing environments.

6. Results and Prospects

This study introduces a preliminary global inclusive fashion design framework aimed at addressing cultural bias in AIGC-based fashion design. By analyzing the causes of cultural bias, the study proposes a theoretical approach that includes constructing diverse cultural datasets, adopting cross-cultural adaptive generation algorithms, and enhancing user feedback. The core concept of this framework is to provide a multi-layered guideline for future AIGC models, helping them better adapt to the diversity of global cultural contexts.

Since this study focuses on the theoretical construction of the framework without empirical validation of its practical effects, it cannot be conclusively stated that the framework will significantly improve the cultural adaptability of AIGC models. However, based on the literature review and analysis, it can be inferred that this framework may offer a valuable reference point for future improvements to AIGC models. In particular, the framework holds potential as a theoretical foundation and implementation pathway for advancing the selection of cultural elements and generation strategies.

Future research could empirically test the framework's feasibility, such as evaluating its impact on AIGC generation performance using real-world multicultural datasets and assessing the effectiveness of the proposed multimodal learning, cultural context correction, and dynamic optimization mechanisms. Additionally, further studies could explore how to refine AIGC model training and generation processes in a globally diverse cultural landscape to support more inclusive fashion design innovations, thereby creating new opportunities for progress in the design field.

DESIGN AND ANIMISM IN/THROUGH/OUTSIDE THE DIGITAL: LEARNING FROM KAUPAPA MĀORI AND THE DIGITAONGA PROJECT

Sarah Elsie Baker[a]

Media Design School, Auckland. Aotearoa/New Zealand
sarah.baker@mediadesignschool.com

ABSTRACT |
It has been suggested that, while animism is fundamental to the ways humans deal with objects, the virtual magnifies these tendences, opening up spaces where matter has a vitality that is 'active, self-creative, productive, unpredictable' (Krebs, 2023; Marenko & Van Allen, 2016). As technologies become smarter and less visible, the extent to which users attribute personality, agency and intentionality to devices only intensifies (Marenko & Van Allen, 2016). At the same time, however, digital technologies are frequently designed by those working in contexts less connected with animist beliefs and practices.

By focusing on the case study of the Digitaonga research project, this paper explores what Kaupapa Māori approaches to digitisation could teach us about our entanglements in/through/outside of the digital. I describe the Digitaonga project, outline the unique taonga-led approach to digitisation that emerged through collaboration with Māori communities, and reflect on the ethics involved in this process. Drawing on these insights, I turn to look more broadly at how animism reveals itself in Western design contexts and how we can step into uncertainty and unpredictability to enable new human/non-human relationships to emerge. I conclude by exploring how an animist orientation may even mean challenging the notion of 'Design' itself.

KEYWORDS | ANIMISM, DIGITISATION, KAUPAPA MĀORI RESEARCH

1. Introduction

"What if the taonga don't want to be scanned."

Te Awhina Rangmarie Arahanga (Ngāti Tūwharetoa, Te Ati Haunui a Paparangi, Ngāti Hauiti ki Rata), Curator at Kaikoura Museum

The question raised by Te Awhina Rangmarie Arahanga above about the agency of taonga (prized Māori artefacts) marked a fundamental turning point in the Digitaonga research project, for which the project team and myself are forever grateful. Digitaonga is a project that explores the preservation, reconnection and repatriation of taonga Māori using emerging technologies such as 3D scanning, AI and blockchain. The first stage of the project worked with three groups of museums and Māori iwi and *hapū* (tribes and subtribes) to identify taonga that might be scanned to aid digital and/or physical repatriation. The project team included alumni, tech experts and Māori researchers. The question from Te Awhina Rangmarie Arahanga emerged from one of our first whakawhanaungatanga (establishing and developing collaborative relationships) sessions. It was a pivotal moment because it raised many questions about our approach and process. It called into question 3D scanning practices in museums whereby artefacts are routinely photographed or scanned according to size. It highlighted a different worldview whereby material things have a lively vitality and command an ethics of care towards them as matters of socio-political and spiritual significance. It practically demonstrated that taonga are ancestors. It led us to reflect on, and critique, Western binary notions including subject/object, human/non-human, nature/culture, digital/physical and original/copy. We reconsidered the ethics of our project. Indeed, what if taonga did not want to be scanned, and how would we know if this was the case.

This question also caused me to reflect on my own culture, research interests and experience. Originally from East Sussex in the UK, and having lived in Aotearoa New Zealand for 12 years, I am committed to becoming Tangata Tiriti (a person of the treaty) (Ngata, 2020). As a person, designer, and researcher I have always been interested in material culture, particularly how the value of artefacts gets made over time (Author, 2015). My feelings about the material world and its vitality resonate with the Māori worldview, and as I learn more I am indebted to Māori researchers and communities who have shared their knowledge. I believe that design has a lot to learn from indigenous communities and if we truly want to change design to be more socially and environmentally ethical then there is a wealth of inherited knowledge and practice to draw from. However, as designers from/working in Western contexts often disconnected from precapitalist/'premodern' pasts, can we learn from other worldviews without somehow turning indigenous knowledge into capital accumulated and attached to the possessive individual, or without appropriating concepts and taking them out of the context of their people, places and pasts. Can we humbly listen to indigenous approaches in order to reflect on our own ancestral and contextual knowledge and work towards design that "undermines its own ontological ground" (Fry and Nocek, 2021:3).

In this working paper, I aim to address some of these questions through the lens of animism using the case study of the Digitaonga project. I begin by defining animism and briefly documenting its etymology. I explore recent discussions of animism, digital technologies and design. I go on to describe the Digitaonga research project and outline the unique taonga-led approach to digitisation that emerged in partnership with Māori communities. I conclude by exploring how we can attune ourselves to an animist orientation in design education and practice, and how this may even mean challenging the very notion of 'Design' itself.

2. Animism, the Digital and Design

The term animism comes from the Latin root 'anima' which means "life, breath or soul" and emerged from Enlightenment philosophy which drew a distinction between the "a de-animated world of mere stuff" and human agency (Latour, 2014:8). Matter, as Victor Krebs writes, at least since the 17th century in the West, is conceptualised as:

> "inert, solid, measurable [...], quantifiable, subject to cause and effect and ontologically other to Decartes' res cogitans, which is, on the contrary, agentic, immaterial, and capable of manipulating and reconfiguring matter."
>
> (Krebs, 2023, p.1)

Animist, then, emerged as a term to describe cultures who did not view matter according to these binaries. It is most often attributed to the English Victorian anthropologist Edward Tylor in his book *Primitive Cultures* where he uses it to describe the belief that natural objects have souls. As such, the early origins of the concept are similar to fetishism, and reproduce the idea that cultures with animist worldviews are less "civilized".

Of course, as many anthropologists and ethnographers have reminded us, even in the Global North "people do not universally discriminate between categories of living and non-living things" (Ingold, 2006, p.10). This is because, as Tim Ingold has argued, the concept of animism is misleading "on two counts": firstly what has been described as animism is not a way of "believing about the world", but is a condition of being in it (2006, p.10). Animism, Ingold writes, is "a condition of being alive to the world", of being sensitive and responsive to environments in flux (2006, p.10). He continues:

> "Animacy, then, is not a property of persons imaginatively projected onto the things with which they perceive themselves to be surrounded. Rather — and this is my second point — it is the dynamic, transformative potential of the entire field of relations within which beings of all kinds, more or less person-like or thing-like, continually and reciprocally bring one another into existence. The animacy of the lifeworld, in short, is not the result of an infusion of spirit into substance, or of agency into materiality, but is rather ontologically prior to their differentiation."
>
> Ingold (2006, p.10)

This view of the world resonates with Bruno Latour's statement that we have "never been modern," which includes questioning the divide between a premodern animated world and a

modern de-animated one. This perspective also finds common ground with Giles Deleuze and Feliz Guattari, and the new materialists who draw from their work, who recognise that "materiality is always something more than mere matter", it is an "excess, force, vitality, relationality or difference that renders matter active, self-creative, productive, unpredictable" (Coole and Frost, 2010:9). It is this view of matter, as objects constituting themselves in "a transverse, vibratorial position, conferring on them a soul, a becoming ancestral, animal, vegetal, cosmic", that for Guattari offers potential to "decolonize" habitual ways of thinking, and destabilise the Cartesian dualisms central to social and environmental injustice (2000, p.102).

It is new materialist ontologies such as these that inform recent discussions of digital animism and animist design. For example, in *Digital Animism: Towards a New Materialism*, Victor J. Krebs argues that despite the abstraction of emerging technologies, somewhat paradoxically, it is our increasing interaction with the virtual world that is revealing the vital and transient nature of matter. Krebs observes that typically the virtual has been judged within a modern dualistic framework, as to how "close it comes to empirical experience" (2023, p.1). This results in two polarised stances – either the virtual is seen as fake, unreal or illusory and less than the "real", or it is seen as an upgrade to reality as "technology that can redeem us from a fallen world" (2023, p.2). He argues, however, that the virtual has more to do with force than simulation, it is potency or "a dimension of possibility inherent to all reality" (Massumi cited in Krebbs, p.4). Drawing on Deleuze, he suggests that the real and the virtual are two aspects of a constant inter-flowing phenomenon. It is this temporal movement and mutability that leads Krebs to argue that increased engagement with virtual digital worlds is providing tools to overcome "estrangement, reconceive matter and subvert the Enlightened secular stance of modernity towards the world" (2023, p.2).

The idea that people are becoming "animist" in order to deal with a world populated by artificial intelligence has quite a long history in interaction design. For example, as Betti Marenko (2015) notes, since the late 1970s, design theorists and critics such as Brenda Laurel and Erik Davis have been concerned with how pervasive computing induces animistic responses. Developing this line of thinking, Marenko argues that 'the current pace of digital innovation encourages the "consideration of the animate and inanimate assemblage in ways that were unthinkable only a decade ago" (2015, p.221). She goes on to argue, like Krebs, that "as a relational ontology, characterised by mutuality, emergence, and situated-ness, animism becomes a tool to explore our relationships to objects", and reassess and reconfigure our place in the world (2015, p.226).

In another article, Betti Marenko and Philip van Allen (2016) develop the notion of uncertainty-driven animistic design "as a strategic and experimental tool to rethink human–machine interaction" and document how animistic design feels in use. Through two speculative projects they consider how animism offers a way of thinking differently about interaction not from the perspective of the user, nor the object but "from the ongoing modulation of their less-than-predictable interaction" (2016, p.53). They identify several characteristics of animistic design which involve designing for "heterogeneous multiplicity" ('diversity of perspectives and behaviours embodied by multiple actants'), "embodiment" (physicality and tangible actions), and "distributed cognition" (thinking is in, and emerges from "*la milieu*") (2016, p.59-62). Marenko

and van Allen note that the idea of "data as actant" offers an interesting opportunity for further exploration. They give the example of a patient's medical data having a "unique personality that includes the owner's ethical rules, sharing/privacy protocols and history of use", which determine the way it would interact with external data systems (2016, p.64). Marenko and van Allen conclude by suggesting that animistic design, "can augment and sometimes replace the conventional, user-centered, solutionistic approach that we have today" (2016, p.68). These arguments resonate with many of the findings and reflections upon the Digitaonga project, which I now explore.

3. The Digitaonga Project and Approaches to Digitisation

As mentioned above, the first stage of the Digitaonga project worked with three groups of museums and Māori iwi and hapū (tribes and subtribes) to explore how emerging technologies such as blockchain and 3D scanning might aid in digital and physical repatriation efforts. The project was guided by a Kaupapa Māori research framework (informed by tikanga Māori — Māori values, practices, and ways of doing things) and co-design practices. Kaupapa Māori research is done by Māori, with Māori and for Māori, and this was implemented by employing a Māori research lead, Dr Moana Nepia who is an expert in Mātauranga Māori (Māori knowledge systems), as well as working with/and for Māori communities. The Kaupapa Māori research framework includes principles such as Whanaungatanga, the process of establishing meaningful, reciprocal and family-like relationships through cultural respect, connectedness and engagement; Māhaki, showing humility when sharing knowledge; and Mana, relating to power, dignity and respect (Tuhiwai Smith and Cram, 2018). Throughout the project we made sure we maintained these principles by working alongside our partners as they selected the taonga that they would like to scan, as they discussed the digital experiences they would like to create, and as they helped us to explore the ethics of data storage and security. In that sense, this project is a product of many people's ideas and we recognise that when people share their kōrero (thoughts and advice) the project becomes as much theirs as it is ours.

This ongoing collaboration led to, what we have termed, a taonga-led approach to digitisation. Taonga are a product of the quality of their relationships and are interconnected with every "word, thought, object, mineral, place and person" (Roberts, 2015). Taonga have their own mana, and kaitiaki (guardians) have the responsibility to uphold and protect their spiritual status and significance. The digitization of taonga Māori is by no means new and our project builds on a rich history of engagement with digital technologies by Māori iwi and hapū as well as museum curators. We have also looked to other indigenous digital repatriation projects for inspiration. For example, in a collaboration between the Smithsonian National Museum of Natural History in the US and the Tlingit community of Southeast Alaska a copy of a previously repatriated Kéet S'aaxw (Clan Crest Hat) was created and used in the museum in place of the original. The Tlingit community did not want to produce an exact replica, however, rather they preferred that the "copy" have some unique features (Hollinger et al, 2013, p.204).

This response to the largely Western idea of the 'copy' and the 'original' was also echoed in our discussions with Māori advisors, curators and whānau (family). Museum directors and curators suggested to us that the problem with current digitisation initiatives is that they are

conceptualised as a separate activities to contextualisation and storytelling rather than as extensions of taonga, with their own stories and identities inspired by, but not the same as, the originals. Thus, while we continue to strive for accuracy in high resolution scanning for preservation purposes, after that point, we are creating new interpretations, adding to layers of story-telling and cultural significance that already exist, to enhance the mana of taonga and their communities of origin. This perspective echoes the arguments of Krebs in which he writes that digital entities enter our world "not as copies that downgrade or upgrade reality' but as 'spontaneous and creative emergences" (2023, p.6). More broadly then, perhaps we should reconceptualise using "3D copying technologies" as they are sometimes called, as creative activities.

With this approach in mind, we reflected on how we would respond to the question that Te Awhina Rangmarie Arahanga asked us and how a taonga-led approach could be implemented in practice. At a high level, it meant that any decisions regarding digitisation and creative interpretation would be driven by the taonga and its kaitiaki (guardians). And if, for example, a particular taonga did not want to be scanned, we would remain open to consider alternative suggestions and responses, such as recording oral stories about the piece, or using a Māori artist to visually represent its form.

Figure 1. Whānau, curators and the project team with the korowai

This approach to digitisation looks different from typical scanning practices. For example, the

scanning of the Korowai (a Māori cloak) held at Kaikōura Museum took place over two days. On the first day of the two-day wānanga (meeting) we discussed the project's progress, the korowai and its history. The korowai was physically present with us during the discussion and the kaitiaki could connect with and feel its presence (Figure 1.). In the afternoon we visited locations key to the history of the taonga (Figure 2.). The whānau felt that scanning should go ahead and on the second day the korowai was photographed to create the 3D model. The whānau stayed to watch the process of photogrammetry and they were showed what would happen next to create the digital asset. The wānanga was closed by putting the korowai back on display in the museum and with a karakia (blessing) (Figure 3.).

While we were not aware at the time, this process resonates with the characteristics of animistic design that Marenko and van Allen identify. The open wānanga allowed for "heterogenous multiplicity" in terms of the involvement of multiple actors (human and non-human) with diverse viewpoints. The process allowed for embodied interaction: the people present were physically present in person with each other and the korowai. The two-day format also allowed for "distributed cognition"; knowledge emerged from the "intra-action" between the artefact itself, the kaitiaki, the project team, as well as the environments we visited, the sounds, smells and the weather we experienced.

Figure 2. Visit to Mangamaunu Marae where Tētahi Ropata created the korowai.

Figure 3. Whānau, curators and the project team after the karakia in the museum.

Not acknowledged by Marenko and van Allen however, is the spiritual realm in which we found ourselves. Our participants, the kaitiaki, were fully aware of the mauri (life force or essence) of the taonga and we were reliant on listening to them to ascertain whether and how we could go ahead with the process. This is listening in the broadest sense of the word, not 'hungry listening' that that fixes and fixates the person you are learning from (Robinson, 2020) but being sensitive to the feelings in the room however they are expressed. The closest thing, perhaps, from a Western secular perspective would be sensing the atmosphere or the vibe.

Discussions from the two-day wānanga also led to greater consideration of how the project would ensure Māori data sovereignty through data storage and security. We are currently building a digital platform that looks to organise, store and secure digital data and artefacts together in ways that resonate with the customary Māori practice of kaitiakitanga, the protection and care for taonga. This includes the protection of collectively owned information considered outside the paradigm of Western individualised systems of ownership, and affording taonga with the status of legal personhood as has been the case with Whanganui River, Te Uruwera, and Taranaki maunga (mountain) in Aotearoa. As Charles Dawson (2017) argues, the concept of a river having legal personhood is a "profound gift from Māori", because it demands and institutionalises a wider perspective on the world, one that prioritises kaitiakitanga over ownership. Similar to Marenko and van Allen's discussion of 'data as actant' this possibility could embed an ethics into data that would not exist otherwise in Western contexts and perhaps could further an acceptance of the vitality of matter more broadly.

4. (Not a) Conclusion: Animism and Design in/through/outside

of the Digital

However, what are the politics and ethics of these types of "gifts"? Indeed, should I be writing about the project at all without my Māori colleagues and collaborators. As I stated at the beginning of the paper, my motivation is not to appropriate or lay claim to Māori knowledge but to consider what might help design "undermine its own ontological ground" (Fry and Nocek, 2021, p.3). It is to reflect on what we can learn from worldviews that deny the separation of spirit and substance. Through the lens of animism and the Digitaonga project, I believe there are several insights that could be instructive for designers and design education:

- Animist approaches to the virtual challenge the dualisms of original/copy and digital/physical. As creative practitioners we should be more attune to the creativity of "3D copying" technologies, as well as the materiality of the digital, and the virtuality of the physical.
- Data has its own vitality, and animist approaches could ensure more ethical systems and conduct.
- An animist orientation that includes attunement to all the senses, embodiment and atmospheres could help designers to move beyond solutionism that often reinforces, rather than disrupts, Western constructs and binary dualisms.
- Animist approaches recognize and allow for distributed cognition, thinking that emerges in and from multiple human and non-human actors. This challenges the notion of predetermined outcomes or plans often central to design practice.

It is this last point in particular that may cause us to consider whether the term 'design' can be used to represent these sorts of emergent creative activities and practices. As Alfredo Gutiérrez Borrero (2021) argues, in adding more and more adjectives to the word design (co-design, pluriversal design, indigenous design etc), the noun itself is strengthened, and this reproduces the dominance of Western concepts and contexts over others. Gutiérrez Borrero doubts that the word design "which has advanced colonially over the planet, can be stripped of its colonial condition" (2021, p.48). He speaks of "dessobons", "designs with other names" to refer to creative activities whose "lineages do not respond, neither by etymology, epistemology, or ontology to the idea of design, because they arise from relational entanglements external to modernity, and are violated by incorporating them into it" (2021, p.47). Gutiérrez Borrero argues that "dwelling in incompleteness and separating ourselves from the referent [design], we notice that we are not talking about different perspectives on the same thing, but about different 'the same' recognizable in their incomprehensibility" to each other (2021, p.49).

I have felt this sense of incomprehensibility and unknowing through my engagement with the Digitaonga project. Instead of heading back into safety, I have tried to welcome an "animist cosmovision" and in turn look to how this manifests itself in Western approaches, histories, and environments (Akomolafe, 2023, para 1). For example, it is well documented how gentleman collectors in late-nineteenth and early-twentieth-century literature were challenged and destabilised by their collections (Allsop, 2013). Thus, perhaps we need to look to the vital materiality of creative activity to explore the radical possibilities that come with incompleteness and uncertainty. Rather than excluding that which doesn't fit, perhaps we should move into the generative space of not-knowing. Thus, rather than conceptualising the insights above as

'animist design', I hope they are useful for cultivating posthuman neo-animist sensibilities, which as Bayo Akomolafe (2023) has argued, may be able to help us move beyond reproducing ever more of the same.

ABSTRACT | Despite growing integration of AI voice assistants into daily life, blind and visually impaired users frequently encounter exclusionary barriers in their design and use. While these systems promise accessibility, they often perpetuate subtle forms of hidden violence—design decisions that, though unintentional, systematically disadvantage disabled users. This paper adopts a critical disability perspective to examine how structural inequalities are embedded in AI voice interfaces. Drawing on five in-depth interviews with blind users and framed through theories of structural violence (Galtung) and design justice (Costanza-Chock), we explore how algorithmic bias, interaction design, and personalization deficits combine to marginalise blind users. Our thematic analysis identifies three core patterns: (1) biased speech recognition and linguistic exclusion, (2) rigid interactions and contextual breakdown, and (3) lack of personalization and loss of agency. These findings reveal how voice interfaces enforce normative assumptions about users—standard accents, visual confirmation, and simple commands—that exclude those who communicate or navigate differently.
Rather than treating these as isolated usability failures, we argue they reflect systemic design neglect and reproduce ableist structures. We call for a reorientation of voice interface development based on design justice principles: centring disabled users in co-design, diversifying training data, and embedding personalization as an ethical imperative. By reframing accessibility as a matter of justice—not just technical compliance—we illuminate how AI voice technologies can be reimagined to empower rather than marginalize. This paper contributes a critical, theory-informed lens to HCI and AI ethics, and urges a shift from designing *for* the "average" user to designing *with* those most affected. In doing so, we argue for a future where AI voice systems become tools of equity, dignity, and digital inclusion.

KEYWORDS | Design Justice; Structural Violence; AI Voice Interfaces; Accessibility; Critical

Disability Studies; Human–Computer Interaction

1. Introduction

Globally, an estimated 2.2 billion people live with visual impairments, which significantly impacts their daily activities. Voice-based artificial intelligence (AI) assistants (e.g. Amazon Alexa, Apple Siri, Microsoft Seeing AI) promise to enhance digital accessibility by enabling hands-free, eyes-free interaction. Such tools *could* alleviate burdens for blind and visually impaired users by increasing autonomy and independence. However, in practice these technologies often inadequately accommodate the diverse requirements of disabled users. Significant shortcomings persist: many AI voice systems fail to recognize non-standard speech, cannot handle complex tasks, or otherwise fall short of blind users' needs. These failures largely stem from systemic issues – for example, AI models trained primarily on data from non-disabled, "typical" users – leading to biased performance that deters adoption among people with disabilities. In effect, design and data biases built into voice interfaces end up *excluding* the very users who might benefit most, reinforcing a digital divide.

This paper examines these issues through the lens of critical disability studies and design justice. We contend that the subtle yet pervasive design flaws in AI voice interfaces constitute forms of *"hidden violence"* – structural harms that, while not overtly intentional, systematically disenfranchise blind users. Drawing on Johan Galtung's concept of structural violence, we understand "violence" here as social structures or processes that harm people by preventing them from meeting their needs or realizing their potential. Inaccessible technology design can be viewed as such violence "built into the structure" of digital systems, invisibly constraining and harming marginalized users. From a critical disability perspective, disability is not inherent to the individual but produced by environmental and design barriers. Thus, when voice interfaces are designed without regard for blind users, the resulting exclusions are a form of structural or *implicit* violence enacted through design.

Our investigation is informed by in-depth qualitative interviews (n=5) with blind users of AI voice assistants. Rather than a usability evaluation, we conduct a thematic, critical analysis of these interview narratives to uncover how biased design choices manifest as everyday barriers and "violent" exclusions. We situate our findings in the context of broader literature on design justice (e.g. Costanza-Chock's framework of community-led inclusive design), structural violence in technology, AI ethics and bias, and human-computer interaction (HCI) accessibility research. By adopting a thematic, argument-driven structure, we connect empirical insights to systemic critiques. The paper begins by framing relevant literature and theory, then outlines our interview methodology. We then present three major themes from our findings, illustrating how hidden design violence operates in voice interfaces. Finally, in the discussion, we critically examine these issues through design justice principles and propose how voice technologies might be reimagined to promote justice rather than perpetuate exclusion.

2. Literature Framing: Bias, Violence, and Justice in Design

2.1 Systemic Bias and Structural Violence in Technology

AI technologies are often touted as objective and universally beneficial, yet ample

evidence shows they can reproduce societal biases and inequities. Notably, much AI bias discourse has centered on race and gender, with far less attention to disability. This omission is significant, as disabled people have faced historical marginalization and exclusion from power and resources. Those patterns of marginalization become "imprinted in the data" used to train AI, embedding past discrimination into present systems. As a result, people with disabilities – often statistical *outliers* relative to normative data – are at heightened risk of harm from biased AI. In the context of voice interfaces, biased design might enforce standards of "normal" speech and ability that treat those outside the norm as problems. According to the social model of disability, widely endorsed in disability studies and codified in the UN Convention on the Rights of Persons with Disabilities (CRPD), disability is largely *"a social construction,"* arising from the mismatch between individuals and their environment. When mainstream technologies are built without regard to users with disabilities, they effectively create disability by imposing barriers.

Structural violence provides a lens to understand these design failures as more than accidental oversights. Galtung (1969) defines structural violence as harm perpetrated by social systems that unevenly distribute opportunities and agency. Crucially, it lacks a single identifiable perpetrator; instead, the "violence" is embedded in normal procedures and institutions. A classic example is when preventable social conditions (poverty, inequity) lead to suffering for certain groups. We can analogously view a poorly designed voice interface that consistently frustrates blind users as *"violence by design"* – an injury inflicted not by malicious intent, but by neglect and systemic bias. The constraints such technology places on blind individuals' communication and information access represent a preventable harm structured into the technology itself.

Importantly, biases in AI systems are not merely technical defects; they are symptoms of broader social biases and power imbalances in design. As researchers note, technological bias is "not simply an isolated technological failing, but rather a manifestation of larger social and design systems" that disproportionately disadvantage marginalized groups. For example, if a voice assistant performs well for users with standard American English pronunciation but poorly for those with different accents or speech patterns, this reflects whose voices were prioritized (and whose were ignored) in the design and training data. Such a biased system can deepen the *"gap in digital equity"* for blind users, especially since voice input is often more essential to them than to sighted users. Indeed, visually impaired people report using voice commands on mobile devices at higher rates than sighted users. Thus, when voice interfaces are biased or poorly designed for blind users, the impact is especially acute and structurally reinforced: those already marginalized by disability are further marginalized by technology, exemplifying how structural violence operates through design.

2.2 Design Justice and Critical Disability Design

Addressing these inequities requires rethinking design processes through the framework of design justice. *Design justice* is an approach that examines how design – of products, interfaces, infrastructures – distributes benefits and burdens among different groups, often along lines of existing oppression. Sasha Costanza-Chock (2020) and the Design Justice Network articulate this as focusing on the ways design can reproduce or challenge the "matrix of domination," the interlocking systems of oppression (such as white supremacy, heteropatriarchy, ableism, capitalism, etc.) that structure society. In other words, design justice asks: Who is design *for*, who participates in design decisions, and who is harmed or left out? It is both a theoretical lens and a growing social

movement aimed at equitable distribution of design's benefits and burdens, meaningful inclusion of marginalized communities in design, and recognition of their experiential knowledge. In the context of AI voice interfaces, a design justice approach insists that blind and visually impaired people – traditionally excluded users – must be centered in the entire design process. Costanza-Chock (2018) argues that centering marginalized users (e.g. blind people) in design and development is necessary to prevent technological systems from reproducing existing injustices. This means involving blind users in ideation, user research, prototyping, testing, and refinement of AI systems so that they become *"the driving force behind the final result,"* rather than treating their needs as an afterthought. Design justice thus flips the script: instead of designing for an abstract "average" user and forcing disabled users to adapt, it calls for designing *with* and *by* disabled communities so that their perspectives define the goals and criteria for success.

Such a shift aligns with principles from critical disability studies and HCI that emphasize participatory design and disability-led innovation. Echoing Costanza-Chock, researchers have noted that AI systems should be developed to *help marginalized populations resist systemic bias rather than defaulting to the needs of a "typical" user*. When designers default to a hypothetical average user (often assumed to be sighted, able-bodied, using a dominant language), they implicitly encode the matrix of domination into technology by privileging those already privileged. In contrast, a justice-oriented design would treat, for example, a blind person with a regional accent as a primary stakeholder whose use case is just as important as any other. Centering such users could prevent many biases at their root. For instance, if blind users had been heavily involved in designing voice assistants, issues like lack of speech output for certain prompts or inability to adjust speech speed might have been caught and addressed early. The human-centered AI perspective also reinforces this: as Wang (2020) posits, AI design must develop a deep understanding of the end-user's lived experience. For blind users, that means AI assistants (whether visual recognition tools or voice agents) need to be *customized to fit their daily challenges* and contexts. Personalization and flexibility are not just nice-to-have features but ethical imperatives when designing for disability, because a one-size-fits-all approach will tend to fit only the non-disabled majority.

2.3 AI Ethics, Fairness, and Voice Accessibility

There is a growing recognition in the AI ethics community that fairness and accountability efforts must include disability axes. Algorithmic bias discussions have often omitted disability, but recent work is correcting this. For example, Trewin et al. (2019) outline considerations for AI fairness for people with disabilities, highlighting issues like representation in training data, accessible model evaluation, and inclusive user testing. Similarly, Guo et al. (2020) call for a research roadmap toward fairness in AI for people with disabilities. A major insight from such work is that many biases affecting disabled users arise not only from algorithms per se but from design decisions around how problems are framed and who is included in development. Newman-Griffis et al. (2023) demonstrate that definitions of disability built into AI systems (e.g. treating disability via a medical-deficit model vs. a social model) lead to very different design choices and downstream biases. They further show that a *lack of disabled participation and transparency in AI design amplifies these harms*. In other words, bias often "begins at the beginning" – in problem formulations, data collection, and interface design choices made without the input of disabled people. This underscores that inclusive processes (who gets a say in design) are as crucial as inclusive outcomes.

Within HCI, research on voice interfaces and accessibility provides valuable context. Voice

assistants have emerged as unintended assistive technologies for many people with disabilities – *"accessibility came by accident,"* as Pradhan et al. (2018) famously titled their study. In that work, the authors found that users with various disabilities adopted commercial voice-controlled assistants (like Amazon Echo) to help with everyday tasks, despite those products not originally being designed with disability in mind. Blind users, for instance, use smart speakers to get information or control devices without needing visual UIs. However, because these devices were not *intentionally* designed for them, users often encounter frustrating limitations. Recent studies have catalogued challenges such as voice assistants failing to recognize screen reader users' fast speech rates, difficulties in discovering accessible features, and the tendency of some devices to provide visual output or cues that blind users cannot perceive. Oumard et al. (2022) provide an overview of current voice user interface requirements for blind and visually impaired users, noting that many needs – from better feedback to advanced query handling – remain only partially met by mainstream products. In short, the literature suggests a gap between the *potential* of voice AI to empower visually impaired people and the *reality* of exclusionary design in today's systems. This gap is maintained by structural factors: whose voices are heard in design, what data is used, and which use scenarios are prioritized. Disability, Bias, and AI, a 2019 report by AI Now Institute, argues that centering disability in AI development not only surfaces these gaps but points the way to remedies. By moving beyond a narrow focus on technology as a "solution" and instead accounting for social context, history, and power structures, we can begin to address the root causes of bias in technologies like voice interfaces. These insights from prior work guide our analysis of how *hidden design violence* operates in AI voice interfaces and how a design justice approach could transform these technologies.

3. Methodology: Interviews and Thematic Analysis

To investigate the lived experiences behind the abstractions of bias and injustice, we conducted an empirical study based on qualitative in-depth interviews with blind users of AI voice interfaces. Five participants (n=5) who are blind or severely visually impaired were recruited through local disability advocacy networks. Each participant was a regular user of at least one voice-based AI assistant (including platforms such as Amazon Alexa, Google Assistant, or smartphone voice assistants) in their daily life. We used a semi-structured interview format, allowing participants to freely describe their usage patterns, preferences, and the challenges or frustrations they encounter with these technologies. Example prompts included: "Can you walk me through how you use voice assistants in a typical day?", "Have you had instances where the assistant misunderstood you or couldn't do what you needed? How did that affect you?", and "If you could change anything about these voice assistants to make them work better for you, what would it be?" Such open-ended questions encouraged participants to reflect on not only usability issues but also how using (or struggling with) voice assistants made them *feel* and fit into their broader life.

Interviews lasted approximately 45–60 minutes and were conducted one-on-one via audio call. Audio recordings were transcribed verbatim for analysis. We then employed a thematic analysis approach to code and interpret the data, following standard qualitative procedures for identifying patterns across narratives. Initially, two researchers independently reviewed the transcripts and generated open codes for notable concepts (e.g. "misrecognition of speech", "feeling of not being heard by device", "workaround strategies", "privacy worries"). We then collaboratively grouped related codes into candidate themes reflecting higher-level concepts. Through iterative discussion and refinement, three primary themes emerged that captured recurrent experiences and critiques voiced by participants. These themes were: (1) **Biased Speech Recognition and**

Linguistic Exclusion, (2) **Rigid Interactions and Contextual Breakdown**, and (3) **Lack of Personalization and Agency**. We interpreted these not just as usability problems, but as *manifestations of hidden structural violence* in design, aligning each theme with the critical frameworks discussed earlier. To ensure trustworthiness of our analysis, we engaged in reflexive comparison with existing literature (as described in the Literature Framing) to see how our emergent themes resonated with or differed from known issues. The small sample size means our goal is depth of insight rather than generalizability; we aimed to uncover rich, illustrative examples of how design shortcomings are experienced by blind users. All participants gave informed consent, and pseudonyms are used to protect their anonymity in reporting. In the following section, we present the themes with supporting evidence from interviews, analyzing how each reflects a form of "hidden design violence" embedded in current voice interfaces.

4. Thematic Findings: Hidden Design Violence in Voice Interfaces

4.1 Finding 1: Biased Speech Recognition and Linguistic Exclusion

Participants unanimously reported issues with voice assistants misunderstanding their speech, in ways that pointed to biases in speech recognition algorithms. Several interviewees observed that the system seemed tuned to *someone else's voice*, not theirs. For instance, one participant who is a non-native English speaker described frequent failures: *"I have to repeat myself multiple times, or try speaking like an American newscaster, just to be understood."* This experience reflects how current voice AI often struggles with diverse accents, dialects, or speech patterns that deviate from the "standard" language model. Indeed, voice recognition systems are typically trained on large datasets of speakers, but if those datasets underrepresent linguistic diversity (regional accents, non-native pronunciations, atypical speech from disabilities), the model will perform poorly for those voices. Research confirms that mainstream speech recognizers work best for "mainstream" speech and can be ineffective for atypical speech, implicitly excluding many disabled users. In our interviews, this translated into a feeling of *linguistic alienation*: participants felt "the assistant doesn't understand people like me." One interviewee, who speaks quickly and uses screen readers at high speed, noted that the voice assistant often failed to keep up: if they spoke a command as fast as they comfortably could, the system would either misinterpret it or not respond at all. This resonates with prior findings that visually impaired users often listen to and produce speech at higher rates, whereas voice AIs aren't optimized for such speeds.

The *consequence* of these recognition biases is more than just inconvenience; it is exclusion from effective use of the technology. Participants described scenarios where they simply gave up on using a voice command because "it's just not getting what I say." One participant said, *"It makes you feel a bit invisible – like I'm speaking, but it's as if I'm not there."* This emotional impact illustrates how a biased algorithm can erode a user's sense of agency. From the user's perspective, the system's failure to recognize their voice is experienced as a form of rejection or neglect. In design justice terms, the benefits of the technology (quick information access, hands-free control) are not equitably distributed; instead, the harms (frustration, time loss, psychological stress) fall more on those with certain speech characteristics. The exclusionary pattern is systemic: users with accents or speech differences have to *adapt to the machine*, rather than the machine adapting to them – a subtle form of oppressing the user. Prior work has identified this as a broader issue: AI voice assistants tend to enforce implicit standards of "normal" speech, treating

those who don't fit as outliers. The cost of being an outlier is clear in our data – repeated errors, longer interaction times, and sometimes abandonment of the technology. As one study aptly noted, bias in voice interfaces goes beyond simple recognition errors to create a "broader pattern of exclusion." Users with language barriers, strong regional accents, or non-standard pronunciations often experience chronic misinterpretation, unless they artificially change how they speak. This need to code-switch or overly enunciate every command is itself a burden that sighted, non-disabled users don't face – effectively a *tax on disability*. Moreover, when the assistant fails, blind users lose time and patience. Our participants echoed what has been reported elsewhere: *"I'll ask Alexa to do something, it messes up, I try again and again… by the third time I'm just frustrated"*. Such iterative failures act as a hidden barrier, slowing down interactions and undermining the purported efficiency of voice interfaces. In sum, biased speech recognition exemplifies hidden design violence: an ostensibly neutral feature (the AI's listening ability) becomes a mechanism of marginalization when it consistently works better for the majority and worse for an already disadvantaged minority.

4.2 Finding 2: Rigid Interactions and Contextual Breakdown

A second prominent theme was the rigidity of voice assistant interactions, particularly the inability to handle multi-step or context-dependent tasks, which often led to user frustration and abandonment of tasks. Participants shared numerous instances of hitting a "wall" with the assistant's limited dialogue memory. Unlike human conversation, where context carries over, current voice interfaces typically require each command or query to be largely self-contained. One interviewee recounted an experience trying to get information piece by piece: They first asked for a famous person's birthdate, and the assistant provided it. Then they naturally followed up with "How old is he now?" – a question that clearly refers to the person just mentioned. The assistant, however, responded with *confusion* or an irrelevant answer because it did not retain the prior context of who "he" was. This lack of contextual understanding forced the user to rephrase the question with the person's name again. The participant described this as *"tedious and annoying – I feel like I have to babysit the assistant through every little step."* Such frustration with having to constantly repeat context was common. In fact, an exploratory study of conversational agents similarly noted *"frustration over the lack of context memory and the obligation to constantly repeat context to Alexa"* among users. Our interviews mirror that finding: voice assistants often forget what was just said, and the onus falls on the user (even a blind user juggling other tasks) to formulate each query from scratch.

For blind users, this rigidity can be particularly limiting. Many said they wished to accomplish *compound tasks* by voice – for example, "find my nearest pharmacy and call it," or "open my email and read the first unread message." Instead, they must break tasks into discrete steps and sometimes switch to other tools. One participant remarked that after a certain point of back-and-forth with the assistant, *"I just sigh and pull out my laptop with a screen reader because it'll be faster."* Inaccessibility thus isn't always a binary inability to use the tool at all; it often manifests as the technology being so cumbersome that the user opts for an alternative. Here we see hidden violence in design as the extra "time tax" and cognitive load imposed on disabled users by an inflexible system. The requirement to constantly restate contexts or simplify requests to fit the machine's limited understanding is an inequitable burden: sighted or non-disabled users might simply use a screen or find another workaround more easily, whereas a blind user trying to stay within voice interaction is stuck with an inferior experience. This *sequential command failure* reflects designers optimizing for simple, single-shot commands (turn

on light, set timer) while neglecting more complex, real-world scenarios that are important for users' autonomy. Studies have observed that many commercial voice assistants are indeed optimized for short, shallow interactions and their performance "decreases significantly when handling advanced, personalized interactions that require understanding of user intent and context". Our participants' experiences put lived experience behind that statement – they encounter a structural limitation where the design does not accommodate chaining commands or maintaining conversational state, which in turn *prevents* them from accomplishing certain goals efficiently.

From a design justice viewpoint, this reveals a misalignment between the design assumptions and the needs of blind users. The inability to process sequential or contextual commands can be seen as a form of *structural discrimination*: the system's design assumes users can fall back to visual interfaces or are only interested in simple tasks. Those assumptions exclude a whole class of use cases particularly relevant for blind users who might prefer a continuous voice dialogue for complex tasks. One participant gave an example of trying to manage a calendar appointment via voice. They could ask "What's on my calendar for tomorrow?" and get an answer, but if they then said "Schedule a meeting with John in that free slot," the assistant would fail to connect the dots (who is John? what slot?). The user has to query availability, then separately issue a new command to schedule, specifying all details again. This cumbersome process reflects a lack of *assistive intelligence* in what should be an assistive technology. It subtly diminishes the user's agency – instead of commanding one's assistant to handle a task smoothly, the user is micromanaging the assistant. As one focus group participant in another study lamented, after the assistant failed to remember context, *"in the beginning it is fun… but after a while you just want it to do the things you bought it for and not some senseless gimmicks"*. In our analysis, the hidden violence here is the erosion of trust and confidence: the user cannot rely on the system to follow through, so they either perform undue labor to use it or abandon its use for that task. This erodes the promise of independence that AI assistants are supposed to offer. In effect, the design's inflexibility *privileges* certain interactions (simple, stateless queries) while marginalizing the more complex, context-rich interactions that many disabled users actually need for daily life. The outcome is a slower, more frustrating experience for the blind user – a systematic disadvantage built into the interaction design.

4.3 Finding 3: Lack of Personalization and Loss of User Agency

The third theme from our interviews is a pervasive lack of personalization or adaptability in voice interfaces, which contributes to a feeling of disempowerment among blind users. Participants noted that current voice assistants tend to treat all users the same, offering little ability to tailor the system to individual needs or preferences – and in doing so, they implicitly center an able-bodied user profile as the default. One interviewee put it bluntly: *"These devices weren't made for me. I'm just adapting to them."* This sentiment captures how the absence of customization options or adaptive behavior forces blind users to conform to the technology, rather than the technology accommodating them. Specific examples raised by participants include: speech output speed and verbosity**,** content of responses**,** and interaction modalities. Several blind users are power users of screen readers and are accustomed to very high speech rates (far above typical speaking speed). Yet voice assistants often have a limited range of speed adjustment – for instance, a participant noted that their smart speaker's fastest talking speed was still much slower than they would like. This meant they had to listen to responses at a plodding pace, which made interactions needlessly time-consuming. Research on speech rate preferences confirms this mismatch: visually impaired users often desire

faster speech feedback than what commercial voice agents provide. When a system cannot personalize something as fundamental as speech rate, it effectively penalizes users who could otherwise operate more efficiently.

Another aspect is the *content and format* of the assistant's responses. Participants mentioned that sometimes the assistant gives overly generic or unhelpful responses that aren't what they actually need, and there is no way to change that behavior. For example, when asking a device for the time or weather, a sighted user might glance at a screen or have a short response suffice. A blind user might prefer more detail in certain answers (since they can't quickly scan additional info visually). One participant described asking a voice assistant about bus schedules and getting an answer that "there are multiple buses in the next hour," which was not specific enough – but the device did not offer an easy way to refine or personalize the response format. Similarly, participants felt that assistants did not learn from repeated interactions. If a user always asks for a specific radio station in the morning, the system does not proactively offer it – the user must ask every time. The technology thus lacks *adaptive learning* that could improve the user's experience over time. This failure to adapt or allow personalization was interpreted by users as a sign that their individual needs were not accounted for in design. In critical disability terms, it is an expression of ableism in design – the tacit expectation that all users have the same needs as a non-disabled person, so features for customization are not prioritized.

The lack of personalization also ties directly to loss of user agency. Agency in using technology means the user feels in control and that the tool can be configured to serve their goals. Our participants often felt the opposite: constrained by the device's fixed settings and behaviors. One described it as, *"I work around the device's quirks, instead of it working around mine."* This inversion of control is a hallmark of *non-inclusive design*. It can be viewed as a structural issue: mainstream design processes often define a singular user experience deemed acceptable (often based on majority feedback or assumptions), and those who fall outside that norm are expected to cope. From a design justice perspective, this reflects a failure to equitably distribute the *benefits* of design and minimize the *harms*. The benefits of personalization – efficiency, comfort, relevance – are part of the "distribution of benefits" that design justice advocates examine. When blind users cannot get the same level of personalized service from an AI that others might get (or that would meaningfully improve their access), it is a form of marginalization. Costanza-Chock notes that design justice requires fair and meaningful participation in design decisions. Had blind users been meaningfully involved, many of these personalization features likely would have been highlighted as priorities rather than left out. For instance, a blind co-designer might insist on a mode where the voice assistant gives more contextual feedback or confirms actions verbosely for users who can't see a confirmation light – features that currently often have to be enabled via tedious settings or are absent.

Encouragingly, one of our participants had experience with a beta feature on a voice assistant that allowed custom voice commands to be programmed (effectively letting the user create shortcuts or aliases for complex tasks). They found this empowering: *"It finally felt like I could teach it something."* This suggests that when given tools for personalization, disabled users can significantly enhance their own experience – essentially performing "crip technoscience" or user-led innovation to hack the tool for their needs. However, such features are rare and not well-supported in most mainstream voice interfaces. The norm remains a *"one-size-fits-all"* design that in truth fits only the majority, reflecting what one might call the tyranny of the typical. As Costanza-Chock (2018) observed, the aim of design justice is to avoid defaulting to the needs of a "typical"

user and instead build for the full range of human diversity. Our findings reinforce how far current design is from that ideal: voice AI systems still largely default to abled norms and treat the disabled user as an edge case. This not only limits functionality but, in a deeper sense, is *symbolically violent*. It sends a message – however unintended – that the needs of blind users are not important enough to warrant special consideration in the design. In critical disability theory, such neglect is a form of symbolic annihilation of disability in tech culture. While not an overt harm, it contributes to feelings of otherness and lack of belonging in a digital world that touts AI as a progressive force. The hidden violence here is subtle but pervasive: it lies in every instance of a blind user thinking "I guess this thing wasn't made for people like me."

5. Discussion: Toward Design Justice in Voice Interfaces

5.1 Reframing Design Failures as Structural Violence

Our findings illustrate how seemingly minor design, and algorithmic decisions can accumulate into patterns of structural inequality in user experience – what we term "hidden violence" in AI voice interfaces. The term is apt because the harms (frustration, exclusion, loss of agency) are often invisible to those not experiencing them, and there is no single culprit to point at. Yet, as Galtung's theory of structural violence reminds us, the absence of an obvious perpetrator does not mean the absence of violence; it simply means the violence is woven into the fabric of the system. In the cases above, the "system" includes the data pipelines that underrepresent diverse voices, the design processes that ignore disabled perspectives, and the business priorities that fail to value accessibility. These combine to create technology that *systematically* under-serves blind users. Each time a blind person is forced to repeat a command thrice due to accent bias, or to abandon a task because the assistant can't follow context, that is a small cut – an instance of *"slow violence"* in Rob Nixon's terms. Cumulatively, these cuts constrain the user's ability to live and thrive in a digitally mediated world. Slow violence, as applied by Teo (2024) to AI, describes harms that are incremental and accrete over time, often ignored by mainstream narratives of innovation. The experiences our participants shared – the daily hassles and indignities – exemplify AI's slow, hidden violence to the rights and dignity of disabled persons.

5.2 Design Justice as a Framework for Inclusion

Understanding these issues through a critical lens highlight that the problem is not *poor blind users need better tools*, but rather *power imbalances and exclusions in how technology is designed*. This is where design justice offers both critique and a way forward. Design justice tells us to ask who has voice and power in the creation of voice interfaces. Currently, it appears that blind users have had little say: they were not the assumed end-user during design, and perhaps not significantly included in testing either. The result is a classic case of what Costanza-Chock calls *"matrix of domination"* being encoded in design. The matrix here might include ableism (privileging able-bodied communication styles), but also commercial and time pressures that prioritize quick deployment over thorough inclusive design. By centering blind users moving forward, we can begin to dismantle this matrix within voice technology.

5.3 Participatory Design and the Redistribution of Design Power

Inclusive co-design and participatory methods are crucial. If blind users are co-creators of voice assistants, the design requirements would likely expand to include context retention, flexible speeds, alternative interaction flows, etc., from the outset. This aligns with broader calls in AI ethics to center the voices of those most impacted by AI systems. For instance, the AI Now Institute emphasizes learning from disability activism – such as the principle of "nothing about us without us" – in working toward AI accountability. In practical terms, companies developing voice AI could establish advisory panels of users with disabilities, conduct targeted user research in the blind community, and employ disabled designers or engineers who bring lived experience into the product development. Such steps move us closer to what Whittaker et al. (2019) advocate: *centering disability in discussions of AI to account for social context, history, and power structures*. By doing so, we shift from viewing accessibility as a narrow technical fix to seeing it as part of a justice-oriented transformation of technology culture.

Our analysis also underscores the need to adopt what scholar Ruha Benjamin calls a "people's perspective" on technology, wherein the aim is not simply to *fix* biased systems but to question who builds, owns, and governs these systems in the first place. The notion of "justice by design" implies that fairness and inclusion should be baked into the entire lifecycle of technology creation. In the context of voice interfaces, this could mean implementing guidelines that require diverse training data (including voices of people with different disabilities and linguistic backgrounds) and auditing models for performance disparities across user groups. It could mean enforcing accessibility standards that go beyond minimal compliance (for example, requiring that any function available via an app or screen is equally available via voice feedback for blind users). It certainly means *listening* to disabled users' accounts of harm and taking those as seriously as bug reports or feature requests from other users. The fact that our participants' struggles are not widely recognized as "bugs" is itself telling – it reflects a societal bias in whose experiences are valued. Design justice pushes us to validate those experiences and treat them as actionable knowledge.

5.4Implications for AI Policy, Practice, and Ethics

Another dimension in discussion is the role of policy and structural interventions. If we view the exclusion of blind users from voice tech as a form of structural violence, then like other forms of structural inequality, it may require structural remedies. Anti-discrimination law and accessibility regulations can play a role. For example, the Convention on the Rights of Persons with Disabilities (CRPD) obligates states to promote accessible technology and eliminate barriers. This could translate into stronger enforcement of digital accessibility standards or incentives for inclusive innovation. While tech companies often tout AI fairness and ethics commitments, disability inclusion should be explicitly incorporated into these frameworks. Currently, issues like model bias for accents might be seen as secondary performance issues; a justice lens insists they are primary equity issues.

In discussing these findings, we also acknowledge the intersectional nature of design justice. Within the blind community, there is diversity of language, race, gender, socioeconomic status – and these intersections can compound disadvantage. For instance, a blind user who is also a non-native speaker or from a minority ethnic group might face even greater misrecognition from a voice assistant, as some of our participants did. A design justice approach in AI would thus be attuned to intersectionality, ensuring that the most marginalized (e.g., blind users and speakers of

underrepresented languages) are centered. This approach resonates with black feminist theory on centering the margins to liberate everyone. If voice interfaces were designed to robustly handle the needs of a blind, non-native speaker, for example, it's likely they would be more robust and flexible for all users. In that sense, inclusive design can drive innovation that benefits a wider user base – but the motivation must first be ethical (justice), not just market expansion.

In summary, the discussion highlights that hidden design violence is not fate. It is the result of choices – often unconscious or externally constrained – in the design and deployment of technology. By surfacing these issues and reframing them as questions of justice, we open up possibilities for change. Centering disabled users, diversifying design teams and data, and holding technology accountable to inclusivity are key strategies. Our findings serve as a reminder that bias in AI is not only an algorithmic issue but a design and development issue. The inequities experienced by blind voice assistant users are solvable but solving them requires shifting power and priorities in tech design. The next section turns to concrete implications and recommendations stemming from this critical perspective.

6. Limitations

This study offers an in-depth, critical examination of how AI voice interfaces exclude blind users through design decisions embedded with systemic bias. However, several limitations should be acknowledged. First, the study is based on in-depth interviews with five participants, which, while suitable for qualitative thematic analysis, limits generalisability. The sample size reflects a goal of depth over breadth, but the experiences documented may not fully represent the diversity of blind and visually impaired users, particularly across different age groups, technological proficiencies, and regional contexts.

Second, all but one participant were based in China, with one based in the United Kingdom. This geographical concentration may introduce cultural or infrastructural biases—such as differences in device availability, voice assistant performance in Mandarin vs English, and accessibility policies—that shape user experience. Future research should explore cross-cultural comparisons to further unpack how sociotechnical contexts affect the manifestation of hidden design violence.

Finally, this study focused exclusively on blind users. While this lens was necessary to foreground visual accessibility issues, it does not account for how other disabled populations (e.g. people with speech impairments, cognitive disabilities, or intersecting marginalisations) may interact with or be excluded by voice interfaces. Further research is needed to explore how overlapping forms of exclusion operate in AI design, and how inclusive strategies can be adapted for a broader range of users.

Despite these limitations, this study contributes critical insights into how AI systems can unintentionally replicate structural inequities, and how design justice offers a pathway for more inclusive and empowering voice technologies.

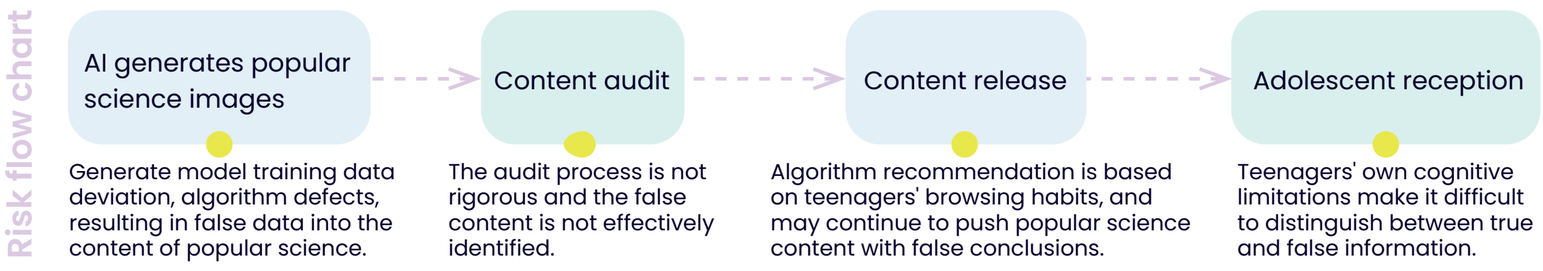
Abstract

With the emergence of AI-generated content (AIGC) technologies, the landscape of information dissemination is rapidly evolving (Anantrasirichai & Bull, 2020). In the diverse field of popular science communication—that is, in the popularization of scientific knowledge—images are omnipresent (Hüppauf & Weingart, 2008). AIGC has the potential to transform how science popularization images are created and consumed, offering new opportunities for engagement and learning (Chen et al., 2020). However, as these technologies become more integrated into educational contexts, designers and educators face significant challenges (Zhang & Aslan, 2021) in enhancing the acceptability and comprehensibility of such materials among diverse audiences, particularly adolescents. This demographic is increasingly exposed to digital media, yet their ability to critically engage with and understand AIGC varies significantly (Yue et al., 2022). This study aims to investigate how adolescents comprehend and embrace AI collaborative science popularization illustrated information design, underscoring the significance of ethical design within the context of the science information environment. The research employs the SATAI (Student Attitudes Toward AI) (Suh & Ahn, 2022) scale to assess adolescents' attitudes and acceptance of AI-generated popular science images, with participants drawn from three different regions. This research provides empirical insights that inform designers in promoting user welfare and social responsibility within the scientific information environment, thereby advancing ethical considerations and innovative practices in design. The ultimate objective is to achieve equity, trust, and inclusivity, while supporting the sustainable development of science education.

Background

As an efficient tool of information dissemination, popular science images play a crucial role in visualizing scientific knowledge. Traditionally, the creation of such images relied on manual drawing or photography, a process that was both time-consuming and costly. However, the emergence of AIGC technology has revolutionized this field. It enables the rapid generation of images in diverse styles and themes. This significantly improves creative efficiency, reduces production costs, and provides science communicators with greater creative freedom.
Meanwhile, the growing unreliability of scientific literature raises concerns, as it is often filled with false figures, fabricated data, and misleading conclusions that are hard to detect. For adolescents, who are a key audience of popular science materials, these issues present unique ethical challenges. Adolescents, with their incomplete cognitive development, differ from adults in moral judgment, leading to varying levels of critical thinking and discernment. Regardless of intellectual ability, they lack the autonomy and responsibility of adults. Therefore, AIGC guidelines for adolescents should not simply extend general user rules or cater to vulnerable groups but instead address their specific needs and vulnerabilities.



Research objectives

This paper explores adolescents' perspectives on AI-generated popular science images, focusing on their understanding, acceptance, and ethical implications. By examining their cognitive and moral development, the study aims to guide the responsible use of generative AI tools in popular science creation, ensuring content is both ethically appropriate and educationally effective for this group.

Methodology and tools

Questionnaire survey

Experimental approach

Research Process

1 *Research Design*
A mixed-method approach was adopted, combining quantitative surveys and experiments to obtain numerical data.

2 *Experiment*
Ten images, 50% human-generated and 50% AI-generated, are shown to adolescents. These images cover five themes: animals, plants, life sciences, astronomy, and mechanical engineering. In the experiment, adolescents are informed the images come from both sources but not the ratio. While viewing, they score each image on a scale from -3 (AI-generated) to 3 (human-generated).

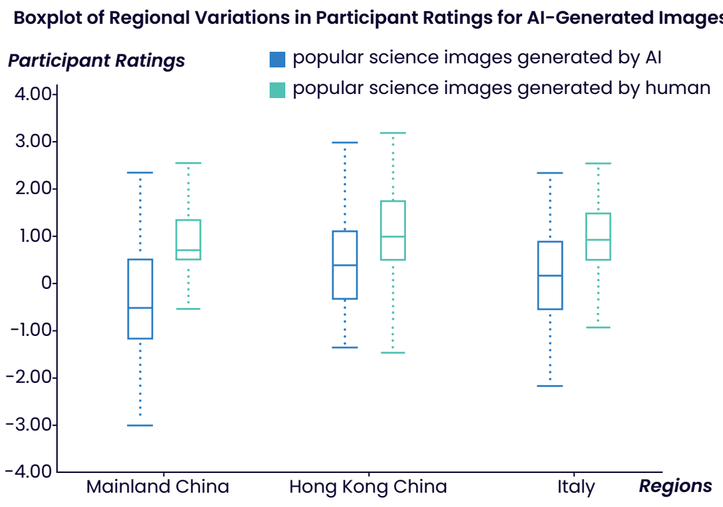
3 *Questionnaire*
It has two parts, covering demographics and the acceptance of AIGC, which divided into three dimensions: Cognitive components, Affective components, and Behavioral components(Suh & Ahn, 2022).

4 *Data Collection*
Surveys were sent online and offline. 142 questionnaires were distributed in Italy, Hong Kong (China) and Mainland China. After removing 1 invalid, 141 were valid.

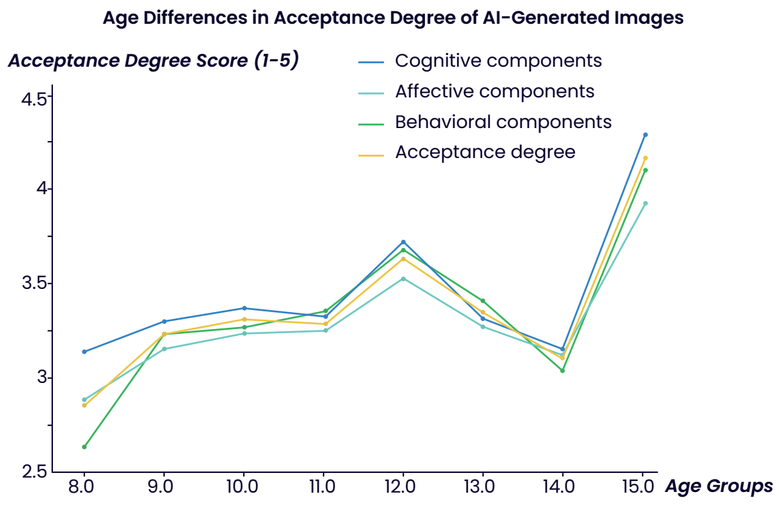
5 *Data Analysis*
Analyzed data with SPSS. Calculated Cronbach's α (0.963) and KMO (0.877) to ensure data reliability and validity.

AI-Generated vs. Human-Generated Popular Science Images: Materials for Adolescent Acceptance Study
Images were presented to adolescent participants in random order to mitigate the potential impact of presentation sequence on rating results.

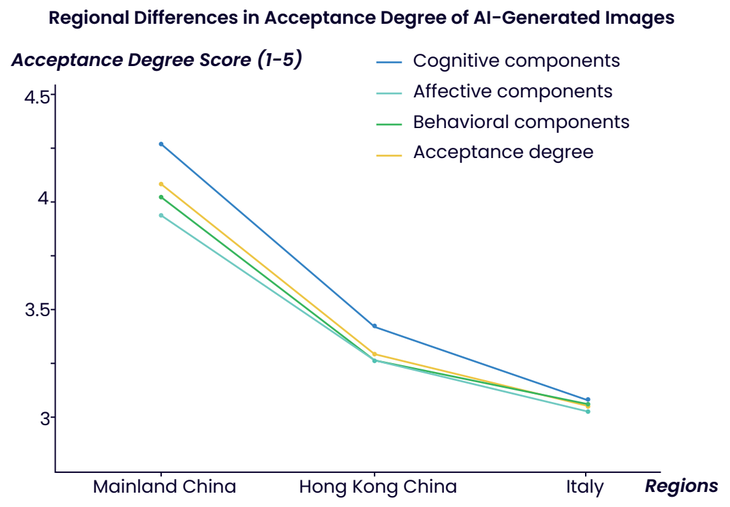
Results



In general, teenagers tend to evaluate images as generated by humans. Teenagers in Hong Kong have a wider range of scores, but they still tend to think it is made by humans.



There is no difference in the acceptance of different gender samples, but there are significant differences among different age samples.



Teenagers in mainland China are more receptive and inclusive to AI, followed by Hong Kong and finally Italy.

Conclusions

By aligning with frameworks such as the EU's Ethics Guidelines for Trustworthy AI and UNESCO's recommendations, this study underscores the importance of integrating ethical considerations into the design, dissemination, and evaluation of AI-generated content for adolescents.

(1)Fairness and Respect for Regional Characteristics:
Adolescents' understanding of AIGC exhibits significant regional variations. These differences must be respected in the design and dissemination of AI-generated popular science images to ensure cultural inclusivity and avoid bias.

(2)Transparency and Age-Appropriate Design:
When formulating AI-driven design strategies, the cognitive development levels of different age groups must be carefully considered. Transparent communication about the use of AI in creating such materials is essential to foster trust and understanding among adolescents.

(3)Accountability through Media Literacy Education:
Strengthening media literacy education is critical to empower adolescents to identify AI-generated content and discern potential misinformation. This education should not only equip them with practical skills but also instill a sense of responsibility in consuming and interpreting digital content.

(4)Protection of Rights and Interests:
The application of SATAI provides valuable insights into adolescents' attitudes toward AI-generated popular science images. These findings can inform the development of robust evaluation systems for AI educational materials, ensuring that the rights and best interests of adolescents are safeguarded in accordance with ethical AI principles.

ABSTRACT | This paper investigates how Artificial Intelligence (AI) tools in product design perpetuate socio-cultural ideological biases through algorithmic processes and historical data reliance. By employing a mixed-methods approach—including AI-generated design artifacts via Midjourney and semiotic analysis—the study reveals how AI-driven designs reinforce stereotypes related to gender, identity, and societal roles. The research demonstrates that AI models, trained on biased datasets, prioritize and amplify existing norms, leading to design outputs that reflect and propagate dominant ideologies. The proposed *Framework of Ideological Reinforcement* delineates a five-stage cycle: data input, algorithmic processing, filter mechanism, user interaction, and self-replication. A case study of AI-generated office chairs for lawyers exemplifies how designs reinforce traditional gender roles and authority structures through material and aesthetic choices. The findings highlight AI's dual role as a mirror and agent of societal values, normalizing biases through material and functional choices. While existing strategies like dataset diversification and fairness-aware algorithms offer partial solutions, the study underscores the urgency of ethical oversight, critical designer awareness, and inclusive practices to disrupt ideological cycles in AI-driven design.

KEYWORDS | AI-GENERATED DESIGN, IDEOLOGICAL REINFORCEMENT, ALGORITHMIC BIAS, SEMIOTIC ANALYSIS

1. Introduction

In recent years, the integration of Artificial Intelligence (AI) tools into product design has revolutionized creative processes, enabling designers to rapidly generate concepts and prototypes. However, this growing reliance on AI also introduces a critical issue: the inherent biases embedded in AI algorithms(Zhang et al., 2023). These biases, often reflective of societal stereotypes, can significantly influence the design outcomes, subtly reinforcing ideologies and perpetuating existing power dynamics(Atzei, 2024). While most research has focused on the ideological biases reflected in AI-generated images, texts, and interactive interfaces, there remains a discernible gap concerning how these biases manifest within AI- generated product designs.

This paper seeks to fill this gap by critically examining how AI-generated product designs serve as vehicles for ideologies, reinforcing stereotypes and perpetuating ideological biases related to gender, identity, and socio-cultural roles. Specifically, this study explores how AI-driven product designs—by virtue of their algorithmic processes—may unintentionally amplify stereotypes and contribute to the broader dissemination of ideological messages embedded in design objects. Through a mixed-methods approach—including the generation of design artifacts via Midjourney, along with content analysis rooted in semiotics—this study aims to uncover the embedded ideological biases within AI-generated product design and explore how these biases exacerbate the ideological control inherent in contemporary design practices.

This study sheds light on how these biases affect the design field, particularly in terms of the products that reach consumers, and the potential long-term consequences for both designers and users. It emphasizes the need for awareness and corrective measures in AI-driven design to ensure that future design practices are more inclusive and mindful of their ideological implications.

2. Theoretical Framework

2.1. AI-Generated Design and Ideological Bias

Algorithmic bias in AI-generated design stems from the human-curated nature of training data and the predictive logic of machine learning models. Rather than correcting historical and cultural biases, these systems tend to reinforce them by reproducing dominant design norms embedded in the datasets they are trained on(Atzei, 2024). Unlike human designers, who may critically evaluate socio-cultural biases, AI models operate through statistical pattern recognition, prioritizing design elements that align with historical data rather than fostering alternative perspectives. AI-generated design functions as a mechanism of ideological reinforcement by embedding cultural norms into consumer goods through algorithmic

optimization.

Prior research indicates that AI's reliance on biased training data has resulted in systematic reproduction of social inequalities across multiple domains, such as employment, financial services, public safety, and consumer-facing applications—where algorithmic outputs often exclude or misrepresent marginalized user groups(Kordzadeh & Ghasemaghaei, 2022). Research shows that AI-generated designs often replicate western aesthetic norms and gender stereotypes, reinforcing existing power structures. This stems from biased training data and the opaque nature of AI systems, where stereotypes are absorbed and reproduced without clear accountability (Doh & Karagianni, 2024; Thiebes et al., 2020). Designers, acting as cultural mediators, may unconsciously perpetuate these biases through familiar visual codes embedded in media culture(Roxburgh & Caratti, 2018).

Furthermore, algorithmic bias extends beyond individual designs to broader ideological constructs, subtly embedding dominant social narratives into material culture. As AI-generated designs become more prevalent, these biases are not only preserved but recursively amplified through a process of self-reinforcement.

2.2.Product as a Carrier of Ideology

Products operate as semiotic constructs that communicate ideology by encoding socio-cultural values through their form, function, and sensory attributes. Saussure's dyadic model frames each product as a sign composed of a signifier—its perceptible features—and a signified—the meanings constructed through cultural systems of difference (Chandler, 2022). These meanings are not fixed, but shaped relationally within a broader system of signs. Peirce's triadic model expands this framework by introducing the representamen (the form), the object (what is referred to), and the interpretant (the user's interpretation), highlighting how meaning is actively made by users through situated interpretation (Chandler, 2022). In product design, this interpretative process enables products to materialize ideology, subtly embedding cultural narratives into physical objects.

Extending this semiotic foundation, product semantics and cognitive linguistics emphasize that users derive meaning through conceptual metaphors, whereby unfamiliar product experiences are understood through familiar domains. According to Lakoff and Johnson (2003), metaphors shape not only language but perception and cognition, mapping abstract or novel concepts onto known experiential structures. Building on this, Du, Siu, and Shih (2024), propose that designers intentionally construct meaning by aligning *target domains* (product categories) with *source domains* (metaphoric references), enabling new concepts to emerge through *mapping* of shared attributes. For instance, a sports car's aggressive form and angular features metaphorically convey "speed" and "power," reinforcing masculine-coded ideals. As such, metaphor and semiotics converge to show how products both reflect and reinforce ideological norms through symbolic structure and experiential cues.

From a critical theory perspective, particularly the Frankfurt School, consumer products serve as cultural reproduction tools, embedding ideological norms under the guise of functional necessity(Horkheimer & Adorno, 2016). Marcuse (2013) critiques the assumption that technology is neutral, arguing that it often reinforces existing power structures. Product design, shaped by market logic, prioritizes commercial viability over ideological disruption, perpetuating dominant socio-economic structures.

Objectification theory offers a lens to understand how design reinforces social hierarchies by

treating users not as autonomous individuals but as instruments fulfilling predefined social functions (Nussbaum, 2000). Product design decisions often encode normative assumptions about gender, class, and identity—for instance, products marketed toward women may emphasize elegance, delicacy, and domesticity, while those targeting men frequently stress strength, control, and technical authority. These aesthetic codes embed ideological expectations into material form, illustrating how design functions as a medium of objectification and an agent of social norm reinforcement.

By synthesizing semiotics, critical theory, and objectification theory, it becomes evident that product is an active agent in the transmission and reinforcement of socio-cultural ideologies, embedding dominant power structures within material culture.

2.3.AI-Generated Product Design as Ideological Reinforcement

Compared to AI-generated graphic design, where biases may be more visually apparent, biases in AI-generated product design are more insidious—embedded not in images, but in material choices, affordances, and usability logics. This makes their ideological influence more difficult to detect, yet more pervasive in shaping user interactions and reinforcing social expectations.

This process can be understood through the concept of semiotic pollution (Manzini & Cullars, 1992), which describes how the overproduction of signs and forms leads to desensitization and diminished critical interpretation. AI-generated product design operates in similar fashion: repeated design iterations shaped by biased training data normalize particular aesthetic and functional conventions. Over time, this saturation conceals the socio-cultural assumptions embedded in design, reinforcing dominant norms while rendering alternative possibilities obscure or illegible.

Unlike static visual outputs, AI-generated products exist as physical realities—actively shaping how people move, touch, sit, grasp, and navigate. Drawing on Merleau-Ponty’s (1964) phenomenology of perception, product interaction is not abstract but embodied; consciousness is formed through action—what he terms an “I can” rather than an “I think”. When AI-generated designs prioritize a normative user—often aligned with male, Western, or dominant body types—they materialize exclusion through usability constraints, reinforcing invisible hierarchies through interaction.

AI’s reliance on historical data compounds this issue. Rather than challenging inherited design biases, machine learning models amplify them through recursive optimization—a process akin to what Flusser (2000) describes as self-replicating ideology. For example, ergonomic datasets that center male proportions or stylistic precedents rooted in Western minimalism shape future outputs that marginalize other users and aesthetics. In this loop, AI does not merely reflect ideology—it actively participates in its reinforcement.

AI-generated product design embeds biases in subtle yet pervasive ways, shaping user interactions and societal norms through material and functional choices. These biases—sustained by semiotic pollution and recursive ideological reinforcement—not only normalize dominant narratives but systematically obscure alternative perspectives. Addressing this requires more than technical correction; it demands a critical rethinking of design’s role in the reproduction of social hierarchies and a commitment to more reflexive, pluralistic design futures.

2.4. Summary

This section has demonstrated that AI-generated product design is not a neutral or value-free process, but one that systematically reproduces existing ideological biases. Through algorithmic optimization, AI embeds socio-cultural norms into product aesthetics, functionalities, and usability logics. Semiotic analysis reveals how these outputs materialize power hierarchies and gendered expectations, reinforcing dominant social structures. This ideological reinforcement operates recursively, as market validation privileges historically established conventions over alternative or subversive possibilities. Together, these findings lay the theoretical foundation for articulating an ideological reinforcement framework within AI-driven product design.

3. The Ideological Reinforcement Framework of AI-Generated Product Design

As AI becomes increasingly integrated into the product design process, its generative capabilities play a significant role in perpetuating and reinforcing ideological biases. To unpack this phenomenon, the following analysis explores the structured process through which AI-generated product designs sustain and propagate socio-cultural norms, embedding them into material culture. By outlining the Framework of Ideological Reinforcement, we aim to illuminate the mechanisms by which AI contributes to design homogeneity and reinforces dominant power structures, offering a foundation for critical examination and intervention.

3.1. Framework of Ideological Reinforcement

The ideological reinforcement of AI-generated product design operates through a structured mechanism in which AI systems encode, reproduce, and solidify socio-cultural norms through iterative design processes. This mechanism comprises five interrelated stages—Data Input, Algorithmic Processing & Ideological Encoding, Filter Mechanism, User Interaction & Behavioral Reinforcement, and Self-Replicating & Reinforcement—forming a closed-loop cycle that perpetuates dominant ideologies in AI-generated products. Figure1 visualizes the closed-loop cycle of ideological reinforcement, and the following paragraph provide a detailed analysis of each stage, examining how they collectively contribute to the ideological reinforcement of AI-generated product design.

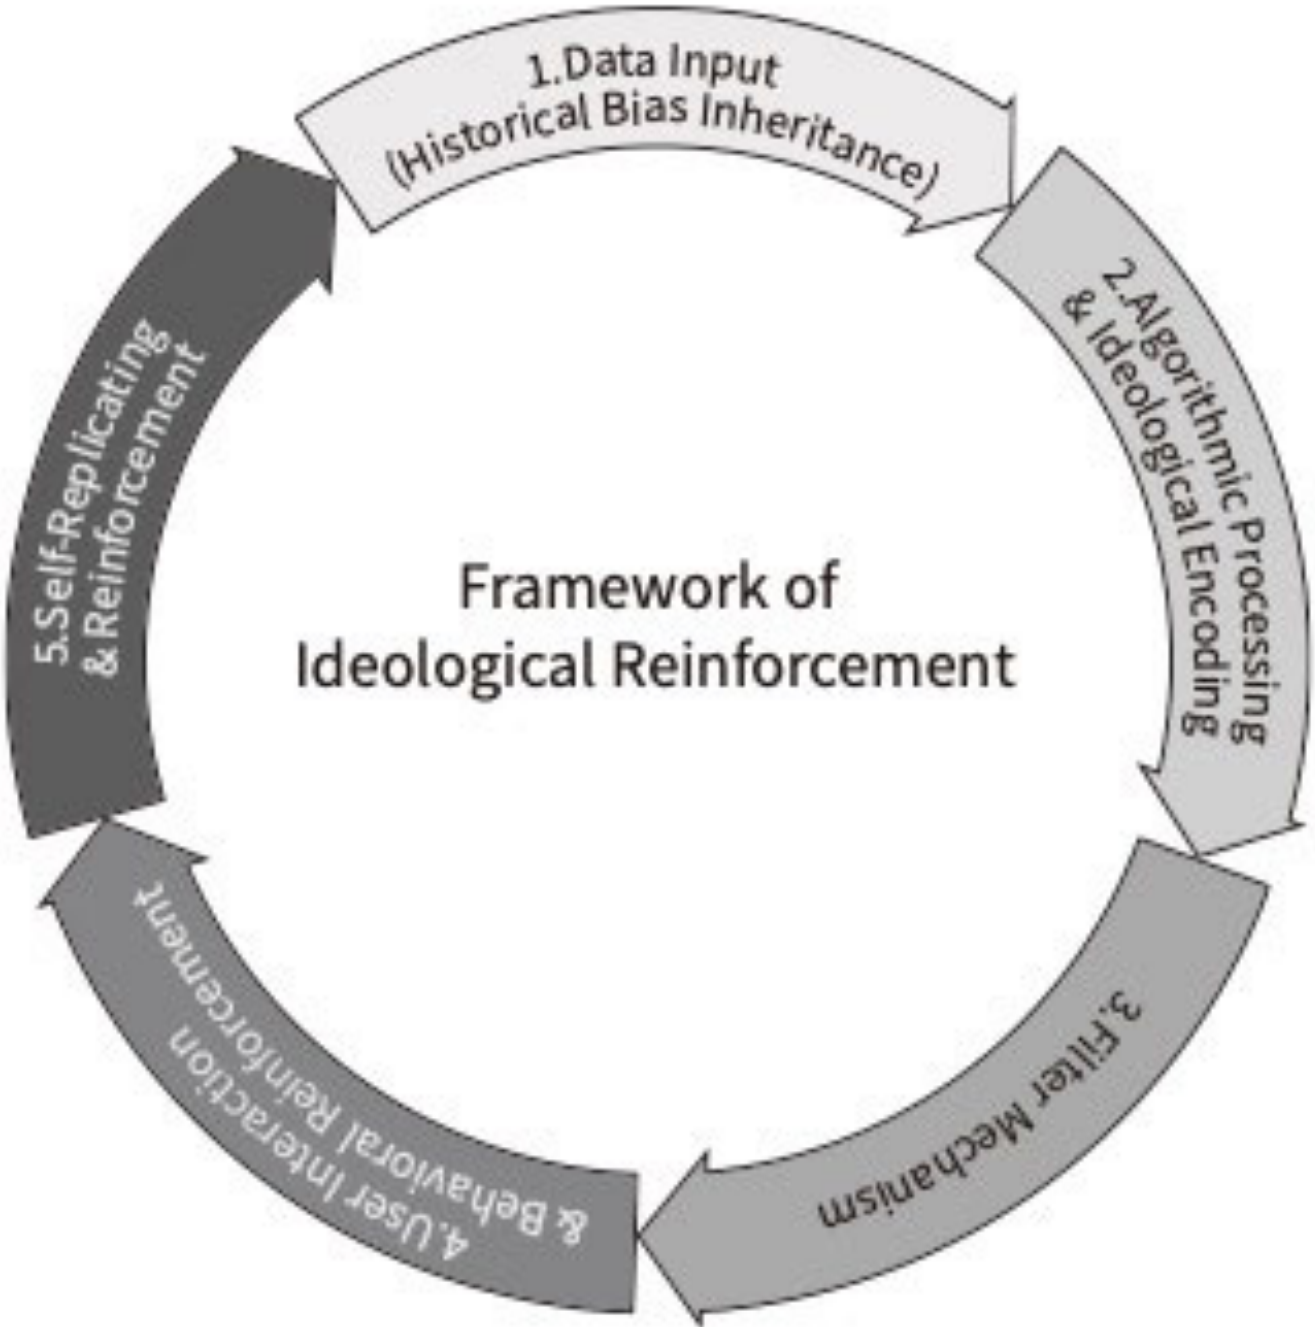

Figure 1. Framework of Ideological Reinforcement delineates a five-stage cycle: data input, algorithmic processing, filter mechanism, user interaction, and self-replication.

Stage 1-Data Input (Historical Bias Inheritance): AI design models are trained on historical datasets that inherently reflect market trends, user behaviors, and pre-existing socio-cultural biases. These biases, embedded in previous design conventions, establish a foundation where AI perpetuates dominant gender roles, Western-centric aesthetics, and class-based usability assumptions.

Stage 2-Algorithmic Processing & Ideological Encoding: AI applies pattern recognition and probabilistic optimization to generate product designs aligned with prior commercial successes. In this stage, design elements that conform to established norms are favored over alternative representations. For instance, ergonomic furniture is often based on anthropometric data primarily derived from male users, systematically excluding other demographic groups from optimal usability. Additionally, AI-generated products reinforce

conceptual metaphors in design, embedding existing socio-cultural meanings within material objects.

Stage 3-Filter Mechanism: AI-generated product designs enter a selection phase, where their commercial viability is assessed based on consumer preferences, corporate strategies, and regulatory influences. Products that align with mainstream user expectations are more likely to be produced and marketed, while those that challenge prevailing norms are filtered out. This selective reinforcement further entrenches ideologically encoded designs, limiting diversity in consumer product offerings.

Stage 4-User Interaction & Behavioral Reinforcement: Once AI-generated products enter the market, they actively shape user interactions and social behaviors. Consumers subconsciously internalize the ideologies embedded in these designs, further normalizing social roles and expectations. Gendered product aesthetics, for example, shape perceptions of who should use certain products, reinforcing long-standing cultural stereotypes.

Stage 5-Self-Replicating & Reinforcement: AI-generated product designs enter a continuous feedback cycle, where consumer engagement data is reabsorbed into training datasets. This process reinforces dominant aesthetic and functional norms, as AI models prioritize historically successful design patterns over novel or disruptive alternatives. The resulting self-replicating loop strengthens ideological continuity, making it increasingly difficult for alternative representations to emerge and perpetuating design homogeneity over time.

This structured framework demonstrates that AI-generated product design functions not merely as a technological tool but as an active mechanism for ideological standardization. By dictating aesthetic and functional standards, AI models extend their influence beyond the material realm, shaping behavioral norms, social hierarchies, and economic systems.

3.2. Ideological Encoding in AI-Generated Product Design

To empirically examine how AI-generated product designs encode and perpetuate ideological biases, a case study was conducted analyzing the outputs of a generative AI model (Mid-Journey) through the lens of Peirce's triadic model of semiotics. By focusing on a specific prompt—"an office chair for lawyer"—the study aims to uncover how AI interprets and materializes socio-cultural norms associated with professional identity and authority. This analysis not only demonstrates the practical application of semiotic theory in design research but also highlights the subtle ways in which AI reinforces dominant ideologies.

The case study involves two main steps. First, Mid-Journey was used to generate a series of office chair designs based on the prompt "an office chair for a lawyer." These outputs serve as the primary data for analysis. Second, Peirce's triadic model of signs was applied to deconstruct the AI-generated designs. As previously discussed, Peirce's model examines the relationship between the Representamen (the form that the sign takes), the Object (what the sign refers to), and the Interpretant (the effect produced by the sign or the sense made of it). This framework allows for a systematic analysis of how AI-generated product designs encode ideological meanings and how these meanings are likely to be interpreted by users.

Figure 2 displays the AI-generated office chair designs based on the prompt "an office chair for lawyer." The four designs exhibit striking similarities in form, material, style, and overall aesthetic.

Figure 2. Mid-journey generated images of “an office chair for lawyer”.

Figure 3. presents the semiotic analysis of these designs using Peirce’s triadic model. The Object, "an office chair of lawyer," serves as the foundation for the generated designs. The Representamen includes high backrest and wide seat, dark leather upholstery, tufted design, and soild wooden base. Each feature symbolizes elements traditionally linked with masculinity, luxury, and hierarchical power, conveying exclusivity and dominance. The Interpretant reinforces cultural perceptions of dominance and traditionalism, aligning with societal narratives of the legal profession as hierarchical and male-dominated. This analysis highlights how AI-generated designs embed and normalize existing ideologies through material and aesthetic choices.

AI-Generated Product Design using prompt “an office chair of lawyer”
-by Mid-journey

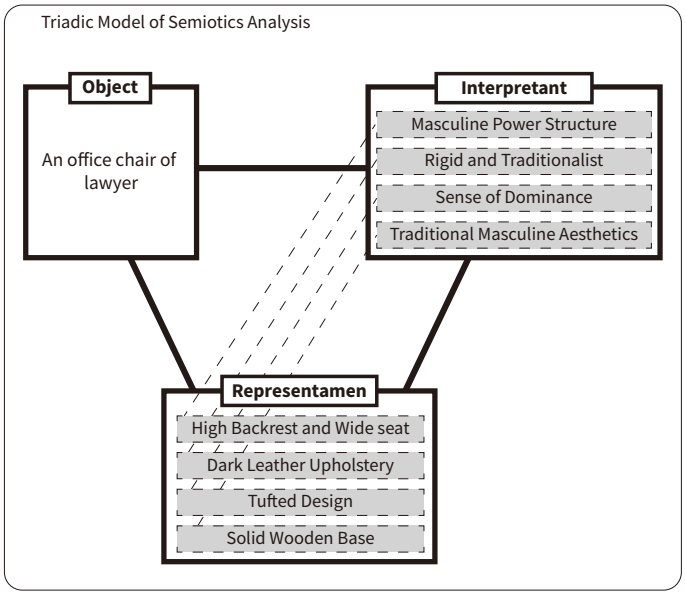

Figure 3. Analyzing AI-generated product design through Triadic Model of Semiotics.

The analysis of AI-generated office chair designs demonstrates how seemingly neutral generative processes perpetuate and amplify socio-cultural biases through material and aesthetic elements. By embedding traditional notions of masculinity, power, and exclusivity into the design, AI models reinforce existing hierarchical structures and cultural stereotypes. This case study highlights the subtle yet pervasive ways in which AI-generated product designs contribute to the normalization of dominant ideologies, underscoring the need for critical engagement with AI-driven tools in design processes. These findings further validate the proposed framework of ideological reinforcement, bridging theoretical insights with empirical evidence.

3.3 Integrated Findings

This section synthesizes insights from the proposed framework and the case study, demonstrating how AI-generated product designs encode, propagate, and normalize socio-cultural ideologies. The framework outlined in Section 3.1 offers a structured understanding of how historical biases embedded in datasets are translated into material designs through algorithmic processes. The case study in Section 3.2 complements this theoretical framework by providing tangible evidence of these dynamics in real-world outputs.

Together, the framework and case study reveal a self-replicating cycle of ideological reinforcement. Historical data repositories act as reservoirs of socio-cultural norms, shaping algorithmic outputs that prioritize conventional aesthetics and usability standards. These outputs then influence user perceptions and behaviors, further entrenching existing ideologies into material culture. The iterative process highlights the dual role of AI: as a mirror of societal values and as an agent actively perpetuating them.

These findings underscore the necessity of diversifying training datasets, embedding ethical oversight in AI development, and fostering critical awareness among designers and users. By addressing these challenges, the design community can work to disrupt cycles of ideological reinforcement, advancing more inclusive and equitable design practices.

4. Existing strategies

Existing strategies to mitigate ideological biases in AI-generated design include preprocessing, algorithmic training, and post-processing adjustments. Techniques such as reweighing, optimized pre-processing, and disparate impact remove address bias in datasets(Bellamy et al., 2018) (Friedler et al., 2019), while methods like adversarial debiasing and fairness-aware regularization aim to reduce bias during model training (Friedler et al., 2019). Post-processing approaches, including equalized odds post-processing and reject option classification, further refine outputs to enhance fairness(Bellamy et al., 2018). Additionally, counter-stereotypical design strategies(Gill & Lei, 2018) and reflective design practices(Turner & Turner, 2011)—such as gender-neutral aesthetics and inclusive user participation—offer ways to challenge entrenched norms in product design.

However, these solutions often rely on designers' critical thinking, judgment, and experience to identify and counteract problematic outputs. While effective in professional settings, these strategies fail to address the widespread, unchecked adoption of artificial intelligence by individuals with limited design expertise, such as students, hobbyists, and early-career professionals. These users frequently misuse artificial intelligence, uncritically accepting AI-generated content due to a lack of critical thinking skills, design experience, and judgment.

5. Discussion

This study highlights the pervasive role of AI-generated product design in encoding and perpetuating socio-cultural ideologies. The proposed framework and case study reveal a self-reinforcing cycle where historical biases in datasets shape algorithmic outputs, which in turn influence user perceptions and behaviors.

The limitations of existing strategies, particularly their reliance on professional expertise, point to the urgent need for accessible guidelines and educational resources to promote responsible AI use, fostering critical engagement with AI outputs across diverse user groups.

DISCIPLINE-AND-CONTROL SOCIAL MEDIA: EXAMINING POWER, FREEDOM, AND PRIVACY ON FACEBOOK, AND THE ETHICAL IMPLICATIONS FOR INTERNET GOVERNANCE AND USER EXPERIENCE DESIGN.

Ming Cheung*[a], Zhen Chen[b]

a Distinguished Chair Professor in Digital Media and Creative Industries, Nanjing University of Information Science and Technology
b Senior Lecturer in Digital Advertising, University of the Arts London
* drmingcheung@gmail.com

ABSTRACT | Background: The proliferation and penetration of social media into professional and everyday lives have reshaped the way in which people engage with multiple stakeholders and deal with their personal information, and called for user experience designers to develop refreshed understanding of the power relationship between individual users and technology giants in the design of social networking sites. While Facebook has rapidly ascended to the peak of social media popularity, the ease of connection to a common space also poses the threat of intrusions into personal space, which is even greater now that Meta is heavily investing in artificial intelligence, virtual reality, extended reality, and digital currencies in the Metaverse. Privacy might be on the verge of death as new media constantly erode private spaces and blur the boundary between the private and the public. **Research gap:** The widespread acceptance of Facebook in social and professional communications has bestowed on the network a

unique and highly influential form of power: the power to control users' privacy and construct new online privacy norms. If the use of Facebook is a realisation of the "technologies of power," then the process of surveillance and normalisation by which Facebook users are made objects of control may actualise Foucault's well-known panopticon metaphor. However, despite intensified privacy concerns and crises over social media, there is little research on the correlations between users' privacy perception and protection in non-Western settings. **Research aim:** Focusing on Hong Kong Chinese Facebook users, this study examines the extent to which they are willing to sacrifice control over their information in exchange for self-expression, sociality, and intimacy in their social roles and relationships. **Theoretical contribution:** Informed by literature on privacy paradox and Foucault and Deleuze's work on power, we developed the notion of "discipline-and-control social media" to describe the situation in which the power relationship is co-shaped and negotiated among the platform, governing bodies, user experience designers, and users, in a combination of both discipline and control. **Methodology:** Data from a survey of 797 Hong Kong users were used for our analysis of privacy perception and protection. The survey contained three sections: Facebook usage, attitudes and behaviours, and demographics. **Results:** The findings reveal that the privacy paradox is evident for Facebook users in Hong Kong, and that excessive Facebook use leads to reactive privacy awareness and normalisation behaviours. **Ethical implications:** We suggest that technology giants should be pioneers in safeguarding users' privacy while encouraging the establishment of social relationships and freedom of expression in digital ecosystems. The implications for Internet governance as well as user experience design, in terms of balancing between usability and accessibility on the one hand and privacy and risk on the other, are discussed from a multistakeholder perspective.

KEYWORDS | DISCIPLINE-AND-CONTROL SOCIAL MEDIA, FACEBOOK, POWER, FREEDOM, PRIVACY PARADOX, INTERNET GOVERNANCE, USER EXPERIENCE DESIGN

1. Introduction

The proliferation and penetration of social media such as Facebook into professional and everyday lives have reshaped the way in which people engage with multiple stakeholders and deal with their personal information, and called for user experience (UX) designers to develop refreshed understanding of the power relationship between individual users and technology giants in the design of social networking services (SNSs). While statistics indicate that Facebook, the world's most popular SNS in 2025, is present in every major global market and in many cases with remarkable levels of penetration (Statista, 2025), the ease of connection to a common space also poses the threat of intrusions into personal space, which is even greater now that Facebook has rebranded itself as Meta and is heavily investing in artificial intelligence, virtual reality, extended reality, and digital

currencies in the Metaverse.

Under such circumstances, user privacy has become a key point of contention, and might be on the verge of death as social media and search engines constantly erode private spaces and blur the boundary between the private and the public. As it stands, the Facebook privacy debate sits between two extremes: at one end is the argument that society is, in general, loosening its standards regarding privacy, which makes privacy a luxury commodity in the social media age (e.g., Papacharissi, 2010, 2023), and at the opposite end is the argument that it is essential for personal privacy to be maintained and improved (e.g., Cadwalladr & Graham-Harrison, 2018).

While most of the research on user privacy in the social media age has been conducted in Western contexts in relation to topics such as media use and user behaviours (e.g., Khan, et al, 2023; Xu & Jia, 2015) and privacy awareness from a legal perspective (e.g., Hanlon & Jones, 2023; Martin, 2016), Chen and Cheung (2019) demonstrate that privacy concerns have been on the rise in Eastern contexts, despite privacy being understood differently in Eastern cultures. Using Facebook as a case study, this study focuses on the privacy perception and protection of Hong Kong Chinese users, with the aim of contributing to filling the research gap opened by the tendency of Facebook research to focus on Western users, despite its primary users being outside the US (Singh & Bagchi, 2020).

As pointed out by Cheung (2016), Facebook tries to naturalise and advance the notion and acceptance of social transparency as its wealth is sustained through the commodification of personal information generated by its users, which is sold on to advertising companies to assist in targeted advertising campaigns supported by recommendation algorithms and engines. It is thus in Facebook's best interests to encourage people to continue sharing more personal information and, at the same time, to downplay any concerns raised by privacy advocates. Meanwhile, although it seems logical to say it is not in users' best interests to place their personal information at risk of exposure, users continue to flock to Facebook while doing little to protect their personal privacy. It appears that during the time it has taken for users to reach a point of disillusionment with Facebook, they have simultaneously been heavily investing in and accumulating social capital through the SNS, the perceived value of which appears to outweigh that of personal privacy. Yet privacy concerns still prevail at different levels.

At a personal level, Facebook users have newly formed and often algorithm-based social norms and conventions as well as popularity-based algorithmic feeds imposed upon them online. They are also the target of information attacks, and face political, commercial, and organisational surveillance and intrusion that are directly connected

with user privacy (Chen & Cheung, 2019). Facebook features, such as *Feed* and *Share*, have also triggered specific privacy concerns. Users can publish their personal information on the SNS and have connected parties automatically notified through the site's *Feed* function, even though personal information unintended for disclosure may be retrieved by unwanted third parties. This is evident in the scandal involving Cambridge Analytica, with Facebook accused of meddling with the 2016 US presidential election by granting access to users' data to third parties (O'Sullivan, 2018). Users are also forced to grandstand to an ever-greater extent when uploaded materials are "liked" or "reacted to" by other users. In addition to Facebook's overlords and the advertisers who are their clients, each user's own social network of friends, family members, colleagues, and acquaintances may also present a heteronomous power over what users post (Trepte, 2021).

At an organisational level, such digital labour not only sustains the "free in exchange of advertising" business model but also generates valuable big data stacks awaiting further exploitation for algorithm-prioritised engagement (Bairstow & Neofytos, 2024). On the other hand, privacy concerns not only challenge the very business model of social media but also pose policy, legal, and political concerns over Internet governance and UX design. Internet governance is defined by Solum (2008, p.50) as the "regulation of Internet infrastructure, its current operation, and the processes by which it develops and changes over time." The stakeholders include not only legislators, policymakers, and regulators, but also service providers, UX designers, and SNS users, among others.

Within the legal framework, privacy and cybersecurity laws, such as Hong Kong's Personal Data (Privacy) Ordinance and the European Union's General Data Protection Regulation, have been enacted to tackle the issue of privacy and to improve Internet governance. However, some unregulated corporate platform strategies, algorithms, and affordances present challenges for users' online privacy literacy (Bartsch & Dienlin, 2016). According to some studies, users expressed anxiety and regret over publishing their activities online (e.g., Guha, et al, 2018; Moore & McElroy, 2012). The rise of social media poses even more severe threats to the lay users who frequently publish highly personal information onto Facebook.

However, it is unreasonable to simply make use of hindsight to criticise Facebook users' relatively blind confidence in the purity or goodwill of the social network. Their perception of social media is in line with the early utopian notion of an open internet, which has been strengthened by the celebration of participatory culture (Jenkins, 1992) and empowered by the marketing and public relations rhetoric deployed by commercialised social media and relevant interest groups (Chen & Cheung, 2019; Cheung, 2016). The initial sense of grand optimism about the power that Facebook gave users to connect is problematic,

especially when the “networked self” has become entangled with the public sphere and when the boundary between the public and the private is increasingly blurred. Against this backdrop, this study explores the power dynamic between Facebook and its users. It addresses the following research question:

> **RQ.** Although Hong Kong Chinese Facebook users are expected to adhere to the social and organisational codes, regulations, and norms of social media use, to what extent are they willing to sacrifice control over their information in return for the ability to express themselves, and to interact freely and maintain connection and intimacy in their social roles and relationships?

This article first situates the research by reviewing the literature relating to Facebook privacy and using Foucault and Deleuze’s conceptualisations of power in society to frame relevant hypotheses. It then turns to the research methodology and introduces a questionnaire survey conducted among 797 participants, the results of which are followed by a discussion of their ethical implications for Internet governance and UX design.

2. Literature review

2.1. Power, freedom, and privacy

To provide an understanding of the power dynamic between Facebook and its users, this article draws on the work of Michel Foucault and Gilles Deleuze. According to Buchanan (2015), the origin of Deleuze and Guattari’s work is a central concern with power, with a particularly close link to the Foucauldian conceptualisation of power and governmentality. Foucault (1980, p.93) states,

> "Power is not an institution, and not a structure; neither is it a certain strength we are endowed with; it is the name that one attributes to a complex strategical situation in a particular society."

Power, for Foucault, is omnipresent and manifests itself through discursive interactions (e.g., power and knowledge creation). Since the translation of Foucault’s *Discipline and Punishment* in 2009, there has been a refashioned sociological interest in revisiting Foucault’s ideas on governmentality or the technologies of the self (Gane, 2012). As we show in this article, the “individualization of the self” thesis is actualised by the “technologies of the self” (Foucault, 1988), where self-formation and normalisation (according to certain norms—in this case, the normalisation of self-exposure through social media) are practised through the self as an enterprise, intertwined with disciplinary

states, and penetrative market forces. This reflects the central focus of Foucault's account of liberalism and neoliberalism, in which he argues that in the neoliberal market economy, power "conducts the conduct" through economised self-management and disciplinary control. On this line of thought, freedom or autonomy is practised at a minimal level that is captured and disguised by neoliberalism.

In the online environment of Facebook, users appear to possess many freedoms. However, when it comes to individual privacy, Facebook users have, or at least behave in such a way that would suggest they have, a declined sense of their own freedom and rights to privacy. The widespread acceptance of Facebook, as an integral part of modern social and professional communications, has bestowed on the network a unique and highly influential form of power: the power to control users' privacy and construct new online privacy norms. If the use of Facebook is a realisation of the "technologies of power," then the process of surveillance and normalisation by which Facebook users are made objects of control may, to a certain extent, actualise Foucault's well-known panopticon metaphor, which refers to Jeremy Bentham's 1785 architectural design for prisons. Foucault (2000, p.70) states,

> "Panopticism is a type of power that is applied to individuals in the form of continuous individual supervision, in the form of control, punishment and compensation, and in the form of correction, that is, the molding and transformation of individuals in terms of certain norms."

From this idea, we can grasp that Facebook actualises power over its most highly ritualised users (those who are frequent users of the platform and have become familiar with its functions and vernacular culture over time) as reflected by its discipline in shaping their behaviours. In addition, there is a level of control reflected by its normalisation of privacy transparency for its less ritualised and prospective users. In this connection, Deleuze (1992) argues that as technology advances, there is a gradual move from the Foucauldian disciplinary society to a "control society." Unlike the disciplinary society, the control society as described by Savat (2009, p.54) is "solely interested in predicting rather than producing specific forms of behaviour, and in part because, depending on the code that is generated, a given pattern is allowed or enabled to continue or not."

Based on this assessment, we developed the notion of "discipline-and-control social media" to describe the situation in which the power relationship is co-shaped and negotiated among the SNS platform, governing bodies, UX designers, and its users, in a combination of both discipline and control. Currently, Facebook users sacrifice to a certain extent the privacy of their personal information in return for the freedom to

express themselves and to interact with friends and acquaintances. Despite the seemingly clear decision from many users to comply with this arrangement (forming a kind of social contract at a platform level), it is logical to assume that this will not be mirrored in the thoughts and desires of Facebook users in the future. As users' unwillingness to accept diminished freedom shines through, the dominant position that Facebook enjoys in this power relationship will continually face challenges and resistance.

2.2. Discipline-and-control social media

As is the nature of technology, Facebook has spent its relatively short life in a constant state of evolution. However, one aspect of its development that has remained consistently at the forefront of criticisms is the way in which Facebook manages its users' privacy on the site. Facebook has, to its credit, been somewhat proactive in response to public criticism, making changes and additions to the functionality of its user-controlled privacy settings. However, these changes have seldom been met with praise from privacy advocates. A key example of an occasion that resulted in a negative backlash and criticism of Facebook came in December 2009, when Facebook initiated a major shift in how their users' privacy was controlled; this involved altering the default privacy settings of users from their old settings to instead making their information visible to "everyone" (Kirkpatrick, 2009). When questioned about the privacy changes, Facebook CEO Mark Zuckerberg stated,

> "People have really gotten comfortable not only sharing more information and different kinds, but more openly and with more people. That social norm is just something that has evolved over time." (Johnson, 2010)

Interestingly, Zuckerberg's use of the term "social norm" implies a direct belief that Internet users are evolving into more transparent creatures to be disciplined, controlled, and put under surveillance. It is a counter-discourse (against the ongoing Internet governance and legal discourses) with an aim to shape and normalise, in a Foucauldian sense, the sharing of private information. It forms part of the apparatus of the technologies of the self, with the aim to discipline and change users' beliefs and behaviours. At purely face value, this assertion is hard to rebut; by sheer power of numbers, it would appear that Facebook users are not just comfortable but even keen to live with increased transparency through social media. However, the assertion has failed to garner any support from research addressing the behaviours, opinions, and perceptions of Facebook users with regard to privacy. Studies (e.g., Masur & Trepte, 2021; Lilley, et al, 2012) indicate that Facebook users' complicity in increased levels of transparency is not driven by any internal shift in the beliefs that govern perceptions of

privacy norms among them; rather, the informed possibility of severe consequences that could arise through the misuse of personal information was a catalyst for increased privacy concerns.

Combining the knowledge of these studies debunks the manipulation of discourse by Facebook to claim that society is evolving to embrace transparency by way of ignoring individual privacy. This leads us to the conclusion that Facebook does, indeed, play a role in engineering new online privacy norms as support for the assertion that the new norms are socially driven is empirically ungrounded. Given the amount of coverage that Facebook privacy issues have received in the mass media over the past few years, it would be hard for users to not have become aware, to some degree, that they should harbour concerns about the privacy and protection of their personal information on Facebook. It would be logical to assume that the natural response to such concerns would be to seek a means to improve the security of their personal information. However, there is a privacy paradox in that users hold a high level of concern but, in reality, do little to further the protection of such information.

To try to understand the cause of this paradox, we can speculate that it comes down to a simple cost-benefit analysis by Facebook users. Studies indicate that loneliness, self-presentation, and audience response are positive predictors of Facebook use (Bareket-Bojmel, et al, 2016; Blachnio, et al, 2016). Once users have integrated part of their social engagement within the Facebook system, the incentive for them to remain a part of the system outweighs their need to secure their privacy online. In response, the incentive for Facebook to willingly improve the privacy of its users is not nearly as strong as it might otherwise be, as it understands the social investments its users have made will drive most of them to stay regardless of whether it delivers the improvements that they call for. This is without mentioning the fact that Facebook's wealth is sustained through the commodification of user-generated content (Cheung, 2016).

The social power that Facebook has now acquired drives more and more people to become involved and to stay involved in an effort to avoid social exclusion. This has translated to users' continued use of the SNS despite privacy concerns. It renders Facebook a powerful "discipline-and-control social media" in line with the Foucauldian *disciplinary society* and the Deleuzian *control society*. In this context, *discipline* refers to the "designated rules and regulations" that shape users' behaviours, and *control* signifies the "becoming codes and mechanisms" that anticipate normalising and ritualising the beliefs and behaviours of current and prospective users. Users are part of the power apparatus as they post, share, and carefully curate their own online identity with significant social and emotional investment. Such self-representation and performance both support and resist the "discipline-and-control social media" as users verbalise (post

and share) and confess to their everyday life goals and failures. To continue using social media in the anticipated (and resistant) manner is the only way for users to demonstrate their identity and existence.

2.3. Research hypotheses

Thus far, we have established the existence of an intriguing and somewhat concerning power dynamic at play between Facebook and its users. Users would not usually willingly sacrifice the freedom of control over their personal information, yet they do so because the alternative of leaving Facebook is the equivalent of self-imposed social exclusion. Despite heavy dialogue, Facebook and its users have been unable to reach a point of equilibrium on the matter (e.g., Glance, 2018). This study's first hypothesis is, therefore, the following:

> **H1.** Hong Kong Chinese Facebook users possess a concern for their privacy but their behaviours continue to indicate an acceptance of Facebook's imposed privacy norms. That is to say, the perceived fulfillments derived from using Facebook outweigh the importance of privacy protection.

Other studies have indicated that many people are displaying habitual Facebook usage patterns that suggest a wariness and concern for the possibility that their privacy may be exploited or that they are under some form of surveillance. These habits include removing tags from photos, editing the Facebook wall, unfriending people, adjusting self-disclosure strategies, and attempting to adjust privacy settings (e.g., Taneja, et al, 2014). This study's second hypothesis is thus as follows:

> **H2.** Hong Kong Chinese Facebook users are aware of the surveillance over their lives, and this awareness influences the online behaviours of frequent Facebook users and promotes the formation of behaviour normalisation on Facebook, in an evident case of "discipline-and-control social media." A panoptic effect is relevant here as the platform aims to "discipline" users' behaviours while also aiming to "control" a process within an anticipated and imposing "prison without walls."

3. Research methodology

The study was situated in the context of Hong Kong, where the majority of the population is Facebook users. Following the exploratory approach of Nassar-McMillan and Borders (2012), a survey instrument was developed and validated through the conduct of focus group interviews with a sample of active Facebook users in the city. The survey questionnaire derived consists of three sections:

- 15 multiple-choice questions related to Facebook usage;
- 49 items concerning respondents' attitudes and behaviours with regard to Facebook;
- Requests for information from the respondents about their basic demographics.

The survey was then distributed via an online platform to 1472 young adults randomly recruited from the email lists of the business, humanities, law, and sciences faculties of a Hong Kong university over a four-week period. They are all Hong Kong Chinese. At the survey's conclusion, a total of 797 responses had been received, yielding a response rate of 54.14%. The survey was voluntary, and respondents were entered into a cash prize draw.

The respondents started by providing basic information on their Facebook usage, and were asked about their motive for setting up their Facebook account. In addition, to investigate the role played by Facebook "friends," respondents were asked to indicate how many friends they had and what kind of friends they accepted. Moreover, respondents were asked to specify what types of personal information they had revealed in their Facebook profiles, such as basic descriptors, contact information, education and work information, personal likes and interests, and the names of family members. They also indicated the accuracy of each piece of profile information by selecting one of three options: 1. "I don't provide this information at all," 2. "I provide this information, but it is not complete or not accurate," and 3. "I provide this information, and it is complete and accurate." Furthermore, the survey asked them how often they updated their profile information. In addition, they were asked a number of questions about their privacy protection practices, including, how often they adjusted their Facebook privacy settings; their major reason for using fake names or photos in their profile; to whom they disclosed their profile such as photos/videos, and contact information, etc.

To evaluate the weight of perceived fulfillments relative to the importance of privacy protection (H1) and to investigate the relationship between awareness of surveillance and the ritualised use of Facebook (H2), 49 attitudinal items were included in the survey questionnaire: 32 items addressing H1 and 17 addressing H2. Respondents reported their answers on a 7-point Likert scale ranging from 1 for "strongly disagree" to 7 for "strongly

agree." Finally, such demographic variables as age range and education level were also recorded.

4. Results and discussion

Four of the survey respondents (n = 797) had no Facebook account and were thus excluded from the dataset. The remaining 793 were all current Facebook users, with 89.53% in the 18–25 age range and 8.70% aged 26–35. The majority of the sample was undergraduates (68.22%), followed by diploma/higher diploma/associate degree students (17.53%), and postgraduates (14.25%). Since the primary focus of this study is frequent Facebook users, respondents who indicated they logged into Facebook fewer than three times per week were defined as nonfrequent users, with the 79 who fell into this category eventually filtered out of the dataset. As a result, the data of 714 out of 797 respondents (89.59%) were deemed applicable for analysis.

In terms of Facebook usage patterns, 89.77% of the 714 respondents had set up their Facebook accounts more than a year previously and that 56.72% had three or more years of Facebook experience. Less than a quarter (16.67%) of respondents logged into their accounts just 3–5 times per week, with 19.47% logging in 6–9 times per week, and 63.87% logging in at least 10 times per week. Roughly a fifth (21.01%) reported spending 15 minutes or less, on average, during each visit to Facebook, whereas 37.25% said they spent 15–30 minutes, 20.73% said 30–60 minutes, and 21% said more than an hour.

In this survey, just 9.94% of respondents reported fewer than 100 Facebook friends, followed by 22.55% with 100–200 friends, 22.27% with 201–300 friends, 19.47% with 301–400 friends, 12.18% with 401–500 friends, and 13.59% with more than 500 friends. When asked about the role of friends on Facebook, 69.89% of the respondents said they accepted as friends only "people whom I know personally."

When asked about their profile information on Facebook, 52.80% of respondents indicated that they seldom update it, whereas 27.31% said they do so 1–2 times per week. The survey results also indicate that respondents were likely to disclose some of their personal information fully, such as their gender (85.43%), profile picture (71.57%), email address (71.01%), and date of birth (63.45%). In contrast, far fewer respondents said they share such information as their personal phone number, home address, employer's name, job title, sexual orientation, partner's name, family members' names, and religious views.

When asked about their privacy settings on Facebook, 61.48% of the respondents reported that they seldom adjust them, with 29.55% stating that they do so 1–2 times per month.

Furthermore, 40.76% of the respondents reported using fake names or photos on Facebook. The major reason for doing so for 23.53% of the respondents was “to hide myself”; 10.36% cited their reason as “to have fun,” and 1.54% “to attract attention.” Facebook also gives users a choice regarding who can see their profile information. Most of the respondents reported that they were likely to share information with their friends alone, including photos/videos posted by themselves (65.13%) and their friends (57.84%), wall posts posted by themselves (65.41%) and their friends (64.85%), profile information (65.97%), and contact information (64.71%). A rather surprising finding was that 13.03% of the respondents said they disclose contact information to themselves alone.

4.1. Results of testing for H1

H1, which predicts that Facebook users possess a concern for their privacy, yet their behaviours indicate an acceptance of Facebook's imposed privacy norms, that is to say, the perceived fulfillments derived from the Facebook experience will appear to outweigh the importance of privacy protection, garners support from the findings. The score for the former comprises 24 items and that for the latter eight. All of these items showed a very high degree of reliability, with an average Cronbach’s coefficient alpha of 0.91. Results of a paired-samples *t*-test indicated a significant difference between perceived fulfillments (mean = 4.18, SD = 0.64) and the importance of privacy protection on Facebook (mean = 4.35, SD = 0.74; $t(714) = -5.45$, $p < 0.0001$). This finding constitutes the first step in the formation of the Facebook privacy paradox. The finding suggests that respondents were more likely to pay attention to privacy protection than to the perceived fulfillments derived from using the SNS, directly indicating an increasing concern for privacy. However, as our results revealed, users’ actions do not always mirror their assessed concerns.

A paired-samples *t*-test was also performed separately to measure the difference between each of these 24 items and two mean scores. Four items (see Table 1) related to perceived fulfillments were each found to have a significantly higher mean score than the mean score of privacy protection at a 0.01 level of significance. It should be noted that these fulfillments were generally related to maintaining relationships, friendship, and entertainment. The result for the item “I have become a more responsible person by participating on Facebook” indicates that respondents took responsibility for constructing their identity through engagement in social interactions.

Table 1. Item mean scores of perceived fulfillments compared to mean score of the importance of privacy protection using a paired-samples *t*-test.

Items	Mean[1]	*SD*	*t*-Test	(*p*-Value)
I am entertained by using Facebook.	0.58	1.18	13.16	(< 0.0001)
I use Facebook to maintain social relationships.	0.32	1.37	6.26	(< 0.0001)
I get to delve into my friends' lives through Facebook.	0.27	1.28	5.63	(< 0.0001)
I enjoy Facebook because it allows me to share common topics with my friends.	0.15	1.40	2.89	(0.0040)
I enjoy the feeling of being cared for by others when I use Facebook.	0.15	1.62	2.50	(0.0126)
I feel my relationships with other Facebook users have become more intimate.	0.16	1.38	3.03	(0.0025)
I have become a more responsible person by participating on Facebook.	0.62	1.53	10.82	(< 0.0001)

Note: Mean[1] = mean of item - mean of the importance of privacy protection; level of significance = 0.01.

Surprisingly, there was a significantly positive but very weak correlation between the items "I have become a more responsible person by participating on Facebook" and "I am concerned with the consequences of sharing my identity information on Facebook" (r = 0.1245, p = 0.0009). The implication is that even though a respondent felt having become a more responsible person, he or she was little concerned about the consequences of sharing his or her own information on Facebook. The significantly positive correlation between the items "I have become a more responsible person by participating on Facebook" and "I am always concerned about my privacy on Facebook" (r = 0.5823, p < 0.0001), in contrast, demonstrated that the respondents were concerned about their privacy on Facebook to a greater extent if they felt that Facebook participation had rendered them more responsible. This indicates that the ritualised use of Facebook, which proliferates forms of privacy reactive behaviour, results in users who feel they are more responsible in the wake of privacy concerns.

The paired-samples *t*-test results presented in Table 2 show that each of the two items related to privacy protection had a significantly lower mean score than the mean score of perceived fulfillments. It can be observed that the respondents reported spending little time on adjusting their privacy settings even though they did not believe their personal information to be well protected on Facebook. Recall from the foregoing discussion that the overall result for the importance of privacy protection outweighed that for perceived fulfillments; the implication is that the respondents were aware of the privacy protection

concept, but seldom took action to ensure their protection. This concludes our prediction that users would possess an increasing concern for privacy, yet their behaviours would suggest an acceptance of Facebook privacy norms. The privacy paradox thus appears to be rather ingrained in Facebook users, who are behaving in ways that suggest concern but then display acceptance through behaviour adaptations.

Table 2. Item mean scores of the importance of privacy protection and perceived fulfillments using a paired-samples *t*-test.

Items	Mean[2]	*SD*	*t*-Test	(*p*-Value)
I am familiar with Facebook's privacy settings.	0.12	1.64	2.03	(0.0428)
I adjust my privacy settings from time to time.	0.49	1.48	8.90	(< 0.0001)
I believe my personal information is well protected on Facebook.	0.64	1.29	13.33	(< 0.0001)

Note: Mean[2] = mean of perceived fulfillments from channelling into ethical telos - mean of item; level of significance = 0.01.

4.2. Results of testing for H2

H2, which predicts that Facebook users are increasingly aware of the surveillance over their lives and that the increased awareness influences and proliferates reactive behaviour normalisation in frequent Facebook users, is supported by the results. The first five items composed the score for the ritualised use of Facebook and the other 12 items for surveillance awareness, and all 17 items demonstrated a very high degree of reliability, with an average Cronbach's coefficient alpha of 0.91. It was observed that users who practised habitual use of Facebook displayed evidence of behaviour that could best be described as a direct reaction to increasing awareness of surveillance, for example, sending private messages instead of posting on a friend's wall.

To better understand the relationship between the awareness of surveillance and the ritualised use of Facebook, the scores for the latter were divided into three groups, "high," "medium," and "low," by standardising the original score for such use to mean = 0 and standard deviation = 1. Respondents with a standardised score higher than 0.6 were defined as "high" ritualised users, whereas those with a score lower than -0.6 were defined as "low" ritualised users, and the remainder were classified as "medium" users. Two correlation coefficients were identified to investigate the relationship between the ritualised use of Facebook and awareness of surveillance on the SNS for the "high" and "low" groups.

For "high" ritualised users (ritualised use mean = 5.68, *SD* = 0.43), the ritualised use of Facebook and surveillance awareness were positively correlated, with Pearson's correlation coefficient $r = 0.2554$, $p = 0.0003$. Thus, these users were more aware of the surveillance over their life (awareness of surveillance mean = 4.33, *SD* = 0.79). The "low" ritualised users (ritualised use mean = 3.50, *SD* = 0.61), in contrast, were found to be less aware of this issue (awareness of surveillance mean = 3.68, *SD* = 0.65), as the two means were relatively lower, albeit still positively correlated ($r = 0.2829$, $p = 0.0003$), than those in the "high" ritualised case. In other words, whereas the users who reported using Facebook in a ritualised manner displayed greater awareness of surveillance, their non-ritualised counterparts were found to be less aware. The increase in normalised privacy awareness behaviours was also found to be positively correlated with "high" ritualised users. This suggests that excessive Facebook use leads to reactive privacy awareness behaviours being formed.

5. Implications and conclusion

Social media is now heavily intertwined with people's work, study, and everyday life. What is most concerning about users' acceptance of Facebook's stance on privacy is that over time accepting conditions as norms may become social legislating. The acceptance of Facebook's stance on privacy, and subsequently Facebook's continued practice, may result in a new online privacy paradigm being established as the accepted norm, the result of which may be a world in which privacy is significantly, and possibly permanently, reduced. The possibility of such an outcome makes the significance of addressing issues pertaining to user privacy on Facebook evidently clear. It is therefore essential that studies such as this on personal privacy continue to be undertaken and expand the awareness of how social media is evolving and penetrating into various aspects of society.

It is also of utmost importance that diminished rights for Internet users do not define the current period of social media evolution, as we demonstrate through the concept of "discipline-and-control social media." This study has addressed the issue of privacy on Facebook by placing it in the context of the power relationship between the SNS and its users. Shining a light on the imbalanced nature of this relationship, exhibited most clearly by the Facebook privacy paradox, has allowed us to grasp the true gravity of the current imbalance in a non-Western context. It can be asserted that negative outcomes, both social and economic, will result if the balance continues to skew. The new normal posed and elevated by the COVID-19 pandemic calls for more up-to-date and situated studies on privacy perception and protection such as this one that goes beyond the advocacy of media literacy and privacy awareness education.

In response to H1, the importance of privacy protection was found to outweigh to a significant degree the perceived fulfillments derived from using Facebook. It appears that as the respondents became more ingrained in the Facebook system, their perception of personal data accessibility was affected and this prompted them to seek a higher degree of privacy protection and greater control over their Facebook privacy settings. At the same time, however, the findings show that a large proportion of the respondents reported rarely adjusting their privacy settings and stated that they shared such personal information as their real name, date of birth, and personal photos. The survey results indicate that in a *renqing shehui* (networked society or society of favour), the sociality between known acquaintances and strangers still has a lasting impact and is strengthened through the network effect garnered through technology giants such as Facebook. The results also show that maintaining relationships with friends outweighed any privacy concerns the respondents had with regard to Facebook, even though they believed that the disclosure of information could lead to such serious consequences as surveillance and stalking. There is thus an obvious contradiction between how Facebook users think and how they act when it comes to privacy protection, which reveals the discrepancy between users' understanding and actions in defending their personal information and maintaining privacy on the SNS.

In support of H2, the survey results indicate that respondents were aware of the surveillance and control over their lives stemming from their use of Facebook, and the "high" ritualised users were found more likely to have had a superior sense of surveillance on Facebook than their "low" ritualised counterparts, who displayed little such sense. The result showing that ritualisation on Facebook was positively correlated to the extent of respondents' surveillance awareness also supports this argument. It suggests that the "low" ritualised users are the most vulnerable and therefore the most likely to have their privacy exploited. This also confirms our proposal of the "discipline-and-control social media" in the sense that "high" ritualised users develop and negotiate constantly with Facebook within a power dynamic. Conversely, "low" ritualised users have little capital to negotiate because their engagement is minimal; therefore, their power to counter the discourse being shaped and engineered by Facebook is limited. Nonetheless, these "low" ritualised users are still being controlled.

This study has several ethical implications for Internet governance and UX design. In the development of digital ecosystems, Internet governance involving multiple stakeholders as mentioned above may prove necessary if harmony is to be achieved in an international virtual platform on which millions or billions of selves are channelling voices expressing different extremes of opinion. For the design of UX, although freedom of expression should be protected as a fundamental human right, that protection should be balanced with the safeguarding of privacy as a shield against possible abuses of such

freedom. Foucault's panopticon metaphor is applicable to today's Internet environment to the extent that self-regulated behaviour and mutual respect are required of all users, with everyone conforming to a common set of rules. In the context of "discipline-and-control social media," control over users and platforms should be and is being negotiated, exemplified by platform regulation and surveillance, users' self-disciplining, and users' counter-control over platforms. Extreme applications of freedom of expression, including Facebook's engineered discourse on radical privacy transparency, may on the one hand lead to invasions of privacy and on the other lead individuals to become overly protective of their own privacy and experience the anxiety that goes with it. Eventually, and ironically, this will diminish users' desire to express themselves as the survey results in this study indicate. This should be an especially prominent concern for SNSs such as Facebook as they look to further increase their stranglehold on the global social media marketplace.

With regard to digital ethics, there is no question that Facebook users bear the primary responsibility for safeguarding their personal information. Yet, however, through UX functions that allow the editing of personal profiles, the uploading of pictures and videos, and the tagging of friends, users are encouraged to express themselves and to disclose more of their information through the voluntary sacrifice of privacy. Individuals' sense of sacrifice and sense of alarm over privacy violations are alleviated when disclosure is limited to their friends based on mutual trust and respect. Yet personal privacy can be particularly threatened when the newly added connections are not close friends. Users often retreat rather suddenly upon discovering that their privacy is at imminent risk. Therefore, UX designers bear the important task of balancing between usability and accessibility on the one hand and privacy and risk on the other. At the same time, if Facebook wishes to attract more users, then it has both the responsibility and an incentive to ensure that its platform is functionally and technically secure. In addition, user education is essential that those who make Facebook a part of their daily lives and work, whether "high" or "low" ritualised users, develop a deeper understanding of the site's operation and better familiarity with its privacy settings, especially as their social spheres expand.

Neither Facebook nor its users should consider the current privacy paradigm to be an end point. As social and professional communications are now taking place via complex and diversified service platforms that are new to human history, policymakers are inevitably being pushed to synchronise their legal and regulatory approaches to privacy protection with the rapid advancement and integration of information technology. The challenges they face are not limited to protecting Internet users' sense of security, which is a basic need that arises in people in the course of expressing themselves to and interacting with others; they also stem from the need to balance human beings' natural desire for

freedom of expression in social interactions with the necessary restrictions against and censorship of cybermedia to shield against privacy intrusion and cyberbullying. Privacy acts and related legislation and policies must, therefore, be regularly revisited and revised to meet the pressing need of regulating the virtual world while giving due consideration to the constitutionally guaranteed and fundamental human right to freedom of expression. In this respect, designers especially those responsible for UX innovations should be at the forefront of working with multidisciplinary stakeholders to create digital experiences that promote trust and accountability and to drive ethically responsible approaches that positively impact individuals, societies, and the environment.

Facebook, which currently enjoys an advantage over its competitors due to its extremely broad range of users of different ages, cultures, and views, could be used as a platform to educate users and raise their privacy awareness, thereby establishing a convergence of cross-cultural perspectives on balancing freedom of expression and privacy protection and providing a vision for the elimination of cultural and geographical barriers. Facebook holds a unique form of power in terms of control over its users' personal privacy through its influence in engineering and re-engineering privacy norms. Consequently, it is of vital importance for academics, designers, and policymakers to ensure the world's social media giant wields this power with due responsibility. Future research could therefore attempt to make cross-sector and cross-cultural comparisons on privacy awareness and practices using the same survey items as those used in this study. The quantitative measures could also be supplemented with in-depth interviews with Facebook users to obtain richer insights into their personal experience of Facebook use—such as preferences in privacy settings, levels of self-disclosure, and perception of social capital—contributing to the development of a more inclusive and desirable digital future. In addition, we believe that future research could benefit from comparative studies conducted across multiple digital platforms such as Facebook, Instagram, LinkedIn, Pinterest, TikTok, WeChat, WhatsApp, X, and YouTube, that would potentially reveal notable distinctions in content creation, media consumption, platform governance, user experience, information design, social interaction, and privacy protection strategies.

ABSTRACT | Artificial intelligence (AI) increasingly assumes roles traditionally carried out by human assistants. AI virtual assistants can offer significant benefits such as convenience, efficiency, and personalized user experiences, making them critical equipment for customers and businesses (Mekni, 2021; Okuda & Shoda, 2018). One notable demographic that stands to benefit from AI virtual assistants is the elderly (Gessl et al., 2019). As people age, they may face functional disabilities and cognitive decline. Older people become vulnerable in various aspects of life. AI virtual assistants are posited to improve the quality of life for older adults by assisting with medication management, providing companionship, and supporting independent living (Mekni, 2021). In recognition of the elderly's unique needs, there has been considerable research exploring the use of AI virtual assistants in aging-related domains.

While numerous AI opportunities exist to facilitate the elderly, the current research often focuses on technological applications and their effects. These studies, however, overlook a critical aspect: the acceptance of AI by older users. Despite the widespread promotion of AI's potential benefits for the elderly, limited attention has been directed to how older adults perceive and accept these technologies. The studies investigating the acceptance of AI among older adults seem to emphasize cognitive factors such as perceived usefulness and perceived ease of use. While these elements provide valuable insights,

they fall short of addressing the broader and influential role of design in shaping user interaction and acceptance. Few studies examine how specific design features influence older adults' willingness to adopt AI technology. This study seeks to fill this gap by investigating how design elements of AI virtual assistants, specifically virtual appearance and conversational style, affect the acceptance of older adults.

This study employs a qualitative approach through one-on-one semi-structured interviews. We randomly selected 20 participants from 67 registerees aged 65 or older and residing in Hong Kong and conducted 1-hour interviews with them. Two comparative experiments were embedded within the interview process. The first experiment assessed the impact of two conversational styles: human-like versus mechanical style on user acceptance. The second experiment examined the effect of three levels of anthropomorphism on an assistant's appearance: high, medium, and low. After the interview, a small questionnaire was used to record older participants' acceptance levels of AI virtual assistants.

The finding reveals that a human-like conversational style and a relatively high level of anthropomorphic appearance foster greater acceptance of AI virtual assistants among elderly users. A human-like conversation could include the name of virtual assistants, a greeting, and a friendly tone. An anthropomorphic appearance indicates the use of realistic avatars. Additionally, older adults show a preference for assistants that are straightforward, easy to use and have clear instructions. The results suggest that when designing AI virtual assistants for the elderly, it is essential to prioritize human-like communication and a moderately anthropomorphic design to enhance user acceptance. These insights underscore the importance of tailoring AI virtual assistant design to meet the special needs and preferences of older populations.

KEYWORDS | AI VIRTUAL ASSISTANTS DESIGN, AI ACCEPTABILITY, AGING AND TECHNOLOGY, HUMAN-LIKE COMMUNICATION, ANTHROPOMORPHIC APPEARANCE

1. Introduction

Artificial intelligence (AI) is reshaping the landscape of human-computer interaction, increasingly fulfilling roles traditionally reserved for human assistants. AI virtual assistants (AVAs), in particular, have emerged as transformative tools that offer unparalleled efficiency, convenience, and personalization in various domains (Arora et al, 2020; Verhagen et al., 2014). From answering questions to facilitating customer interactions, these digital entities are becoming indispensable for both consumers and businesses. As the integration of AI into everyday life continues to expand, one demographic with much to gain from these advancements is the elderly.

The aging process often brings about a range of challenges, including functional impairments, cognitive decline, and a heightened sense of vulnerability in managing day-to-day tasks (Fisk et al., 2020; Pilotto et al., 2020). In this context, AVAs have the potential to play a pivotal role in supporting independent living, improving well-being, and enhancing the quality of life for older adults. Their applications span critical areas such as medication reminders, companionship, and assistance with routine activities, offering a lifeline for maintaining autonomy and reducing the burdens often associated with aging (Mekni, 2021).

Despite the promising capabilities of AVAs, their successful adoption by older adults remains uncertain. While existing research predominantly focuses on the technological

aspects and functional benefits of these systems, the question of how older users perceive and accept AVAs have received comparatively less attention. Acceptance of new technologies, particularly among older populations, is a complex phenomenon influenced not only be cognitive factors such as perceived usefulness and ease of use but also by the interactional and aesthetic characteristics of the system itself.

Notably, the design of AVAs, which encompass elements such as conversational style and virtual appearance, can significantly shape user experiences and influence adoption rates. For instance, a human-like conversational tone or a visually relatable avatar may help foster trust, comfort, and a sense of connection, particularly for users unfamiliar with advanced technologies (Araujo, 2018; Chen et al., 2024). However, empirical investigations into how such design features affect the acceptance of AI systems among older adults are sparse.

To address this critical gap, this study aims to answer what effects of different conversational styles (human-like versus mechanical) and levels of anthropomorphism in virtual appearances (high, medium, and low) are on the acceptance among older users. By employing a qualitative methodology involving semi-structured interviews and embedded experiments with older adults in Hong Kong, this research seeks to uncover actionable insights into the interplay between design and acceptance. The findings are anticipated to inform best practices in the development of AVAs, ensuring that these systems are not only functionally beneficial but also accessible and welcoming to all users, particularly those who may face barriers to technology adoption. Ultimately, this study aspires to contribute to the growing discourse on designing inclusive and user-centered AI systems.

2. Literature Review

2.1 AI virtual assistant

The AVA is an independent entity that offers a wide range of services to users, encompassing both technical and social assistance (Arora et al., 2020). AVAs operate in various capacities, including but not limited to administrative duties, customer service support, and social media marketing. These services can be used across diverse organizational settings, and the continuous training of virtual assistants contributes to the ongoing enhancement of work efficiency (Schmidt et al., 2018). AVAs leverage AI to interpret and respond to both spoken and typed commands. For instance, when a user requests information, such as asking for the weather or instructing the assistant to add a new event into the calendar, the assistant employs several technologies like Natural Language Processing (NLP) to comprehend the intent behind the query. Upon understanding the user's request, the AVA retrieves the relevant information or completes the specified task, such as providing weather updates or creating new events. Over time, AVAs improve their understanding of the user by learning from previous interactions, and they are even able to recognize individual voices and tailor responses based on user preferences (Arora et al., 2020).

2.2 Conversational style of AI virtual assistants

Natural language interactions between humans and AVAs play a critical role in shaping the overall user experience. Based on existing findings, machine-like communication tends to involve limited social interaction, whereas human-like communication

incorporates more informal elements such as greetings, small talk, feedback, and encouragement (Cassell et al., 2000; Chattaraman et al., 2019). Users increasingly seek natural and human-like interactions with computers, desiring conversational styles that evoke a sense of human connection (Araujo, 2018). A human-like conversational style tends to offer warmth and comfort to users, thereby fostering trust and enhancing the overall user experience. Cassell et al. (2000) emphasized the importance of incorporating interaction rituals, such as greetings and farewells, into these dialogues to strengthen users' trust. Roy and Naidoo (2021) explored the effectiveness of these conversational styles through scenarios in the hotel and smartphone industries, where the human-like style was described as more friendly, gentle, and personal. Similarly, Chen et al. (2024) revealed that human-like communication methods encourage users to disclose more information, thereby enabling chatbots to engage in more profound and meaningful interactions to gather relevant data.

While the human-like conversational style is increasingly favored, some studies suggest that a machine-like conversational style may be preferred in certain contexts. For instance, Cheng and Toung (2024) examined chatbots across different brands and concluded that top-tier brands should employ a more professional tone when communicating with customers, as it promotes a positive brand evaluation through a perceived greater match between the communication style and brand identity. Additionally, Zhu et al. (2023) found that consumers tend to prefer an instrumental communication style, one focused on achieving specific outcomes, particularly in high-pressure environments.

For older adults, preferences regarding conversational styles appear to be more nuanced. Harrington and Egede (2023) investigated the perceptions of older black adults towards health-information chatbots and found a preference for a natural conversational style. In contrast, Chattaraman et al. (2019) categorized older adults into two groups based on their internet competency—low and high—and discovered that high-competency users tend to require more emotional support, while low-competency users prioritize task-oriented interactions. Given these intriguing differences, this study aims to explore how older adults in Hong Kong perceive two contrasting conversational styles: human-like versus machine-like.

2.3 Virtual appearance of AI virtual assistants

The visual design of a virtual assistant significantly impacts user behavior, and it is crucial for designers to consider this factor when developing new conversational user interfaces. According to the social presence theory, it is possible to establish a sense of human-like interaction without actual physical contact (Gefen & Straub, 2004). This is achieved by fostering enhanced online interactions that create a sense of connection between the virtual assistant and its users (Baylor, 2009). The human-like visual appearance of AVAs plays a pivotal role in generating the social presence effect, thereby contributing to a sense of loyalty that users develop through their interactions with the virtual assistant (Belanche et al., 2021). The creation of an online social presence through the human visual characteristics of virtual assistants is also considered essential in providing a high-quality customer experience (Li & Sung, 2021; Verhagen et al., 2014).

Anthropomorphism refers to the attribution of human or personal characteristics to non-human entities or devices (Epley et al., 2008). Chattaraman et al. (2014) investigated the interaction experiences of older adults with two types of retail virtual agents: one featuring a persona image and one without. Their study revealed that older participants

demonstrated higher levels of perceived interactivity, trust, and intention to use the virtual agents that included a persona image. Similarly, Li and Sung (2021) found that individuals preferred AI virtual assistants with higher levels of anthropomorphism, evaluating them more positively. Priya and Sharma (2023) also observed that perceived anthropomorphism significantly influenced users' hedonic attitudes towards intelligent virtual assistants.

Recent empirical studies have confirmed that the level of anthropomorphism in a virtual assistant's appearance influences users' acceptance and adoption of AI virtual assistants. However, the specific impact on older users remains underexplored. To further examine how varying levels of anthropomorphism in the visual appearance of AVAs may affect the experiences of older adults, this study will explore three distinct levels of anthropomorphism: high, medium, and low. Gong (2008) developed 610 computer-synthesized facial images from various sources and invited undergraduate students to rate their degree of human-likeness, resulting in 12 images representing three levels of anthropomorphism. Schneider et al. (2019) examined the impact of anthropomorphism in a learning environment, utilizing blood cells depicted with no face, simple facial features, and more human-like faces to represent three levels of anthropomorphic design. These prior studies lay the foundation for us to create three-anthropomorphism-level images.

3. Methodology

This study employs a qualitative methodology to explore older adults' acceptance of and design requirements for AVAs. The research incorporates one-on-one semi-structured interviews and comparative experiments as its primary methods. To ensure the clarity and feasibility of the interview materials and procedures, a pilot study was conducted with 10 elderly volunteers. Following this preliminary phase, minor adjustments were made based on feedback, and the revised materials were subsequently validated. Participant recruitment commenced after the modifications were finalized.

This study will specifically focus on AVAs designed for banking services, using this platform to explore the experiences and preferences of older adults. The rationale for this focus is twofold: first, older adults often require more accessible and user-friendly banking assistants to resolve their issues without the need to visit physical branches (Cheng et al., 2024); second, the senior population tends to have a higher degree of familiarity with mobile banking, making it easier to conduct and illustrate the experiment within this demographic.

3.1 Participants and procedure

Participants were randomly chosen from a pool of 67 individuals, all of whom were residents of Hong Kong. The selection criteria were as follows: (i) aged 65 or above, (ii) possessing prior experience with mobile banking, and (iii) having some awareness or knowledge of artificial intelligence. To achieve a balance between manageability and diversity in the sample, a total of 20 participants were included in the study. Table 1 provides an overview of the participants' demographic characteristics. The sample comprised eight women and twelve men, with the gender distribution reflecting the larger proportion of male enrollees in the initial selection pool. This distribution is deemed representative of actual AVA usage patterns among older adults.

Table 1. Participants' demographic information

No.	Gender	Age	No.	Gender	Age
1	Female	65	11	Female	66
2	Male	73	12	Male	67
3	Female	65	13	Male	65
4	Male	71	14	Female	75
5	Female	68	15	Male	67
6	Female	67	16	Male	70
7	Female	67	17	Male	68
8	Male	70	18	Male	71
9	Male	68	19	Male	68
10	Male	69	20	Female	69

Before the interviews, participants were provided with an information sheet and required to sign a consent form to ensure adherence to ethical standards. Each interview session lasted approximately one hour, during which both qualitative and experimental data were collected.

The interviews consisted of four main components. In the first component, participants answered open-ended questions about their past experiences, perceptions of AVAs in financial services, and expectations. This approach facilitated the collection of baseline qualitative data. The second component involved presenting AVA-related materials to the participants and explaining current specific applications of AVAs in banking services. Participants were encouraged to ask questions freely during this phase to ensure they gained a comprehensive understanding of AVAs, which was essential for the subsequent experiments. The third component embedded two comparative experiments within the interview process, focusing on the influence of conversational style and virtual appearance on participants' attitudes. Participants observed various styles and designs of AVAs and engaged in guided discussions to capture their impressions and preferences. Finally, the fourth component included a short questionnaire designed to measure participants' acceptance of AVAs. The questionnaire comprised five Likert-scale items evaluating dimensions such as trust, satisfaction, comfort, resistance, and intention for future use. The questionnaire data provided a quantitative summary of participants' attitudes, complementing the qualitative findings.

All interviews were conducted in Cantonese, the participants' native language, to minimize language barriers and facilitate effective communication. With participants' consent, the sessions were audio-recorded and subsequently transcribed for analysis. The qualitative data were analyzed using thematic analysis to identify recurring patterns and insights, while the quantitative questionnaire data were summarized to support the overall evaluation.

3.2 Conversational style experiment

The first experiment examined how conversational style influences participants' acceptance by presenting two distinct interaction styles: a human-like conversational style, characterized by warmth and natural flow, and a mechanical style, which was more formal and robotic in tone. In this study, a scenario was created in which a user asked a banking assistant about the branch's opening hours. The humanized style has a greeting ("Hello") and AVA's name (Joy); the robotic style has no greeting and no name, as shown

in Figure1. The use of scenario-based manipulation aligns with prior research (Go & Sundar, 2019; Roy & Naidoo, 2021). Drawing from the literature, this study employed conversation screenshots, rather than live chats, to represent human-like and machine-like conversational manipulations (Chung et al., 2020). To isolate the impact of conversational style, no avatar images were included, thereby minimizing the potential influence of virtual appearance.

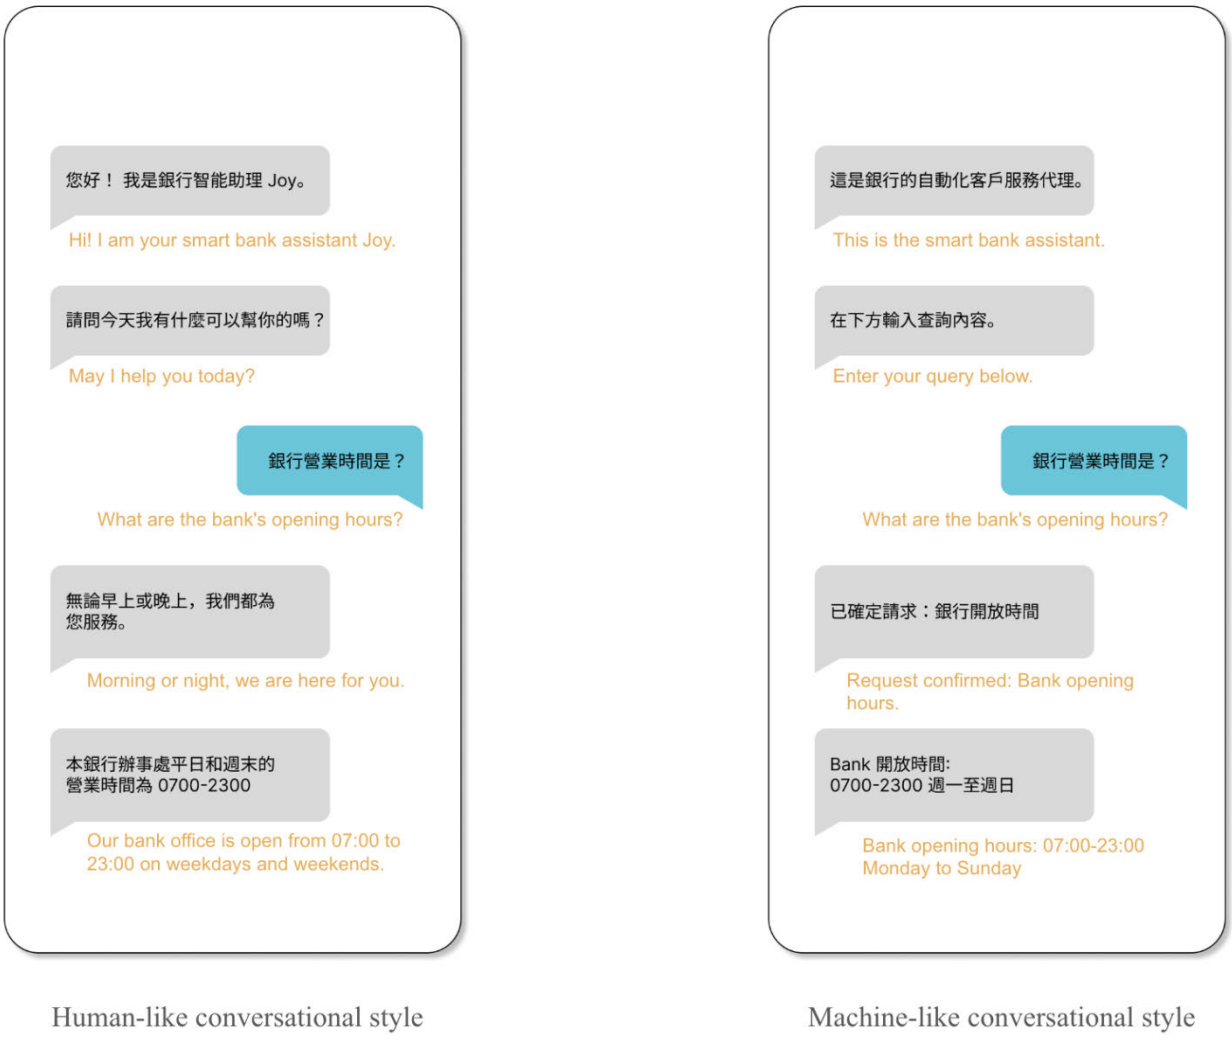

Figure1. Two conversational-style scenarios used in the experiment 1.

3.3 Virtual appearance experiment

The second experiment investigated the role of virtual appearance in shaping user preferences and expectations. To explore the effects of anthropomorphism, this study drew inspiration from prior research (Gong, 2008; Schneider et al., 2019). We categorized virtual appearances into three levels: no image or robot-like avatars for low anthropomorphism, animated character avatars for medium anthropomorphism, and real human images for high anthropomorphism. By observing the avatars commonly used in the Hong Kong market, we found that most companies choose female avatars for their chatbots. Therefore, we selected female images for both animated characters and real human representations in this experiment to enhance familiarity and comfort for older adults. Using female images consistently also helps eliminate the influence of

gender on decision-making (Fisk et al., 2020). Six interfaces (Figure2) featuring different avatars were designed and presented to participants, who were then asked to choose their preferred designs and explain. This approach provided insights into user preferences and the perceived impact of anthropomorphic design on the interface experience.

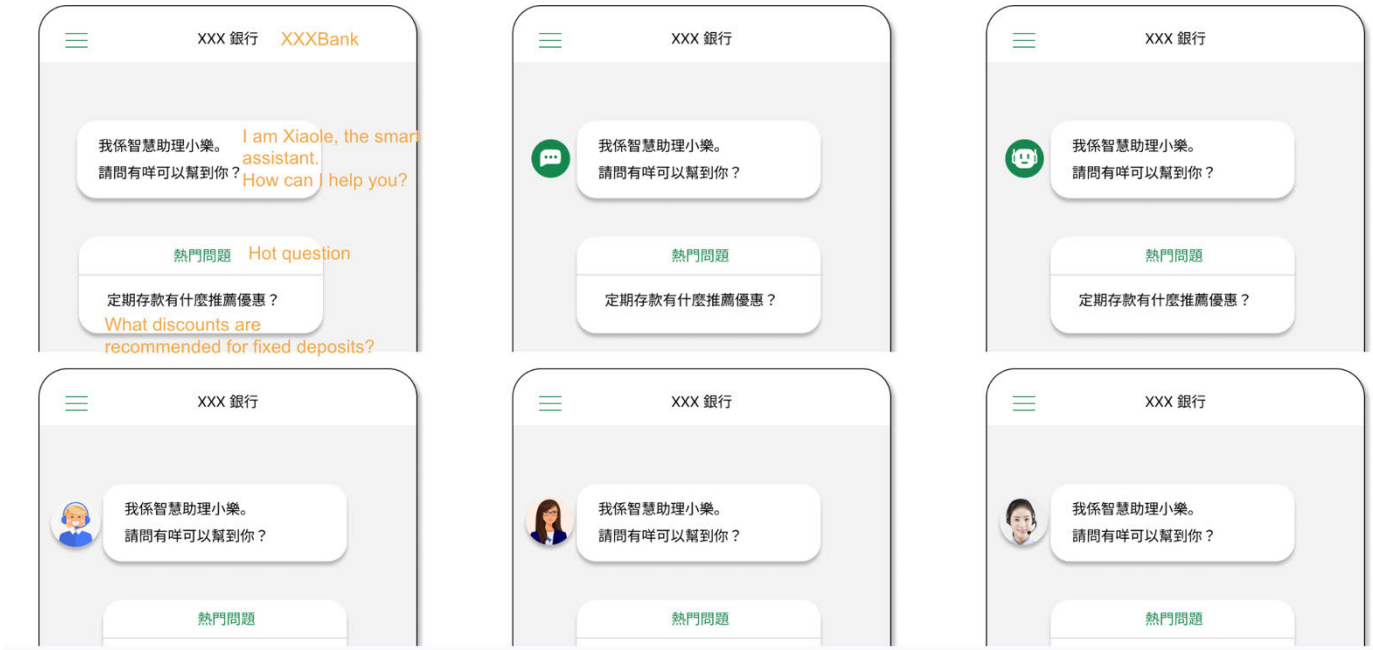

Figure2. Six avatars' images used in the experiment 2.

4. Results and Discussion

4.1 Conversational style preference

The majority of participants (n=13) expressed a clear preference for the human-like conversational style. This style was appreciated for its warmth, relatability and perceived empathy, which contributed to a sense of comfort and an enhanced user experience for older adults. P4 remarked, "*This is a more considerate service, more human, and more comfortable … It is not good to be too robot-like.*" Assigning a name to the virtual assistant was also highlighted as a feature that fosters a feeling of connection and closeness like interacting with real bank staffs. For example, P1 noted, "*AVA has a name that I can call and chat with, which makes me feel more comfortable.*" Similarly, P7 commented, "*It is like talking to a staff member.*" Participants frequently cited ease of understanding, the natural flow of conversation, and the ability to resolve queries in a personalized manner as key reasons for choosing the human-like style. For instance, P19 stated, "*This conversation is easier to read*" while P10 observed, "*It feels very direct. The machine-like style is a bit complicated.*"

In contrast, a smaller subset of participants (n=2) preferred the mechanical conversational style, associating it with clarity, simplicity and efficiency. These participants valued the straightforward nature of the interaction, devoid of unnecessary dialogue or human-like warmth, deeming it more suitable for functional purposes. P13 explained, "*I do not need humanized communication, and machine-like conversations are simpler and clearer.*" Additionally, a few participants (n=5) reported that their experiences were not significantly influenced by the conversational style, focusing instead on whether the AVAs could meet their needs. For instance, P12 stated, "*Just answer me directly. You don't need to introduce yourself. I know that the other party is an*

AI." Although these participants did not express a strong priority for either human-like or mechanical styles, they emphasized a desire for a direct and straightforward communication style.

While the majority of participants chose a human-like conversational style, the preference was not uniform. The findings suggest that, for older adults, human-like conversational styles are useful in creating comfort and fostering emotional connections, particularly in banking service contexts. However, mechanical styles were preferred by some participants who prioritized task efficiency and clarity. This indicates that context-aware adaptability in conversational style could significantly enhance user satisfaction. These results align with the findings of Chattaraman et al. (2019), who demonstrated that both human-like and machine-like conversational styles can cater to older adults' predilections in different service scenarios. Designers should, therefore, recognize the varied expectations of users based on their comfort levels with technology and personal interaction preferences.

Notably, some participants expressed concerns about a conversational style being "*too human-like.*" For instance, P2 reflected on a negative prior experience, stating, "*I know it is fake, I do not trust it… I did not believe it.*" This highlights the potential distrust or discomfort associated with the over-humanization of virtual assistants. Thus, while human-like conversational styles can cultivating a sense of intimacy, the degree of humanization requires further research. Murtarelli et al. (2021) similarly emphasized that the perceived level of humanness in interactions influences the credibility and perceived risks associated with virtual assistants. Future research should investigate how to ethically design human-like conversational interactions to ensure older adults feel cared for and experience an enhanced safety.

4.2 Virtual appearance preference

A significant proportion of participants (70%, n=14) expressed a preference for high-anthropomorphism appearances, specifically those utilizing real human images. This preference was frequently attributed to the sense of realism and friendliness conveyed by such representations. For instance, P4 remarked, "*It is just like chatting with a real person, so it gives you a feeling… This portrait will be more real.*" Similarly, P6 noted that "*It is better to have a portrait of a real person; it is more friendly.*" Some participants also highlighted the confidence they derived from high-anthropomorphism images. P14 stated, "*The others all look fake… Real people (pictures) are better and give me more confidence,*" while P7 commented, "*It feels like someone is answering me and can help me.*" Compared to medium- and low-anthropomorphism images, high-anthropomorphism visuals were reported to create a more comfortable experience, particularly for older participants. P10 and P13 both indicated a preference for real-life images and suggested avoiding avatar pictures if a realistic option was unavailable. These observations align with the findings of Li and Sung (2021), who emphasized the positive evaluation of anthropomorphic avatars when their design closely mirrors human characteristics.

Four participants expressed a preference for medium-anthropomorphism appearances, using animated images, citing them as more suitable in certain contexts. P2 described medium-anthropomorphism visuals as having "*enough feelings*" while P5 appreciated the warmth and care they could convey. However, some participants expressed skepticism about the necessity of anthropomorphism. P9 questioned the purpose of using real human images, stating, "*I do not know why I need to use this. There is no need*

to get a real person picture." Similarly, P18 preferred the artificiality of animated images, remarking, "*On the contrary, I like fake people because everyone knows they are fake.*" These findings suggest that medium-anthropomorphism representations may appeal to users who value emotional connection without requiring a realistic depiction.

Finally, two participants expressed a preference for low-anthropomorphism appearances, such as robot-like icons, citing the appeal of simplicity and transparency. P3 stated a dislike for the pretense of robots imitating humans, remarking, "*I know the person on the other side is a robot, so I do not want to pretend to be a real person.*" P8 similarly indicated a preference for robotic visuals, explaining, "*Overall, it is more comfortable, I think these robots.*" These responses highlight a minority perspective that values authenticity in robotic representations over anthropomorphic imitation.

The findings emphasize the significance of designing anthropomorphic appearance with user preferences and needs. High-anthropomorphism designs might be favored for their ability to foster a sense of realism, friendliness, and trust, particularly among older users who found them more relatable and comfortable. Medium-anthropomorphism designs appealed to users seeking warmth and emotional connection, though some preferred their artificiality over full realism. Low-anthropomorphism designs could be preferred by users who valued simplicity and authenticity, avoiding the imitation of human traits. These findings suggest that designers should carefully consider the level of anthropomorphism to suit the target audience, with high-anthropomorphism enhancing trust and relatability, while medium- and low-anthropomorphism may be more suitable in contexts requiring neutrality, simplicity, or explicit artificiality.

4.3 Older users' experience of AVAs

From the interviews, it was evident that perceived convenience is a key factor that enhances older users' satisfaction with banking assistants and increases their acceptance. Participants generally expressed that using a banking assistant could eliminate the need to visit a physical bank branch or wait in queues, thereby saving time. For instance, P9 noted, "*I believe it would be faster if we use a banking assistant. Going to the bank takes time, and even calling the bank involves waiting for someone to pick up.*" Additionally, the ability of banking assistants to provide services at any time was widely acknowledged. As P4 stated, "*As for the user experience, I think it is very convenient because you can perform operations anywhere at any time*." This always-available feature is particularly beneficial for elderly bank customers with limited mobility, enabling them to manage their financial matters more effectively.

Social influence also plays a significant role in user acceptance. Several participants mentioned that using a banking assistant reduces social stress by avoiding face-to-face interactions with staff. For example, P6 shared, "*Sometimes I have questions that I think are silly, but the AI chatbot won't laugh at me. I can talk to it about anything.*" Some participants also observed that interactions with AVAs avoid the emotional variability often encountered in human interactions, as the assistant maintains a consistently friendly tone. This makes the experience more comfortable, especially for users who feel uneasy during face-to-face interactions. For these individuals, AVAs offer a more accessible and less intimidating way to engage with banking services.

However, operational difficulties pose significant barriers to adoption among older adults. Age-related physical limitations, such as poor eyesight, were frequently cited as challenges. Participants emphasized the need for larger fonts, simpler interfaces, and less

reliance on lengthy text input to accommodate their needs. For instance, P9 remarked, "*Because of my age and poor eyesight, sometimes I can't read my mobile phone clearly. I wait until I get home to use my iPad.*" Similarly, P12 stated, "*For elderly users, the font size is too small. The mobile phone is already small; the font should be larger.*"

In addition to usability concerns, elderly users expressed reservations about the ability of banking assistants to provide personalized and accurate investment advice. Many felt that face-to-face interactions with banking staff are necessary to gain a better understanding of their preferences and risk assessments. Furthermore, limited familiarity with technology heightened concerns about operational errors and security issues. Traditional banking services, which share transaction risks and offer a higher perceived level of security, were seen as more reliable. For example, P13 remarked, "*If the investment fails, I can't afford to be angry with an AI chatbot.*" P5 similarly expressed skepticism, stating, "*Speaking of AI assistants now, I don't think they're trustworthy at the moment.*"

5. Design Implications

Adjusting conversational settings for older adults: To accommodate the diverse conversational preferences of older adults in various contexts, designers must conduct thorough user research to determine whether humanized, warm, and engaging expressions or more professional, efficient, and direct prompts are better suited for specific scenarios. For instance, while older adults may prefer human-like conversational styles in banking assistants, designers should adopt a case-by-case approach. In task-oriented services, a consistent and robotic tone may prove more efficient and favorable. A generalized solution to address these varying preferences could involve providing an option for users to select the depth of interaction and preferred communication style at the beginning of a conversation.

Leveraging anthropomorphic appearance: To improve the acceptance of older adults, it is essential for designers to evaluate the influence of anthropomorphic elements on user comfort in different contexts. In the case of banking services, high-anthropomorphism designs, such as those incorporating realistic human images, are particularly effective for older users, as they foster trust, friendliness, and relatability. However, other applications may require medium or low levels of anthropomorphism. For example, medium-anthropomorphism, such as animated images, strikes a balance between emotional warmth and artificiality, making it suitable for platforms where older users seek human-like connections without expecting complete realism, such as communication tools. In contrast, low-anthropomorphism designs, characterized by robotic or minimalist icons, cater to users who prioritize simplicity and transparency, which may be more appropriate for technical applications. Offering customizable levels of anthropomorphism can accommodate individual preferences, enabling older adults to select the appearance they find most comfortable and engaging, thereby enhancing user satisfaction.

Age-friendly interface design: Designers must consider the unique requirements of older adults to improve accessibility and usability in digital services such as banking assistants. Key design considerations include addressing age-related physical limitations, such as poor eyesight, by integrating larger, adjustable fonts, high-contrast visuals, and simplified navigation layouts. Interfaces should reduce reliance on lengthy text inputs, favoring intuitive, voice-based, or guided interactions instead. Furthermore, alleviating social stress and fostering user confidence can be achieved by employing consistent and friendly tones in AI interactions, thereby eliminating the fear of judgment that can arise in human communication. Offering 24/7 availability and seamless functionality empowers elderly users with limited mobility to manage their tasks conveniently from home, further

supporting their independence. Nevertheless, ensuring trust and security remains critical, as older users often view traditional in-person interactions as more reliable for high-stakes activities, such as investment decisions. By aligning interface design with these considerations, digital services can promote inclusivity, improve user satisfaction, and facilitate wider adoption among elderly populations.

6. Ethical Considerations

This study aims to promote inclusivity and enhance access to digital services for older adults. Given the involvement of a vulnerable population, several ethical considerations arise. First, we respected participants' autonomy and dignity during data collection. All interviews were conducted with informed consent, and participants were made aware of the purpose of this study, their right to withdraw at any time, and how their responses would be used. We also ensured that the language and format of materials were accessible and appropriate for older adults. Second, we selected female avatars for both animated characters and real human images based on observations of existing chatbot designs in the Hong Kong market. This choice was made to enhance familiarity and comfort for older users. However, we recognize the importance of avoiding gender stereotyping and plan to explore gender dynamics in future studies (Feine et al., 2020). Third, we maintained ethical standards in data processing. All collected data were anonymized before analysis to protect participant identity and no personal identifiers were retained. The data were stored securely and were accessible only to the research team. Overall, ethical awareness was integrated throughout the research process, from study design and participant recruitment to data handling and interpretation, to ensure that the design is respectful and inclusive.

7. Conclusion

Our findings underscore the critical impact of design features, particularly conversational style, and virtual appearance, on the acceptance of AI virtual assistants by older adults. The results reveal that a human-like conversational style, featuring personalized elements such as names, greetings, and a friendly tone, and a higher level of anthropomorphism in appearance foster more acceptance. Older adults also expressed a preference for assistants that are straightforward, and easy to use. These insights emphasize the importance of tailoring AI virtual assistant designs to accommodate the specific needs and preferences of elderly users. By prioritizing human-like communication and moderately anthropomorphic designs, designers can improve the accessibility and acceptance of these technologies among older populations.

ENHANCED (AI)NSPIRATION: BRIDGING SYSTEMIC COMPLEXITY WITH AI AND HUMANITY-CENTERED DESIGN

Arianna Vignati*[a], Piero Fissore[b]

a Torrens University

b University of San Raffaele Rome

*arianna.vignati@torrens.edu.au

ABSTRACT | The *Enhanced (AI)nspiration* methodology addresses the increasing complexity of global design challenges by expanding Human-Centered Design with Humanity-Centered Design, Systems Thinking and Generative AI. The methodology focuses on the Inspiration Phase of Design Thinking, to enable designers defining problems systemically, anticipate unintended consequences and better align solutions with societal and ecological goals. Key hypotheses tested include AI's potential to empower systemic exploration, preserve and even enhance human creativity and critical thinking while meeting practical limits of the design process. The study explored how AI can support problem framing and decision-making within a modular design framework. Validation activities included a workshop and pilot projects spanning diverse fields. Feedback highlighted efficiency gains, enhanced empathy and deeper systemic insights but also underscored risks like over-reliance on AI and challenges with synthesizing data, which informed a subsequent strengthening of the methodology with embedded risk mitigation. The results illustrate AI's role in supporting systemic analysis and decision-making, enhancing the designer's agency throughout the process. The methodology's 37 AI-driven prompts, structured into a Handbook to facilitate implementation in design education and practice, provide flexibility and adaptability to diverse design contexts. *Enhanced (AI)nspiration* aims at empowering designers to acknowledge their dual role by addressing systemic challenges as problem solvers while anticipating and mitigating unintended consequences, advancing design's ethical and holistic impact.

KEYWORDS | AI-augmented Design, Systems Thinking, Humanity-Centered Design, Ethical Design, Inspiration Phase, Problem framing, Complexity management

1. An urgent responsibility for designers

Designers today rely on methodologies like Design Thinking (DT) and Human-Centered Design (HCD), which prioritise individual needs and foster empathetic, user-friendly solutions across industries. However, global challenges like climate change, unsustainable economic systems and social inequality have intensified the need for designers to acknowledge the duality and broader consequences of their actions.

While addressing specific needs, design solutions can inadvertently trigger ripple effects beyond their initial scope. Recognising this has prompted decades of discourse on expanding traditional methodologies. Victor Papanek's *Design for the Real World* (1971) warned that neglecting complex intersections of stakeholders, social structures and technical factors could lead to resource depletion, pollution and societal breakdown. Don Norman's *Design for a Better World* (2023) further urges designers to adopt broader responsibilities and perspectives, incorporating societal, ecological and political dimensions to achieve long-term positive impact.

Navigating this systemic complexity, including an ethical and efficient use of emerging technologies like Generative AI (AI), calls for new, flexible and advanced toolkits. The critical stage of the design process, where initial research, context analysis and problem framing have an intrinsic systemic complexity (Norman & Stappers, 2015), is the Inspiration Phase of HCD (IDEO.org, 2015), where this research has identified the opportunity to integrate Humanity-Centered Design (HCD+) and Systems Thinking (ST), emphasising root-cause analysis, long-term perspectives, and balancing human and planetary well-being.

This study addresses a specific research question in this framework: How can AI, framed as a dialogic partner, support designers in integrating systemic and humanity-centered principles, anticipating unintended consequences, and reducing externalities while sustaining agency, creativity, critical reflection and complexity management?

The authors introduce the *Enhanced (AI)nspiration* methodology as a complementary addition to existing design workflows, accompanied by a Handbook to support its practical implementation. The methodology comprises a modular collection of structured and adaptable AI prompts devised to assist designers during the Inspiration Phase, encouraging broader systemic inquiry, deeper exploration, and ethical reflection while preserving full agency. Tested through two experiments in a design education environment, preliminary findings indicate that the methodology shows promise as a pedagogical aid and potential for broader adoption in professional settings, helping designers always remain at the centre of the process, with AI enhancing their critical thinking, creative depth, and process efficiency.

2. A new foundation for defining design challenges

Design theory continues to evolve, enriched by diverse epistemological and ontological approaches that foster innovative tools and frameworks to address modern challenges (Norman & Stappers, 2015; Boehnert, 2018; Boylston, 2019; Norman, 2023). As Norman (2023) highlights, two perspectives stand out for their transformative potential:

Humanity-Centered Design (HCD+) and Systems Thinking (ST).

HCD+ extends traditional Human-Centered Design (HCD) by addressing the interconnectedness of people, ecosystems and the environment. It focuses on tackling systemic root causes, balancing immediate needs with long-term impacts and fostering community collaboration for sustainable, contextually relevant solutions. It bridges dualities such as global and local, human and ecological while promoting harmony between humanity and the planet, as outlined in the *United Nations Sustainable Development Goals* (UN SDGs). Compared to HCD, HCD+ is newer and less structured in its activities (Gorichanaz, 2024).

ST, as articulated by Donella Meadows in *Thinking in Systems* (2008), offers a holistic approach to understanding complex systems by exposing non-linear causalities, relationships, feedback loops and patterns. It identifies systemic root causes, highlights key actors and emphasizes long-term impacts. Applicable across industries, ST enables decision-makers to identify leverage points and develop sustainable solutions by analyzing interconnected elements rather than isolated components. Amissah et al. (2020) emphasize that ST equips designers to approach change holistically by fostering motivation, enhancing collaboration, refining focus and encouraging continuous learning. Jones et al. (2022) show that combining these approaches into practical frameworks enhances design practice.

Recent studies have highlighted the potential of Generative AI (AI) to support different stages of the design process. Xu et al. (2023) explore how AI can help embed ethical principles beyond technical requirements. Khanolkar et al. (2023) map AI capabilities across engineering design phases, showing a focus in current research on ideation and feasibility assessment. Han et al. (2024) and Tschepe (2024) also examine AI's role in concept evaluation, data extraction and scenario exploration.

Few studies have explored how AI could act as a true dialogic partner, a tool that supports designers in asking broader, deeper and better questions, structuring systemic inquiry and reflecting critically on their assumptions. This gap is particularly relevant during the Inspiration Phase of HCD, where designers immerse themselves in users' contexts to understand needs and challenges deeply, fostering empathy and laying the foundation for the design process (IDEO.org, 2015).

This paper seeks to integrate established methods and tools from HCD, HCD+, and ST into a modular, AI-augmented methodology devised to complement - not replace - existing design workflows. The structured prompts tested with this study aim to help designers manage an increasing amount of information, anticipate systemic impacts, and embed ecological and ethical considerations in the early stage of the design process.

3. Building the Enhanced (AI)nspiration methodology

The research conducted to define the *Enhanced (AI)nspiration* methodology had two main goals:

- to collect and to structure relevant activities, tools and approaches derived from Human-Centered Design (HCD), Humanity-Centered Design (HCD+) and Systems Thinking (ST) for the Inspiration Phase;

- to integrate Generative AI (AI) as a dialogic partner to help manage the complexity of both challenge and process dimensions while retaining - or even enhancing - designers' agency.

To achieve these goals, the study analysed foundational works in each domain, including *The Field Guide to Human-Centered Design* (IDEO.org, 2015), *Design for the Real World* (Papanek, 1971), *Design for a Better World* (Norman, 2023) and *Thinking in Systems* (Meadows, 2008). The study evaluated each method and tool for relevance to the Inspiration Phase's goals, such as context analysis, primary and secondary research and problem framing. These insights have been categorized into a unified framework of 34 key methods and tools (18 for HCD, 5 for HCD+ and 11 for ST), structured into five sub-phases: Challenge, Planning, Research, Synthesis and Opportunities (see Table 1).

Table 1. The 34 key methods and tools collected from HCD, HCD+ and ST useful for the Inspiration Phase.

Phase	Human-Centered Design	Humanity-Centered Design	Systems Thinking
1. Challenge	Frame Your Design Challenge Define Your Audience	UN SDGs Correlation Reference Communities	Boundaries Actors Goals
2. Planning	Create a Project Plan Build a Team	/	/
3. Research	Secondary Research Interviews Expert Interviews Extremes and Mainstreams Immersion Analogous Inspiration	Reducing Prejudice	Stocks Flows Feedback Loops Delays Self-Organization Hierarchy Resilience
4. Synthesis	Empathy Maps Affinity Maps User Personas User Journeys User Stories Problem Statements Insight Statements	/	/
5. Opportunities	Opportunity Areas	Incremental Implementation TRIZ Analysis	Leverage Points

The authors conducted a series of experiments to evaluate AI benefits for each identified method and tool. Starting from defined design challenges, several AI prompts have been

developed, tested (with *OpenAI ChatGPT model "4o"*, retrievable from www.chatgpt.com) and refined following OpenAI's *Prompt Engineering Guide* (n.d.).

These tests demonstrated AI's potential as a dialogic partner, helping manage complexity in both challenge and process dimensions. The key results are summarized, for each sub-phase, as follows:

- *Challenge.* AI helped identify the system's boundaries, actors, and goals, uncovering historical path dependencies that shaped current constraints. It revealed hidden interactions and systemic contradictions, enhancing problem clarity and understanding intricate system dynamics with a reflective approach.

- *Planning.* AI helped match required expertise with project needs, organized resources, and identified affected stakeholders. It ensured a holistic view of issues and skill gaps, supporting effective resource allocation and structured, ethically guided research plans.

- *Research.* AI helped streamline primary and secondary research by optimizing interview and immersion setups, automating data collection and analysis, producing concise summaries, and uncovering patterns. The bias removal dialogic approach ensured balanced, multidimensional perspectives. Insights grounded the process in real-world data and broadened understanding of key issues such as conflicting forces and interests within the system.

- *Synthesis.* AI helped aggregate data into actionable formats, highlighting recurring themes and contradictions. Integrating tools like Empathy Maps and Insight Statements clarified user needs and opportunities, guiding empathetic identification of transformative design directions.

- *Opportunities.* AI helped challenge key assumptions before prioritizing innovation areas and explored high-potential system contradictions worth solving. It pinpointed leverage points for impactful solutions, providing a well-informed foundation for the subsequent Ideation Phase.

Insights from these preliminary evaluations have been distilled into 37 specific AI prompt types, tailored to the methods and tools in Table 1. These prompts were organized into five sub-phases: Challenge (6 prompts), Planning (3 prompts), Research (15 prompts), Synthesis (7 prompts), and Opportunities (6 prompts).

The prompts demonstrated adaptability, allowing relevant sets to be selected independently, modified to address emerging topics, and tailored to the specific requirements of each initially defined design challenge.

Figure 1 presents a schematic overview of the methodology's key methods and tools, guiding the process from initial context exploration and systemic problem framing to the identification of ethically grounded, high-potential opportunities. The methodology is specifically designed to support the formulation of well-framed design challenges, leading the designer up to the threshold of the Ideation Phase of HCD.

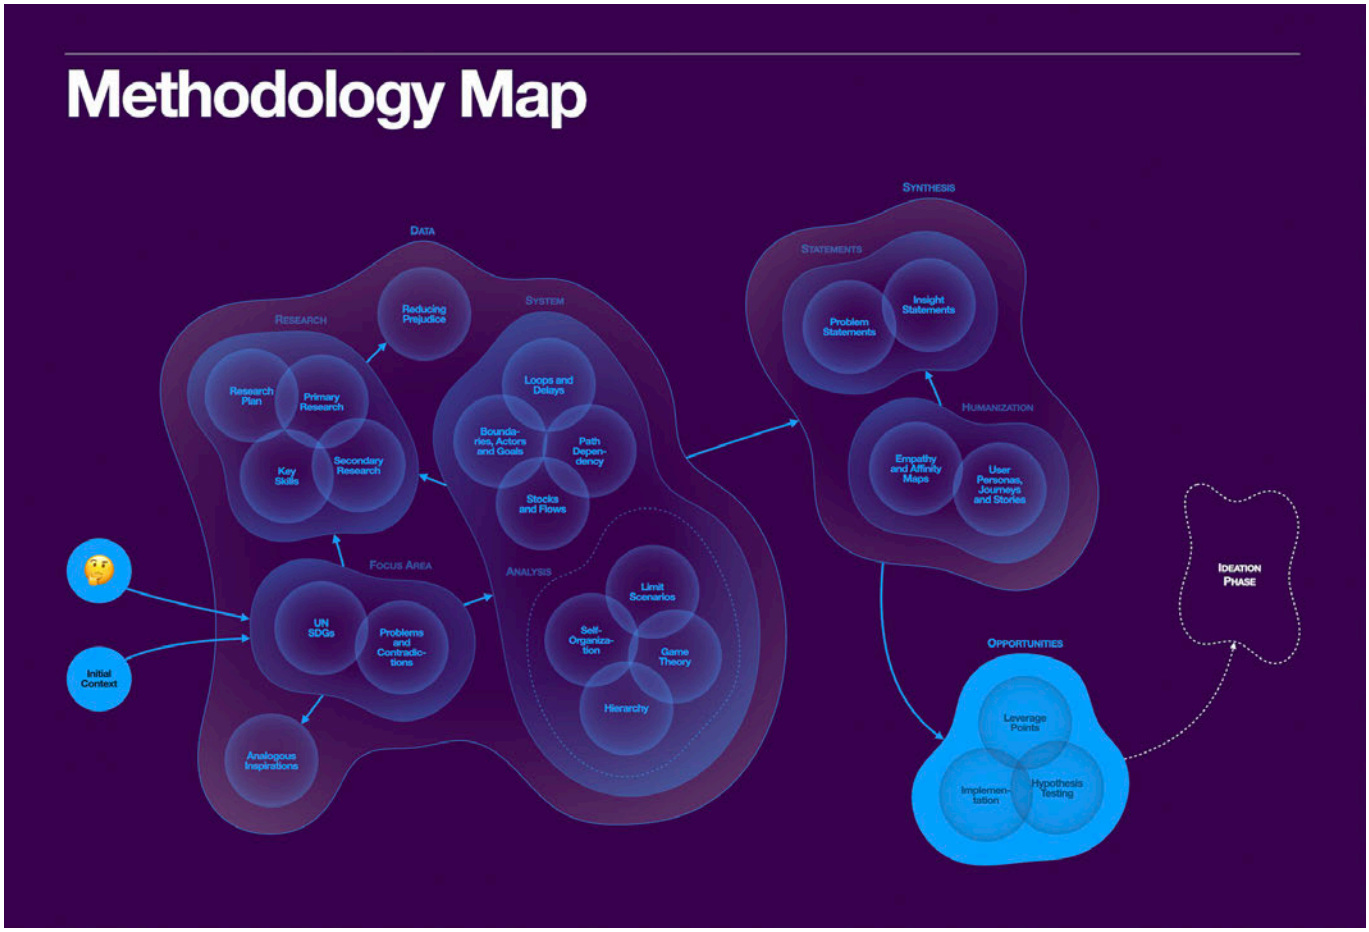

Figure 1. Enhanced (AI)nspiration: a schematic overview of the key methods and tools in the methodology, from initial context exploration to ethically grounded, high-potential design opportunities.

4. Testing the methodology and learning from feedback

The *Enhanced (AI)nspiration* methodology validation was guided by the following key hypotheses:

- combining Human-Centered Design (HCD), Humanity-Centered Design (HCD+) and Systems Thinking (ST) while integrating Generative AI (AI) as a dialogic partner would enhance designers' ability to broaden and deepen their perspective when framing design problems while preserving creativity, intuition and control over the process;
- AI would help designers manage the complexity of the resulting design process;
- the methodology's modular prompts could adapt to diverse design contexts while maintaining focus and efficiency.

Two experiments in an academic environment with design students have been conducted to test the methodology. This choice was informed by the authors' combined expertise - decades of experience in design education and equally long background in professional practice - offering complementary insight into both pedagogical and applied design contexts. The first experiment has been conducted in a workshop at University of Politecnico di Milano in June 2024 in collaboration with the *James Dyson Foundation*, which involved 23 advanced design students working on projects in the field

of Design for Kids. The authors introduced the first version of the methodology in a lecture, presenting a concise selection of 17 key AI prompt types (due to time constraints) focused on foundational activities within the Inspiration Phase. The prompts were structured as sheets detailing each activity's purpose, input requirements and expected outputs, with guiding examples for clarity (see Figures 2 and 3). Participants were tasked with designing a new product or service for children, spanning all three phases of HCD (Inspiration, Ideation and Implementation), applying the methodology in the Inspiration Phase.

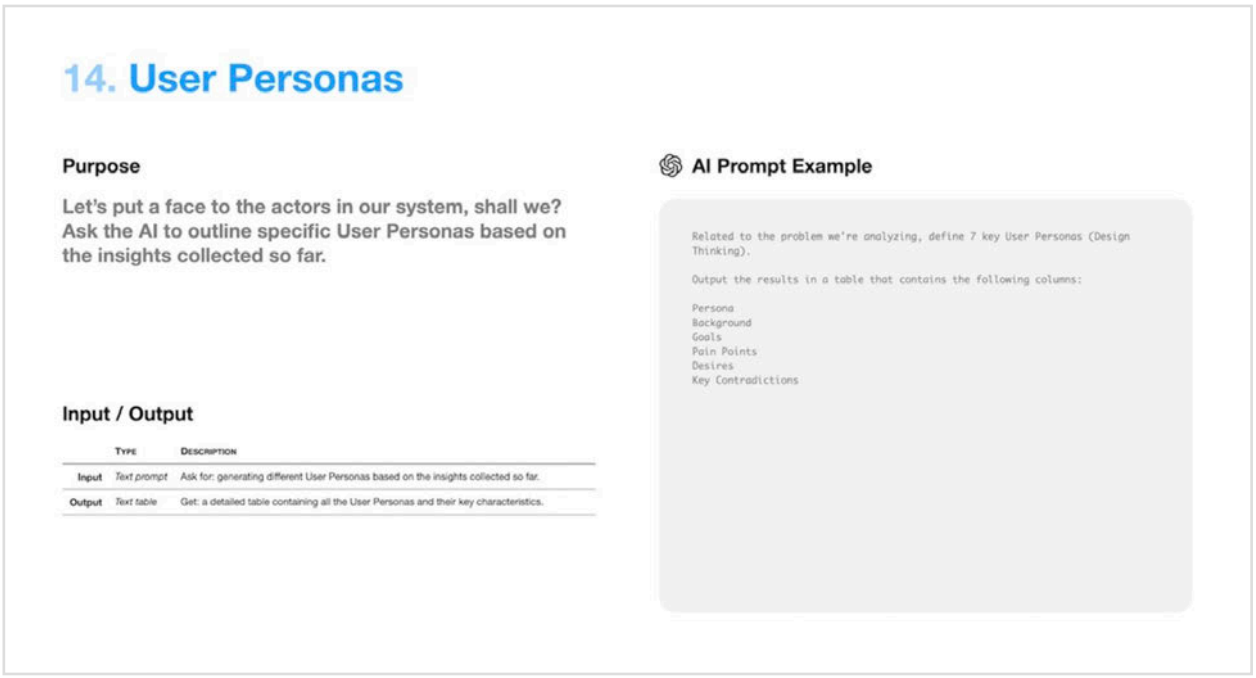

Figure 2. The first version of the methodology presented two distinct pages for each of the prompts. Here, an example of the first sheet describing the purpose, expected input/output and a practical example of the AI prompt for the specific activity.

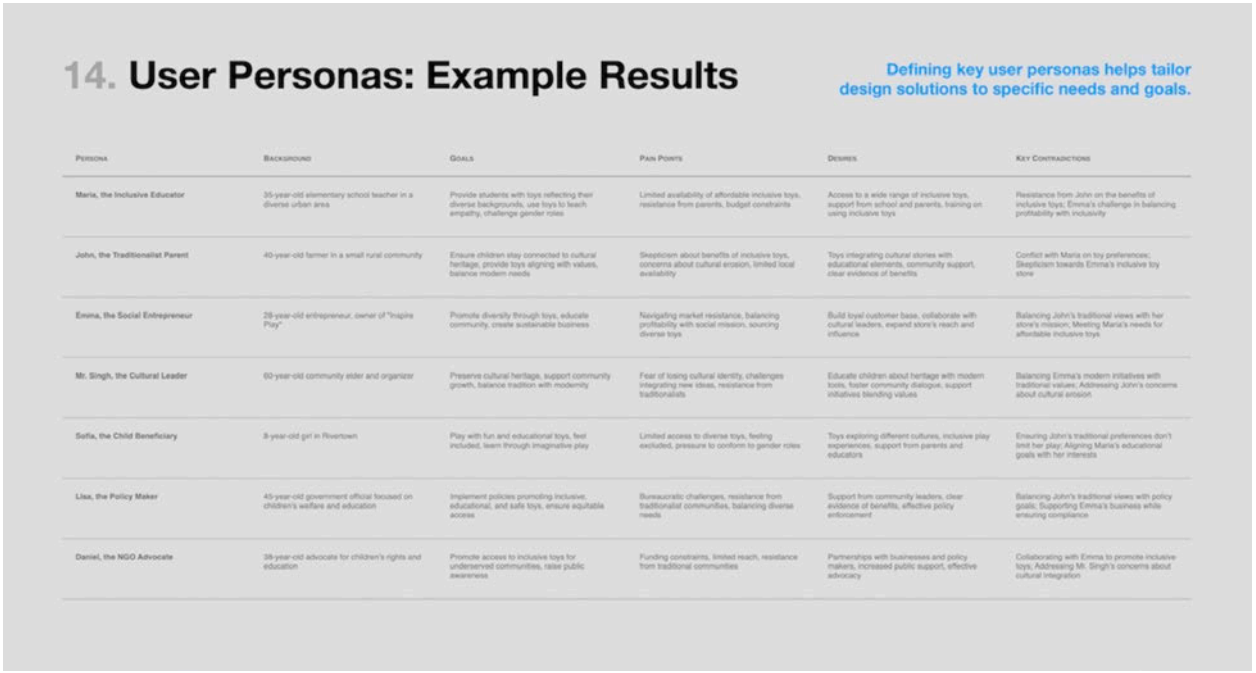

Figure 3. The first version of the methodology presented two distinct pages for each of the prompts. Here, an example of the second sheet, showing an example of possible result for the AI prompt shown in the first sheet.

Students were chosen as their evolving workflows enable clearer observation of how the methodology influences process, framing, and decisions compared to traditional HCD approaches. A workshop survey assessed participants' familiarity with AI and the methodology's utility and efficiency. Results showed that 43% used AI casually in design, 43% outside design and 14% were new to it. Despite varying experience, 86% found the methodology very or extremely useful, with 71% noting significant positive impacts. Participants praised its ability to streamline data, foster empathy and clarify systemic interdependencies. However, they highlighted challenges such as sometimes overly lengthy AI responses and difficulty synthesizing information. Concerns included AI potentially hindering critical thinking without proper use. Suggestions included implementing concise summaries and more precise instructions for integrating prompts into workflows.

The second experiment was conducted with two pilot projects in two courses with design students involved in the development of an urban furniture system and a wearable device for emotional development in children. The authors were directly involved in the process alongside the students, allowing them to apply their combined academic and professional expertise while critically reflecting on the methodology's performance in real time. Thanks to structured AI prompts, students have been able to systematically identify interconnected factors operating across different levels - such as historical path dependences, stakeholder relationships, and long-term system behaviours - which were not explicitly addressed in initial HCD-driven approaches. This expanded the problem space beyond immediate users, fostering a broader consideration of indirect actors and long-term consequences. The methodology also facilitated critical self-questioning around design assumptions through bias-awareness and contradiction-analysis prompts, contributing to more robust challenge definitions. During the tests, the authors recognised the need to work on sometimes overly lengthy AI responses and the risk of AI hindering critical thinking, as emerged during the workshop.

The validation activities highlighted significant qualitative benefits. Timesaving and efficient data analysis were notable. The methodology improved data quantity, quality and depth, enabling to navigate socio-technical complexity and conduct wider and deeper analyses. Iterative synthesis reduced information overload, maintaining focus on critical areas. AI helped reveal unexpected connections, fostered innovative insights and supported complex scenario simulations, enhancing systemic understanding. It also helped mitigate unconscious biases, ensuring balanced perspectives and improved research planning by identifying relevant themes, skills and participants within given time and resource constraints.

The validation also revealed a key insight: AI did not replace the central role of the designer. On the contrary, the process highlighted how critical thinking, creativity, and empathy remained essential for transforming AI-generated insights into meaningful, context-sensitive research insights. Ethical judgment, rooted in human experience, guided socially and environmentally responsible decisions while ensuring relevance and impact. Flexibility and intuition proved indispensable throughout the assessment in navigating complex scenarios and interpreting AI suggestions with critical discernment. Direct engagement with users, interdisciplinary collaboration, and the capacity to manage uncertainty emerged as irreplaceable human contributions.

These validation activities provided a robust foundation for strengthening and refining the methodology to reach its advanced version, as described in the following section.

5. Strengthening the methodology and addressing risks

Following validation feedback, the authors improved the methodology with key refinements:

1. the need for a design tool: a preliminary tool (Handbook) has been designed as a comprehensive guide structured around the five phases of the methodology. Each phase was introduced with a dedicated panel summarizing its purpose, methodologies and activities, color-coded to improve navigation (see Figures 4 and 5).

Figure 4. Methodology's Handbook introductory sections help designers better understand information at a glance.

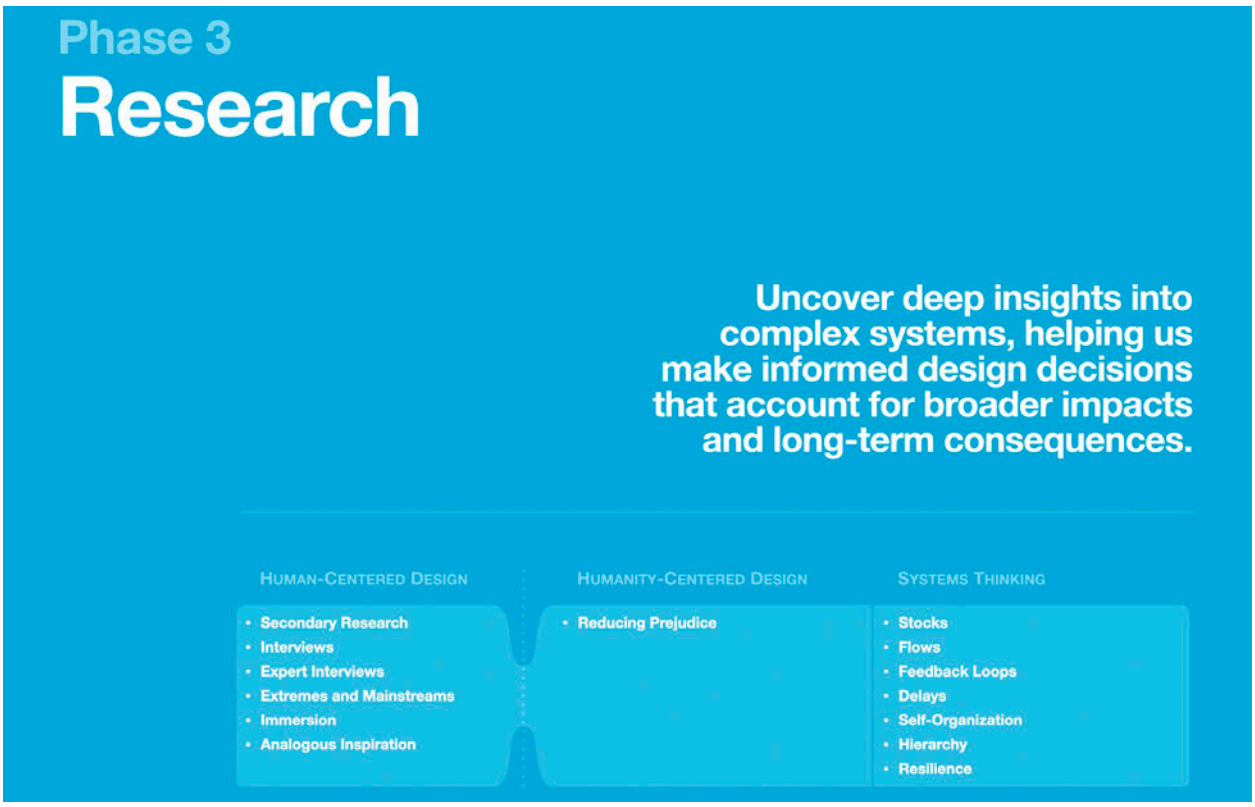

Figure 5. Methodology's Handbook introduces a specific phase with a brief description and specific methods and tools used.

2. the need for a clear connection with HCD, HCD+ and ST tools and methods: a major integration to the methodology has been the detailed and actionable information for each step (see Figure 6) to established design methodologies via a "Proven Methodologies Compass," including tools to help designers synthesize results. This improvement addressed feedback collected during the validation activities to ensure more clarity and accessibility:

    - clear explanations of Generative AI (AI) integration, specifying its purpose, benefits and expected outputs;
    - explanation of the methodology's principles, motivations and foundational values;
    - customizable AI prompts tailored to each activity;
    - example outputs in a readable, less overwhelming, tabular layout.

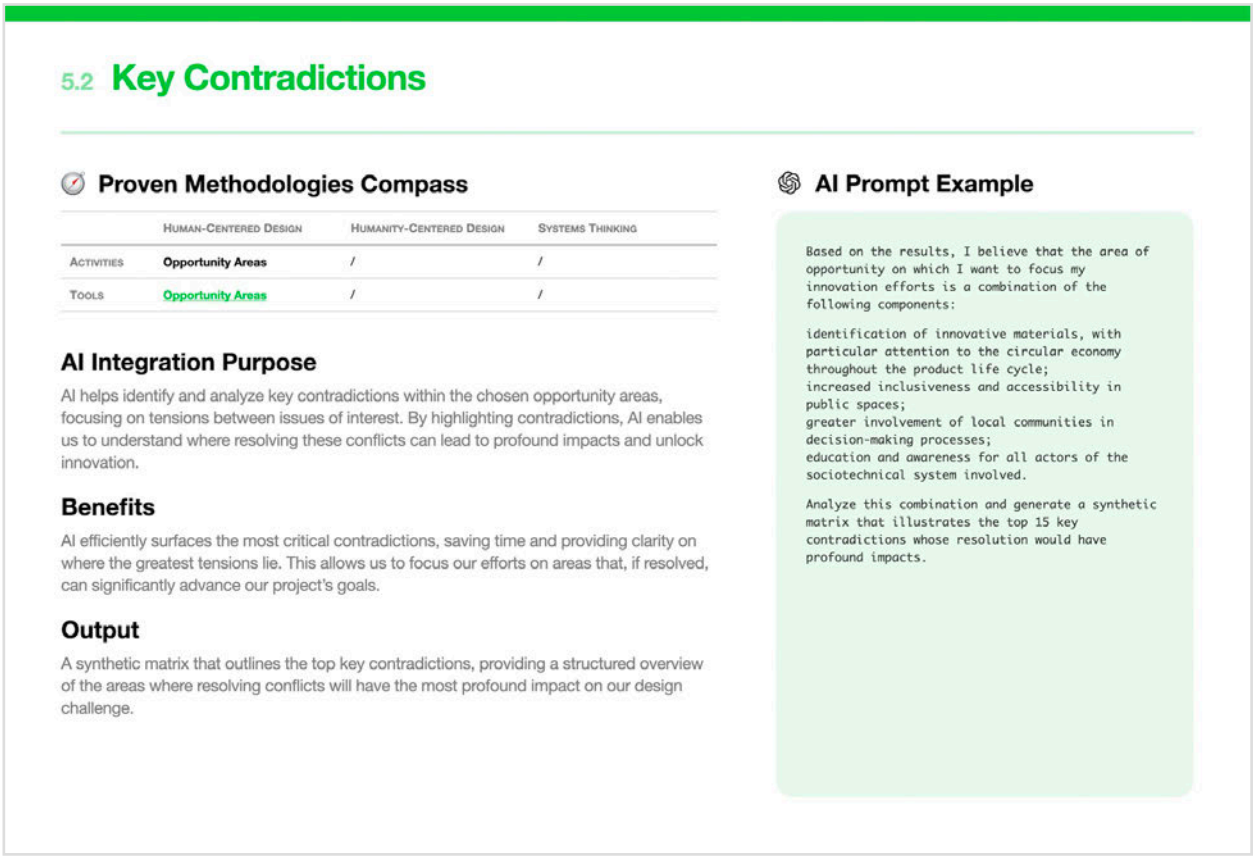

Figure 6. Handbook typical activity sheet, helping designers better integrate the specific step into their workflow.

Following feedback from validation activities, the *Enhanced (AI)nspiration* methodology acknowledged the risks inherent in integrating AI into the design process and embedded solid safeguards to mitigate them. A key risk was over-reliance on AI-generated suggestions, which could undermine critical thinking, empathy and creativity. To mitigate this risk, the methodology emphasized the designer's central role in decision-making, framing AI as a supportive tool rather than a substitute and reinforcing the importance of thorough primary and secondary research.

The methodology also addressed biases and inaccuracies in AI outputs, often stemming from opaque training datasets (a limitation expected to improve with future AI models). It prioritized human-led verification through robust human-centered research activities

(like ethnography, observations, field immersion, etc.) and included prompts to help designers critically assess data and reduce biases. Technological risks, such as irrelevant or erroneous AI responses, were mitigated through verified prompt examples and strategies for tailoring interactions to project needs.

To avoid standardization or homogenization of solutions, the methodology encouraged adapting prompts to specific project contexts, preserving the uniqueness and diversity essential to design. The Handbook also emphasized core values prioritizing cultural sensitivity and innovation, guiding designers to navigate complex challenges responsibly.

By embedding these safeguards, *Enhanced (AI)nspiration* ensured a more dynamic and balanced integration of AI into ethical and impactful design practice.

6. Future research directions

The *Enhanced (AI)nspiration* methodology has current limitations requiring future exploration. Field validation in diverse professional contexts would strengthen its applicability while introducing quantitative business metrics to measure efficiency, impact, and return on investment, which could provide clearer insights into its value for stakeholders. Expanding the methodology to include the Ideation and the Implementation Phases would create a comprehensive framework, bridging research, concept development and execution.

The methodology's dialogic nature could make it a valuable tool in design education, fostering continuous learning and raising awareness about Humanity-Centered Design and Systems Thinking. This potential - particularly in terms of learning outcomes, behavioral changes, and long-term impact - warrants further investigation. Deeper exploration of these aspects could strengthen the methodology's contribution, equipping future designers to navigate complex challenges with a systemic perspective and heightened ethical responsibility.

7. The role of Enhanced (AI)nspiration in design leadership

Designers are increasingly challenged to address systemic, ethical and interdisciplinary demands that traditional methodologies like Human-Centered Design (HCD) alone cannot fully address. This paper introduced the *Enhanced (AI)nspiration* methodology, which builds upon HCD, Humanity-Centered Design and Systems Thinking, integrating Generative AI (AI) as a dialogic partner to navigate the complexity of modern design challenges.

The methodology demonstrated its effectiveness in refining the Inspiration Phase, offering tools to frame problems systemically, manage complexity and align design with long-term societal and ecological goals. Its modular AI prompts, validated through workshops and pilot projects, streamlined research and synthesis, providing actionable insights while preserving the designer's critical role.

Enhanced (AI)nspiration benefits a wide range of users like design students, educators,

product and service designers, strategic designers, innovation teams, and interdisciplinary researchers by empowering them to approach challenges holistically, balancing innovation and ethical responsibility. Future research should expand the methodology's scope, validate its application in diverse industries and explore its impact quantitatively, reinforcing its role in advancing design practice and education.

Further insights will be collected throughout critical discussions on the methodology's structure with the scientific community.

Enhancing Assistive Products for Older Adults with AI: The Role of Artificial Intelligence in Personalization, Independence, and Reducing Stigma.

Subinay Malhotra
Assistant Professor, Industrial Design
Iowa State University, Ames, Iowa, United States

Artificial Intelligence (AI) is transforming assistive products for older adults by addressing the limitations of traditional technologies. Many existing devices, such as walkers, hearing aids, and medical alert systems, lack adaptability and personalization, which limits their effectiveness. These devices often carry a stigma, being visibly associated with aging and dependency. Many older adults hesitate to adopt these technologies due to discomfort with digital tools or unfamiliarity, further diminishing their utility. The absence of universal design principles makes these products functionally and aesthetically misaligned with the diverse needs of older adults globally. AI offers a path to transform assistive products into adaptive, intelligent systems that support independence and dignity for older adults.

A survey assessing AI-powered technologies among older adults revealed that while some seniors had access to these tools, they needed to be sufficiently personalized to meet their individual needs for independent living. Highlighting suboptimal user experience, with smart devices needing to be more intuitive and easier to use. This underscores the need for more intelligent, user-friendly solutions (Sweeting et al., 2024).
AI enhances assistive products by enabling real-time data processing, predictive analytics, and personalized care. Using AI to monitor health data from wearable devices and smart home sensors predicts risks such as falls or medical emergencies before they occur. These systems improve everyday tasks by adjusting lighting to prevent falls, offering voice-assisted reminders for medications, and detecting irregular patterns of movement that may indicate health concerns.

Incorporating universal design principles into AI-driven technologies can reduce stigma and improve product acceptance by making devices accessible, intuitive, and adaptable to a broader range of users. AI-based personalization further enhances user experience, allowing assistive devices to evolve with the changing needs of older adults and fostering greater independence and dignity (MacLachlan et al., 2018).
In conclusion, many existing assistive products for older adults need to be more adaptive and often stigmatize users. AI and emerging technologies offer a promising future by transforming these devices into intelligent, personalized systems that enhance functionality and dignity.

AI in Aging, Smart Wearables for Seniors, Assistive AI Technologies, Fall Detection AI Systems, AI-Powered Smart Homes for Older Adults, Predictive Health Analytics for Aging, Personalized AI Health Monitoring, Universal Design in Aging Tech, Inclusive AI Solutions for Seniors, Digital Health Innovations for Aging Populations.

Addressing the Gaps: The Role of Artificial Intelligence for Aging Populations to Enhance Assistive Technologies

The rapid integration of Artificial intelligence AI into assistive technology products for seniors is growing quickly. With a rapid increase in the senior population globally, expected to exceed 1.5 billion by the year 2050 (United Nations, 2020), personal use of adaptive assistive technologies and smarter systems is in much higher demand. As technology advances, people are getting smarter and much more aware of the new innovations in the technology domain, especially with artificial intelligence technology advancements of how it is helping the global population but neglecting the growing senior population. The most prominent concern is that mostly the younger population is getting exposed to the use of AI. Many algorithms are getting trained by their inputs and not by the seniors as much, which is leading the datasets to not be in sync with the older adults and eventually having inaccuracies in recommendations and inaccuracy with answers or assistance provided to them.(Obermeyer et al., 2019)

The most recent advancements with AI for seniors have been done in the field of predictive healthcare, homes becoming smarter, some prominent categories of mobility aids being enhanced and advancements in the cognitive support systems. Some examples being remotely monitoring health systems which can detect early signs and abnormalities in human beings including neurogenerative disorders and even cardio vascular diseases and also prediction the risk of falls in seniors being the biggest reason for seniors to lose their independence (Alexandru et al., 2022). Tools developed by MIT media Lab such as MemPal provides memory assistance for managing daily tasks for seniors with cognitive impairment(Maniar et al., 2025)

Technologies at home such as smart hone devices have advance fall detection and also monitor emergency situations reducing and even eliminating the need of smart wearable device es by the use of wireless technology which can analyse wave dorms to detect abnormal movements in senior care housing and movement in homes (S. Wang et al., 2019). Furthermore, with the advancement in the autonomous automotive industry, developing and testing the autonomous vehicles, AI powered mobility aids can address reflexes and mobility challenges faced by seniors(Veras et al., 2025). AI is also prominent in enhancing social connectedness by introducing social robots and virtual companions which can engage in interactions with seniors but fail at making meaningful relations for a longer period. There assistive companions can become tools for mitigating loneliness and dependencies while enhancing the need of emotional wellbeing of the rising senior population.

1. Gaps in Recent Advancements: Leveraging Artificial Intelligence to Enhance Assistive Technologies for Aging Populations

On the other side the healthcare sector is advancing with the advancements of AI algorithms to improve medical and clinical decision making. A recent study at Standford's deep AI learning algorithm can assess mortality risks based on patient profiles that further enables in planning for end-of-life decisions and discussions. Also, recent tech enables diagnostic tools that having a huge impact on identifying diseases like dementia through advance speech analysis and MRI scans but all this either remains

in research or not accessible to all with a rage in artificial intelligence overlooking its need for the growing senior population.
Accessing to the recent advancements, the $60 million investment by the national institute on aging is establishing AI collaborators with the Johns Hopkins University in order to develop personalised Ai solutions for seniors (Moore et al., 2019). This collaboration will mainly focus on involving all the stakeholders to work with the advancing AI language and algorithms themselves to train AI with the unique needs off the aging population.

With the advancements in AI specifically tailored for the younger population including kids, there is a lot of recognised advancements but the traditional devices such as mobility aids, example wheelchairs, crutches, and even hearing aids, there are huge challenges and notably not a lot of industries are not working with them in order to advance them by adding the artificial input to make it functionally present for today's times and the times to come. Be it lack of adaptability, limited options of personalisation and even hesitations due to acceptability and stigmatic factors, the aging populations not being addressed particularly(MacLachlan et al., 2018).

AI solutions, that are available as open source, are limited by natural language processing(NPL) for seniors but has the capability to process prompts for solutions real time singing creative intuitive tools that can evolve using personalised senior needs(Chen et al., 2023)

2. Artificial Intelligence: The Emotional and Psychological Impact and prevailing gaps

Social isolation and being lonely are some of the most challenging situations that are faced by senior in today's times that lead to adverse and mental health outcomes. Various researches suggest that prolonged loneliness and social isolation leads to a significant risk of depression connected to cognitive decline and mortality (Holt-Lunstad et al., 2015). Some studies have shown that companionship models using AI can improve the overall well-being of seniors by fostering social isolation and reducing loneliness (Wu, 2022)

2.1 Artificial Intelligence – Emotional connectedness and AI

A product designed specifically for seniors, ElliQ, for examples is a social companion that works on advanced models of AI than the existing google homes and Alexa, engaging older adults by providing reminders, having healthy conversations and also touching the emotional aspects of senior conversations to promote healthy behaviours with seniors (Broadbent et al., 2023). Research also compares AI driven companionship with human interaction bringing an outcome that suggests AI interactions can have similar psychological benefits during the phases of loneliness and depression. Older adults who engaged regularly with AI companions reported reductions in feelings of loneliness and an improved sense of social connectedness in a study by(Anjum et al., 2021)

Despite all these promising results, there are still concerns that remain regarding emotional authenticity and the ability of AI to replicate genuine human relationships with emotions and not just plastic boxes connected to the internet can solve all the prevailing issues related to seniors with emotions and psychological disturbances.

2.2 Artificial Intelligence and the concerns of mental health in seniors.

AI-powered virtual assistants and chat bots offer psychological support by engaging seniors in various types of conversation be it mental health support of catering to their questions or demands, monitoring emotional states and providing solutions when required (Fiske et al., 2019). Beyond companionship, AI has been applied increasingly to support the mental health of older adults. This intern is also benefiting in reducing the symptoms of depression and anxiety in seniors specially with those how have very limited access to the traditional therapies while aging(Tielman et al., 2019)

AI has advanced in the field of emotion recognition that further enhances mental health support by detecting and responding to user's emotional state. Ai-driven models can assess and analyse the tone of voice, facial expressions and various types of language models and adjust resonances accordingly (Tian et al., 2024). However, ethical concerns arise regarding the accuracy of these language models developed with biases and prominent intake by specific user groups in regard to emotion recognition and risks associated with data collection. AI models need to work towards transparent ethical strategies for ensuring accuracy with user content that remains a challenge.

2.3 Improvement in memory and cognition through AI

Decline in human cognition is significant in the aging population that affects memory, problem solving capabilities and even attention. There are advancements in neuroscience and brain training program by the application structured by AI which are gamified and developed to mitigate these challenges (Livingston et al., 2020). Research have proven that AI driven cognitive trading can improve functioning and memory retention with the aging population and a perfect example being MemPal that uses personalized cognitive exercises that enhances individual's performance and responses that offers an interesting and personalised way to maintain the enhanced cognitive function. Detecting early signs of decline and actively responding to them has also been a great part of the AI driven systems monitoring cognitive performance over time.

Larger datasets can be used to understand behavioural patterns by training machine learning modules by even flagging details of onset of neurodegenerative diseases such as Alzheimer's can find deviations and act on them but the effectiveness of AI in diagnostics and treating cognitive decline has a lingering way to go with further studies to prove long term impact (J. Wang et al., 2023).

2.4 Ethical considerations with mental health and AI

There is a significant rise in the ethical, accessible and privacy concerns with AI even after having enormous benefits of its developing models. The key issue remains data privacy as thesis AI models collect a lot of sensitive user information related to health and wellbeing's of the growing senior population (Reddy et al., 2020). Another ethical issue being seniors not able to connect deeply with the ever-growing AI models because of their user experience with systems and subsystems.

The grown aging population is the least familiar with the AI interfaces, Language models and daily advancements which affects their engagement and interaction with this complex technology. Therefore, AI designers, User experience experts and developers should work towards a universal design approach ensuring that assistive technologies are accessible, intuitive, and adaptable to the diverse needs of aging users also taking care of the AI bias that also remains as one of the biggest challenges as the many AI models are trained on datasets that lack adequate representation of older adults, potentially leading to inaccuracies and misdiagnoses (Caliskan et al., 2017).

2.4 Ethical considerations with mental health and AI

There is a significant rise in the ethical, accessible and privacy concerns with AI even after having enormous benefits of its developing models. The key issue remains data privacy as thesis AI models collect a lot of sensitive user information related to health and wellbeing's of the growing senior population (Reddy et al., 2020). Another ethical issue being seniors not able to connect deeply with the ever-growing AI models because of their user experience with systems and subsystems.

The grown aging population is the least familiar with the AI interfaces, Language models and daily advancements which affects their engagement and interaction with this complex technology. Therefore, AI designers, User experience experts and developers should work towards a universal design approach ensuring that assistive technologies are accessible, intuitive, and adaptable to the diverse needs of aging users also taking care of the AI bias that also remains as one of the biggest challenges as the many AI models are trained on datasets that lack adequate representation of older adults, potentially leading to inaccuracies and misdiagnoses (Caliskan et al., 2017).

3. AI-Powered accessible assistance for seniors at home - Aging in place.

3.1 Introduction to AI powered accessibility

There is an increasing need for intelligent smart home solutions and environments for the rising global aging population to enhance independence, safety and a better lifestyle for older adults. And with this need AI powered smart home advancements are on a rise as well by offering more optimised potential solutions that could support the aging population as well by maintaining autonomy and remote access while reducing burden on caregivers.

These smart home solutions include home automation systems, health monitoring devices, fall detection systems and even voice assistants, but they have been always available from almost a decade now and the new advancement is the integration of AI that further is not personalised for the senior population. Despite these technological advancements with the use of AI, there are huge risks and adoption barriers among the aging population that makes it even more important to evaluate and work towards the potential and limitations for the use of AI in smart home system for older adults.
The use if Internet of Things, machine learning and now the long language models with AI should create a personalised and enhanced responsive environment for the seniors

3.2 AI smart home solutions for Aging users

The applications and advancements of Amazon Alexa, Google home and even Apple intelligence are very popular among the younger demographic and is advancing day by day with immense usage by the customers and the Ai models are getting trained faster than ever leaving the aging users behind as they do not have as much input as the younger population.

There are systems furthermore offer gimmicky applications like hands free interactions, voice inputs for small daily tasks like controlling home devices to writing using AI generated models or even correcting the tone of the language, but their application in assisting older adults remains controversial. People with visual impairments and hearing disabilities are still benefiting from the available AI models that can improve accessibility for those individuals with mobility, hearing and visual impairments that further helps

them in living an indented lifestyle but on the other had adoption of such technologies or even awareness is low with the aging seniors. Some of the significant reasons being unfamiliarity with the interfaces or very complex models that even the younger population is not exploring due to ill presence of self-intuitive user expressive with devices and services (Periša et al., 2025).

Studies suggest that research done with voice assistants and senior make them struggle to understand functionality and these models fail, that they do certainly because ion newer updates day by day, due to low vocal projection or wen cognitive impairments. Moreover, privacy concerns related to AI-driven voice assistants, in context to passive listening and data collection, have been cited as significant deterrents to widespread adoption (S. Wang et al., 2019). The current systems to move towards enhancing the accuracy of natural language processing models and ensuring transparent and ethical data policies that intern might be effective for the senior population to latest start adopting AI as assistive technology. Predictive care including remote or live health monitoring represent another crucial application of AI-powered smart home integration for the aging adults.

AI-enhanced smartwatches and wearable sensors now enable live tracking of physiological indicators such as heart rate, and sleep patterns, and oxygen saturation allowing for real-time assessment of health status and early detection of potential medical issues.

Adding to this smart home automation systems are useful but are not targeted towards seniors. Using the specs of the smart home systems enabling automated lighting adjustments, security protocols and even climate control can be personalised to the needs of older adults. For example, AI powered in home smart lighting systems can automatically adjust based on their movement patterns which in turn reduces their risk of fall without much manual intervention and keeping them mentally at peace for living independently. AI powered appliances can regulate room temperatures, notify when food is ready, set reminders, detect any leaks or damage in the house and alter caregivers and remote family members if even doors are open.

Studies prove that smart home systems can improve the quality of life for aging adults by reducing the need for physical exertion and incidents of accident (Marino et al., 2023). But the big gap can be noted where many older adults find it difficult to set up and rely alone with these technologies and now with daily advancements with AI, highlighting the need for more universal and inclusive onboarding experiences and accessible technical support services (Zamudio-Rodríguez et al., 2020)

3.3 Challenges in AI-Integrated Smart Homes for Seniors

Smart home products such as Nest Protect, Walabot Home, and Apple’s Fall Detection feature is enabled by compute vision and advanced algorithms that work digitally with the physical product, machine learning, and motion sensors to identify falls in real time, giving an advantage to inform caregivers or first responders immediate information to rescue a fall.
Studies have shown that AI-based fall detection systems can improve response times and reduce the severity of fall-related injuries by facilitating immediate medical intervention (Vasoya et al., 2023). However, there is a massive gap in understanding the present ecosystem and user experience connected to it as it has not been designed or developed keeping various aspects of the needs of the aging population such as affordability, privacy, language, mental and physical state of seniors and the real-world adoption remains limited due to issues such as false alarms, device accessibility

concerns, and resistance among seniors to continuous monitoring. To enhance the user experience and make seniors trust o these devices, future AI-driven fall detection solutions must prioritise accessible, inclusive and unobtrusive design, personalised user experience with alert systems that can reduce unnecessary distress while ensuring timely intervention when necessary.

4. AI-Powered Health tracking technology for Seniors

4.1 Introduction to the advancements in wearables for health care in Aging.

As the aging population grows, the demand and need for intelligent, AI-enhanced wearable health devices has grown substantially. These intelligent, previously smart, wearables provide predictive future insights, in various aspects of health including cardiovascular health stats, neurodegenerative readings, diabetic overview of the body (Shajari et al., 2023). It is considered that these wearables let seniors to monitor their heath stats from home, reducing the burden on health care providers and systems but professionally working with such brands for over a decade and having that knowledge, either they end up being mimics or because of cost the AI powered systems are not up to the mark for giving accurate data and end up being a lifestyle product that might help seniors in emergency situations.
And with all the advancements, many barriers remain, including cost, digital literacy, usability concerns, brands and solution developers using high quality sensors and even a personalised approach for seniors to enhance their user experience by designing and developing intuitive and inclusive AI powered wearable products. This part of the research focuses on the capability, reliability, challenges, and future directions of AI-powered wearable health technology for older adults.

On one side wearable health technology has undergone significant updates in recent years, with artificial intelligence leading in personalised health monitoring advancements focusing on various chronic diseases and even predictive healthcare and exploring the new sectors where it can be useful in the future. AI-powered wearables provide innovative approaches to promote independence with seniors as that is one of the main aspects that studies prove about seniors, and with the use of these real time diagnostics at home reduces seniors to visit hospitals frequently and take care when the devices suggest by real time tracking.

Advancements in components available now but not used due to high costs of chipsets and sensors of wearables such as biosensors for diabetes, accurate heart monitoring, mental health state medical wearables with a high-end AI model now integrate features including fall detection, heart health management, tracking sleep patterns, and diabetes management to provide active health care systems (Heikenfeld et al., 2018). But integration of heath AI bots that can be accessible to seniors which not only provide live health status but also help them create their diet plans or enhance their daily food intake that in turn affects their health through validated sources, will be an intelligent approach of using Artificial intelligence.

4.2 Market available intelligent Health Monitoring Wearables

One of the most significant contributions of AI in wearable health technology is its ability to provide continuous, passive health monitoring. Devices like as the Garmin watches, Whoop health band and the latest Samsung Galaxy devices with their integrated personalised AI solutions tap into the machine learning algorithms indicate sleep patterns, hearth heath, daily walking steps and even blood oxygen levels, But this was only useful and came out like gimmick features during and post pandemic. Studies also indicate that these special health devices can track and inform about irregular heart rhythms, as atrial fibrillation (AFib), and indicate early warnings for potential cardiac events (Wilmink et al., 2020)

Another big advancement in the neuroscience sector for the human brain activities, AI-models and solutions for electrocardiogram (ECG) features are available and are being tested in wearable devices that allow older adults to conduct mental and physical health assessments without visiting a hospital or doctors, that in turn reduces their medical costs keeping them stress free of the dependency to visit caregivers or

even doctors reducing the stress of thinking about aging all the time.

Real time and all-time glucose monitoring (CGM) systems, such as Dexcom G6 and now the new and refined Dexcom G7 and Abbott's Freestyle Libre, are ready to use and provide analytics to provide custom insulin management suggestions for individuals with diabetes (Demiris et al., 2004). And very prominently brands like Ultrahuman and Noise from India are designing and developing, AI powered smart rings, such as the Luna Ring, that works with the sleep patterns and metabolic data, that was never an aspect that worked on with as wearables are really not the products humans can wear and sleep but products like smart rings are on a finger and not hinder with the daily life activities.

And with the advancement of these flexible chipsets used in these devices, brands are also proactively working with thinner AI engine and apps too provide customised and personalised offering insights into fatigue management, stress management, and overall lifestyle and wellness. These AI powered smart wearable devoices can support the growing senior population toward a better stress free and analytically ready future, that minimises the need for reactive medical interventions. AI-powered wearable biosensors are also gaining attention and being developed on a faster pace with models getting advanced for their ability to predict the future health impacts from their daily activities and identify health risks based on always on real-time physiological data.

Again, With all these products present in the market and advancing, first, these products are not tailored towards the older population, being the ring sizes or even understanding the fatigue of wearing these devises by older adults, that hinders with the product to be effective universally and has an inclusive design and development approach with user experience prominently those who lack digital literacy and cannot cope up with daily advancements and updates (Charness & Boot, 2019).

Accordingly, seniors require simplified user experiences and interfaces personalised to their requirements, larger and accessible displays, and easy to use applications on their smartphones to increase and improve adoption rates. And also, another aspect mention in the previous sectors where AI creates a risk is working on data privacy as these devices, once designed and developed as lifestyle products not are gathering one's personal health data and using them in order to learn but many other factors can let people use this for wrong means and that is why AI powered smart wearables still consists of significant barriers to widespread, inclusive and universal use.

4.3 AI-Enhanced Fall Detection and Emergency Response

Toady with all the technological advancements, even the best caregivers and nurses can't be with different patients at the same time. Even with skilled caregiving professionals present, a resident fall can happen instantly that can have massive disturbing impacts on seniors, caregivers and even hospital organisations. Fall prevention powered by artificial intelligence enhances the peace of mind for busy nursing teams, seniors and even their close ones even if they are constantly motoring their loved lone.

Here a compilation of the smart homes connect to the smart wearable can proactively help in keeping the aging population safe by connectedness to various systems and preventing falls. Falls are one of the most affective causes of injury-related accidents among seniors, that makes fall detection and monitor the epitome of application and use in order to prevent injury-related hospitalisations and Advance AI Systems and wearable devices have significantly improved fall detection accuracy, with machine learning algorithms analysing motion patterns to distinguish between normal movement and a dangerous fall (Thomas et al., 2016). Wearables such as Philips Lifeline Alert and the Apple Watch's Fall Detection, Medical Guardian and many more automatically detect falls and send alerts to emergency contacts and even help in understanding their daily health patterns that could inform seniors to sit when not in the best of health stats throughout the day or night, ensuring faster response times and potentially reducing injury severity.

AI modelled wearable gait analysis sensors are also being designed and developed to assess movements, balance and even walking speed with movement patterns, predicting fall risks before they occur. AI wearable working in conduction with smart homes can suggest preventative measures, assistive device interventions, home environment changes and setup according to the data generated by analysing movement patterns of users to reduce fall risks.
However, false alarms due to no accuracy and brands designing and developing gimmicky models just to earn the first mover advantages have really distracted the industry which makes it a big challenge of what

products can be trusted on to cover come the critical challenge, as many market available fall detection systems fail to differentiate between disturbed routine movements and actual falls such as sitting abruptly or bending down(Abbate et al., 2011). One of the important aspects to think and develop for the wearable fall detection AI is bridging the ability to integrate with smart home ecosystems, family circles, neighbourhoods and emergency response ecosystems. Devices like AngelSense and Walabot Home are designed to automatically trigger voice-assisted calls using artificial intelligence to emergency responders, to make sure emergency services are informed and accessed withe the seniors are not even able to access a phone but needs to be accurate and needs reduction in false alarms. However, discomfort with continuous monitoring, privacy concerns and accurate information still reduces the adoption rates for such solution with the aging population.

4.4 Considerations of Cognitive and Neurological Health powered by AI

Wearables powered by artificial intelligence are being developed to understand and analyse cognitive health, mainly for people at risk of Alzheimer's, Parkinson's disease, and other neurodegenerative disorders New age headbands are being designed and developed under that category of AI powered wearable EEG (electroencephalography), by brands such as NeuroSky and Muse, analysis and predict AI patterns to detect early and ongoing signs of memory decline, neurological decline, mental health analysis. Extremely advanced AI models recognise and run these patterns and create biomarkers to intervene at early stages of such disorders that might help in suggesting lifestyle alteration solutions to slow down disease progression. With the cases of mild cognitive impairment (MCI), AI-powered memory-assist wearables are also being designed and developed to support the growing aging population. Consumer centred products which use voice-based AI assistance such as like MemPal to help users with managing daily schedules, medication or doctors' reminders, reduces their cognitive load on keeping a track of all these aspects of survival daily.

But these devices are either not avail to the masses or do not have accurate responses.
Studies suggests that AI powered memory assistance models can provide a better approach in using these available AI models for training and helping seniors with exercises to help enhance their cognition(Yamada et al., 2024)

Despite their potential, and all the advance technology present, privacy, accuracy and availability to all still makes their adoption very limited and in most of the cases these products are designed throes the lens of lifestyle products do not validated by the medical associations also backed by a really high cost of buying for certain exclusive applications. Advance Clinical trials and proofs are still needed to get up to accuracy of these systems otherwise fit falls in the same category of so many wearables available in the market and only few provide the accurate data with brands like Whoop wearable that is enhancing as a brand and product with validations and proofs of optimised accuracy.

5. Addressing Bias and Accessibility: The Ethical implications of AI and Aging.

One of the major aspects of integrating AI into assistive devices seeking for personalisation is bias in AI-driven technologies tailored for the aging population. It is mainly concerning as we work towards at the aspects that can cater and optimise life during aging such as personalised assistive mobility, health diagnostics, empowerment through wearables and even health monitoring. Artificial Intelligence algorithmic are being updated every second and bias stems from the underrepresentation of diverse aging populations with AI datasets being trained, leading to inaccurate and under assessed and analysed health assessments and forecasting with misinterpretation of actions like movement patterns in AI-powered fall detection systems. to false alarms with wearable tech and even inaccurate health monitoring that we would start relying on keeping the senior population at the forefront of usage.

Similarly, Digital literacy and even user experience with new devices, interfaces and the ever advancing and renewing digital technology (Caliskan et al., 2017). A framework needs to be established where studies can propose an integration of Human centred AI for developers, designers, investors and even policy makers. The stakeholders need to prioritise universal data, privacy algorithms, data security and transparent regulatory compliance that should be available to all to battle the concerns with the advancement in AI for aging.

5.1 Algorithmic Bias in AI-Driven Aging Technologies

There is a need to eliminate bias in AI-driven aging technologies, designers, developers and brands must work with inclusive and representative datasets that should include and implement validated auditing techniques that identify and find differences in algorithmic decision-making. multi-generational AI testing. AI-powered healthcare tools and assistive devices risk exacerbating existing inequalities rather than enhancing accessibility for older populations without these safeguards.
There is an unusual exclusion of the older adults in AI testing phases reasons being, less participation, opposing the use of artificial knowledge that can be connect to less exposure to advance digital literacy. Many AI-based products on the whole even including mobility aids and robotic companion assistants are not tested with the older adults with disabilities reducing their effectiveness in real-world applications(Guo et al., 2020).

Similarly, voice-controlled AI assistants may perform well for younger population as they are using the technology rigorously but restrain to give reliable interactions for older individuals with cognitive impairments.

5.2 AI and Assistive Technologies creating Universal accessibility implications and the integration of empathetic AI driven design and models.

Cultural inclusivity and large language accessibility creates major implications with AI-driven aging technologies. AI-powered products lack the support of linguistic variety of a language globally with speech recognition and does not primarily support for multi-language interactions, limiting their usability for non-English-speaking older adults (J. Wang et al., 2023). To advance AI for the universal population and making it inclusive for personalisation, independence, and reducing stigma.
In addition, interfaces driven by AI designed primarily for Western markets may not accommodate the behavioural expectations, cultural preferences and even emotional connect of aging populations in other regions globally. Ensuring that AI-driven assistive technologies adhere to universal design principles and accessibility standards is essential to enabling broader adoption and equitable distribution of AI benefits after the challenges of digital literacy is solved with these high-end technological terminologies floating the industry.

Furthermore, In a study, emphasise the importance of balancing aesthetics and functionality in assistive technologies for individuals with cerebral palsy and other disabilities where universal design plays a vital role in creating products and services for a larger audience keeping empathy driven innovations at the forefront, which itself has a delusional presence when it comes to AI integrations and how artificial intelligence can connect with emotional and empathetic intelligence that hums hold and highlighting how empathetic design can enhance user acceptance and self-esteem (Oro et al., 2024).

5.3 Ethical Governance and private data for older adults.

There needs to be ethical compliances established for keeping health data secure by creating transparent data policies as the implementation and use of AI technology with seniors can exploit the data that always is under strict norms while visiting docs and clinics and the open use of AI can exploit it. Defining how exactly data can be used stored and collected is very necessary. AI-driven assistive technologies must adhere to strict privacy regulations and policies, such as GRPD and HIPAA, to ensure that health data remains at secure clouds and is only accessible to authorised validated individuals (Reddy et al., 2020).

Also enhancing the user experience with AI powered devices and applications, accessing privacy norms and understanding the transparency or their health data is essential to build trust and encourage seniors to adopt these advancing technologies.

The right to privacy becomes nuanced when we balance the two aspects of benefiting from real time monitoring and predictive healthcare with the interference in the personal lives of seniors.
Exploring the aspects of the advancing tech world provokes people for data breaches, sharing secured information to third parties and the even misusing of AI-driven health predictions compromising privacy as well as the trust needed for widespread adoption for older adults. Emphasising privacy-by-design principles and the integration of ethical AI governance frameworks, transparent data management policies, and user content control models to ensure that AI assistive technologies would live of the aging population without having concerns about security, dignity and independence.

Conclusion

This research explores AI-powered assistive technologies across multiple domains, including predictive healthcare, mobility solutions, wearable health technologies, cognitive support tools, and ethical and privacy incorporated with AI design principles but still studies and existing products and services are either gimmick of the real exploration, advancements and developments or not accessible the drawing aging population. However, thinking and exploring a framework for smart assistive products enhanced by AI is the major component in the broader explanation of ideas.

This research lays down a foundation from critically analysing what exactly is being developed creating a conceptual framework that highlights how AI can be effectively integrated into the lives of the growing senior population to address their unique needs This framework includes principles of personalisation, privacy preservation, ethical data handling, and human centric AI design to ensure that intelligent assistive products are not only functional but also trusted and widely adopted by older populations keeping various explained aspects into consideration.

Also, considering interoperability with existing systems and strategies related to help and lifestyle for reducing the digital divide that often the growing aging world.
Also, the paper talks about the ethical frameworks governed by artificial intelligence reviewing the existing market that can benefit the older population if created, deployed and tested ethically in order to keep senior independence as a major aspect yet using AI ethically and giving the correct product to senior where they can surely benefit and not think about the implications that could arise with the advancement of AI.

The paper also explores the possibilities in areas related to AI-assisted aging, such as emotional intelligence, cross-cultural inclusivity, and adaptive learning for cognitive impairments which will guide future research in the development of more inclusive and ethical AI solutions and also fuel the future designer and developers to keep these implications in mid while designing frameworks around seniors, be it input of varied language, incorporating senior thought process and even testing with them to get the optimal solutions with even the existing products in the market that are not tailored and personalised to seniors but have huge potential.

Also, analysing through the lens of an Industrial designer and a user experience expert, the advanced role of artificial intelligence in assistive technologies for older adults has huge potential but is not given so much attention, emphasising how AI-driven solutions can enhance independence and dignity with older adults. While universal design and stigma reduction are well-established in assistive technology discourse, this research extends beyond these concepts to address critical ethical considerations surrounding AI-driven assistive devices. The integration of AI into intelligent home products and health monitoring systems cannot work independently to provide solutions for the aging seniors and creating a data dump for AI to use meaninglessly. Ensuring transparent data policies, privacy-by-design frameworks, and user-controlled consent mechanisms will be essential to protecting the rights and autonomy of older adults in AI-powered ecosystems.

By addressing these gaps and emphasising varied considerations from emotional intelligence to aging in place, and from smart wearable to advancing AI with a language and ethic that the seniors believe in, this research aims to guide the responsible development and deployment of AI-powered assistive technologies, ensuring that older adults can benefit from innovation without compromising their privacy, autonomy, or

dignity while maintaining their independence.
Creating universal product frameworks and strategies will not only help seniors but also the brands and the market that would benefit from creating meaningful solutions for the aging.

boris.abramovic@univie.ac.at *orhan.onder@marmara.edu.tr

ABSTRACT | As digital tools, artificial intelligence (AI), and robotics become increasingly integrated into healthcare, it is essential to view them not merely in terms of their technical efficiency but as culturally and socially responsive tools that can provide new ways to enhance patient-centered care. One innovative approach is the incorporation of creativity and art-based engagement in healthcare technology, which holds unique potential for more imaginative forms of treatment. Current initiatives that demonstrate how creativity and the arts can inform healthcare technologies include socially assistive robots designed for art therapy, virtual reality (VR) interventions for post-surgery recovery, and patients' experiences with technological art as a therapeutic method, all aimed at psychological and social rehabilitation. In this paper, we explore the opportunities and challenges posed by these emerging technologies by focusing on existing innovations and using anticipatory methods to identify and assess potential future developments in this novel and exciting field. This analysis draws on insights from technology ethics and care ethics, along with considerations of public perceptions regarding such technologies. The ethical considerations addressed include risks to user privacy and autonomy, the growing need for technology to adapt to diverse socio-cultural identities among care recipients, and concerns regarding deception and emotional reciprocity in interactions with these technologies.

KEYWORDS | HEALTHCARE TECHNOLOGIES, ETHICAL IMPACTS AND RISKS, ROBOTS, ART & CARE, IMAGINING FUTURE CARE, CREATIVE EXPRESSION & IDENTITY

1. Introduction

The new ways in which creativity and art-based engagement are integrated into healthcare technologies are promising. Current efforts in this area include pilot studies and prototypes that enhance creative expression

and patients' experiences of art, thereby introducing more imaginative forms of care. These efforts encompass robotic-assisted visual art therapy, virtual and augmented reality for post-surgery pain management, and generative AI music therapy, all aimed at psychological and social rehabilitation. Before these devices fully enter healthcare systems, which is reasonably expected in the near future, it is important to consider their exciting possibilities while also addressing the potential ethical risks they may carry. To examine this emerging landscape, we use a framework informed by care ethics, which emphasizes relationality, attentiveness, and responsibility as core components of caregiving practices (Tronto, 1993; Held, 2006; Gilligan, 2014). Care ethics can guide our analysis by shifting the focus from mere technological efficiency to novel forms of treatment that rely on the inspirational potential of artistic engagement and creative expression, recognizing the relational and emotional dimensions of caregiving at the core of these practices.

Another relevant ethical framework we consider, given the evolving nature and potential role of arts and creativity in healthcare technologies, is anticipatory technology ethics. This framework employs foresight methods to anticipate the future development of certain technologies and their potential ethical and societal impacts (Brey, 2012). Such anticipatory approaches can be particularly valuable for research into emerging technologies characterized by growth and expected impact but still often regarded as risky due to the ambiguities and uncertainties surrounding them (Rotolo et al., 2015). Alongside insights based on these theoretical possibilities, this paper also takes into account public perceptions of these technologies, particularly concerns regarding excessive automation and the depersonalization often associated with AI and robotic solutions in healthcare. As with any new technologies, inherent risks are often only recognized in hindsight. Our analysis aims to anticipate these risks and discuss the ethical challenges they may present. The ethical issues we focus on include risks to user privacy and autonomy, considerations of how these technologies could potentially deceive users, their limited capacity for genuine emotional reciprocity, and how they will recognize and adapt to the diverse socio-cultural identities of patients.

2.The Emerging Creative and Arts-Based Approaches

The incorporation of creativity and arts-based engagement in healthcare technologies is an emerging practice that creates new possibilities for patient-centered care. A key element supporting this outlook is the well-established role of traditional arts-based methods in healthcare, particularly in fostering self-discovery, self-expression, and social identity (van Lith et al., 2013). On this basis, creative and arts-based interventions in technology-mediated care are expected to achieve positive outcomes, especially in psychological and social recovery. While much remains to be explored regarding the direction and full potential of these approaches, research projects and studies are already producing tangible results. One notable example is a participatory pilot study conducted at Aalborg University in Denmark, in collaboration with local Arts & Health partners, which involved joint drawing workshops with a social robot designed to support mental health (Jochum et al., 2024). The study reported positive outcomes related to participants' creative expression and social cohesion (Jochum et al., 2024). Comparable explorations into the health benefits of using robotics for the creation of art include collaborative drawing and painting workshops within the HEART project at Aalborg University (Hansen et al., 2020) and an interactive robotic art installation at the University of Canberra Hospital, both of which demonstrated improvements in health and well-being (Herath et al., 2020). Related solutions are also being developed in the realm of sound, as exemplified by projects such as an auditory environment tailored for people living with neurodivergent conditions, created by the Creative Robotics Lab at UNSW Sydney (UNSW Sydney, 2022). Another promising area is the application of virtual reality (VR), a technology rooted in interactive visual design and often classified within creative technologies, which is showing positive results, including physiological, psychological, and rehabilitative benefits (Ehioghae et al., 2024). In this realm, possibilities are sought in approaches such as therapeutic VR-based devices for the creation of art (Hacmun et al., 2018).

3.Ethical Considerations

In this section, we examine the ethical considerations and potential impacts of current and future healthcare technologies that are based on creativity and artistic approaches. While the focus is on the associated risks, we also discuss opportunities and present strategies for mitigating the identified risks.

3.1. Privacy and Data Issues

Privacy is a core human right essential for preserving our freedom, independence, and dignity. Safeguarding our privacy amid new technologies is proving to be increasingly challenging, particularly concerning personal data protection (Spiekermann, 2015). Public anxieties about data security are heightened by the risks associated with big data analytics, which aim to uncover patterns and correlations within vast datasets (Sagiroglu & Sinanc, 2013). Concerns regarding data security extend beyond big data, given cases involving data breaches and misuse, where third parties can access personal information such as medical records. These issues present significant challenges that can lead to emotional and financial harm for patients (Christl & Spiekermann, 2016). Data security issues are often discussed in hindsight, after harm has already occurred, while the lack of more robust regulations regarding how sensitive information is processed and stored remains a concern.

Such data-related challenges are relevant for future solutions in the design and use of healthcare technology. One significant technological development likely to gain momentum in future healthcare innovations is the personalization of robotics and AI systems. This personalization involves utilizing patient information—such as medical history and cognitive state—to create user profiles that allow systems to adapt their behaviors to the needs of individual users (Onder & Deniz, 2026). For example, a robot caretaker designed for older adults, drawing on user profiles, can provide tailored support by adapting to the patient's cognitive state and specific needs (Rossi et al., 2017). This development is gaining prominence in socially assistive robotics (Butler et al., 2015; di Napoli et al., 2023) and is also attracting more interest in therapeutic VR applications (Belmaqrout et al., 2023). While personalized approaches hold promise in meeting user needs, the associated risks should not be underestimated, as collected data may be prone to leaks or other breaches if there is no responsible data handling and security. This is also relevant for personalized systems in creative technology, such as AI-driven art therapy for mental health recovery, as many of the healthcare devices yet to come are likely to follow the trend of personalization. Therefore, a responsible approach to data collection and handling must be a key consideration for such devices.

3.2. Autonomy, Care Machines, and Our Freedom of Choice

The issue of patient freedom of choice is anticipated to be a relevant matter for future art-based healthcare applications. Studies on public perceptions of new healthcare technologies reveal anxiety that patients may lose control over their healthcare choices, with scenarios such as AI systems making decisions for them (Witkowski et al., 2024). Such concerns regarding some of the current technologies do not seem unjustified. While future devices intended for use in AI-driven art therapy or brain-computer interfaces for patient artistic expression may soon become more prevalent as means for psychological and social recovery, there is a risk that some of them may be designed for over-guidance or overly persuasive input, where the manipulation of patient free will may emerge as a significant concern.

In this regard, the principles of care ethics can offer guidance. This ethical framework, as articulated by Joan Tronto (1993), emphasizes that the act of caring fundamentally challenges the traditional notion of individuals as entirely autonomous or self-sufficient. Instead, Tronto advocates for viewing autonomy in care contexts as relational, underscoring the interconnectedness inherent in care relationships. This perspective can be relevant for the design of future healthcare technologies, including those that leverage creativity or art-based patient engagement. This approach is ethically sound as long as these tools facilitate decision-making in a relational manner while remaining subtle and respectful of individual preferences. Known as nudging, this form of guidance involves non-coercive suggestions aimed at fostering positive outcomes in the patient's best interests (Thaler & Sunstein, 2021). Such nudges are likely to be incorporated into many future creative healthcare solutions, ensuring that technology enhances rather than diminishes the

patient’s sense of agency and choice.

3.3. Users' Culture and Identity

There is a growing need for technologies that are not developed from a single perspective but recognize the diversity of users and the socio-cultural characteristics that shape their identities. To that end, ethical frameworks that emphasize understanding people's social and cultural contexts provide valuable insights. Joan Tronto, in her work "Moral Boundaries" (1993), suggests that good care inherently responds to the vulnerabilities and inequalities experienced by others. This perspective transcends personal realms and extends into public and political spheres, advocating for the recognition of diverse identities and needs as a matter of social justice (Held, 2006; Gilligan, 2014). In the realm of technology-based care, these principles can be leveraged to design systems that are sensitive to users' cultural backgrounds and personal identities. It is not surprising that users appreciate this aspect of technology and are more inclined to trust and accept solutions that resonate with their cultural contexts (Wang et al., 2010).

This approach holds promise for creative or art-based engagement in future healthcare technologies, given the role of the arts as powerful means for self-expression and empowerment, amplifying voices and supporting forms of expression that might otherwise be overlooked due to cultural differences or social marginalization. However, significant risks remain, as the inclusiveness of such technologies mainly depends on design choices and trends shaping the robotics industry, which may lead to failures in upholding diverse identities and instead reinforce exclusions and stereotypes. In light of these concerns, one cannot overlook how biases and discrimination embedded in new technologies are deeply reflected in various domains, including healthcare systems (Kiran et al., 2015). One critical challenge is algorithmic bias, which can lead AI systems to perpetuate stereotypes by relying on skewed data (Ferrara, 2023; Zaga et al., 2023). Consequently, care tools may unintentionally uphold harmful assumptions or fail to consider cultural sensitivities. A related issue is that many technologies are designed with dominant groups in mind, often overlooking the diverse needs of users from various backgrounds. For instance, a VR tool intended for mental health support may incorporate visuals or music that prioritize specific cultural norms, potentially alienating other users. Addressing these challenges requires thoughtful consideration during the design process to ensure that care technologies are inclusive and culturally sensitive, effectively meeting the varied needs of all users.

3.4. Realness of Experiences and the Issue of Deception

Consider a highly realistic VR environment that allows for patient expression through immersive experiences, such as the three-dimensional creation of art (Hacmun et al., 2018). These therapeutic environments can be particularly effective due to the immersion resulting from high levels of realism that many patients may find pleasant. However, such devices have the potential to deceive users by immersing them in experiences that feel authentic or emotionally impactful but lack the quality of realness inherent in actual life interactions. In particular, VR can blur the lines between reality and simulation, especially as heightened realism becomes a trend, including strategies that provide users with the sensation of inhabiting another body (Yee & Bailenson, 2007).
The deceptive potential in VR and similar technologies, like the Metaverse, raises concerns about the authenticity of interactions that occur in such healthcare applications, which is also relevant for further creative or art-based methods in this area. Perspectives in technology ethics caution that experiences with technologies, particularly care robots, may never fulfill our true needs and desires, which are inherently tied to authentic interactions found only in the real world (Sparrow & Sparrow, 2006). Conversely, some scholars argue that not all technology-mediated experiences are disconnected from reality, and that even virtual interactions can carry a significant degree of realness depending on context and actions (Brey, 2020; Coeckelbergh, 2016). Supporting arguments for such realness in VR imply that certain virtual experiences can possess an embodied quality and social aspects similar to those found in the physical world

(Coeckelbergh, 2016). Such perspectives can be important for regulatory frameworks that will guide the design of future healthcare technologies, as addressing issues of deception and realism is crucial to prevent adverse consequences and ensure that users are not misled.

3.5. Reciprocity of Emotion in Robotic/AI Care

One deceptive aspect of robots and AI in care contexts is that the emotional reciprocity these technologies provide to humans is often more automated and far from the genuine reciprocity found in human-to-human relationships. For instance, consider robots that guide patients through art-based rehabilitation, such as drawing or painting interventions aimed at psychological and social recovery. While these experiences are underway with the potential to improve patient well-being, there are occurrences generally deemed undesirable, such as patients forming emotional attachments to the robots they interact with—an outcome often reported, particularly during long-term human-robot interactions. However, machines cannot genuinely reciprocate feelings, making such human sentiments toward robots inherently one-sided (Turkle, 2007). This reflects public perceptions that machines in healthcare will only be able to offer automated types of interactions while simultaneously detracting from patients' much-needed human connections (Witkowski et al., 2024).

The concept of reciprocity in human-to-human care is explored in care ethics, emphasizing that good care relies on mutuality, responsiveness, and recognizing others as moral subjects (Tronto, 1993). Such criteria for good care, however, appear challenging for technologies like AI or robots to fulfill. While some argue that AI technologies can be viewed as relational and socially engaging, any sentiment directed toward them remains unreciprocated (van Wynsberghe, 2013, 2020). Nonetheless, scholars suggest that the lack of more genuine reciprocity in AI-driven care should not dismiss these technologies as unethical or unsuitable for future practice. One argument is that we should not idealize human care over technological alternatives, as human care often lacks deep emotional engagement due to high patient-to-carer ratios and other shortcomings associated with public health services. Another point frequently raised in discussions about the future of healthcare is that while current AI systems are limited in their capacity for reciprocity, they may be equipped with more advanced emotional capabilities as technology evolves (Coeckelbergh, 2010). The prevailing view among scholars and the public, however, is that these technologies should not replace human medical professionals in roles requiring deep engagement (Onder, 2025). Instead, they should serve as supportive tools that enhance human work in various medical settings (van Wynsberghe, 2020). These perspectives can inform the design of such technologies, including future art-based applications in healthcare.

4.Discussion

Unlike many technological solutions that often overlook human experiences, those based on creative approaches, such as creating art with robots or experiencing patient-tailored sound environments, can broaden treatment possibilities beyond mere utility and efficiency. Nonetheless, the inherent risks associated with such technologies, as discussed in this paper, are anticipated to persist, particularly those concerning user privacy, autonomy, and socio-cultural identity. Future efforts to address these risks will hinge on the development of more robust ethical and regulatory frameworks governing the responsible design and use of technology, ensuring that devices are safe and transparent, allowing people to better understand their abilities, intentions, and limitations (Wortham et al., 2017). As arts-based treatments evolve, particularly with novel creative and experiential possibilities offered by advancements that are continually emerging, ensuring emotional safety and cultural sensitivity will remain crucial.

Even risks discussed in this paper that may appear abstract and thus harder to regulate in terms of legal and ethical principles, such as machine deception and the absence of genuine emotional reciprocity in robots and AI, are expected to be subject to sharper regulation as these considerations are already addressed to some extent in ethical and regulatory frameworks regarding technology design (Boden et al., 2017). Furthermore,

as users become more tech-savvy, they will be better equipped to recognize and counteract issues like deception. It is expected that new features of such devices, such as VR or similar technologies, will allow users to gain control over the realism of these tools, enabling them to calibrate the level of deception (Slater et al., 2020). Future designs in this emerging area are anticipated to focus on addressing ethical risks while emphasizing relational and experiential aspects of care, thus fostering innovative approaches and devices that remain sensitive to users' personal spheres and contribute to improved health outcomes.

5. Conclusion

In envisioning the future of healthcare technologies, one can anticipate both the transformative potential and the inherent challenges, including those that may be specific to creativity and art-based interactions. By embracing artistic methods and ethical perspectives, we can navigate potential risks and enhance the experiences and imaginative potential that these technologies can cultivate for patients. This approach holds the promise of fostering new opportunities for more personalized and patient-centered experiences.

Ethical Design: Auxetic Patterns and Sustainable Customization

María PÉREZ-RIPOLL, Rafaela MORALES-MORALES, David MÍNGUEZ-GARCÍA, Jaime GISBERT-PAYA***
***Universitat Politècnica de València, Camí de Vera s/n, 46022 València, Spain, Email: jaigispa@txp.upv.es**
****EASD Valencia, Calle del Pintor Domingo, 20, 46001 Valencia, Spain, Email: mperez@easdvalencia.com**

Abstract

This research explores the integration of ethical, sustainable, and user-centric design principles in advanced technologies. It highlights the innovative use of auxetic geometries and laser-cut patterns in garments like bras, enhancing adaptability to diverse body shapes. Through 3D software simulation, users can preview customized fits before purchasing, improving user experience and reducing returns.

This study promotes sustainability by simplifying bra sizing through the use of auxetic patterns, which help minimize excess inventory and reduce environmental impact. Thanks to the prior digital simulation, the personalization for each specific customer not only enhances the fit but also increases the durability of the garment over its lifespan, as the auxetic geometries allow the bra to adapt to the user's body changes over time.

By applying these innovations in digital ecosystems and exploring their role in shaping user-centric, sustainable products, this study contributes to discussions on the ethical dimensions of design, specifically in the context of advanced digital tools.

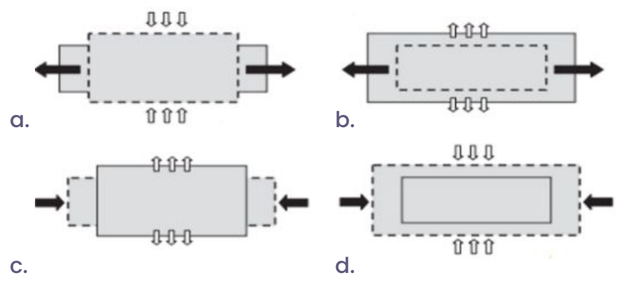

Figure 1: Fig. 1. Tensile/compressive behaviour of materials: a, c - conventional materials or fabrics; b, d - auxetic materials or fabrics.

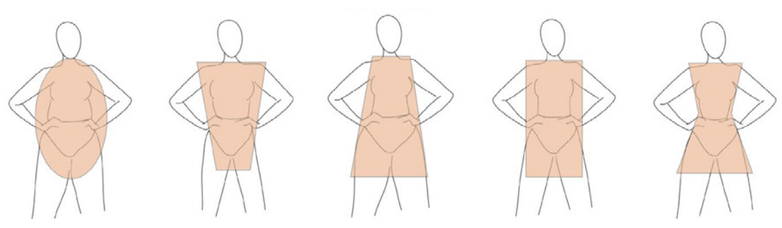

Figure 2: Shapes adaptations.

1. Research Objectives

The main objective is to demonstrate how auxetic patterns improve the adaptability of bras to diverse body shapes, allowing a single base pattern to fit multiple sizes and thus reduce the necessary stock. .

We aim to evaluate different auxetic geometries to determine which provides the best performance in terms of adaptability and comfort.

Another objective is to explore the customization of garments using these geometries as a functional design resource, leveraging digital 3D customization tools beforehand.

2. Methodology and Tools

• The research uses 3D simulations of garments with different auxetic patterns and with avatars of different sizes.

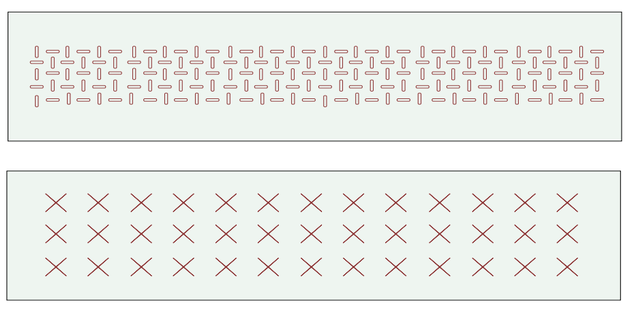

Figure 3: Auxetic geometries applied to patterns

• Physical prototypes of laser-cut patterns are made to verify the correspondence with the digital simulations.

• Clo3D design software is used for simulations, and elastic fabrics composed of 82% polyamide and 18% elastane are used.

3. Research Process

The process begins with the study of potential auxetic geometries. Two selected geometries are tested in the same position on the same fabric. Physical prototypes are created using laser-cut patterns. Finally, the results of simulations on digital avatars and tests on mannequins are compared to validate the behavior of the geometries.

Subsequently, different positions of the geometries will also be tested, and their comfort and adaptability will be evaluated.

4. Expected/Obtained Results

• It is expected to demonstrate that 3D simulations can accurately predict the behavior of auxetic geometries in physical prototypes.

• It seeks to validate that a single base pattern with auxetic geometry can adapt to multiple sizes.

• The research anticipates that the ability of 3D simulations to accurately predict the behavior of auxetic geometries will reduce pre-consumer waste, as the individual purchases a base pattern that is scanned and adapted in-store to fit their specific body. This approach eliminates the need for excessive pre-made inventory and significantly reduces stock requirements.

Figure 4: Models 1 and 2. 3D prototyping of garments with auxetic geometries. Final result on real garment. Detail of the cut of the geometries on the garment.

5. Ethical Issues in the Textile Industry

• The research addresses ethical issues such as the lack of body positivity and the tendency of brands to design only for standard bodies.

• It confronts the problems of overproduction and excessive stock, as well as the high level of pre-consumer waste of unused finished products.

• This project aims to reduce these problems by proposing a customization system that adapts to different bodies and reduces mass production.

• **This research paves the way for a transformative approach to textile design, reducing environmental impact and advocating for true inclusivity.**

Exploring Cultural Ethical Boundaries of Generative AI in Fashion: The Participatory 'CulturalDNA Blind Test' Audit Framework

Yujia Liu[a], Yinchun Zang*[b],

a,b Tsinghua University
*yingchun71@126.com

ABSTRACT | This study proposes a "CulturalDNA-BlindTest" participatory workshop framework. Through a three - level progressive experiment, it explores the cultural and ethical boundaries of generative AI. A modular design system is constructed, with a random combination of various templates and models, making participants active reviewers of AI ethics. The experiment uses a three - party evaluation interface based on generated results and cultural prototypes, including visual and semantic matching and open - ended interpretation, to form an adversarial verification cycle. The core innovation is to couple physical interventions (cutting / pasting/drawing) with the digital regeneration process, creating a dynamic observation field for the transfer of creative rights. Through algorithm transparency adjustment experiments, it examines the impact of algorithm transparency on the accuracy of cultural attribution, the effectiveness of participatory review in revealing implicit biases in commercial AI systems, and the reinforcement of ethical awareness through tactile interaction. This framework is scheduled to be implemented at CumulusNantes2025. It is expected that the evaluation protocol can capture the cross-cultural perception mechanism in algorithmic aesthetics,

providing a mixed methodology for detecting cultural biases in generative systems.

KEYWORDS | PARTICIPATORY REVIEW, GENERATIVE AI, ALGORITHM TRANSPARENCY, CULTURAL ATTRIBUTION, TACTILE INTERACTION

Description

This experimental framework proposes a three-stage adversarial workflow to investigate the dynamic interplay between human creative agency and algorithmic cultural homogenization in fashion design systems. Structured as a 30-minute interactive workshop for 15-25 participants at CumulusNantes2025, the protocol employs a hybrid physical-digital environment where designers engage with AI systems through iterative intervention cycles.

First Phase (Generative Baseline Phase): Participants first assemble design prototypes without specific cultural inclinations using modular components (10 geometric contours + androgynous mannequin - Figure 1). Then, these prototypes will be processed through an AI pipeline that randomly combines 10 fine-tuned pre-trained models(Ma & Chung, 2024) (based on Stable diffusion - Flux) via an image-to-image generation process. Real-time metrics track the Design Intent Preservation(Li, 2024) through participants' self-assessment (using a 5-point Likert scale)(Norman, 2010). Meanwhile, an expert panel quantifies the Model Characteristic Intrusion by evaluating and comparing the output results with the characteristics of known training data.

Second Phase (Interventional Compensation Phase): A physical interference protocol is introduced - participants physically modify the basic designs through cutting, collage, or hand-drawing to introduce more subjective characteristics, compelling the AI system to reconcile these subjectively generated factors during the synthetic generation process. The evaluation part of the first phase is repeated. Quantitative analysis measures the "resistance" degree of the algorithm through the deviation of the Style Consistency Index.

Final Phase (Cultural Provenance Verification Phase): A triple-blind verification is implemented: The image-matching group matches the original output results with cultural prototypes in image form; the label-matching group matches the generated results with a cultural feature label library; the free-description group collects participants' spontaneous cultural associations with the output results. Key innovations include the adversarial loop architecture (human interference → AI regeneration → counter-intervention) and a mixed-reality verification matrix that correlates physical intervention traces with digital feature residuals.

Ethical monitoring(Memarian & Doleck, 2023) focuses on three aspects: 1) Algorithmic Suppression Rate (the frequency at which human interventions are eliminated or weakened); 2) Cultural Dominance Index (the proportion of hegemonic aesthetics); 3) Creative Agency Transfer Coefficient (the decision-making path dependence of participants across iterations).

The core advancement of this framework lies in its "Cultural DNA Decoder" mechanism - a hybrid analysis engine that combines computer vision-based pattern matching (quantifying cultural appropriation through feature similarity metrics) with natural language processing (NLP) (Wu et al., 2023) -driven semantic analysis of free-response narratives (calculating the cultural attribution dispersion through word embedding variance). By integrating manual craft processes (scissors, glue, markers) into the digital regeneration pipeline, this experiment creates a tangible observation field for tracking the transfer of creative authority.

Anticipated outcomes include a transparency gradient model that correlates algorithmic explainability with cultural attribution accuracy, and a bias detection matrix that reveals how commercial AI systems encode regional aesthetic preferences through latent space

geometries. The workshop will conclude with a tactile ethics interface where participants physically reconstruct AI outputs using mixed-media materials, leaving material traces for subsequent computational analysis of human-AI aesthetic negotiation patterns.

From Sketches to AI: Enhancing Early-Stage Co-design with AI-Extended Visual Thinking Tools—An Empirical Research of Remote Multidisciplinary Teams

Tongwen Sun[a], Yunlu Liu[b], Mingshuo Zhang[a], Wen Chen[a], Min Fang[a], Chaohui Yang[a*]

aSchool of Art, Soochow University
bThe School of Design, Faculty of Arts, Humanities and Cultures, University of Leeds

ABSTRACT | This study investigates the impact of AI-enhanced visual thinking tools on the efficiency, creativity, and collaboration within remote, multidisciplinary teams during early-stage design phases. The research adopts a mixed-methods approach that integrates a comprehensive literature review, expert interviews, and a formal experiment. The experiment involved 28 participants from various disciplines, including 7 subject matter experts, who were recruited based on GPower analysis to ensure sufficient statistical power. A multi-phase experiment was conducted to evaluate the effectiveness of AI tools in improving collaboration efficiency, task completion times, and creative output,

while also exploring ethical considerations related to fairness and trust in decision-making processes.

To assess the effectiveness of these tools in early-stage remote multidisciplinary team collaborations, the research utilizes GPower for a one-tailed paired sample t-test power analysis. The findings indicated that with α = 0.05 and an effect size of d = 0.5, a minimum of 27 individuals was required to achieve a statistical power of 0.8. A total of 28 participants from various disciplines and 7 subject matter experts were recruited. The experimental design was refined via expert interviews to guarantee the rationality and viability of the method and theoretical framework. The participants underwent a multi-phase experiment. Data on alterations in participants' cognitive states were collected using qualitative and quantitative methods, including observation, interviews, and questionnaires. The normality of the data distribution was assessed by skewness and kurtosis values. T-tests were employed to evaluate the significance of differences in the experimental data, whereas PLS-SEM was utilised to analyse the structural interactions among variables. Triangulation analysis was employed to validate the dependability and consistency of the research findings by juxtaposing quantitative data with qualitative comments.

The findings indicate that AI tools significantly improve task completion times, increase creative output, and enhance collaboration efficiency during early-stage design tasks. However, these tools may also affect the depth of discussions and consensus-building processes, with implications for fairness and the inclusion of all team members' contributions. The study underscores the value of AI tools in enhancing the efficiency of remote team collaboration, while also emphasizing the need for careful consideration of their ethical and practical impacts in multidisciplinary settings.

KEYWORDS | AI-Enhanced Visual Thinking Tools, Co-design, Remote Team Collaboration, Initial teamwork

1. Introduction

Our society is confronted with intricate socio-technical challenges that are inherently multidisciplinary. Collaborative endeavors such as co-design, which involve participants from diverse fields, are deemed a promising approach to addressing open, complex, dynamic, and networked issues (Wang et al., 2022). Particularly in the initial stages of a project, collaboration among cross-functional teams is crucial for ensuring the comprehensive definition of the project (Yin et al., 2023). However, discrepancies in understanding the expected outcomes often lead to ineffective collaboration and wastage of resources (Senescu et al., 2013). As technology advances and project complexity grows, visualization tools like sketches and models have become increasingly recognized as vital for enhancing team collaboration and communication efficiency (Whyte et al., 2008). These tools support design thinking through graphic representation and structured thought, aiding team members in a more profound understanding and organization of information (Goldschmidt, 1994). Visual thinking, facilitated by these tools, promotes creativity, problem-solving, and knowledge construction, and effectively advances communication, decision-making, and knowledge sharing across multidisciplinary teams (Atilola et al., 2016). Recent studies have discovered that Artificial Intelligence (AI) can act as a visual stimulus, providing random and unexpected conceptual elements to spark creativity and lateral thinking (Chen et al., 2019), thus

offering possibilities for AI to enhance visual thinking tools (Sreenivasan & Suresh, 2024; Schmitt & Weiß, 2018).

This research hypothesizes that AI-augmented visual thinking tools could significantly enhance the efficiency of remote collaboration among multidisciplinary teams, especially during early-stage design phases. Although visualization tools are widely utilized in design practices, their specific impact on team dynamics and outcomes has been less explored (Mou, 2024). Consequently, this research empirically analyzes the impact of AI-enhanced visual thinking tools on collaborative efficiency, while concurrently examining their potential ethical implications in team collaboration. It aims to explore how to balance the tension between efficiency gains and ethical considerations in practical applications, providing an academic foundation and practical guidance for multidisciplinary teams to better utilize AI tools in remote collaboration.

2. Formatting rules

The proven benefits of team diversity significantly enhance the formation of innovative collaborative models, as evidenced by Rosen (2009). This advantage is particularly pronounced in the practice of design thinking, which predominantly relies on collaborative activities necessitating effective communication mechanisms and visual expressions for the co-construction of knowledge (Carlgren et al., 2016; Bresciani, 2019). This has led to the development of visual thinking as a core cognitive and communicative paradigm in design practices. Especially in the early stages of a project, team members often hold different mental models or interpretations of objectives, solutions, and processes. Ideas at this phase tend to be vague and abstract; however, visual outputs such as sketches, mock-ups, diagrams, and low-fidelity models help concretize these ideas, facilitating their discussion and manipulation in collaborative settings (Jansen et al., 2023; Yang et al., 2019; Goldschmidt, 2007).

Research indicates that the requirements for visual representation tools vary across different design stages, stemming from the dynamic evolution of task objectives, collaborative modes, and levels of information abstraction (Whyte et al., 2008). Particularly in the early stages of design, there is an emphasis on ambiguity and divergent exploration, yet this intentional maintenance of ambiguity must be delicately balanced with the clarity of information transmission. Tools should support unstructured expressions such as low-fidelity sketches and mock-ups(e.g., LEGO), employing flexible media like whiteboards and paper sketches to facilitate cross-disciplinary empathy and open-ended iteration (Jansen et al., 2023; Yang et al., 2019; Ranscombe et al., 2017). However, while deliberate ambiguity can foster divergent exploration, it may also lead to misunderstandings within multidisciplinary or cross-cultural teams (Casakin & Badke-Schaub, 2017; Nik Ahmad Ariff et al., 2012). Although previous research has achieved partial success in bridging disciplinary gaps through visual tools (Graell-Colas & Gill, 2008; Goldschmidt, 2007), effectively integrating complex information within diverse knowledge backgrounds remains a challenge, especially when addressing contextual differences and communication barriers (Casakin & Badke-Schaub, 2017).

Artificial intelligence(AI) offers new solutions by alleviating communication barriers through the standardization of conceptual exchange hubs (Marshall, 2009) and stimulating creativity with random conceptual elements as a source of visual stimulation

(Chen et al., 2019), demonstrating its potential as a tool for extending visual thinking (Sreenivasan & Suresh, 2024; Liao et al., 2020). Generative AI transforms shared visual elements through language prompts, producing diverse representations swiftly while lowering technical barriers (Verheijden & Funk, 2023; He et al., 2024), effectively balancing divergent thinking with the need for semantic convergence, and supporting equitable participation in asynchronous collaboration (Han et al., 2024; Gonzalez et al., 2024).

Although current research has made certain advancements in enhancing creativity and collaboration through artificial intelligence, significant limitations remain. Most studies focus on single disciplines or localized collaborative design scenarios (Guridi et al., 2024), with few exploring the mechanisms of collaboration within multidisciplinary remote teams and lacking a systematic framework that integrates generative AI, visual thinking, and online collaborative design. The potential value and applicability of artificial intelligence in the initial creative phases of design practice have not been fully explored (Stoimenova & Price, 2020), posing new challenges for existing models. The existing literature not only lacks a thorough analysis of potential AI ethical risks in multidisciplinary collaboration, such as algorithmic bias and power dynamics (Guridi et al., 2024), but also significant gaps remain in the integration strategies of synchronous/asynchronous tools (He et al., 2024; Shin et al., 2022), and an evaluation system that balances collaboration scaffolding with efficacy has yet to be established.

These research gaps reveal a three-tiered need: firstly, to develop cognitively adaptive and scalable collaboration systems to handle complex remote collaboration scenarios; secondly, to establish ethical safeguards throughout the multidisciplinary collaboration process; and lastly, to develop a novel evaluation framework. This framework should consider key dimensions such as role clarity of team members, the rationality of goal setting, collaborative efficacy, and AI tool adaptability. It should also empirically verify its accuracy in capturing the dynamics of collaboration and their impact on team efficacy and experience. The coordinated advancement of these dimensions will effectively address the structural contradictions between technological integration, ethical governance, and evaluative validity in current research.

3. Methodology

3.1. Research Design

This study employs a multi-stage, mixed-methods approach incorporating both qualitative and quantitative research techniques. In the first phase, a comprehensive literature review is conducted to systematically examine and analyze the current applications of artificial intelligence in cross-disciplinary design collaboration, the design field's demands for AI applications, and the potential of AI in design collaboration. The second phase involves interviews with experts and researchers from fields including artificial intelligence, experience design, cross-disciplinary collaboration, brand design, and statistics, in order to establish the influencing factors and evaluation criteria for "AI-enhanced visual assistance tools in remote team collaboration," based on the findings from the literature review (see Table 1). In the third phase, a small-scale pilot experiment is carried out to validate the feasibility of the experimental procedure and task setup. The fourth phase consists of the formal experiment, which integrates quantitative methods, surveys, and qualitative observations to provide a comprehensive assessment of the

impact of AI tools on team collaboration effectiveness.

Table 1. Dimensions of Team Collaboration Evaluation

Serial No.	Dimension	Indicator	Explanation	Sensory-Team Experience Dimension	Utility-Tool Adaptability Dimension	Collaboration-Efficiency Dimension
1	Individual Psychological Burden	Cognitive Demand	The mental and perceptual effort involved in completing a task.	✓		
		Physical Demand	The physical activity level and intensity involved in task completion.	✓		
		Time Demand	The perceived time pressure experienced during task completion.	✓		
		Workload	Perception of workload during collaborative tasks.	✓		
		Self-Efficacy	Confidence in successfully completing a task.	✓		
		Frustration	Feelings of insecurity or frustration (opposite of security or satisfaction).	✓		
2	Ease of Use	Willingness to use the tool（26）	Degree of willingness to use	✓		
		Complexity, 27	Perception of complexity	✓	✓	✓
		Convenience of use (28, 29)	Tool usability perception		✓	✓
		Functional (30)	Satisfaction with different levels of functional integration		✓	✓
		Consistency (31)	Perceived response consistency			
		Learning (32, 35)	Perception of difficulty level in	✓		✓

			learning			
		Confidence (34)	Confidence level when using tools			
		Obstacles to use (33)	Difficulties in use	✓		
3	Usefulness (Quality of Experience)	Reliability	Accurately fulfilling its functions	✓		
		Responsiveness	Quickly, efficiently, and smoothly execute tasks or provide responses		✓	
		Ensure	Give users trust and confidence in using	✓		
		Tangibles	Accurately conveying and facilitating better understanding and communication of collaborative content		✓	
		Empathy	The information provided can meet and consider the collaborative needs of users	✓	✓	
		Value	The positive impact of team collaboration or individual efficiency and experience	✓	✓	
4	Collaborative experience	reativity and flexibility	The level of creativity and flexibility in the team		✓	✓
		Ability to adjust and modify	The degree to which visualization projects can be dynamically changed		✓	✓
		Clear and guiding ability	Clarify and focus on core information and key content		✓	✓
		Integrity and wholeness	Visual cues suggest the degree to which the project has been completed		✓	✓
		Accuracy of information	The clarity of visualization results		✓	✓

		and clarity of relationships	provides quick understanding		
		Collaboration support and team experience	The degree to which visualization controls the process of group discussions	✓	✓
5	Work efficiency	Task completion time	The total time required for each part of the project from start to completion		✓
		number of iterations	The number of rounds of modifications or improvements experienced before the project reaches its final state		✓
		Design Quality Rating	Evaluation of project design quality		✓
		Outcome output	The specific amount of results generated after the completion of the project		✓
		Reaching consensus (debate+speed)	Measure the efficiency and speed at which a team achieves shared decision-making in situations of disagreement.		✓

3.2. Participants and Sampling

- Expert Interviews

To identify common pain points in remote team collaboration, recognize key factors that may affect the efficacy of AI-assisted visual tools, and gather insights on the design processes and evaluation criteria in brand upgrade tasks, the researchers, building on a literature review, developed expert interviews following the questionnaire design guidelines of Gläser and Laudel. Using a standard sampling method as outlined by Patton (2002), seven experts from relevant fields, either practitioners or researchers, were invited for semi-structured interviews. These experts were recruited through the research team's

industry and academic networks and provided informed consent prior to the interviews.

- Formal Participants in the Experiment

Based on expert interviews and the results of the pilot study, this research employed GPower to conduct a power analysis for a one-tailed paired sample t-test. The results indicated that, with $\alpha = 0.05$ and an effect size of $d = 0.5$, at least 27 participants were required to ensure a statistical power of 0.8. A total of 28 participants were recruited from various disciplines and divided into seven groups, with four participants in each group. The groups included members from the fields of design, economics, business administration, and psychology, ensuring a realistic simulation of cross-functional team collaboration. One group consisted of pilot study participants.

- Materials and Tools

This study conducts experiments on the "Boardmix" cloud collaboration platform, which integrates AI plugins (https://boardmix.cn), utilizing Tencent Meeting for video recording and remote communication, and employs "Wenjuanxing" to design post-experiment questionnaires.

3.3. Experimental Design

The experimental design adheres to the Double Diamond Model proposed by the British Design Council in 2005. In order to align with the early-stage context, the experiment primarily focuses on the first two phases: Discover and Define. These phases are further divided into four distinct components: problem identification, problem refinement, solution exploration, and solution specification. Each component is represented by an interactive area on the Boardmix platform (Figure 1), which facilitates the deepening of visual thinking and the systematic recording of experimental data.

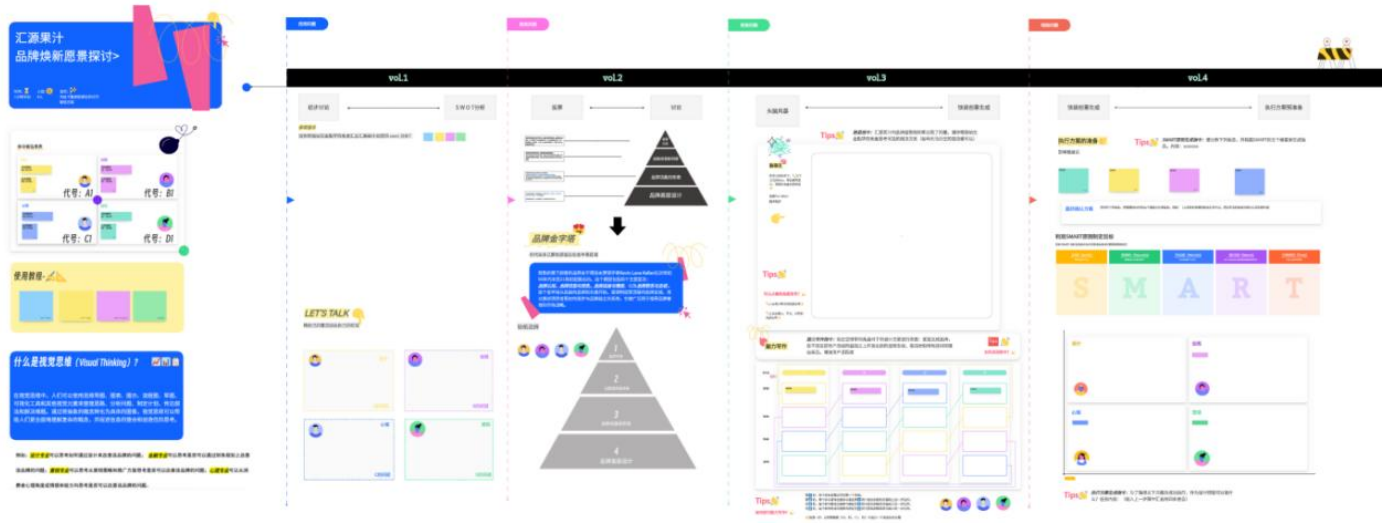

Figure 1. Interactive Area Diagram Constructed by "Boardmix"

The experimental design follows a within-subjects approach, comparing two conditions: one utilizing AI-assisted tools for design and the other relying on traditional remote collaboration methods. Each group of participants is required to complete two collaborative design tasks: one

using only the traditional visual thinking tools provided by the online collaboration platform, such as sketches, drawings, models, and stickers (referencing Eppler & Burkhard, 2007; Gonçalves et al., 2014), and the other incorporating AI-supported visual thinking tools in addition to the traditional ones. To mitigate learning effects, each group performs two distinct but similar tasks on the same collaborative platform. To counterbalance order effects, the experimental sequence (1. No AI – AI; 2. AI – No AI) is randomly assigned across six experimental groups, ensuring that the effectiveness of AI tools in multidisciplinary remote collaboration is not influenced by the sequence of tasks. Upon starting, participants engage in online discussions to share experiences and observations, followed by approximately ten minutes of divergent discussion.

To enhance the academic rigor and practical relevance of the study, a series of structured action plans were employed, and functional interactive panels were created for each testing phase within the Boardmix platform. These panels provided spaces for participants to post their ideas. Before each task, the researchers introduced a fictitious brand facing developmental challenges and needing a brand revitalization. Participants were then provided with relevant information and used sticky notes representing their roles to add ideas to the corresponding interactive panels. In the event of disagreements during group discussions, consensus was reached through anonymous voting. Upon completion of both rounds of testing, two comprehensive brand strategy proposals were produced, one of which was collaboratively developed with the assistance of AI tools.

The researchers (moderators) recorded the entire testing process using mobile devices and screen recording tools. Each session lasted approximately 30 to 50 minutes. To ensure participants clearly understood the task flow and relevant information, detailed instructions were provided before each session and task. At the end of the test, participants completed a questionnaire consisting of 35 questions, enabling the researchers to gather precise and detailed feedback.

3.4. Data Collection

Data collection is divided into two parts. The first part involves the experimental data obtained through the researchers' observations and records during the experimental process. The second part consists of quantitative data collected via questionnaires completed by participants after each experiment.

- Experimental Data

The experimental data primarily comprises records made by the researchers during the experiment and is further validated through a review of these records post-experiment. The key variables assessed include:

1. Task Completion Time: In the context of collaboration, task completion time is a crucial indicator for assessing the effectiveness of tools (Dennis & Valacich, 1999). Accordingly, the researchers recorded the total time taken by each test group to

complete each segment of the task, from initiation to completion.

2. Design Quality Assessment: The quality metrics of the final output, both with and without the use of AI tools, are reflected through internal team voting. An output is considered high-quality when it receives approval from more than half of the team.

$$\text{Calculation Method: } \frac{\text{The number of outputs recognized by three or more individuals}}{\text{Total output in this phase}} \text{ X 100\%}$$

3. Output of Results: Through internal team voting, we assess the creativity metrics of team collaboration when using AI tools versus when not using them. (Outputs are considered valid if they receive approval from half or more of the team and are recorded as potential alternatives.)

$$\text{Calculation Method: } \frac{\text{The number of outputs recognized by two or more individuals}}{\text{Total output in this phase}} \text{ X 100\%}$$

4. Participation: This data primarily evaluates whether the contributions among participants within each test group are balanced.

$$\text{Calculation Method: } \text{Var(E)} = \frac{1}{\text{N}} \sum_{\text{i=1}}^{\text{N}} (\backslash engagement_i - average\ engagement,))^2$$

N:Number of group members $\backslash engagement_i$: the engagement of the i-th member; $\frac{\mathbf{1}}{\mathbf{N}}$: $average\ engagement$

Total group engagement = 1 - Variance of engagement

5. Number of iterations: In design or creative tasks, the number of iterations is often regarded as an indicator of the depth of the team's creative process, reflection, and revision. Both excessively high and low iteration counts can signal distinct issues in collaboration, such as excessive repetition or insufficient in-depth discussion. It refers to the number of modifications or improvements a project undergoes before reaching its final state.
6. Consistency: In design or creative tasks, the number of iterations is commonly seen as a measure of the depth of the team's creative process, reflection, and refinement. A high or low iteration count may indicate underlying problems in collaboration, such as over-iteration or a lack of substantial dialogue. This refers to the number of rounds of revisions or improvements a project undergoes before its completion.

$$\text{Calculation Method: } K = \frac{P - P_e}{1 - P_e}$$

P: The proportion of the same level selected by multiple evaluators.

P_e: The expected consistency derived from the probability of each level being selected.

7. Reaching Consensus: Researchers determine whether the use of AI tools facilitates faster and more efficient collaboration by observing and recording the communication time and task completion time among participants during the experiment. This helps to assess whether AI tools reduce unnecessary communication costs and enhance overall team performance.
8. Topic Relevance: The proportion of content in the generated ideas that is highly related to the topic, compared to the overall output.

$$\text{Calculation Method: } \frac{\text{Content with high relevance}}{\text{The total output generated in this phase}} \text{ X 100\%}_{\text{。}}$$

3.5. Questionnaire Data

In addition to the experimental record data, the researchers utilized a questionnaire to document each participant's subjective perceptions following each task, in order to assess the AI tool's impact on 'collaboration-efficiency,' 'sensory-teamwork experience,' and 'utility-tool adaptability.' The evaluation employed a 5-point Likert scale, ranging from 1 = 'Strongly Disagree' to 5 = 'Strongly Agree.' The questionnaire items were derived from the SUS, NASA-TLX, and SERVQUAL frameworks, and were subsequently modified by the researchers to suit the specific needs of the experiment.

4. Conclusion

4.1. Experimental Data Conclusion

To streamline the experiment description, the experimental rounds using traditional tools will be collectively referred to as Round A, and those using AI tools will be collectively referred to as Round B.

- Problem Identification: SWOT Analysis

An analysis of task completion times reveals that the Round B experimental group significantly reduced task completion times during this phase. This improvement can be attributed to the AI tools, which, by providing rapid data retrieval and automated analysis, helped the team minimize manual effort, thereby accelerating task completion. In terms of output, as depicted in Figure X, the Round B group produced significantly more content than the Round A group. However, the quality of their output was only marginally better than that of the Round A group, and the output conversion rate was notably lower. This suggests that while AI tools facilitate the rapid generation of vast amounts of information during the problem identification phase, much of the content lacks practical utility. At this stage, the team must invest time in evaluating and filtering this content. Furthermore, although the Round A group demonstrated slightly higher engagement than the Round B group, the difference was minimal, and observational data indicated that participants in both rounds exhibited high levels of engagement. Thus, at this stage, the use of traditional tools versus AI tools does not appear to significantly impact team member participation.

Step 1		SWOT Analysis								
Round	Group	Task Completion Time	Design Quality Evaluation	Output	Participation calculation					
					P1	P2	P3	P4	Variance	Participation

Figure 2. Data illustration from the SWOT analysis phase.

- Focused Issue: Brand Pyramid

In terms of iteration frequency, the B-round experimental group experienced significantly fewer modification and refinement cycles during task completion compared to the A-round experimental group. Additionally, the average time spent reaching a consensus in the B-round group was slightly shorter than that of the A-round group. This phenomenon may be attributed to the assistance provided by AI tools, which accelerated the consensus-building process. Furthermore, the Fleiss's Kappa coefficient for the B-round group was significantly higher than that of the A-round group, indicating a greater level of inter-member agreement during the evaluation phase within teams using AI tools. This outcome likely results from the higher standardization of the results provided by AI tools, which reduces divergence among team members during the evaluation process, thereby enhancing collaboration efficiency. In contrast, teams using traditional tools may experience greater evaluation biases due to differences in subjective opinions and interpretations, leading to more pronounced disagreements and necessitating additional time for coordination and correction.

Step 2		Brand Pyramid							
Round	Group	number of iterations	consistency						Consensus Achievement
			Category Counts				Internal Consistency	Expected Consistency	Fleiss's Kappa coefficient	
A	Pilot	0	0	3	1	0	0.5			N/A

Figure 3. Data Illustration from the Focused Issue Analysis Phase

- Finding Solutions: Brainstorming and Mind writing

In the brainstorming phase of this stage, the B round experimental group outperformed the A round experimental group overall. Firstly, the average task completion time of the B round group was lower than that of the A round group. Moreover, the B round group not only produced more content but also demonstrated a higher conversion rate of results and higher-quality output compared to the A round group. Additionally, the relevance of the topics produced by the B round group was superior. This may be attributed to the experimental group using traditional tools, which placed excessive emphasis on creativity and divergent thinking during the process, causing some of the outputs to deviate from the original design objectives. Therefore, using AI tools to assist the team in problem-solving not only facilitates the rapid generation of large volumes of high-quality, effective solutions, but also ensures that the output remains closely aligned with the task objectives. Furthermore, the participation results indicate that the use of AI tools did not affect the level of engagement among team members. On the contrary, the B round group exhibited higher engagement levels compared to the group using traditional tools.

Additionally, the lower variance in the B round group suggests that AI tools may have helped reduce the dominance of individual members, thus mitigating issues of unfairness and avoiding decision centralization within the team. Consequently, AI tools may contribute to improving collaboration efficiency and fostering more balanced teamwork.

Figure 4. Data Illustration for the Finding Solution Phase

In the mindwriting phase, similar to the brainstorming phase, despite a slightly longer consensus-building time for the B round experimental group compared to the A round group, the B round group demonstrated a significant efficiency advantage in overall task completion time. Notably, although the B round group saved time, their evaluation consistency was marginally lower than that of the A round group. This phenomenon likely arises from the rapid speed of creativity generation facilitated by AI tools, which prevented in-depth discussions. Additionally, the lower consistency in the B round group may indicate that AI tools, to some extent, could lead to decision biases, thereby influencing the fairness of the decision-making process. Hence, while AI tools significantly enhanced collaboration efficiency in this stage, they did not appear to significantly improve the depth of collaboration or consensus. At the same time, despite accelerating the decision-making process, AI tools may not have ensured equal consideration of all team members' opinions or equal influence in the decision-making, though this was not observed in this experiment.

Across both phases of this stage, AI tools positively impacted the overall task completion

time, significantly reducing the average duration. However, the effect of AI tools on internal team decision fairness showed divergent results, likely linked to the differing nature of the tasks and the varying interactive demands of each phase. In the brainstorming phase, where every member quickly accessed a wealth of information, AI tools played a crucial role in fostering information sharing and ensuring equal participation. This mechanism facilitated broader involvement among team members, effectively reducing the centralization of decision-making and occurrences of unfairness. In the mindwriting phase, however, the task requirements did not necessitate the rapid generation of large quantities of content, which led to AI tools focusing more on accelerating task completion, at the expense of deep discussion and the opportunity to thoroughly evaluate each idea. Consequently, team members, influenced by the rapid pace of decision-making, may not have fully discussed the ideas, thereby affecting the fairness and consistency of decisions.

Figure 5. Data Illustration for the Finding Solution Phase

- Clear Solution: The Five SMART Principles

At this stage, the performance of the B-round experimental group was significantly faster

than that of the A-round group, with AI tools markedly reducing task completion time. However, despite the B-round group's output being considerably higher than the A-round group, the quality of their results did not show a significant advantage over the A-round group. In fact, their conversion rate of results was slightly lower. This indicates that while AI tools facilitated the rapid generation of a large volume of results, and even allowed for the production of more high-quality outcomes, their impact was limited. In terms of engagement, the B-round group displayed lower levels of involvement, which could be attributed to the introduction of AI tools and varying familiarity with their usage, leading to inconsistencies in team members' performance. Consequently, AI tools may not have significantly enhanced the engagement of team members at this stage, and the differing levels of familiarity with these tools might have also affected the fairness of decision-making.

4.2. Conclusion of Questionnaire Data

- Section 1: Evaluation of Collaborative Efficiency in AI-Extended Visual Thinking Tools

The results from the questionnaire in this section indicate that, in terms of overall output (8) and individual output (7.75), the B group in Round B outperformed the A group (7.19 and 6.5) in collaborative efficiency. This suggests that AI tools have a distinct advantage in enhancing both team and individual efficiency, with a slight reduction in repetitive tasks (A: 6.63/B: 6.75). Additionally, AI tools more effectively support team collaboration. However, the A group in Round A scored higher in facilitating quicker consensus within the team (8.19) compared to the B group (7.25), implying that while AI tools may accelerate efficiency, they may also compromise the depth of decision-making and the speed at which consensus is reached. Moreover, both tools showed similar effects in reducing conflicts (A: 6.69/B: 6.81), indicating that AI tools may prioritize expediting task progress over fostering in-depth discussions and ensuring equal participation among all team members, potentially affecting the fairness of team decisions. Therefore, while AI tools may enhance efficiency, they may fail to balance the expression of opinions among all members, resulting in some voices being marginalized.

Table 2. Section 1 Questionnaire Results & Issues

Question	A-round experimental group questionnaire results	B-round experimental group questionnaire results
In the process of using this collaborative tool, conventional/AI-Extended visual thinking methods have enhanced the overall productivity of the team.	7.19	8
In the process of using this collaborative tool, conventional/AI-Extended visual thinking methods have improved individual productivity.	6.5	7.75
In the process of using this collaborative tool, conventional/AI-Extended visual thinking methods have reduced the frequency of rework by individuals.	6.63	6.75
In the process of using this collaborative tool, conventional/AI-Extended visual thinking methods have satisfied all collaborative needs.	5.75	6.63
In the process of using this collaborative tool, conventional/AI-Extended visual thinking methods have enabled the team to reach consensus more rapidly in the project.	8.19	7.25
In the process of using this collaborative tool, conventional/AI-Extended visual thinking methods have reduced the number of discussions (or disputes) within the team during the project.	6.69	6.81

- Section 2: Evaluation of Collaborative Experience in AI-Extended Visual Thinking Tools

In the evaluation of collaborative experience, the B group in Round B scored higher than the A group across several indicators. The B group rated higher in information accuracy and clarity of relationships (A: 7.19/B: 7.56), indicating that AI tools contribute to improved understanding of

information within the team. Additionally, the tools reduced the cognitive load (A: 7.63/B: 5.38) and time demands (A: 5.19/B: 3.44) for participants during task execution, enabling team members to complete tasks more efficiently. Furthermore, AI tools were found to effectively increase members' confidence (A: 7.44/B: 7.69) and reduce feelings of frustration (A: 3.88/B: 3.31). However, AI tools may have limited the creative expression of team members in certain aspects (A: 7/B: 6.75). This suggests that while AI tools reduce pressure on team members, they may simultaneously suppress creativity.

Table 3. Section 2 Questionnaire Results & Issues

Question	A-round experimental group questionnaire results	B-round experimental group questionnaire results
When using predefined charts within conventional/AI collaboration tools with team members, how do you think it affects the team's creativity and flexibility?	7	6.75
When using predefined charts within conventional/AI collaboration tools with team members, how do you think it impacts the team's ability to adjust and modify content to meet specific needs?	7.25	7.19
When using predefined charts within conventional/AI collaboration tools with team members, do you believe it helps clarify and direct the team's attention to key information and critical points?	7.5	7.5
When using predefined charts within conventional/AI collaboration tools with team members, do you think it enhances the team's perception of the overall coherence and integrity of the information?	7.94	8.13
When using predefined charts within conventional/AI collaboration tools with team members, do you feel it improves the team's understanding of the accuracy of information and the clarity of relationships?	7.19	7.56
When using predefined charts within conventional/AI collaboration tools with team members, do you think it provides better collaborative support and a more effective team experience?	7.63	7.31
When using predefined charts within conventional/AI collaboration tools with team members, do you think the visual appeal enhances engagement and participation in the collaboration?	7.44	7.25
Cognitive Demand: When performing this task using conventional/AI collaboration tools, how mentally and cognitively demanding do you find it? (e.g., thinking, decision-making, calculation, memory retrieval, research, etc.)	7.63	5.38
Physical Demand: When performing this task using	6.19	4.44

conventional/AI collaboration tools, how physically demanding do you find it? (e.g., information input, communication, note-taking, etc.)		
Time Demand: When performing this task using conventional/AI collaboration tools, how much time pressure do you feel? (e.g., how do you feel under time constraints, such as completing a task in 10 minutes that typically requires 10 minutes?)	5.19	3.44
Workload: When performing this task using conventional/AI collaboration tools, how much effort do you think is needed to maintain a standard level of performance?	5.94	4.25
Self-Efficacy: When performing this task using conventional/AI collaboration tools, how confident are you in your ability to successfully complete the task? (Imagine playing a game you are highly skilled at—how confident are you in your ability to successfully complete a level?)	7.44	7.69
Frustration: When collaborating using conventional/AI collaboration tools, do you experience feelings of insecurity or frustration (opposite feelings being security or satisfaction)? How do you feel when striving to complete a task but being unable to succeed despite your efforts?	3.88	3.31

- Section 3: Evaluation of Tool Adaptability for AI-Extended Visual Thinking Tools

In the tool adaptability section, the B-round experimental group outperformed in responsiveness (A: 7.06/B: 7.38) and usability (A: 6.38/B: 7.56), while also scoring higher in reducing the need for technical support (A: 4/B: 3.13) and learning curve (A: 7.63/B: 7.88). This indicates that AI tools can execute tasks more efficiently and smoothly, making them more accessible to cross-disciplinary collaborators. Additionally, the B-round group demonstrated better performance in functional integration (A: 7.19/B: 7.5) and response consistency (A: 3.69/B: 3.25), suggesting superior coordination among multiple functions and consistency in task responses. However, the A-round experimental group excelled in reliability (A: 7.69/B: 7.06), tangibility (A: 7.94/B: 7.38), and trust in the tool (A: 6.19/B: 6.5), reflecting the traditional tools' advantages in stability, interface intuitiveness, and greater trust from team members. Moreover, AI tools show a higher dependency and lack of transparency in data security. Overall, while AI tools demonstrate significant advantages in adaptability and efficiency, challenges remain in reliability and trust. Furthermore, although AI tools lower technical barriers, concerns over trust and privacy may affect the fairness of cross-disciplinary collaboration.

Table 4. Section 3 Questionnaire Results & Issues

Question	A-round experimental group questionnaire results	B-round experimental group questionnaire results

Reliability — The conventional/AI collaboration tool consistently and accurately performs its functions.	7.69	7.06
Responsiveness — When used simultaneously by multiple individuals, the conventional/AI collaboration tool executes tasks or provides responses swiftly, efficiently, and seamlessly.	7.06	7.38
Assurance — The conventional/AI collaboration tool instills trust and confidence in users through a high-quality experience (e.g., users trust the information provided by the tool and are assured that data is secure).	6.5	6.19
Tangibles — The icons, symbols, and other elements within the conventional/AI collaboration tool are intuitively designed, clearly conveying their function and enhancing the understanding and communication of collaborative content.	7.94	7.38
Empathy — The conventional/AI collaboration tool offers information that meets and considers the collaborative needs of users, fostering stronger connections within teams.	7.75	7.56
Value — The conventional/AI collaboration tool positively impacts team collaboration or individual efficiency and experience.	8	7.44
I foresee frequent use of the conventional/AI collaboration tool during team collaborations.	7	7.19
I have observed that using the conventional/AI collaboration tool in collaborative tasks can introduce unnecessary complexity.	3.44	3
I believe the conventional/AI collaboration tool is user-friendly during collaborative tasks.	6.38	7.56
I feel that technical support is required to use the conventional/AI collaboration tool.	4	3.13
I find that the various functions of the conventional/AI collaboration tool are well-integrated, fulfilling my diverse needs.	7.19	7.5
I think the responsiveness of the conventional/AI collaboration tool exhibits significant inconsistencies.	3.69	3.25
I believe most people will quickly learn how to use the conventional/AI collaboration tool.	7.63	7.88
I find the conventional/AI collaboration tool to be quite cumbersome to use.	3	2.25
I have complete confidence in using the conventional/AI collaboration tool.	7.94	7.69
Before using the conventional/AI collaboration tool, I	2.94	2.69

need to learn a substantial amount.

5. Discussion

In this study, the researchers conducted empirical analyses (design experiments and surveys) to explore the impact of AIGC tools on cross-disciplinary remote collaboration during the early design stages. They assessed the tools across three dimensions: collaboration efficiency, collaboration experience, and tool adaptability. The study revealed the potential of these tools to enhance team efficiency, creativity, and collaboration depth, while also highlighting the challenge of balancing the efficiency benefits of the tools with concerns regarding trust and fairness in team collaboration. The key contributions of this research include:

- Application of AI Tools in Multidisciplinary Remote Collaboration

Through experimental data analysis, the study demonstrated how AI tools enhance team creativity, efficiency, and collaboration during the solution-finding phase (such as brainstorming and creative writing). AI tools not only help reduce task completion time but also influence team members' engagement and creative efficiency in generating ideas and integrating solutions.

- Impact of AI Tools on Team Collaboration

Although AI tools significantly improve task execution efficiency and reduce workload in most areas, the research data reveals limitations in promoting in-depth discussions and team consensus. This finding helps to understand the role of AI tools in accelerating the decision-making process and their potential impact on the depth and consistency of team decisions.

- Evaluation of Tool Adaptability by Team Members

Survey results from the experiment revealed that AI tools excel in enhancing responsiveness, usability, and functional integration, while also pointing out the shortcomings of AI tools in reliability and trust, particularly in cross-disciplinary collaboration. These insights guide future research directions.

- Ethical Implications

Based on data analysis, the study identified potential issues related to equal participation and trust within team collaboration. AI tools may lead to uneven member participation, accelerated decision-making that affects discussion depth, and concerns over data privacy and security. These findings provide practical and ethical guidance for the design and application of AI tools.

- Limitations

Although this study is based on an empirical design experiment, it lacks more reliable validation and evaluation processes. Additionally, due to the limited sample size, the

study did not encompass a broader range of participants. Therefore, future work should expand the sample size to include more cross-disciplinary collaborators, ensuring the generalizability of the research findings.

FUTURE FICTIONS: YOUNG DESIGNERS AND THE ROLE OF GENERATIVE AI IN WORLDS BUILDING

Emna Kamoun*[a], Isabelle Cossin[a],

Estelle Berger[a], Ioana Ocnarescu[a]

a Strate school of design
*e.kamoun@strate.design

ABSTRACT | This article explores imaginaries of the future expressed by young designers using generative AI and traditional methods. It examines a design fiction workshop with 900 design students in France, where participants developed future scenarios over a three-week period. The workshop focused on climate trajectories and human activities such as mobility, housing, food, clothing, healthcare, entertainment, education, information, communication, and goods delivery. The students worked in 170 multi-level groups, each dedicated to a specific human activity, and created their deliverables, an A3 poster with a single image and a one-page text, while adhering to constraints of specific societal models, climate scenarios (+1.5°C to +3°C), and biodiversity conditions.

The article analyzes this diverse corpus by focusing on the representations of humans and technical systems within the designs. A framework was developed to categorize the students' work based on six key dimensions: The presence of humans and technical systems, the orientation of the world (utopia vs. dystopia), the intention of the project (problem-solving vs. question-framing), the scale of change (individual/behavioral, collective/organizational, systemic/structural), and the principal levers of change (technical, legislative, societal choice). This framework enables first, to question the representations produced by design students in a design fiction exercise (A3 posters) and second, to examine how the tools used in building these outcomes influence these representations, particularly regarding the growing use of generative AI.
Furthermore, the article extends the reflection on the ethical implications of generative AI in design which was mainly used by students in this project. We thus considered it relevant to study whether this medium impacted their projects. It raises concerns about

the potential for AI to take over the imaginative process, given that these tools come with inherent biases that could lead to the production of uniform objects and stereotypes disconnected from cultural and social contexts. Rather than taking a purely distrustful view of AI, the article advocates for proactive education in AI usage, encouraging designers to engage with these biases in a critical and responsible manner. The goal is to foster a practice of "designing consciously," where designers understand the limitations of generative AI and learn to integrate its outputs into creative processes without losing sight of the broader social and ethical responsibilities that come with shaping future scenarios.

KEYWORDS | DESIGN FICTION, DESIGN REPRESENTATIONS, FUTURE, FORESIGHT, GENERATIVE IA, REPRESENTATION TOOLS

1. Introduction

Thinking about the future can often evoke a sense of vertigo - a destabilizing and uncomfortable experience, as Grimaux and Wacquez (2023) describe. Yet, envisioning, embodying, and questioning possible futures is an essential exercise, despite its complexity. In this direction, design plays a critical role: it allows for the manipulation of complex material by crafting specific representations that shape how ideas are presented, debated, and perceived. In the context of foresight through design fiction, it is essential to recognize that the tools used are not neutral. This article has two objectives: first, to question the representations produced by design students in a design fiction exercise (A3 posters) and second, to examine how the tools used in building these outcomes influence these representations, particularly regarding the growing use of generative AI. Indeed, these generative tools induce specific visual ways of representing, thereby influencing the perception and discussions around the futures they depict (Masure, 2023). Therefore, this article extends the reflection on the ethical implications of using generative AI, by initiating a discussion on the designers' awareness towards the integration of these technologies into their practices. It questions how the representation of futures may involve “transferring” some of the imaginative process to these tools, despite their inherent biases. It highlights the risk of producing uniform objects and stereotypes, which would lack evocative power, nuance in representation, and be disconnected from social and cultural contexts.

The article begins by reviewing the existing literature on design fiction, focusing on the impact of tools in shaping representations in design practices. It then introduces the research context and methodology through a detailed case study, examining how 900 design students produced 170 visual representations of the future in the context of a design fiction project, with some using generative AI. Finally, the discussion explores the ethical implications of these technologies, emphasizing the importance of fostering critical awareness and responsibility among designers.

2. State-of-the-art / context

The literature review explores two interconnected dimensions critical to the study of future representations in design. First, it delves into design fiction and foresight, emphasizing speculative practices that use narrative and prototyping to envision and critique alternative futures. Second, it examines the impact of representation tools on the design process, highlighting how these tools shape creative outputs and influence designers’ thinking.

2.1 Critical approaches in design and essential criteria for effective implementations

Foresight methodologies have historically aimed to broaden the scope of strategic thinking, moving beyond linear extrapolations of the past. Gaston Berger, one of the pioneers of foresight, emphasized the importance of considering human aspirations and ethical reflection when imagining the future (Berger & al., 1959). Design fiction is a speculative practice that uses fictional narratives and prototypes to explore alternative futures. It exists at the intersection of design, science fiction, and foresight. Building on the speculative approach proposed by Dunne & Raby (2013, 2024) and drawing from the work of Bleecker (2009) and Sterling (2013), who argue that design requires a 'speculative turn,' Hales (2013) presents Design Fictions as a "cluster of problems," creating "a discursive space within which new forms of cultural artefacts (futures) might emerge."

Through the creation of "diegetic prototypes" (Kirby, 2010; Sterling, 2013)—artefacts that can build entire worlds while leaving room for the viewer's imagination—designers craft objects and narratives that embody imagined futures. These prototypes invite participants to engage with hypothetical scenarios in a tangible, experiential way, allowing them to explore and reflect on possible futures through these objects. Following the speculative turn, design also requires an "experiential turn," which bridges the gap between abstract future possibilities and life as it is directly experienced in the present. As Candy (2016) suggests, "bridging the 'experiential gulf'" involves cultivating the skills and sensibilities necessary for futurists to engage with the experiential aspect of design fiction. This approach seeks to integrate cultural, social, and political dimensions into projections, recognizing the inherently performative power of these representations in shaping present-day decisions (Kinsley, 2010). And this experiential gulf is related to the medium in which these fictions are represented, so that their audiences can interact with them effectively. Indeed, one of the key contributions of design fiction is its ability to shift participants from passive observers to active agents in shaping the future. Stuart Candy and Jake Dunagan (2016) emphasize the importance of making futures tangible and experiential, engaging participants on sensory, emotional, and intellectual levels through different formats: from an artefact or instantiation (the stuff) to a visitable representation of time and place (the situation), then through a scenario - a specific future history or state to the setting of the experience. This approach transforms speculative scenarios into lived experiences, fostering empathy and deeper understanding.

As mentioned earlier, design fiction extends its roots from speculative design. The value of foresight lies in its exploratory nature, where fiction becomes a tool to navigate ambiguity and challenge entrenched assumptions. As Dunne and Raby (2007) note, "this shift from thinking about applications to implications creates a need for new design roles, contexts, and methods. It's not only about designing." This highlights the need for designers to reflect not only on the artifacts they create but also on the ethical and political implications of these creations, questioning who decides, on whose behalf, and to what end these futures are imagined. This reflexivity aligns with the idea that futures are not fixed destinations, but rather capabilities—spaces for ongoing ethical and creative negotiation. In educational contexts, design fiction and speculative design have been particularly effective in equipping young future designers with the tools to navigate uncertainty and complexity. By creating immersive prototypes and engaging narratives, students learn to question assumptions, explore alternative trajectories, and critically evaluate the implications of their work. These practices encourage a form of anticipatory literacy, where designers not only imagine futures but also critically interrogate the processes and tools used to shape them. As Helgason et al. (2021) highlight, speculative design in education has moved beyond its early function of provoking internal debates, to a more outward looking role of facilitating urgent discussions about the central role design plays in shaping our collective futures and society as a whole. One of the most striking themes that emerged was the clearly articulated desire to implement

transformation and to create impact on the world through action. Speculative design has matured beyond its early focus on internal debates, now playing a critical role in facilitating urgent discussions about design's influence on society and our collective futures, with an emphasis on creating responsible, transformative, and just change. However, for such critical practices to be effective, the question arises: through what mediums are these futures represented, and how do these representations shape their impact?

2.2 The invisible hand of design tools: how representation shapes imagination

Design tools play a central role in shaping the creative process, influencing not only the final output but also the ideas that underpin the design. Design representations has continuously evolved, adapting to new technological paradigms that challenge traditional notions of authenticity, authorship, and perception. Walter Benjamin (1936) provides a foundational framework for understanding the impact of reproduction technologies on artistic and design practices. His concept of the "aura," referring to the unique presence and authenticity of an artwork tied to its historical and cultural context, remains highly relevant in contemporary design analysis. Today, as AI-generated imagery becomes an integral part of creative workflows, new analytical filters emerge to interpret the transformation of design outcomes. Benjamin argued that mechanical reproduction erodes the aura of an artwork by detaching it from its original, unique existence. In the realm of visual mediums of representations of design fictions, traditional design techniques (hand drawings) once carried the mark of manual craftsmanship, embodying a distinct aura. However, digital tools (2D and 3D digital design) and mostly and more recently, generative AI are redefining design productions.

As Morelli and Tollestrup (2007) note, within the established paradigm of product design, designers have a well-defined understanding of what to communicate, to whom, and when during the process. However, tools that mediate representation, such as digital design tools, can alter the course of design thinking itself. Oxman (2006) citing Mitchell (2005) highlights the transition from paper-based drawings to digital tools in architecture, where digital models enable a more nuanced response to contextual factors such as site, program, and expressive intention. This shift, described as “digitally mediated design” brings about a complexity that expands the designer's ability to conceptualize and materialize their ideas. Further on Oxman (2006) underscores how digital tools bridge the gap between design and materialization, even in the conceptual stages, offering new depths of contextualization and performative design. These tools, which include everything from CAD software to virtual reality environments, enable designers to test and visualize concepts in ways that were once impossible. Also Norman & Verganti (2014) suggest that radical product innovation is driven by either advances in technology or a deliberate change in the meaning of the product, “the introduction of a new technology that provided new affordances to the designers or to a new meaning assigned to the product and its uses, allowing for radical changes using existing technologies”. However, they also limit the designer’s thinking by privileging certain aesthetic or functional possibilities, thus framing the outcome in ways that are often constrained by the tool’s affordances (Norman & Verganti, 2014).

Representations in design are more than simple visual artifacts; they are mediators that influence how ideas are communicated and understood. Wright & Cairns (2011) and Kinsley (2010) argue that representations are not neutral—they serve as key agents in the design process by translating abstract ideas into tangible outputs. Furthermore,

representations are performative, creating a space of anticipation in which the boundaries of what is imagined and how futures are framed are defined (Zamenopoulos & Axeliou, 2020). Tools like sketching, prototyping, and digital modeling shape this anticipatory space, influencing how design is conceptualized and experienced. Bodker (2009) offers an insightful perspective on the role of representations in design, emphasizing their function as both externalizations of ideas and collaborative tools that facilitate communication among designers and stakeholders. Representations, whether formal or informal, act as containers for ideas, helping to externalize concepts that are yet to be fully realized. They not only help designers hold onto their ideas but also serve as a medium through which those ideas can be shared, critiqued, and refined. Bodker (2009) states that design representations serve a dual purpose: they both reflect aspects of the future application and act as affordances (Norman, 1991) that shape the design process. Unlike goal-oriented design methods that define the product upfront, representations in design evolve and resist predetermined paths.

In the case of generative AI, tools that automate part of the creative process raise new challenges. Masure (2023) notes that while these tools can standardize design outcomes, they also bring the risk of diminishing the designer's control over the creative intent. As AI introduces new visual vocabularies and modes of representation, it simultaneously raises questions about the implications of standardization versus innovation, and whether these tools might inadvertently perpetuate biases, disconnecting designs from the social and cultural contexts in which they exist. In design education, the influence of tools is particularly pronounced. Students are trained to think through the capabilities of their tools, which ultimately shapes how they approach problems, envision solutions, and consider the future. The performative and experiential nature of prototypes, including dioramas or interactive installations, helps foster a richer, more immersive design process (Candy & Dunagan, 2016). As Masure (2017) argues, our world is "modeled" by the tools we use, but to truly understand it, we must also "deform" it, as Jerome J. McGann suggests. Masure emphasizes that the digital transformation of knowledge must manifest in changes of form to bring contemporary realities into consciousness. This requires bridging the concerns of the "old" humanities—ambiguity, variation, subjectivity—with the modes of digital thought, including simulation, modularity, automation, variability, and transcodification. By doing so, we can uncover the latent possibilities often overshadowed by the noise of technological "innovations" in new media.

In this context, the integration of generative AI and other advanced design tools offers both significant opportunities and challenges, expanding the ways in which young designers can engage with the world-building process. However, there is a lack of research focusing on how the usage of generative AI in design education is influencing the learning process and creative development. Early works, such as Yadav (2024), show that "*generative AI technology may be used to imagine design in a number of ways, including producing resources for image design, creating pictures with certain styles, and realizing image style conversion.*" AI-generated art, while offering new creative processes, provides fresh tools and inspiration for designers. However, as Yadav highlights, the rise of AI in design also introduces potential issues, such as copyright conflicts and privacy concerns. "*The use of AI in the big data age may potentially result in copyright conflicts, raising concerns about the privacy protection of users and customers*." The study calls for well-defined legal limits to protect both users' and customers' rights. These challenges, however, are accompanied by opportunities to enhance the effectiveness and quality of image processing and design. With the increasing range of applications for AI generation platforms, it becomes essential to carry out theoretical research grounded in artistic practice to guide the appropriate use of AI technology, while also addressing its potential drawbacks and limitations.

The question then arises: does AI-generated design lack aura, or does it cultivate a new form of digital authenticity? Some other questions may follow: are AI-assisted works evoke emotional or intellectual responses differently compared to manually designed productions? Not all of these questions will be answered in this paper. However, a first discussion will be proposed to contribute to them.

3. Research context, corpus and methodology

The corpus of student projects analyzed in this study originates from a partnership with a consultancy firm specializing in guiding organizations toward decarbonization, climate adaptation, and biodiversity restoration. The overarching objective of the project is to develop quantified foresight scenarios to help businesses anticipate the strategic transformations necessary for long-term viability.
In the first phase of the project, four distinct future narratives (N1, N2, N3, N4) were co-developed through collaborative design workshops with experts from the involved companies. Each narrative represents a different societal model, structured around four key value dimensions: social structure, perception of time, relationship with nature and technological development. These narratives outline four distinct future scenarios, each shaped by different guiding values:

- N1: Humans prioritize collective well-being, acknowledge their interdependence with other living beings, and adopt a long-term perspective in alignment with biological cycles. While they are not opposed to technology, its role is strictly utilitarian, minimizing its use whenever possible.
- N2: There is strong awareness that humans are part of a broader ecosystem that must be protected. Consequently, technology is leveraged to improve collective living, automate certain tasks, and allow people to live in harmony with natural cycles.
- N3: While there is a desire to protect nature, it is still primarily seen as a resource. Individual freedom is prioritized, and technology is perceived not as an end in itself but as a means to enhance personal performance, happiness, and hyper-personalized experiences.
- N4: Nature is viewed purely as a resource serving individual aspirations. Speed and performance are highly valued, and technological development is seen as a tool for eliminating constraints and accelerating access to desires.

3.1 Design Fiction Workshop and Corpus

The design fiction workshop, which serves as the foundation of this study, involved 900 design students in France over a three-week period. The goal was to develop speculative future scenarios addressing climate trajectories and human activities such as mobility, housing, food, clothing, healthcare, entertainment, education, communication, and goods delivery. Each student group was assigned a specific set of constraints, including:

- One of the four future narratives (N1, N2, N3, or N4).
- A climate trajectory (+1.5°C, +2°C, or +3°C).
- A biodiversity condition (endangered, stabilizing, or regenerating).
- A specific human activity (e.g., mobility, housing, healthcare).

The objective was to produce a design fiction scenario envisioning a unique future for the year 2060. Each scenario was presented in a standardized format: a single A3 poster featuring one image and an accompanying text. The final corpus consists of 170 projects (each comprising one image and one text), distributed relatively evenly across the four narratives and the various human activities.

3.2 Framework for Analysis

Our analysis was motivated by the initial observation of the widespread adoption of generative AI in student projects. The detailed analysis of this corpus focuses on how students represent humans and technical systems within their speculative futures. To structure it, we developed a framework that examines six dimensions:

1. Representation of humans
2. Representation of technical systems
3. Orientation of the world: Utopian vs. dystopian futures.
4. Project intention: Problem-solving vs. question-framing.
5. Scale of change: Individual/behavioral, collective/organizational, or systemic/structural.
6. Means of change: Technological, legislative (imposed regulations), or societal (driven by collective choices).

4. Research questions

During the presentation of the posters produced by the students, we realized that a significant majority had chosen to use generative AI to depict their design fiction scenarios. Out of 170 projects, 97 were created using this technology, representing 57%, compared to 38% that used digital tools and only 5% that relied on more traditional representation methods, which we have categorized as manual tools (including drawing, collage, photography, or physical modeling). It is difficult to fully understand why such a large proportion of students opted for generative AI, especially in a school where hand sketching is widely integrated into the various methodological phases of the design process.

Indeed, AI enables the rapid generation of images, likely making it an appealing tool for both idea generation and formalization. The images produced tend to be visually striking and captivating, often creating an immediate "wow" effect due to the wide range of styles and creative possibilities they offer. This inevitably influences the creative process, potentially altering or at least transforming the way students construct their concepts and scenarios: do they start with an image and then build their story around it, or do they begin with a narrative and use AI to illustrate it? A parallel concern, as raised by Masure (2023), is the bias introduced by the use of generative AI, regardless of the specific tool employed. If all students use the same technologies, does this risk leading to a standardization of visual outputs, contradicting the very essence of design, which values grounded choices and unique creative perspectives? Could this result in an aesthetic homogenization and a loss of graphic diversity? What connections did students establish between design fiction and artificial intelligence? How do these new tools shape the way they conceptualize and represent their scenarios? More broadly, can design fiction reinvent itself through these technologies?

As Masure (2017) notes, over the past thirty years, the way design work is approached has been profoundly influenced by the introduction of software tools that automate many tasks previously inherent to the design process. These tools increasingly frame creation as a set of problems to be solved by software, a perspective now shared by many designers. Thus, does the use of AI significantly impact the content and representations produced? Do these tools shape future imaginaries by limiting certain representations while favoring others? To what extent do they influence not only the aesthetics of the outcomes but also the concepts and worldviews that emerge from them? These questions open up new avenues for reflection, both for design education and for the

evolution of design fiction as a distinct field within design. In the following sections, we will analyze the various dimensions presented in our analytical framework by comparing the use of different representation techniques and their specific impact on each aspect.

5. Results and discussion

The results highlight key patterns, such as the anthropocentric and technological driven future and a tendency towards problem-solving despite demand for systemic change. Each of these themes is explored in depth to understand several implications of the tools used and first assumptions on how they shape the students' perspectives on the future.

5.1 An Anthropocentric View of the Future

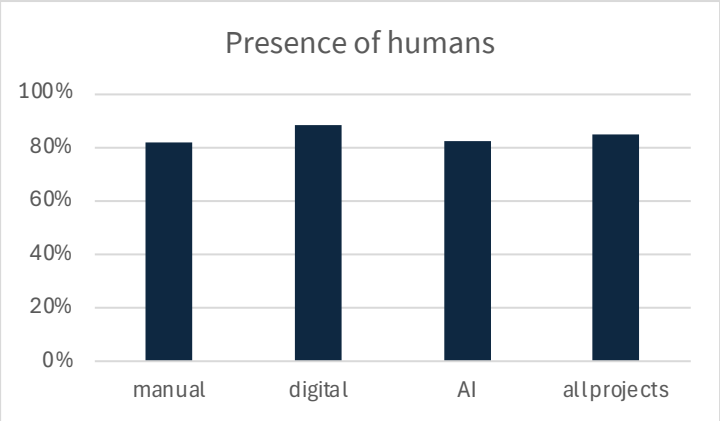

Figure 1: Proportional comparison of presence of humans

Humans are significantly more represented than other living beings, appearing in 85% of projects, compared to 49% for plants and only 14% for animals. This leads to an initial observation: contrary to the idea that generative AI might dehumanize creative outputs, its use does not reduce the presence of humans in the produced images. On the contrary, human figures are slightly more represented in projects using digital tools than in those created with traditional techniques or generative AI. These findings invite us to reconsider the relationship between technology, imagination, and representations of living beings in design fiction. Rather than fading in favor of a fully automated imaginary, human figures remain a central element in the creative work of young designers. This aligns with the fundamental definition of design, which is inherently grounded in human experience. However, a more critical perspective reveals that this large representation of humans reflects an anthropocentric imaginary, where other species and natural resources - often grouped under the term "nature" - are primarily depicted as mere resources for sustaining human life and, at times, ensuring human comfort. This tendency is even more pronounced in projects that used AI, as those following N4 trajectory, which featured the most humans, were also based on the most pessimistic climate and biodiversity scenario.

5.2 The Persistent Hyper-Presence of Technical Systems

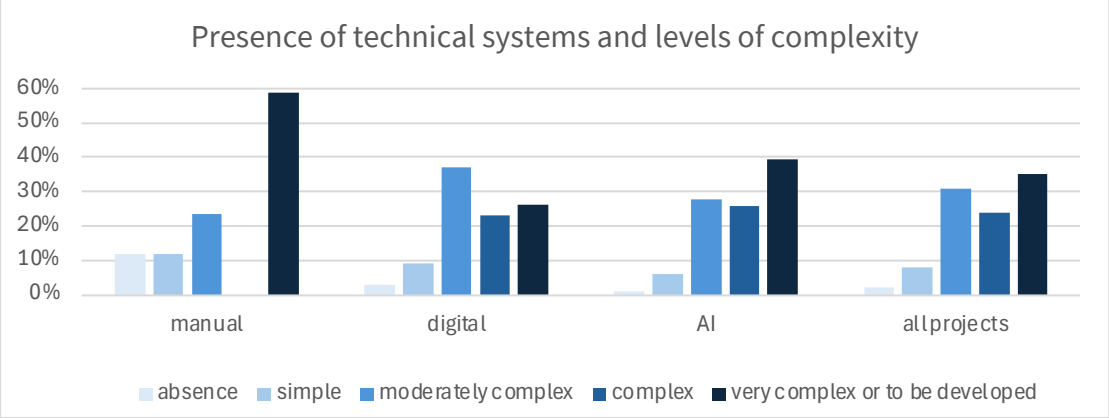

Figure 2: Proportional comparison of presence of the different levels of technical systems

Technical systems are overwhelmingly present in the projects, appearing in 98% of them. Figure 2 shows how the presence of technology is found in each representation category. These systems can be categorized into five levels of complexity:

- Absence, no technical system represented or suggested: 2%
- Simple, primarily manual or mechanical: 8%
- Moderate, involving automation or renewable energy: 31%
- Complex, incorporating robotics and/or AI: 24%
- Very complex, depicting speculative future technologies: 35%

At the scale of the entire corpus, this result raises questions about the level of trust the younger generation places in technology to address uncertainties and ensure humanity's survival—sometimes even enhancing human comfort. Interestingly, there is no clear correlation between the use of AI-generated images and the projects that depict highly complex or futuristic technologies. On the contrary, projects using traditional manual techniques tend to envision more radical technological shifts. These alternative futures often portray significant departures from current lifestyles, though not necessarily in a more sustainable direction. Could this suggest that designers find greater creative freedom in traditional techniques, allowing them to imagine what does not yet exist? Perhaps hand-drawing, collage, or physical modeling enable a more radical form of speculation.

This would align with Norman & Verganti's (2014) theory of radical innovation, which requires a complete reframing of existing paradigms—something generative AI may struggle to achieve, as it relies on pre-existing image datasets. Additionally, the need to articulate ideas through written prompts in AI tools might encourage a more predefined and structured vision. In contrast, manual techniques offer greater flexibility for metaphorical and suggestive representation rather than direct illustration or literal figuration.

5.3 Dystopia as a Catalyst for Radical Change

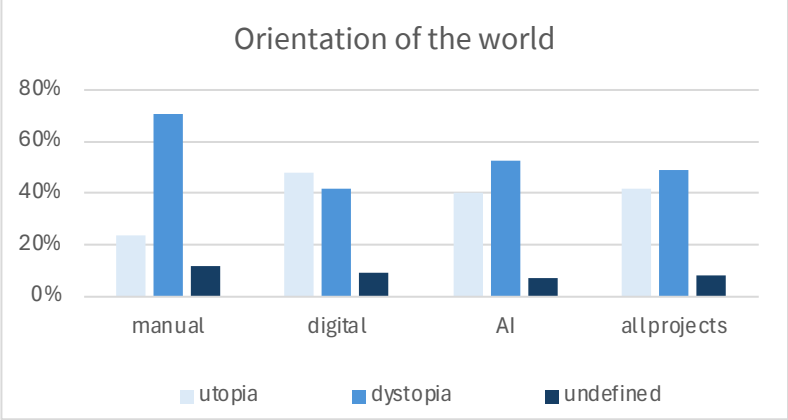

Figure 3: Proportional comparison of the nature of the projected world

Overall, the projects are nearly evenly split between utopian (42%) and dystopian (49%) contexts of the builded worlds, with a small proportion (8%) remaining neutral. However, when analyzing this distribution based on representation techniques, slight variations emerge. The proportion of dystopian worlds increases among projects using AI-generated imagery (52.6%) and even more significantly in those employing manual techniques (70.6%). Additionally, manually created projects exhibit a slightly higher share of neutral scenarios. This suggests that the choice of representation technique reflects a particular stance. Whether used to frame a solutionist response by highlighting the role of design through contrast, or to provoke debate about undesirable futures, dystopian narratives prove to be a powerful tool, especially in projects using manual techniques. Once again, could the act of drawing by hand allow for a freer, more radical exploration of dystopian themes, one that elicits stronger emotional engagement?
The distribution across different narrative frameworks does not reveal significant differences. However, dystopian scenarios are more prominent in narratives N3 and N4, which emphasize individual agency over collective well-being. In these narratives, nature is largely perceived as a resource for sustaining human life, sometimes with an awareness of the need for its protection, but often as a mere backdrop to human survival.

5.4 Problem-Solving as a Designer's Reflex

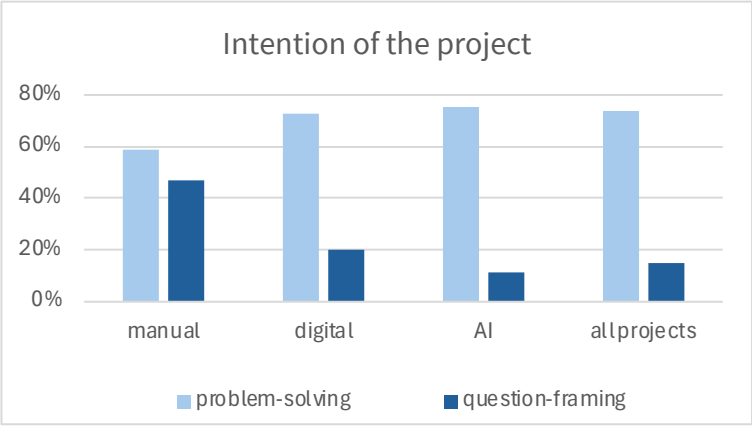

Figure 4: Proportional comparison of the intention of the project

This category reveals the most significant variation between two approaches: three-quarters of the projects present a solution to a given problem. When examining how different representation techniques were used, we observe similar proportions of solution-oriented projects among those employing digital tools and AI. However, projects

using manual techniques show a greater tendency toward question-framing rather than direct problem-solving. Once again, this raises the question of the creative freedom allowed by manual representation techniques. While design fiction is a powerful tool meant to provoke debate, the ingrained habit of young designers to respond to a given issue with a problem-solving approach has largely taken precedence.
When analyzing this trend across different narrative frameworks, we notice that projects based on N1 and N2, whose value systems diverge more significantly from contemporary lived realities, tend to favor question-framing (See tables 1 to 4 in appendices). These narratives emphasize three fundamental values that contrast with the forces driving humanity into the Anthropocene: prioritizing the collective over the individual, valuing deceleration over acceleration, and recognizing human interdependence with ecosystems to maintain harmony. Could it be that questioning desirable futures is more effective when starting from what does not yet exist?

5.5 Systemic Change as a Desirable Horizon

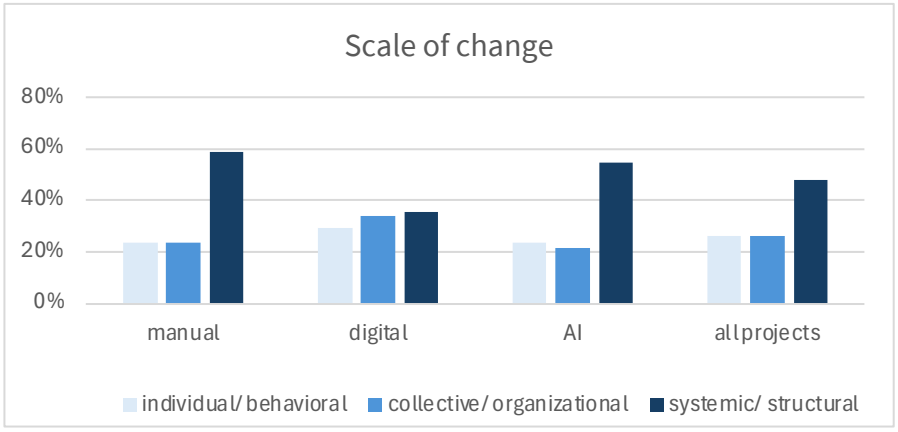

Figure 5: Proportional comparison of the scale of change

Half of the projects address structural and systemic changes in society and lifestyle (48%), highlighting profound transformations in cultural norms and practices. The remaining half is evenly divided between projects focusing on individual behavioral changes and those centered on organizational-level shifts. This overall trend appears similar in projects using manual techniques and AI, with a slight increase in the proportion of projects tackling systemic change. However, projects describing change at the organizational or individual scale are more prevalent among those using digital tools. Once again, this raises questions about the ability to project into distant futures or to adopt unconventional perspectives- especially for young designers accustomed to designing use-case scenarios on an individual or small collective scale. Are digital tools less conducive to imagining radically different futures?
Given that these tools are widely used in student project presentations, we can question their effectiveness as tools for speculative thinking. As observed with manual techniques, which sometimes allow for questioning the radicality of necessary change, digital tools may instead reinforce conventional approaches. Indeed, projects depicting large-scale changes, shifts in systems, cultures, or worldviews, which are inherently more abstract, are proportionally more frequent in projects using manual techniques.

5.6 Technical Levers as a Driving Force for Change

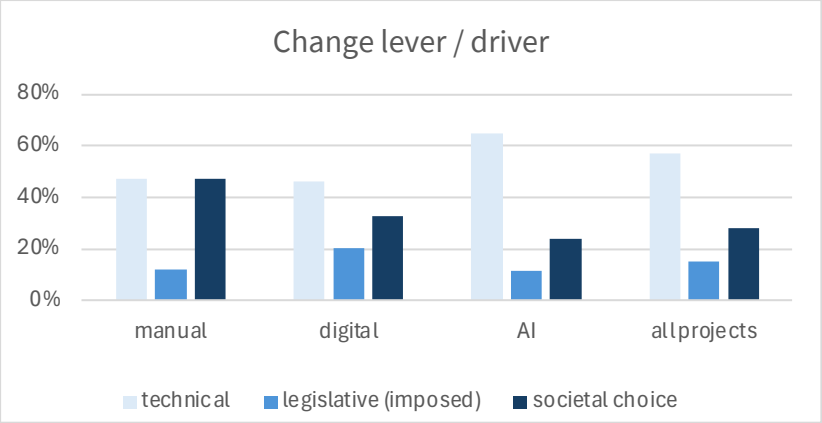

Figure 6: Proportional comparison of the principal driver of the change

Most scenarios depict futures where change is primarily driven by a technological lever. While this reflects a certain optimism regarding the ability of humans to transform their way of life by choice rather than obligation, it also raises questions about the dominant role given to technical solutions as the primary catalyst for transformation. Notably, the proportion of projects emphasizing technology as a key driver of change is higher in those using AI compared to projects employing other techniques, where no significant difference is observed on this category of levers.
However, projects influenced by Narrative N1 stand out from this overall trend (see tables 1 to 4 in appendices). In these scenarios, change is often portrayed as a social choice stemming from a collective awareness of human interdependence with the living world. Interestingly, the use of AI did not diminish the prevalence of such scenarios compared to other techniques. More broadly, AI does not appear to shape the underlying values of the scenarios. Instead, the opposite trend emerges: AI serves as a representational tool that reinforces the narrative's initial values, particularly when those values emphasize technological change as the primary enabler of transformation.

6. Conclusion and further discussion

The overall results of this study raise important questions about how young designers project the world, particularly as the scenarios explore futures shaped by technology, climate change, and other profound social mutations.
Most projects reflect a technosolutionist mindset that continues to dominate imaginaries. Even if scenarios depict lifestyles vastly different from today, they consistently feature technological mediation, increasingly complex systems, and sometimes even technological levers as drivers of systemic change. Indeed, many of the projects remained problem-solving despite inspiration and methodological guidelines from the field of speculative design given to students. In order to deconstruct these imaginaries, the design fiction approach can help shift perspectives, challenge assumptions, and open up possibilities that move away from the solutionist approach that has become almost automatic in design practice. However, this requires more practice! By incorporating more design fiction and a foresight approach into design education, regardless of specialization, we can stimulate a broader debate about the futures we collectively want to build while fostering reflection on the ethics of the profession.

Reflecting on the representation techniques and the influence of generative AI, this area

also needs more maturity. With this analysis, it is difficult to definitively state the specific role of generative AI in reinforcing anthropocentric visions of the future, where humans remain central to the visual narrative, sometimes at the expense of other forms of life or alternative environments. At the same time, it is unclear whether these tools enable the exploration of new narratives, reaffirming humanity's place in an uncertain future.
As Masure (2017) states, "design is the receptacle of new techniques, but it also works to divert them from linear logics of productivity and profitability to make something else of them." Promoting hybrid approaches — positioning AI as one tool among many rather than an exclusive solution — and encouraging experimentation with both the tools themselves and the representations they produce should not exempt us from questioning the use of these tools within the design curriculum. It is still essential to teach students and young designers to understand the proper use of these new tools, while also raising awareness of broader ethical concerns, including intellectual property and algorithmic influence (Masure, 2017). Following the philosophy of Bernard Stiegler (2004), who critiques the "symbolic poverty" produced by overused technologies, designers should be encouraged to rethink the industry and consider a "re-enchantment of the world" through their practice (Stiegler, 2006). Looking at the current moment, we notice a notable appetite for the use of AI among students, possibly driven by generational factors or an attraction to new technologies. However, this usage does not seem to significantly impact the direction of the projects created. Yet, if we take an optimistic view, there is a slight tendency to associate manual techniques with a greater sense of freedom and radicality. This is an aspect worth exploring further in future research to confirm.

As a perspective, we would like to engage the discussion on ethics in the use of AI. It is not enough to simply master its functioning and prevent biases related to its programming and learning processes. We must also question why we need it (or not). Integrating this question into design education should be preceded by an ethical positioning regarding the industry for which we are preparing students. Given the speed with which these tools can impact the ways we think and act, the time for debate and critical reflection on technology is crucial. Without it, we risk training a new generation of designers who will simply integrate AI modules or assistive devices with the goal of driving innovation, while ignoring their negative impact.

About the Authors:

Emna Kamoun is an assistant professor at Strate School of Design working with a multidisciplinary team of researchers. As a designer, with a background in semiotics, she explores design narratives and specializes in adapting design education to face the Anthropocene's challenges.

Isabelle Cossin art historian and teacher-researcher at Strate Research, explores body representation in animated films and the sensory, imaginative impact of arts and techniques on collective and individual imaginaries, both historically and prospectively. She also leads the first two years of Cursus Design program at Strate School of Design.

Estelle Berger pursues research on reflective and embodied practice, to support transformations with the means of design (systemic, strategic, for transitions). Her initiatives bring together academics, students, companies and actors from the public sector, to act for more sustainable and desirable futures.

Ioana Ocnarescu is head of research at Strate School of Design. She explores multidisciplinary design research to foster diverse perspectives through experience design, design fiction, and low-tech prototyping, with a focus on emerging technologies and decision-making in the design process.

ABSTRACT | This working paper proposes a reimagined Human-Centered Algorithm Design (HCAD) framework to embed human-centered and equity-focused principles within algorithmic systems. HCAD looks beyond traditional 'black box' and "glass box" approaches to creating algorithms. It positions algorithm development as a design challenge instead of a technical one. The eight steps of Human-Centered Algorithm Design include deep diving into the problem context, mindfully selecting your data, creatively considering models, designing the algorithm, iterating with people, scrutinizing the impact, and using it responsibly. Throughout the steps, HCAD designers must also integrate responsibility pauses throughout the design process to reflect on potential biases and societal impacts. Using a case study approach, this study explores the application of HCAD in a venture philanthropy firm's effort to broaden its funding pipeline beyond established networks using big data sources. By applying HCAD, the organization expanded its pool of potential grantees 25 times and enhanced representation across all U.S. states. The case study illustrates how HCAD reinforces the importance of ethical leadership in digital design by actively involving affected communities in algorithm development. HCAD offers a more broadly replicable model for ethical digital practices.

KEYWORDS | Human Centered Algorithm Design, Human Centered Design, Responsible Design, Data, Embodied Cognition

1. Introduction

Algorithms are step-by-step instructions for solving problems or accomplishing tasks (Deng, 2018; Howard, 2022). In recent years, algorithms have become increasingly powered by datasets consisting of large numbers of records and features (Zhou et al., 2017). While much has been accomplished with these big datasets, there remain limitations regarding quality, complexity, and noise (Dhawan et al., 2018; Zhang, 2016). Further, there is an accelerating trend of algorithms making decisions affecting humans with minimal or no direct human input (Bader et al., 2019). Algorithms are here to stay, but keeping humans-in-the-loop is critical to maintaining transparency, fairness, and accountability for their outputs (Rahwan, 2017).

Recent international initiatives have shaped the way design practices work with algorithmic and AI systems. The Human+AI Initiative at Carnegie Mellon University (CMU) explores ways AI can work alongside human designers (Carnegie Mellon University, 2025). The research and educational initiatives at POLIMI are both designed with service to humanity as a core tenet (Politecnico di Milano, 2025). The Digital Design Lab at the L'École de Design examines how natural intelligence of living systems merges with artificial intelligence to create better user experiences (L'École de Design Nantes Atlantique, 2025). The approach to algorithm design outlined in this paper complements these initiatives by requiring ethical reflection and stakeholder co-design throughout the algorithm development process.

Drawing on central concepts in human-centered design - including designing with the individuals who use or are affected by a product, service, or system - this working paper positions an evolved concept of human-centered algorithm design (HCAD). Here, HCAD is introduced as a way to leverage the utility of algorithms while addressing the underlying limitations of the big datasets that power them.

This working paper is structured into four sections. The Conceptual Framing includes an overview of the supporting literature. The Methodology outlines the nature of the case study used and provides context. Next, a Worked Example demonstrates the core steps of human-centered algorithm design using a case study from the venture philanthropy sector. Lastly, the Discussion section distills high-level takeaways, implications, and limitations.

2. Conceptual Framing

The following conceptual framing combines insights from traditional and human-centered algorithm development, human-centered design, and embodied cognition to offer an integrated perspective on designing algorithms responsibly with the people who use them and are impacted by them.

2.1. Algorithm Development

Over the past few decades, data generation and storage capability growth ushered in the era of "big data" (Shi et al., 2019). This development was followed by the rapid development of sophisticated machine-learning algorithms designed to process these big datasets. Several successful examples of machine learning algorithms are being applied across industries using natural language processing, predictive analytics, and

image recognition, among others (Goldberg, 2017; Christou et al., 2020; Liu et al., 2020). These domain applications were then carried over into various sectors, including healthcare, criminal justice, and corporate contexts (Cahan et al., 2019; Zavrsnik, 2019).

Traditionally, algorithms applied in these contexts have been designed using a "black box" where the algorithmic outputs are accompanied by unclear explanations (Holm, 2019). An alternative approach, "glass box," has emerged where the algorithms are more interpretable (Caruana et al., 2022). Efficiency and accuracy are among algorithms' most commonly cited benefits (Al-Jarrah, 2015). However, several studies have highlighted the limitations and risks associated with algorithms, including bias amplification, data quality, lack of transparency, and overreliance on automation, among others (Bandy, 2021; Nagendran et al., 2020; Goddard et al., 2012).

2.2. Human-centered Design

Human-centered design is generally understood as designing with rather than for the individuals who use or are affected by a product, service, or system (Norman, 2014; Rouse, 1993; Giacomin, 2014). While it often appears alongside terms like "design thinking" and "creative problem solving," unlike these design practices, human-centered design focuses heavily on usability, user context, and minimizing negative impacts. It places human needs, behaviors, and limitations at the center of decisions (MacDonald, 2005).

Human-centered design creates solutions starting with people's needs, environments, contexts, actions, and behaviors (Norman, 2014; Rouse, 1993). It uncovers these through qualitative research techniques designed to unlock empathy, such as interviews, observations, collaborative testing, and iteration (Maquire, 2001). Methodological rigor is an important but often overlooked component of human-centered design. Without it, designers succumb to biases, prioritizing their knowledge, perspectives, and practices (Steen, 2008 & 2011).

2.3. Human-centered Algorithm Design

Human-centered algorithm design is an emerging approach that aims to *'center the process of designing algorithmically based systems around humans'* (Baumer, 2017). Centering the design around the users of the algorithm, regardless of whether it has been specifically called Human Centered Algorithm Design, has achieved traction in a wide variety of domains (Lee, 2017; Riedl, 2019; Zhang, 2002; Shneiderman, 2020). However, these approaches often think about the users who interact with or use the algorithms but not those impacted by their outputs or decisions. In contrast, the Human-Centered Artificial Intelligence (HCAI) initiatives at Stanford HAI (2025) work to enhance human flourishing through AI systems while Explainable AI (XAI) initiatives work on algorithmic transparency (Minh et al., 2021; Ding et al., 2022; Giulia Vilone et al., 2021). HCAD addresses a different but related area. It focuses not only on end-users but also on all those affected by algorithmic decisions, with a focus on co-design and iterative inclusion. In doing so, HCAD bridges the gap between technical interpretability and social responsibility.

However, there is a noticeable grey space between these interpretations of human-centeredness. People are often directly impacted by traditional and AI algorithms even if they do not directly use them. For instance, an algorithm that decides if someone should receive a mortgage for a car is used by a mortgage broker. However, the decision impacts several stakeholders including potential buyers, prospective sellers, and buyers' agents. Similarly, a recruiter uses an algorithm to filter candidates. This decision impacts the hiring manager, the candidates, and the company legal team. To be truly human-

centered, algorithm design needs to evolve to embody the central tenets of human-centered design, including having empathy for stakeholders involved in the problem landscape.

2.4. Embodied Cognition For Algorithmic Learning

Cognition has traditionally been viewed as abstract thought and processing in the mind, disconnected from the body and the context in which it is situated (Glenberg, 2015). Embodied cognition challenges this traditional approach and suggests that the mind, the body, and the sociocultural context are interconnected. As a result, thoughts and the meaning of information can be grounded in sensorimotor experiences through this lens (Glenberg, 2015). Although questioned by some in abstraction (Goldinger, 2016), evidence from educational research suggests that embodied cognition learning strategies can enhance understanding and improve learning outcomes, particularly in STEM disciplines and multimedia (Kontra, 2012; Skulmowski, 2018). These strategies can also reduce cognitive load and improve the comprehension of abstract concepts (Fiorella, 2021; Weisberg, 2017). As a result, when working with stakeholders who have observed or potential apprehension to STEM concepts, such as algorithms, turning to embodiment as a strategy can be very effective for empowerment.

3. Methodology

This paper leverages a case study of Human-Centered Algorithm Design applied to a venture philanthropy firm using the Internal Revenue Service's Form 990 dataset to provide a worked example of the proposed framework first outlined in Forshaw (2024).

3.1. Case Study Context

Venture philanthropy applies business and VC techniques to philanthropic goals. It accounts for a large share of philanthropic giving in the United States. However, like many sectors, venture philanthropy has inherent inequities in its norms and practices. For instance, the sector has historically favored organizations with leaders that possess extensive philanthropy networks. As a result, less connected organizations typically receive less access to venture philanthropic funding.

A venture philanthropy firm working in the United States set out to address this inequity. They aimed to use large and complex datasets to access a list of all registered charitable organizations in the United States and create a new potential pool of organizations to enter the top of their funding pipeline.

However, this novel approach gave many of their existing nonprofit partners cause for concern about the reasonable potential for inequities to be amplified or reproduced. To address this, the firm applied the (HCAD) approach (Forshaw, 2024) to expand and diversify its pipeline. The HCAD approach involved collaboration with stakeholders from diverse backgrounds to co-design an algorithm that identified potential organizations for funding using the IRS Tax Exempt Organization dataset (Internal Revenue Service, 2023).

4. Human-Centered Algorithm Design with Public Datasets

Based on the tenets of human-centered design and traditional algorithm design outlined in the conceptual background, HCAD involves stakeholders in co-designing explicitly human-centered algorithms. These algorithms are rounded in human needs and contexts and evaluated for potential negative implications or unintended consequences. Through this eight-step approach (see Figure 1), users are involved in the complete design process, fully comprehend how and why it works that way, and have a voice in the cost-benefit analysis of potential impacts. This is essential because the potential impacts will likely affect them and their community.

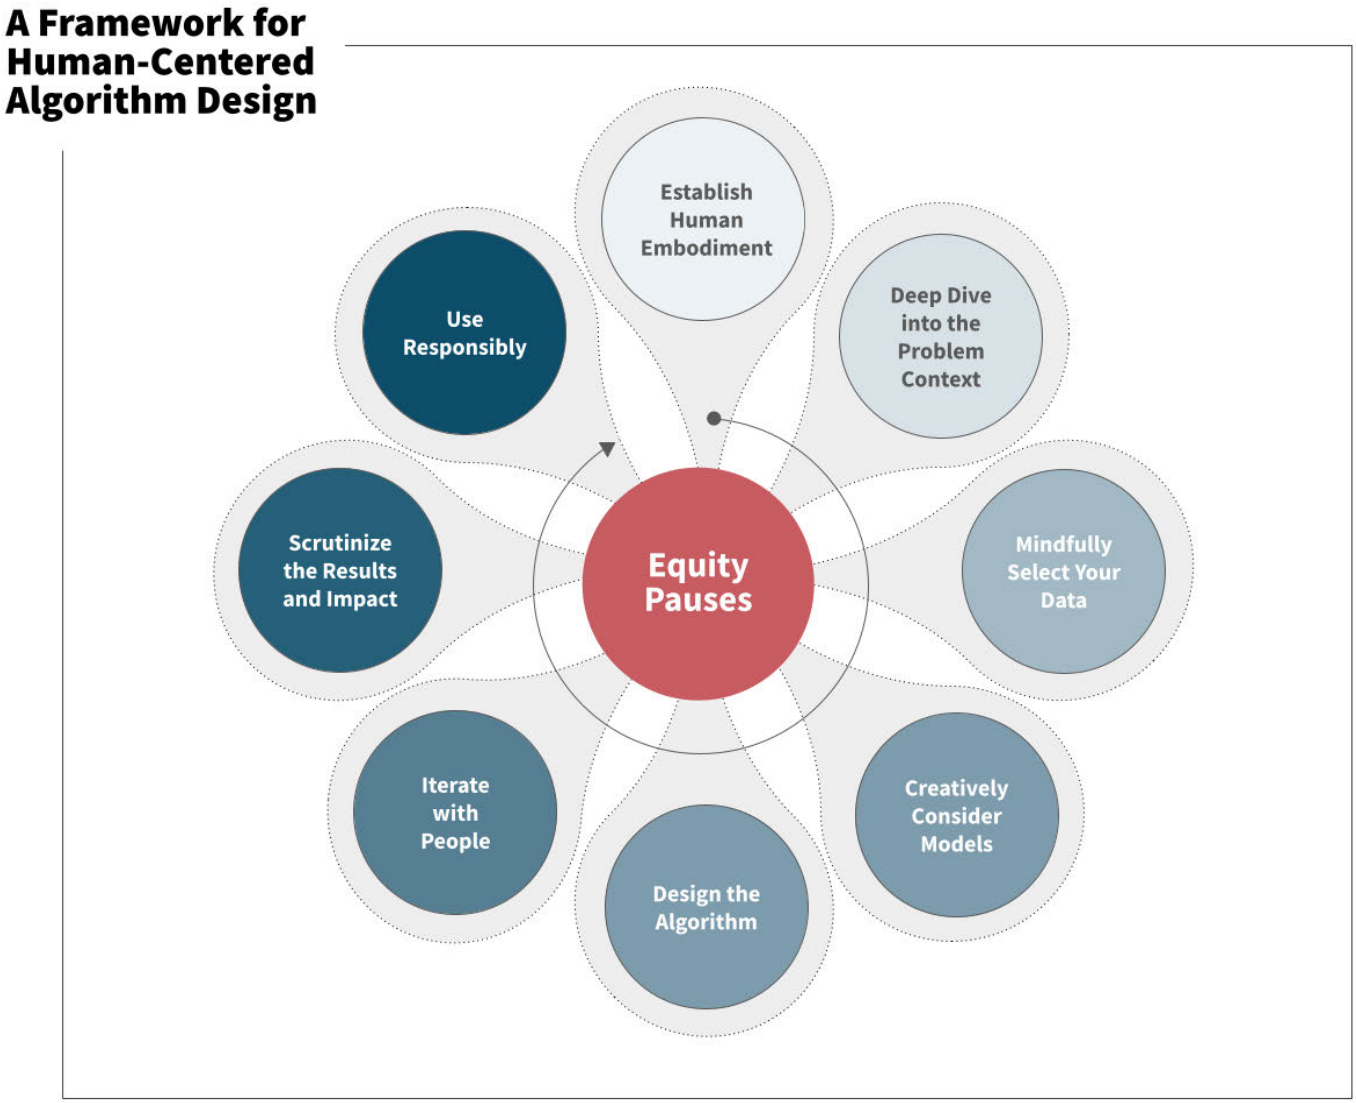

Figure 1. A Framework for Human-Centered Algorithm Design. Reproduced with Permission from Forshaw, 2024.

4.1. Human-Centered Algorithm Design Worked Example

The descriptions below outline an eight-step process for developing and implementing a human-centered algorithm. By drawing upon the literature on human-centered design, embodied cognition, and algorithm design, the following case study demonstrates how these principles were operationalized in venture philanthropy.

Step 1: Establish Human-Embodiment

This step involves including individuals traditionally excluded from technological spaces

and supporting them through principles of embodied cognition (Glenberg, 2015) to demystify abstract algorithmic processes and empower traditionally excluded participants. For the venture philanthropy firm, this involved guiding participants through how algorithms extract, transform, and load data using interactive sessions on digital whiteboards. Before then, potential biases and unintended consequences were explored in a workshop designed to pause and focus on discussing and foreshadowing how they might reinforce existing inequities.

Step 2: Deep Dive into the Problem Context

During this step, staff and 17 external "network nodes" from diverse backgrounds were interviewed about the challenges with equity in venture philanthropy pipeline development. The goal was to ensure varied perspectives to shape a comprehensive problem statement and a deep understanding of the context within which the algorithm would operate. The list of stakeholders was determined using an intentional focus on varied perspectives and then enhanced using a snowball sampling method that connected the venture philanthropy firm to additional stakeholders across the country. By actively engaging diverse stakeholders, this step mirrors the human-centered design emphasis on understanding user contexts and experiences as outlined by Norman (2014).

Step 3: Mindfully Select Your Data

Like traditional algorithm development, this step involves aligning requirements with available data. In the venture philanthropy firm case, organizations had to be nonprofits above a revenue threshold and be aligned with their definition of economic mobility work. Beyond the algorithmic objectives, the firm aimed to facilitate a discussion on the inequities present in the philanthropic sector. Thus, the data needed to be publicly available so that others could replicate the process outlined. This set of requirements led to selecting Form 990 data available through the Internal Revenue Service. These annual filings contain information on revenue and programmatic details, among other information. This careful alignment of data with the design requirements reflects prior research on mitigating biases inherent in big data (Bandy, 2021; Nagendran et al., 2020), ensuring that the process is both transparent and accountable.

Step 4: Creatively Consider Models

There are almost two million nonprofits in the United States (Urban Institute, 2021). This step involves selecting an explainable model capable of identifying organizations that meet the requirements outlined or provide the reasons they were excluded. Every stakeholder acknowledged that making tradeoffs is a key part of the design process and must be made explicit. To accomplish this, a rule-based model was chosen. This design choice was influenced by prior work emphasizing transparency and explainability in algorithmic models (Caruana et al., 2022), ensuring stakeholders could trace decision paths.

Step 5: Design the Algorithm

This step involves translating the findings from interviews, desk research, and workshops into a series of rules that can be encoded into the algorithm. Given that only nonprofits file Form 990s, the dataset inherently met this requirement. The rules regarding total revenue were set. A bag-of-words model was developed to identify the organizations aligned with the venture philanthropy firm's focus; it translated interview and workshop models into a set of key terms that could be applied to the text field containing programmatic information within the Form 990s. The bag of words was designed as a series of words with varying levels of priority.

Step 6: Iterate with People

Algorithms need to be refined based on substantive feedback from real people using them and impacted by the algorithm's decisions. Think of this as keeping humans in the loop in algorithmic decision-making. In this step, the venture philanthropy firm gathered feedback from the people most affected, refining the algorithm with new "bags of words" and verifying its outputs against a previous reference list. Once stakeholders felt it accurately captured their needs and experiences, the venture philanthropy firm's team again held a workshop designed to pause and focus on discussing how its output might reinforce existing inequities.

Step 7: Scrutinize the Results and Impact

Once the algorithm was satisfactory, the next step involved testing the algorithm's outputs by sampling and reviewing them. This was done by engaging a two-pronged approach to enhance the precision and fairness of the algorithm. The first part of the approach was to benchmark the algorithm's output against a reliable dataset to evaluate accuracy. The second part involved conducting a review of specific outputs to discern nuanced intricacies and determining if the organizations returned really belonged in their pipeline pool. With each round of testing, they refined the bag of word lists, introduced more complex logic, such as establishing priority levels, and crafted a "negative" list. The result was a consensual algorithm reflecting stakeholder-informed trade-offs and 2,465 organizations that reflected the venture philanthropy firm's investing landscape.

Step 8: Use Responsibly

This final step is enduring. It requires the venture philanthropy firm to understand and acknowledge the algorithm's limitations, remain transparent about its potential unintended consequences, and develop a plan for continuous evaluation. Over time, they will need to update threshold criteria and refine their word lists while also maintaining awareness of the list's limitations, specifically regarding potential exclusions and their reasons.

5. Discussion

5.1. Key Takeaways

Key Take Away 1: Public Data Needs Human Centeredness

Human-centered algorithm design is especially critical when working with public data because such data inherently represents and impacts human communities. Public datasets like the IRS 990 filings provide information about nonprofits—organizations composed of people that serve human needs. However, conventional algorithmic approaches often center solely on the end-user (for example, a venture philanthropy manager) while neglecting the broader community affected by algorithmic decisions. HCAD bridges this gap: it ensures that direct users, the people within the organizations, and the constituencies served by these organizations were considered during the design process. This is particularly important given the well-documented challenges with public data, such as the inaccuracy in the data can propagate errors and unintended consequences (O'Neil, 2016; Pasquale, 2015; Kitchin, 2014). Thus, HCAD not only enhances the ethical rigor of data interpretation but also reinforces the accountability and transparency necessary to use public data to serve as a public good.

Key Takeaway 2: Human-centered Algorithm Design Helped Create a Shared Mental Model Among Diverse Stakeholders

Bringing diverse stakeholders together to develop a shared mental model for what kind of organization they would fund was a forcing function for clarifying previously ambiguous areas. A central element of this is ensuring every participant is empowered to talk about algorithms, which can be done quickly and effectively by embodying the algorithm (as inspired by embodied cognition theories, e.g., Glenberg, 2015).

5.2. Implications for Practitioners and Researchers

Implication 1: Increase Your Human Centeredness, Even if Only by a Little Bit

The eight-step HCAD process demonstrates that each step adds discrete, measurable value to the final algorithm—even when stakeholder involvement is limited to one or a few steps. For example, insights from stakeholders engaged solely in initial context-setting or data-selection can independently enhance transparency, reduce biases, and refine system performance. A single, well-executed step is far better than no human-centered intervention at all.

Implication 2: Recognize That Different Contexts Might Require a Different Mix of Things

The eight-step HCAD approach is a guide, a mental model, a heuristic, and a worked example. Different public data sets and contexts—each with unique challenges like data errors or misclassification (e.g., inaccurate NTEE codes)—may require tweaks, such as more robust data validation or community-driven model evaluations. Practitioners might make different decisions about their processes, and research could be well-positioned to consider what different contexts need for their unique realities. This contextual flexibility is rooted in the conceptual framing, which underscores the need for adaptive, human-centered strategies that address the specific limitations of each environment.

Implication 3: Empower Participation with Embodied Cognition of How Algorithms Work

By physically embodying the algorithm you are designing, you can empower stakeholders to participate and engage in your process. Practitioners might run workshops using sticky notes to walk through logic steps. This practice, grounded in embodied cognition theory (Glenberg, 2015), helps demystify abstract algorithmic logic and enhances participation, especially for those lacking technical expertise. In turn, it fosters more informed, inclusive, and ethical algorithmic outcomes. A consideration for further research might be to more closely examine whether stakeholders who traditionally lack technical expertise gain a deeper understanding—and thus stronger empowerment—of algorithmic outcomes through embodied cognition pedagogical practices.

Implication 4: Consider using human-centered algorithm design elements for the design of many different types of algorithms

Regardless of the algorithm type, refining algorithms using HCAD principles remains valuable. For example, implementing a neural network would benefit from bringing together diverse stakeholders most impacted by the algorithm's output to dive deep into the problem context before the algorithm design process begins. Even if this is the only HCAD step the neural network design team incorporates into their process, the finished product will be better. Whether dealing with complex neural networks or more traditional predictive models, the principles of human-centered design and iterative refinement are universally applicable.

5.3. Limitations

It is important to acknowledge that this study is a case analysis of one application of Human Centered Algorithm Design in a limited context. As a result, these findings are not uniformly generalizable to every other possible application. However, that was never the purpose; instead, this study aimed to propose an extension of human-centered algorithm design to include the people impacted by the algorithms and to discuss a specific application to large public datasets.

Innovative Ecological Framework for Intangible Cultural Heritage Exhibition and Dissemination in the Digital Survival Era

Xiaozhan Liang
Beihang University
dearzhan1019@163.com

In the "digital survival" era, the exhibition and dissemination of intangible cultural heritage (ICH) face unprecedented opportunities alongside significant challenges. As digital technologies increasingly permeate cultural sectors, they introduce both innovative possibilities and critical dilemmas concerning the preservation and authenticity of ICH. This paper aims to construct an innovative ecological framework for ICH exhibition and dissemination, specifically addressing key issues posed by digital technology: the overshadowing of ICH's original forms, the tension between technological dominance and emotional engagement, and the challenges inherent in digitally recording and authentically reproducing ICH information.

The findings suggest that the strategic introduction of smart technologies can offer new avenues for the protection and transmission of ICH, empowering it to maintain a vital role within modern society. Future research should focus on optimizing these technologies and methodologies, exploring diverse application scenarios to further enhance the sustainable development and cultural transmission of ICH in the digital era. By fostering a comprehensive understanding of these ecological systems, we can ensure that ICH is not only preserved but also invigorated, enabling it to thrive amidst the complexities of digital evolution. This research lays a foundation for continued dialogue and exploration into innovative approaches for ICH, advocating for a future where cultural heritage is celebrated and safeguarded through thoughtful integration with technology.

Integrating Ethics in an AI-Enhanced Double Diamond Framework: Zooming In and Out using Ethical Lenses

Geert Hofman[a]

a Department Business and Media, Network Economics, University College of West-Flanders, Kortrijk, Belgium

ABSTRACT |

This research explores the integration of generative AI into creative industries using a modified double diamond framework that balances human agency and ethical oversight. By examining AI's role in digital design, industrial product design, and marketing/communication, the study moves beyond traditional AI ethics by embedding ethical considerations as creative constraints rather than limitations. Through a dynamic "zooming" methodology, this approach ensures responsible AI use while enhancing innovation. Such structured ethical considerations align with existing discourse on AI ethics, which emphasizes the need for practical implementation rather than abstract principles (Bleher & Braun, 2023; Dignum, 2019).

A core element of the framework is a modular set of ethical lenses derived from virtue ethics, deontology, care ethics, consequentialism, and existentialism. These perspectives provide structured ethical guidance while fostering creativity, reinforcing research that demonstrates how constraints can serve as catalysts for innovation (Leach, 2022; Rosso, 2014). Creativity within AI-assisted processes is often shaped by boundaries that guide ideation rather than restrict it (Boden, 1998). At crucial points in the project the lenses are calibrated with industry supported methods routed in a streamlined version of multi-capital theory (Baue, 2020; McElroy & Thomas, 2015).

This methodological approach reflects broader efforts in AI ethics to create actionable frameworks that integrate seamlessly into professional workflows (Georgieva et al., 2022). It contributes to the discourse on AI ethics by offering concrete tools for creative practitioners while addressing concerns about AI's impact on human creativity and autonomy, emphasizing the need for keeping the human in the loop (Buçinca et al., 2021; Eapen et al., 2023; Liu & Nah, 2020; Vallor, 2024). By moving beyond theoretical discussions, this research provides a pragmatic approach to ensuring ethical AI use in the creative industries, fully realizing in what sense the tools we use shape us (Hurme & Jouhki, 2017).

1. Introduction

The rapid advancement of generative AI technologies has revolutionized the creative industry, offering new tools for brainstorming, prototyping, and content creation. However, this technological evolution brings with it a host of ethical challenges that must be addressed to ensure responsible use. This paper proposes a modified double diamond framework that integrates ethical considerations into the creative process, ensuring that AI tools are used in a manner that enhances human creativity while adhering to ethical standards.

The research focuses on three distinct application domains: digital design, industrial product design, and marketing/communication. Rather than treating ethics as a restrictive set of guidelines, our approach integrates ethical considerations as creative boundaries that enhance rather than inhibit the creative process. This integration is achieved through a dynamic "zooming" methodology: "zooming in" to examine the rationale and value of specific AI tools, and "zooming out" to evaluate broader implications using ethical lenses (Munn, 2023; Steen, 2023). These lenses are calibrated using techniques derived from the multi-capital accounting practice at crucial transition points in the design process (Baue, 2020).

This modular set of ethical lenses derived from major philosophical traditions, including virtue ethics, deontology, care ethics, consequentialism, and existentialism, are therefore central in our methodology. These lenses serve a dual purpose: they provide structured ethical guidance while promoting playful exploration within the creative process. This approach acknowledges research showing that creativity often thrives within well-defined boundaries, transforming ethical constraints into catalysts for innovation (Meincke et al., 2024).

Initial testing of the methodology using the enhanced double diamond framework has been done with student groups in creative curricula and select companies from the three target domains. Comprehensive testing with the integrated ethical lenses methodology is planned for completion by June 2025. We anticipate that our findings will demonstrate how this ethical framework can ensure responsible AI implementation while enhancing creative outcomes through meaningful constraints and deeper engagement with design choices.

The research aims to contribute to the growing discourse on responsible AI implementation in creative industries while offering practical tools for practitioners. It addresses a critical gap in current AI ethics discourse by moving beyond abstract principles to provide actionable frameworks for creative professionals (Bleher & Braun, 2023; Dignum, 2019). It demonstrates how ethical considerations can be seamlessly integrated into existing design methodologies while enhancing rather than impeding creative processes.

Our approach is grounded in the belief that ethics should not be seen as a nuisance but as a catalyst for innovation (Rosso, 2014). By incorporating ethical lenses derived from major philosophical traditions, we provide a structured yet flexible framework that guides

designers in making ethically informed decisions throughout the creative process (Boden, 1998). This framework is particularly relevant for professionals in creative agencies, where the integration of AI tools is becoming increasingly prevalent and where critical ethical considerations often are overlooked.

In section 2 we explain how the AI enhancement of the double diamond framework is conceptually conceived. It will recap the essential principals of the double diamond framework and its possible variants and continues with an explanation of the place of man and machine in the creative process visualized with this framework. We also aim to show how this can be practically implemented using a modularly constructed toolset.

Section 3 explains what the ethical lenses are and how they can be implemented as building blocks in a versatile way within the toolset developed for the AI enhanced double diamond. We also take a look at the concept of zooming in and zooming out and the principal of calibrating the ethical lenses.

Finally, section 4 goes into the more specific trials and test cases that have already been done using the framework and describes the major test case that will take place in spring 2025. We also describe possible future work that could be done to make the practical implementation of this framework more accessible to a wider public, not only aiming at the traditional creative industries but also the domains of business, technological innovation and problem solving.

2. The AI Enhanced Double Diamond Framework

2.1. The Double Diamond Framework

The double diamond framework, developed by the British Design Council, is a widely used design process model that consists of four phases: Discover, Define, Develop, and Deliver (Design Council, 2025). A comprehensive view of the process can be seen in Figure 1.

Each diamond contains divergent and convergent thinking, allowing designers to explore a wide range of possibilities before narrowing down to the most viable solutions. Within the diamond a whole set of specific techniques can be deployed to facilitate the creative process adapted to the needs of the stakeholders and the team involved in the process. This methods bank is not a fixed set of tools but a flexible collection of methods usable in different creative contexts. Examples thereof can be found in publications of the Design Council (Design Council, 2025) or other organizations like IDEO.org (IDEO.org, n.d.). As can be seen in the Design Councils' (2025) Figure 1, this process is not linear but highly iterative.

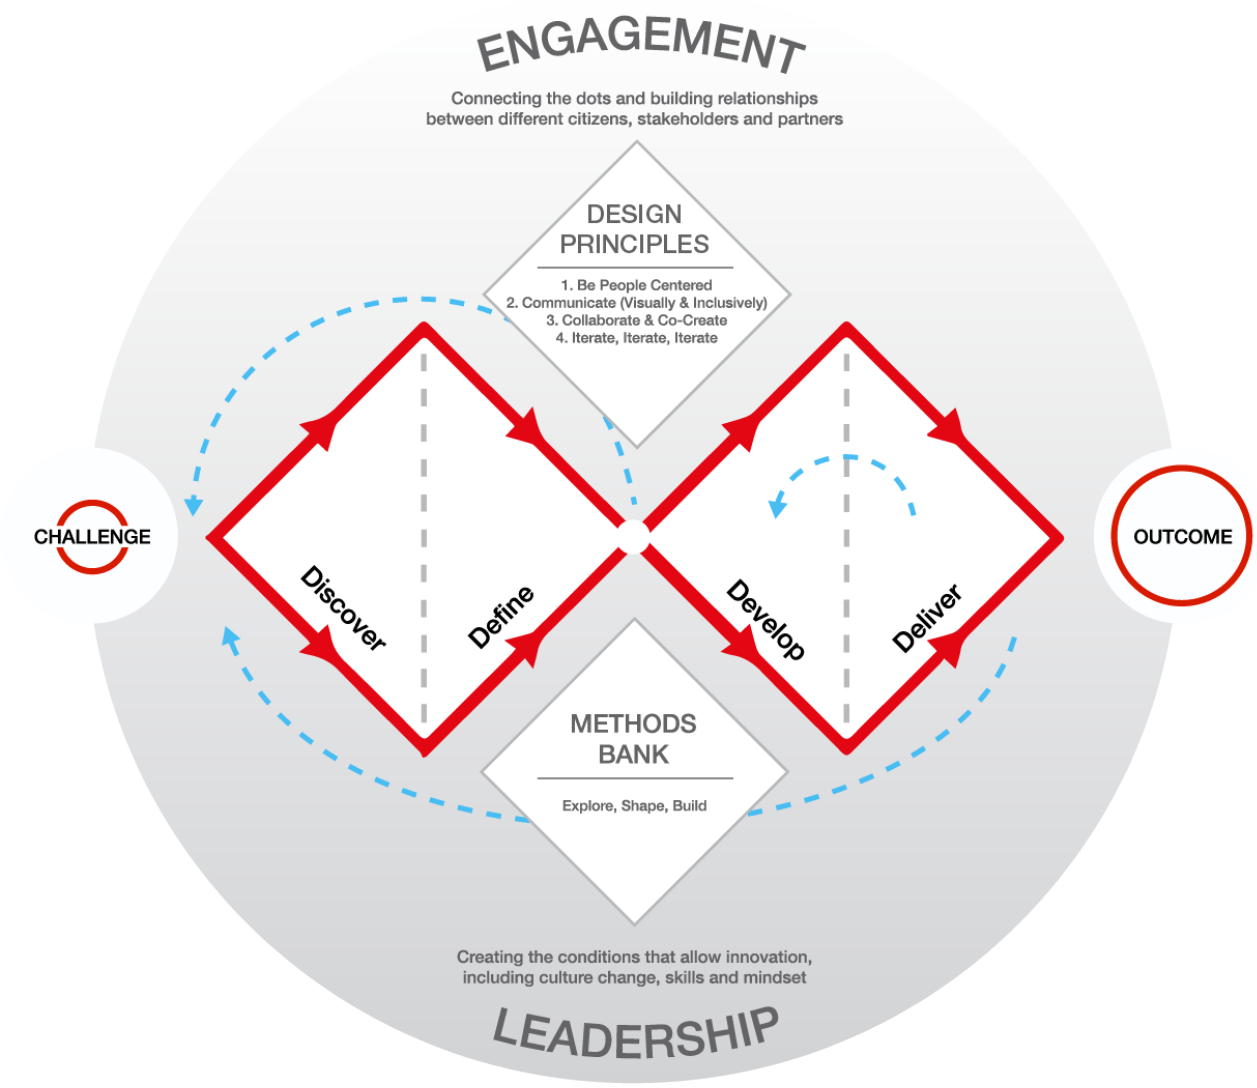

Figure 1: The Double Diamond Framework. CC-BY - This work by the Design Council is licensed under a CC BY 4.0 license.

The different diamonds or even the separate components within a diamond can be split among different teams, which means that in many cases the practical execution of a creative project can involve a variety of people with different skill sets throughout the process. This allows for delegation of tasks and diversification of insights, but also requires special care when transferring results from one team to another. The risk of losing the big picture in the process is not imaginary in this context (Kwon et al., 2021).

While such division of tasks is common in practice, for the purposes of our research, we will assume that the design team completes the entire diamond cycle, or at least one complete diamond.

2.2. Enhancing a solid framework using AI

As mentioned in the introduction, one of the most important contemporary developments in the creative sector is the prominent place that artificial intelligence is taking up, especially since the advent of generative AI (Eapen et al., 2023). A vast selection of AI-tools are available today to aid in the creative process, from aiding in research, drafting and impersonating personas to brainstorming and creating visual drafts. Not only professional designers but students or the public at large can access these tools for free or for a small fee. It is evident that this has a major impact on the design process itself (Benjamin et al., 2024). The main purpose of our research project is to try to incorporate

these new tools at our disposition in a responsible and sensible way. The development of an AI enhanced double diamond framework is the path we are following to realize this end goal.

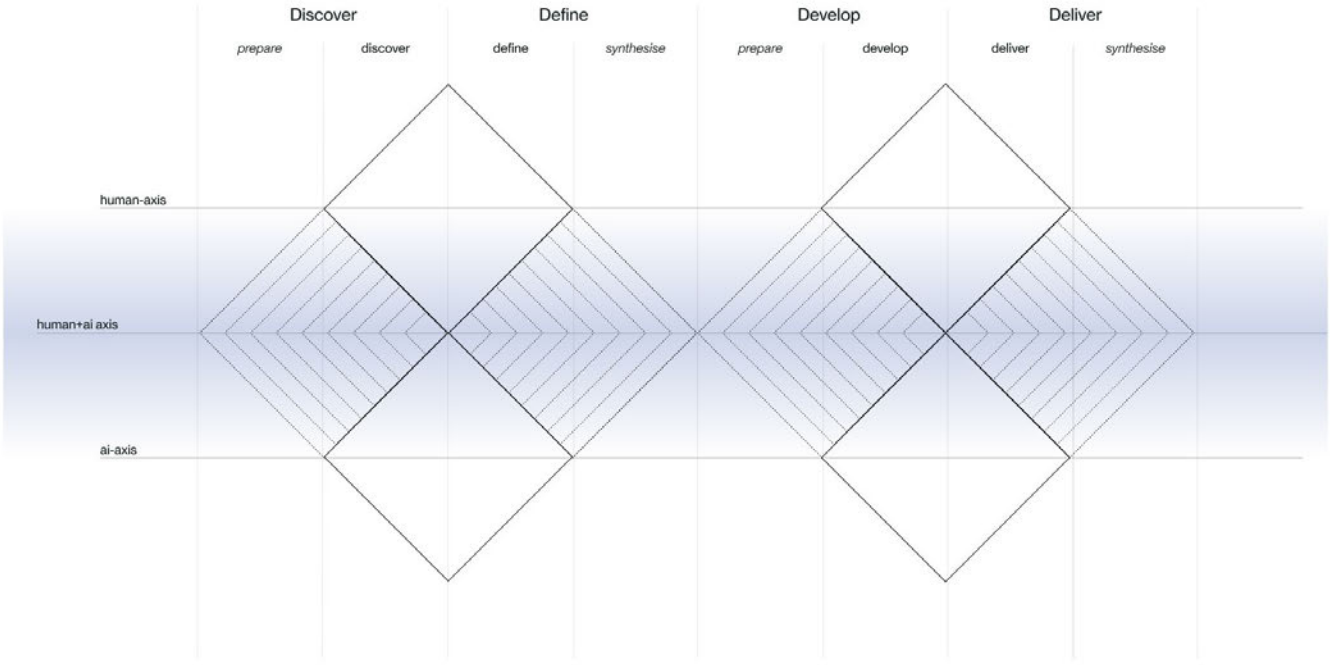

Figure 2: The augmented double diamond (Ganzevles, 2024).

Figure 2 details the augmented double diamond we are proposing. It consists of some additional phases and layers. Each diamond has been separated into a human part and an AI part on the vertical axes, in order to facilitate the human-AI cooperation within the model. Horizontally this has an impact on the different phases. The added prepare and synthesize phases, are very welcome in the context of tool utilization planning and evaluation, as well as for the ethical lenses' calibration and evaluation which will be introduced in section 3.3. A previous publication by one of the team members of the research project explains clearly what the logic is behind the theory and describes the practical experiments conducted with this model (Ganzevles, 2024).

2.3. Modular implementation

While the augmented double diamond model sketches a conceptually rich and clear picture of how this established framework can be enhanced to encompass artificial intelligence within the creative process, it remains largely theoretical and requires practical adaptation for real-world application.

The practical application of the framework begins with the preparation phase, where the pipeline within the diamond is prepared. In this phase, the design team assesses the challenge at hand and conducts a primary evaluation to determine whether to proceed with the challenge, based on legal, ethical and practical considerations. Legal and practical considerations are dependent on the time, place and available human and other resources at hand (Engelfriet, 2023). This evaluation serves as a straightforward calculation to determine the team's capacity to execute or delegate the proposed challenge. The ethical considerations, on the other hand, are dependent on the culture, values and the implemented evaluation process used by the design team. This aspect is

closely related to the calibration phase of the ethical lenses described in 3.3.

Once the project has been accepted, the team needs to consider the building blocks required to achieve the desired result. As previously mentioned, various techniques are available for the different standard phases in the double diamond framework. An exemplary but far from exhaustive list of methodologies or techniques can be listed here (Elmansy, 2021):

- discover phase: empathy mapping, persona building, surveys, interviews, focus groups, literature review, …
- define phase: user stories, value propositions, root cause analysis, boundary examination, morphological analysis, …
- develop phase: scamper, real life prototyping, cherry split, biomimicry, a day in the life of, …
- deliver phase: user acceptance testing, usability testing, user feedback analysis, six thinking hats, …

The design team working on the challenge will identify the methodologies used in order to construct a pipeline to traverse through one or both of the diamonds.

Templates that have some, all or no artificial intelligence components can be constructed for each technique or tool. An example of such a template can be found in Figure 3. It is within this pipeline using comparable templates that ethical lenses will be deployed, as described in the following section.

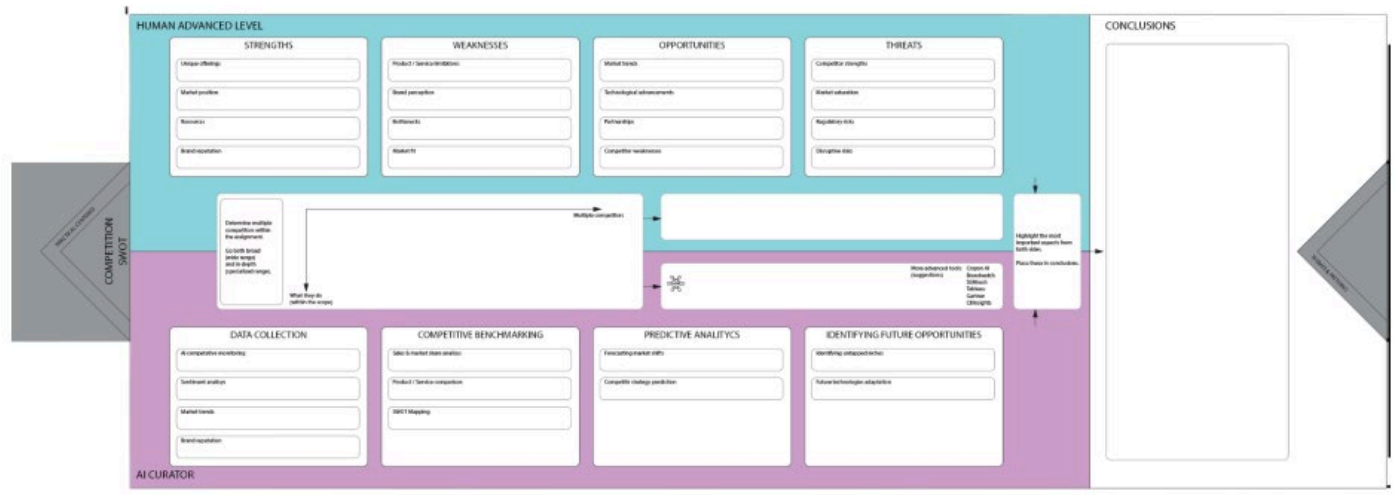

Figure 3: Human-AI version of a SWOT analysis (adapted from Demortier, 2024)

The evaluation of what template to use for each method is a decision the design team must make during each preparation phase. Leadership in this decision-making process depends on the team's working culture. As suggested in another paper written in the context of this research project, adopting the role of a conductor is worth considering (Hofman, 2024). This role can be taken up by a senior designer or a sub-team of experienced designers.

Going through this pipeline with one or more iterative loops within it, ultimately leads to the synthesize phase. This phase is somewhat comparable to the retrospective phase known from scrum (Schwaber & Sutherland, 2020), sharing many of the same objectives. It is intended to evaluate the functioning of the team as well as of the utility of the tools, methods and techniques used in the normal pipeline. As a result of this phase an evaluation of templates is also in order. Adjustments can be made to the balance

between human and machine contributions, and new templates can be created to increase or decrease reliance on either component.

The key difference between the scrum based retrospective and the synthesize phase, is that the latter leads to a follow up phase in the second diamond or to a retake of the whole first diamond. The consequences of the synthesize phase are therefore quite important and sufficient time should be reserved for it. Even at the end of the second diamond, the decision to finish the project and deliver the end product or service, or go back to the first or second diamond has an enormous impact on all aspects of the project.

3. Implementing Ethical Lenses

3.1. The Relevance of Ethical Traditions in Creativity

The intersection of ethical traditions and creative processes has taken on new urgency in the era of generative AI. Drawing from virtue ethics, which emphasizes the cultivation of moral character, creative professionals must develop virtues like transparency and intellectual honesty in their use of AI tools (Vallor, 2016). Meanwhile, deontological ethics provides crucial guidance about respecting human dignity and autonomy in creative work, while consequentialist approaches help evaluate the broader societal impacts of AI-driven creative processes (Wright, 2022).

Traditional ethical frameworks, from care ethics' emphasis on relationships and responsibility to contractarian perspectives on fairness and consent, offer valuable insights as AI systems trained on vast datasets generate new content. These frameworks help address questions about the potential displacement of human creators and the authenticity of AI-generated art (Risse, 2023). Existentialist ethics, with its focus on human freedom and authenticity, raises particularly relevant questions about maintaining genuine human agency in an AI-augmented creative landscape (Terzis, 2020).

Each of these traditions also has its drawbacks (Buyl & De Bie, 2024; Munn, 2023; Raghavan, 2024), which makes it interesting to use more than one ethical tradition to take on the diverse range of ethical challenges posed by the use of new generative AI tools and what they produce.

For digital designers, product designers, and marketing professionals, these ethical traditions provide practical guidance. Virtue ethics can inform the development of professional integrity, while care ethics highlights responsibilities to stakeholders and communities. Deontological principles help establish boundaries around data privacy and manipulation, while consequentialist thinking aids in evaluating the long-term impacts of AI-powered design and marketing strategies. Contract theory offers frameworks for establishing fair terms of AI use and data collection.

However, AI can also be an impressive new creative tool that, when thoughtfully integrated with these ethical traditions, might enhance rather than diminish human creativity. The key lies in developing frameworks that synthesize virtue-based, duty-based, and consequence-based approaches while respecting intellectual property rights, maintaining transparency about AI involvement, and preserving the economic viability of creative professions. This requires balancing innovation with responsibility, ensuring that our embrace of new creative possibilities aligns with enduring ethical principles.

3.2. The Concept of Lenses

To integrate ethics into the double diamond framework, we propose the use of ethical lenses derived from six major philosophical traditions:

- virtue ethics: focuses on the moral character of individuals and the cultivation of virtues such as wisdom, care, and creativity;
- deontological ethics: emphasizes adherence to universal rules and the importance of duty;
- consequentialist ethics: evaluates the moral worth of actions based on their outcomes;
- contract ethics: involves establishing ethical principles through a hypothetical social contract;
- care ethics: prioritizes human dignity and relationships;
- existential ethics: Emphasizes individual freedom and responsibility.

This list is by no means exhaustive, as numerous variations remain possible. However, in our research we are focusing specifically on these traditions.

These lenses provide a structured approach to ethical decision making, allowing designers to consider the broader implications of their work while maintaining a focus on creativity and innovation. They can be integrated in templates the same way as the other tools and techniques used in the framework.

3.3. Calibrating the Lenses

As sketched in section 2.3., in the preparation phase of the first diamond, the ethical aspects will need to be weighed against the culture, values, beliefs and ethical practices of the design team. As ethics is not something eternal and universal, these can differ substantially between different teams and even within teams over time. What a team considers ethical enough to begin investigating using a creative pipeline is something that is beyond the scope of our research. Our research focuses on the phases once the team has accepted the challenge.

In the preparation phase of each diamond a “full spectrum” ethical analysis is required. No specific lens is being used in this context, although one could argue that we are using all lenses at the same time.

We propose using a simple accounting and balancing methodology at this stage. To facilitate this procedure, we provide a multi-capital matrix that takes 9 capitals divided between 3 larger domains into account. This multi-capital matrix is inspired by the writings of Bill Baue (2020) who is working on a comprehensive new economic framework that takes a broader approach than the current economic system (*R3.0 | Redesign for Resilience & Regeneration for a Green, Inclusive and Open Economy*, n.d.). The MultiCapital Scorecard is a concrete implementation of this framework (McElroy & Thomas, 2015).

The capitals we have chosen to use are:

- Human:
    - Social
    - Intellectual

    - Psychological
- Economic:
    - Produced goods
    - Financial
    - Primary resources (land, raw materials)
- Natural:
    - Biosphere
    - Environment based (human habitat)
    - Physical (health related)

For each of these capitals an estimation is made of costs and profits associated with them on three levels:

- micro: concerning the client as an entity (which can be a person, business or organization);
- meso: related to the direct network of the client (customers, suppliers, relations, family, etc.);
- macro: taking the whole network into account that experiences an impact of the resulting product of service being realized through the creative process.

This leads to an example matrix, as illustrated in Figure 4. The numbers presented are purely illustrative. The specific procedure on how to score positive or negative effects should be determined based on the context of each project or within the context of a specific company or organization.

Multi-capital matrix																	
Human capital						Economic capital						Natural capital					
Psychological		Social		Intellectual		Produced goods		Financial		Primary resources		Biosphere		Human environment		Physical	
+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-
3	0	3	0	3	0	3	0	3	0	3	0	3	0	3	0	3	0
3		3		3		3		3		3		3		3		3	
1	2	5	1	5	1	5	1	5	0	1	1	1	2	3	2	2	1
-1		4		4		4		5		0		-1		1		1	
2	0	4	1	5	2	3	2	0	1	2	3	4	2	0	1	1	1
2		3		3		1		-1		-1		2		-1		0	

Figure 4: An example multi-capital matrix

This procedure should not be considered a bookkeeping procedure. The main intention of using this methodology is to consider where the main struggle points will be. Using this format stimulates a discussion between a chosen subset of stakeholders over a broad range of values that are generally important for human well-being. Based on this assessment the team can see where the most pressing issues could be to consider in more detail during the execution of the creative process. Those matrix cells where costs outweigh the benefits, might deserve more scrutiny using appropriate ethical lenses during the zooming in and out moments of the project.

These preparation phases provide the skeleton for all other ethical reflection moments. At these crucial points in the project the participants need to assess what ethical lenses are most valuable in the context of each specific project and what values within the chosen lenses have priority, taking all relevant stakeholders into account.

3.4. Zooming In and Out

"Zooming in" involves examining the rationale and value of specific AI tools or its results at a detailed level. This process includes evaluating the ethical implications of using particular tools, considering their impact on the design team, and assessing their alignment with the project's goals. For example, when using a generative AI tool for brainstorming, designers might consider whether the tool promotes creativity and

empathy within the team (virtue ethics) or whether it adheres to ethical standards (deontological ethics).

"Zooming out" involves evaluating the broader implications of AI tools at crucial transition points in the regular design process. This includes considering the societal (Van Maanen, 2022; Verdegem, 2022) and environmental impact (Crawford, 2021) of the tools, as well as their alignment with the organization's ethical values (Klingefjord et al., 2024). For instance, when transitioning from the Discover to the Define phase, designers might reflect on whether the AI tools used in the Discover phase have promoted inclusivity and accessibility (contract ethics) or whether they have considered the long-term societal impacts of their designs (consequentialist ethics).

3.5. The basic ethical building block

The basic ethical building block is a template to be used in the constructed pipeline at crucial points in the flow. The parameters mentioned in the following lists need to be determined in the preparation phase and should be fitting for the logical structure of the whole process.

Each ethical building block has the following properties and components:

- a number of state indicators chosen during the preparation phase intended to guide the AI based reflection context:
    - direction: post, pre or double;
    - stage: prepare, discover, define, develop, deliver, synthesize;
    - zooming state: in, out;
    - main capital: one of the 3 capital domains or 9 capitals;
    - lens (non-exhaustive): Virtue, Consequentialist, Deontological, Care, Contract, Existential, ...
- several interconnected components guiding the ethical reflection procedure (described in the flowchart in Figure 5):
    - a field to describe or summarize the conclusions from the previous building block (only at the start of this sub-process mutating to read-only once started);
    - a field to describe the next building block (only at the start of this sub-process mutating to read-only once started);
    - a button (or step if performed manually) to generate a reflection question related to all parameters given and the results and/or descriptions of the previous and next building blocks;
    - the output generated by the generative AI tool;
    - a field to describe the conclusion(s) from the ensuing discussion (to be filled in after the discussion phase);
    - a button (or step if performed manually) to generate reflective feedback;
    - a choice to continue to the next building block, remain in the same building block given additional discussion result input or return to a previous building block effectively iterating.

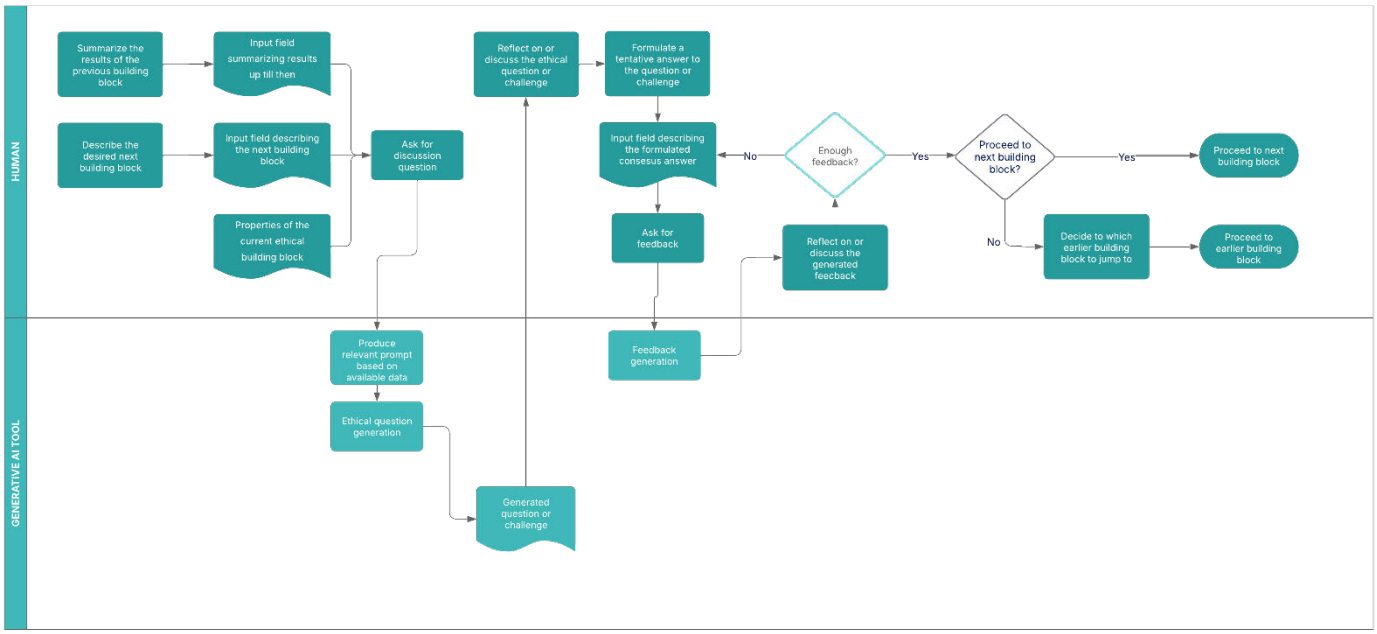

Figure 5: Ethical building block procedure

Starting with the summary of the results of the previous building block and describing what the next building block will be, combined with the properties of the prepared ethical lens, results in a prompt for a generative AI tool of choice. This tool generates an ethical discussion proposal (be it a question or challenge) for the team that discusses the topic and formulates a summary of the findings of this discussion. Feedback on this summary is asked of the generative AI tool. This results in a loop where the team needs to decide to continue discussing or proceed to the following phase. In principle, the AI component could be replaced by an ethical professional or the conductor mentioned earlier, however this would beat the purpose of enriching the process of an AI augmented double diamond. The added value of the fundamentally different AI intelligence is an important component of the whole concept.

The main purpose of integrating these ethical building blocks in the creative process is to open new perspectives. One of the side effects might be a slowing down of the process to reach the end result. This is not necessarily a negative thing. Viewing AI as a form of efficiency enhancing automation and rushing to an end result is one of the risks of using AI components (Reigeluth, 2023). When thinking only in terms of financial and human resource gains is the wrong way to use the benefits of using artificial intelligence tools. Using the created gains to produce richer end results is the only way to really profit from the huge opportunities these AI tools provide.

3.6. Fitting Building Blocks in the Modular Design

As mentioned in section 3.2. the lenses and techniques will be implemented using the same kind of templates as the other building blocks within the creative pipeline. Where they need to be placed, how many and what specific lenses will be used is the primary task of the coordinating sub-team or the conductor in one of the preparation phases, possibly using feedback from the synthesizing phases when available.

4. Current Results and Future Work

Initial testing of the methodology without the ethical lenses has been conducted with student groups in creative curricula and select companies from the three target domains.

The results indicate that the concept of using a mixed human-AI method enhances the creative process which confirms some of the findings in the literature (Wu et al., 2021). Ethical aspects up till now where only introduced ad hoc. No automation was used. The fact that ethical components were used was considered an important added value. Participants reported that the "zooming" methodology helped them to consider the specific as well as the broader implications of their work, leading to more ethically informed design choices.

Comprehensive testing using a (semi-)automated ethics building block integrated in the fully augmented double diamond flow, is planned for completion by June 2025. Several student groups will be testing a project workflow as illustrated in Figure 6. They will take on a creative challenge from the three application domains mentioned in the introduction: digital design, industrial product design, and marketing/communication.

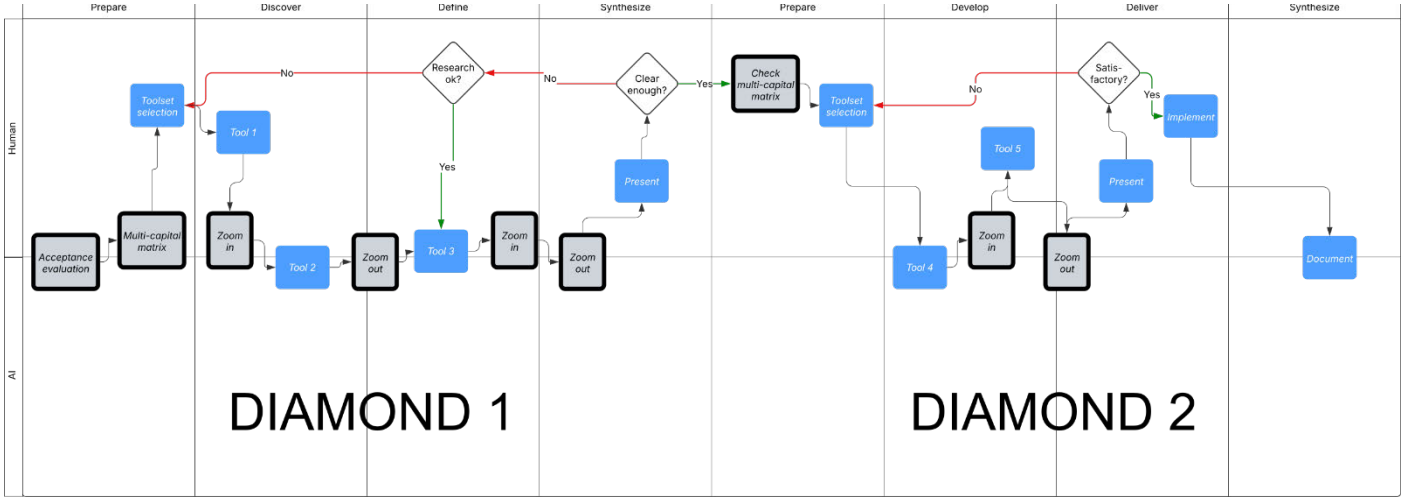

Figure 6: Example project flow

The testing process will begin with a preliminary calibration phase, as described in section 3.3. Teams will define the scope of their project, select relevant AI tools, and establish the ethical parameters using the multi-capital matrix. This initial step ensures alignment between the project's goals and the ethical constraints guiding decision-making. This step will be guided by an experienced instructor.

Once calibration is completed, participants will go through a controlled application phase, where they will execute the standard double diamond process while systematically integrating AI-generated ethical prompts at predefined moments. At each critical stage—Discover, Define, Develop, and Deliver—teams will be required to document their use of ethical lenses, assess the impact of AI interventions, and reflect on the decision-making adjustments influenced by these ethical considerations.

To capture variations in real-world applications, the testing will require the intermittent use of AI enhanced ethical lenses and ad hoc ethical procedures. Comparing both implementation within each team will help determine whether structured and AI supported ethical interventions lead to more responsible and innovative outcomes without hindering creativity.

Additionally, an iterative feedback loop will be incorporated, allowing participants to refine their approach based on intermediate evaluations. This will be facilitated through structured synthesis sessions, where teams will review AI-generated reflections, discuss the alignment of their work with ethical priorities, and adapt their methodologies accordingly.

The evaluation of the testing phase will be conducted through a multi-dimensional assessment framework that includes qualitative and quantitative metrics.

Qualitative data will be collected through structured interviews, focus group discussions, and design diaries maintained by participants. These will provide insights into how designers perceived the impact of ethical lenses on their workflow, creativity, and decision-making.

Quantitative evaluation will involve a combination of efficiency metrics, such as time spent on ethical reflection phases, and impact measurements, including shifts in design choices, changes in AI-tool reliance, and stakeholder assessments of final project outcomes. Surveys and scoring rubrics will be developed to systematically measure improvements in ethical awareness, decision-making quality, and design innovation.

A key component of the evaluation will be external validation, where final design outputs will be assessed by independent panels composed of domain experts, ethical scholars, and target users from the respective industries. This will provide an unbiased assessment of whether the integration of ethical lenses led to more ethically sound and functionally effective creative solutions.

5. Conclusion

This research addresses a critical gap in current AI ethics discourse by moving beyond abstract principles to provide an actionable framework for creative professionals. By integrating ethical lenses into the double diamond design methodology, we demonstrate how ethical considerations can be seamlessly embedded into existing design processes, ultimately enhancing rather than constraining creativity.

The proposed approach represents a significant advancement in responsible AI integration, offering a nuanced alternative to both uncritical AI adoption and overly restrictive ethical constraints. By treating ethical considerations as dynamic, contextual building blocks within the creative process, we create a more adaptive and responsive approach to technological innovation. This aligns with recent discourse advocating for the integration of AI ethics into practical design workflows (Bleher & Braun, 2023; Georgieva et al., 2022).

Key contributions of this research include:

- a modular ethical framework that allows for flexible, context-specific ethical reflection, leveraging ethical theories from virtue ethics to consequentialism (Vallor, 2016; Wright, 2022);
- a systematic approach to "zooming in and out", enabling designers to consider both micro and macro ethical implications at various stages of the creative process, inspired by methodologies that promote iterative ethical engagement (Steen, 2023; Munn, 2023)
- a multi-capital assessment methodology that broadens the evaluation of creative projects beyond traditional economic metrics, incorporating environmental, social, and intellectual capital as key components (Baue, 2020; McElroy & Thomas, 2015).

The methodology we propose goes beyond mere compliance, positioning ethics as a

generative force that can spark innovation rather than a set of restrictive guidelines. Prior research has shown that constraints can act as catalysts for creativity rather than limitations (Rosso, 2014; Boden, 1998), and our framework builds on this insight by embedding ethics as an integral part of creative ideation. By encouraging designers to engage deeply with ethical considerations through AI-assisted reflection, we open new pathways for more thoughtful and socially responsible creative work.

Moving forward, our comprehensive testing planned for June 2025 will provide crucial empirical validation of this approach. By systematically analyzing the impact of ethical lenses within real-world design challenges, we anticipate refining the framework for broader adoption. Findings from this testing phase will also contribute to ongoing discussions on AI's role as a collaborative design partner, reinforcing perspectives that emphasize the augmentation of human creativity rather than its replacement (Eapen et al., 2023; Liu & Nah, 2020).

Ultimately, this research underscores the potential for AI to be a collaborative partner in ethical innovation—one that amplifies human creativity while maintaining a robust commitment to fundamental moral principles (Dignum, 2019; Klingefjord et al., 2024). As generative AI continues to transform creative industries, frameworks like the one presented here will be essential in ensuring that technological advancement remains aligned with human values and societal well-being (Crawford, 2021; Van Maanen, 2022).

INVESTIGATING VIDEO GAME HARASSMENT THROUGH DESIGN RESEARCH: THE PROCESS OF MAKING A BRAIDED COMIC THROUGH CREATIVE INQUIRY

Elizabeth Hejny

ABSTRACT | *Git Gud: A Braided Comic About the Good, Bad, and Ugly in the Video Games Community* (2024) is a creative inquiry into presenting research in a braided comic format. Comics-based research refers to a broad set of practices that use the comics form to collect, analyze, and disseminate scholarly research. The unique design aspects of this project include the creation of a braided comic about harassment in video games, which adapts the principles of a braided essay into a visual braid of three strands: a narrative short story, research on harassment in video games, and my autoethnographic experiences with harassment as a video game player. When your research is investigating a wicked design problem, focusing on one small piece is not enough, and the many elements seem tangled and intertwined, like a bad hair day, braiding together the strands can add order to the many overlapping components. This session will review the development of the braided comic as a format to present these three strands of harassment in video games. The session presentation will overview the process of creating this research-informed comic and reflections on creative inquiry and design discoveries from working within this comic-making process for researching complex problem spaces in digital human interactions. Then this session will review of the affordances of this process, such as novel connections and increased visual communication are included in this paper, the discovered downsides to braided comics in design research, and practical recommendations for how to integrate comics-based research for others interested in adopting this format effectively. The session will conclude with suggestions and advice for how this format can be applied to broader research contexts and how design researchers

and educators can incorporate braided comics or other fluid research methods within their own work.

KEYWORDS | COMICS, CREATIVE INQUIRY, ONLINE HARASSMENT, VIDEO GAMES, BRAIDED

1. Introduction

"Git Gud" is a slang expression in the video game community. "Git Gud" is an intentional misspelling of the phrase "get good" and is used to heckle inexperienced players or 'newbies' in online video games. I use the slang 'Git Gud' in the title of my project, Git Gud: A braided Comic about the Good, Bad, and Ugly in the Video Games Community (2024), because I think there is an opportunity to reconsider the term from the perspective of my research. What if 'Git Gud' was a phrase that encouraged other players to be kind or good to each other? To an experienced video game player, that suggestion might sound laughable. However, encouraging good or sportsmanlike behavior of players is a good design strategy for many video game designers. In a world where players set a priority to strive to 'Git Gud' by leveling up their collaboration and sportsmanship skills, the toxicity associated with the video game community would likely be reduced.

However, 'Gitting Gud' is also a moving target because defining 'good' and 'bad' is subjective to each player. Defining negative behavior in the video game community is complicated and filled with overlapping terms and perspective-based nuance.

When approaching negative interactions in video games from a design research perspective, more investigation into the problem space resulted in a recognition that a clear understanding of all the overlapping elements was a part of the problem itself.

The primary research utilized for this process involved the project-based 'research through art and design' (Frayling, 1993) process. Research through design in human and computer interaction (HCI) involves reflection in iteratively understanding the people, problem, and context around a situation that researchers feel they can improve (Zimmerman & Forlizzi, 2014). Comics-based research (CBR) has emerged across the sciences and humanities. CBR refers to a broad set of practices that use the comic form to collect, analyze, and disseminate scholarly research (Kuttner et al., 2020). Using research through art and design and project-based research, a braided comic format was utilized to capture, translate, and present the results of video game harassment and bullying design research findings, which include the investigation of anonymity online, the emotional impact on victims of harassment, players' relationships to their avatars, perspectives on trash talk, and depicting interactivity online. This project also heavily utilized creative inquiry, which is the ability to generate new and alternative ways of addressing problems, answering questions, or expressing meaning in the pursuit of learning (Joubert, 2022). Creative inquiry is a problem-solving process combining various ideation strategies with targeted research and purposeful critical thinking (Steward, 2021). It emphasizes the development of questions compared to formal research focused precision, organization, and efficiency (Holland, 2017). Uniting creating inquiry and research through art and design, this project investigates how the video game community can strive to 'Git Gud.'

Limited Sharing and Bottom-Line Safeguarding: Ethical Design Knowledge Flow in Chaos and Game

Haoyi Lin[a] ,Jing Liu*[a]

a. Faculty of Innovation and Design, City University of Macau

*jingliu@cityu.edu.mo

ABSTRACT | In the digital and knowledge economies, the challenge of sharing and safeguarding design knowledge has emerged as a significant societal issue(Luchs et al., 2016; Yang et al., 2022). Open communities advocate for collective intelligence and innovation through the sharing of design insights, while many profit-driven individuals and businesses prioritize safeguarding their original designs to maintain a competitive edge. This conflict complicates knowledge management(Benabdellah et al., 2024; Oygür, 2018) particularly given the lack of effective mechanisms for regulating knowledge sharing and safeguarding individual rights.

To address this challenge, an ethical framework is introduced for managing design knowledge flow, integrating chaos theory and game theory to balance knowledge sharing with individual rights in design communities. Initially, leveraging chaos theory, the unpredictable behavior of design knowledge dissemination is explored in complex digital environments. Critical variables impacting knowledge flow are identified, and strategies to mitigate uncertainties and risks are proposed, enhancing flow efficiency(Zhuge, 2006). Next, game theory is applied to examine the interests of designers and users in shared knowledge environments. By simulating interactions on design platforms, strategic decisions made by both parties are quantified, considering factors like copyright safeguarding and user willingness to pay, to assess how different sharing approaches impact safeguarding and collaboration. Finally, the status quo of different design community platforms are analyzed, the closed-loop design knowledge ecosystem of creation, dissemination and feedback is explored, and the current strategies for sharing and protection of the platform are reviewed.

The study shows that the integrated strategy based on chaos theory and game theory can achieve a balance between knowledge sharing and individual rights safeguarding. Designers can ensure the safe sharing of their works on an open platform through a

reasonable copyright safeguarding mechanism, while users can access and use these works in a standardized framework, resulting in a win-win situation. The study also verifies that the introduction of copyright safeguarding measures and terms of use significantly reduces the risk of copyright infringement and enhances designers' motivation to participate in open sharing environments.

The findings offer valuable knowledge management strategies for the design industry and other knowledge-intensive fields, providing theoretical foundations for balancing knowledge sharing and safeguarding in the digital age.

1. Introduction

Knowledge is a kind of social resource, it needs to go through production, transformation, creation, application and other stages to achieve its maximum value. The knowledge economy's power makes knowledge an important source of social assets and competitive advantages, but its value depends on its effective flow and communication in society. From the perspective of content form, the flow of design knowledge is a process of observation and transformation from data, information, knowledge and intelligence to wisdom(DIKIW). This Knowledge flow of the DIKIW refers to the chain link of knowledge application(Liew, 2013). From the perspective of time and space, the concept of dynamic knowledge introduces flowing. This kind of flow promotes the optional docking with knowledge sources in specific knowledge application scenarios and leads to the connection between specific knowledge users and knowledge providers(Holtshouse, 1998). It is the concern of knowledge economy, design knowledge flow and design collaborative innovation that has become an indispensable part of design knowledge management research.

In the era of knowledge explosion, the value of knowledge is no longer only embodied in independent accumulation but can realize full and effective circulation and collaborative sharing in society. Therefore, optimizing the benefit of knowledge dissemination has become the core issue, which is embodied in the emergence of community knowledge, the wisdom sharing of group knowledge and the original declaration of individual knowledge. Knowledge sharing and safeguarding are considered important issues in knowledge management research. However, the design itself is a collaborative innovation process, including interdisciplinary, cross-department and cross-organization cooperation and collaboration among heterogeneous organizations, that is, it has the attribute of flow communication. As the essential core of collaborative innovation, the flow and dissemination of design knowledge is the sharing of private or shared knowledge among heterogeneous subjects, thus forming a collaborative interaction process of knowledge creation and value spillover. Therefore, the dissemination of design knowledge involves the diversity of heterogeneous subjects, the diversification of interests, and the multidimensional attributes of knowledge. The development of a digital design knowledge community will be influenced by the particularity of design knowledge and the flow characteristics of interdisciplinary and cross-organization.

The existence and dynamic change of the knowledge community is an important mechanism to promote knowledge innovation and evolution. Designers represented by

design knowledge groups generally believe that designers are the source of work knowledge, as well as the expression and transmission of knowledge. Designers through continuous learning and mastering of new design concepts and technical means, that is, to acquire new design knowledge, to promote the innovation and development of design. In this process, the practical experience and creative inspiration of designers inject new vitality into the knowledge network and promote the renewal and evolution of knowledge. The process of designers publishing works on the design platform, on the one hand, is the process of showing the transformation of knowledge into creative works, which involves the safeguarding of their original knowledge; On the other hand, the open platform is used to improve its influence, hoping to get a high degree of attention and widespread. Community group refers to the knowledge disseminators and receivers in the design platform, such as professional designers, amateur design enthusiasts and ordinary browsing users. The design of knowledge network evolution rules shows that community groups have an active role in promoting the evolution of knowledge networks and show non-uniform distribution. Although the contribution of a single community group to the Knowledge network is concentrated in a specific domain or period, that is, the views of some design knowledge emerge. While for the overall design platform, cross-domain cooperation and knowledge sharing need to be encouraged to maintain long-term activity and diversity, that is, the Knowledge Ecosystem of massive design works(Paavola et al., 2004; Zhang et al., 2009). However, either side of the community is a participant in the knowledge flow of community open innovation design, and all face the moral and ethical question of knowledge sharing or safeguarding.

Based on this, the tradeoff between knowledge sharing and property safeguarding in the design community is the tragedy of the commons. As a result, the digital design community is caught in a catatonic dilemma of limited sharing and bottom-line safeguarding. This contradiction highlights the invalidity of traditional knowledge management theories. A dynamic theory of organizational knowledge creation based on the linear propagation hypothesis makes it difficult to explain the cascading effect caused by the secondary creation of community groups(Nonaka, 1994). Therefore, ethical design knowledge flow is crucial, as shown in the **figure 1**.

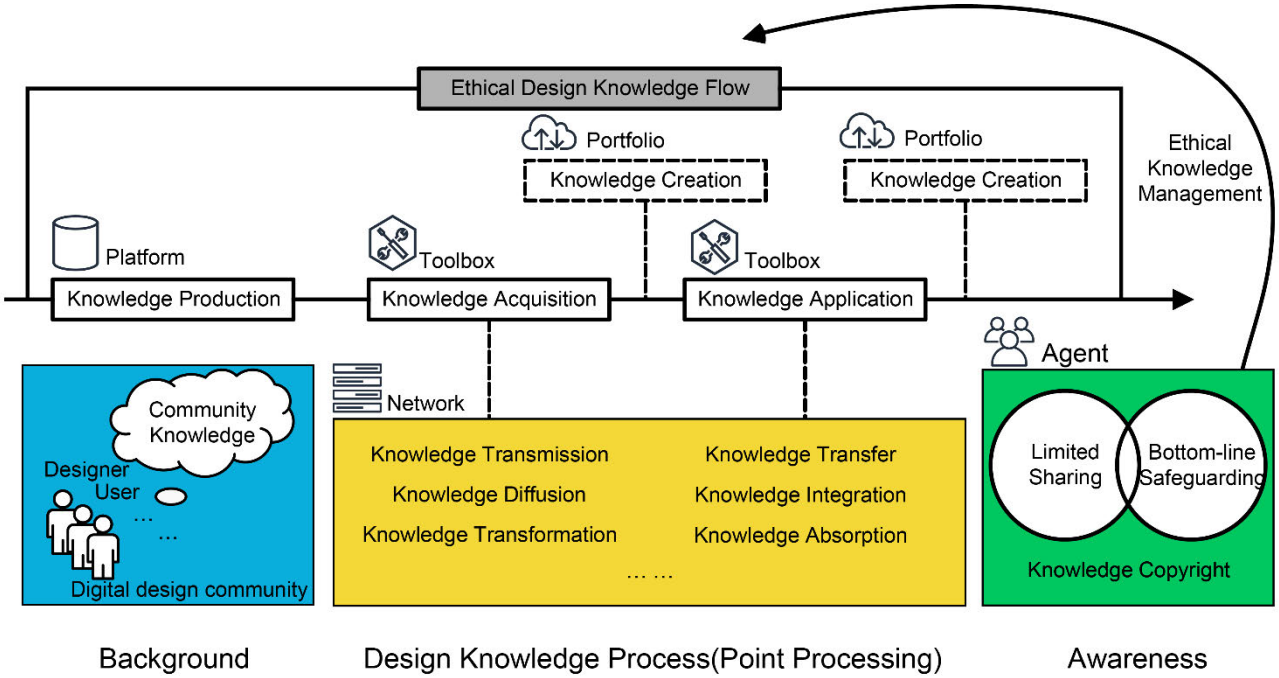

Figure 1. Ethical Design Knowledge Flow by Considering Limited Sharing and Bottom-Line Safeguarding.

2. Knowledge Management for Sharing and Safeguarding

2.1 Knowledge sharing

The characteristics of knowledge such as replicability, propagation and transferability determine knowledge sharing. Knowledge sharing is a process of spreading and sharing through information media, in which knowledge receivers expend new knowledge or interact with each other through known knowledge, thereby improving the value of knowledge utilization and expanding the effect of knowledge economy(Wijnhoven, 1998). Considering knowledge ontology in the description of Knowledge sharing, knowledge trading is the basis of knowledge sharing, knowledge transfer is the process of knowledge sharing, organizational learning is the means of knowledge sharing, and knowledge creation is the purpose of knowledge sharing(Wang & Noe, 2010). Specifically, from the perspective of market transaction, knowledge sharing is regarded as a valuable commodity, and participation in the transaction of the knowledge market will bring the improvement of knowledge output. From the perspective of information communication, knowledge sharing refers to the process of knowledge transfer between people, that is, the process of communication between people; From the perspective of organizational learning, knowledge sharing can be understood as the transfer of knowledge among organization members to achieve the common ownership of individual knowledge by the organization. From the perspective of systems engineering, knowledge sharing is the result of many factors.

Collective Intelligence is the aggregation of available knowledge into common models that facilitate the design knowledge flow(Suran et al., 2020). Previous studies have studied the problem of sharing from the perspective of different attributes of knowledge. But they have not considered the changes in the connotation and extension of knowledge attributes given by the increasingly sound intellectual property safeguarding law, which has brought about the chaos of attribute characteristics and the game related to interests and cannot further promote the efficient management of knowledge.

2.2 Knowledge safeguarding

From the perspective of intellectual property rights, the process of knowledge sharing is the process of acquiring, transferring and sharing knowledge about product innovation in the form of property rights safeguarding.

Knowledge sharing mechanism can be divided into incentive mechanism and constraint mechanism. Specifically, the incentive mechanism runs through the whole process of knowledge sharing to determine the state of entering and exiting the sharing evaluates the results and distributes the benefits according to the will of the subject, while the constraint mechanism is to safeguard the rights and interests of heterogeneous subjects, and the law and morality provide the most basic guarantee of trust level(Bhaskaran & Krishnan, 2009). The incentive mechanism under the network knowledge economy is the rightness of property rights based on the theory of labor property(Cwik, 2014) and personality right(Hughes, 1998), while the restraint mechanism is a series of measures for digital copyright, a technology patent and digital trademark and anti-unfair competition.

Due to the expansion of the scope of knowledge safeguarding and the ambiguity of safeguarding rules, the “creative commons license” was proposed(Kim, 2007), which is a mechanism for the licensing of intellectual property linked through the World Wide Web.

The principle is that a modest “selective retention of rights” replaces the default “retention of title”. Under the framework of the platform's sharing agreement, platform users are allowed to use the design creative results free of charge with the declaration of necessity and selective restrictions. The declaration and conditions of the copyright sharing agreement framework include disclosure of identity, non-commercial use, non-secondary creation, and restricted dissemination and sharing(McGuirk, 2008). However, the degree of openness and limitation of design knowledge has not been clearly defined, and more generally, the platform's preconceived safeguarding scope is defined.

3. Ethical Design Knowledge Flow in Chaos and Game

3.1 Knowledge Flow in Ethical Design from Chaotic Systems Perspective

Under the macro point, the dynamic factors of a chaotic system can be divided into the trust mechanism of community cooperation and the legal constraints of platform supervision.

Trust mechanism of community cooperation is the positive driving force. The starting point of inter-group trust is community cooperation activities, and it is the interaction and cooperation between groups or individuals that form complex and close social relations. In community organizations, the important role of subject trust is especially reflected in the trust between heterogeneous subjects can affect and decide their transaction behavior. Examples encompass crowdsourced design that facilitates collaboration, parallel design that reduces transaction costs, and collaborative design that connects partners and focuses on the task itself. Mutual trust between the entities will also improve the overall operation efficiency of the system organization, make cooperation between the entities smoother, and reduce the total transaction cost. Therefore, in the process of knowledge sharing, the inter-subject trust mechanism will become the driving factor in the process of knowledge flow.

The legal constraints of platform supervision are both positive and negative driving forces. Platform supervision based on intellectual property rights is the process of applying and obtaining intellectual property rights from design knowledge innovation generated in the process of using the platform. Therefore, intellectual property is an effective way to motivate the intellectual labor achievements of the subject in platform supervision. From the perspective of legal attributes, the ownership of intellectual property rights includes rights such as possession, use, disposition and income, and the economic benefits of the content of rights are generated from the multi-dimensional attributes of commodities. In the design of a knowledge platform based on the social network, knowledge-sharing behavior among subjects may lead to knowledge externalities, such as the loss risk of non-human knowledge spillover and human knowledge theft. Therefore, in the process of knowledge sharing, the safeguarding of rights within the subject will become the resistance factor in the process of knowledge flow.

From the perspective of legal attributes, the safeguarding of knowledge sharing can be categorized into two dimensions: legal exclusivity and public nature. The legal exclusivity granted to heterogeneous subject knowledge confers proprietary and monopoly rights to intellectual property rights holders, which may impede the realization of knowledge sharing. Legal exclusivity refers to the robust safeguarding of intellectual property rights for diverse entities, acting as an insulator to knowledge sharing. Conversely, the public nature of legal provisions for heterogeneous subject knowledge emphasizes the safeguarding of

fundamental rights and interests of rights holders, thereby encouraging the creation and design of new knowledge by safeguarding their interests rather than imposing absolute exclusivity. This promotion of public property facilitates the dissemination, transfer, diffusion, creation, and utilization of knowledge, fostering effective knowledge sharing. The public nature of law serves as a facilitator of intellectual property rights for diverse entities, the conductor of knowledge-sharing. Therefore, within a legally constrained environment, legal exclusivity and public nature coexist. Exclusivity provides localized potential energy to incentivize innovation, while public nature contributes to global entropy increase, promoting knowledge diffusion, thus forming a mutually beneficial relationship under platform supervision. Therefore, a dynamic factor model for design knowledge sharing can be obtained based on chaos theory, including the trust mechanism of community cooperation and the legal constraints of platform supervision, as shown in the **figure 2**.

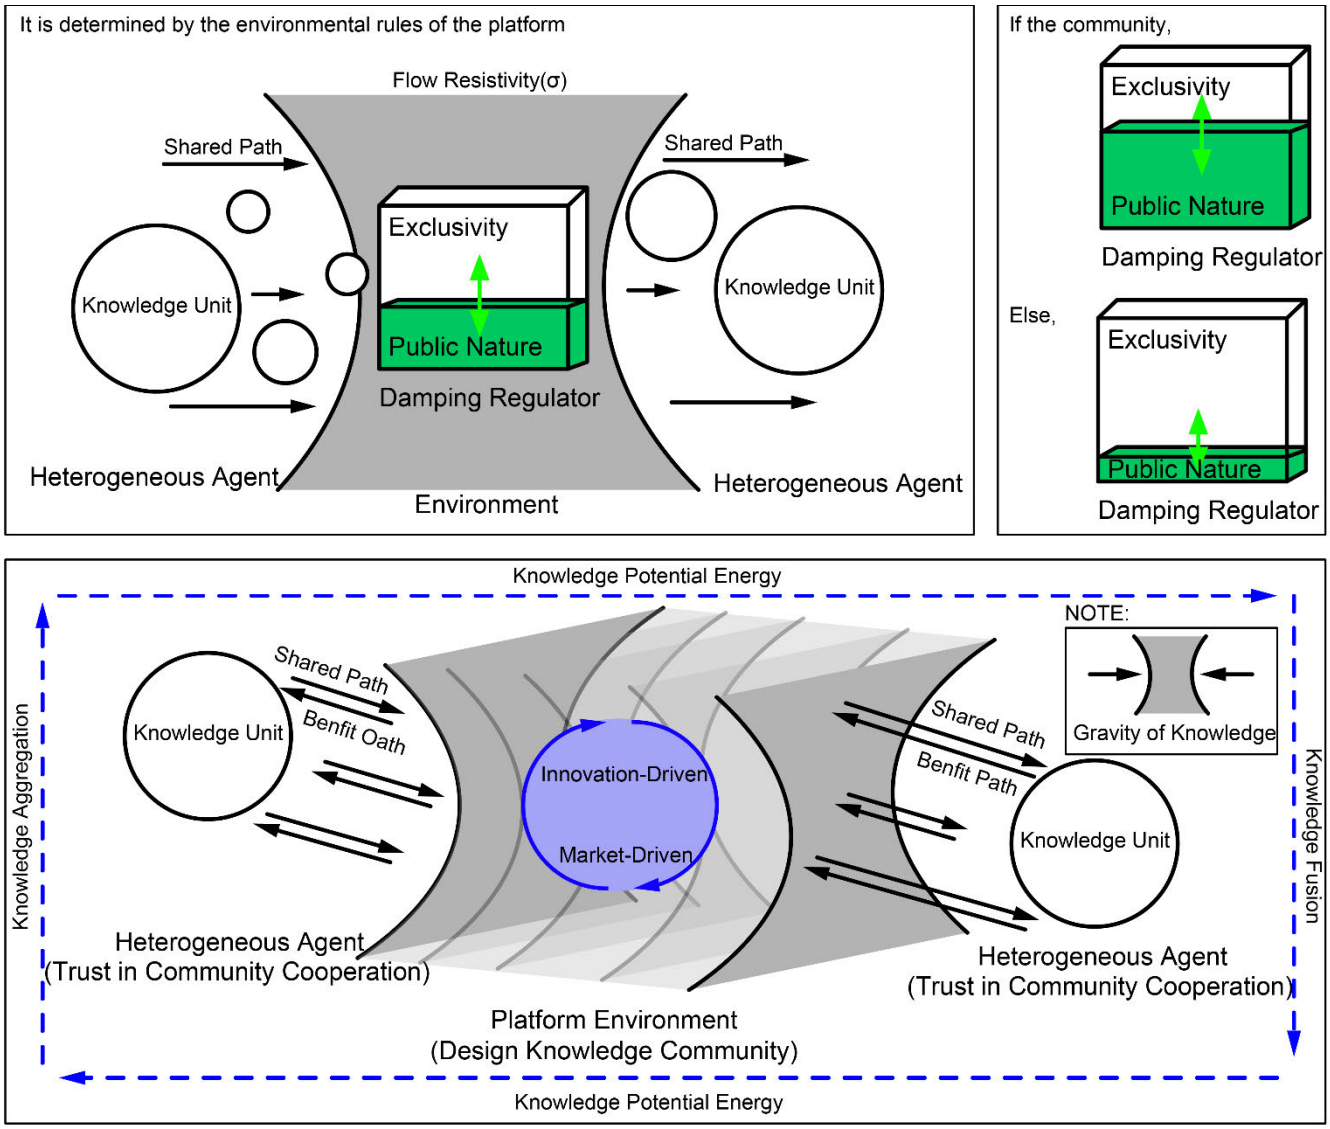

Figure 2. Knowledge Sharing from the Legal Perspective.

In figure 2, the design knowledge flow is compared to the flow of electrons in a dielectric, which has a dielectric constant (or flow resistivity) to control the flow speed, and it is influenced by the environment and its knowledge of gravity. Therefore, the intensity of safeguarding and promotion of the platform's intellectual property rights when sharing becomes a damping regulator in the execution environment. At the same time, the design knowledge community is driven by collaborative innovation and market interests, and due to the community cooperation and trust of the main body, the design knowledge is always driven by potential energy, and the exchange of design knowledge is completed in the

repeated aggregation and integration.

Under the meso point, the nonlinear dynamic equations of chaotic systems(Akhmet & Fen, 2015; Lorenz, 1963) can be constructed from the mutual perturbations among designers, community platforms and platform users. The dynamic mapping requires the construction of a three-dimensional variable system, which is detailed as follows.

- Designer creativity (X): Designers are the subject of innovation supply and knowledge sharing. Creativity (X) includes the rate of innovation (X1), the tendency to share knowledge (X2), and the ability to resist interference (X3). The rate of innovation (X1) is the efficiency with which designers generate new ideas, products, or solutions, and is influenced by individual capabilities (e.g., design knowledge understanding), collaborative tools (e.g., open-source knowledge transfer), and incentives (e.g., intellectual property revenue). Knowledge sharing orientation (X2) represents the willingness of designers to actively open knowledge (e.g., open-source knowledge protocols) or participate in community collaboration, shaped by cultural values (e.g., geekiness) and institutional design (e.g., copyright flexibility). Anti-interference capability (X3) represents the adaptability of designers to changes in platform policies (e.g., tightening of property rights) or sudden changes in user needs, relying on knowledge resource reserves and knowledge ecological stability (e.g., umbrella intellectual property rights).
- User behavior entropy (Y): Users are demand-driven and ecological feedback subjects. Behavioral entropy (Y) includes activity (Y1), heterogeneous demand (Y2), and feedback efficiency (Y3). Among them, activity (Y1) represents the frequency of user engagement with the platform (e.g., content likes, favorites, and reposts), driven by experience fluency (e.g., platform technology support) and value perception (e.g., personalized recommendations). Heterogeneous demand (Y2) represents the heterogeneous demand distribution of user groups, which determines the directional dispersion of designer innovation. Highly homogeneous requirements can lead to system rigidity (e.g., "high traffic recommendation" dependency). Feedback efficiency (Y3) is expressed as the rate at which user reviews, and data behaviors (e.g., secondary creations) are translated into designer-understandable signals, relying on algorithmic transparency (e.g., recommendation mechanism interpretability), and community communication channels.
- Platform rule flow (Z): The platform is the main body of rule-making and resource coordination. The platform rule flow (Z) includes governance intensity (Z1), technology empowerment level (Z2) and policy flexibility (Z3). Among them, governance intensity (Z1) represents the intensity of the platform's control over intellectual property safeguarding, content review and benefit distribution, which is reflected in the complexity of rules (e.g., copyright agreement terms) and implementation costs (e.g., investment in infringement monitoring algorithms). The technology enabling level (Z2) represents the infrastructure (e.g., API interfaces) and toolchain (such as collaborative editors) provided to the platform, which directly affects the efficiency of the designer's interaction with the user. Policy flexibility (Z3) refers to the ability of the platform rules to dynamically adjust to changes in the external environment (e.g., legal amendments) and internal imbalances (e.g., user loss). It needs to balance stability (avoiding frequent changes) and flexibility (responding quickly to crises).

Based on the above variable descriptions, the nonlinear dynamic equation can be roughly constructed, as shown in the **figure 3**.

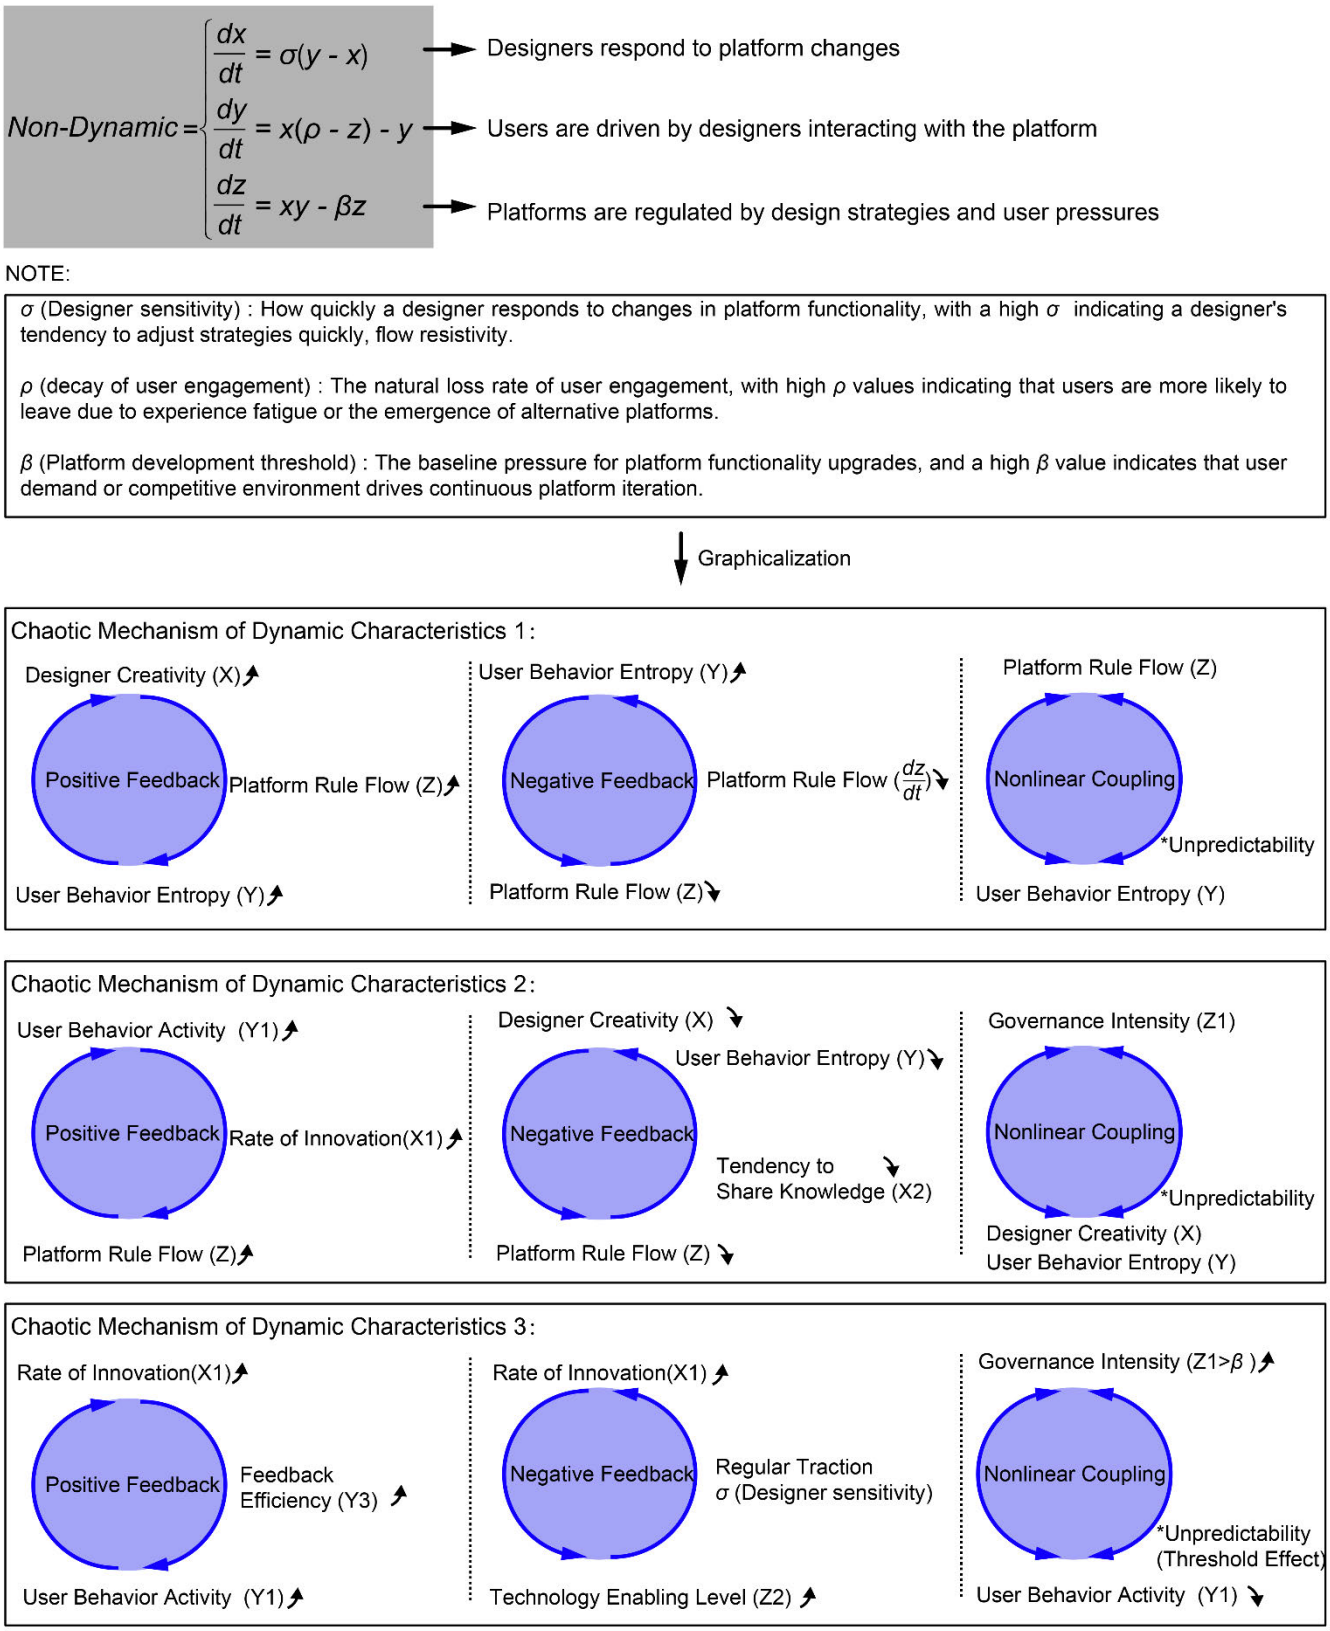

Figure 3. Nonlinear dynamic equations and dynamic characteristics of chaotic systems.

- Positive feedback mechanism. For example, user demand (Y) stimulates designer innovation through market signals (user ratings) (X1); Platform function optimization (Z) improves user experience (Y1) to attract more users to join; Designer-user collaborative innovation (XY) enhances platform attractiveness

(Z2), forming network effects; Developers in the open-source community (X1) iterate quickly on code through user feedback (Y3) to improve user retention (Y1)

- Negative feedback mechanism. For example, excessive platform control (Z) may inhibit knowledge sharing (X2), resulting in closed-source innovation; Designers over-catering to users (X2) can lead to innovation convergence and reduce long-term user interest (Y1); High-intensity governance (Z) may reduce user autonomy (trigger Y), which in turn weakens innovation supply (X).
- Nonlinear Coupling mechanism. For example, the random unpredictability of user behavior (X) and platform rules (Z) themselves; Users switch to competing products (Y1) due to the tightening of the platform's data privacy policy (Z1 exceeds the threshold ρ); Platform launches more open-source collaborative innovation tool (Z2), lowering the threshold for designers to innovate (X1)

Under the micro point, the phase space reconstruction and singular attractor establishment of chaotic systems need to further explore the time series of platform behavior, as shown in the **figure 4**.

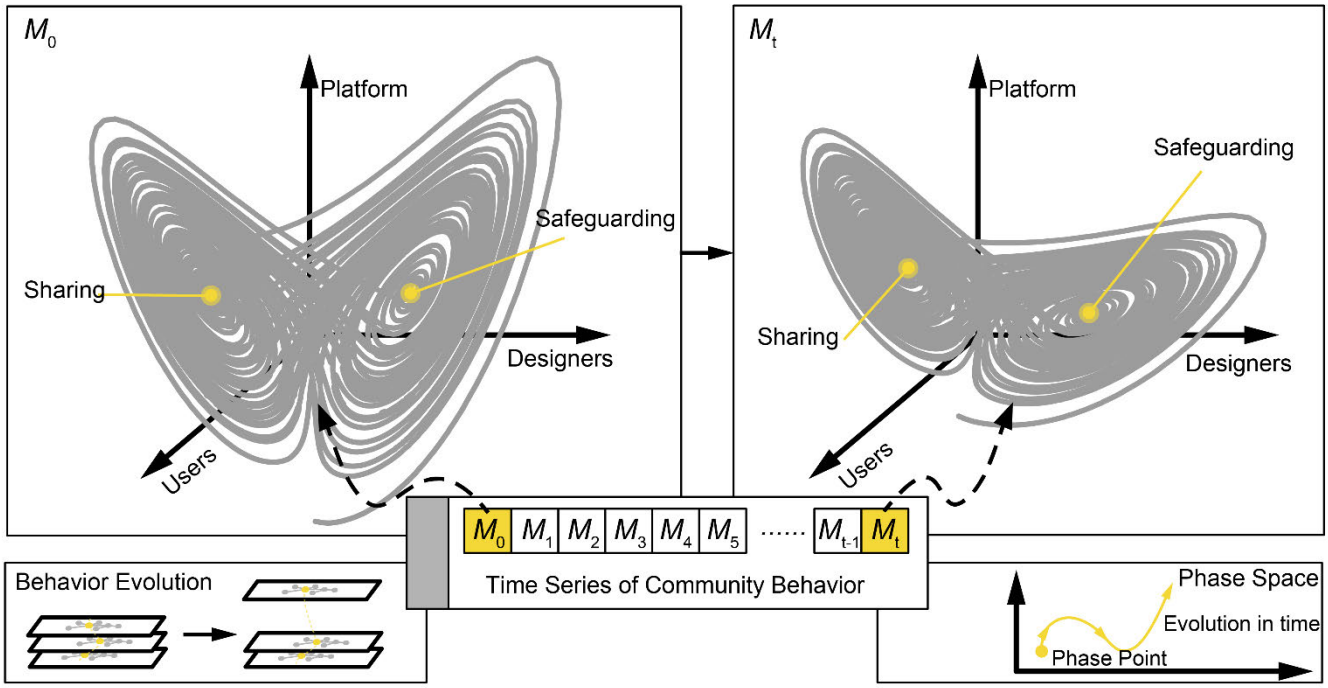

Figure 4. Lorentz Singular Attractor for Chaotic System, Source: (Sugihara et al., 2012).

Under the time series of the slices of the system layer, the sensitive points in the knowledge propagation process can be judged by calculating the Lyapunov index, and the nonlinear nature of the sensitive dependence of the knowledge propagation system on the initial conditions can be revealed quantitatively. At the same time, through the multi-dimensional reconstruction of phase space, an extended phase space model including knowledge diffusion rate, copyright constraint strength, innovation incentive factor and other multi-dimensional parameters can be constructed. The dynamic equilibrium region of the system in the parameter space can be identified by tracking the geometric evolution of the singular attractor, to achieve the game balance between copyright safeguarding strength and community creativity. In addition, the knowledge propagation network can be abstracted into a dynamically evolving weighted graph structure, the nodes of knowledge propagation agents and the edges of knowledge propagation probabilities can be explored, and the self-similarity of the network can be quantified by fractal dimension, to verify the self-similar diffusion path of design knowledge.

3.2 Knowledge Flow in Ethical Design from Dynamic Game Perspective

The Nash equilibrium analysis of a static game is a binary static game between the designer and the user. In the strategic space, the designer has the choice of knowledge sharing and knowledge safeguarding, while the user has the choice of free recreation and paid use, and the game relationship between the two is not completely opposite but has an evolutionary equilibrium state. Therefore, the payoff matrix of the designer's benefit and the user's benefit under the combination of platform strategies can be obtained. In this matrix, there are several adjustable parameters, such as knowledge original value, user base utility, copyright transaction cost, copyright infringement loss, theft revenue coefficient, sharing rate, and collaborative innovation gain. Currently, the solution of Nash equilibrium is about the pure strategy equilibrium and mixed strategy equilibrium. The pure strategy equilibrium is to determine the return equilibrium under the stable state condition by analyzing the dominant strategy. Mixed strategy equilibrium is to solve the spatial optimal probability distribution(Abedian et al., 2022). Since the analysis of static games often ignores the periodic decay of knowledge value and the imperfect rationality of instantaneous decisions, the strategy imitation of dynamic evolutionary games and the dynamic simulation of knowledge stock can be introduced.

The strategy imitation of the dynamic evolutionary games is to dynamically analyze the bounded rationality of the platform through the adjustment strategy of the participants' community behavior, that is, the platform strategy imitation mechanism with time series. At the same time, the participants' community behavior was heterogeneous. Designers' community behavior can be divided into professional (high knowledge stock) and amateur (low knowledge stock) design knowledge dissemination, while user behavior can be divided into commercial (high willingness to pay) and individual users (low willingness to pay) design knowledge acquisition. The solution of the Dynamic Equilibrium Point (DEP) is the Dynamic evolutionary game payoff matrix (Dynamical evolutionary games) based on chaos constraints. Currently, the combination of sharing and safeguarding strategies of the design platform forms the income combination of the designer and the user. Therefore, the replication dynamic equation can be constructed, and the derogation rate of design knowledge circulation in the platform can be properly included, which reflects the dynamic timeliness. A “reputation-discounted factor” can even be introduced to quantify long-term game effects(Tang et al., 2024).

The knowledge evolution dynamics model is a theoretical framework to understand how knowledge arises, spreads, evolves and dies over time(Malhotra & Majchrzak, 2022). Its core lies in revealing the dynamic change law of the knowledge system and its driving mechanism and specifically analyzing the interaction process of knowledge in different subjects, environments and social structures. The knowledge evolution dynamic coupling analysis of the platform can introduce the knowledge stock equation to represent the state variable, that is, the knowledge evolution equation. Among them, the regulating factors are the shared cooperation coefficient, knowledge attenuation coefficient and derivative innovation rate.

Evolutionary Stable Strategy (ESS) is a dynamic equation composed of a simultaneous replication dynamic equation and knowledge evolution equation for local stability analysis. At this time, the three-dimensional dynamic equation can be analyzed from the phase space of chaos theory, and the attractor domain and bifurcation condition can be identified(Hofbauer & Sigmund, 2003). Strategy solving involves the existence conditions of equilibrium points and local stability, such as exploring boundary equilibrium and internal saddle point equilibrium, and determining the eigenvalues of the Jacobian matrix, as shown in the figure 5.

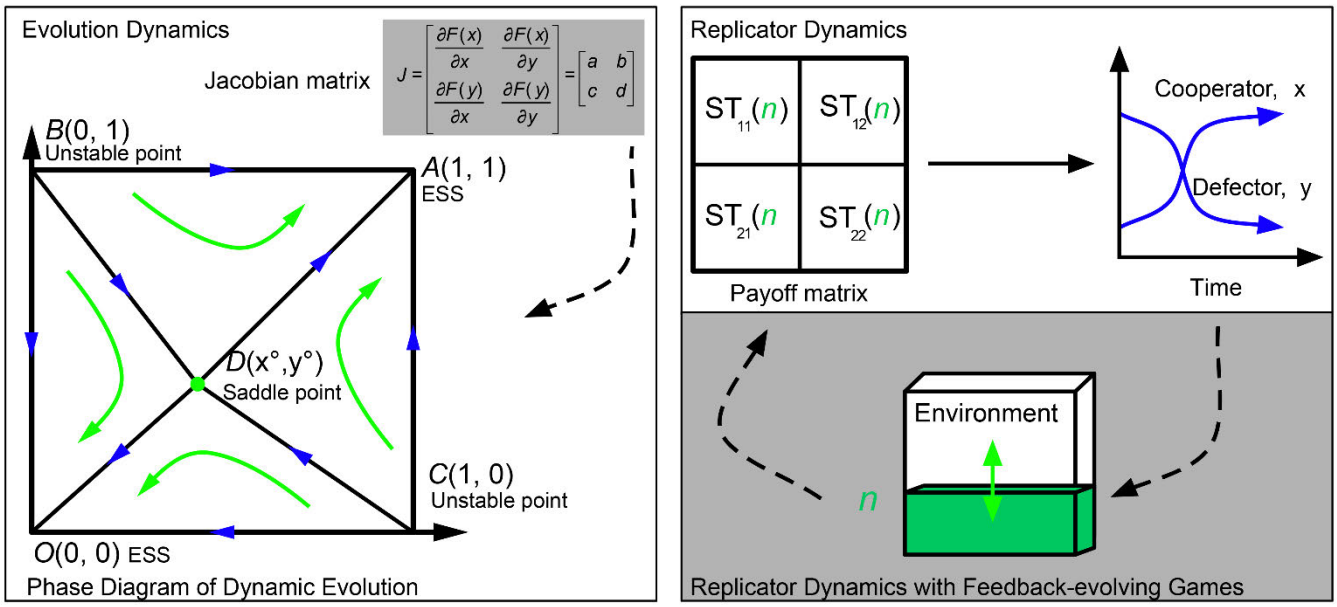

Figure 5. Coevolutionary Game Theory, Source: (Friedman, 1991; Weitz et al., 2016).

3.3 Ethical Design Knowledge Management Framework based on Chaos-Dynamic Game Coupling

An ethical design knowledge management framework can be proposed in **Figure 6**.

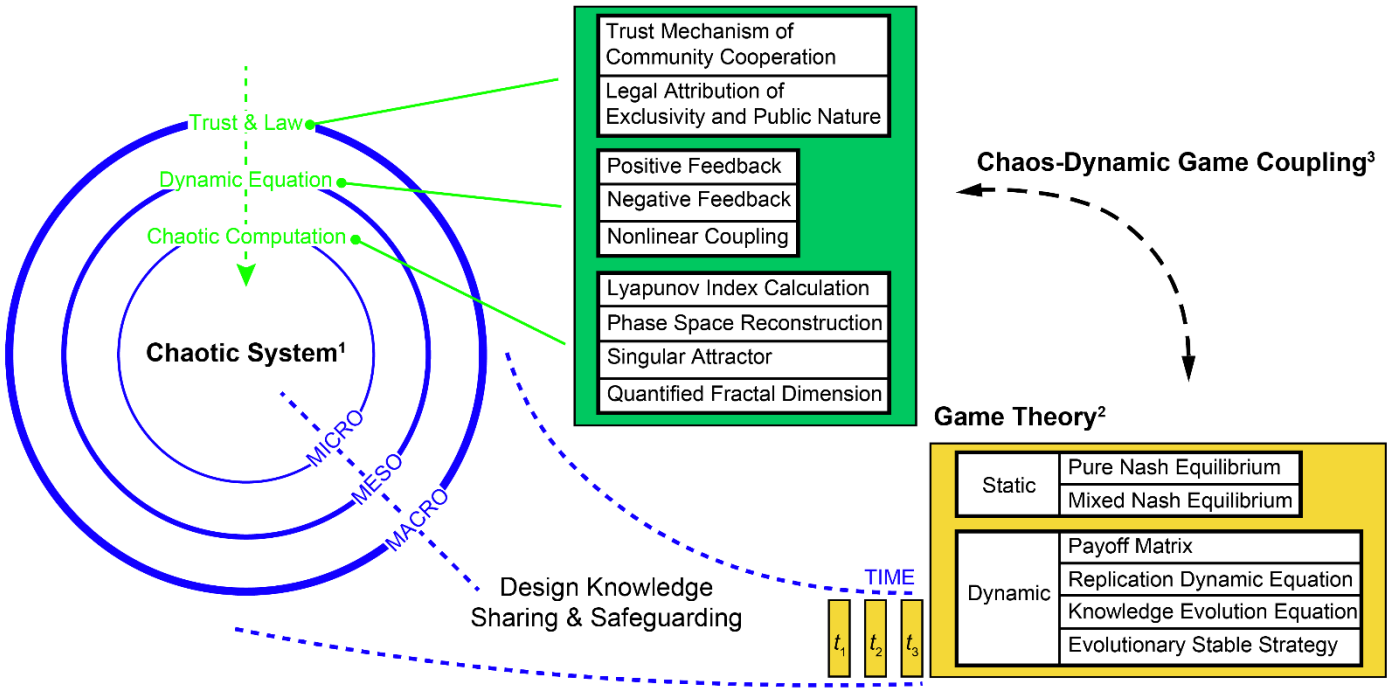

Figure 6. Ethical Design Knowledge Management.

4. Ethical Design Knowledge Flow from Digital Community

Existing design community platforms are exploring knowledge-sharing and safeguarding measures, such as Creative Commons licenses, digital watermarking technology, metadata anchoring, copyright reporting mechanisms, etc. At the same time, safeguarding measures may include digital rights management (DRM), privacy Settings, banning downloads, etc. But be aware of the ethical implications that these measures may

bring, such as over-safeguarding that may limit knowledge sharing, or lax policies that lead to infringement problems.

Therefore, the objects of this study are set as Pinterest, Behance, Dribbble, DeviantArt and Zcool. All of these are knowledge-sharing design platforms with interactive communities as the core. This type of community platform allows creative professionals (artists, designers, photographers, and others in the creative field) to showcase and discover creative work, and to enable the flow of knowledge through open social interaction (following, liking, commenting, etc.). The platform covers the full spectrum of visual design. From graphic design (e.g., Behance and Adobe Creative Cloud), user interface prototyping (e.g., Dribbble), and digital art (e.g., DeviantArt) to localized commercial design (e.g., Zcool), there are vertical subdivisions of specialization. Pinterest uniquely connects the front end (concept generation) and the end (finished product display) of the design process through the "Mood Board" mechanism. Zcool deeply integrates the demand of e-commerce and design competition to realize the direct transformation of knowledge sharing into commercial value but generates the risk of creative homogenization while creation.

The five platforms selected above all build a closed-loop ecosystem of creation, dissemination and feedback. There are three layers of creative Commons: (1) The base layer is standardization of work metadata (e.g., Behance's Project Details template mandates labelling of authoring tools, collaborators, and copyright notices); (2) Interaction layer is knowledge diffusion driven by the social graph (e.g., Dribbble's Shot push algorithm prioritizes the work of followers); (3) Derivative layer is secondary creation incentives (e.g., DeviantArt's Literature community allows poetry to be adapted from visual works)

In terms of ethical risk prevention and control, it is found that platforms generally face the governance paradox of "Limited sharing and Bottom-line safeguarding". It can be divided into the triple promotion path of knowledge sharing and the dual characteristics of enabling and restricting knowledge safeguarding.

The promotion of knowledge sharing by the platform is embodied as a triple path. The first is to break down industry barriers through the weak connectivity of social networks, such as Dribbble's "Rebound" feature that allows designers to adapt others' work and tag the original author. The second is to build informal learning Spaces, such as Behance's "Creative Challenges" to provide structured skill transfer. The third is the use of algorithm recommendation to realize the explicit implicit knowledge, such as Pinterest's visual search tool can automatically associate the user's collection of images with color theory or composition law labels.

The practice of knowledge safeguarding is characterized by both technical empowerment and institutional constraint. At the technical level, digital fingerprint technologies such as digital watermarking (e.g., Pinterest), metadata anchoring (e.g., Behance's Content Authenticity Initiative), and blockchain storage (e.g., Zcool's "original storage chain") are adopted. At the institutional level, a dynamically balanced knowledge governance framework is formed through Creative Commons customization options (e.g., DeviantArt, which offers 25 copyright combinations) and regional regulatory adaptation (e.g., Zcool's green channel for infringement complaints).

All of these platforms explore knowledge sharing and safeguarding from their domain dimensions. Taking the Behance community platform with more design ecology as an example, through the two-tier architecture of "free work exchange & paid knowledge market", the organic unity of knowledge sharing gradient and commercial value transformation is realized, as shown in the **figure 6**.

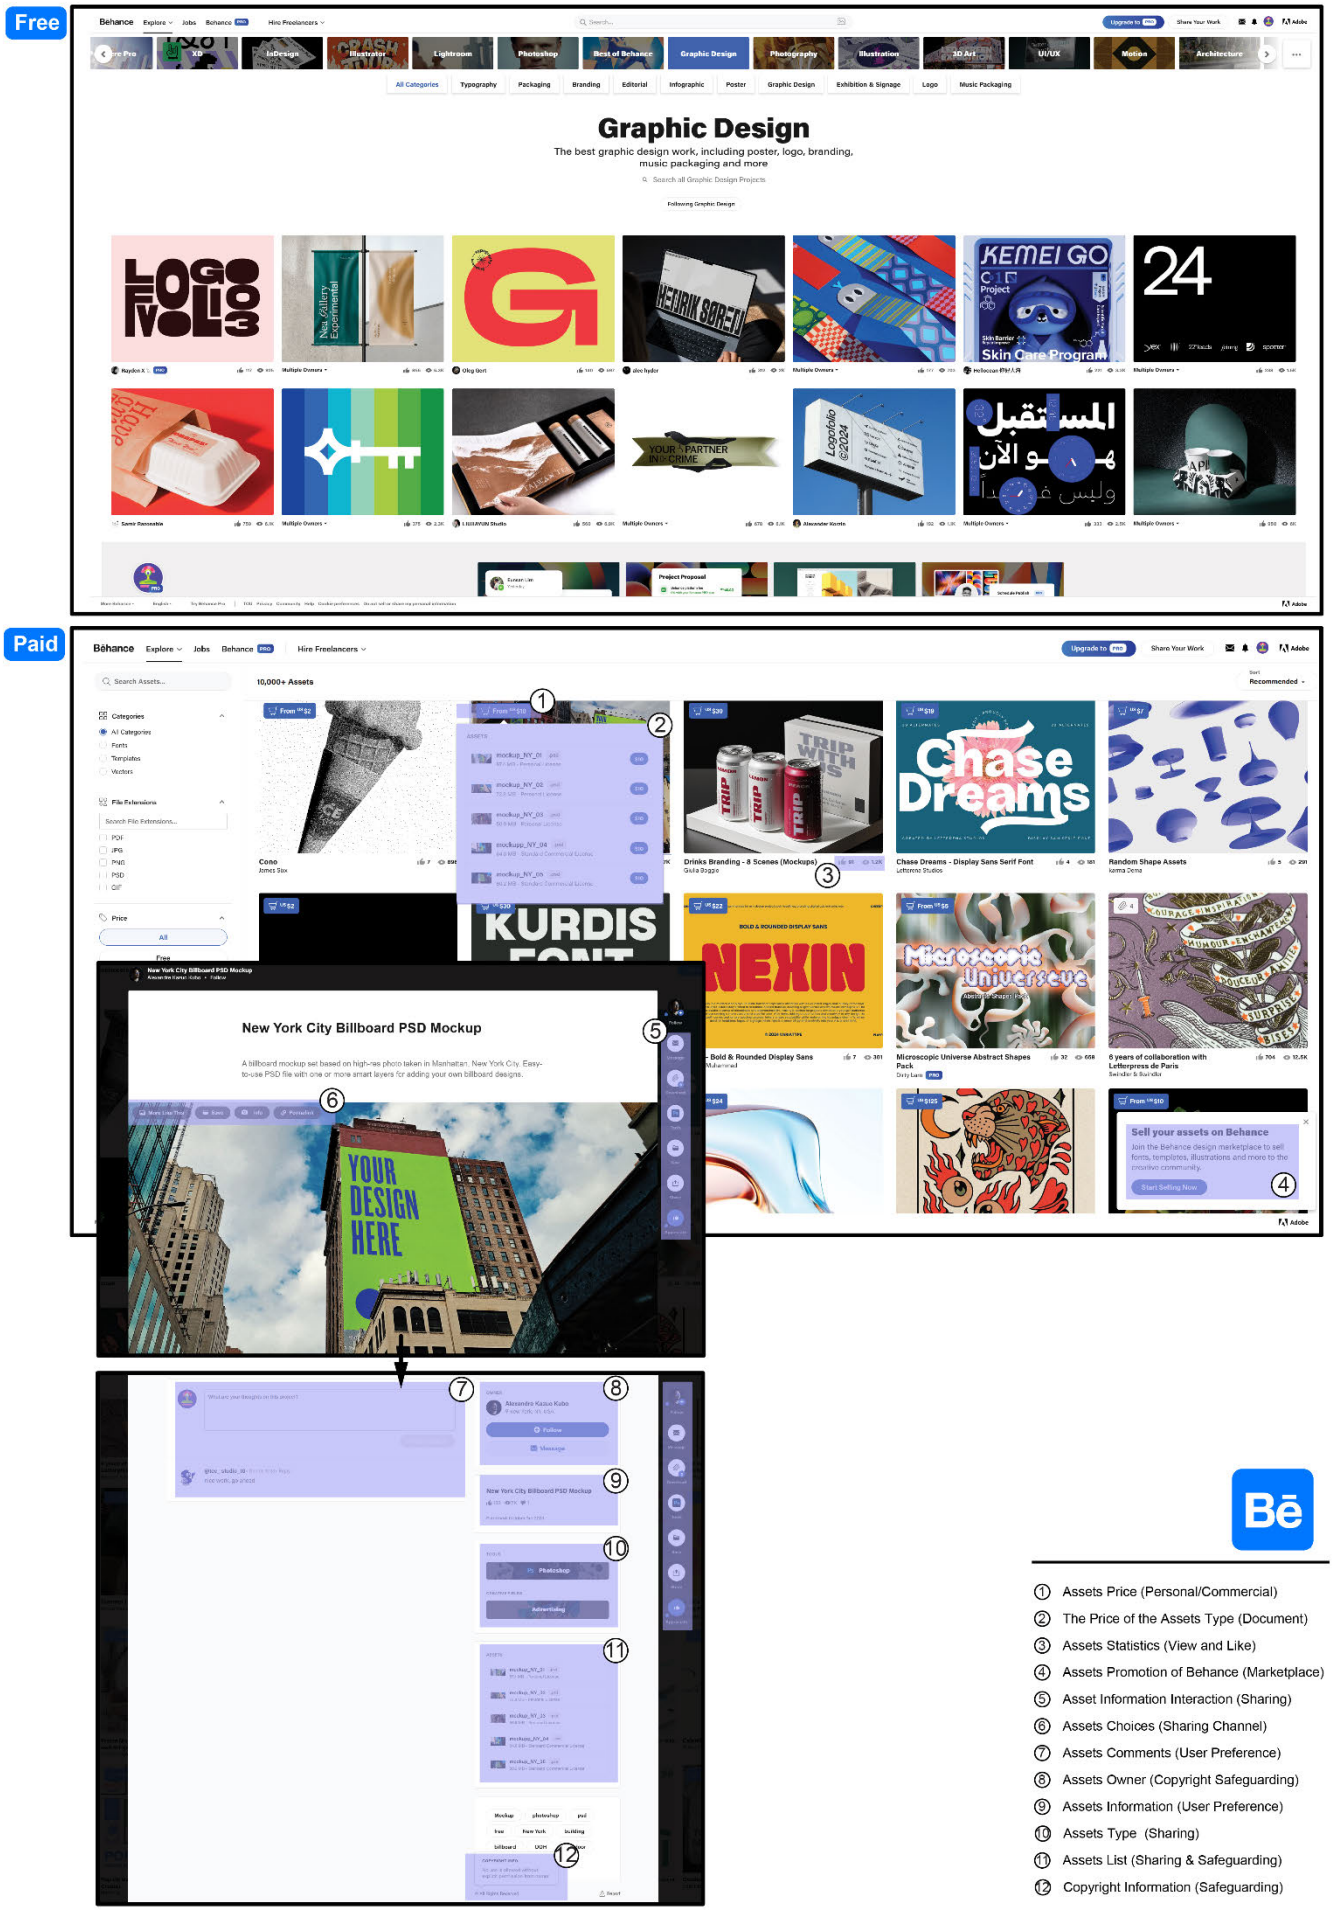

Figure 6. Limited sharing and bottom-line safeguarding of the Behance platform, Source: (Behance 2025).

5. Tragedy of the Commons from Ethical Design Knowledge Flow

The ethical design flow based on chaos and game support proposed in this study is a new thought for design work in the context of digital ethics. In the past, most people highly praised the improvement of design efficiency of digital design platforms. But often ignored the copyright supervision of design platforms, the safeguarding of intellectual property rights of designers and the cultivation of design ethics of users.

Therefore, from the macro, meso and micro aspects of chaos theory, the potential dynamic analysis of design cooperation in digital communities is supported by nonlinear dynamic equations. The equation presents the effects of positive feedback, negative feedback and nonlinear coupling on the relevant dimensions of the three subjects. At the same time, the behavior elements with time series are revealed, and the phase space reconstruction and singular attractor determination are used to capture more detailed propagation and diffusion paths. However, it is a pity that the quantitative calculation of the platform case data cannot verify it. To a great extent, the chaos threshold design of the platform system will directly affect the chaos toughness, that is, the platform sharing and safeguarding strategy. The selection of chaos threshold caused by the differential positioning of the platform itself cannot be ignored.

For the dynamic game, although the dynamic game and knowledge evolution dynamics reveal the dynamic nature of design knowledge flow, the heterogeneity of agents is still clearly bounded, resulting in a single payment matrix. The introduction of the accumulation concept of reputation discount may lead to the existence of multi-lateral reputation cross-discounts and reputation bubbles of endogenous risk in social networks. In general, there is still a lot of room for future research on designing knowledge management from the perspective of chaos and game, especially more multi-phase space dimensions and internal and external variable factors.

6. Conclusion

This study employs chaos theory and dynamic game methodology to systematically analyze the ethical design knowledge flow, and delineate the current landscape of mainstream design knowledge communities. Through comparative analysis of platform case studies, this research identifies appropriate measures for knowledge sharing and protection. It is evident that further investigation into the chaotic and gaming dynamics of heterogeneous agents within knowledge community behavior systems is warranted. Notably, this study has limitations, including the failure to implement dynamic calculations and behavioral simulations based on chaos and dynamic game theories in the design of knowledge community cases. Future research will undertake more comprehensive simulation calculations after capturing behavioral data from platform datasets. Additionally, as research progresses, comparing the proposed knowledge flow of ethical design with existing design platform strategies will facilitate future studies on digital ethics. Moreover, while this paper focuses on theoretical and methodological aspects, it will continue to conduct in-depth empirical analyses on multiple cases to gain a more holistic understanding of the management framework for knowledge flow in ethical design.

Navigating privacy concerns in smart home: Exploring challenges and design strategies from a family perspective

Zixiang Feng*[a]

a Royal College of Art
*fzxqwq@gmail.com

ABSTRACT | Existing literature mainly focuses on smart home privacy concerns from an individual perspective, underappreciating family member interactions in smart homes and related privacy concerns, especially within Chinese culture-based contexts. This study, grounded in the context of typical Chinese household environments, explores the challenges of privacy perception in smart home design from a family perspective and seeks potential design opportunities to address them. Using a multi-case study research design, we investigated 11 households utilizing smart home devices, conducting 20 in-depth interviews with family members. From the perspective of multi-member interaction behaviors, our thematic analysis identified four key aspects around users' privacy perceptions in interactions with smart home devices: (1) Privacy concerns regarding data sovereignty; (2) Privacy concerns in user psychology; (3) Privacy concerns arising from system configurations; (4) Privacy concerns regarding family member collaboration. The findings underscore the need for improvements in smart home system design, including the development of enhanced smart home maintenance services, the provision of customizable user data storage options, and the implementation of more trustworthy interaction mechanisms to enhance user experience. This study offers deeper insights into smart home research by elucidating the evolving dynamics of user privacy perception within family interactions. It further provides theoretical and practical contributions to optimizing and developing smart home technologies.

KEYWORDS | SMART HOME, DATA SOVEREIGNTY, PRIVACY CONCERN, INTERACTION DESIGN, CASE STUDY

1. Introduction

With the extensive adoption of smart homes, research on smart home technologies and devices has drawn significant attention. Since the term "smart home" was initially coined by Richard Harper in 1984 at the American Association of House Builders (Dingli & Seychell, 2015), subsequent scholars have conducted in-depth research on various aspects of smart home systems.

In the early days, investigations primarily revolved around the interaction between individual users and smart home setups. A case in point is the study by Cabitza, Fogli, Lanzilotti, and Piccinno (2017), which highlighted how goal-oriented interfaces play a crucial role in augmenting user capabilities. Similarly, Gupta and coauthors developed a multi-objective reinforcement learning framework that aims to minimize energy consumption while maximizing user satisfaction(Gupta, Bhambri, Dhingra, Buduru, & Kumaraguru, 2020). More recently, research efforts, such as those by Netinant, Utsanok, Rukhiran, and Klongdee (2024), have explored IoT-enabled smart home security and automation. Their research endeavors seek to enhance user-friendliness by incorporating voice commands and sensor integration. Overall, these research trajectories across different timeframes illustrate the dynamic evolution of smart home research.

Most studies primarily examine privacy concerns in smart home environments from an individual perspective. This body of literature examined users' privacy perception from multiple perspectives, including the influence of user emotions (Park, Choi, & Jung, 2021), users' convenience needs (Zheng, Apthorpe, Chetty, & Feamster, 2018), privacy framework for smart homes (Bugeja, Jacobsson, & Davidsson, 2021) and privacy transparency (Janssen, Matheus, Longo, & Weerakkody, 2017).

The home serves as a crucial application scenario for smart home technologies, where multiple smart home devices can be shared and synchronized through collaboration and interaction among family members. However, there is a lack of research on how such interactions and collaborations influence users' privacy perceptions. Family members encounter significant privacy challenges when jointly using smart home devices. For instance, due to the exchange of information among multiple members, individual family members may develop distinct privacy perceptions based on their experiences with smart home device usage.

To fill this research gap, this research aims to aims to explore the following research questions:

(1) How do family members perceive privacy concerns within smart home systems?
(2) What UX design strategies can mitigate these privacy concerns?

Our research is based on a set of typical smart home scenarios in China. It is important to acknowledge that the study has limitations in terms of cultural diversity. The findings primarily reflect an in-depth exploration of privacy and security concerns within Chinese smart home households, and may not fully represent or address similar issues in other cultural contexts.

Our research enhances smart home scholarship by providing deeper insights into the sociocultural privacy dynamics within smart home systems. More broadly, it offers novel perspectives and strategies for UX design in smart system environments, contributing to the advancement of user experience design in interconnected digital ecosystems.

2. Literature Review

2.1. Smart home

The term “Smart Home” was originally coined by Richard Harper in 1984 at the American Association of House Builders, marking the beginning of its conceptual evolution (Dingli & Seychell, 2015). Initial interpretations, such as those articulated by Lutolf in 1992, framed smart homes as systems integrating diverse services via a unified communication network (Lutolf, 1992). In a contemporary context, Satpathy has expanded this definition, positing smart homes as environments that enhance the independence and comfort of residents through an interconnected framework of mechanical and digital devices, thereby fostering an interactive living space (Satpathy, 2006).

In the field of smart home research, researchers have identified a variety of factors that influence user engagement with smart home systems (Li et al., 2023; Shuhaiber & Mashal, 2019; Singh, Psychoula, Kropf, Hanke, & Holzinger, 2018) while also focusing on control methods within these systems (Neßelrath, Lu, Schulz, Frey, & Alexandersson, 2011; Vogiatzidakis & Koutsabasis, 2019). Regarding smart home frameworks, Muddasser Alam and coauthors have proposed a new framework that simplifies the modeling, prototyping, and simulation of smart infrastructures, facilitating the construction of smart home models and the application of AI technologies (Alam, Alan, Rogers, & Ramchurn, n.d.). Additionally, Hu and her team introduced an innovative system framework that reduces system load and optimizes response times (Hu, Tang, Liu, & Wang, 2016). Further studies have focused on applying smart home systems in energy optimization (Machorro-Cano et al., 2020; Reinisch, Kofler, Iglesias, & Kastner, 2011). Overall, the essence of smart homes lies not just in individual devices but in the interconnectedness and communication within the entire system.

2.2. Privacy concerns in smart home

In recent years, smart home (SH) devices have become widely used in domestic spaces (Kim, Park, & Choi, 2017). With the advancement of technology, the Internet of Things (IoT) has taken a prominent role in smart homes. These devices enable remote and multi-modal control through various communication protocols and routing protocols, such as Wi-Fi, Bluetooth, Radio Frequency Identification, and Local Area Networks, thus enhancing the convenience and functionality of smart homes (Zielonka et al., 2021).

Along with the extensive adoption of IoT in smart homes, privacy concerns have become a significant focus of research in human-computer interaction. In real-time monitoring environments supported by IoT , security and privacy have emerged as key challenges for users (Ismagilova, Hughes, Dwivedi, & Raman, 2019; Tawalbeh, Muheidat, Tawalbeh, & Quwaider, 2020; Zhou, Cao, Dong, & Vasilakos, 2017). For instance, when using IoT devices, users need to transmit a large amount of personal information to the cloud to enable the ubiquitous nature and extensive internet connectivity of the devices. This reliance on cloud storage makes privacy more vulnerable to unauthorized access or leakage, and the cloud-based storage system itself is susceptible to attacks and data breaches (Zhou et

al., 2017). Moreover, as smart home devices become increasingly interconnected, involving more extensive computation and information exchange, the importance of addressing privacy concerns in smart home contexts has only intensified.

Within the realm of smart homes, existing studies have explored both the “formation mechanisms” and the “resolution strategies” of privacy concerns. In terms of formation mechanisms, researchers have examined the psychological experiences, emotions, attitudes, and identities associated with privacy concerns across individual, social, and policy levels.

At the individual level, studies have investigated users’ privacy behaviors and attitudes toward privacy in smart home environments. For example, regarding the impact of privacy concerns in smart homes on user behavior and attitudes, Park and coauthors explored the influence of privacy issues related to smart speakers, finding that negative emotions mediate the relationship between privacy concerns and users’ coping behaviors (Park et al., 2021). Zheng and coauthors conducted interviews to study users’ privacy attitudes in smart homes, discovering that users’ privacy behaviors were significantly influenced by their need for convenience (Zheng et al., 2018). Notably, Chalhoub and coauthor, through a six-month ethnographic study of six UK households, examined the inconsistency in users’ management of security and privacy from a longitudinal perspective. They found that while granting permissions was relatively easy, revoking permissions was often difficult, revealing a significant imbalance between granting and refusing consent. Their study also identified security and privacy issues arising from the repurposing of smart home devices for unintended uses, highlighting the risks associated with devices being used beyond their original design (Chalhoub, Kraemer, & Flechais, 2024).

At the social level, existing research has explored the dynamics of privacy concerns in interactions between household members or between household members and external users. For example, Windl and Mayer introduced the concept of the “bystander” as a social actor, who is concerned with privacy issues in the smart home environment. Their study found that bystanders’ privacy concerns were significantly higher than those related to personal computing devices and were closely linked to the strength of social relationships (Windl & Mayer, 2022). Other studies have focused on interactions between social actors such as nannies and parents. Abu-Salma and coauthors compared the privacy threat models of nannies and parents, revealing that the role and identity of the device user significantly affect privacy perceptions (Abu-Salma, Choy, Frik, & Bernd, 2024). In the same year, Zhang and coauthors focused on the privacy attitudes of elderly individuals toward surveillance cameras, emphasizing the profound impact of privacy breaches on dignity and control. These studies collectively reveal how privacy concerns are influenced by emotions, social relationships, and user roles (Zhang et al., 2024). Furthermore, as technology becomes more widespread, Kraemer and coauthors proposed a descriptive framework illustrating how family members collaborate to achieve shared privacy goals, emphasizing the central role of roles and rules in managing privacy within households (Kraemer, Chalhoub, Webb, & Flechais, 2023).
Researchers have further recognized the significant impact of context on user privacy. Abdi and coauthors studied privacy norms in smart home personal assistants, focusing on the influence of contextual integrity on the acceptability of information flows, laying the foundation for understanding privacy rules in complex ecosystems (Abdi, Zhan, Ramokapane, & Such, 2021). Lehikoinen and coauthors applied privacy theories from social sciences to examine how interactions between people, devices, and environments influence users’ privacy (Lehikoinen, Lehikoinen, & Huuskonen, 2008).

Despite the burgeoning research on smart home privacy, a notable gap exists. Current privacy studies mainly adopt a single - user perspective, overlooking the fact that smart

homes are used by multiple individuals, especially within family settings. In real families, members have diverse privacy attitudes, tech proficiencies, and usage habits. For example, parents might worry about children's data privacy, and data sharing among family members in smart homes raises complex privacy issues. However, there is limited research on these multi-members family - specific privacy concerns. This study aims to bridge this gap by introducing a multi-member perspective to smart home privacy research.

3. Methods

We conducted an inductive, exploratory case study to investigate the nuanced privacy perceptions of smart home users, focusing on the experiences of multiple family members within real-life contexts. This qualitative approach, effective for examining contemporary phenomena where boundaries are blurred (Yin, 2003), aimed to provide a deep understanding of the factors influencing privacy in the usage of various smart home products. By integrating rich descriptions and insights, our study sought to illuminate broader social phenomena, personal experiences, and cultural differences, thus offering a nuanced interpretation of privacy dynamics in smart homes.

3.1. Research setting

We recruited 12 families in China based on their extensive use of smart home devices and the presence of multiple family members (see Table 2). Additionally, these families owned diverse smart home devices and experienced varied usage contexts (see Table 1). This setting provided an ideal background for exploring our research questions, as it allowed for an in-depth investigation of smart home users' privacy perceptions in an environment where smart home technology is seamlessly integrated into daily life.

It is important to note that the contextual setting of our study is limited to Chinese households. This focus was shaped by two primary considerations. First, in terms of data accessibility, we had greater proximity and access to Chinese families, which facilitated deeper ethnographic engagement. Second, our aim was to enrich the current body of literature on privacy concerns, which predominantly centers on Western contexts, such as those in Northern Europe or the United States. In contrast, there remains a notable lack of research on privacy perceptions and practices in China. Our study thus contributes to filling this gap by offering culturally grounded insights.

Specifically, the Chinese smart home context presents several distinctive characteristics. These include: (1) a more collectivist cultural orientation with stronger alignment with governmental structures; (2) a higher tolerance toward privacy compromises among users; and (3) potentially more severe conditions of privacy leakage and misuse compared to mainstream Western countries. These contextual factors make the Chinese case particularly valuable for expanding the global understanding of privacy dynamics in smart homes.

Table 1. Sampled Cases

	Event	Family members in event	Smart Home Devices
C1	User remotely uses a smart camera installed in the yard to keep the elderly safe and watch their movements around the house.	User, User's father, User's mother	Smart camera
C2	Using a Smart Robotic Vacuum Cleaner for the daily cleaning of home environment.	User, User's father, User's mother	Smart robotic vacuum cleaner, Smart speaker
C3	Using smart speakers to go to the convenience of looking up information and making itineraries.	User, User's elder brother	Smart speaker
C4	Daily emotional companionship for the elderly at home with smart speakers.	User, User's husband, User's father, User's mother	Smart speaker
C5	Users use a smart robotic vacuum cleaner to check whether their sister is at home.	User, User's younger sister	Smart robotic vacuum cleaner
C6	Multiple family members at home collaborate to use smart cameras to check on the status of the elderly at home.	User, User's younger sister User's husband, User's father, User's mother	Smart camera
C7	The user uses a smart camera to monitor their home while on a business trip.	User, User's mother	Smart camera
C8	Elderly family members use a smart speaker for daily emotional companionship.	User, User's husband, User's father, User's mother	Smart robotic vacuum cleaner
C9	The morning light setup activates before the elderly typically wake up, ensuring their safety	User, An elderly, User's mother, User's child	Smart Lights
C10	The smart speaker was accidentally activated during a family gathering conversation.	User, User's father, User's mother, User's grandfather, User's grandmother	Smart robotic vacuum cleaner
C11	Smart robotic vacuum cleaner suddenly malfunctioned at home and emitted a human-like voice.	User, User's father, User's mother、User's grandfather, User's grandmother	Smart robotic vacuum cleaner
C12	The smart speaker keeps uncontrollably connecting to user's smartphone.	User	Smart speaker
C13	Smart robotic vacuum cleaner, which had been used for a long time, suddenly broke down and needs to be sent out for repairs.	User, User's husband, User's father, User's mother	Smart robotic vacuum cleaner
C14	The smart speaker inserts product advertisements during use, overlapping	User, User's father, User's mother, User's maternal aunt	Smart speaker

	with the user's recent conversations.		
C15	User discovers fingerprint traces left on their long-term used smart door lock.	User	Smart door lock
C16	The user's father sent them a video about someone else's smart door lock privacy issue.	User, User's father	Smart door lock
C17	The user's father sent them a video about a case where someone's smart door lock was unlocked and their home was burglarized.	User, User's father	Smart door lock
C18	The user discovered that they could see their grandparents' phone screen content through the smart camera.	User, User's grandfather, User's grandmother	Smart camera

Table 2: Demographics of the participants

	Age	Gender	Technology acceptance level	Composition of family smart home devices
P1	35	Female	High	Smart robotic vacuum cleaner
P2	22	Female	High	Smart camera, Smart speaker, Smart doorbell
P3	30	Female	High	Smart camera, Smart speaker, Smart Door lock, Smart robotic vacuum cleaner, Smart curtains
P4	27	Female	Middle	Smart robotic vacuum cleaner, Smart TV
P5	34	Male	Low	Smart speaker
P6	38	Female	Middle	Smart robotic vacuum cleaner, Smart TV, Smart door lock
P7	41	Male	Middle	Smart speaker, Smart TV
P8	40	Male	High	Smart robotic vacuum cleaner, Smart speaker, Smart door lock，Intelligent washing machine
P9	37	Female	Middle	Smart robotic vacuum cleaner, Smart speaker
P10	26	Male	Middle	Smart robotic vacuum cleaner, Smart door Lock
P11	30	Female	High	Smart speaker, Smart camera, Smart door lock
P12	43	Female	Low	Smart speaker, Smart TV

*P=Participant

3.2. Sampling strategy

This study employed purposive sampling, with 12 smart home users were recruited online, representing diverse demographic characteristics in terms of gender, age, household composition, types of smart home devices used, and usage contexts (see Table 2). Each participant participated in a semi-structured interview lasting approximately 30 to 50 minutes, conducted in Mandarin. This approach was designed to capture a broad spectrum of experiences and perspectives on smart home usage and privacy perceptions.

3.3. Data collection

Our primary data source consists of semi-structured interviews, with each interview lasting approximately 30 to 35 minutes per participant. Each participant was interviewed once every two days, for a total of seven interviews over a 14-day period. All interviews were conducted online via Zoom. Prior to participation, we obtained informed consent from all participants.

The interview questions were divided into five main sections. The first section collected basic demographic information, including the number of family members, the types and number of smart home devices used, the duration of device usage, and participants' attitudes toward smart home technology. The second section focused on privacy concerns arising from the everyday use of smart home devices within the household. Participants described incidents that triggered privacy concerns and explained the reasons behind their concerns. The third section asked participants to describe typical scenarios in which family members jointly used smart home devices and to assess whether these interactions could lead to privacy concerns, encouraging them to provide as many details as possible. The fourth section explored specific cases where smart home technology raised privacy concerns, using prompt questions to investigate the challenges and opportunities within these interactions.

Our online participants were recruited through digital channels. Before participating in the study, each participant underwent an initial semi-structured interview lasting approximately 30 minutes.

3.4. Data analysis

This study utilizes thematic analysis to identify, examine, and interpret recurring patterns (themes) within the data. Rather than simply summarizing the information, this method enables a comprehensive and in-depth understanding of the findings (Braun & Clarke, 2006). Our approach is inductive, exploratory, and data-driven, progressively incorporating theoretical frameworks throughout the empirical analysis.

The initial analysis involved coding 18 distinct family interaction events where smart home usage led to privacy concerns. These events, defined as various scenarios in which family members engage with one or multiple smart home devices, were analyzed to capture participants' concerns, emotions, interpretations, and expectations.

Following a family perspective, we coded dynamic interactions, particularly those involving privacy concerns in collaborative device use. Further analysis explored the underlying causes of these concerns and potential design improvements to enhance users' psychological comfort. Employing an iterative, inductive approach, the study continuously refined insights, leading to well-founded research conclusions.

4. Findings

Our analysis reveals four prevailing themes influencing family members' privacy concerns regarding smart home usage: (1) privacy concerns regarding data sovereignty; (2) psychological privacy concerns of the users; (3) system configuration-related privacy concerns; (4) privacy concerns related to family member collaboration. Below, we will elaborate on each of these themes in detail.

4.1. Privacy concerns regarding data sovereignty

We have found that users' concerns about data sovereignty influence their perceptions of privacy. Data sovereignty refers to the control over data being attributed to the data provider or the country in which the data is located, subject to relevant laws and regulations (Hummel, Braun, Tretter, & Dabrock, 2021) . However, the presence and stringency of data sovereignty significantly impact the privacy perceptions of smart home users.

First, we observed that some users' privacy concerns regarding government access to their data are particularly pronounced in the context of corporate data breaches. For instance, if a company provides users' private data to foreign governments or corporations, it may heighten users' privacy concerns. As one participant, P8, stated: "There was news about a Chinese company, Didi, allegedly attempting to sell data to the United States. I am also worried that smart home software might sell my data to other countries." Therefore, corporate data breaches under the framework of data sovereignty can lead to heightened privacy concerns among users.

Furthermore, we found that users with high privacy concerns identified smart home devices as a potential source of persistent privacy risks, a concept they referred to as "privacy inheritance." This concern arises from the fear of excessive personal data collection during seamless device usage and the potential risk of data being accessed after the user has passed away or abandoned the device. The fact that users do not retain sovereignty over this data exacerbates their privacy concerns, particularly if such data is accessed by governments or corporations. One participant elaborated: "Before owning smart home devices, I was not as lazy, nor did I have so many concerns. However, once I started using them, I became dependent on their convenience. If one day these devices severely infringe on my privacy, I might dispose of them all. I am worried that society, and even the government, knows everything about me. Losing money is a significant loss, but what is worse is the thought that after my death, my private data might still be accessed I would not be able to rest in peace."

4.2. Privacy concerns in user psychology

We found that smart home users' perceptions of privacy are significantly influenced by their subjective assessment of the potential targets of data breaches. Current smart home users tend to identify subjective data breach targets and evaluate the consequences and impacts of potential privacy leaks. Our interviews revealed that the majority of smart home users exhibit weaker privacy concerns when the target of the data breach is the smart home company or service provider, compared to when the target is hackers or malicious individuals. For instance, one participant P1, stated: "If sharing data with them can lead to better services, then let them take it."

Additionally, another participant, P2 in C2, remarked: "I'm willing to take on these privacy risks for the sake of convenience. If the floor plan of my home doesn't fall into the hands of thieves, it's not a big deal." This highlights how users' conceptualization of the target of privacy breaches significantly impacts their privacy perception.

Beyond the target of data breaches, we also identified that users' evaluation of the consequences of privacy leaks influences their privacy perception. During the interviews, participants reflected on potential privacy risks associated with their regular use of smart home devices. For example, when discussing privacy concerns, participant P3 said: "I don't

see privacy as an issue when it's about exposing non-critical personal data through smart home devices. But when it involves money, that's something I can't accept or afford."

We also observed that users with lower privacy concerns regarding their smart home devices often had higher trust in the brand they chose before purchasing. These users tend to perceive lower privacy risks compared to others. For example, participant P4 shared: "I feel more confident in the handling of user privacy by Xiaomi, a prominent Chinese technology company known for its smart products. However, for other companies that mainly produce devices like robot vacuums and TVs and do not primarily focus on backend technology, I perceive their privacy protections to be less robust."

Moreover, users often balance privacy and convenience in their subjective decision-making processes, especially in context-specific scenarios. For instance, participant P2 shared: "I sometimes realize that smart home devices might leak my privacy, but I feel their protective functions outweigh those risks. For example, I use cameras to monitor family members when I'm not at home, and at that moment, privacy concerns become irrelevant." This indicates that users are willing to compromise privacy for the convenience these devices offer.

4.3. Privacy concerns arising from system configurations

Our analysis reveals that certain system features in smart home devices significantly affect users' privacy perceptions. Specifically, we identified six aspects of smart home systems that are closely linked to users' privacy concerns: the excessive integration of smart home devices with other user devices, the system architecture of smart home components, the service and repair methods provided by smart home manufacturers, residual user privacy information left on smart devices, the highly personalized recommendation systems developed during smart home usage, and the interaction wake-up mechanisms embedded in smart home systems.

We found that when smart home devices are overly integrated with other user devices, this seamless connectivity increases users' privacy concerns. This phenomenon is closely related to users' inability to control or monitor such interactions. For instance, participant P5 in C12 mentioned: "I had an experience today where I felt my privacy was at risk while using a smart speaker. The speaker in my home frequently connects to my phone without any prompt. This situation made me feel very confused and worried. I immediately checked the connection status, fearing that the speaker might access my call logs, messages, private photos, or other family members' information." Such automated connectivity leads to heightened privacy concerns as users fear the possibility of data leaks or unauthorized associations beyond their control.

We also discovered that the repair methods of smart home devices impact users' privacy perception. Some repair processes, such as requiring users to send devices to a service center, increase privacy concerns. For example, participant P6 in C13 shared: "My robot vacuums cleaner broke down recently, and I sent it back to the manufacturer for repair. It's been a while, and it hasn't returned. Since the robot has been used for a long time, it knows the layout of my house and has recorded family voice commands. I'm worried that the manufacturer might extract this data and leak our personal information."

The highly personalized recommendation functions of smart home devices strongly correlate with user privacy concerns, significantly intensifying users' apprehension. When the recommended content aligns too closely with users' intentions or behaviors, users often perceive that their daily lives and private conversations are being "monitored" by the devices, resulting in heightened discomfort and mistrust. Firstly, when personalized

recommendations closely match users' expressions or intentions, users may suspect that the devices are monitoring their conversations or behaviors. As Participant P12 noted, "Sometimes when I'm chatting with friends about something like a TV show, my smart TV will suddenly display advertisements or recommendations related to it. It feels like the device is listening to our conversations, as though I'm being watched." Such highly precise recommendations lead users to believe that their private exchanges are being recorded covertly by the devices. Secondly, when smart home devices push commercial advertisements that strongly overlap with users' everyday data, concerns about excessive data collection or potential leaks become more pronounced. For instance, participant P5 in C14 shared, "One day, while using my smart speaker to play music, it suddenly started broadcasting product recommendations for items I had never searched for before. These products, however, seemed to be related to recent conversations I had." This phenomenon not only deepens users' suspicions about privacy breaches but also reinforces their perception that their usage behavior is under constant surveillance.

We found that residual privacy information left on smart devices due to certain materials or designs exacerbates users' privacy concerns. For instance, smart locks that use fingerprint or password mechanisms often leave visible traces of fingerprints or pressed keys, making users anxious about potential misuse. Participant P8 in C15 remarked: "Today, I noticed that our smart lock had obvious fingerprints on it after use. I'm worried someone could exploit this information to break in."

Erroneous activation of interaction mechanisms in smart home devices significantly heightens users' privacy concerns. Many smart home systems rely on voice-activated wake-up words, such as "Xiao Ai" for Xiaomi devices, "Tmall Genie" for Tmall devices, or "Xiao E" for Huawei devices. These mechanisms can be triggered by similar-sounding phrases or system malfunctions, giving users a sense of being "monitored." Participant P9 in C10 shared: "Today while talking to my family about private matters like income and insurance, the smart speaker suddenly responded with 'I'm here.' It made me feel like the speaker was listening to the whole time, which is extremely concerning. If such private conversations were accessed by malicious actors, it would be very dangerous, as if my family's secrets were exposed." System malfunctions also contribute to these concerns. For example, participant P9 in C11 recalled: "While at home, the charging light of my robot vacuum suddenly turned on, and a man's voice came from it. It was terrifying. I asked my dad if he had logged in, and he said no. This made me feel like the device is spying on us." Moreover, the human-like responses of smart devices often amplify users' privacy worries, as they make the devices feel more intrusive.

The foundational system architecture of smart home devices influences privacy perceptions. Different implementation methods for similar functionalities can lead to varying levels of privacy concerns. For instance, we found that users choosing robot vacuums often compare models based on whether they use radar or vision-based obstacle avoidance systems. Users perceive radar-based systems as likely to cause fewer privacy concerns. Participant P8 noted: "When purchasing products, I consider their system architecture. I think choosing products with mechanisms that better protect privacy can help mitigate privacy risks."

4.4.Privacy concerns regarding family member collaboration

Our study reveals that the collaborative use of smart home devices and interactions among multiple family members can significantly influence privacy concerns among certain household members. Specifically, we identified three aspects: emotional attachment to smart home devices leading to user dependency and affecting other

family members' privacy perceptions; the impact of collaborative information-sharing functions on privacy concerns; and the transmission of privacy-related incidents among family members, which influences their perception of privacy risks.

First, emotional attachment to smart home devices can foster user dependency, thereby influencing the privacy perceptions of other family members. For example, in households with elderly members or children, these individuals may develop a sense of companionship with smart home devices, such as smart speakers, which creates a form of emotional reliance. This sense of companionship can, in turn, affect other family members' concerns about privacy. Participant P9 in C8 noted: "The elderly in my family have grown accustomed to the companionship of the smart speaker and treat it as if it were their grandchild. Whenever I see this, it alleviates some of my concerns about the device's privacy risks." This finding highlights how the differential use and perception of smart home devices among family members can influence privacy concerns across the household.

Second, we found that the transmission of privacy-related incidents among family members can shape privacy perceptions and even prompt protective measures. In many cases, family members who share privacy breach incidents or potential risks on social media can significantly affect others' awareness of privacy concerns. For instance, participant P2 in C16 shared: "My father sent me a video about smart locks, showing how a small magnet could make it seem like the door was locked when it wasn't. After watching the video, I conducted a two-day inspection of the locks at home." Similarly, participant P11 in C17 noted: "My father sent me another anti-theft video, asking me to wipe down the smart lock. The video showed how burglars scouted homes, which made me anxious." This type of information-sharing not only impacts family members within the same household but can also extend to users of similar smart home devices, amplifying privacy concerns through social media channels.

Finally, we observed that the different contexts in which collaborative viewing functions of smart home devices are used can also influence users' privacy perceptions. For example, when family members use smart cameras to monitor others in the household, they may inadvertently expose sensitive information, such as the content of private conversations or mobile phone screens, which can heighten privacy concerns. Participant P2 in C18 stated: "When the elderly sit under the camera playing with their phone, it's easy to see the information on their screen clearly." Additionally, concerns about privacy arise when family members use smart cameras to monitor each other. Participant P4 in C6 explained: "As younger family members, we communicate with each other to avoid checking in on the elderly without proper communication. We also monitor for any unknown accounts accessing the system to prevent potential privacy risks."

5. Discussion

In our exploration of interactions among smart home members, we unearthed various privacy concerns. Consequently, we have proposed a comprehensive set of design strategies. By incorporating these privacy - aware elements, the next - generation smart homes can not only deliver seamless functionality but also uphold the privacy rights of every user.

5.1. Provision of differentiated smart home maintenance services

Our first strategy is to offer differentiated smart home maintenance services. Our Analysis

indicates that the current repair methods for certain smart home devices remain relatively uniform. The predominant approaches—on-site repair and mail-in services—pose several concerns. Notably, these methods can exacerbate users' privacy anxieties due to the strong personal association between users and their smart home devices. Losing control over these devices during the repair process may foster distrust among users. Additionally, these repair approaches often entail extended service periods, further heightening users' concerns regarding potential privacy breaches. For instance, as highlighted in C13 from our interview with P6, such concerns were explicitly emphasized. To enhance privacy security in smart home maintenance, this paper proposes a more flexible repair framework. By tailoring repair services to accommodate varying levels of user-device intimacy, it is possible to significantly mitigate users' privacy concerns and improve their overall trust in the repair process.

5.2. Increased control of intelligent interaction privileges

Currently, most smart home devices support voice control through wake words but lack a clearly defined sleep word mechanism. This absence of an explicit deactivation command may lead to concerns regarding user privacy, as it does not provide a convenient way to actively disable voice recognition when not needed. For instance, one of our interviewees, P9, stated, "I prefer to manually toggle the power of XiaoAi so that it only listens when I need it. This makes me feel much safer. "To mitigate such privacy concerns, we propose that smart home systems incorporate an explicit sleep word function, allowing users to easily suspend voice recognition when necessary. Additionally, smart home design should better account for user autonomy by enabling granular control over device access permissions and activation states based on household members' needs. This approach would enhance user trust and improve the overall privacy experience in smart home environments.

5.3. Provide localized storage solutions for privacy-sensitive smart home devices

Most devices that handle highly sensitive user data primarily rely on cloud-based storage solutions. However, this lack of user control over cloud storage significantly amplifies privacy concerns, especially for devices that process visual data. Such devices often contain a large volume of private user information, and the reliance on cloud storage increases the risk of data breaches.

Through interviews, we found that not only individual users, but also entire household members are deeply concerned about potential cloud-based privacy leaks. In a home environment, visual data frequently involves multiple household members, meaning that any privacy breach could have far-reaching consequences. For instance, footage recorded by home security cameras may include daily activities, conversations, and other highly sensitive personal information. If such data were compromised due to cloud storage vulnerabilities, it could pose a severe threat to the privacy of the entire household. Research indicates that localized storage solutions can effectively mitigate these concerns. Although local storage requires larger disk capacity, it provides users with an alternative storage option that enhances privacy control. From the perspective of household interactions, localized storage reduces concerns over data sovereignty by granting each household member greater control over their data. For example, parents can decide what data should be stored locally and implement security measures to safeguard household privacy. This approach not only strengthens individual control over personal data but also protects the collective data privacy rights of the household.

6. Concluding remarks

This study employs case analysis to conduct an in-depth examination of the privacy risks encountered by different family members when using smart home technologies and proposes targeted design strategies to mitigate these risks. The study makes two key contributions to design and privacy research.

First, it introduces the perspective of multi-member family interactions, shifting the focus away from the traditional emphasis on individual-technology interactions to a more holistic view of family dynamics. This perspective enables a deeper exploration of the origins, evolution, and impact of privacy concerns within the interactive process. Second, the study provides a series of design strategies aimed at alleviating family members' privacy concerns, offering designers practical solutions to address the prevalent privacy issues in smart environments.

Although our objective is to thoroughly investigate the dynamic nature of privacy concerns, existing research is limited in terms of the number of cases examined and the cultural contexts considered.

Our study remains constrained by a relatively small number of cases, predominantly situated within Eastern cultural contexts. Future research could expand in the following directions:

First, our study has a notable limitation in terms of cultural context. The research is confined to an in-depth exploration of smart home scenarios within a Chinese cultural setting. Consequently, the findings may be limited in their transferability and generalizability to other contexts. Future research is urgently needed to investigate privacy practices and concerns in smart homes situated in different cultural backgrounds, such as those in Europe or the United States. This is particularly important as users' attitudes toward privacy, as well as the prevalence and nature of data breaches and privacy violations in smart home environments, may differ significantly across cultural and regional contexts. Second, further exploration of privacy risks and corresponding design strategies across different family structures (e.g., nuclear families) is needed to refine research findings and enhance the specificity of design interventions. Third, it is important to examine how to continuously safeguard family members' privacy as smart home technologies increasingly integrate with emerging technologies such as the Internet of Things (IoT) and artificial intelligence (AI), ensuring the long-term relevance of design strategies. Lastly, conducting cross-cultural studies to compare how families from different cultural backgrounds perceive and address smart home privacy concerns can enhance the universality of smart home design and better meet the demands of the globalized market.

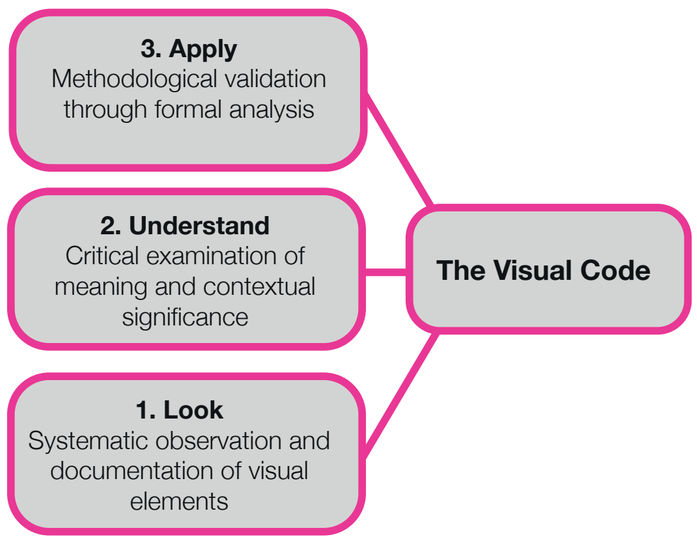
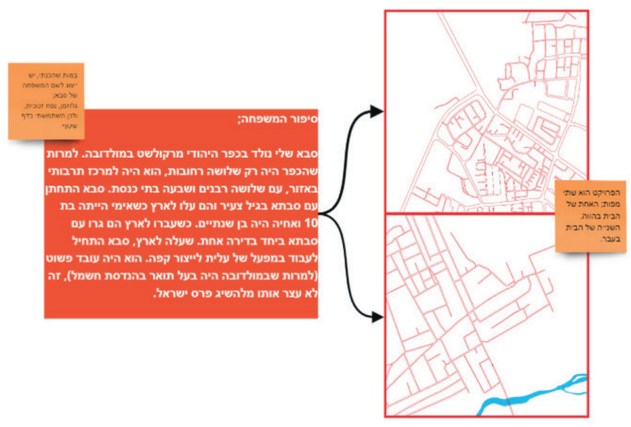
Project RSO: Reclaiming Subjective Objectivity of Visual Literacy In an era characterised by digital revolution and visual culture transformation, established approaches to critical thinking warrant fundamental reconsideration.

Digital platforms and artificial intelligence increasingly challenge conventional cognitive frameworks, particularly within domains marked by inherent ambiguity and requiring enhanced cognitive flexibility.

Building upon established theoretical foundations, **Project RSO** introduces an innovative approach to **visual literacy education** that synthesises critical analysis with evidence-based methodologies. At its core lies the inherent dialectic between subjective interpretation and objective analysis, which the project addresses through systematically structured yet adaptable frameworks.

The Visual Code, our primary pedagogical framework, operates through three interconnected analytical layers:





Whilst maintaining alignment with cognitive flexibility theory, the model has demonstrated considerable efficacy in design education (Topelberg & Ventura, 2024). Our current research examines its implementation within **"Eretz-Ir" (Land-City)**, an interdisciplinary programme integrating secondary school pupils, design students, and educators, thus providing substantive insights into its scalability and cross-contextual applications.

Objectives

- Enhancement of visual literacy through systematically structured yet adaptable analytical frameworks
- Development of rigorous methodologies for critical engagement with digital and AI-generated content
- Establishment of sophisticated cross-educational assessment protocols
- Adaptation of the model to diverse cultural and educational contexts whilst maintaining methodological integrity

Initial Findings

- Enhanced Student Engagement: Participants demonstrated a marked progression from fundamental task completion to sophisticated analytical practices, evidenced through the development of complex digital mind maps synthesising textual elements, critical enquiries, and original visual components.
- Pedagogical Adaptability: Teaching staff exhibited considerable facility in modulating the depth and pace of enquiry to suit varied learning contexts, whilst successfully implementing the methodology across diverse disciplinary domains.

Anticipated Impact

- **Cultivation of sophisticated visual literacy** competencies for navigation of complex media landscapes
- A seamless **integration of traditional and contemporary** pedagogical approaches
- **Enhancement of societal discourse** through elevated media literacy
- Development of **globally applicable frameworks** for visual literacy education

Reimagining food delivery: Designing towards a fairer platform

Dr Yuanjun Li, Dr Fangzhou You*, Dr Lanyun Zhang, Qiuyuan Jing, Dr Chen Chen

***School of Arts and Creative Technologies, University of York, UK**
fangzhou.you@york.ac.uk

Abstract

Food delivery applications (FDAs) represent a gig work platform that challenges traditional labour structures and impacts the digital wellbeing of individuals. Whilst FDAs provide convenience for customers, they raise significant ethical challenges, such as algorithmic control, which have led to social conflicts among delivery riders, customers and restaurants. These conflicts often arise from issues including AI-powered route planning and order prioritisation, unrealistic time expectations and a lack of transparent dispute resolution processes. Addressing these issues requires a holistic and ethically grounded redesign of FDAs that considers the needs of all stakeholders. This study conducts a scoping review to explore the impact of current FDA designs on three key stakeholder groups and identifies design opportunities for creating fairer FDAs. The findings aim to inform ethical design practices that prioritise fairness, digital wellbeing and stakeholder satisfaction.

Research Objectives

The scoping review aims to answer the research question: **How can FDAs be ethically designed to addressing social conflicts amongst customers, restaurants and delivery riders**. The objectives of this research include:

1. Explore how existing food delivery applications affect customers, restaurants, and delivery riders in a perspective of digital ethics, focusing on social conflicts, stakeholder wellbeing and algorithmic control.
2. Identify knowledge gaps in understanding the ethical and practical implications of ethical FDA design tools within the Human-Computer Interaction (HCI) domain.
3. Provide recommendations for redesigning FDAs to prioritise fairness, well-being, and satisfaction for key stakeholders, contributing to digitally ethical FDAs design practices.

Methodology & Process

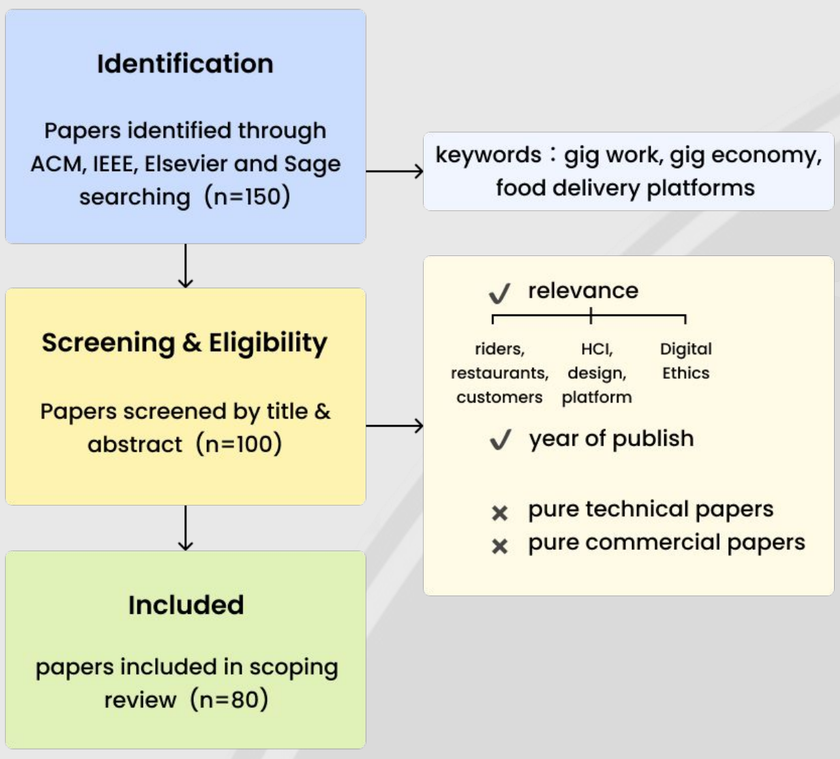

Figure 1. PRISMA flowchart of paper selection process

This scoping review followed the PRISMA framework, beginning with the identification of 150 papers through database searches (ACM, IEEE, Elsevier, Sage) using keywords such as ‘gig work’, ‘gig economy’, and ‘food delivery platforms’. Titles and abstracts of 100 papers were screened for relevance to topics like riders, restaurants, customers, HCI, design, platforms, and digital ethics, whilst ensuring latest publications. Purely technical or commercial papers were excluded. Finally, 80 papers were included for review, providing a comprehensive foundation for examining the ethical design dimensions of FDAs.

Findings: Ethical Design of FDAs

Ethical concerns in FDAs arise from the interplay of labour practices, customer expectations, and platform accountability, challenging the equitable treatment of key stakeholders. The ethical design of FDAs is crucial not only for addressing the negative impacts caused by these platforms but also for offering ethical guidance in the context of digital gig work platforms.

The findings of this research suggest the ethical design of FDAs must factor in the aspects of:

1. Algorithmic control over delivery riders and customers
2. Managerial control over restaurants
3. The need for the development of ethical FDAs design guidelines

In summary, further investigation is required into design recommendations for mitigating key stakeholder conflicts in the field of HCI study. Figure 2 outlines the work in progress, where researchers focus on reducing the negative impacts of algorithmic and managerial control, as well as labour relations in FDAs, by providing a set of ethical design guidelines.

Tag Writing Method for LoRA Model Training Under The Cross-Cultural Background: A Case Study of New Chinese Yunjian

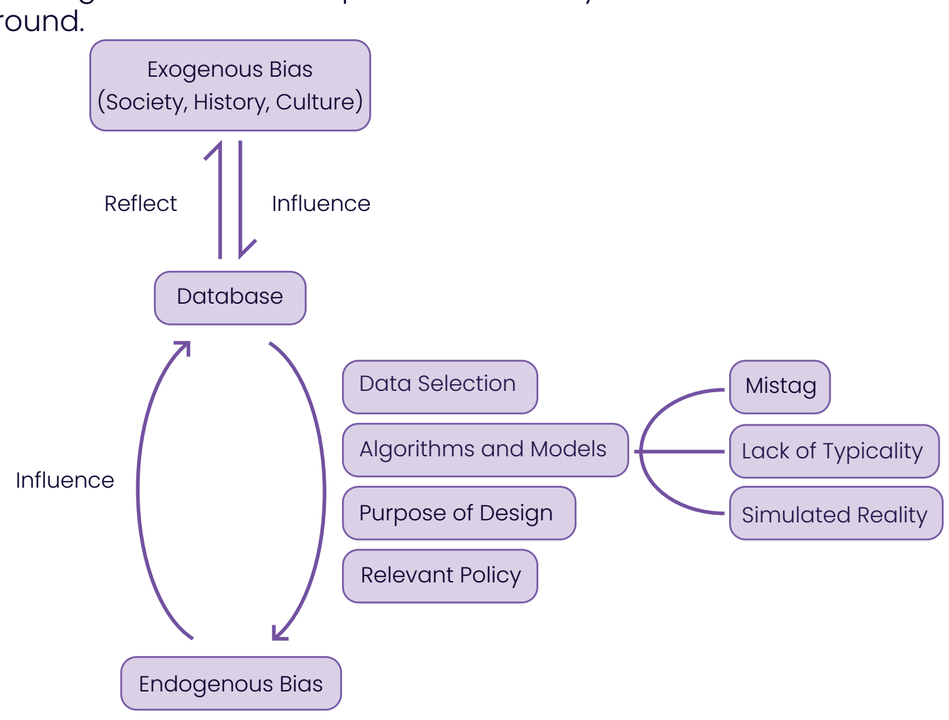
Meiru Wang, Zhiyu Zhao
Zhiyu Zhao
zhaozhiyu@ buaa.edu.cn

Abstract

Research has found that there is a significant lack of cultural representation in generative artificial intelligence. The data used to train AI primarily comes from Western developed countries. It means that a lot of of data comes from Chinese Internet are overlooked. As a result, the generated content cannot meet the needs of users with different cultural backgrounds. In the field of Natural Language Processing (NLP), it is widely acknowledged that biases may stem from five main factors: data, annotation process, input representation, model, and research design. As an open-source project, Stable Diffusion provides transparency by offering its architecture, code, and training data. Its openness allows users to understand the functionality and potential deviations of the model. LoRA is a low-rank adaptation method for large language models(LLMS). Users can customize LoRA models to meet their own needs. Training LoRA models for targeted subjects to absorbe diverse data to improve AI's understanding of different cultures, it may help bridge the gap between databases and specific cultures.
This study took "Yunjian", a unique shoulder ornament in traditional Chinese costumes, as an example. There was a significant imbalance in the representation of global cultures from AIGC database sources and algorithm design. Automatic tagging tools often generated a large number of invalid tags when tagged images. The wrong tags caused errors in algorithm learning. The authors proposed a tag writing framework based on the intrinsic characteristics of Yunjian. Through experiments, it was found that the effective tags are selected by using the framework. It made the details fit the form of Yunjian better and the generation effect more in line with the user's needs. By training a specifical LoRA model for Yunjian to increase the diversity of the data, which may reduce biases in AI-generated content and open up new possibilities for the application of AIGC across different cultures.

Research Objectives

The purpose of study is to control the data selection and tagging process in the LoRA training model to make the generation effect more applicable to Chinese cultures, so as to reduce the errors caused by cultural bias in artificial intelligence generation and explore the usability of AIGC in the cross-cultural background.



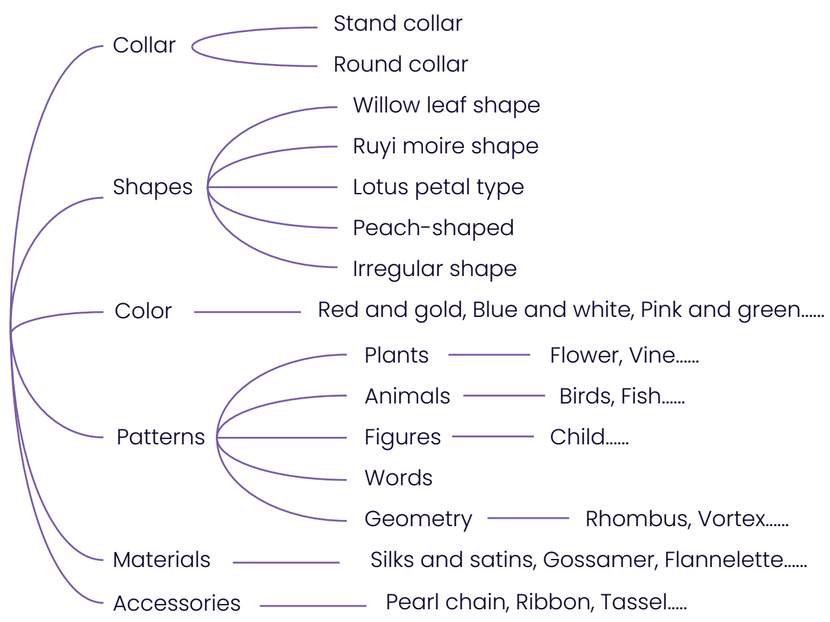
The Mechanism of Bias in Generative Artificial Intelligence

Methodology and Tools

This study used the empirical research method and used Stable Diffusion to train LoRA model for comparative experiments.
Stable Diffusion is a potential diffusion model that generates specific images from text descriptions with high stability and low computational complexity. It reduces the training cost but maintains excellent image generation performance. Low-Rank Adaptation (LoRA) is a method for large language models, reducing the barrier of model training and broadening the scope of output, which efficiently generates the target image using a small amount of data with a low-rank matrix.

Research Process

The authors divided tag writing into six sections according to characteristics of Yunjian, and summarized more detailed descriptors on this basis.

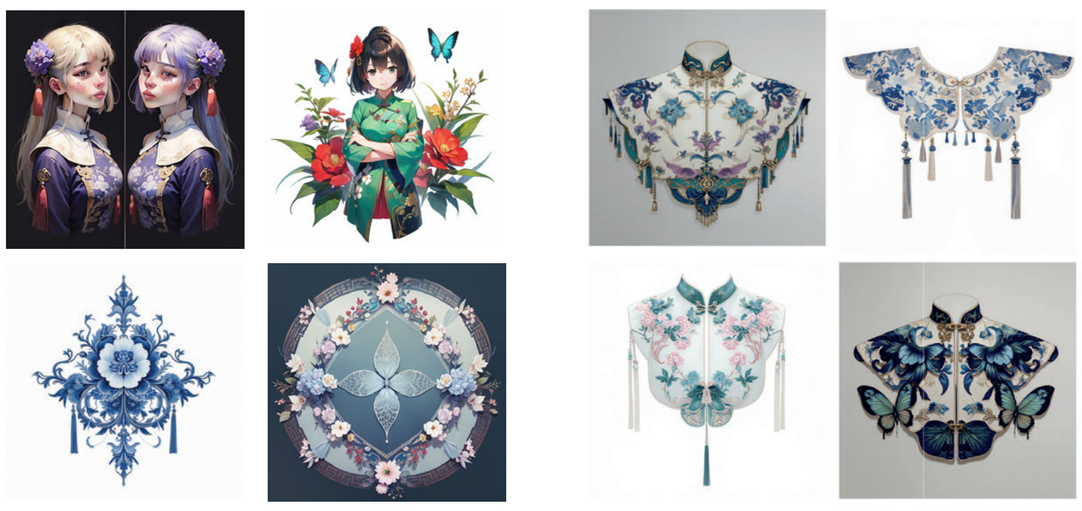


Comparison between Automatically generated tags and designed tags:

	Automatically Generated Tags	Designed Tags
	closed eyes, flower, from side, full body, gem, grey background, long hair, profile, snowflakes, standing	Yunjian, Chinese style, symmetric structure, white background, no avatar, round collar, irregular flowered margin, light blue and white, oriental cherry pattern, organza material, pearl chain, tassel
	artist name, beads, bell, gem, grey background, simple background, solo, tassel	Yunjian, Chinese style, symmetric structure, white background, no avatar, round collar, lotus petal shape, red and gold, peacock feather pattern, embroidery, tassel

Expected/Obtained Results

The authors tagged 200 cropped images of Chinese Yunjian using the two aforementioned methods and conducted model training. By inputing the prompts "Yunjian, Chinese style, symmetric structure, butterfly shape, flower, tassels, red/blue/green, satin material, white background, and no avatar" to teste two models. It was found that the LoRA model trained with automatic tagging tool could only learn the symmetric structure and Chinese patterns from the training set but failed to generate the unique shape characteristic of Yunjian. It even produced images of people that were completely out of character. In contrast, the tag framework constructed with careful design enabled the algorithm to more accurately learn the distinctive features of Chinese Yunjian from the training set.



Images generated from LoRA model through automatic tagging tools

Images generated from LoRA model trained by tag writting framework basedon the characteristic of yunjian

The Anticipated Impact of The Contribution

This research contributes significantly to discussions on cross-cultural adaptation in AI-generated content, presenting a practical framework for effective tagging in culturally specific design applications.
From a practical perspective, completely eliminating data bias is Extremely difficult. This requires coordination from all sides of society. However, for designers, training LoRA models with diversified data and fine-tuning large language models is an effective and simple approach to mitigate these issues.

ABSTRACT

In a rapidly evolving technological landscape, artificial intelligence (AI) has transformed creative processes, fostering aesthetic standardization that contrasts with human craftsmanship's uniqueness. While AI expands access to visual creation, it often dilutes artistic individuality, raising questions about authorship and originality. In response, there is a renewed interest in artisanal design, which values imperfection, authenticity, and emotional depth. This research explores the intersection of AI-generated aesthetics and craftsmanship, proposing a balanced approach that integrates technological efficiency with manual expressiveness. Through case studies and interviews, it examines how design students, professors and professionals can preserve their creative identity in AI era.

RESEARCH OBJECTIVES

1. Analyze the impact of AI on the creation and perception of handcrafted design in Europe.
2. Evaluate the evolution of e-commerce in the craft and graphic design sectors.
3. Compare the client's experience in small design ateliers.
4. Examine the relationship between design customization and customer loyalty.
5. Propose the integration of AI tools in the design process, ensuring a balance between technological efficiency and human creativity.

METHODOLOGY

1. Review of theoretical background.
2. Practical comparison between AI and handcrafted styles.
3. Aesthetic and formal comparison.
4. Evaluation of the creative process.
5. Analysis of user and designer experiences.
6. Surveys students and professors

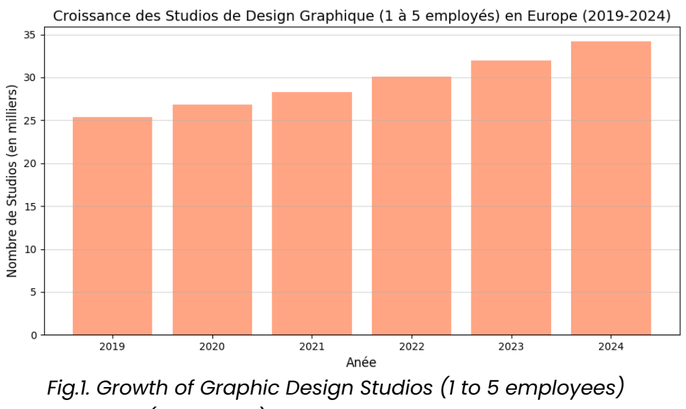

Fig.1. Growth of Graphic Design Studios (1 to 5 employees) in Europe (2019-2024)

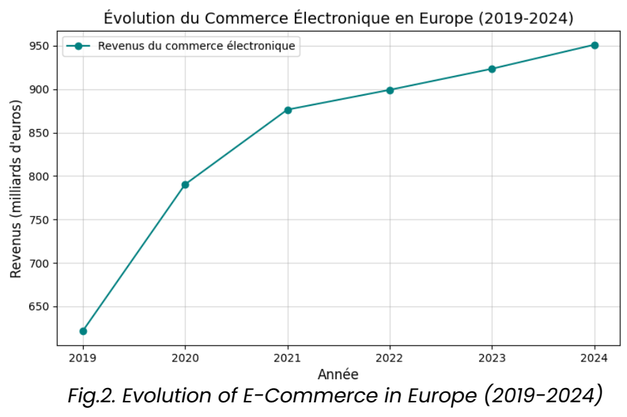

Fig.2. Evolution of E-Commerce in Europe (2019-2024)

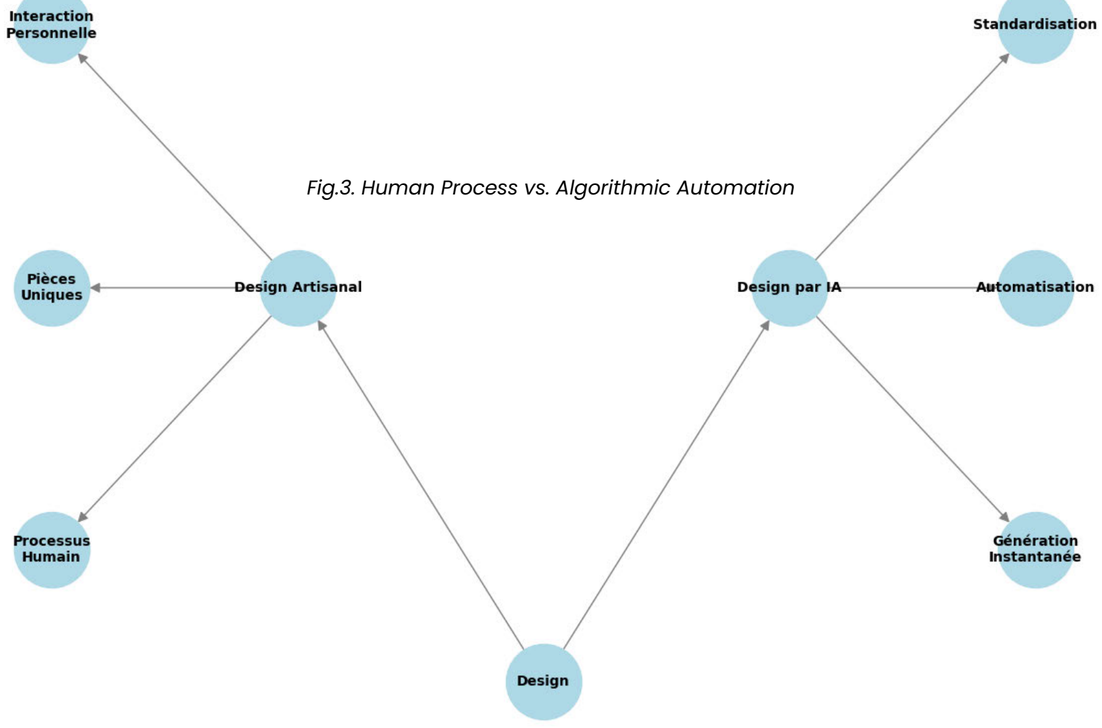

Fig.3. Human Process vs. Algorithmic Automation

RESEARCH PROCESS

1. **Theoretical background review.** The evolution of AI in design. Growth design studios (1-5 employees) analysis and market trends were also examined. (Fig. 1 and 2)
2. **Practical comparison between AI and craft. Hybrid Design Process** (Fig 5.)
2.1 **Analysis of EASD Castelló students' creations.** Ceramics, illustration, and graphic design.
2.2 **Experimental workshop EASD Castelló.** Students completed exercises: one assisted by AI and no AI. (Fig.4)
3. **Analysis of User and Designer Experiences**.
3.1 **Surveys EASD Castelló Students and Professors.** 30 students and 30 teachers were surveyed about perception of AI

EXPECTED/OBTAINED RESULTS.

1. **Interaction as a Differentiating Factor.** (Fig. 3)
2. **Experiential Value vs. Material Value.** Turning the acquisition into a emotional experience.
3. **Experience as Social and Spiritual Capital.** Access to enriching experiences in ateliers reflects a cultural and emotional identity, surpassing material accumulation.
4. **A Relationship Based on Trust and Recognition.** The client forms a deep relationship with the designer
5. **Uniqueness vs. Standardization.** Handcrafted design stands out for its uniqueness and emotional connection, while AI generates standardized products.
6. **Human Process vs. Algorithmic Automation.** Atelier design is human, with imperfections and evolution, while AI produces instant designs without narrative or interaction. (Fig. 3)
7. **Emotionality vs. Functionality.** Handcrafted design conveys emotions and stories, while AI creates visually impactful products but lacks emotional depth.
8. **Active Client Participation vs. Passivity.**

ABSTRACT | The integration of artificial intelligence (AI) in conversational agents (CAs) has become increasingly prominent across various industries, including human resources. While the anthropomorphization of AI is often seen as an enhancement of user interaction, ethical concerns related to its design remain significant.
This paper proposes a comprehensive framework for designing the personality of CAs based on four key components: brand mission and values, user needs, the agent's role, and an appropriate personality model. By focusing on these aspects, the proposed framework aims to create conversational agents that not only align with brand identity but also foster positive user experiences. The study uses the "Big Five" personality model as a foundation for mapping out the traits that should be incorporated into the CA design. Additionally, this research explores the ethical implications of anthropomorphic AI and its potential impact on users. Through interviews, personas, and user scenarios, the framework aims to offer guidance for designing more intuitive, empathetic, and ethically responsible CAs.
Anthropomorphization refers to attributing human characteristics to non-human entities, such as CAs, and it has been central to the development of AI interfaces. This concept has been integral to AI design since the Turing Test, which was developed to evaluate a machine's ability to mimic human intelligence. Today, CAs are designed to emulate human-like interactions, utilizing natural language processing (NLP) and social rules that replicate human-to-human interactions. Research within the "Computers Are Social Actors" (CASA) paradigm suggests that, despite knowing CAs are not human, users often treat them as such, applying similar social expectations. This blurring of lines between human and AI interaction raises ethical concerns, particularly around trust and the

psychological impact of interacting with highly anthropomorphized agents.
To address these challenges, this paper proposes a framework to guide the design of CA personalities, ensuring they are aligned with both the brand's identity and user expectations. The framework is structured around four key components: the brand's mission and values, a deep understanding of user needs, the CA's role, and an appropriate personality model. These elements ensure that the CA's personality is consistent with brand objectives while enhancing user experience and trust.

1. Brand Mission and Values: A CA's personality must reflect the core values and tone of the brand it represents. Analyzing the brand's mission ensures that the CA embodies the right personality traits that reinforce brand identity.
2. User Needs: Understanding user goals and frustrations is key to tailoring the CA's personality. Through user research and persona development, designers can identify personality traits that align with user expectations and alleviate common pain points.
3. CA's Role: The CA's social role, whether it acts as a guide, assistant, or motivator, shapes the appropriate personality traits for the system. This allows the CA to maintain an appropriate dynamic with users, even when their personality profiles may differ.
4. Personality Model: The Big Five personality model (OCEAN: Openness, Conscientiousness, Extraversion, Agreeableness, and Neuroticism) is employed to map out the CA's traits systematically. This model provides a comprehensive framework for designing nuanced, human-like personalities while maintaining consistency with brand identity.

By following this framework, organizations can create conversational agents that are not only functional but also embody ethical considerations, particularly in terms of user trust and the psychological effects of interacting with human-like machines. The proposed framework addresses both practical challenges in CA design and broader ethical implications, ensuring that AI technologies remain aligned with human values.

KEYWORDS | AI ETHICS, CONVERSATIONAL AGENTS, PERSONALITY DESIGN, DESIGN ETHICS,

1. Introduction

The integration of artificial intelligence (AI) in conversational agents (CAs) has become increasingly prominent across various industries. Since its inception in the 1950s, AI has evolved significantly, multiplying its uses and application domains.
While the anthropomorphization of AI is often seen as an enhancement of user interaction, ethical concerns related to its design remain significant. Anthropomorphization refers to attributing human characteristics to non-human entities, such as CAs, and it has been central to the development of AI interfaces. This concept has been integral to AI design since the Turing Test, which was developed to evaluate a machine's ability to mimic human intelligence. Today, CAs are designed to emulate human-like interactions, utilizing natural language processing (NLP) and social rules that replicate human-to-human interactions. Research within the "Computers Are Social Actors" (CASA) paradigm suggests that, despite knowing CAs are not human, users often treat them as such, applying similar social expectations. This blurring of lines between human and AI interaction raises ethical concerns, particularly around trust and the psychological impact of interacting with highly anthropomorphized agents.
From a Weberian perspective of the ethics of responsibility (Hottois, 1996), questioning the impact of AI on its users is a moral inquiry, akin to corporate social responsibility (CSR). The design choices of AI (Esteban, 2020) notably direct the impact of this technology: usage functions, support platform, type of AI, etc. Amazon's selection algorithm, which excluded female

designations, is notoriously emblematic (Black & Esch, 2020) and illustrates the potentially deleterious consequences of an AI whose ethical implications are poorly thought out. The anthropomorphic design of certain AIs has a particular influence on users (Cherif & Lemoine, 2019; Przegalinska et al., 2019) and thus constitutes an important dimension to address the ethical questions in this field.
To address these challenges, this paper proposes a comprehensive framework for ethically designing the personality of CAs based on four key components: brand mission and values, user needs, the agent's role, and an appropriate personality model. By focusing on these aspects, the proposed framework aims to create conversational agents that not only align with brand identity but also foster positive user experiences.

2. Litterature review

Conversational agents are computer programs that interact with users using natural language (Masure, 2015). They fulfill a need for companies to embody themselves to users, allowing users to feel understood and supported in their endeavors, even in the absence of a physical agent. Trends show that companies are rapidly implementing CAs within their services. However, consumers should not be forced to adopt solutions that do not improve efficiency, effectiveness, or satisfaction compared to traditional systems (Black & Esch, 2020).
Artificial intelligence (AI) enhances conversational agents by smoothing dialogues, adding coherence and fluidity to the user experience, and creating the illusion that the user is conversing with a human (Cherif, 2016). After examining results that demonstrate the robust functioning of social rules in human-computer interaction (HCI), it seems natural to make the interface more human, conforming to the predominant social expectations of users.
The idea that people treat computers as if they were human (Nass & Brave, 2005; Nass & Moon, 2000; Reeves & Nass, 1996) has received consistent empirical support by using a wide range of social rules observed in human-human relationships. This research paradigm, known as "Computers Are Social Actors" (CASA), indicates that although people know that computers do not justify social treatment, they tend to apply social expectations and exhibit the same responses to computers as to human interactions.

Conversational agents are often attributed human characteristics, including gender, face, and personality. Gender, in particular, creates expectations that impact users' experiences with the agents. Research on the gender affordances of conversational agents shows that users more frequently attribute negative stereotypes to female CAs than to male CAs. Female CAs are more often subject to implicit and explicit sexual attention and abuse (Przegalinska et al., 2019). Gender stereotypes tend to affect relational (style) interaction more than referential (content) interaction. For example, when computer gender manifested in sexually marked cartoon characters, participants were more likely to accept suggestions from a male computer for sports and vice versa for fashion anecdotes (Lee, 2003).
Beyond gender, anthropomorphism can benefit the perception of personality. CAs with a high level of humanity increase trust and familiarity, offering a more natural interaction with humans. This is because humans know how to interact with other humans and will assume a CA will interact like a human if it has a more human appearance. However, research has shown that being too human-like can have a negative effect on human perception, a phenomenon known as the "uncanny valley" (Mori, 1970). Empirical research has not consistently supported this intuitive notion (Dehn & van Mulken, 2000), raising questions about how human attributes of the interface modify how people interact with a computer. For example, when do anthropomorphic interfaces elicit more positive or negative reactions from users than their mechanomorphic counterparts? Are there individual differences in how people react to more or less human-like interfaces? Although the tendency to anthropomorphize computers is considered quite universal within the CASA tradition, some researchers have examined how various anthropomorphic qualities of the interface affect user responses. Sproull, Subramani, Kiesler, and Walker (1996), for example, used a computerized career counseling system that presented its results via simple text display or a talking face. This research revealed that while auditory resemblance to humans did not make people more likely to exhibit social responses to flattering computers, it served as a peripheral cue that significantly improved users' evaluations of the computer's performance and compliance

with the computer's suggestions among people with chronic illnesses.
Finally, a study revealed that the personality of CAs had a significant positive effect on user experience with virtual interfaces, but this effect depends on the context, the task performed, and the user group. Humans have bodies, feelings, emotions, personalities, and behaviors that all influence how we communicate, behave, and interact. CAs must be able to simulate these skills to be perceived as more than a computer and become competent social actors. Similarly, just as people are more attracted to similar others than to dissimilar ones (Byrne, 1971), when the "personality" of the computer was implicitly conveyed through textual cues, participants responded more favorably to the computer whose personality matched their own (Moon & Nass, 1996). Dominant users preferred a dominant computer that displayed greater self-confidence and used more assertive language, while submissive users found the interaction more satisfying when the computer used tentative language expressing lower self-confidence.
Emotional intelligence, anthropomorphism, humanity, politeness, human etiquette, humor, and gender are important variables to consider when designing a CA because they are crucial for how users perceive it (Callejas et al., 2011; Xiao et al., 2005; McTear et al., 2016). However, user profiles are still rarely considered in the design of CA personalities, leading to low-quality interactions between CAs and users.
Designing CAs involves balancing human-like attributes with functionality to create effective and ethical interactions. The integration of AI and attention to ethical issues, such as anthropomorphism, are essential for the successful adoption of CAs across various contexts. Thus, in this paper, we question what role and tone should the avatar have to conform to the brand's communication performance requirements? What personality should the avatar adopt to meet user needs for emotional acceptability?

3. Hypothesis

In human interaction, we use several social cues that dictate our behavior and how we are perceived by our interlocutors. Fogg (2002) proposes that there are five main social cues:

1. **Physical:** Face, eyes, body, movement
2. **Psychological:** Preferences, humor, feelings, empathy
3. **Language:** Interactive use of language, spoken language, language recognition
4. **Social Dynamics:** Turn-taking, cooperation, praise, answering questions, reciprocity
5. **Social Roles:** Doctor, teammate, adversary, teacher, pet, guide

Our social interactions are dynamic. We reflect on and modify our behavior regarding our conversation partners. Our social role is another important factor that influences our behavior in different situations; we act differently if we assume the role of a parent than we would as a friend. We hypothesis that aligning the CA’s personality traits with social interaction principles will lead to more intuitive and ethically responsible AI-human interactions.

4. Designing the personality framework

Designing an effective and ethical personality framework for Conversational Agents requires a deep understanding of both users and brand identity. This framework must be rooted in user research, identifying their needs, frustrations, and expectations, while aligning with the brand’s mission, objectives, and values.
We believe that structuring the CA’s personality around four key components, designers can ensure an intuitive, user-centered, and ethically responsible AI interaction.

4.1. The four key components of the CA personality framework

Brand Mission, Objectives, and Values
To ensure consistency and coherence in user interactions, the CA's personality must align with the brand's identity. This involves analyzing and defining:

- **Mission Statement:** The brand's overarching purpose and goals.
- **Core Values:** Principles that shape how the brand interacts with users.
- **Tone of Voice:** The style and manner in which the brand communicates across platforms to maintain a consistent and familiar user experience (Cummings, 2017). A well-defined tone of voice helps users perceive the CA as an extension of the brand, fostering trust and engagement.

Understanding Users and Their Needs
A user-centered approach is fundamental to designing a CA personality that meets expectations and enhances interactions. Understanding users involves:

- **User Research:** Conducting primary and secondary research, including semi-structured interviews, surveys, and ethnographic studies.
- **User Personas:** Developing detailed personas based on research findings to summarize users' motivations, frustrations, and specific needs (Benyon, 2014).
- **User Scenarios:** Mapping out realistic interactions that the CA will handle to ensure it provides value and solves user pain points. By grounding the CA's design in user research, designers can create a personality that feels intuitive and empathetic.

Defining the Role of the CA
The CA's role dictates its expected behavior and personality traits. A well-defined role ensures:

- **Task Relevance:** The CA's function aligns with user expectations and brand goals.
- **Behavioral Expectations:** The CA exhibits behaviors appropriate to its role. For instance, a customer service CA must exhibit patience, helpfulness, and professionalism (Burge, 2016; Lipcamon, 2013).
- **Technical Considerations:** The CA's AI capabilities, NLP features, and API integrations influence how effectively it fulfills its role. Defining the role helps maintain consistency in interactions and user engagement.

Selecting an Appropriate Personality Model
To structure the CA's personality, a well-established framework is necessary. The **Big Five Personality Model** (OCEAN) is a widely accepted model for mapping personality traits and is particularly useful for linguistic interfaces (John & Srivastava, 1999). This model includes:

- **Openness:** Creativity, curiosity, and adaptability.
- **Conscientiousness:** Organization, reliability, and responsibility.
- **Extraversion:** Sociability, enthusiasm, and assertiveness.
- **Agreeableness:** Friendliness, empathy, and cooperation.
- **Neuroticism:** Sensitivity to stress and emotional stability. Each CA personality is designed by adjusting the balance of these five factors to match the brand identity and user needs.

Implementing and Testing the CA Personality Framework
Once the framework is defined, testing and iteration are crucial to refine and validate the CA's personality. This involves:

- **User Scenario Testing:** Evaluating how well the CA responds to real-world interactions.
- **A/B Testing:** Comparing different personality configurations to determine the most effective approach.
- **Feedback Loops:** Gathering user feedback to continuously optimize the CA's

personality. Through iterative testing, designers can ensure the CA delivers a seamless, engaging, and ethical user experience.

By integrating brand identity, user research, role definition, and personality modeling, the proposed framework provides a structured approach to designing CAs that enhance user interactions while maintaining ethical considerations. This methodology ensures that CAs are not only functional but also foster trust, engagement, and positive user experiences.
quotations within the text should be marked with double quotation marks: Lawson also has a broad understanding of design when he mentions: “Professional designers such as architects, fashion designers and engineers” (Lawson, 2004, p.5). Longer quotations of more than one line should be formatted as below, again within double quotation marks:

4.2. Designing a support tool for designing CAs

Based on the Big Five model, we have defined specific archetypes that brands can use as references. To achieve this, we drew inspiration from the MBTI test and its 16 archetypes, adapting them to the Big Five framework. We also renamed the archetypes to better align them with virtual assistant personalities.

Each archetype is characterized by a dominant personality trait from the Big Five. Each archetype has its own unique characteristics. It can be described through multiple categories that help designers create a virtual assistant that closely aligns with its personality. These categories serve as guidelines to ensure coherence in the assistant's behavior, tone, and interaction style. To structure the tool, a decision tree was developed based on the classifications to provide recommendations and suggest one or two archetypes that best match the responses given during the research protocol.

Steps of the Decision Tree:

1. **What is the context of use?**
2. **What are the main assistance traits?**
3. **What are the primary motivation traits?**

This structured approach helps designers select the most suitable archetype for their virtual assistant, ensuring alignment with user expectations and brand identity.

How It Works:

1. **Structured Questionnaire:** Designers check the boxes that best describe the assistant’s context, traits, and motivations.
2. **Automated Recommendation:** Based on the selected criteria, the tool suggests the most fitting archetype(s).
3. **Customization Options:** Designers can refine the recommendation to better match specific needs.

This approach simplifies the design process, ensuring that the virtual assistant’s personality aligns with user expectations and brand identity.

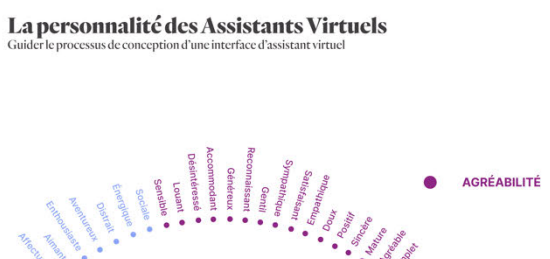

Figure 1. The design framework serves as a synthesis of the methodology needed to define the ideal archetype for a virtual assistant. By simply selecting the relevant options, the tool can recommend the most suitable archetype

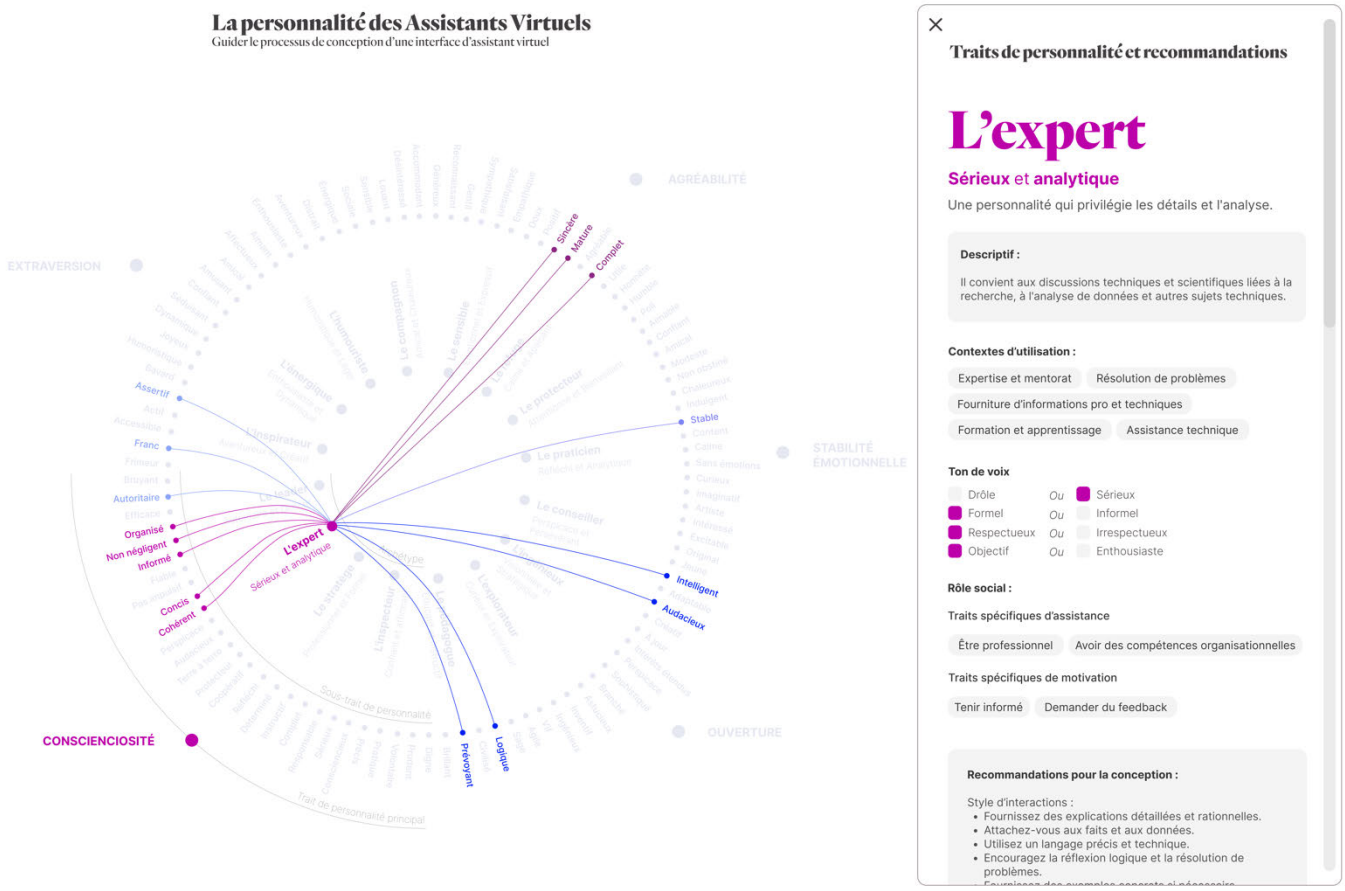

Figure 2. The archetype sheets compile all the essential elements needed to design a virtual assistant that aligns with the recommended archetype from the design framework. **Contents of an Archetype Sheet: Tone of Voice:** Defines the assistant's communication style (formal, friendly, authoritative, etc.).; **Social Role:** Outlines the assistant's function in user interactions (guide, advisor, companion, etc.). ; **Personality Traits:** Highlights key characteristics based on the Big Five model. ; **Design Recommendations:** Provides guidelines on dialogue flow, interaction style, and adaptability.

By using these sheets, designers can ensure consistency and coherence in creating a virtual assistant that embodies the chosen archetype effectively.

4.3 Design used case

We then conducted a workshop to hypothesized different use case to test this framework.

CAs for healthcare: While the AI improved patient adherence to treatment, feedback indicated the risk of emotional dependency, highlighting the need for clear disclaimers on the system's limitations. This emphasizes the importance of transparency and user education in healthcare applications to prevent over-reliance on AI systems.

CAs for education : An AI tutor, designed with an extraverted and agreeable personality model, led to increased student engagement. However, ethical concerns emerged about the potential for AI to replace human instructors, underscoring the importance of balancing AI with human interaction. AI in education should complement, rather than substitute, human teaching, ensuring students benefit from both human and AI elements.

CAs for customer service : A customer service CA, incorporating conscientious and agreeable traits, received positive feedback, with users reporting higher satisfaction. However, transparency issues arose, prompting adjustments to clarify the AI's decision-making process. Ensuring transparency in AI operations is vital to maintaining user trust and satisfaction in customer service environments.

5 .Discussion

Anthropomorphism in AI design is often motivated by the desire to enhance user experience. Human-like interactions make AI-driven conversations more intuitive, engaging, and relatable. Studies indicate that users perceive anthropomorphic agents as more credible and approachable, leading to increased satisfaction and cooperation (De Visser et al., 2016). By incorporating human-like traits such as empathy, humor, and politeness, CAs can create a more positive and memorable user experience. For instance, CAs like Apple's Siri and Amazon's Alexa have been designed with distinct personalities that reflect their respective brands, making interactions more enjoyable and fostering user loyalty.

Despite these benefits, the anthropomorphization of AI introduces several ethical dilemmas:

- **Trust and deception:** Users may develop an exaggerated sense of trust in CAs, potentially leading to misinformation or manipulation. The human-like appearance and behavior of CAs can create an illusion of understanding and reliability, which might not always be warranted given the limitations of AI (Nass & Moon, 2000).
- **Psychological dependency:** Vulnerable populations, including children and the elderly, may form unhealthy attachments to AI entities, leading to emotional reliance. This psychological dependency can have negative consequences, such as reduced human interaction and social isolation (Sharkey & Sharkey, 2012).
- **Privacy and data exploitation:** Anthropomorphic AI may encourage users to disclose personal information under the false impression of human-like empathy. This raises significant privacy concerns, as sensitive data could be exploited for commercial purposes or fall into the wrong hands (Zuboff, 2019).
- **Bias and discrimination:** Human-like AI systems risk perpetuating and amplifying societal biases embedded in training data. If not carefully designed and monitored, CAs can reinforce stereotypes and discriminatory practices, leading to unfair treatment of certain user groups (Noble, 2018).

These ethical challenges underscore the need for responsible AI design practices that prioritize user

well-being and fairness. Designers and developers must be vigilant in addressing potential harms and ensuring that CAs operate transparently and ethically.

While the anthropomorphization of CAs can significantly enhance user experience, it also necessitates careful consideration of ethical implications. By adopting a user-centered design approach and adhering to ethical guidelines, it is possible to create CAs that are both effective and responsible. It opens question that should be tackles by interdisciplinary teams of researchers in design, phychology, cognitive science to assess questions such as : should technology be designed to replicate human experience and emotional expressiveness ; Does personality type influence the preference for affective personal assistants? Does interaction with an emotionally aware agent influence user behavior?
We recognize that we have not yet conducted any evaluated user tests, and we view this as the next step in our research. A continuation of this project will involve evaluating the personality design system to further explore these new research directions.

6. Conclusion

Designing user-centered personalities for Conversational Agents requires a deep understanding of users' needs alongside a careful analysis of the brand's goals and values. The proposed framework, which integrates four core components with the five-factor personality model, provides a systematic approach for developing effective and ethically responsible CAs.

By prioritizing user needs, brand integrity, and ethical responsibility, we can thus create CAs that are not only effective but also trusted and respected by users. Continuous evaluation and adaptation will be essential to ensure CAs contribute positively across sectors like healthcare, education, and customer service.

Value-Driven Healthcare Design: A Card-Based Game for Identifying Design Values in Glaucoma.

Joana Couto da Silva, Inês Silva, Ricardo Melo
Fraunhofer Portugal AICOS, Porto, Portugal
joana.couto@aicos. fraunhofer.pt

ABSTRACT

Values shape human actions and decisions, and technology both embodies and influences these values. Value-Sensitive Design (VSD) is a key approach to incorporating values into technology design but has been criticised for focusing on predefined moral values, limiting stakeholder engagement and flexibility. This is especially relevant in healthcare, where technologies are often reappropriated for unintended uses, leading to reinterpretations of designers' original intent. This poster presents a card-based methodology for identifying and reflecting on values in glaucoma diagnosis and treatment. Developed from interviews with ophthalmologists and co-designed with researchers and designers, the tool uses **value and scenario cards** to facilitate discussions on how values shape clinical practices and influence technology design. Tested in interdisciplinary workshops with ophthalmologists, HCI researchers, designers, data scientists, and philosophers, the method promotes **dynamic value prioritisation and bottom-up value elicitation**, ensuring healthcare technologies better align with diverse user needs and guiding the design of speculative prototypes.

OBJECTIVES

Healthcare technologies embody implicit value systems that shape clinical decision-making and patient experiences. However, these values evolve dynamically through interactions with technology, often in unforeseen ways (Manders-Huits, 2011; Van Der Weij et al., 2023). While VSD provides a structured approach to embedding values in design, it struggles to capture **emergent values** — values that arise during use and may not be adequately captured by predefined lists (Borning & Muller, 2012; Le Dantec et al., 2009).

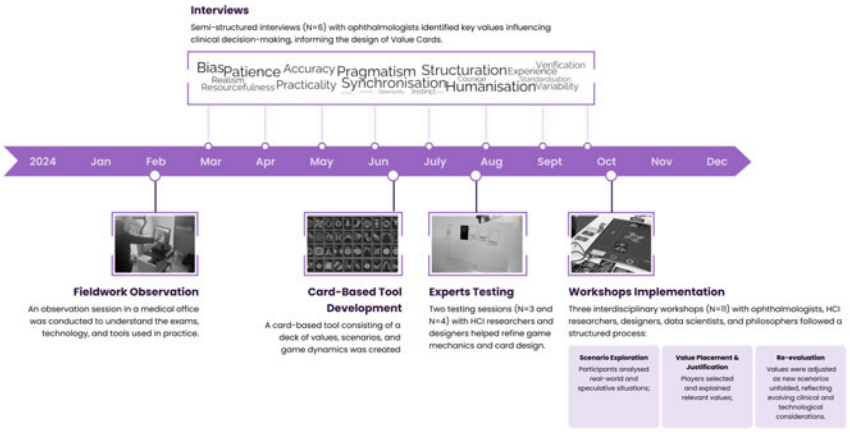
Technology can embody values and shape human behavior (Flanagan et al., 2008), making it necessary to develop **adaptive, stakeholder-driven methods** that capture evolving values in real-world contexts. The rise of AI further complicates this challenge, necessitating more context-sensitive methods for value identification (Umbrello & Van De Poel, 2021).

This project seeks to develop a **participatory method** to identify and reflect on values in glaucoma diagnosis and treatment. By integrating **ethnographic inquiry and participatory design**, we explore how values influence technology use and clinical decision-making. The project also examines **how AI-driven decision-support tools can better align with the values of ophthalmologists and patients.**

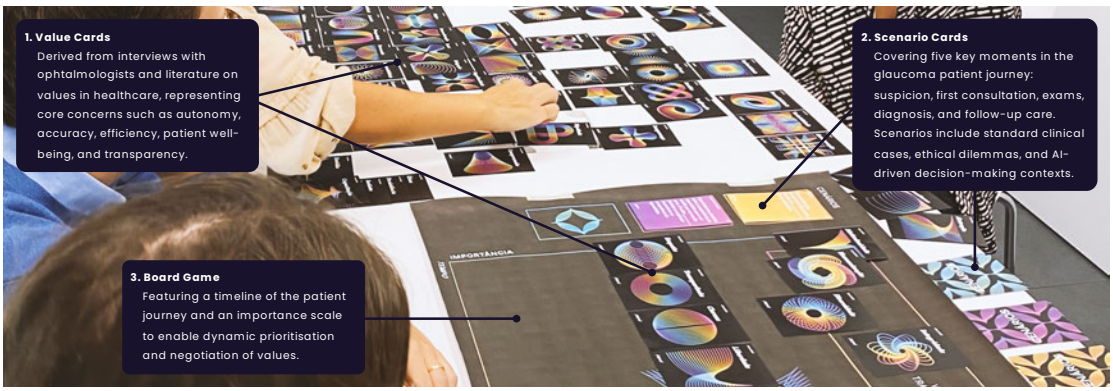
METHODOLOGY

The methodology involved developing a **card-based tool** informed by **ethnographic research, expert validation, and participatory workshops** to explore values in glaucoma diagnosis and treatment.

The following timeline describes the phases and activities of research, design, assessment and implementation of the game.



OUTCOMES



Key insights included: 1) **Tensions between efficiency and patient-centered care** in glaucoma treatment; 2) **Concerns about transparency and trust** in AI-driven decision-making; 3) **Differences in value prioritisation** among stakeholders.

The game facilitated **discussions on value trade-offs**, promoting bottom-up value identification and mapping stakeholder priorities. These insights inform the development of **AI and decision-support tools that align with real-world clinical practices and ethical considerations**.

ABSTRACT | **Twenty-five years ago, starting a journey into sustainable product design to address product obsolescence, the answers to complex sustainability challenges, including regenerative design or a Mutualistic Society, were difficult to come by. Today, solutions can be found through the study of Permaculture Design, thanks to the movement's founders Bill Mollison and David Holmgren. In the 1970s, they promoted harmony with nature by establishing a philosophical system of sustainable living, design and land use founded in ecological energy theory. Following this philosophy, starting in 2008, we began training numerous community members in these practices. However, by 2011 we recognized the need to supply students and communities with perennial edible plants, beyond mail-order nurseries, which have limited availability and sizes, or large national stores that sell well-known cultivars that are unfortunately highly disease and pest-prone in the region. Founding a nursery that would supply perennial plants for food forests, edible landscaping, or public forage gardens in an urban rust belt city of one million people was necessary. Perennials allow the gardener to minimize work while maximizing yield versus high work annual farming or gardening (Hemenway, Gaia's Garden: A Guide to Homescale Permaculture, 2009). This resulted in the launch of a low-cost, not for profit, edible perennial nursery called Growing Value, specializing in disease and pest-resistant cultivars, which includes native plants for the region, increasing urban food resilience with little effort to obtain a yield year after year because it was designed with nature from the start (Jacke, 2005) (Weisman, 2014). From a design standpoint, this was a strategic project to leverage large amounts of change linked to food resilience, giving communities access to perennial edible food sources (Bailey, 2018) that, once planted, either by private individuals or by community-initiated projects, would produce food for decades or centuries depending on the type of food planted, taking pressure off rural lands. This food had the added advantage of being carbon-**

negative after a few years of production to sequester the delivery footprint. Growing Value continues to be leveraged by helping gardeners, farmers, landscapers, community organizations, and even other nurseries learn the proper cultivars and perennial food sources ideal in this region. After fourteen years, tens of thousands of food-producing plants have been sold and planted across the region, addressing food insecurity and increasing access to fresh food for all community members as we move towards a sustainable future. This nursery builds on the permaculture concept that if we have resilience in the most critical aspects of our survival, specifically food and housing then we can break free from the drive to sell another low quality durable good. Through mitigating our exposure to the brittle aspects of our economy, we can design longer lasting products, bringing this journey full circle. This paper highlights how the practice of Permaculture Design has powerful design principles to answer complex sustainability challenges in tackling Industrial culture's brittleness, specifically around food access (Hemenway, The Permaculture City: Regenerative Design for Urban, Suburban, and Town Resilience, 2015).

KEYWORDS | Permaculture Design, Mutualistic Design, Food Resilience, Product Longevity, Regenerative Agriculture

1. Introduction

Twenty-five years ago, starting a journey into sustainable product design to address product obsolescence, the answers to complex sustainability challenges were difficult to come by. Early introductions to working with the homeless while also being introduced to home ownership in the US through mortgages made me very aware of the gerbil wheel we had created. These experiences coincided with my early introduction to Industrial Design and its issues with planned obsolescence. All of this made me keenly aware of the ruthless drive for employment to avoid the threat of homelessness and starvation. We had designed an ecologically destructive brittle society (Diamond, 2011). Around this time, I was also introduced to Earthship homes and their owners who lived debt free with a very low cost of living through building their own Earthships. Earthships are fully off-grid homes made of repurposed tires, cans, and bottles combined with other natural and a few industrially produced materials to create passive solar homes. They capture and store the sun's heat and coolth of the earth through passive solar design, eliminating fossil fuel use. They also incorporate rain water harvesting for their water sources, however as waste equals food, it's recycled to grow plants off the cascading waste water cycles of the house 4x to produce food and to filter the water. Lastly, they employ small solar systems for western comforts such refrigeration, lights and electronic media like computers and televisions. This concept made me realize that one of the best ways to transition a society from destroying itself through ecological failures was through empowering individuals through deep green living. Around the same time, I was introduced to permaculture design. Earthships nested within permaculture's holistic philosophy as they employed many of the same Principles of Permaculture, which are simply a reflection of cooperative ecological principles.

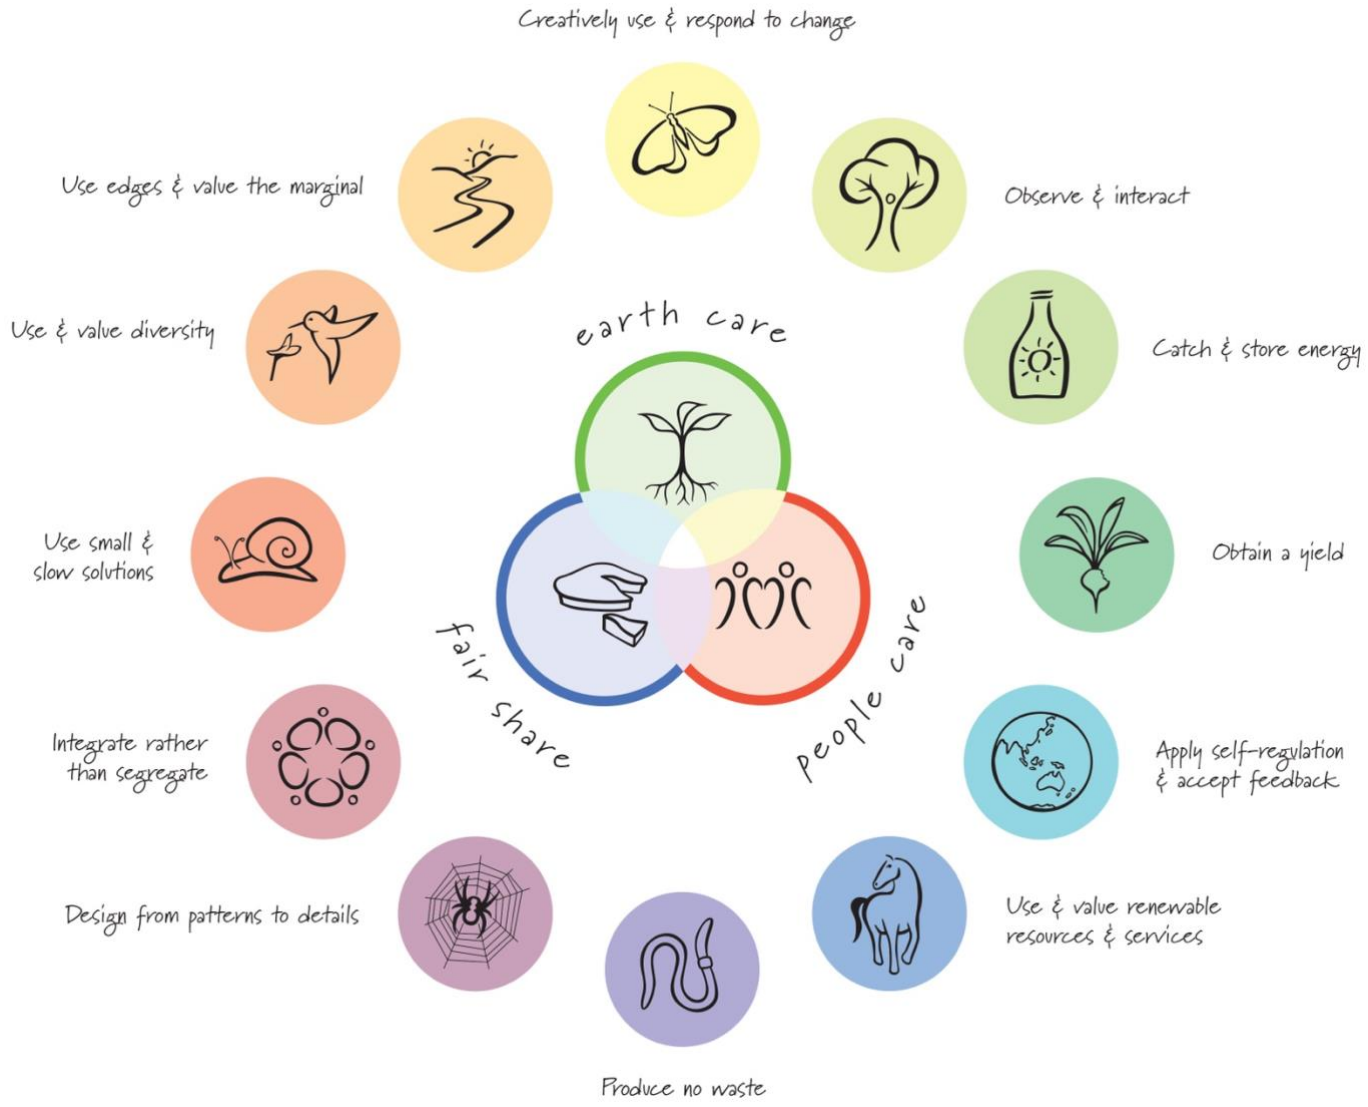

Figure 1: Holmgren's Permaculture Principles and Ethics (Holmgren, 2002).

However, Permaculture expanded Earthships drive for ecological independence through its design principles and methods to create low work, high yielding landscapes surrounding the home. This was achieved through radiating the home user's management capacities out, via interaction frequency, into the yard and any surrounding farm land but also communities, and even nature, to support humanities needs of food, fiber, fuel, fodder, pharmaceuticals, and fertilizers (Jacke, 2005). This was all while supporting native flora and fauna's needs, all to help us break free of unsustainable industrialized methods. Its ideal aim was to be as ecologically independent from Industrial societies' destructive ways through working with nature and enhancing it. After attaining my Permaculture Design Certification (PDC) by its founders I began to train others in my hometown. This was received well, and after 2 years and 60 graduates of our PDC it became clear that a Nursery was needed. A Nursery was a key leverage point that could create the 'greatest change for least effort' (a Mollison permaculture principle that's reflected in its foundations of 'eco'-systems design) that was low cost and attainable to move society towards this vision of ecological integration. There are many other ways to implement this permaculture vision, such as how the Earthships are doing it, or accessible green energy, or bike lanes, but they are much more technical, complicated, and expensive, especially in a city, compared to a simple nursery. A permaculture-based nursery was a gap in local sustainable resources in our community's green ecosystem. This was underscored as the nursery grew into a

community staple in a handful of years, helping people to build out low work, high yielding food sources throughout our community. Overtime, it became clear that this was a complimentary strategy to other permaculture aligned strategies to address product longevity through individual and community resilience. If all the people who touched that product's journey to market had this type of ecologically designed resilience into their lives, then that goal could be achieved (Macchindra, 2024). Now it may not address the hyper resource needs of our largest urban cities, but it could address the needs of our midsized cities or ones designed around the automobile, as David Holmgren points out in his book ***Retro-Suburbia: The Downshifters Guide to a Resilient Future***. This paper explores the build out of that nursery and its impact on resilient urban life in a city of 1 million. This is one strategy of Permaculture and case study of Mutualistic Design which can ideally slow non-renewable resource use in product design.

1. What is Permaculture?

To begin, Permaculture is an ethical ecological design philosophy that could be summed up as Human Centered Design meets homesteading or ecological living (Hemenway, The Permaculture City: Regenerative Design for Urban, Suburban, and Town Resilience, 2015). Permaculture is founded in ecological energy theory and the work of Howard T. Odum, who pioneered the quantification of the ecological footprints of our fossil fueled society (which is simply fossilized carbohydrates) to help us get a grasp of the challenge, one of non-renewable energy (Odum, 1996). It offers design solutions to build a society beyond finite resources through designing with nature. It is founded in Ethics – Earth Care, People Care & Return the surplus to the first two ethics. Followed by numerous Principles created by its founders and added to by countless practicing permaculturists, all to understand and reflect the cooperative principles of nature. Third is the design process, which concisely consists of zoning (human energy radiating out from the home with 5 defined zones, 1 being daily interaction, 2 weekly, 3 monthly, 4 biannually and 5 - the wild ecosystem), combined with sectors (natural energies flowing into a property that can be mitigated or captured, such as sunlight, water or wildlife) and guided by the niche analysis for each element placed on a site (identifying the needs/inputs, yields/outputs and intrinsic characteristics of each element placed in a site, be it a fruit tree, fertilizing plant, livestock, greenhouse, garden or solar panels) to ideally fulfill the users and every elements needs on site through fulfilling ones needs with the yield of another element on site. This creates the development of a self-sustaining habitat for humans through good design processes. In 2006 David shared with me that they produced 60% of their food, 80% of the economic value (implying that staple crops were supplemented) on their 2.2 acre permaculture homestead in Hepburn Springs, Victoria, Australia. David documented much of their first 10 years of implementing permaculture at this site with his family through his 1995 publication, ***"Melliodora" Hepburn Permaculture Gardens: 10 years of Sustainable Living***, proving that this was possible. I will add that while I was there for 10 days, they had plenty of free time throughout the day, despite producing a majority of their food, reiterating its potential.

2. A Short History of Permaculture

To begin, understanding the history of permaculture is to understand the limitations of a society powered by non-renewable energies, for it was developed shortly after the US hit Peak Oil in 1973 and the ensuing malaise in the subsequent years. It was David Holmgren's senior capstone, whom he worked with his Professor, Bill Mollison on. They went on to publish a book together, ***Permaculture 1*** in 1978. David told me in 2006 that he

envisioned agriculture synthesized with ecology through design thinking. This was reiterated in ***Permaculture One***, on page one paragraph 2:

> "Perhaps we seek the Garden of Eden, and why not? We believe that a low energy, high-yielding agriculture is a possible aim for the whole world, and that it only needs human energy and intellect to achieve this." (Mollison B. &., 1978).

David said that he went on to live it, as he wanted to prove that it could work, hence why he didn't have another major contribution to the field through publications for another 17 years. Yet, Bill went on and published ***Permaculture Two*** a year later, expanding on these initial ideas. He acknowledges 'fruitful' conversations with several people including, Keyline Design inventor, P. A. Yeoman and Industrial Designer and author of ***Design for the Real World***, Viktor Papinek in his second publication (Mollison B. , Permaculture Two: Practical Design for Town and Country in Permanent Agriculture, 1979). In later publications, they went on to expand these ideas to sustainable building, living and society, while also validating their ideas through a global network of trained practitioners (Mollison B. , Permaculture: A Designer's Manual, 1988). It really expanded globally through the PDC in conjunction with books and the internet.

It initially gained a lot of momentum in the 1970's during an era of hyperinflation as food grown at home has minimal impact from inflation, which was not exclusive to permaculture. The Ford Administration created the Whip Inflation Now or WIN campaign with one of the most successful New York Ad agencies, which it promoted through advertisements that this $10 gardening set could save you $290 by growing your own vegetables (Rocca, 2023). Permaculture took these ideas to end inflation and built on the '70's back to the land movement and filtered it through these design influences. This shifts the idea of the consumptive lifestyle towards an ecologically productive lifestyle. This is critical in a post-Industrial boom built on finite resources as Industrialization and its outgrowths such as planned obsolescence are only viable if resources are cheap and abundant. It also begins to rebalance the transition from 90% of Americans being employed as farmers in 1790 to less than 1% still being employed in the field – resulting in a brittle Industrialized culture (Trauth, 2016). It is this dance between brittle industrialized progress and designed resilient sustainable living that permaculture offers to address the formers shortcomings. Ultimately offering a designed path to deindustrialize into a comfortable sustainable lifestyle anywhere in the world but leaving it to the individual and their communities to find that balance.

3.Creating a Permaculture based Nursery

After successfully training a small community through our initial course, supported by 4 fellow trained Permaculturists, this edible landscaping nursery was the best next step to build out the budding community. This nursery was, simply put, built on the ecological principles of a forest, yet with a higher useful yield. This idea is a large topic, and one teacher, now colleague that I reference, Dave Jacke has written a 2 volume, 900-page series on the design of this one topic of permaculture, focusing only on temperate climates. However, he lays out a vision of food production, modeled after forests that, once understood, can translate into several other low work food production models, such as forage gardens, edible landscaping, and regenerative agriculture (Bailey, 2018). There are more condensed books on the topic too, but none built on such extensive ecological research and design processes (Weisman, 2014). One permaculture principle, "We are Nature Working", coined by Permaculture teacher, Penny Livingston Stark, broke me of my

deep ecology training of protect nature as a pristine museum over there and live green in society over here, was critical. This nursery was built off this idea.

Perennials are used because nature primarily relies on perennials (plants that live multiple years) over ruderal annuals that require work each year to make them productive, which modern society is built upon (Hemenway, Gaia's Garden: A Guide to Homescale Permaculture, 2009). Ruderal annual plants are rare in nature, waiting for disturbance to occur, such as a tree falling, so they can quickly capitalize on the available sunlight to reproduce (Jacke, 2005). Annuals are rare in climates with available water and temperatures to generate a forest and thus one of the many reasons to mimic a forest for these designs besides its reduction in work. Our dependence on annualized farming is how civilizations destroyed their soil. This has always been the foundation of civilizations energy sources (both food and otherwise), and thus as tillage each year destroyed their soils slowly over an average 500 years, they ultimately contracted and unraveled (Montgomery, 2007).

If a community is located in a lower producing ecosystem, such as a prairie or desert, (these large settled communities are only possible in a fossil fueled world) then they need to aggregate and concentrate rain and surface water through Keyline design processes to alter the landscape in order to increase its productivity (Shephard, 2020) (Lancaster, 2019). However, even in a rainy climate these Keyline design processes, such as swales, can help low managed food forests survive an extended drought, especially during establishment. Once they are established though, they should operate as closely to a forest as possible, minimizing work and increasing yield.

Food Forests are different than orchards, especially industrial orchards, in that orchards are traditionally designed to minimize nature's impacts through sterilization and then replacing those support networks with industrial inputs, just like industrial annual agriculture. Dissecting a forest and its complex relationships, through ecological science is the foundation of designing a food forest or forage garden. The ethics, principles and design methods that Permaculture employs are reflective of nature's resilient, regenerative and mutualistic aspects that have kept it productive through thick and thin for millions of years. Understanding these processes is critical to build sustainable food and resource development and ultimately economy, which is simply mimicking the system we evolved out of. To think we can develop a better system than from where we came on a limited planet is to our own peril as exemplified throughout history (Diamond, 2011).

4. What design goals do we need for a Permaculture Nursery?

4.1 Plant Architecture & Function to Create Guilds

Jacke's design process is extremely thorough, given the complexities of nature, so we kept it simple for the sake of assisting people to replicate these models, pulling from his trainings and other permaculture sources. Starting with assigning each food forest plant into their architecture and function allowed us to identify what plants we needed to carry. Architecture he bases off the plants mature size, which he breaks into 7 categories:

1. tall tree
2. small tree
3. shrub
4. herb

5. ground cover
6. vine
7. roots.

Some of these layers, such as root and vine can cross over into other layers as its difficult to fit all plants into clean categories, given that evolution is a complex process. For function, he breaks plants into one or more of 5 categories:

1. producers
2. fertilizers
3. habitat for beneficial insects
4. aromatic pest confusers
5. food for pollinators.

Most plants will fit into at least two categories of function, as plants serve many purposes within nature, unlike our monocrop agriculture methods, where we only see and employ them for one yield. This allows the designer to check boxes as they seek to mimic the many roles' plants fulfill in nature to build its resilience and self-renewing productivity. These multiple yields, if designed right, can increase the productivity of each plant, minimizing work for the user. An example might be the placement of a Paw Paw tree and a Box Elder. A Paw Paw tree will produce food for humans and wildlife alike. However, if both are placed in the right location for Time Stacking, the fast-growing Box Elder can provide shade for the young shade loving Paw Paw, relieving sun stress on it, helping it get established. Once the Paw Paw is established the Box Elder can be harvested for timber or fuel wood. Both can provide the yield of shade for a house or shade loving plant on a hot summer day (eliminating the need for energy to cool the building or installing awnings) while their leaf drop in the fall allows the sun to warm the house in the winter. Other yields could be fuel wood, structural wood, medicine, syrup, soil building through its leaves and soil stabilization through its roots, just to name a few. Mollison states that:

> "The only limit on the number of uses of a resource possible within a system, is the limit of the information and the imagination of the designer" (Bill Mollison, 2011)

There are many other design processes that Mollison lays out to mimic those natural systems, but we'll keep it focused on that of the Nursery. Proper placement though, is critical to capture those yields, especially when designing a guild of plants. Jacke defines a guild as *"groups of species that partition resources or create networks of mutual support."* This is the foundation of a food forest on the smallest scale. Each plant is sharing resources through thoughtful design in space and time rather than competing for scarce resources they both need in a given time or space through mindless design. This is a form of Designed Mutualism.

Figure 2: Edible landscaping in Cincinnati modeled after food forest principles.

4.2 Ecosystem Succession

Succession is the process of a field going from bare soil to mature forest over decades. In the Tropics, this process is much quicker than Temperate climates. Jacke explores the ideal horizon that we should aim for in our successional designs quite thoroughly in his book, exploring many different possibilities. Dave identifies that an Oldfield, a temperate climate field that hasn't been mowed in 20 or so years as an ideal model because productivity is at its highest before taller trees begin to shade smaller trees and reducing productivity. Fortunately, as he points out, most of our perennial foods are evolved for this level of succession, including most of our fruit trees like apples, pears, and peaches to name a few. However, we've found that there are cases where sites may afford limited management and thus aiming for a more mature food forest horizon, one that mimics a mature forest is more appropriate. Thus, we also carry taller trees as well, although they

turned out to be much slower sellers due to their time and size commitment for producing useful food or yields, especially in tight urban sites.

4.3 Designing with Succession and Function

By working with natural successional processes of an ecosystem, reflecting one permaculture principle from the west coast of the US, “Work with, not Against”, a lot of work is eliminated. In contrast, disturbing ecosystems through tilling to create annual farms and gardens and thus eliminating competition, most often called ‘weeds’ results in a lot of extra work. Some of this work is bringing in artificial support such as pesticides and fertilizers now that the support networks are eliminated. This reflects the principle of “the intervenor becomes the manager” and thus must rebuild all those connections artificially. A forest thrives without any of those artificial inputs. To mimic that process when designing a food forest, instead of pesticides, plants are selected to provide habitat for predatory insects such as spiders. Fertilizing plants are chosen to replace fertilizer produced by finite natural gas and minerals that are mined. Appropriately bred cultivars of food producing plants that have disease resistance ingrained in their genetics are used instead of common, marketable cultivars for industrial distribution. This all builds and mimics the resilience found in a forest, a well-designed and evolved system through trial and error and collaboration with wildlife and in some places, humans, which eliminates work for the manager through good design.

4.4 Plant Propagation and Breeding

The last piece to learn about plants was breeding, a large topic. Although, since we were buying these plants wholesale for the nursery, this wasn’t as much of a concern. Our primary research came down to identifying and selecting desirable, disease and pest resistant varieties, which we learned about this from land grant universities, extension agencies, wholesaler websites and local experience. This basic knowledge is what we built the nursery out of, each year delving into more and more diverse types of plants to add to our design palette as we learned about each cultivar or varieties of plants that worked in our region to produce low work food.

Figure 2: Jujubes (Ziziphus jujuba) growing in an edible landscape in our region.

4.5 The Benefits and Challenges of Native Foods

Wild, native foods are even better, given their adaptations to the local climate. In the eastern US the First Americans cultivated these perennial, now wild foods, which has only been understood in the last few decades with new archeological understandings of the Americas (Mann, 2011). However, there is not much research on the topic, but much evidence that remains with the diverse native food sources in the Eastern US Forests. Some of those foods include American Chestnuts (almost eliminated from disease that was introduced through global trade), Hickories, Acorns, Walnuts, Hazelnuts, Paw Paws and Spicebush to name a few. Fortunately, these food sources are wild and require no cultivation or inputs to 'Obtain a Yield', another permaculture principle from David Holmgren. To employ these foods though, it requires a shift in western palettes as some may not be that tasty to our sugar and fat adapted palettes while others may be high in tannins which may require alternative processing, such as acorns or persimmons.

Figure 3: Paw Paw Fruit (Asimina triloba) are a flavorful native fruit that grow wild in our forests.

4.6 Chemicals, Soil Microbiology loss and Restoration

Industrial cultivars are typically selected for their appearance, flavor, productivity, and shelf stability, over their disease or pest resistance since fungicides and pesticides are sprayed throughout. These chemicals sprayed on these fields are deadly to the natural microbiology that evolved to support all plants nutrient needs but especially our traditional food producing plants. When they are eliminated, then we must do the work to provide it for them (Jacke, 2005). The energy intensive system of industrial agriculture is a net negative in terms of energy in and energy out and is only feasible for a short time while fossil fuels are cheap due to their energy footprint (Trauth, 2016). Industrial farming undermines the soils and the soil microbiology they are grown on, which has been a vexing problem since the earliest forms of this type of agriculture (Montgomery, 2007). Fungi, which most of our plants depend on in the soils, die off quickly once tilled as it destroys the hyphae network they develop. This wipes out a major ally in the development of nutrients in the soil for plants, which most food producing plants rely on, based on a discussion with Dr. Elaine Ingham years ago. Soils transition from bacterially dominated in deserts to fungally dominated in forests and a balance of the two in between (Jacke, 2005). If a site is being restored, then it is recommended to introduce micro-organisms through aerated compost tea inoculated with a handful of soil from a local healthy forest. This introduces these microorganisms back to the site to initiate the healing processes to establish these low work high yielding food systems.

5. Establishing a 501c-3 Nursery

Our goal was to get low-cost perennial edibles to everyone in the community, especially, those in need. So once Cincinnati Permaculture Institute attained non-profit status through the IRS, we established the nursery under its umbrella. This empowered us to purchase plants with tax exempt status, reducing costs. It also allowed us to access grant funding, which helped to keep our prices artificially low. These prices rivaled the cheapest big box hardware nurseries, yet with more appropriate local cultivars. We were required to charge sales tax though to customers unless we kept sales below 6 events a year, per state regulation. We wanted to increase access, so we are open many days a week for most of the year. This 501c-3 status requires a bit more work than a private for-profit business, but the mission has a leveraging effect over most food access non-profits. This is possible in that for the price of a couple quarts of organic berries, one can plant one berry plant that will produce endless quarts of berries for a lifetime. It can produce dozens of quarts of certain berries within one season. This is true for fruit and nut trees as well, multiplying our non-profit dollars, while reconnecting our community with the land once again, which can have many other benefits as well.

Once the nursery was established, we used our design background to brand it and market it to the public, which has slowly grown over those 14 years. Starting with a small $5000 inventory, we soon grew to $50,000 inventory in 7 years through investing sales and through donations from local foundations that believed in our mission. These foundations believed in our mission because one model we worked on developing was addressing fresh food access through forage gardens for communities plagued with food deserts. The nursery now carries 195 named cultivars of perennial edible bushes, trees and herbs to help students' mimic nature's design of the local ecosystem while producing valuable resources, most specifically food though. This empowered students to plant low work food in their own yards and around the city, building food resilience.

6. Community Expansion

As we trained more and more students each year, different opportunities and ideas came to the forefront and gained acceptance by the public and its leaders. Our first collective public demonstration was headed up by a permaculture teaching colleague who also worked with a local organization that managed 40 community gardens. The city had designated a half-acre parcel in the middle of 3 major roads and a bridge, that was a remnant of urban renewal, as part of its 9 plots for urban agriculture. Unfortunately, it had access issues for farming, such as curb cuts for trucks and access to consistent water. This site was perfect for a forest garden though. So, in 2011, my colleague enlisted the help of our local Permaculture Group for volunteer help to plant it out. This forage garden would be an ideal solution to such a parcel of land. It incorporated swales, or ditches on contour, for passive water harvesting, a common permaculture tool, in conjunction with several different species of perennial foods and support plants, most of which were native wildflowers. This helped it get established despite challenging site factors such as urban heat island effects. After a couple years, those resilience strategies paid off and it was producing large amounts of food for little work, with each tree or bush producing bushels, or tens or hundreds of pounds of fruit, nuts or berries depending on cultivar. This was for little work which included primarily grass cutting and weeding in and around the food forest beds.

Figure 4: A swale holding water in winter for irrigation with caged nut and fruit trees below it at our first public forage garden experiment.

For management, this garden has changed hands several times over the years, mostly through various non-profits as they had the funding and capacity. However, the real anchor has always been a neighborhood steward who lived nearby. They always organized and facilitated volunteer days with those non-profits, maintaining consistency over the years. One element that helped boost the effectiveness of it was integration of signage as well as a brochure (half of it is pictured below) to inform people strolling through what and when to harvest. Most people who do access the site are through the bus stop next to it. This is either through transferring between bus lines or walking between a Walmart 300 meters away and the bus line. It is not an ideal location for access because of the roads surrounding it and residences being at least 100 meters or more away. Yet, it does have that access to those bus lines, which are primarily used by a lower income demographic and thus less access to fresh food due to finances. It also gives us an opportunity to experiment with what works and what doesn't work in terms of plants on free land in the city. Overall, it has been a good learning experience for refining this model.

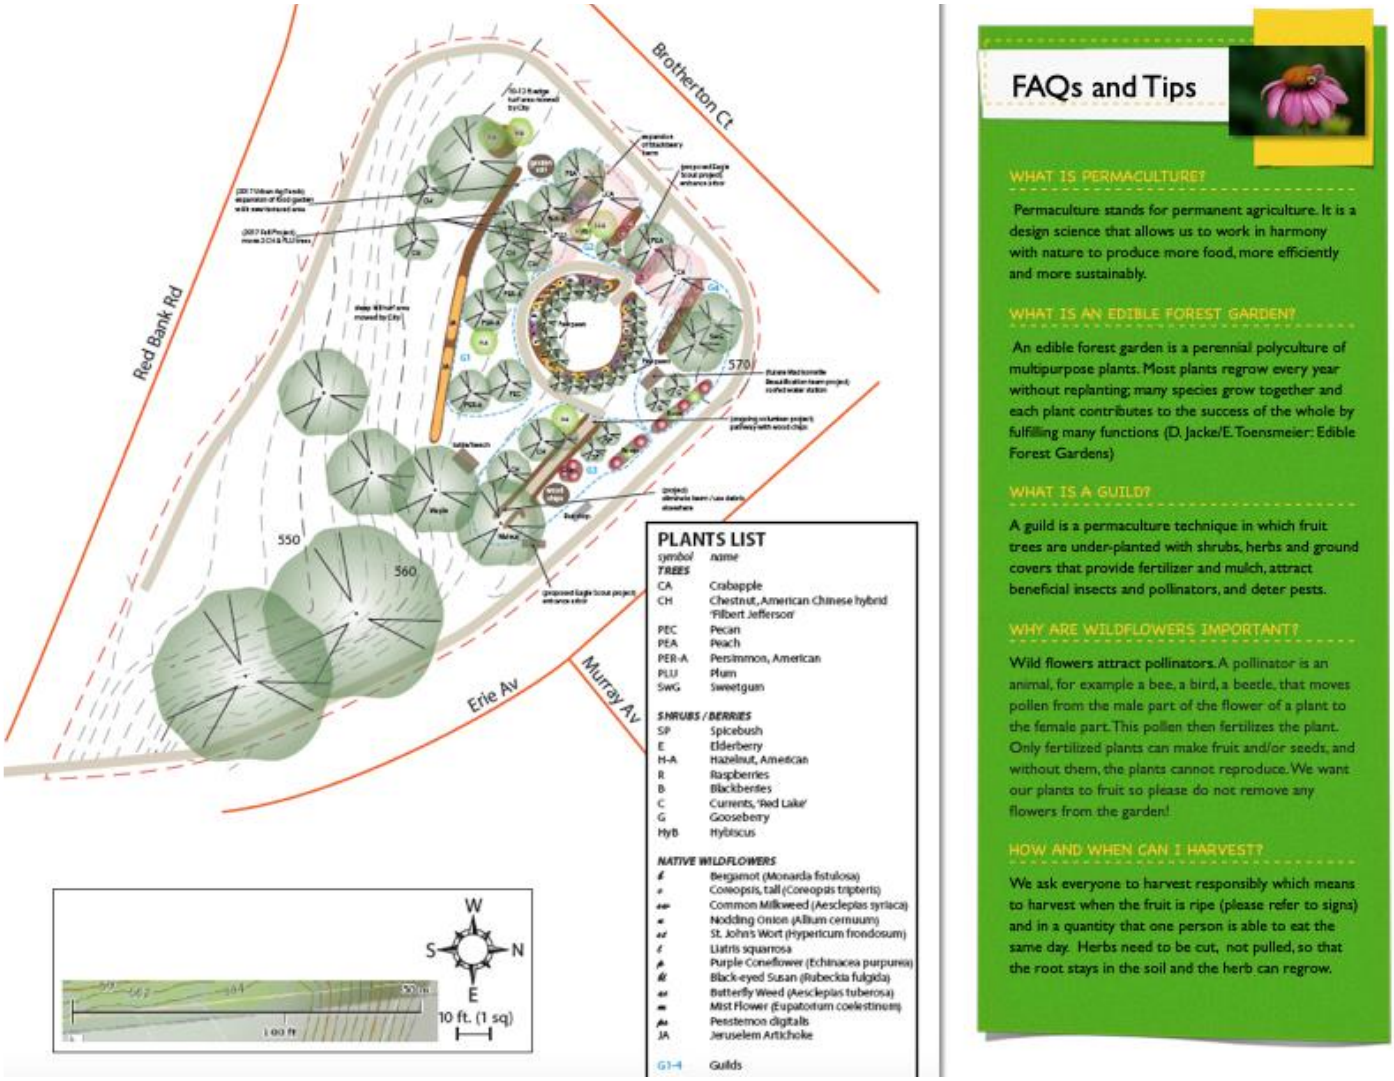

Figure 5: A map from the Forest Garden Brochure laying out where each plant is, along with information about Permaculture gardens

This model was then replicated in 6 different formats around the city. One is a food forest with a longer climax horizon, moving towards a tall food forest of nuts after the smaller and shorter-lived fruit trees have died off. Another is more of an orchard, while one is more like edible landscaping for community beautification. The one commonality amongst these is that they are all in low-income neighborhoods, with less access to resources for beautification or even grocery stores with fresh food. These are all prototypes to increase access to fresh foods, as the poverty diet in America is heavily dependent on low-cost foods that have long shelf lives. This diet is known to have major health impacts and thus underscoring the importance of designing strategies to increase low-cost fresh food access.

These ideas have now been adopted by a new non-profit, Common Orchard Project, who specializes in this topic exclusively, set up by a former permaculture student and teacher of ours. He only focuses on installing low work perennial food gardens around the city.

It has also continued to grow through private endeavors as well. Several students have stepped up to start permaculture based edible landscaping companies. This opened opportunities for students to integrate permaculture landscaping concepts into clients' yards, making it accessible to more of a middle- and high-income crowd.

The last endeavor to expand the impact of the nursery and these concepts has been the

development of Community Food Maps by a colleague. This colleague took it upon himself to document publicly available perennial food throughout different neighborhoods in our city. These have been posted throughout different non-profit locations in each neighborhood as well as online. These approaches are all different ways to build resilience, fresh food access and ultimately mutualistic lives that can slow down and align with the natural productivity of nature and the earth.

These ideas are not exclusive to our community and are being recognized for their potential to address food and resource needs while also increasing ecological activity in our human landscapes. Overtime, these ideas hold a lot of potential to help us transition our cities into higher sustainable productivity (Macedo, 2013). However, having a nursery exploring local perennial food sources accelerates the success of these ideas.

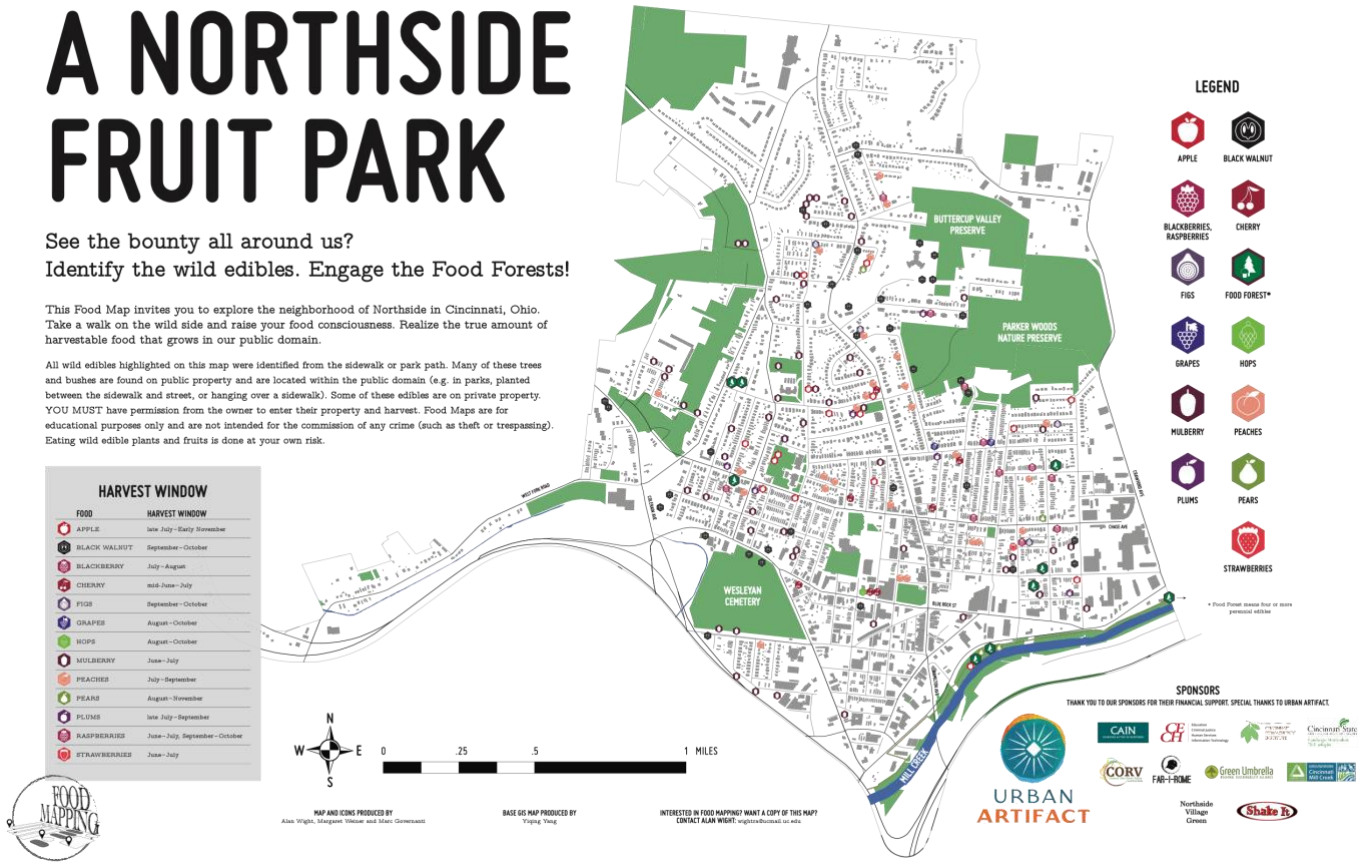

Figure 6: A Neighborhood Perennial Food Map which includes an early public food forest we installed (Wight, 2024)

7. Influencing Product Design and slowing business cycles and consumption through resilient community design

Over time, some of our permaculture students were also industrial design students who, collaborating with one of their permaculture classmates on an idea he had, went on to launch a sustainable product company. However, as they scaled up it became clear that they would become victim of the never-ending struggle for income from product sales unless they embodied the full permaculture ethic, that of designed ecological resilience in their lives. It also underscored that appropriate technology, which their idea was built upon and is a key piece of Permaculture design philosophy, could be applied to

traditional Industrial design. However, if the company integrated permaculture into its employees lives it could liberate or at least reduce the economic brittleness of everyone involved in the products journey to market. Applying the permaculture philosophy liberates humans from the linearly extractive economy. This resolves those deep questions around product obsolescence, a philosophy that was derived out of the Great Depression, an experience that underscored the brittleness of Industrial capitalism (Dannoritzer, 2010). However, to build out the resilience that permaculture aims for requires strategic thinking in how to leverage these ideas into a community. One of the easiest to attain this resilience on a community wide affordable scale was an edible landscape nursery. Working with this start up industrial design company highlighted that there needed to be more guidance, which inspired the next step in building out this vision.

8. Mutualistic Design expansion program

This all led to my Master's Thesis, Symbiotic Design, but renamed to Mutualistic Design; product design through the lens of Permaculture's principles, vision and ecological energy theory (Odum, 1996) to synthesize all these ideas. It is founded in the concept that Humanity is the Planetary Keystone species, destroying or creating ecosystems (Mann, 2011). However, this needed to be accessible and key players in the community needed help to lead and facilitate this change within their employees lives but also into the broader community. Out of this recognition we developed principles and directives, like what Permaculture employs, but more directed at urban communities and wrapped up into what we called Mutualistic Society (Cincinnati Permaculture Institute, 2025). This has been slower to build out as funding and time has been scarce. Nonetheless, it lays out a vision to help accelerate the uptake of these ideas and ultimately build out a Mutualistic Society. Below is the vision and bullet points to build it out.

> We aim to build resilience, independence & mutualism for our city's residents and our bioregional ecosystem through:
>
> - Housing & Buildings:
> - Debt Free Housing
> - Net Positive Water & Energy
> - Food Production
> - Passive food production on low maintained land (relying on perennials)
> - Active food production in high maintained areas (relying on high turnover and high production annuals)
> - Planting of native edibles in urban zone 5
> - Comprehensive Passive water management
> - Passive water harvesting designed into appropriate public & private (not too steep) lands and structures (relying on keyline design strategies to recharge the hydrological cycle and build water resilience)
> - Business
> - Transitioning mature, thriving businesses into worker owned businesses.
> - Collaborating with B Corporations, Permaganic Authenticated
> - Social Justice
> - Access to these concepts to those in need
> - Implementing appropriate accessible technologies to achieve these goals.
> - Developing & supporting cultural events that help integrate & grow the fulfillment of these goals.

This program also includes a graphic, laying out the possibility of this vision. It recognizes the limitations of urban resource production and the increasing potential of resource production as homesites grow as they radiate out from the urban core. Depending on the age of the city, urban cores that were pre-automobile were very dense, yet as the automobile was integrated, yard sizes increased. Our rustbelt city reflects these eras of development, and this graphic reflects that. Based on regional experience, this graphic identifies those yards and farms with 1-5 acres or more have the potential of self-sufficiency and to start supplying the urban core with resource needs. The Nursery aims to support this vison. This is the way cities and towns were always laid out, pre-industrialization. However, finite fossil fuel empowered globalization of foundational resources, including food, and why we must rebuild it.

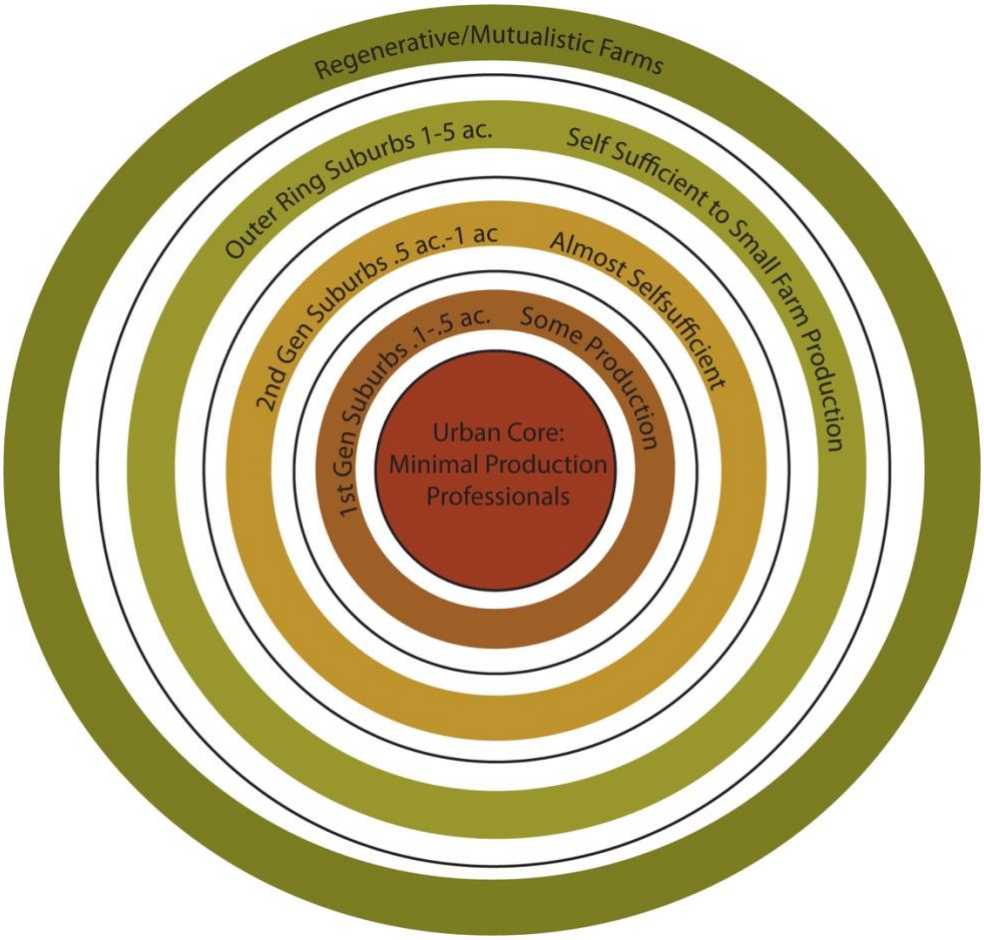

Figure 7: A Mutualistic Design plan for implementing permaculture across urban landscapes (Cincinnati Permaculture Institute, 2025)

9.Conclusion

The roots of planned and perceived obsolescence are rarely identified and talked about due to the complexity of the world we have designed and built in the industrial era. However, answers to these challenges are found through ideas like permaculture and Mutualistic Design. Implementing these solutions have taken years to implement, first to train locals in these ideas, followed by the development of the nursery and then concluding with trials of these various perennial low work urban food production methods. These plantings were experiments that were successful in reclaiming local food

sovereignty after decades of centralized food production through industrialization. These local case studies highlighted that large amounts of fresh food can be functionally produced through these low work processes. Not only were these plants designed and planted in guilds to mimic natural systems in people's yards but also on public and private lands throughout the community. Bill Mollison's quote "The Problems of the World are Increasingly complex, but the solutions are embarrassingly simple" underscores that we can all find our way out of these complex challenges. Fossil Fuel has provided us with incomprehensible opportunities. However, moving beyond its finite, polluting and extremely energy dense realties are an enormous challenge. Fortunately, Permaculture and Mutualistic Design movements give direction on how to design our way out of these complex challenges. We must design products that leverage our capacity to do work, as they've always done, but that also reflect the limitations of finite resources in conjunction with the infinite opportunities of renewable resources of earth.

AN INTERDISCIPLINARY APPROACH TO RESEARCH THROUGH DESIGN AND CONSUMER BEHAVIOR: COMPLEMENTARITIES AND METHODOLOGICAL PROJECTION. APPLICATION TO THE STUDY OF LOCAL CULTURES ROLE IN REDUCING MEAT CONSUMPTION.

Juliette Bretéché

Laboratoire RITM, Universite Paris-Saclay / Food Design Lab' - L'école de design Nantes Atlantique
*juliette.breteche@universite-paris-saclay.fr

ABSTRACT | This article aims to find connections between the two disciplines of design and study of consumer behavior to conduct a doctoral research exploring the role of culture into dietary changes. Reducing meat consumption is one of the major challenges in the transition to a more sustainable food system. In many countries, especially in France, reducing meat consumption faces numerous obstacles. However, this issue extends beyond questions of production and depends on broader systemic factors, particularly consumer behavior, lifestyles, and practices. Indeed, food choices are not rational decisions and are influenced by economic, social, geographic, and cultural factors. The symbolic dimension of food, driven by the eater's food culture, plays a decisive role. The combination of design and management sciences, including consumer behavior, appears to provide a relevant framework for exploring this hypothesis. These two disciplines are complementary and converge both theoretically and practically, as well as the question of their purpose: arising from a consumer society, each hosts movements aimed at improving the "habitability of the world". Theoretical perspectives will emphasize the common characteristics of these two fields regarding their history and purpose, the central position given to the user and the definition of their needs, as well as the major importance of semiotics and representations. On a practical point of view, we will explore the potential contributions of design, particularly as a method of observation and data production. We will examine the designer's sensitive perspective on everyday practices (from

product choice to recipe execution, from the use of utensils to table setting practices and eating manners. Using a research-project approach, we will expose our projected. Finally, we will discuss how design enables innovative research and the production of scientific knowledge in management sciences, as well as in academic research more generally, and how it can offer potential solutions to the current challenges related to food serenity.

KEYWORDS | design research, consumer behavior, marketing research, methodology, interdisciplinarity, project-based research, food design

Introduction

The development of a research project in design raises the question of disciplinary positioning. The interdisciplinarity claimed by designers (Findeli, 2015) can indeed create challenges in defining an epistemological framework. We explore these questions through our doctoral research, which draws on two disciplines: design on one hand, and management and business sciences, specifically marketing and, more precisely, the study of consumer behavior. We attempt to combine these two disciplines in the service of a research project that views local food cultures as levers for the greening of diets. Initially, we will aim to identify the connections between design and research in marketing and consumer behavior. Subsequently, we will attempt to make a broader contribution to the reflection on the contribution of design to academic research by presenting our projected methodology.

1. The combination of design and management sciences

In France, all doctoral work must be registered under a section of the National Council of Universities (CNU). Since design is not a standalone section in the CNU classification, design research is always associated with another discipline. Thus, the doctoral designer typically registers in a discipline closely related to their research topic (historically, design research has mostly been classified under section 18, Architecture, Applied Arts, but it is now expanding into a wide range of disciplines) (Le Boeuf, 2021). This specificity requires a dialogue between design and the discipline in which the doctoral research is registered, in terms of epistemology, theory, and methodology, requiring prior acculturation of the doctoral student with their host discipline (Rapin, Artignan et Fournier, 2024).

1.1 Original definitions and misuse of terms

Marketing and design complement each other, and can be compared on both theoretical and practical, epistemological and methodological levels. Bringing together theory and practice, they take on reflective dimensions and their application through projects. Design and marketing are also two notions commonly misused as qualifying adjectives (Derbaix, 2022). Their definition differs widely depending on whether they are used by the general public or by their practitioners. According to the American Marketing Association, the term *marketing* refers to : "*an activity, set of institutions, and processes for creating, communicating, delivering, and exchanging offerings that create value for consumers, customers, partners, and society at large*" [1]; its common usage describes

[1] Définition of marketing according to the American Marketing Association, 2013, https://www.ama.org/the-definition-of-marketing-what-is-marketing/

manipulative sales practices and the creation of artificial needs (Derbaix, 2022 ; Le Nagard et Giannelloni, 2016). As for the word *design*, in everyday language it characterizes a refined, minimalist style of decoration. Often simplified in a reductive way, these two disciplines can nevertheless enable tangible solutions to contemporary environmental and social issues to emerge. At this point, a brief definition of these two disciplines seems necessary.

Consumer behavior is a field of marketing that studies all the behaviors adopted by individuals to seek out, buy, use and dispose of the products and services with which they wish to satisfy their needs (Schiffman, Kanuk et Wisenblit, 2010) . Here, the consumer is considered in his or her : "*multiple facets and roles*" and "*subject to diverse and constantly evolving influencing factors*" (Clauzel *et al.*, 2016). Studying the role of internal influences (demographic factors, needs, values, motivations and disincentives, attitudes, beliefs and emotions, etc.) and external influences (culture, social factors, situational factors, etc.) on behavior, this field of research borrows numerous concepts and methods from the disciplines of economics, sociology, psychology and anthropology. It is particularly relevant to the field of food consumption and behavior, with food products : "*at the heart of the development of the marketing discipline*" (Aurier et Sirieix, 2016).

Design, as a practice, is defined by the Alliance française des designers as an intellectual, creative process, the aim of which is to provide solutions to problems of use linked to economic, social and environmental issues[2]. Applied to the context of food, this process is known as food design. This design specialty is characterized by its strong systemic dimension, articulated around four major pillars: food, environment, society and technology (Zampollo, 2017). Design research, for its part, is, according to Stéphane Vial : "*the attempt to make design a scientific discipline*", resulting in the creation of knowledge about the design process itself, but also all areas of : "*human ecology*"(Findeli, 2010 ; Vial, 2015)

1.2 Questioning the purpose of these disciplines considering current social and environmental issues

Design and marketing share questions about their purpose: the fruit of the development of the consumer society, they are now home to trends aimed at transforming society to respond to the urgency of ecological and social transitions. For many years, the search for innovation and the creation of new offerings, the main fuel for these two disciplines, had the sole aim of selling an ever-increasing number of products (Dekhili, Merle et Ochs, 2021). In the 1970s, designers and marketers[3] began to question the meaning and purpose of their disciplines. Victor Papanek's publication "*Design for the real world*" (1971), calling on designers to rethink their mission and aim to improve the : "*habitability of the world*", helped transform practices. The more recent development of care design and public-interest design are good examples of the discipline's renewal. At the same time, the "*Marketing's Changing Social/Environmental Role*" issue of the Journal of Marketing (Kelley, 1971) opened up the question of marketing's relevance in areas of : "*real life - such*

[2] Définition of design according to l'alliance française des designers : https://www.alliance-francaise-des-designers.org/definition-du-design/

[3] In the interest of clarity and fostering a dialogue between the two disciplines of design and marketing, we will use the terms "designers" and "marketers" in this article to refer to the practitioners of these fields in all their diversity.

as poverty, war, racism, environmental degradation…" (Derbaix, 2022). The social marketing movement (Kotler et Zaltman, 1971), then, established objectives that were : "beneficial to society and the environment" [4]. Focusing in particular on social purpose organizations or the non-profit sector (Le Nagard et Giannelloni, 2016 ; Parguel *et al.*, 2018), it develops methods to encourage behavioral change (Gurviez et Sirieix, 2017). These issues are reflected in *Transformative Consumer Research*, a marketing research movement encouraging contributions aimed at improving consumer well-being and quality of life (Mick, D *et al.*, 2012). Today, the French Marketing Association (AFM) includes the notions of : "*sustainability*" and consideration of "*the consequences*" of its practices "*on society at large*" in the definition of its discipline [5] (Le Nagard et Giannelloni, 2016).

1.3 The user, the consumer: human-centered approaches

Design and marketing share an approach centered on the user (for the designer) or the consumer (for the marketer), with the aim of meeting their needs. The study and understanding of behaviors, lifestyles, habits and daily life is the common basis of both disciplines, in terms of both research and practical application. Vocabulary and methods differ, but the approaches complement each other.
Planned obsolescence (the first nylon stockings were very resistant [6]), misleading pricing strategies (promotions), packaging (shrinkflation[7]) and communication (packaging or advertising), or the creation of desires by brands (through minor innovations or systematic renewals of product ranges)… are all deleterious practices, obscuring people's real needs. However, these two fields of study can work together to focus on human beings and the definition of their needs, by applying their theoretical frameworks and methodological tools to the task of adapting lifestyles to environmental and social emergencies. Today, more than ever, they must respond to environmental challenges.

1.4 The study of signs and mental representations: the influence of culture and identity on behavior

The visual and symbolic dimension is crucial in the discipline of design. Distinct from the arts in its : "*applied aesthetic*" dimension (Bauhaus) (Findeli et Bousbaci, 2005), its aim is to offer a response to a problem of use. In this discipline, the search for form and line goes beyond purely aesthetic considerations. By studying signs and taking into account the symbolic power of a shape, an object or, more generally, a system or a social interaction, the designer or marketer can identify possible solutions that will meet the needs of the target user/consumer. When confronted with a stimulus, an individual mobilizes his or her mental representations. A concept stemming from social psychology (Moscovici, 1961), mental representations enable the stimulus to be interpreted (via perception), then categorized according to the individual's mental schema of reference. This cognitive

[6] *Prêt à Jeter,* Documentary, Réalisation Cosima Dannoritzer, Arte France, minutes 35 to 40.

[7] is the term used to define the business practice where the price of a product increases or remains the same, while the quantity sold decreases (*Shrinkflation : obligation d'informer les consommateurs sur les produits concernés au 1er juillet !* Publié le 07 mai 2024 - Mise à jour le 29 juillet 2024 - Direction de l'information légale et administrative)

process of : "*slicing up the world*" groups objects according to specific criteria, which are then treated in an equivalent way (Tijus et Cordier, 2003). Categorization varies according to human groups, with each culture creating a system of division corresponding to its own environment (Dortier, 2014). Culture itself is defined as information widely shared across a population, taking the form of mental representations (in the brains of individuals), and social representations, (behaviors and various artifacts in their environment) (Sperber, 2005).
Marketing and design can work together, using formal and symbolic codes to convey information and influence behavior (Silayoi et Speece, 2007 ; Thaler *et al.*, 2010). The marketing approach of consumer culture theory considers the ideological, social, cultural and symbolic dimensions of consumption (Arnould et Thompson, 2005). The use of codes and symbols can have an impact on perceptions, interpreted according to the individual's representations (Gallen, 2005). In the food domain, categorization will generate positive or negative attitudes on the part of the individual, and the adoption of a behavior of engagement or avoidance towards the food (Gallen, 2005). Facilitating acceptance of a particular product by, for example, making a new element familiar, or, on the contrary, giving a new dimension to a known element (Voglaire, 2020) are suggested paths to explore.

2.Projection of doctoral research in design and consumer behavior

2.1 Research context: the cultural specificities of food in a context of protein transition

Human food system has a significant impact on both the environment and health (Willett *et al.*, 2019). Reducing meat consumption is one of the major challenges in the transition to a more sustainable food system (González et al., 2020), but translating these intentions into concrete changes is slow in coming. In many countries, and particularly in France, reducing meat consumption is hampered by a number of obstacles. Far from being limited to the question of production (the available supply), this issue depends on a global system, and in particular on the uses, lifestyles and habits of consumers. Eating habits are not rational, and are strongly influenced by cultural factors. The act of eating, by virtue of its recurrence in everyday life, is a privileged medium for social relations, and by extension, culture. Every world's food culture includes a systems of rules, with their food categories, norms and prohibitions, separating what is edible from what is not (Fischler, 1990). Food choices are therefore not simply the result of deterministic logic (availability of a food), but are the fruit of cultural constructs, with their associated representations and imaginaries (Poulain, 2008). The symbolic aspect of food is decisive (Fischler, 1990 ; Rozin, 1988) and eating practices are profoundly shaped by the local cultures of eaters and their migrations (Sanchez, 2009). Eating habits are always made up of subtle cultural mixes, representative of each eater's identity (James, 2003). Meat is a highly valued product in French food culture, and occupies a central place in its gastronomy. At the same time, French people are very attached to the notion of terroir, and to the geographical origin of products and recipes. However, most of the alternative products and recipes to meat available today come from distant culinary cultures, sometimes

unknown to eaters and difficult to integrate into their eating habits. The doctoral research currently underway explores this question and seeks to determine to what extent the eater's food culture can become a lever for acceptance of a less meat-based diet.

2.2 Academic research by design: which contributions?

The practices specific to designers in a research context are plural subject of ongoing efforts of inventory and identification (de Mourat *et al.*, 2015). We are continuing this process through this doctoral work by adopting a designer-researcher posture and implementing various research methodologies and tools. Working on complex objects, in a context of hybridization of disciplines and according to a principle of iteration, also offers new questions for disciplines hosting design research (de Mourat *et al.*, 2015). At the crossroads of design and consumer behavior, the research posture adopted in this doctoral work will also be able to contribute to discussions in marketing research through its singularity and its departure from the discipline's "*dominant paradigm*"(Parguel *et al.*, 2018)[8].

2.3 Project-grounded research methodology

Project research is a methodology for research through design - as distinct from research on design (design as the subject of research) or for design (research prior to a design project) - that is : "*both scientifically rigorous and fruitful for the profession and users*" (Findeli, 2005). It proposes the development of a design project within the research process, leading to the production of artifacts. This production enables the researcher's active participation in the field, and makes it possible to : "*study a research problem through the context of action*" (Gagnon *et al.*, 2021). The aim is twofold: project research enables both a proposed design response to the research question and the production of scientific knowledge.

2.4 Design practice as a method of observation and data production

Various design doctoral research projects have brought to light examples of specific practices creating a dialogue with their host disciplines, notably observation and data production (de Mourat *et al.*, 2015). Here, we will consider the complementarity of design and consumer behavior research approaches. Certain tools are common to both disciplines, such as observation, interviews or visual anthropology, to which design brings an iterative dimension (back and forth between fieldwork and research), enabling research hypotheses to be tested (by means of artifact production) by users.
Following a review of the current state of the art, this doctoral project, based in Bretagne region (France) will focus on identifying specific markers this food culture, with particular attention paid to the place of meat and plant foods. To this end, a logbook will be

[8] Parguel et al. They develop the hypothesis that the dominant norms (Bourdieu, 1976) in marketing research (namely, the focus on organizational performance and the positivist research paradigm – using statistical tools, seeking objective and context-free knowledge…) propagated in pre-doctoral and doctoral teachings, and shaping the criteria for publication in the leading journals of the discipline, explain the slow and limited emergence of the social perspective in recent marketing research.

distributed to participants. For three weeks, this diary, to be filled independently by participants, will aim to collect data their daily food practices, using graphic tools to make it easier to fill in the information. Following the analysis of these notebooks, we plan to conduct interviews and observe participants in their homes, including during the preparation of a Breton recipe. Photography, drawing and audio recordings will be used to draw up an inventory of the ingredients and their provenance, the utensils and tableware (crockery, textiles, etc.) owned and used by the participants, their daily and festive recipes, and related gestures, tips, stories and anecdotes. Interviews will also be conducted with various professionals connected with the region Bretagne and the subject of diets vegetalization (chefs, producers, heritage managers…). Using a research-project methodology, we plan to produce tangible artefacts (recipes, utensils, tableware featuring markers of Breton food culture) to be tested in situations with users. The aim of these situations is to produce data (collection and recording of tests and user reactions = video/audio/textual/illustrated transcriptions, etc.). Here, the designer can particularly apply his creative and sensitive skills, proposing new angles of observation. He or she is also able to develop tools adapted to the participants and the context, in terms of form and content, for observation and data collection. The restitution of this data, and more broadly of this research work, is envisaged in different formats, (edition, exhibition…) enabling communication to different publics.

2.5 Projecting research design

Chronological projection (Figure 1)

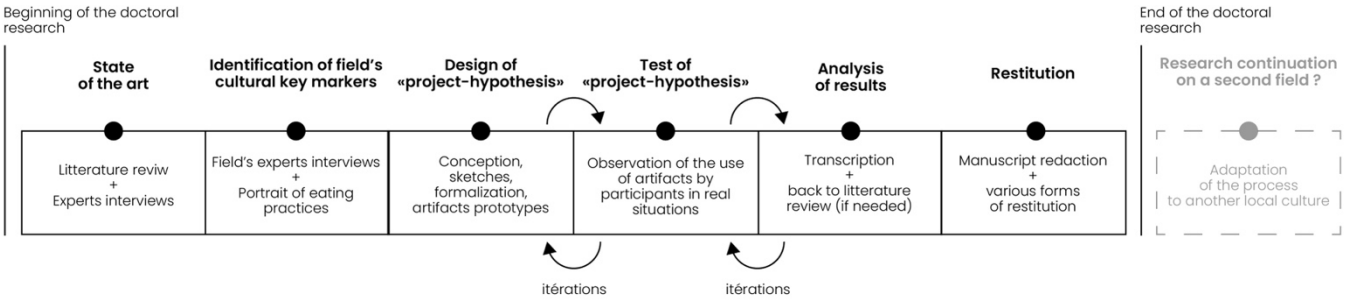

Figure 1. Chronological projection of the doctoral research.

Projected methodology by activity type, objectives and tools according to the matrix of (Gagnon *et al.*, 2021) :

Activity type	**Description**	**Objectives**	**Tools**
State of the art	> Littérature review > Expert's interviews on the topic of cultural identities and plant-based	> Identify challenges, barriers, and drivers > Analyze the influence of local cultural identity on	> Reading articles and publications in the fields of marketing and design, and social sciences at large > Interview guides

	transition of diets	eating practices	> Audio recording and interviews transcription
Bretagne's food culture markers identification	> Expert's interviews on the topic of Bretagne's culture > Survey of eating habits and interviews	> Define a current portrait of eating practices in Bretagne > Identify key markers in eating practices	> Interview guides > Food diary / logbook > Audio recording and interviews transcription > Photographing fridges and cupboards of participants
Design of food « project-hypothesis »	> Project design (artifacts)	Formalisation, making pathways tangible	> Sketches, prototypes
Test food « project-hypothesis »	> Presentation of artifacts to participants and observation of usage	> Test design projects in real usage situations	> Observation > Interview guide > Audio recording and interviews transcription
Analysis of results and writing	> Identification of theoretical, methodological, and managerial contributions > Manuscript writing	> Transcribe and present the research process and results	> Manuscript > Graphic visualization of the process and results

Conclusion

Throughout this doctoral research, epistemological and methodological questions have emerged from the intersection of the disciplines of design and consumer behavior. We have attempted to highlight the points at which design and marketing converge: questions regarding their respective purposes, the central role of the user/consumer, and the importance of perceptions, representations, and identities—particularly cultural ones. These commonalities between marketing and design suggest the possibility of future epistemological and methodological contributions. Moreover, the integration of design and marketing (more specifically, consumer behavior) appears to provide a relevant framework for exploring these hypotheses.

This research aims to contribute to the ongoing reflection on the role of design within academic research, following in the footsteps of designers-researchers. We also intend to examine the contributions of this unique posture to the broader debate on the environmental and societal purposes of marketing research. It will be essential to analyze the extent to which the disciplines of design and marketing intertwine within this research process, and to identify the respective contributions of each discipline, as well as the value and characteristics of their synergy. Care must be taken not to compartmentalize the approach by relegating marketing research to literature reviews and qualitative

interviews, and design to projects development. Instead, we aim to pursue a genuine hybridization of these two fields, while remaining open to insights from across the social sciences and humanities—anthropology, sociology, psychology, history, and beyond.

ATTUNING TO THE DESERT: SITUATED DESIGN EDUCATION THROUGH THE LENS OF ARIDITY

Gionata Gatto[a], Andrea Macruz*[b],

a School of the Art Institute of Chicago
b Parsons School of Design | The New School
*macruza@newschool

ABSTRACT | The paper discusses the work developed during an undergraduate design course, where students were asked to explore the relationship between product design and a given environmental context in the UAE. It aligns with the "Regenerative City and Territorial Development" track by providing theoretical and practical insights into the connections between materials, production processes, and the ecological and socio-cultural context in which they exist or take shape. The methodology primarily involved a three-step design process: (1) Sensory Ethnography, (2) Data Visualization: Mapping as World Sense-Making, and (3) Prototyping: Making as Synthetizing Knowledge. Field work involved site visits to the Al Qudra desert to understand local ecology, resources, and environmental challenges. Students conducted ecological mapping and sampling, and temperature measurements while studying Bedouin culinary traditions for insights into sustainable practices. During the course, students were asked to deliver a data visualization mapping the relationships observed on-site, which informed the development of a concept, followed by prototypes of various sizes and materials, and ultimately a finalized design. The outcomes of this research are presented through four distinct student projects—cooking devices, utensils and experiences developed to function in a desert environment—each exploring a unique speculative approach to integrating ethnographic environmental research with design practice. The work also includes a booklet of new recipes, based on the

student's understanding of local ingredients and traditional methods. They were chosen to represent the best practices from each group, and as empirical evidence for developing an initial methodological framework to be used in contextual environmental design research. The results show that incorporating a situated approach to design, along with digital tools and fabrication, can help develop design work that is not only connected to the environment but also benefits from its settings. The paper also explores how anticipating the contextual use of heat can inspire alternative energy systems for disadvantaged areas, while addressing ecological and social challenges by integrating environmental sustainability and cultural preservation, to develop resilient and equitable solutions for urban and territorial transformation.

KEYWORDS | DESIGN EDUCATION, SITUATED DESIGN, DIGITAL TECHNOLOGIES, DESERT COOKING, ENVIRONMENTAL THINKING

1. Introduction

> "Water, water, water.... There is no shortage of water in the desert but exactly the right amount, a perfect ratio of water to rock, water to sand, insuring that wide free open, generous spacing among plants and animals, homes and towns and cities, which makes the arid West so different from any other part of the nation" (Abbey, 1968).

This paper explores how design education can respond to ecological and social challenges through direct engagement with arid landscapes. Focusing on a second-year undergraduate studio taught at the Dubai Institute of Design and Innovation (DIDI), it examines how students learned to design *with*, rather than for, a desert environment—drawing on local materials, environmental processes, and community knowledge to inspire sustainable, situated design practices (Blanco, 2022; Attia, 2016; Sardana et al., 2024).

When imagining the desert, dominant narratives often evoke vast, pristine territories—spaces of absence rather than presence. In contrast, this course proposed to rethink the desert as a socio-technical environment, whose settings are shaped by context-specific ecological rhythms and modes of cultural adaptations. Drawing on insights from ecological design, postcolonial theory, and more-than-human ethnography, we encouraged students to move beyond deficit-based thinking and engage with the desert as a rich, complex, generative environment.

The studio course, titled *Materials in Human Experiences*, invited students to research portable solar-powered cooking devices, tools, experiences and food recipes for deployment in a desert setting. Each team contributed to a larger collaborative effort, exploring speculative design ideas for a desert ecosystem. What began as an apparently simple prompt— to design a cooking device for the desert— opened other, deeper questions: how do we cook without access to water

or fuel? What forms of knowledge are embedded in local traditions? How can environmental forces such as sun, sand, wind participate in the design process? Students engaged in fieldwork at *Al Qudra*, a sandy desert located 30 km from the center of Dubai, where they studied adaptations to environmental constraints—high temperatures, vegetation, and animal species. Through mapping, multisensory ethnography, and prototyping, they were asked to read the desert as an ecosystem subjected to a multiplicity of relational agentic forces.

This paper explores how environmentally situated design pedagogies can challenge universal design paradigms and foster more plural, context-responsive futures. By negotiating between environmental constraints and cultural affordances, between technological possibilities and ecological boundaries, the course repositioned design as an act of listening, attunement, and negotiation, and framed it not just as a set of outcomes, but as a way of engaging with the world.

2. Reframing Aridity

Scholarly work in the field of Ecosophy suggests that the human failure to perceive our interconnectedness with the environment stems from a culturally and socially constructed separation of the self from the rest of the world (Næss, 1973). Norwegian mountaineer-philosopher Arne Næss argued that genuine ecological care only becomes possible when we transcend an individualistic, ego-centered view of the self and embrace an eco-self—one that is embedded within and responsive to broader ecological relationships. This position fosters the capacity to think like—and care for—nonhuman others. Such a shift in worldview has been explored through the lenses of Multispecies Ethnography (Kirksey & Helmreich, 2010; Ogden et al., 2013), More-Than-Human Design (Giaccardi & Redström, 2020; Gatto & Cadamuro, 2021), Bio Design (Myers, 2012) and Eco Design (Fallan, 2022). These fields challenge anthropocentric design paradigms and advocate for a mindset that sees all living and non-living entities as relational forces within ecological systems. Even fields like sport and outdoor, saw the developed of clean climbing equipment—like the hexcentric nut (Fallan, 2022)—designed to account for and respect the rock, avoiding damage to its surface:

> “Make the rock happy - use a nut. To place a nut, you must begin by thinking about the shape of cracks. Right from the start clean climbing demands increased awareness of the rock environment” (Chouinard & Frost, 1972).

Engaging with ecological and social challenges implies inhabiting the real world, becoming part of new relationships that are formed during the experience and shaped by the meanings they produce. Donna Haraway refers to the result of these meaning-making processes as “situated knowledges” (Haraway, 1988). Following Haraway, Simonsen et al. (2014) argue that all forms of design are situated, being based on processes that emerge within specific social settings and are carried out from an "embedded" position (Simonsen et al., 2014, p. 6). Situated knowledges are key to cultivating the notion of eco-self advanced by Næss: by refusing to distance

the knowing subject from what one seeks to know, such form of knowledge emerge from specific pathways and subjective stances, contributing to the formation of relational identities.

The Materials in Human Experiences course departed from an understanding of ecodesign as a universal practice, foregrounding the need to engage with ecological crises through situated, socio-cultural, historical, and lenses (Escobar, 2018; Manzini, 2015). By promoting a relational lens to engage with the desert, the aim of the course was to reframe aridity—not as lack or scarcity—but as a dynamic and resilient state of ecological balance.

From a postcolonial perspective, the desert is not merely a biophysical environment but a cultural and political space, deeply mediated by histories of imperialism. European colonial powers often cast arid landscapes as blank mileux: uninhabited, uncivilized, and thus ripe for occupation and transformation. This imaginary rendered deserts as non-places—deprived of value unless made productive through irrigation, mining, or industrial development. Such epistemologies erased the complex relationships that Indigenous, nomadic, and nonhuman communities had long cultivated with these ecosystems. This logic of ‘terra nullius’—land considered legally unoccupied and available for appropriation—has been used as both a juridical tool of colonialism and a cognitive framework that fed modernist development and design ideologies (Henni, 2022). Architectural historian Samia Henni (2022) has shown, for instance, how the French colonial administration in North Africa framed the desert as both a frontier of conquest and a site of architectural experimentation, fusing military strategy with environmental manipulation. These views have been carried forward into the present day through infrastructural geo engineering projects, mega solar farms, and resource extraction operations that often displace or bypass local ways of life (Henni, 2017).

Design education that engages with desert ecologies must, therefore, confront these colonial inheritances. This means not only recognizing how certain narratives of aridity have served geopolitical and economic agendas, but also actively recovering vernacular, Indigenous, and other-than-human ways of relating to place. The course demanded a move away from extractive logics toward more participatory, attuned modes of inquiry. Students were encouraged to consider solar energy, wind, and material cycles not as resources, but as collaborators in their design work. Approaching design research from a situated, relational, practice-based perspective does not come without concerns. This mode of positioning designers, for instance, contradicts more established traditions of research as a systematic, positivist, inquiry-driven process (Gaver et al., 2022). This also applies to the context of design education, where students are often trained to approach design from a problem-solving perspective within studio or workshop environments—settings that physically and conceptually distance them from the problems they are asked to 'solve.' This separation arguably prevents students from engaging with complexity and fails to expose them to lateral, critical thinking. The question of what implications a situated approach to design might have on

design students—and their capacity to develop relational awareness—remains largely underexplored.

3. Methodological Approach

The class consisted of 3 hours per week, with students divided into teams of 3 to 6 participants. The methodology involved a dynamic exchange of information using various methods and research techniques, allowing students to develop a personal mode of inquiry toward the environment. The course was structured into three interconnected phases: sensory ethnography explorations, data visualization and prototyping.

3.1. Situated Design in Undergraduate Education

Practitioners of situated pedagogy and Situated Learning (Jean & Wenger, 1991) draw on traditions of experiential education to support the value of direct experience within the design process. The brief provided to the class, along with the designated site, outlined the types of designs students could develop, and possible modes of engagement with the geographical area. Between the others, the brief mentioned: portable solar-powered devices for cooking in the desert, tools for preparing or eating food, new recipes based on the use of local ingredients and informed by traditional methods. The expected outcomes were intentionally kept open to avoid prescribing specific directions for the design work.

3.2. Sensory Ethnography

Ethnography (Plowman, 2003; Van Dijk, 2010) and Autoethnography (Lehtonen & Gatto, 2020; Pink, 2011) have become a central practice for design. Doing fieldwork is a valuable mode of active ethnography (Bryman, 2012) as it provides opportunities for unfiltered hands-on experiences where the researcher can observe and frame a personal understanding of a given situation. Sensory Ethnography is the method proposed to students during the first phase of the course. Rooted in phenomenological anthropology, sensory ethnography stresses the multiple ways in which smell, taste, touch and vision can be interconnected and interrelated within field research. The ethnographic session consisted of one main visit to the site, which lasted approximately three hours. Before reaching the site, students split into teams of three and received suggestions about different tactics that could be used to collect evidence of their observations. Apart from traditional approaches involving the use of on-site field notes (Bryman, 2012, p. 447), students were encouraged to engage with experimental practices involving multisensoriality (Pink, 2011); exploring, for instance, the movements of living entities; heat and humidity; sampling on-site materials; collecting environmental audio-visuals evidence; annotating diaries; sketching; and interacting with local dwellers. For all students, this was the first experience of ethnographic research on a site dislocated far away from the University Campus.

3.3. Data Visualization: Mapping as World Sense-Making

By suggesting the employment of Mapping (Powell, 2010) as a research instrument, the objective was to guide students to engage with site-specific research from a visual perspective. Using mapping as a qualitative tool can lead to "evoking the lived experience of social, cultural, and political issues related to place" (Powell, 2010, p. 539). Building on Powell, mapping was proposed to students as "a multisensory research method in terms of its ability to evoke relationships between place, lived experience, and community" (Powell, 2010, p. 539). By the end of the first project's phase, each student team was asked to deliver a data visualization that mapped the relationship encountered on-site and further studied by the students. We purposefully asked not to simply map actors but to focus on relationships as a mode for students to make sense of the dynamics at play within the studied desert patch.

3.4. Prototyping: Making as Synthetizing Knowledge

During the prototyping phase, each team progressed from initial sketches to technical drawings and three-dimensional models. The integration of digital tools, such as Rhino and SolidWorks (Ikubanni et al., 2022), alongside digital fabrication processes like laser cutting, 3D printing, and CNC machining (Soomro et al., 2021), facilitated the exploration of manufacturing-related challenges in relation to materials and processes investigated in earlier design stages. Moreover, these technologies enabled the precise and detailed production of both low- and high-fidelity prototype (King, 2019).

Low-fidelity prototypes were initially produced in various sizes and materials, including cardboard, blue foam, and MDF. This iterative approach allowed students to refine their ideas before transitioning to more durable materials (Goudswaard et al., 2023). Rapid prototyping methods helped students grasp the project's complexity and assess the functionality of their concepts in real-world settings. As the process advanced, students refined their prototypes by considering sustainability, ergonomics, and cultural relevance, culminating in the development of high-fidelity prototypes.

Beyond enhancing communication among students and between students and professors—by enabling the exchange of multiple layers of information—prototyping played a crucial role in translating abstract concepts into tangible artifacts and experiences. It served as a key medium for synthesizing design ideas into concrete, testable forms.

3.5. Reports and Evaluation Methodology

The paper follows a double reflective process involving professors and students. Each team submitted an initial report on the design process, including a reflexive essay. The professors reviewed the reports according to their own understanding of the work, and returned the reports to the students including feedback. Students were then asked to re-edit their corresponding texts and added parts they thought were meaningful or missing. The final text incorporated a multiplicity of viewpoints

and layers of analysis: professors were able to analyze the student's comprehension of design process, while students simultaneously engaged with and reflected on the professors' perspectives and indications. This allowed a give-and-take of information between teachers and students, and aided meaningful reflections upon the meaning-making processes involved during the course.

4. Results

In this section, we analyze four of the most representative students' project, each representing a unique direction for blending ethnographic environmental research and design practice:

- Direction 1: *Environmental Probes* – observing, designing, and leaving behind probes, similar to cultural probes but focused on environmental contexts.
- Direction 2: *Multisensory Experiences* – designing through the senses, particularly sight and taste.
- Direction 3: *Feeling and Sensing* – exploring the cultural and material properties of environmental phenomenon (e.g., heat) through socio-cultural and environmental sensing.
- Direction 4: *Material Transformations* – using local resources as new mediums for design experimentation.

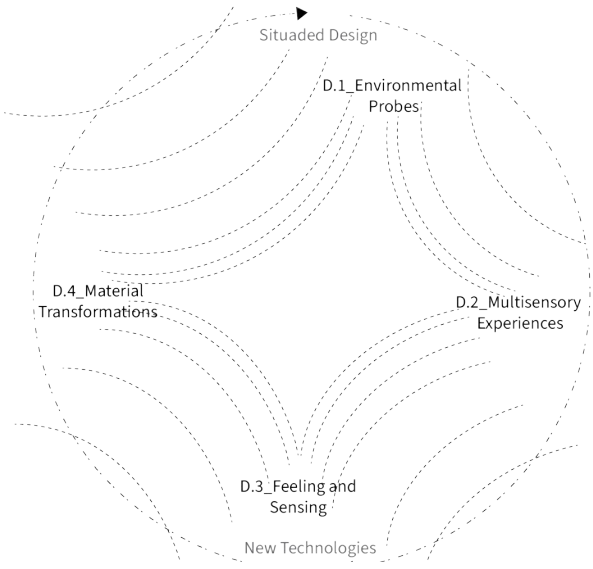

Figure 1. Diagram of the four design directions initially followed by the students' teams.

4.1. Trap N Cook

Trap N Cook belongs to a group of projects where students conducted initial fieldwork by designing environmental probes, hence following direction 1. This technique was inspired by Gaver and Dunne's notion of Cultural Probes (Gaver et al., 1999), a design research method aimed at inspiring and gathering qualitative, context-specific insights from participants in an open-ended, exploratory manner. Cultural probes are designed to be left behind, gathering information without the direct presence of the designer.

The environmental probes designed by the students had an initial similar purpose, yet they collected environmental inputs. During the visit to the desert site, students attempted to collect vegetal and abiotic components and researched local animal species to learn about the desert site's ecology. Multiple probes designs were initially designed and left on site. The first two used shoe boxes with different baits, covered with cling film and a hole on top to allow ants, insects, and beetles to enter. The third design used a water bottle, cut to create a funnel shape that directed potential insects inside the bottle, attracted by date syrup.

Figure 2. Environmental probe 01: white box, environmental probe 02: dark blue box, and environmental probe 03: cut bottle.

The conducted exploration led to research on the nutrients required for a balanced human diet, followed by the categorization of local plants and animals. The system was designed with desert insects and fauna in mind and was combined with desert plants to meet human nutritional needs.

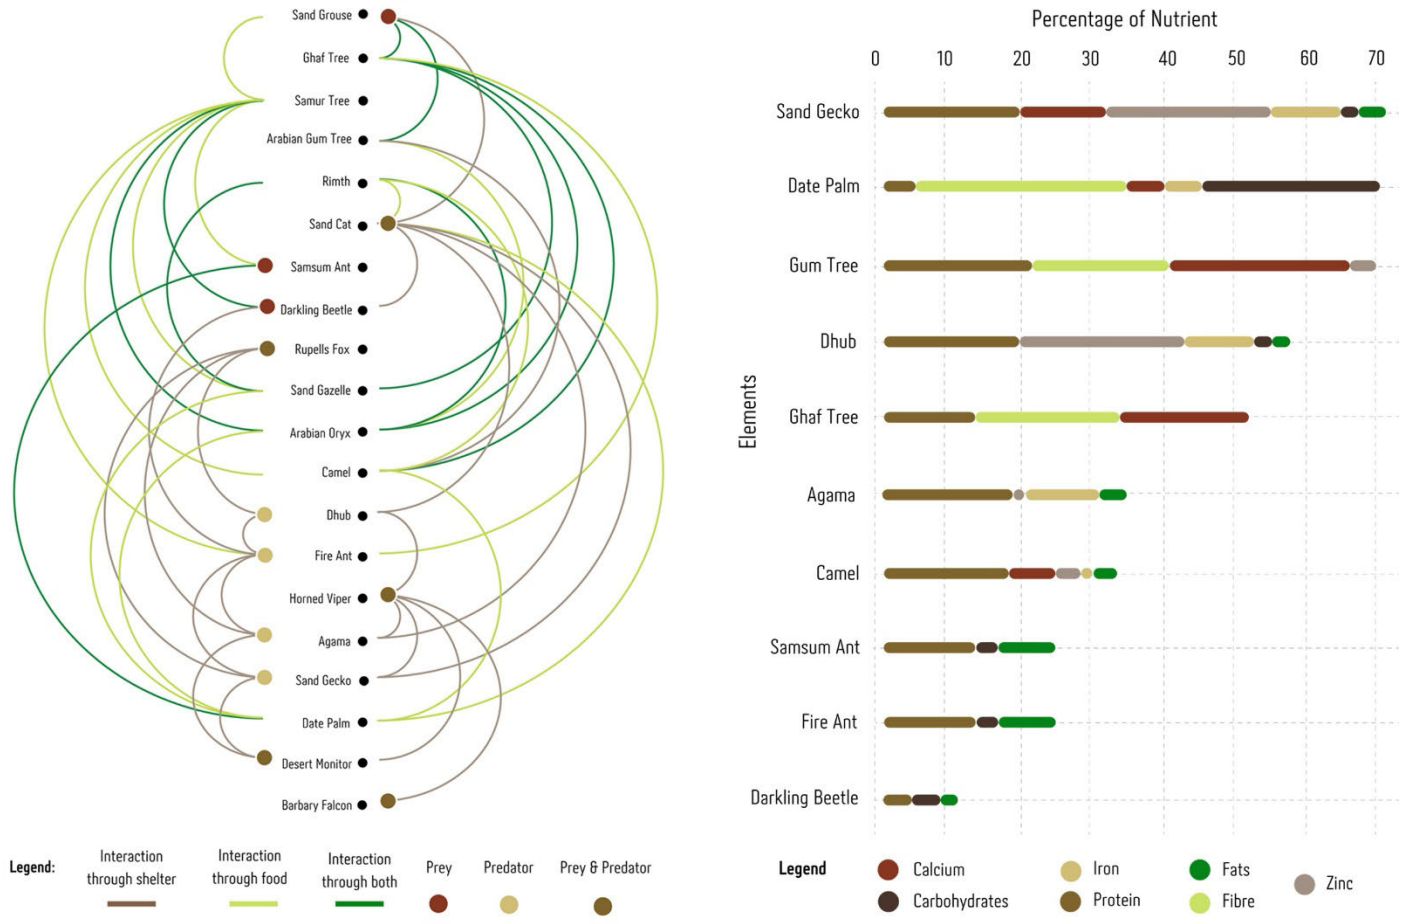

Figure 3. Data visualization illustrating the interaction of animals on-site and their nutrient percentages.

Interestingly, during the project's development, the designed probes evolved into functional cooking devices. The most efficient ones were selected and integrated into a purposefully designed grilling system, allowing animals to be captured and cooked on-site. A prototype was built using cardboard and foam, and later refined into a metal box with a reflective lid, to enhance the heating process -similar to the functioning of a kitchen oven.

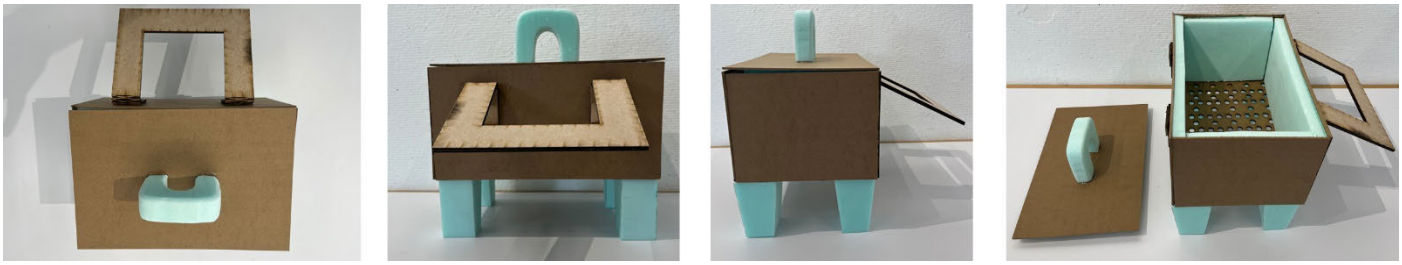

Figure 4. Prototype of the cooking device made from cardboard and foam.

Figure 5. Final prototype of the cooking device.

Figure 6. Final prototype of the cooking device, featuring colored animals to illustrate its working mechanisms.

4.2. Veggie Cooking

The second project, which follows direction 2, belongs to a series of works that borrowed Pink's idea of multisensoriality (Pink, 2011). Initially originated in the phenomenology of perception, the concept assumes that the human body is not just a collection of adjacent organs, but a synergic system whose individual organ's functions are linked together by the very act of "being in the world" (Pink, 2011, p. 123): in essence, each sense function in a continuum with the others.

Veggie Cooking is a project about edible desert flora. Students spent the fieldwork time observing, smelling, identifying and finally tasting plants on-site. Trees such as the Ghaf, the Toothbrush tree, the Saltbush shrub, which hold cultural as well as medicinal value in the UAE, were explored and subsequently adapted as main ingredients of traditional Emirati recipes, to form dishes with different textures and tastes.

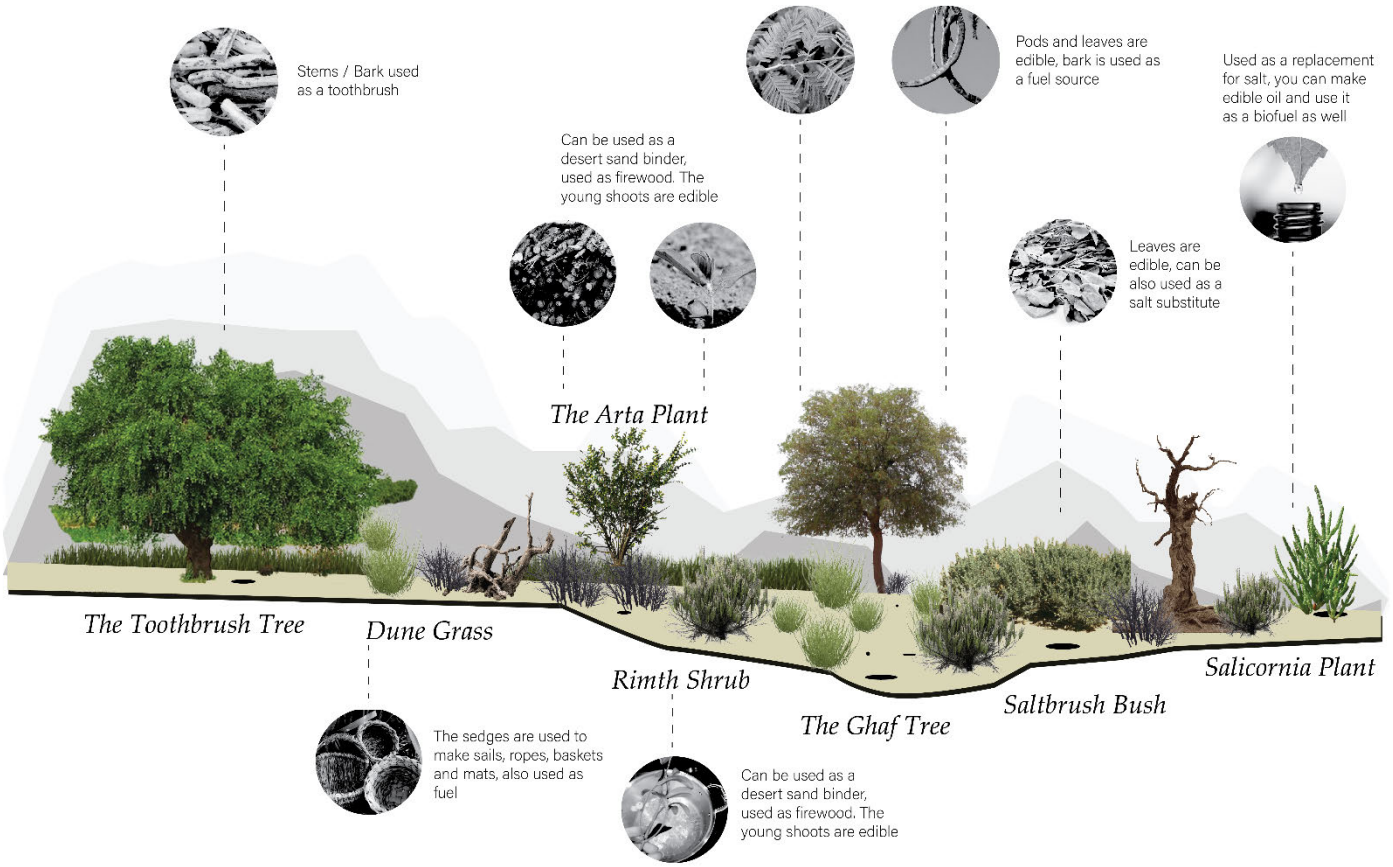

Figure 7. Diagram of the main plants found on-site.

The project was inspired by a traditional method of heating stones to boil water. Students used a Fresnel lens to direct sunlight into a metal container with a concentrator to enhance heat and heat the stones placed inside. Once the stones were heated, they used them to boil water and cook local ingredients and leaves for soups and salads.

Figure 8. Reference image of traditional cooking with stones and the food recipes proposed by the students.

Cardboard prototypes were created to test different proposals. The final design featured a hexagonal-patterned steel body with four compartments for heating stones. The Fresnel lens was mounted on a swing arm, allowing precise adjustment to focus sunlight on the stones. To facilitate the use of various types of leaves, a 3D-printed leaf grinder made with wood-based filament was created.

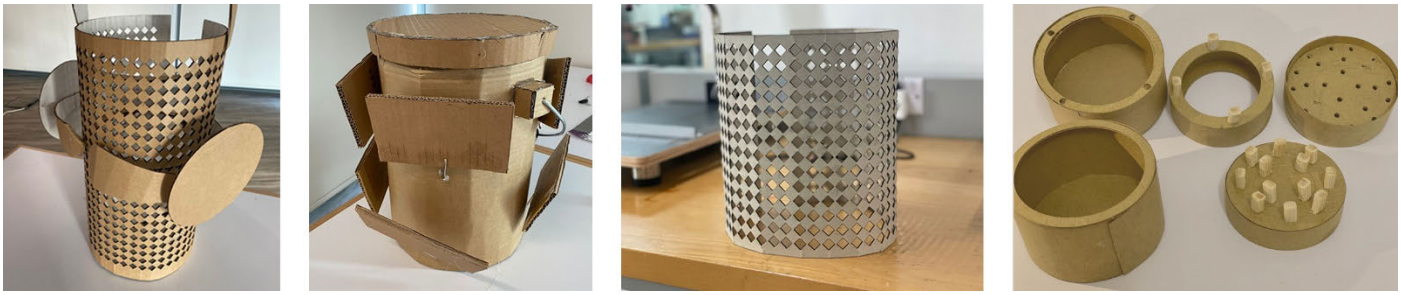

Figure 9. Cardboard prototypes of the cooking device and the leaf grinder.

Figure 10. Final prototypes of the cooking device and the leaf grinder.

4.3. Cooking with Sand

The third group of projects brings together student work that explored environmental data under the lenses of situated social settings. Following direction 3, we called this approach socio-environmental sensing, to underline the strong ties that were found between the nature of on-site materials and their cultural readings. Accordingly, students explored materials for their physical as well as cultural properties.

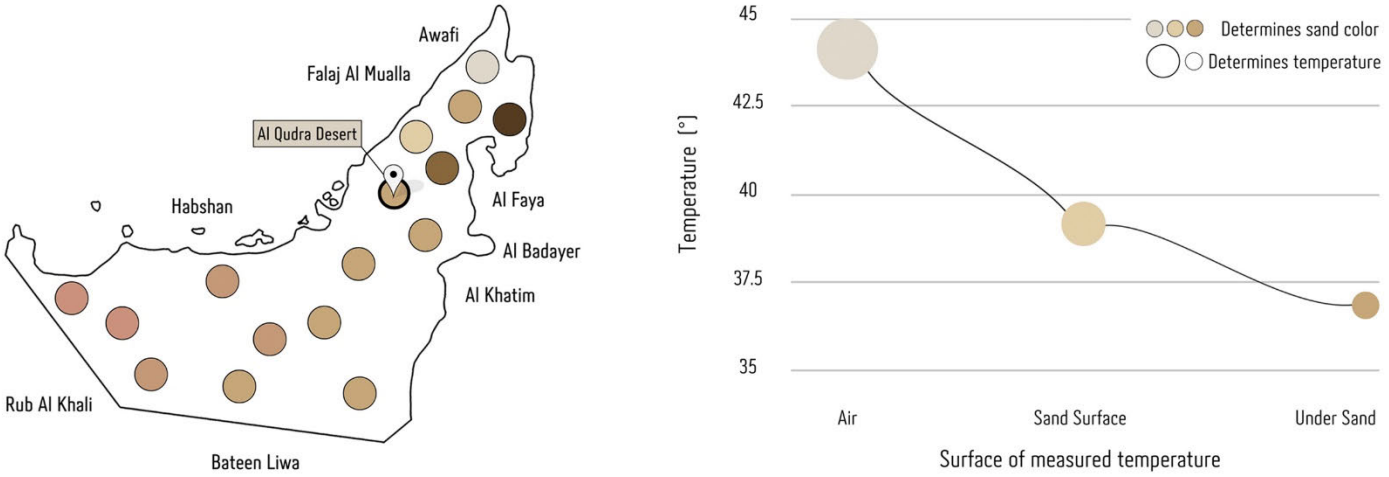

Figure 11. Diagram illustrating that 80% of the UAE consists of desert land and highlighting variations in sand colors, and data visualization showing the relationship between sand color and temperature.

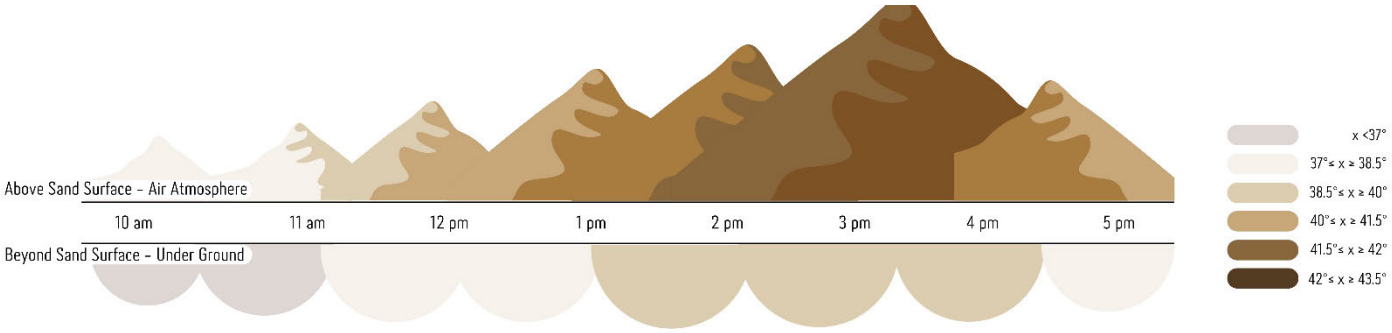

Figure 12. Data visualization showing the temperature variations of the atmosphere at different times of the day.

The project *Cooking with Sand* draws inspiration from Bedouin cooking traditions, which use desert sand as a heat source. Students conducted fieldwork to better comprehend sand as a material, how its color influences temperature, and mapping variations across the desert patch to identify optimal conditions for cooking on sand.

The presented outcomes involved a series of recipes inspired by traditional Bedouin dishes and the design of a portable device that could be easily assembled and disassembled, making it suitable for use in the desert. Cardboard, MDF and clay prototypes were created to test different proposals. The final device is equipped with a Fresnel lens to concentrate sunlight onto a central cooking pot filled with sand, which then distributed heat to smaller clay pots containing the food.

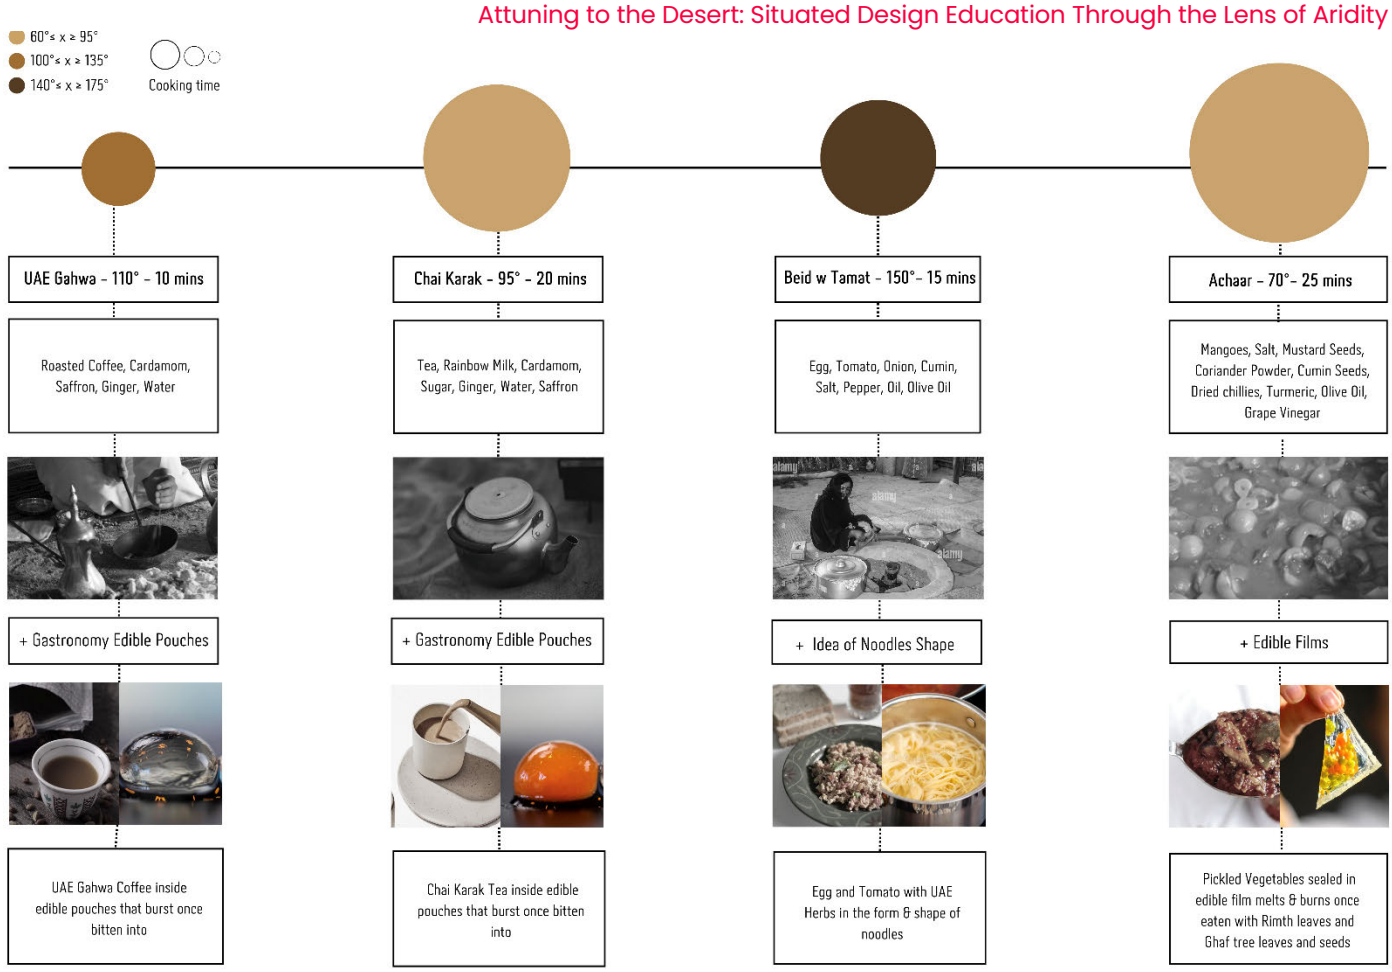

Figure 13. Diagram of traditional vs. student-proposed cooking times and temperatures.

Figure 14. Prototypes made from cardboard, clay, and paper.

Figure 15. Prototypes of various materials and a backpack for transporting the cooking device.

Figure 16. Final prototype disassembled and assembled.

Figure 17. Final prototype showing the clay pots for food preparation.

4.4. Rimal

The last group of works developed by students had the objective of transforming in-situ entities into production materials, aligning with direction 4. In these cases, local resources became the primary medium for developing new materials and fabrication techniques. In many of these projects, students felt compelled to incorporate additional additives to enhance the properties of the materials or refine the design process. These supplementary 'ingredients' were often sourced from outside the fieldwork site, posing questions about the contextual relevance of the final design outcomes.

The Rimal project challenged the idea that cooking must necessarily result in edible outcomes. Rimal, in Arabic, refers to the sandy terrain in desert regions. The project reimagined sand, combined with on-site plants and other elements, as a potential 'ingredient', offering sustainable alternatives to plastic tableware by emphasizing local resources and bio-entities.

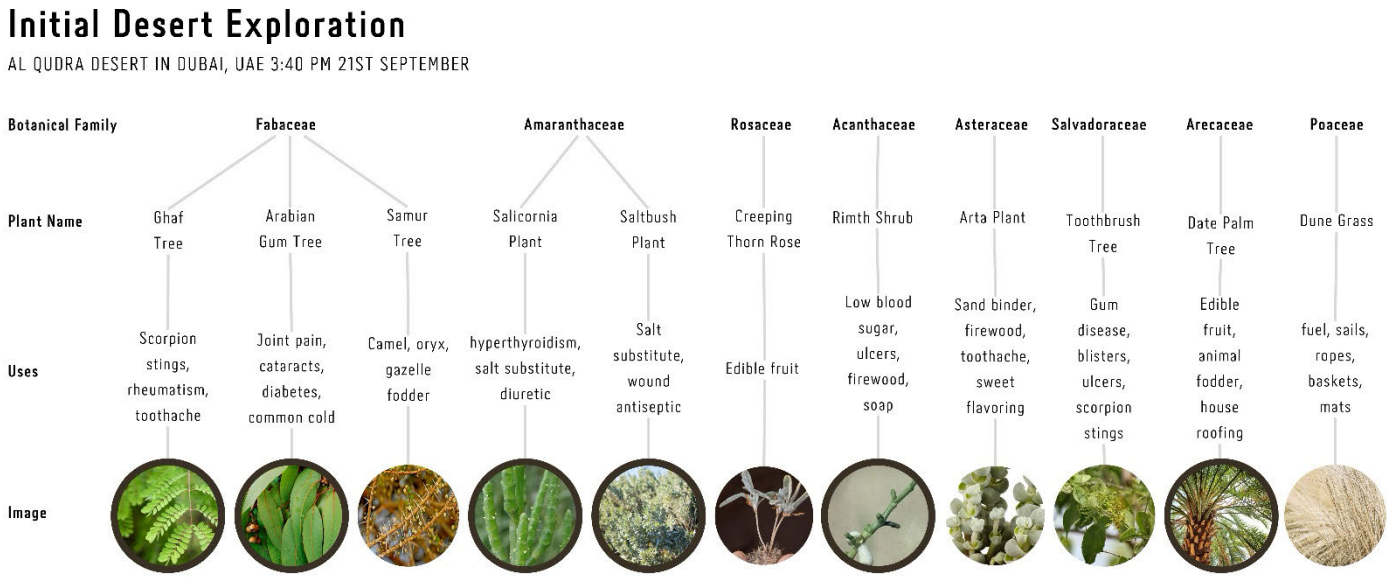

Figure 18. Diagram of key plants found on-site that could be used as ingredients alongside sand.

The project process began with hypotheses and iterative testing, adjusting ingredients to assess functional and aesthetic qualities. Cornstarch, aloe and egg whites were tested for material resistance, while turmeric, sumac, charcoal and Ghaf tree leaves were explored as natural colorants. The final recipe combined sand, okra, and lime in a 40:50:20 ratio, resulting in a moldable paste for crafting cutlery and plates that could be "baked" over an open fire on-site.

Students focused on local materials, avoiding colorant additives. To explore the aesthetic variations of sand, however, they collected samples from multiple locations across the UAE, recording GPS coordinates. These samples revealed unique color tones, reflecting the geographical identity of each artifact.

Figure 19. Samples of sand with various colors and textures.

The kit developed for the project included laser-cut wooden stencils designed to be wrapped around wooden sticks. The stencils were filled with the sand mixture and heated over a fire, where the lime and okra served as natural binders,

solidifying the material. Additionally, the kit also included a portable metal oven to bake the tools.

The outcome was a collection of molded artifacts functioning as cutlery and plates. This work exemplifies a situated approach to materiality and sustainability, integrating both the aesthetic and functional properties of sand into a cohesive design narrative.

Figure 20. Molded artifacts, stencils and prototype of the oven.

Figure 23. Exhibition during the Design Week with all the final prototypes.

5. An Evolving Framework

Student projects completed over the semesters informed the development of an evolving methodological framework aimed at extending and strengthening the pedagogical foundation of the course. In this section, we introduce that framework, one that integrates student feedback, field observations, and the analytical research conducted at the conclusion of the courses.

The four directions outlined at the beginning of Chapter 4: (1) Environmental Probes; (2) Multisensory Experience; (3) Feeling and Sensing; and (4) Material Transformation—served as initial reference points. Observations and feedback were mapped and clustered to identify emerging themes. These clusters were then positioned within the framework as new liminal experiences, based on their thematic content and points of intersection with the original four directions. Each of the six proposed intersecting liminal experiences relates to a different way of knowing, feeling, interpreting and *designing-with* the environment.

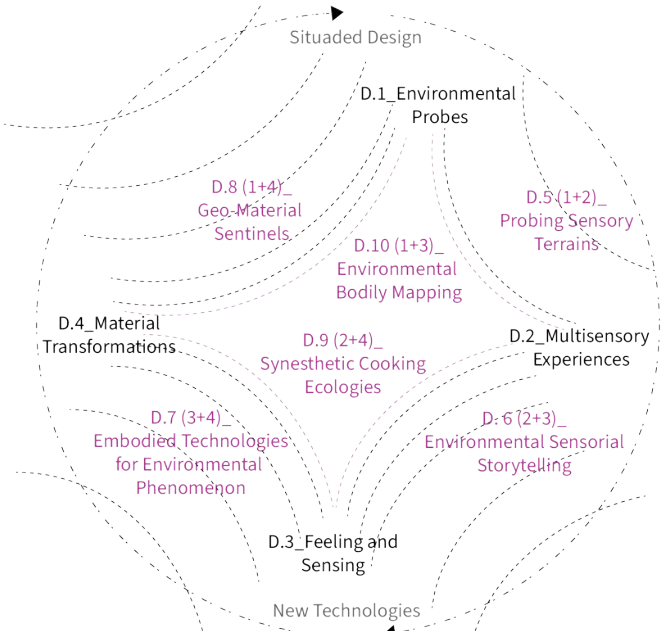

Figure 24. Four directions and six new intersections and proposed liminal experiences.

Direction 5: Probing Sensory Terrains
Direction 1 + Direction 2

This sub-trajectory explores the development of environmental sensory probes, that is, deployable devices that do not just collect environmental data but also evoke or measure sensorial experiences. For instance, how might light or taste perceptions shift in extreme environmental conditions such as sandstorms or intense heat? This could lead to the design of multisensory mapping tools tailored to cooking rituals, capable of monitoring how people feel, taste, or see during food preparation under changing environmental conditions. These tools might be seen as instruments that *sense-what-we-sense*.

Direction 6: Environmental Sensorial Storytelling
Direction 2 + Direction 3

This sub-trajectory investigates how sensorial perception may be altered by environmental phenomenon—such as spices intensifying in high temperatures, and how these changes could serve as narrative media. The environmental becomes a form of expression. For example, heat-reactive materials might shift in flavor or texture, giving rise to adaptive cooking surfaces that tell stories through transformation. These materials could enrich food preparation with embedded environmental cues and responses.

Direction 7: Embodied Technologies for Environmental Phenomenon
Direction 3 + Direction 4

Intersecting Directions 3 and 4 is about designing tools that translate environmental phenomenon into embodied, culturally-inflected experiences through the use of local materials. It explores how such phenomena shape not only food, but also memory, gesture, bodily forms, and spatial configurations. This could inform ritual-based cooking devices, echoing, as in the instance of previously presented designs, traditional Bedouin techniques. Continuing to take heath as an example, potential application might involve the design of cooking systems that reflect the sociality of warmth, activating specific behaviors or postures during food preparation.

Direction 8: Geo-Material Sentinels
Direction 1 + Direction 4

Intersecting Directions 1 and 4 brings together the impetus of environmental probes and that of material transformations. The focus here is ecological responsiveness through material decay or integration. This suggests opportunities for probes design involving the use of local resources (e.g. local sands, clays or organic waste) that transform together with the environment (merging, disappearing, or decomposing in it), while simultaneously collecting data. Probes act therefore as ecological indicators and opportunities for material studies at once.

Direction 9: Synesthetic Cooking Ecologies
Direction 2 + Direction 4

This sub-trajectory is about the creation of multisensory interfaces or materials that taste like or look like their environmental source. For example, exploration opportunities could involve the design of cooking tools infused with different plant's oils extracts that release flavor through heat. This might also open space for visual-taste experiments, where form, color, and flavor work together to communicate ecology.

Direction 10 Environmental Bodily Mapping
Direction 1 + Direction 3

This sub-trajectory investigates how environmental probes can be designed not only to collect external data, but also to translate natural phenomena—such as wind, humidity, salinity, or light—into bodily, perceptible experiences. It aims to connect measurable changes in the environment with the felt, lived experience of those changes, providing a bridge between sensing technologies and bodily perception. For example, probes might transmit environmental shifts through haptic feedback, thermal gradients, or kinetic movement, creating a form of embodied environmental cartography. These tools could be wearable or embedded in cooking objects, offering real-time sensory translations of atmospheric or geophysical conditions: tools that sense with us, extending our bodily understanding of the environment, rather than abstracting it.

These liminal experiences provide a generative scaffold for future iterations of the course, encouraging students to think with, through, and alongside environmental conditions during the design process.

6. Discussion

The course outlined in this paper sought to immerse second-year undergraduate design students in complex, interwoven concepts such as Situated Knowledge (Haraway, 1988), Ecosophy (Næss, 1973), and Multispecies theory (Kirksey & Helmreich, 2010; Ogden et al., 2013), engaging them in site-specific inquiries within an arid desert context. Through reflection on multiple course iterations—by both instructors and students—key insights emerged, as did productive frictions. These are not interpreted nor presented as shortcomings, but as generative conditions that inform future pedagogical development.

A primary strength of the methodology lay in its hands-on, inquiry-driven approach, which blended sensory ethnography, environmental mapping, and iterative prototyping. By working within a distinct ecological context, students were encouraged to engage with the interdependencies between material, cultural, and environmental dynamics. The emphasis on mapping and sensory research helped students to construct nuanced readings of place and inhabit its settings. However, the link between these mappings and the design outputs was at times

inconsistent, suggesting the need for deeper integration between spatial analysis and material articulation.

One of the course's most revealing tensions surfaced in the relationship between field research and design ideation. Several students expressed difficulty in decoupling preconceived notions of the desert—shaped by media or inherited imaginaries—from their lived, subjective site-specific experiences. This occasionally resulted in superficial, biased outputs. Likewise, students often blurred the lines between field research as an open-ended, observational act, and design as a generative, future-oriented practice. Upon reflection, withholding the explicit design brief until after the fieldwork phase may allow students to more deeply engage with the specificity of place without prematurely framing it as a problem that needs to be solved.

The pedagogical structure—where theoretical frameworks were introduced early and gradually enacted through embodied fieldwork—proved effective. The students' initial perception of the desert as a "scarce" or "empty" space—echoing both postcolonial framings of the desert as a 'non-place' and dominant ecological narratives of lack—gradually shifted over the course. Through multisensory and contextual encounters, students began understanding and recognizing the richness of desert ecologies, and the possibilities offered by a situated—as opposed to extractive, approach to design thinking. At the same time, the pedagogical framework also highlighted theoretical gaps. For instance, the desert environment, rich with animal, vegetal, and mineral agents, exposed students to more-than-human actors in ways that existing curricula had not fully anticipated. While students were encouraged to experiment with multispecies narratives and perspectives, many seemed to lack the expertise and conceptual tools to deeply engage with such ethnographic practices. Future iterations would benefit from a strengthened theoretical framing, where more-than-human design, biodesign, and ecocritical perspectives would be integrated not as supplements but as foundational tools.

Another key insight emerged in relation to fabrication and the evolving meaning of the Fab Lab. Rather than positioning the lab as a central, static site of production, the course proposed a distributed, multi-sited model of fabrication. Students were encouraged to reimagine making as a layered process. One that begins in the field, through sensory and material engagement, and culminates in iterative speculative prototypes. In this model, transformation is not confined to material manipulation but includes the translation of observations, bodily responses, and ecological rhythms into new design forms. The lab becomes here a relational node—one that connects local materials, environmental conditions, and cultural knowledge, enabling fabrication to expand across human and non-human registers. Seen this way, the lab is less a technical facility and more a porous epistemic milieu—an interface between the analytical and the affective, the mechanical and the relational. This expanded notion of fabrication, rooted in the idea of co-presence and becoming-with the environment, reflects a deeper commitment to working with, rather than simply upon, the world, particularly when confronting wicked environmental problems.

7. Conclusion

The design course outlined in this paper highlighted the importance of designing with the environment rather than for it, becoming a testing ground for an evolving pedagogical framework. As detailed in Chapter 5, this framework emerged through the interplay of theoretical inquiry, site-specific fieldwork, and iterative design practice. It was shaped not only by ecological and cultural conditions but also by the uncertainties, misalignments, and breakthroughs encountered across the course's multiple iterations.

Rather than prescribing fixed outcomes, the course invited students to embrace complexity, uncertainty, and relationality. In doing so, it repositioned design from a problem-solving, extraction-oriented practice to one of attunement, habitation, and co-presence. Situated knowledge, multispecies relationality, and ecosystemic thinking moved from abstract theory to embodied concern — reframing how students perceive environments, define problems, and prototype responses.

The evolving framework proposed here is inherently and purposefully unfinished. It adapts to the specificity of each site and cohort, and is shaped by ongoing experimentation, reflection, and critique. Its strength lies not in replicability, but in its generative potential — in the principles it helps articulate and expand: to design with, rather than for; to recognize environments and environmental entities as co-agents; to approach fabrication as relational and distributed; and to view the classroom as a worldly, porous, open, system.

Future iterations of this approach will benefit from a deeper integration of multispecies ethnography, critical posthumanism, and ecodesign — not as collateral, but as foundational design tools. By continuing to refine both its methods and its ethos, this framework aims to cultivate designers capable of working within — not outside — the complex, contested, and more-than-human realities of our time.

a new frontier for design

Co-creating everyday future foods with seaweed and insects

Patricia Csobánczi , Aalborg Univesity, pacs@creat.aau.dk
Roseanne Kimber, Designskolen Kolding, roseanne.marie.kimber@gmail.com

The focus of the project was to ***re-imagine eating insects and seaweed together with participants*** to encourage a sustainable food transition. The project employed a participatory design approach. The result of the project is a ***design framework*** that supports sustainable food transitions by exploring climate-friendly ingredients such as seaweed and insects, which are not commonly used in the Global North's contemporary food culture, to develop new meal ideas. The design framework is adaptable to different sustainable ingredients, allowing us to explore and create meals more aligned with our planetary boundaries, taking us all a step closer to the preferred future.

Designers play a vital role in facilitating food transitions, as food is deeply personal and cultural. Through participatory design processes, designers can unravel insights that support the adoption of new ingredients and initiate a transition towards more sustainable everyday foods. To support the transitional phase, we chose to prepare a meal as an intervention based on the prototype closest to ***Now*** on the timeline. This made integrating sustainable ingredients more relatable and less daunting for participants.

The project was conducted over a seven-week period in the fall of 2019 in Kolding, Denmark. Eleven people working in food, such as scientists, chefs, and activists, participated in the project.

1.

1:1 Dialogue Tool: A visual interview tool to guide conversations with statements and questions about food perceptions, supplemented with photos, to understand a baseline of the current perception of these ingredients.

ABSTRACT | The urban community faces complex food challenges, including food waste, limited local supply, and low resident engagement. Traditional approaches, such as composting and waste sorting, often lack a systemic perspective. Research through Design (RtD) serves as an exploratory method that leverages design practices to generate insights and solutions, emphasizing innovation through cross-disciplinary collaboration. This paper employs RtD to integrate sustainable design into community transformation, optimizing resource utilization and encouraging cycles of reuse, thereby advancing sustainable development in urban neighborhoods. Taking Beijing Caochang community, a typical aging hutong community with notable issues of spatial degradation and underutilized resources, as a case study, this project aims to establish an edible, waste-free public landscape through participatory design. The proposed community food system is embedded within a broader ecological renewal strategy, tackling challenges from three perspectives: system optimization, spatial intervention, and organized participation. Through community-building activities, the project brings together residents, stakeholders, and professionals to form a collaborative model of co-creation. A final exhibition will serve to consolidate shared understanding, promote best practices, and enhance the

community's food security, health, and vibrancy.The application of RtD offers innovative approaches to addressing practical food system issues, while providing a structured and interdisciplinary reference for building urban food recycling systems. This method introduces a unique perspective for understanding and addressing the multifaceted food issues within urban communities, offering valuable insights and contributions to future research and practice in related fields.

KEYWORDS | SUSTAINABLE DESIGN,FOOD CIRCULATION,RESEARCH THROUGH DESIGN(RTD),LIFE CIRCLE,COMMUNITY REGENERATION

1. Introduction

The issue of food in urban communities has become a global challenge. Relevant studies indicate that food waste in urban areas spans the entire lifecycle of food, including production, consumption, and disposal (Ivert, L.K. et al., 2015). First, in the production phase, local food supply is insufficient, and urban communities are highly dependent on external sources. This reliance leads to increased food miles and reduces the self-sufficiency of communities (Liang et al., 2024). Secondly, During consumption, households often lack proper procurement and storage planning, leading to significant food waste (Roodhuyzen et al., 2017). This waste extends beyond households to the community level, resulting in substantial food discards during consumption (Peng et al., 2024). At the food disposal level, there is a lack of effective food recovery and reuse mechanisms in the community. This prevents proper disposal of discarded food, further exacerbating the problem of food waste and placing additional pressure on the environment (Garrone et al., 2024). Additionally, low community participation in food systems hinders solutions, as residents' attitudes and participation levels significantly impact their views on food waste and healthy eating (Farr-Wharton et al., 2014). This low level of participation cuts across all aspects of food production, consumption, handling and reuse, further compounding the complexity of the food problem.

As the capital of China and an international metropolis, Beijing community food system faces various challenges despite its role in meeting the basic needs of residents (Ma et al., 2020). In recent years, with the acceleration of urbanization and the improvement of residents' living standards, the complexity and diversity of Beijing community food systems have become increasingly prominent. (Ma et al., 2022). To address these challenges, some communities have begun to take action to promote food system optimization and change, such as establishing community gardens and promoting waste separation, but the overall effect still needs to be further improved. This study aims to explore strategies for embedding sustainable food systems into community ecological regeneration through the RTD methodology and the perspective of whole-life design. Through the design perspective and methodology, it provides new ideas and solutions for optimizing the food system in urban communities.

2. Research Methods and Perspectives

2.1. Research through Design

Research through Design (RTD) is a methodology that tightly integrates design practice with research (Frayling, 1993). The RTD methodology has been systematized by Frayling, C. and Findeli, A. et al. and is centered on design as a central means of research, where design activities are used to generate knowledge, explore problems and propose solutions (Findeli, 2004). Findeli advocates for project-led research, emphasizing participatory, action, and grounded theory approaches (2004,44-45). Other scholars highlight design practice as not only a research tool but also a driving force (Durrant et al., 2017). In this study, RTD is applied to construct a zero-waste edible system in Caochang Community. From the initial stage of the study, design was considered an

important research methodology throughout the research process. Cutting through the lens of design, design workshops were organized and community residents, neighborhood committees, and social organizations were invited to participate. These workshops are not only venues for design activities, but also an important part of the research. Through the process of co-creation with the residents, we gained a deeper understanding of their needs and behavioral patterns, which provided a basis for the planning of the edible no-waste system, and ensured that the implementation of the project could fully reflect the needs and wishes of the residents. This design-centered research approach not only improves the feasibility and acceptance of the project, but also enhances the residents' sense of belonging and responsibility, and promotes the sustainable development of the community.

2.2. Life Cycle Perspective

The concept of life cycle, initially introduced by the advertising firm Booz Allen Hamilton in 1957, is a systematic perspective for depicting the entire process of a product from inception to obsolescence. It follows a "cradle-to-grave" approach, emphasizing comprehensive management across production preparation, manufacturing, use, and disposal to minimize environmental impact and maximize resource efficiency (Zhang, 2013). With growing global attention to environmental protection and sustainable development, the life cycle perspective has been increasingly applied to food system studies (HUI, 2022), focusing on the entire process of food production, processing, transportation, consumption, and waste handling (Rosli et al., 2024). In this study, we apply a full life-cycle perspective to optimize the urban community food system, designing for every aspect of food processing, while delving into the public spaces of the community, focusing on how the dispersed and underutilized urban public spaces in the community can be transformed into sustainable full-cycle productive landscape spaces.

3. Survey on Sustainable Zero-Waste Living in Beijing Caochang Community

3.1. Site Background

The caochang Community in Dongcheng District, Beijing, boasts a rich historical and cultural heritage. Its distinctive location and spatial characteristics make it the only north-south-oriented hutong cluster in the city and one of the best-preserved traditional hutong districts. Bounded by Xixinglong Street to the north and Zhushikou East Street to the south, the community covers an area of approximately 0.32 square kilometers, comprising 25 hutong alleys and 616 traditional courtyard residences. Key community facilities include small convenience stores, an elderly service station, and a kindergarten, as illustrated in Figure 1.

Figure 1. caochang Community Floor Plan, Source: Author's own illustration

Additionally, the community has established the Xiaoyuan Deliberation Hall, a resident-led democratic discussion space, fostering a strong culture of grassroots self-governance and participatory decision-making. In recent years, with increasing attention and support from various stakeholders, the community has developed an innovative, exploratory governance model that integrates diverse interest groups, including government agencies (subdistrict and community committees), NGOs (local social work organizations), resident self-governance groups, and academic institutions. Community governance and placemaking initiatives have been implemented with a strong emphasis on low-carbon development and zero-waste principles, shaping a more sustainable and participatory urban renewal approach.

In 2021, with support from the subdistrict office and under the coordination of the local social work organization Sanzheng Social Work, the caochang Community incubated and nurtured a resident-led self-governance group, A2Z (Action to Zero Waste), dedicated to promoting a zero-waste lifestyle. This initiative introduced and advocated for sustainable waste management practices, helping the subdistrict address challenges related to waste classification at the source. A series of online and offline community activities centered around zero-waste living were launched, culminating in the establishment of Beijing first Zero-Waste Circular Courtyard, an innovative model that laid the foundation for sustainable environmental practices in traditional courtyard-based neighborhoods. Since 2022, the vision of Zero-Waste caochang has emerged as a shared objective among stakeholders, extending beyond waste classification enforcement to a broader

effort of embedding zero-waste principles into daily life. This initiative aligns with China's national ecological civilization strategy and carbon neutrality goals, positioning the community as a testing ground for sustainable urban practices. Against this backdrop, our team engaged with the caochang Community, integrating its zero-waste development objectives into our design practice. Through collaborative governance and innovative community-based interventions, this research aims to contribute to the sustainable transformation of the neighborhood.

3.2. Community Status Analysis

In the preliminary research, we classified the zero-waste behaviors of residents in the caochang Community and found that these behaviors were quite diverse. A significant number of residents had a strong interest in gardening and crop exchange, with kitchen waste making up a large portion of the community's waste categorized for sorting. Further analysis of residents' specific behaviors in waste sorting and kitchen waste composting revealed an interesting phenomenon: many residents tend to repurpose discarded materials such as metal, empty bottles, and wooden boards， as shown in Figure 2.

Figure 2. Residents' Spontaneous Gardening Behavior, Source: Photographed by the author.

These waste materials were often ingeniously used as containers for kitchen waste composting. This spontaneous initiative not only demonstrates strong environmental awareness but also fosters social interaction and collaboration among neighbors. Moreover, residents exhibit a high level of enthusiasm in gathering compostable materials, proactively collecting bones, fruit peels, food scraps, and eggshells for composting, thereby achieving a certain degree of self-sufficiency.Field research further reveals a negative correlation between residents' age and their acceptance and participation in sustainable practices. Specifically, older residents are more inclined to actively engage in zero-waste initiatives, assuming leadership roles in promoting sustainable living within the community, as illustrated in Figure 3.

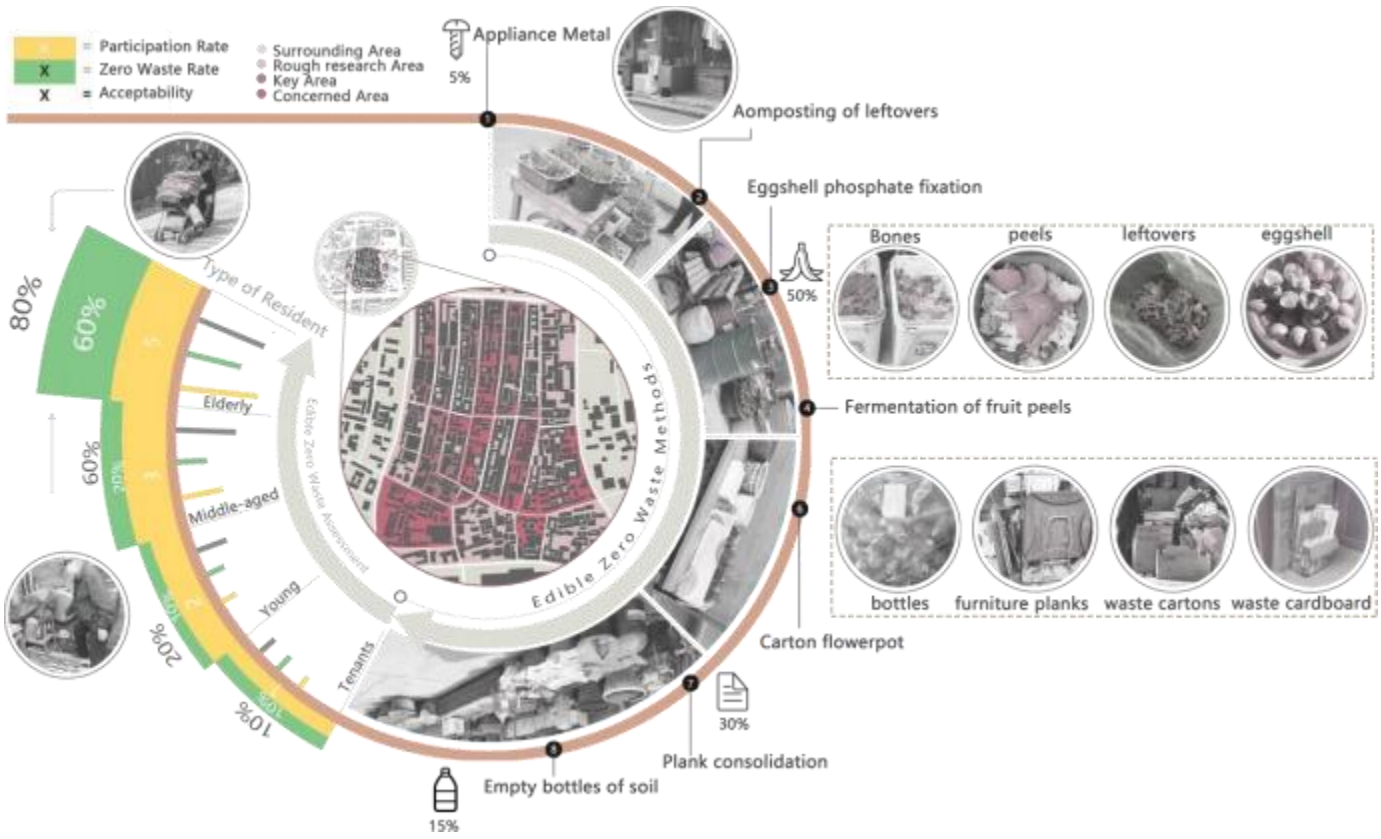

Figure 3. Research on the zero-waste living behavior of Caochang residents,Source: Author's own illustration

However, a comprehensive investigation of the caochang Community revealed significant spatial disparities in the adoption of sustainable living practices, despite the presence of numerous sustainability initiatives and organizations. The core areas of the community, particularly the hutongs surrounding the Xiaoyuan Deliberation Hall, exhibit a high level of engagement. In contrast, residents in the peripheral hutongs, further from the community center, demonstrate a comparatively vague understanding of or even indifference toward sustainable living concepts.This spatial disparity reflects imbalances in multiple dimensions, including residents' awareness, spatial planning, and incentive mechanisms. Residents in peripheral areas often lack both access to community activities and the motivation to participate, making sustained engagement difficult. The current situation in caochang Community may exemplify broader challenges faced by urban communities. As urbanization progresses, many neighborhoods may encounter similar difficulties, including effectively communicating the importance of sustainable living and identifying appropriate approaches to meet residents' needs while promoting sustainable lifestyles.

Given the prevalent challenges in urban communities, including food waste, insufficient local food supply, and low levels of resident engagement, this project adopts the Research Through Design (RTD) approach, using food circulation as a guiding principle to develop a low-carbon spatial framework for the caochang Community. By optimizing the community's food circulation system through a lifecycle perspective, the project aims to establish zero-waste public spaces and promote sustainable community development. The core concept of this project lies in the integration of co-creation mechanisms with food circulation, employing a systematic design approach to maximize resource efficiency and minimize waste, thereby enhancing both environmental sustainability and

social resilience.Shaping Resident Awareness – Through regular community workshops and the establishment of a harvest-sharing mechanism, the project fosters habitual green Environmental Optimization – Utilizing the RTD methodology, underutilized and abandoned public spaces are transformed into productive edible landscapes, improving the community's environmental health, comfort, and sustainability. Building a Community Co-Governance Mechanism – Residents are encouraged to actively participate in every stage of the project, from compost system construction and food cultivation to long-term circular management. This shift from passive acceptance to active governance strengthens residents' sense of belonging and social cohesion.Ultimately, the value of this project extends beyond the creation of an adaptive community ecosystem. It seeks to establish a scalable model for sustainable community development, providing replicable strategies for other urban communities in food resource circulation and system integration.

4. RTD in Beijing Caochang community: Building the Food Cycle

At the initial stage of the project, we conducted questionnaires, interviews, and field studies to gain an in-depth understanding of residents' needs, behavioral patterns, and awareness of low-carbon living. To foster community engagement, we organized multiple resident mobilization meetings to introduce the project's background, objectives, and significance. Through these sessions, we not only communicated the importance of low-carbon living but also gathered residents' preliminary perspectives on the community environment and sustainable development.In the "Food Cycle for Low-Carbon Space Creation" project in caochang Community, we adopted a Research Through Design (RTD) approach as the core methodology, integrating design practices throughout the entire project lifecycle.

4.1. Co-creation workshops and program design

We organized multiple design workshops, inviting community residents, neighborhood committee members, representatives of social organizations, and university teams to participate. These workshops served not only as platforms for design activities but also as essential components of the research process. Through group discussions, brainstorming sessions, and hands-on exercises, residents shared their ideas and suggestions on waste sorting, kitchen waste composting, and the utilization of public spaces within the community. During the workshops, residents proposed creative ways to repurpose discarded materials as composting containers—an initiative that was both environmentally friendly and instrumental in fostering social interactions and cooperation among neighbors, as shown in Figure 4.

Figure 4. Caochang Community Co-creation Workshop, Source: Photographed by the author.

This design approach emphasizes a shift from "designing for the community" to "designing with the community," valuing residents' knowledge and experiences while making them active participants in the design process. By engaging in these workshops, residents not only had the opportunity to express their needs and expectations but also played an active role in shaping the project. This participatory process significantly enhanced the feasibility and acceptance of the project.

Building on the workshops, we further organized resident pairing activities to encourage peer learning and collaboration, as shown in Figure 5.

Figure 5. resident pairing activities, Source: Photographed by the author.

Through teamwork, residents co-designed preliminary composting plans and vegetable garden layouts, reflecting their collective wisdom and providing valuable references for subsequent design iterations. The pairing activities deepened collaboration among residents, fostering knowledge sharing and skill development. Through continuous exploration and refinement in practice, the community cultivated an ongoing learning and innovation environment.This community-based cooperative model not only strengthened residents' sense of belonging and responsibility but also laid a solid foundation for the long-term sustainability of the project. Based on resident feedback and co-creation outcomes, we further refined the design plans, ensuring that they not only addressed the actual needs of the community but also integrated a lifecycle perspective to enhance the project's sustainability and practicality.

4.2. Community Food System Optimization

In Caochang Community, we systematically optimized the residents' food system from a lifecycle perspective, as illustrated in Figure 6. The process encompasses food acquisition, processing, and consumption, followed by the separation of organic and non-organic waste, composting of food waste, and vegetable cultivation, forming a tightly interconnected circular system.This lifecycle intervention not only addresses all stages of food production and consumption but also extends to waste repurposing and resource regeneration, ensuring that each phase aligns with the principles of sustainable development.

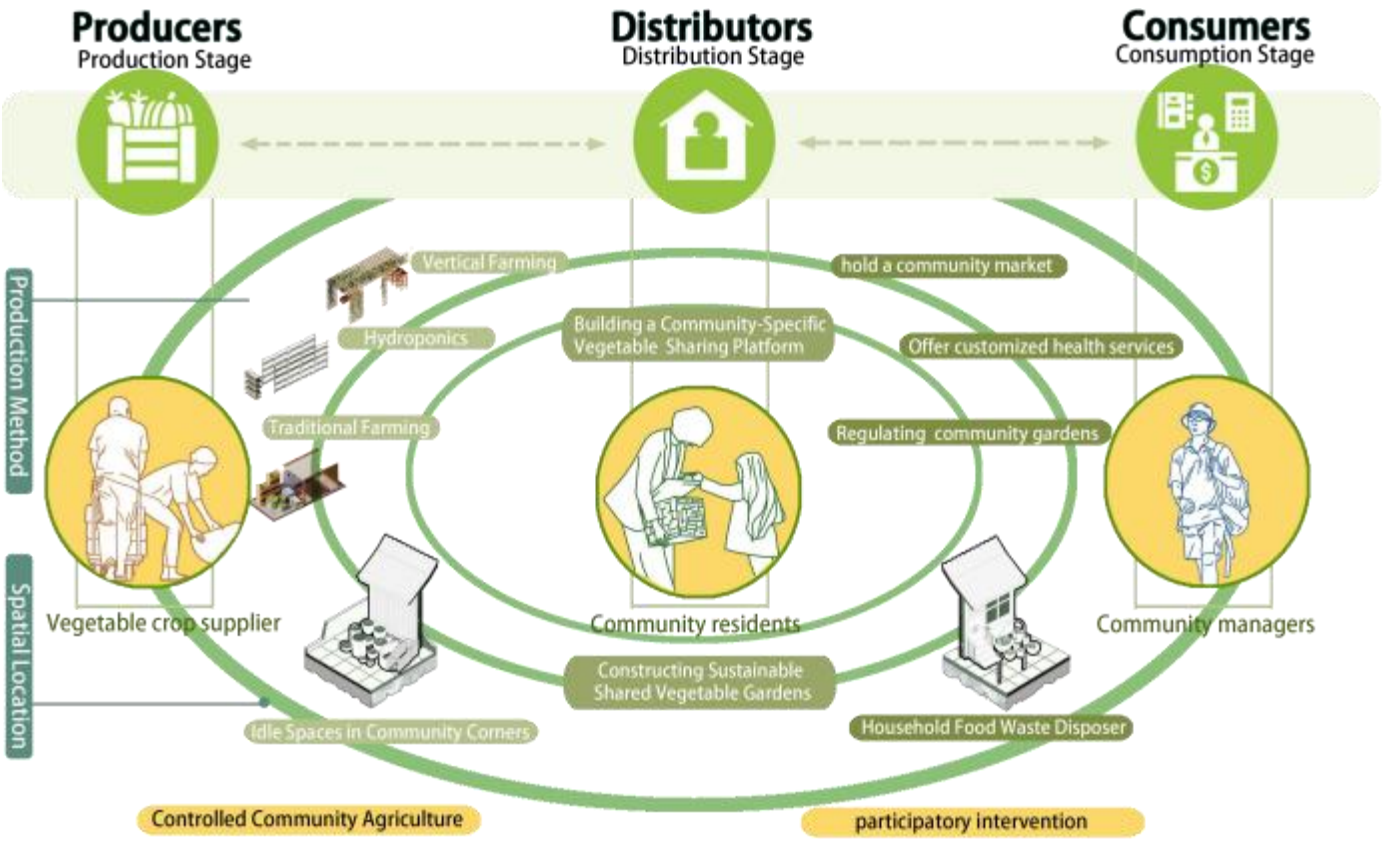

Figure 6. Optimization of Community Food Systems, Source: *Author's own illustration.*

First, we transformed underutilized public spaces that connect different hutongs within the community into shared vegetable gardens for residents. By redefining residents as food distributors, we encouraged a shift from isolated courtyard composting to open, shared composting systems. Through hands-on learning, residents were taught various self-sustaining cultivation techniques and food waste management methods, enabling them to compost effectively and reduce environmental pollution.
We employed diverse spatial planting strategies to cultivate edible, organic green vegetables, integrating residents into the local food distribution network while promoting sustainable urban agriculture.

At the food distribution stage, we established an exclusive community-sharing platform to promote the development of sustainable shared gardens. Residents are encouraged to actively participate in the construction and management of community gardens, gaining firsthand experience in plant cultivation and engaging in vegetable gardening to appreciate the joy of agriculture.Additionally, the community regularly hosts local farmers' markets, enabling residents to exchange fresh, healthy produce. This initiative not only fosters community engagement but also reduces energy consumption and carbon emissions associated with long-distance food transportation.

In the consumption segment, the supervision and management of community shared gardens will be strengthened through community managers running community mini-bazaars, while community activities will be organized on a regular basis to enhance exchanges and cooperation among residents and promote the harmonious development of the community. Residents are encouraged to actively participate in environmental protection and resource recycling in the community, and to develop good habits of waste classification and composting.

4.3 Zero-Waste Interventions in Public Spaces

To establish a new edible low-carbon circular system in caochang Community, we proposed the integration of participatory edible public landscapes, seamlessly linking kitchen waste management with residents' daily lives. This approach aims to foster community self-governance, promote healthier lifestyles, and develop a sustainable management model.We designed diverse plant distributions within public spaces, selecting species that combine environmental adaptability, aesthetic value, and practical use. Residents are encouraged to participate in planting and maintenance based on their interests and expertise, strengthening their sense of stewardship and appreciation for the community environment.

Additionally, we repurposed discarded foam boxes, plastic barrels, and other materials to create multi-functional sustainable planting containers in public spaces, integrating composting, cultivation, and environmental education. These planting units serve as both practical gardening tools and educational platforms, equipping residents with gardening skills and environmental awareness.The participatory edible public landscape is envisioned as the core of the community food system, incorporating ecological planting, kitchen waste processing, and social engagement. By growing and harvesting edible plants, residents can experience the full farm-to-table cycle, fostering a closer connection to nature and active participation in sustainability initiatives.

4.4. Community Organization Operation Strategy

In advancing community self-governance, we place particular emphasis on deep engagement from residents and diverse stakeholders. To facilitate this, we propose the establishment of a community management body or committee, creating a collaborative platform where residents, neighborhood committees, A2Z, and other organizations can jointly participate in decision-making and management of the community food system. This framework aims to ensure the efficient operation and long-term sustainability of the community food system, as illustrated in Figure 7.

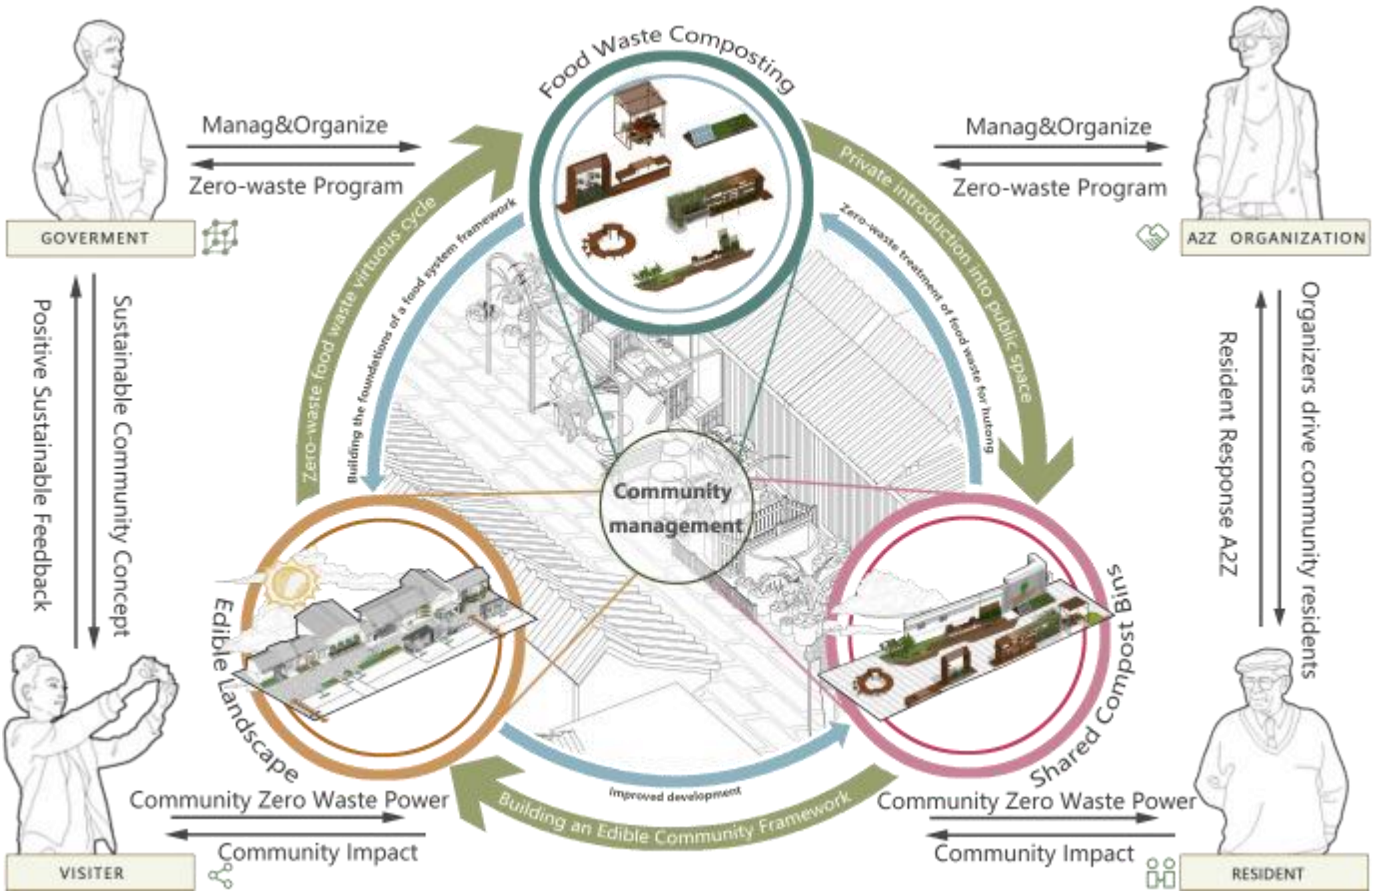

Figure 7. Optimization of Community Food Systems, Source: *Author's own illustration.*

We proposed the establishment of community management institutions or committees to facilitate joint decision-making and governance of the community food system by residents, neighborhood committees, A2Z, and other stakeholders. In this framework, the neighborhood committee and A2Z would serve as the primary organizers and implementers, coordinating resources and driving initiatives to ensure the effective operation and long-term sustainability of the food system.

Their key responsibilities would include organizing community activities and educational seminars to enhance residents' environmental awareness and practical skills, thereby encouraging active participation in zero-waste kitchen waste composting practices. Through increasing resident engagement, the initiative aims to cultivate a sense of autonomy in the maintenance and evolution of the community food system. By embedding sustainability principles into daily life, residents would progressively take

ownership of the system's development, contributing to the broader goal of sustainable community transformation.

Within this strategic framework, we anticipated that the development of the community food system will generate both social and environmental benefits. We aimed to enhance the community's public vitality by involving tourists as participants, gradually transforming Caochang Community into a unique space integrating local life and environmental education functions. Visitors would not only have the opportunity to experience authentic community cuisine but also immerse themselves in sustainability practices, fostering a deeper understanding of environmental conservation and sustainable development principles.

This community-tourist interaction not only supports the long-term sustainability of the community but also serves as a platform for disseminating environmental awareness, establishing a positive feedback loop for sustainable practices. Caocang Community aspires to become a model for urban sustainability, demonstrating how local lifestyles can be harmonized with broader environmental goals.

Ultimately, through collaborative efforts in community self-governance, we aim to extend sustainability principles from the community level to the broader urban landscape. The community food system would not only provide residents with access to fresh and healthy food but also function as a living demonstration of environmental responsibility and sustainable living, contributing to the advancement of urban sustainability initiatives.

4.5. Community Public Space Transformation

Based on the planning of the scheme strategy, we designed three locations in Caochang Community, corresponding to the exchange space area, the shared collection area, and the popular science display area.

The exchange space area corresponds to the public space in front of the Caochang Kindergarten. Considering the daily activities of children and the waiting area for parents to pick up and drop off, the vegetable planting area is relatively small. The design sets up market selling areas and planting areas that match the height of children. Kindergarten teachers can integrate sustainability into daily teaching, instilling sustainable concepts into students from a young age, as shown in Figure 8.

Figure 8. exchange space area rendering, Source: *Author's own illustration.*

The shared market area corresponds to the public space in front of the elderly care station, serving as the location for the community convenience kitchen and small canteen. It completes a series of activities for the shared kitchen. The entire process is open and shared. Residents can experience the most sustainable circulation method of pre-meal and post-meal kitchen waste treatment and apply it to their family dining, as shown in Figure 9.

Figure 9. shared market area rendering, Source: *Author's own illustration.*

The education and demonstration areas are strategically distributed across underutilized public spaces within the community, which have been replanned and repurposed to serve as key showcases for the community's sustainable development initiatives. These spaces now function as important educational hubs, enhancing public awareness and engagement in environmental sustainability, as shown in Figure 10.

Figure 10. education and demonstration areas rendering, Source: *Author's own illustration.*

4.6. Community Building and Outcome Promotion

In the course of the project, we held regular composting workshops, inviting experts in the field of environmental protection to explain the principles and methods of composting to community residents, and instructing them on how to convert food waste into organic fertilizer. Through these workshops, residents not only acquired practical environmental skills, but also strengthened their sense of identification with the sustainable development of the community. Such practical activities not only raised residents' awareness of environmental protection, but also promoted communication and cooperation among neighbors, forming a good atmosphere of community interaction.

At the same time, we organized community staff and volunteers to visit the compounds in the community, to deeply understand the needs and feedback of residents in the process of project implementation, and to solve the problems encountered by residents in a timely manner. Through the visits, we actively publicize the concept of sustainability and encourage more residents to come out from the compounds and participate in the sustainable development of the community. This face-to-face communication not only brought the community staff closer to the residents, but also increased the residents' participation and satisfaction with the project.

After the completion of the design proposal, we organized a design exhibition to showcase the design concept, implementation process and results of the project, as shown in Figure 11.Community residents, community managers and representatives of social organizations were also invited to view the exhibition and discuss the project. Through the exhibition, residents were able to visualize the design scheme and put forward their opinions and suggestions. This way of design exhibition not only promotes communication between residents and designers, but also further optimizes the design scheme. Based on the resident s' feedback, we optimized and adjusted the design to ensure that it better suited the actual needs of the community. This process not only increased the participation of the residents, but also strengthened their sense of identity and belonging to the project, and deepened the awareness of the community's food issues and the construction of a zero-waste community. It also attracted the attention of the community and visitors. Through the exhibitions, we have not only raised the profile of the community, but also further promoted sustainable lifestyles and created a favorable social atmosphere for the sustainable development of the community. These exhibitions not only showcase the efforts and achievements of the community, but also stimulate the interest and participation of more residents and visitors in sustainable lifestyles.

Figure 11. scene at the exhibition, Source: *Author's own illustration.*

5. Conclusions

This study investigates how design-driven approaches can enhance community food circulation and promote sustainable urban regeneration. Through the integration of Research through Design (RTD) and a life-cycle perspective, the project develops a systematic framework that connects food production, consumption, waste management, and spatial transformation within the Caochang Community. Rather than treating food-related issues as isolated problems, this research demonstrates that embedding food circulation into participatory design processes can effectively activate underutilized spaces, strengthen community engagement, and foster a localized circular food system. The findings highlight the potential of design as both a methodological tool and a strategic intervention in addressing complex socio-environmental challenges in urban communities.

5.1. RTD and Life Cycle Perspective Provide a Practical Framework for Community Renewal

The combination of RTD and the whole life cycle perspective provides a new solution for optimizing the community food system. Through design practice and resident co-creation activities, RTD is able to tap into the actual needs and behavioral patterns of community residents, so that the design solutions can accurately meet the needs of community development, and significantly increase the degree of resident participation and the sustainability of project implementation. In the Caochang community, we encourage residents to participate in all phases of the project through design workshops, resident group pairing activities and design exhibitions. In the Caochang community, we encourage residents to participate in all stages of the project through design workshops, resident group pairing activities and design exhibitions, transforming residents from passive recipients to active participants. This participatory design not only enhances the feasibility and acceptance of the project, but also strengthens the cohesion of the community and the residents' sense of belonging through design practice. RTD has demonstrated its strong social mobilization ability in this process, embedding the concept of sustainability into the daily life of the community through design activities, and promoting the deep integration of community autonomy and ecological civilization.

5.2 Necessity of Resident Participation and System Optimization in Community Renewal

In the process of urban community renewal, the whole life cycle perspective provides an important theoretical framework and practical path for system optimization and sustainable development. The whole life cycle perspective emphasizes the complete chain from the production and consumption of resources to the disposal of waste, and integrates all aspects of community renewal into a unified system to ensure the efficient use of resources and minimize environmental impacts. The design practice of Beijing Caochang community connects food production, consumption, and waste disposal into a closed-loop system through a whole-life perspective. This systematic design approach not only optimizes the physical space of the community, but also reshapes the social

structure and cultural identity of the community through the design practice, and enhances the residents' awareness of and participation in sustainable lifestyles. The application of the whole life cycle perspective not only provides a new perspective for community renewal, but also provides a systematic optimization model for other urban communities.

5.3 Limitations of the Study and Future Outlook

Despite achieving significant results in Caochang Community, this study still has some limitations. Firstly, the research sample scope is limited to Caochang Community, and the universality of the conclusions needs further validation. Secondly, the research time span is relatively short, and the long-term effects and sustainability of the project require further observation and evaluation. Additionally, the study lacks quantitative assessment of resident participation, and future research needs to further refine the evaluation index system to more accurately measure resident participation and project effectiveness. Future research can expand the sample scope to apply RTD to more urban communities to verify its universality and effectiveness. The research can also extend the observation period to assess the long-term effects and sustainability of the project. Furthermore, future research can refine the evaluation index system for resident participation to provide a more scientific basis for optimizing community food systems.

Design for ethical food choices: analyzing the opportunities and challenges of smartphone applications in promoting sustainable consumer behavior.

Giulia Panadisi*[a], Vincenzo Maselli[a],

a Sapienza University of Rome

*giulia.panadisi@uniroma1.it

ABSTRACT | In recent years, there has been growing awareness of the ethical implications of food choices, particularly regarding sustainability, environmental impact, animal welfare and health (Benthem de Grave et al., 2024). Despite many consumers expressing a desire to align their eating habits with ethical values, they struggle to make informed and consistent food choices. Factors like socioeconomic constraints, product availability, personal preferences, and the complexity of the food system itself often result in compromises that deviate from ideal decisions (Agyemang et al., 2024).
Digital technology, particularly smartphone applications, has emerged as a powerful tool to support individuals in navigating these challenges. They offer users instant access to information about the ethical implications of their food choices, and provide real-time data on product sourcing, nutritional content, environmental impact, and other considerations, allowing users to make more informed decisions in line with their ethical priorities. While apps designed for health-related diet tracking have garnered significant attention and adoption, those focused on broader ethical aspects of food choices are still in the early stages of development (Haas et al., 2022). There is a growing need to explore how these apps are designed, how effectively they address consumer needs, and what opportunities and challenges exist in their widespread adoption.
This paper aims at bridging this gap by examining the design characteristics of the most popular food purchase apps, and offering an in-depth analysis of the opportunities and challenges they present for effective implementation. The study contributes to a broader understanding of how digital technologies can be leveraged to promote ethical food purchasing and consuming behaviors and is preparatory to define the aesthetic, typological and functional characteristics of new products aimed at supporting ethical

food consumption behaviors. The methodology used in this research combines both quantitative and qualitative approaches by applying the Mobile App Rating Scale (Mauch et al., 2015). First, the most downloaded and higher rated mobile applications related to food purchasing will be identified: will be included those apps written in English, subscription free and with a high user rating. These apps will be then coded to capture their design characteristics, by using the four domains of the above-mentioned MARS scale: engagement, functionality, aesthetics, and information.
The findings aim to evaluate design characteristics of mobile applications and how they influence food purchase behaviors. Aspects under analysis will be the presence of customized recommendations, gamification, real-time feedback, integrated learning modules, and also the quality of interfaces, contents, navigability and all features useful to engage users effectively, and to maintain long-term user engagement – that today remain a big challenge as many users abandon apps shortly after download if they do not see immediate results (Moiz Riaz et al., 2023). Based on the findings, the paper will provide recommendations and design strategies for food purchase technological artifacts. Design choices will be demonstrated to be essential in ensuring that the app's core features are easily accessible, in optimizing the learning process, in motivating users to engage with the app through personalized contents and integrated long-term strategies.

KEYWORDS | UX DESIGN, FOOD PURCHASING AND CONSUMPTION HABITS, ETHICAL DESIGN, SUSTAINABILITY, MOBILE APPS

1. Introduction

In an era where global food systems face mounting challenges, including climate change, resource depletion, and rising health concerns, the promotion of the ethical implications of food consumption choices, particularly regarding sustainability, environmental impact, animal welfare, and health has become a critical priority (Willett et al., 2019). The global urgency to address unsustainable consumption patterns, indeed, is underscored by alarming statistics. According to the World Health Organization (2024), unhealthy diets contribute to six of the top ten global risk factors for disease. Moreover, food systems are responsible for approximately one-third of anthropogenic greenhouse gas emissions and significant shares of freshwater use and land occupation (Aleksandrowicz et al., 2016; Crippa et al., 2021). Consumers are more and more aware of this critical scenario, but they often face challenges in making informed and consistent choices, despite expressing a desire to align their food purchasing and consumption habits with ethical values. Socioeconomic limitations, product availability, personal preferences, and the complexity of the food system frequently led to compromises that deviate from their ideal decisions (Agyemang et al., 2024).
In this scenario, digital technology has become a powerful tool to help individuals navigate food consumption challenges, utilizing various solutions such as wearable devices, online platforms, social networks, and data-driven recommendation systems, with mobile applications playing a particularly important role. The range of mobile apps addressing eating habits and food choices has grown considerably in the last decades (Hingle & Patrick 2016), offering diverse functions tailored to different objectives. The specific focus and functionality of these apps have played a key role in shaping their success and adoption, with apps addressing personal health and fitness goals gaining widespread popularity, while

those tackling broader ethical concerns, such as sustainability and fair trade, have seen slower uptake (Haas et al., 2022). This highlights a growing need to examine how these apps are designed, what opportunities and challenges they face in achieving broader adoption and how effectively they meet consumer needs. Mobile apps, for instance, can offer users instant access to information about the sustainable practices and consequences of their food choices and provide real-time data on product sourcing, nutritional content, environmental impact, and other considerations, bridging the gap between knowledge and action and equipping users with tools to make informed decisions that align with environmental and ethical considerations (Mauch et al., 2018).

Furthermore, the significance of mobile apps in advancing sustainable consumption is supported by an increasing body of research. For instance, a study on the *MySusCof* app highlights its effectiveness in reducing food waste through user engagement and personalized recommendations (Haas et al., 2022). The app's design incorporates behavioral nudges, gamification, and insights to encourage users to adopt waste-reducing habits. Similarly, a review of food-related apps conducted by a group of researchers from the Newcastle upon Tyne University (United Kingdom) underscores the potential of these tools to support ethical decision-making by offering transparency about food sourcing, environmental impacts, and nutritional values (Benthem de Grave et al., 2024). Sustainability in food systems is not solely about reducing waste but also about fostering dietary shifts toward more environmentally friendly and health-promoting options. The *DISH - Dashboard for Improving Sustainable & Health food choices* app, described in an article written by a group of researchers from the University of Arkansas (USA) exemplifies this approach. It provides users with metrics that quantify the health and environmental impacts of their meal choices. By combining data on disability-adjusted life years (DALYs) and environmental footprints, DISH empowers users to make choices that extend beyond personal health to include societal and ecological well-being (Agyemang et al., 2024). Behavioral science plays a pivotal role in the efficacy of these apps. Techniques such as gamification, social comparisons, and feedback mechanisms have proven successful in altering consumer behavior (Dhahak & Huseynov, 2020). For instance, DISH's use of "EnCoins" – a virtual currency earned or lost based on the sustainability of food choices – encourages users to compete and collaborate within social groups, enhancing engagement and accountability. Furthermore, the integration of traffic light labeling systems, as demonstrated in apps like MySusCof and DISH, simplifies complex information into intuitive cues, making sustainable choices more accessible.

These few examples demonstrate that mobile apps act as catalysts for systemic change, fostering demand for sustainable products and practices across the supply chain. However, despite their potential, food-related apps face challenges that must be addressed to maximize their impact. Issues such as low user engagement, lack of integration with broader sustainability metrics, and limited accessibility for diverse populations highlight the need for continuous innovation and refinement.

The food transition thus emerges as a systemic priority that requires the mobilization of both individual and collective behaviors, technologies, and design practices. It is not simply about changing personal habits and food production, but about rethinking how food is distributed, and communicated. Within this framework, it's possible to address "food serenity" as a design goal to the pursuit of a new ethic and equilibrium between health, sustainability, and

pleasure, so placing the well-being of both humans and ecosystems at the core of the design agenda. Designers, in this context, are called to operate within a hybrid and increasingly political space: designing for food is not just about solving technical problems or creating pleasing user interfaces, but about shaping behaviors and values. Compared to other sectors, food-related apps respond to specific needs: they must address deeply rooted cultural habits, the emotional significance of eating, the complexity of supply chains, and users' struggle to access trustworthy information. Designing such applications means acknowledging that each interaction can become an opportunity to support informed, responsible, and ethical choices.
This study aims to examine the design features of the most popular food purchase apps and provide a comprehensive analysis of the opportunities and challenges they present for effective implementation. The research was conducted by the authors between November 2024 and February 2025. The methodology combines quantitative and qualitative evaluation criteria, relying on the Mobile App Rating Scale (MARS) (Stoyanov et al., 2015) to assess the applications in terms of engagement, functionality, aesthetics, and information quality.
The goal is to enhance the understanding of how mobile technologies can be leveraged to encourage ethical food purchasing and consumption behaviors, offering insights that may inform the aesthetic, typological, and functional development of future tools designed to support food transition efforts. This research is preparatory to the design of new digital products that do not merely assist but actively transform food-related decision-making.

2. Ethical practices in design food consumption mobile apps

From a design perspective, ethical food consumption is a goal that can be achieved through different approaches and strategies that address the environmental, social and health dimensions of food systems. Designers interpret ethical practices as a framework to create products and services that are accessible, engaging, beneficial, respectful of the users and the society (FasterCapital, 2022), and in the food consumption scenario this has implied developing tools and strategies for promoting transparency in food production, reducing waste, and advocating for equitable labor practices (Sanchez-García et al., 2024).
Mobile apps design translates these actions into features by integrating data visualization, personalized recommendations, and gamification (Minh et al., 2023). For instance, traffic light systems simplify complex sustainability metrics into intuitive visual cues, guiding users toward healthier and more sustainable options. Similarly, gamified elements such as reward systems encourage positive behavior changes by creating a sense of achievement and community engagement (Agyemang et al., 2024).
Mobile applications designed to promote ethical and sustainable food consumption can be classified according to their core objectives and the social impacts they aim to achieve. Broadly, these apps can aim at one or more of the following purposes:

- *Education*: These apps can focus on raising awareness and educating users about the environmental, social, and health implications of their food choices. Examples can include apps that provide information on carbon footprints, water usage, and fair-trade practices. The above mentioned MySusCof app exemplifies this category by integrating educational content with practical tools to reduce food waste. Such apps often target

individual behavior change by equipping users with knowledge to make informed decisions.

- *Behavioral Change*: Apps pursuing this goal leverage behavioral science principles to encourage sustainable practices. Features like gamification, social comparisons, and rewards are common. For instance, DISH app uses EnCoins and traffic light systems to nudge users toward healthier and more sustainable choices. These apps can create long-term habits by making sustainable behaviors enjoyable and rewarding.
- *Transparency and Accountability:* Transparency apps can provide detailed information about the sourcing, production, and environmental impact of food products. They empower consumers to hold companies accountable for their practices. Examples include apps that scan product barcodes to reveal supply chain data or calculate the ecological footprint of specific items. By promoting transparency, these tools contribute to broader systemic changes in food production and distribution.
- *Community Engagement*: Apps can focus on building communities around sustainable consumption. By enabling users to share their experiences, track collective progress, and engage in friendly competition, they foster a sense of collective responsibility. The social features of DISH, which allow groups to monitor their sustainability performance, highlight the potential of community-based approaches to amplify individual efforts.
- *Decision Support*: Apps can provide comprehensive decision-making support. Again DISH, for example, combines health metrics with environmental indicators to offer a nuanced understanding of food choices. By addressing multiple dimensions of sustainability, these tools cater to users with diverse priorities and motivations.

Apart from the general objectives that drive the primary user decision to download them, the effectiveness and impact of these apps varies importantly based on their design features and on their ability to engage users and integrate seamlessly into daily life. Features such as intuitive interfaces, graphic choices, real-time feedback, and culturally relevant content enhance user experience and adoption. Additionally, collaborations with stakeholders – including governments, non-profits, and private sector entities – can expand the reach and impact of these tools. For instance, partnerships with retailers and food producers can facilitate the integration of app functionalities into shopping experiences, further bridging the gap between knowledge and action.
In the following sections a selection of mobile applications aimed at pursuing ethical and sustainable food purchase and consumption goals will be examined in order to evaluate qualitative aspects such as purposes, design characteristics and how they influence food purchase behaviors. Qualities under analysis will be related with engagement, functionality, aesthetics and purpose (Mauch et al., 2018), such as the presence of customized recommendations, gamification, real-time feedback, integrated learning modules, and also the quality of interfaces, contents, navigability and all features useful to engage users effectively, and to maintain long-term user engagement – that today remain a big challenge as many users abandon apps shortly after download if they do not see immediate results (Moiz Riaz et al., 2023). By categorizing these apps based on their effectiveness, it's possible to gain a deeper understanding of their roles in promoting ethical and sustainable food consumption. As technology continues to evolve, these tools will play an increasingly critical role in shaping a more sustainable and equitable future.

3. Methodology of selection and analysis

The methodology followed for selecting and analyzing mobile applications designed to encourage sustainable food purchasing and consumption behavior has incorporated both quantitative and qualitative criteria.
The selection has involved stringent quantitative filters such as: apps have to be downloadable for free, available in English, have more than 5.000 downloads, a user rating of at least 3.5 out of 5, and be accessible on both Google Play and App Store. Quantitative filters such as download counts and user ratings will be consequently considered further parameters for understanding the impact, the popularity, the satisfaction and the overall adoption rate of the selected applications. Additionally, selected mobile applications must fall within the "Health & Fitness," "Lifestyle," or "Food & Drink" categories. Qualitatively, the apps must explicitly target at least one of the above described purposes: education (providing users with information about sustainable food practices, such as the environmental impact of food choices or nutritional benefits), behavioral change (encouraging users to adopt new, more sustainable consumption habits through tailored interventions), transparency and accountability (offering clear and reliable data on food sourcing, environmental impact, and ethical considerations), community engagement (creating a sense of collective effort by connecting users to communities with shared goals, decision support (assisting users in making informed and ethical food choices through tools like product comparisons or personalized recommendations).
The analysis tool used for outlining the main features of the selected apps has been the *Mobile App Rating Scale* (MARS), an app quality rating tool originally applied for assessing the quality of health mobile apps. The MARS tool provides a comprehensive framework for the evaluation of mobile applications, ensuring a structured and multidimensional analysis of their effectiveness, based on indicators of engagement, functionality, aesthetics, information quality and subjective quality. The integration of the MARS framework with the outlined qualitative objectives provides a holistic approach to evaluating mobile applications aimed at promoting sustainable food consumption. The section “engagement” refers to the app’s ability to captivate and retain user interest through interactive and motivational features. Key aspects include customization, gamification, real-time feedback. “Functionality” evaluates the technical performance of the app, focusing on its usability, reliability, and ease of navigation. “Aesthetics” assesses the visual and design quality of the app. An appealing interface can enhance user satisfaction and encourage sustained engagement. Key components include visual appeal, layout and visual identity of the app. “Information” is a critical parameter, evaluating the quality, accuracy, relevance, and reliability of the content provided by the app. A detailed description of the mentioned components for each quality domain will be provided in the next paragraph.
By hybridizing these parameters with the above-described purposes, the methodology ensures that selected apps not only meet technical and design standards but also effectively influence user knowledge, behaviors and decisions. This dual focus on evaluation criteria and qualitative objectives enhances the potential for these digital tools to drive meaningful change in consumer habits, contributing to broader sustainability goals. Engagement, for instance, ties directly to the qualitative objective of community engagement, as features like

forums, social media integration, or shared goals foster a sense of collective action. Apps with strong engagement strategies are better positioned to motivate users toward sustainable practices and retain them over the long term. The functionality of an app, on the other hand, is closely linked to the qualitative objective of decision support. Reliable tools for searching, filtering, and comparing food products enable users to make informed, ethical choices efficiently. A functional app removes technical barriers, allowing users to focus on their sustainability goals. The aesthetics of an app can indirectly support all five qualitative objectives by creating an environment that feels professional, engaging, and aligned with the app's ethical mission. Apps with robust information strategies, furthermore, directly support the qualitative objectives of education and transparency and accountability. For instance, an app that educates users about the carbon footprint of various food items and provides actionable recommendations enhances both user knowledge and trust.

4. MARS analysis sheet

This section explores in detail the parameters of the MARS framework applied to the selected mobile applications, emphasizing their relevance in assessing the quality of the apps and their broader potential to influence consumer habits.
The Mobile App Rating Scale (MARS) is a tool designed by a group of researchers from the Queensland University of Technology (Australia) to evaluate the quality of mobile health applications systematically (Stoyanov et al. 2015). The tool employs a five-point scoring system, where higher scores indicate better quality, thus providing a nuanced view of app performance. This multidimensional approach enables a more comprehensive evaluation than traditional single-factor rating systems, which may overlook critical aspects of user experience and app effectiveness (Mandracchia et al., 2020).
MARS framework can effectively differentiate between apps based on their quality metrics, revealing significant variations in user engagement and functionality among similar applications (Siddique et al., 2019). Therefore, employing the MARS scale, the analysis of the case studies, provided in the next section, not only assessed the technical aspects of the apps but also considered the user experience, thereby providing a comprehensive evaluation of their potential effectiveness in promoting sustainable consumer behavior.
Its four objective subscales focus on critical quality dimensions: Engagement, Functionality, Aesthetics, and Information Quality, while a fifth section captures Subjective Quality, reflecting personal impressions.
The section "engagement" measures how well the app engages its users. Engagement reflects the app's ability to attract and retain attention through qualities such as:

- *Entertainment*: Evaluates how enjoyable the app is, including the presence of gamification or other engaging features.
- *Interest*: Focuses on the app's ability to captivate users with compelling and well-presented content.
- *Customization*: Assesses the extent to which users can personalize app settings to their preferences.
- *Interactivity*: Rates features such as reminders, notifications, and feedback options, ensuring they are user-friendly and not overwhelming.
- *Target Group*: Evaluates the appropriateness of the app's design, language, and content

for its intended audience.

"Functionality" is a foundational section of app quality, as technical flaws or complicated navigation can compromise the app's effectiveness. Included parameters are:

- *Performance*: Measures the app's responsiveness and technical reliability, including the presence of bugs or crashes.
- *Ease of Use*: Assesses how intuitive and user-friendly the app is, including the clarity of instructions and menu design.
- *Navigation*: Evaluates the logic and flow of screen transitions, as well as the availability of essential links.
- *Gestural Design*: Examines the consistency and intuitiveness of gestures like taps, swipes, and scrolls across the app.

The section "aesthetics" focuses on the app's visual design. Aesthetics are crucial for creating a positive first impression and enhancing the user experience, especially for health apps aiming to engage users consistently. Analysed parameters are:

- *Layout*: Evaluates the organization of buttons, menus, and content on the screen for clarity and usability.
- *Graphics*: Assesses the quality, resolution, and consistency of visual elements.
- *Visual Appeal*: Rates the app's overall attractiveness, including the effective use of colors and stylistic elements.

The section "information" assesses the quality, accuracy, and credibility of the app's content. For these kinds of apps, high-quality information is essential to ensure users receive reliable and relevant guidance, which can impact their health outcomes. This section assesses parameters such as:

- *Accuracy of App Description*: Checks whether the app's features align with its store description.
- *Goals*: Evaluates the app's ability to set clear, measurable, and achievable objectives.
- *Quality of Information*: Rates the correctness, coherence, and relevance of the app's content.
- *Quantity of Information*: Assesses the extent of coverage and whether the information provided is comprehensive but concise.
- *Visual Information*: Examines the clarity and accuracy of visual aids, such as graphs, charts, or videos.
- *Credibility*: Evaluates the legitimacy of the app's source (e.g., government, university, or trusted institution).
- *Evidence Base*: Rates the app's support by scientific evidence, including randomized controlled trials (RCTs).

The fifth section "subjective quality" captures the rater's personal impressions and overall experience with the app. While subjective, these items provide valuable insights into the app's perceived utility, satisfaction, and value to potential users.

- *Recommendation Likelihood*: Assesses how likely the rater is to recommend the app to others.

- *Frequency of Use*: Estimates how often the rater would use the app over 12 months if relevant to their needs.
- *Willingness to Pay*: Reflects the app's perceived value in terms of willingness to pay for it.
- *Overall Star Rating*: Provides a holistic rating of the app based on the rater's overall impression.

5. Case studies analysis

Applying the defined selection criteria, 20 examples of mobile applications focused on sustainable food choices were identified. The complete list of analyzed applications is available in [Figure 1], along with the selection criteria [Figure 2].
As mentioned, the selection does not only include apps that concern the purchase of healthy food, but also those that educate on a more sustainable diet, that allow to reduce food waste in various ways and to have a more ethical and balanced menu.
The first step of the analysis required categorising these applications based on their primary objectives and functionalities, which align with key dimensions such as education, behavioral change, transparency and accountability, decision support, and community engagement.

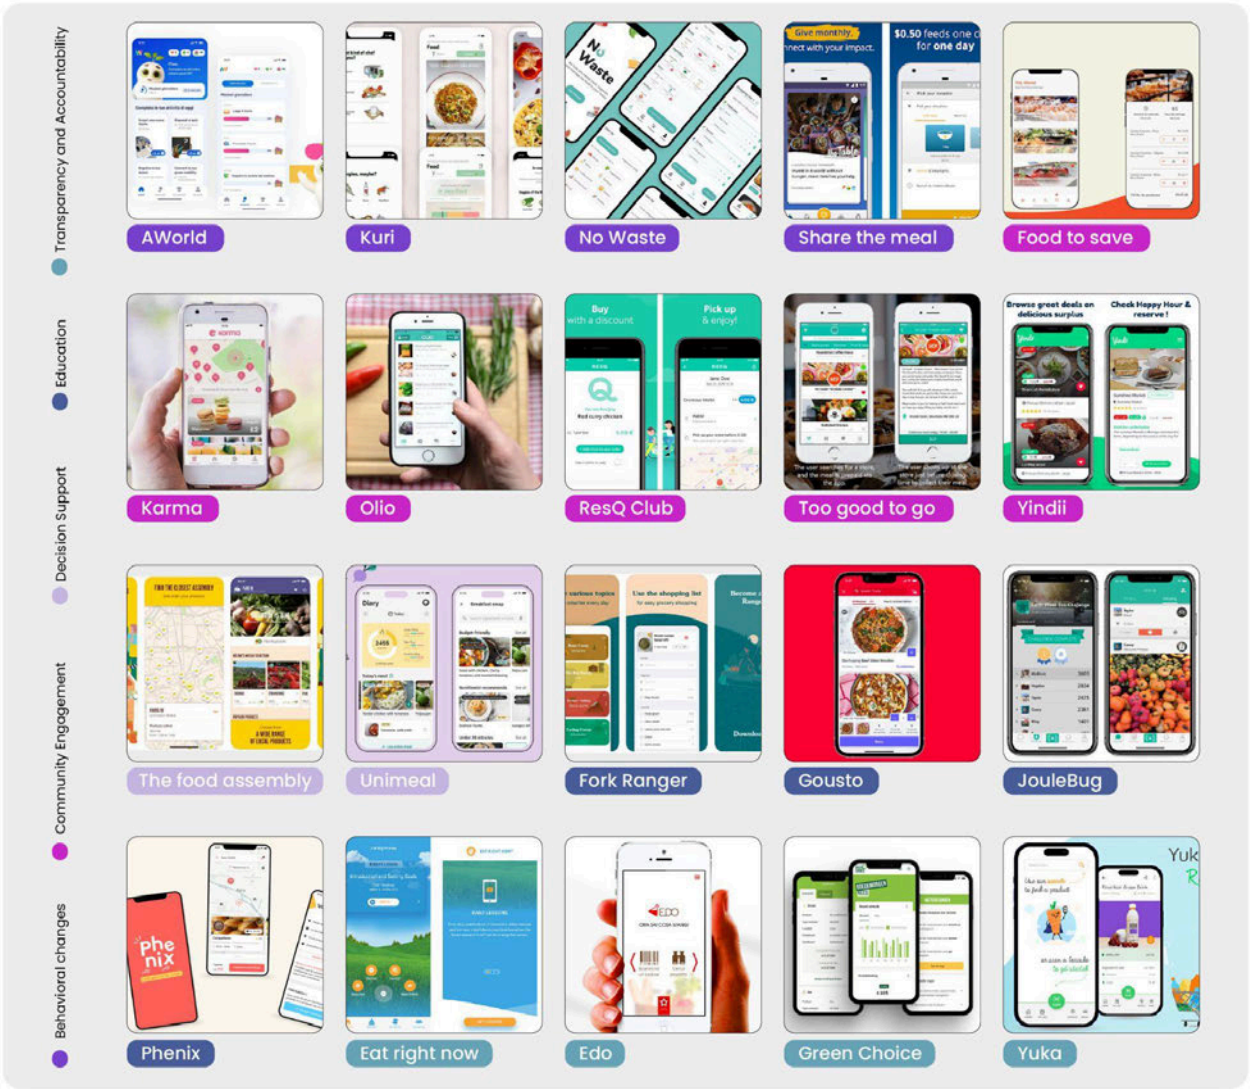

Figure 1. Interfaces of the twenty mobile applications selected and classified according to their core objectives.

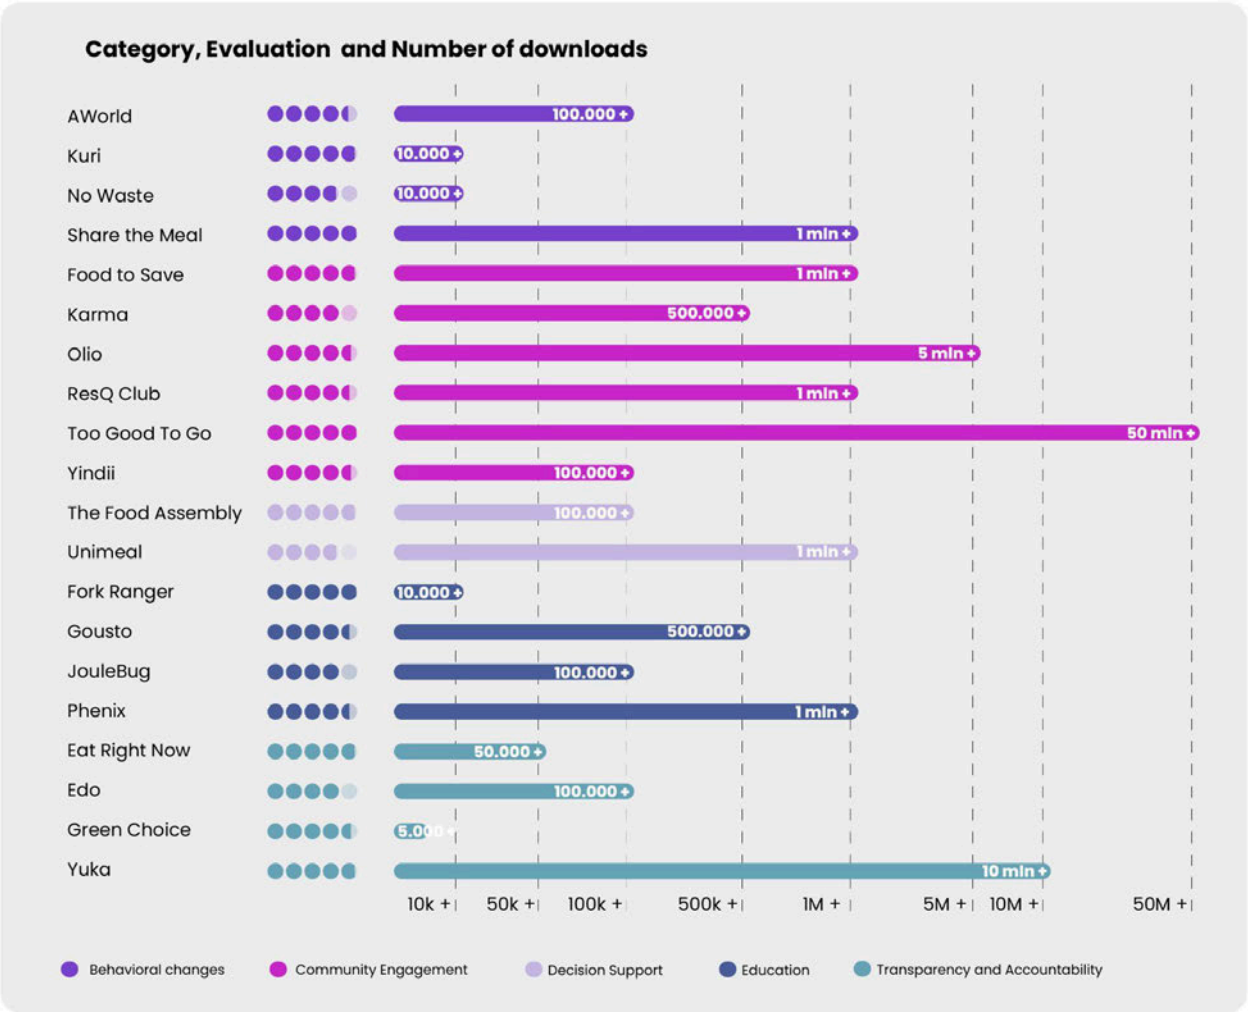

Figure 2. The infographic presents the twenty applications analyzed by identifying their categories, user ratings and total number of downloads.

5.1. Categories of ethical food mobile applications

- Education-Focused Applications
  Educational apps have been developed for the purpose of raising awareness and informing users about the impact of their food choices. These applications offer insights into subjects such as food waste, environmental impact, and nutritional value. For instance, *JouleBug* employs gamification techniques to promote sustainability, utilising challenges and recommendations to minimise waste. Similarly, *GreenChoice* utilises detailed product scores to educate users about the environmental impact of various grocery items.

- Behavioral Change-Oriented Applications
  The utilisation of behavioural change applications has emerged as a significant strategy in promoting sustainable practices among users. These applications employ various techniques, such as nudges, reminders, and gamification, to motivate users to adopt sustainable habits. Notable examples of this include the apps *Too Good To Go* and *Olio*, which have been shown to engender a sense of urgency and motivate real-time actions

to avert the waste of surplus food. These apps leverage behavioural science techniques, such as loss aversion, to motivate users to participate.

- Transparency and Accountability
  Transparency-focused applications empower users by furnishing them with detailed product information, including ingredients, sourcing, and ethical certifications. Applications such as *Yuka* and *Edo* facilitate the scanning of product barcodes, thereby providing immediate feedback regarding the health and environmental impact of items. These applications have been shown to encourage responsibility by drawing attention to unsustainable practices within the food supply chain.

- Decision Support Tools
  Decision-support applications facilitate the process of ethical decision-making by providing users with curated recommendations or alternatives. For instance, *GreenChoice* utilises filtering mechanisms to categorise products based on sustainability and dietary preferences, while *NoWaste* assists users in planning meals by leveraging their existing pantry inventory to minimise waste.

- Community Engagement Platforms
  Community-driven applications are centred on the establishment of connections among users with the objective of promoting shared objectives, such as the reduction of food waste or the support of local producers. Examples of such apps include *Olio* and *Food Assembly*, which facilitate the exchange of surplus food within communities, emphasising collaboration and shared responsibility. These platforms frequently incorporate social networking features, thereby enhancing user engagement.

In order to gain a more deep understanding of the impact of these applications, an analysis was conducted on download counts and user ratings from app stores. Applications such as *Too Good To Go* and *Olio* exhibited high levels of user adoption, with millions of downloads and average ratings in excess of 4.5 stars. These metrics highlight user satisfaction and the perceived value of these tools. Conversely, less popular applications, such as *JouleBug*, exhibited niche appeal, catering to specific user groups but with lower overall adoption rates.

5.2. Analysis by MARS evaluation criteria

After having collected and selected the apps, divided them into categories according to the objectives of each one and collected the numbers relating to downloads and evaluations, the analysis and evaluation phase began by filling out the MARS sheet for each application. In this way each app can be systematically assessed for its effectiveness in promoting sustainable food behaviors. A detailed analysis was carried out for each application, the results of which are summarised below. The final scores obtained by the applications according to the five criteria of the MARS scale are taken into consideration, and the most successful applications for each of these are highlighted. This will facilitate comprehension of the most effective design elements for this application type and potential enhancements in the design of analogous products.

Engagement [Figure 3] is defined as the extent to which an application successfully captures and retains the interest of its users. Applications that demonstrate high performance in this domain incorporate features that are interactive, gamification mechanisms, and personalisation elements. To illustrate this point, consider the example of the *Too Good To Go* app, which utilises real-time notifications to alert users to available surplus food, thereby creating a sense of urgency. Similarly, *JouleBug* employs leaderboards and achievements to foster competition among users. Conversely, applications with static interfaces and limited interactivity, such as *NoWaste*, encounter difficulties in sustaining long-term user engagement, despite their practicality. Community engagement is another critical aspect. Exemplary apps in this regard include *Olio* and *Food Assembly*, which utilise food-sharing platforms and local initiatives to foster social connections. These features not only increase user activity but also contribute to broader societal goals, such as reducing food insecurity and building resilient communities.

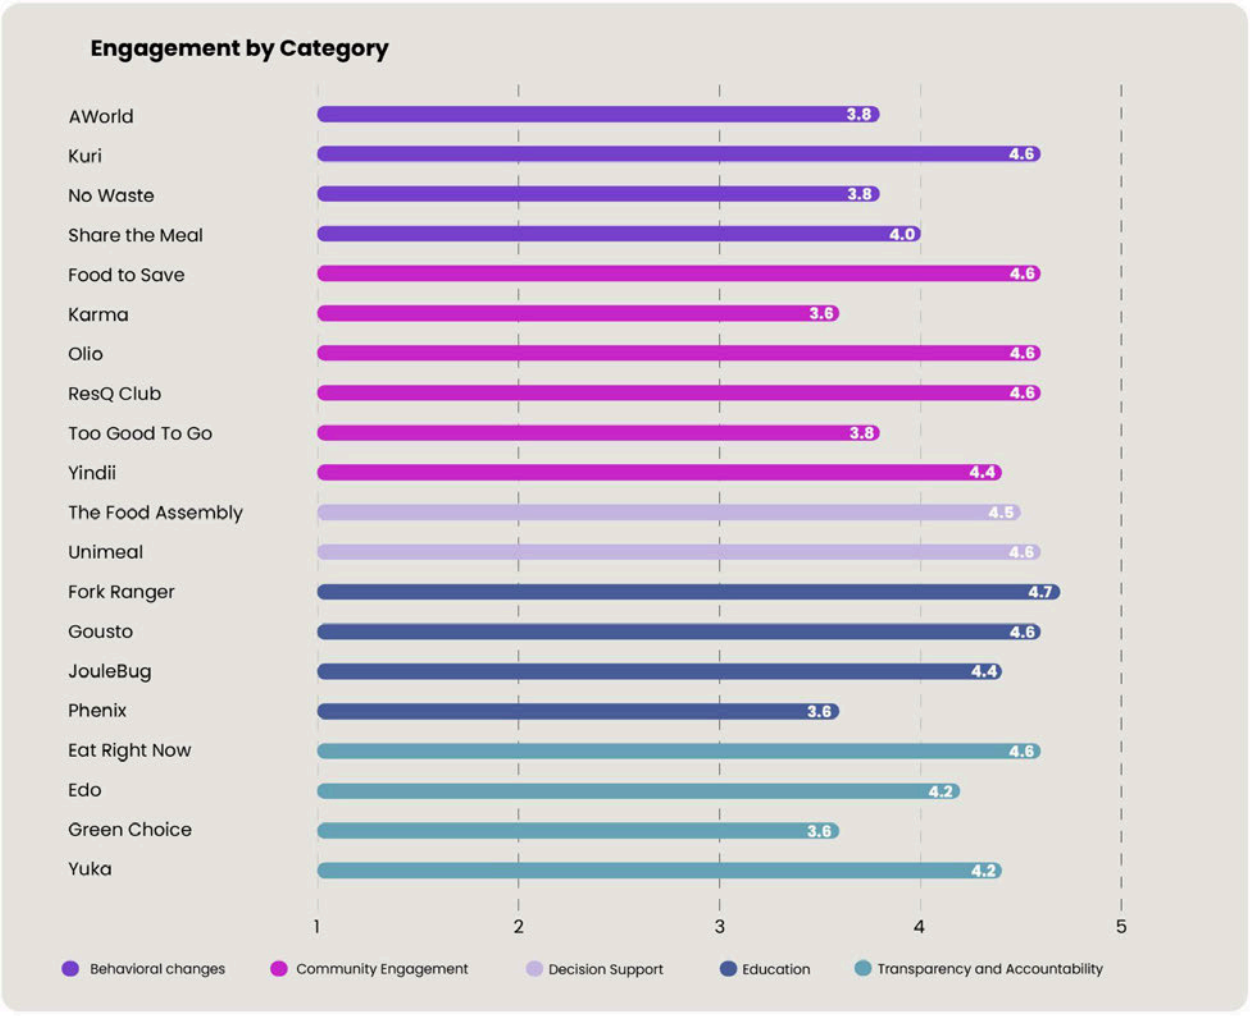

Figure 3. The infographic presents the twenty applications analyzed by identifying the categories they belong to and the evaluation of the engagement parameter, according to the MARS sheet.

Functionality [Figure 4] is defined as the technical performance and usability of an application. This encompasses parameters such as speed, reliability, and ease of navigation. Notable examples of such applications include *Yuka* and *GreenChoice*, which are distinguished by their advanced barcode scanning capabilities, providing users with

immediate feedback on the sustainability of products. These functionalities are complemented by intuitive interfaces that guide users effortlessly through complex information.
Conversely, certain applications have been observed to demonstrate deficiencies in their technical capabilities. For instance, users of *Phenix* have reported intermittent crashes and protracted load times, which may impede the app's adoption. Furthermore, the absence of offline functionality in certain apps, such as *Too Good To Go*, poses challenges for users in areas with limited internet connectivity.

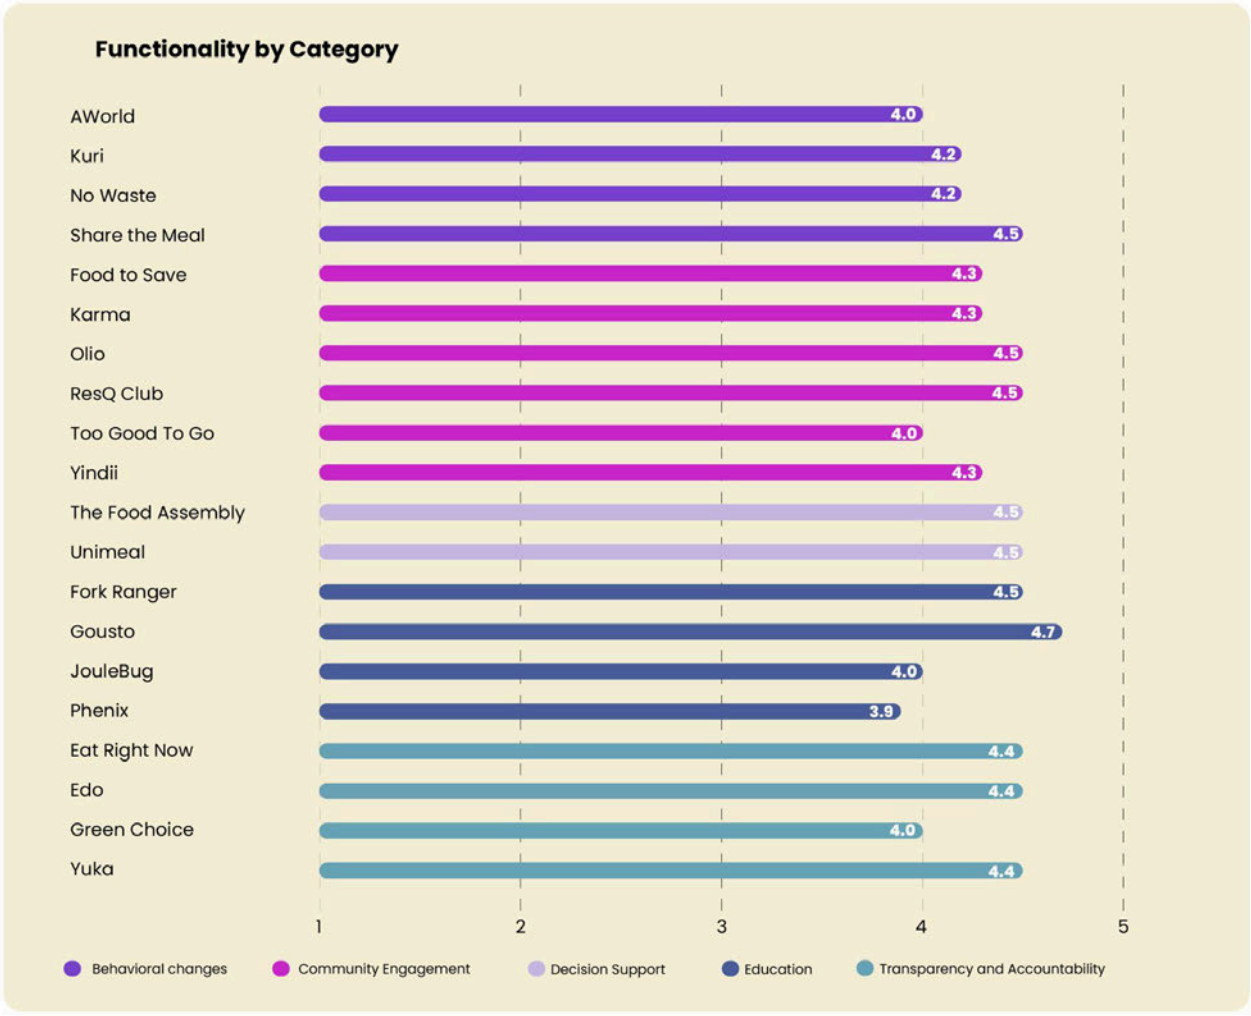

Figure 4. The infographic presents the twenty applications analyzed by identifying the categories they belong to and the evaluation of the functionality parameter, according to the MARS sheet.

The concept of *aesthetics* [Figure 5] in the context of software applications refers to the visual design and overall appeal of the application. Effective applications, such as *Olio*, employ clean layouts, consistent colour schemes and visually engaging graphics to enhance the user experience. The efficacy of these design choices is twofold: they enhance the aesthetic appeal of the application and improve its usability by reducing cognitive load.
However, it is important to note that not all applications meet these standards. A case in point is the *Karma* interface, which is characterised by a cluttered layout and an absence of visual hierarchy, potentially causing users to experience being overwhelmed. This underscores the

importance of aligning aesthetic design with functional goals to create a cohesive user experience.

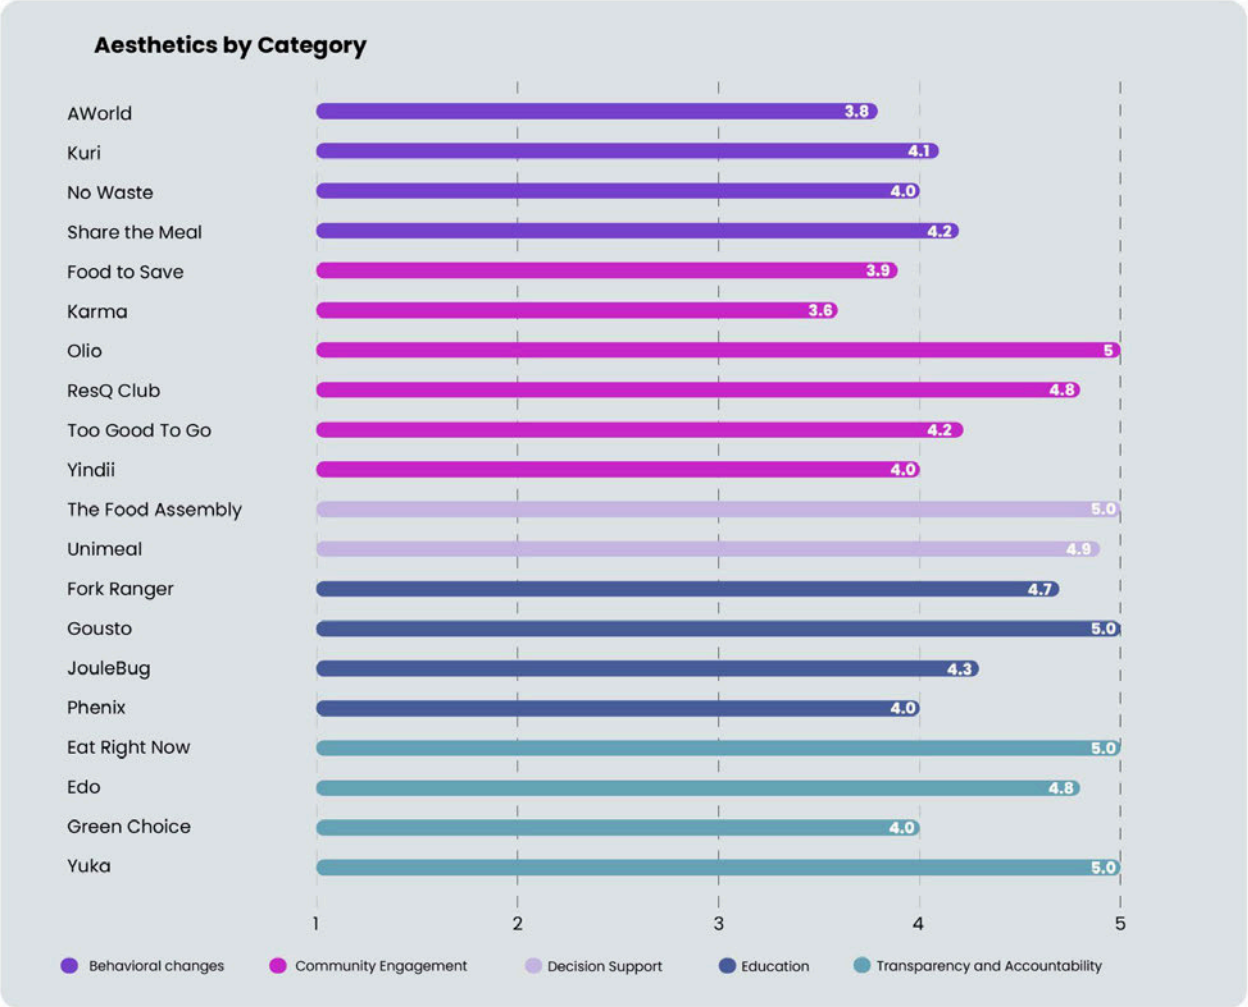

Figure 5. The infographic presents the twenty applications analyzed by identifying the categories they belong to and the evaluation of the aesthetic parameter, according to the MARS sheet.

The *quality of information* [Figure 6] provided by an application is critical for its credibility and effectiveness. Applications such as *Yuka* and *Edo* are exemplary in this domain, as they provide scientifically validated data on product health and environmental impact. These applications frequently incorporate citations from reputable sources, thereby enhancing their perceived reliability.

Nevertheless, the depth and breadth of information vary significantly among apps. For instance, while the *Too Good To Go* app's emphasis is on pragmatic solutions to address food wastage, it provides comparatively limited educational material, as evidenced by its similarity to *JouleBug*. This discrepancy can be attributed to the differing objectives and target demographics of these platforms.

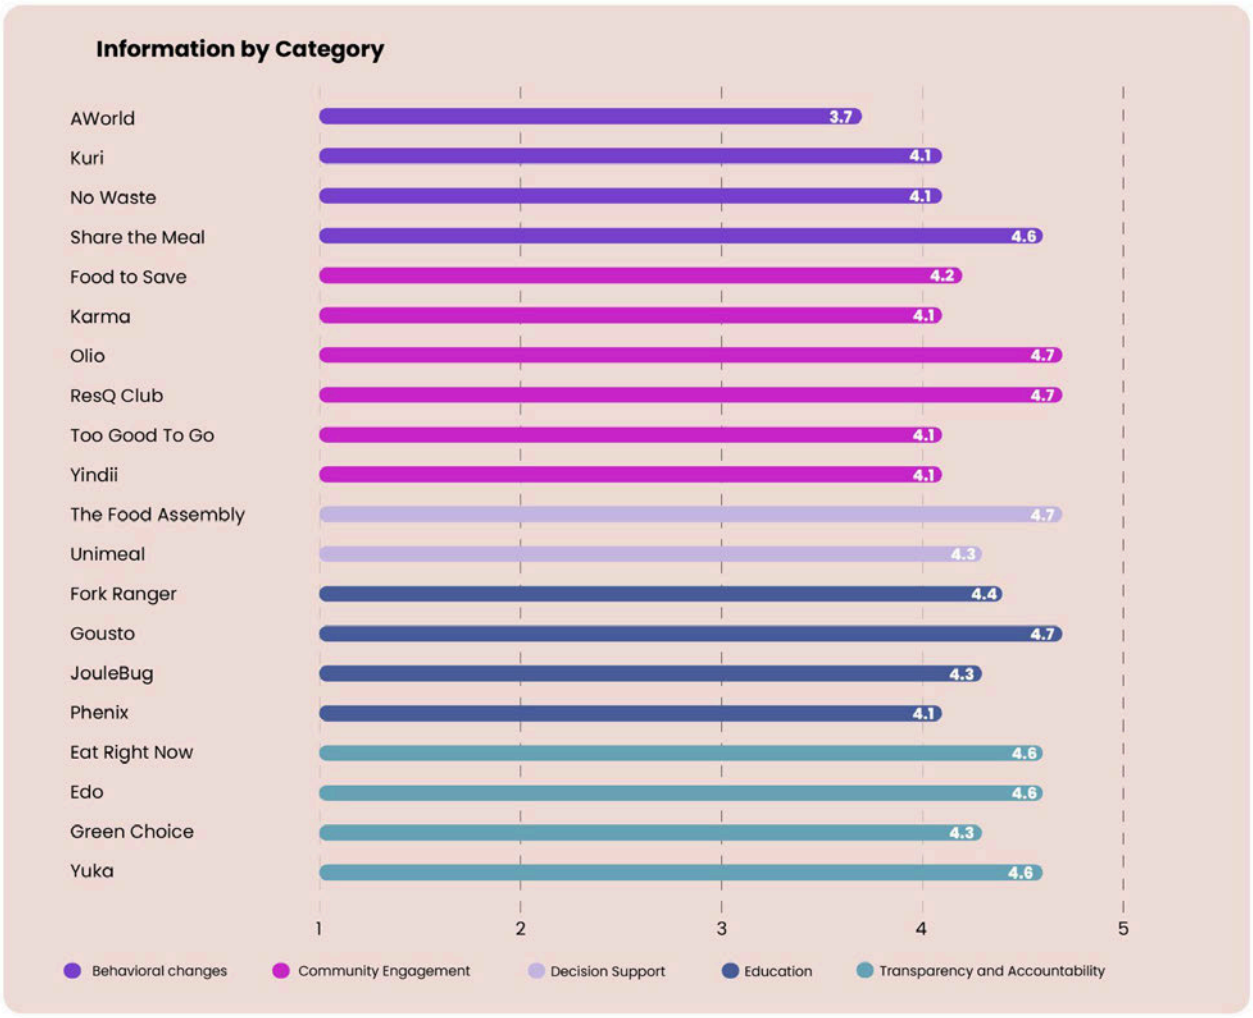

Figure 6. The infographic presents the twenty applications analyzed by identifying the categories they belong to and the evaluation of the information quality parameter, according to the MARS sheet.

Subjective quality [Figure 7] is defined as the user's perception of an app, including its ease of use, relevance, and overall value. High-rated applications such as *Gusto* and *Fork Ranger* have been shown to receive positive feedback with regard to their impact and practicality. Users value the tangible benefits of these apps, such as financial savings and reduced waste, which align with personal and environmental goals.
Conversely, apps with lower ratings are often the subject of criticism regarding technical issues or a lack of clear value propositions. For instance, some users of *Aworld* reported difficulty in setting up their pantry inventory, highlighting the need for more intuitive onboarding processes.

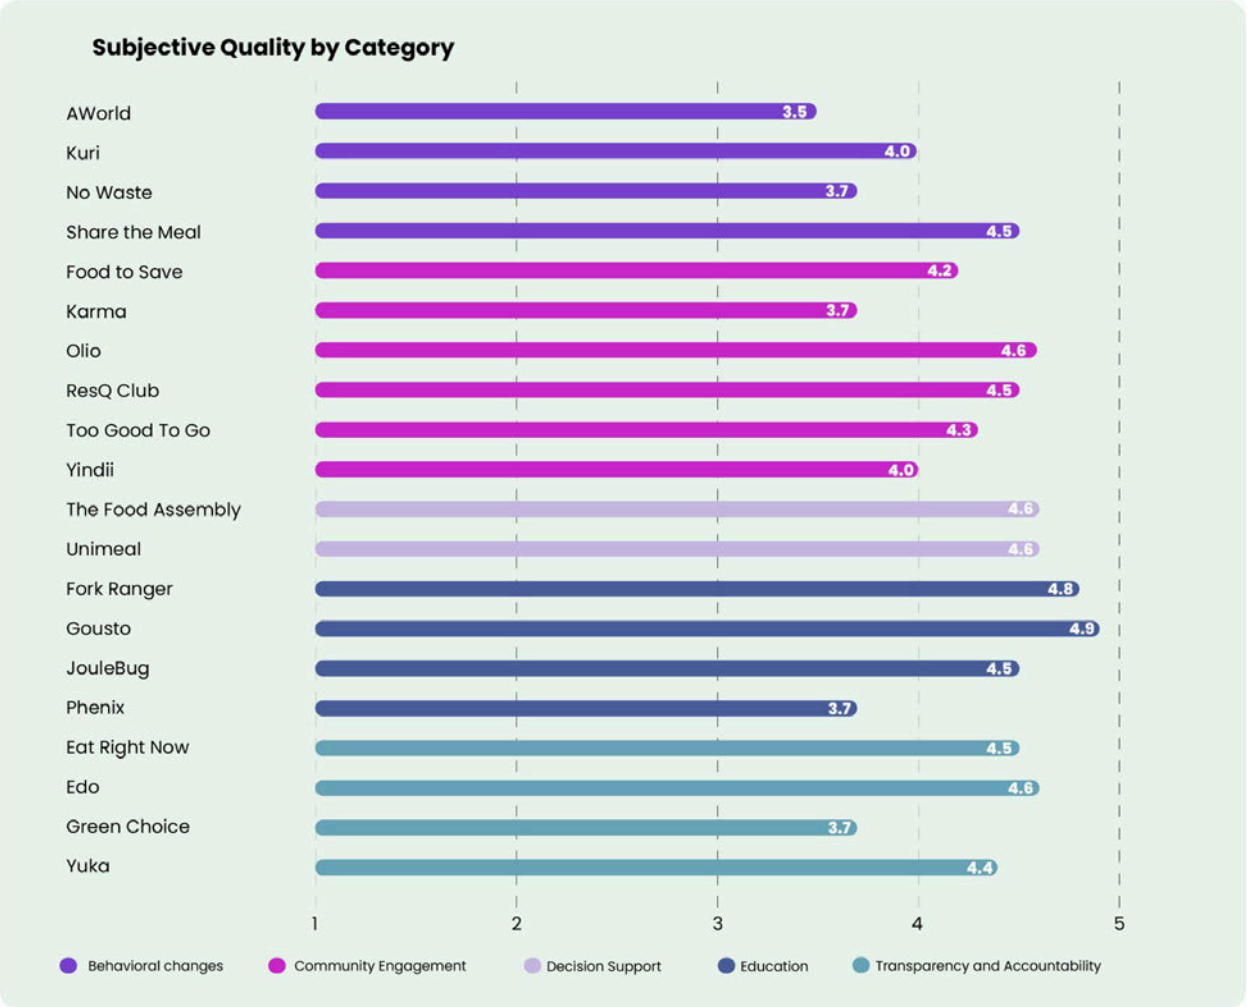

Figure 7. The infographic presents the twenty applications analyzed by identifying the categories they belong to and the evaluation of the subjective quality parameter, according to the MARS sheet.

6. Discussion and conclusion

This case studies analysis underscores the heterogeneity of approaches to promoting ethical food choices and their divergent levels of effectiveness. By employing a categorization system based on five key dimensions — education, behavioral change, transparency and accountability, decision support, and community engagement — it becomes evident that each app category addresses unique aspects of sustainable consumer behavior.
Furthermore, the comparison between the MARS sheet analyses highlights that the most successful apps integrate multiple dimensions, leveraging engagement, functionality, and information quality to maximize their impact. Nevertheless the highest scores were achieved, according to the authors, in the "aesthetic choices " category, as seen in [Figure 8].
This comprehensive evaluation offers a detailed understanding of the opportunities and challenges in designing digital tools for ethical food choices, paving the way for future innovations in this field.

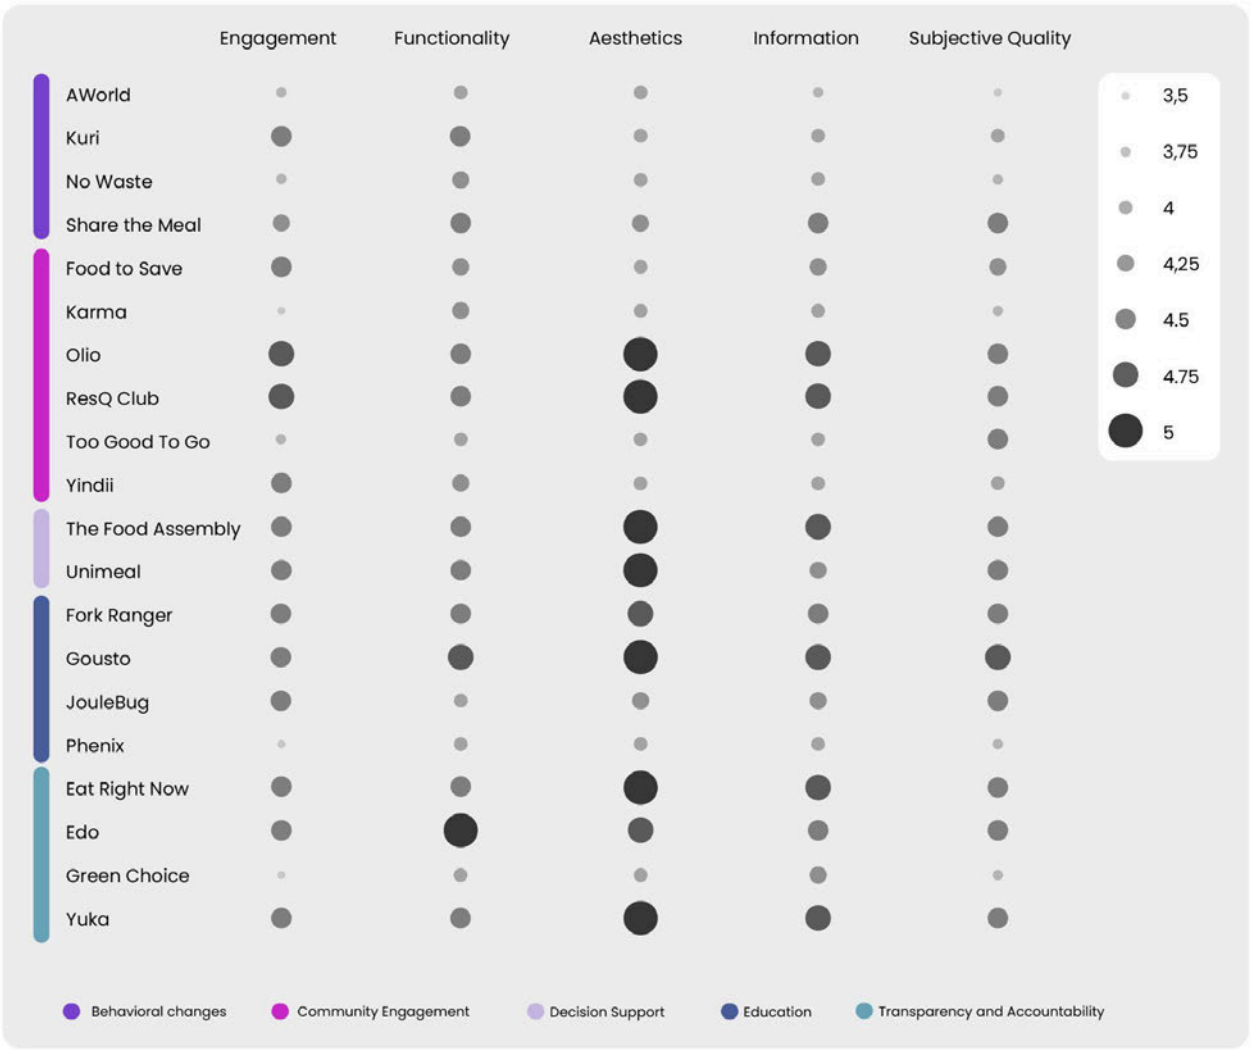

Figure 7. The infographic compares the twenty applications according to all the five MARS categories and evaluates them according to the MARS five-point scoring system.

A substantial body of research has identified that a significant proportion of users tend to discontinue the use of apps shortly after downloading them, primarily due to an absence of immediate results or engagement (Shah et al., 2022). Consequently, it is imperative to evaluate the quality of interfaces, navigability, and content to ensure sustained user engagement (Roy et al., 2020). The incorporation of personalised recommendations and gamification strategies has been demonstrated to enhance user experience and promote long-term commitment to ethical food choices (Stifani et al., 2023). As a result of the analysis of the case studies, several design strategies can be identified as being critical for creating impactful and effective applications in this domain.

- Integrating Education and Gamification: Combining educational content with gamified elements can enhance user engagement and promote behavioral change. For example, incorporating challenges, rewards, and progress tracking motivates users to adopt sustainable habits. Apps like JouleBug demonstrate how gamification can transform sustainability into an engaging activity.
  Gamification strategies can include daily challenges, interactive leaderboards, and badges for milestones. For instance, apps could reward users who save a specific amount of food or complete a week without wasting groceries. These strategies can

create a sense of accomplishment while embedding sustainable habits in everyday routines.

- Enhancing Transparency and Accountability: Applications should provide clear, accessible, and scientifically validated information about the ethical and environmental impact of food products. Barcode scanning features, as seen in Yuka and Edo, can empower users to make informed decisions. Transparency builds trust and fosters long-term engagement.
  Enhancements in this area could involve real-time updates on product sustainability scores or partnerships with ethical certification bodies. For example, integrating blockchain technology could improve traceability, allowing users to verify the origin and environmental impact of a product throughout its supply chain.
- Leveraging Community Engagement: Encouraging users to participate in collaborative efforts, such as food-sharing platforms or local initiatives, can strengthen the social impact of these apps. Features like community forums, event planning tools, and real-time sharing capabilities can foster a sense of collective responsibility.
  For instance, apps could implement neighborhood-based challenges where users collaborate to reduce a predefined amount of waste. Additionally, integrating feedback mechanisms, such as user reviews of food-sharing experiences, could strengthen trust and encourage active participation.
- Improving Accessibility and Usability: Ensuring that apps are intuitive, responsive, and accessible across diverse user groups is essential. Simplified onboarding processes, offline functionality, and support for multiple languages can broaden the reach and inclusivity of these tools.
  Accessibility-focused design can include voice recognition for visually impaired users or simplified interfaces for those less familiar with digital technologies. Apps like Too Good To Go could also integrate offline meal planning tools to assist users in areas with limited connectivity.
- Incorporating Behavioral Science Principles: Apps can integrate nudges, reminders, and loss-aversion strategies to influence user behavior effectively. For example, Too Good To Go uses real-time notifications to encourage immediate action, leveraging urgency to drive engagement.
  Additional principles, such as positive reinforcement and visual storytelling, could be utilized. For instance, showing users their cumulative impact—such as the amount of food saved or emissions reduced—can reinforce sustainable behaviors. Highlighting small, achievable actions fosters long-term adherence.
- Supporting Decision-Making with AI: Advanced algorithms and AI-driven recommendations can tailor the user experience to individual preferences and needs. By analyzing user behavior and providing personalized suggestions, apps like GreenChoice help users align their choices with sustainability goals.
  Expanding AI capabilities can include predictive features, such as recommending recipes based on expiring pantry items, or alerting users about local food-sharing events. AI can also analyze broader trends to offer community-wide suggestions for collective impact.
- Balancing Aesthetics and Functionality: A visually appealing interface should complement, rather than compromise, an app's usability. Clean design, consistent

layouts, and well-organized information can enhance user satisfaction while ensuring functionality remains a priority.
Designers can experiment with dynamic visual elements, such as progress dashboards or interactive maps, to present data in an engaging yet intuitive manner. Moreover, incorporating color schemes aligned with sustainability themes (e.g., greens and earthy tones) can reinforce the app's mission.

- Prioritizing Long-Term Engagement: Features that encourage repeated use, such as daily tips, habit trackers, and progress reports, can sustain user interest over time. Gamified rewards and social validation mechanisms can further reinforce positive behaviors.
  Apps could introduce seasonal challenges or community-wide goals, such as reducing food waste during holidays. By periodically refreshing content and goals, apps can maintain user interest and prevent stagnation.

By adopting these strategies, designers can create applications that not only address the challenges of promoting ethical food choices but also inspire lasting behavioral changes among users.

Designing for Dignity: Addressing Food Insecurity & Mental Well-Being Among Aging Adults

Amrita Datta, Amy Perry-Goldsmith
Indiana University - Herron School of Art and Design, Indianapolis
amdatta@iu.edu

ABSTRACT

Over the past decade, extensive discussions have centered on the United Nations and its Sustainable Development Goals (SDG). As human-centered designers, how can we make an impact on individuals and communities? What role can designers and design educators play in collaborating with communities to ensure that our designs align with the needs and aspirations of both organizations and residents?

In the United States, communities are grappling with systemic inequities that disproportionately affect older adults, particularly concerning food insecurity. A design study investigating food insecurity in older adults was undertaken at Indiana University in Indianapolis, one of the top five universities in the United States recently recognized for research progress toward the UN SDG. Since 2020, Central Indiana has experienced over 50% increase in people requesting food assistance. Thus, the research investigates essential aspects, including dietary requirements, the existence of food deserts, challenges related to mobility and accessibility, and the impact of social services on the mental and social welfare of older adults. The goal is to pinpoint effective modifications in food systems and support frameworks to improve their overall quality of life.

A critical aspect of the study emphasizes the authors' pedagogical approach within the undergraduate Visual Communication Design curriculum and how this design project was developed and facilitated within a virtual global exchange with students from South Korea in a studio classroom environment.

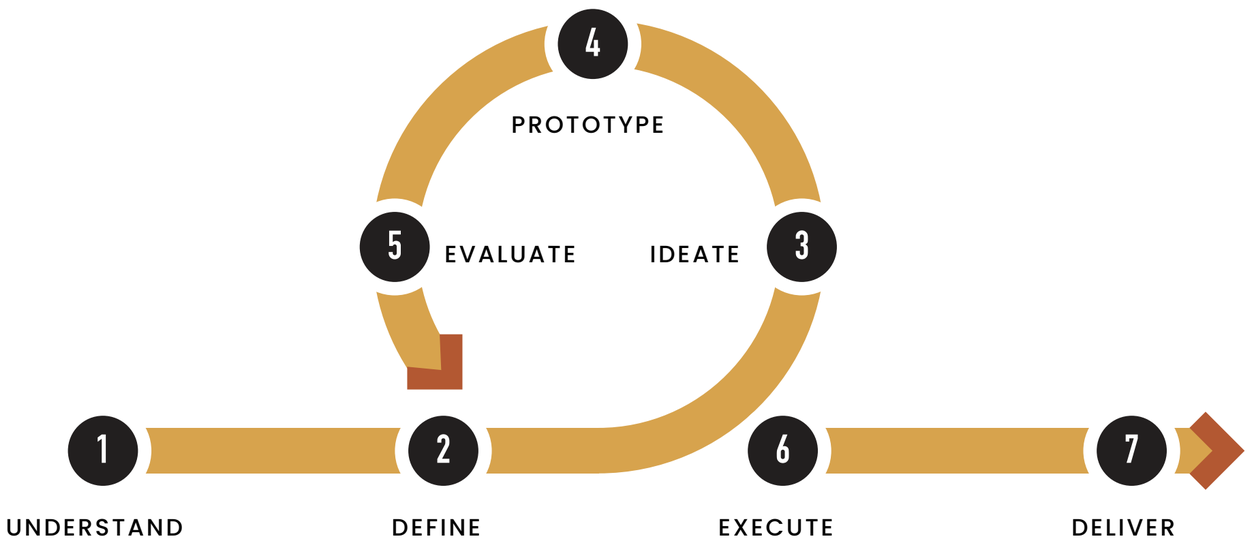
TEACHING METHODOLOGY



© Visual Communication Design Herron School of Art + Design

Collaborative Action Research in Design (CARD) Process

PROJECT PURPOSE

+ To collaborate with community partners and utilize the design process that can drive a positive change and contribute to the Sustainable Development Goals.

++ To educate elderly populations about nutrition, food programs, and how to access help.

+++ To visualize a series of posters that draws attention to the issue of food insecurity among the elderly.

PROCESS, CHALLENGES AND OUTCOMES

To execute this project, we followed the seven-phase Collaborative Action Research in Design (CARD) Process Model developed by Herron School of Art + Design.

Understand: Student designers met with our partners at the Boner Center to learn about how they support seniors with food security and understand their communication needs on the topic.

Define: As a part of the virtual global exchange, students from Herron & Yonsei divided into groups with different defined problems to address, ranging from "Exercise and Food Synergy" to "Hydration for the Elderly" & conducted independent research.

Ideate-Prototype-Evaluate: Each team ideated about how to design effective visuals for Boner Center clients, developed protoypes, and offered their work to the larger group for critique and evaluation. This iterative cycle was repeated until each group produced refined work that communicated its message well for the Senior Center audience.

Execute: Once teams created final versions of their designs, they produced professional quality printed posters and/or pamphlets.

Deliver: For the final step in the CARD Process, Herron students delivered their materials to the Boner Center, installing posters in the Senior Center and giving pamphlets to staff to share with clients.

While navigating this community-engaged learning experience, students faced the challenge of empathizing with the elderly–considering typeface and font size that would be readable and color choices that would be high contrast for people with low vision. Students also had to learn about unfamiliar topics and expand their engagement in the community.

Students learned to use the CARD process to work with community partners and develop designs that address sustainable development goals. Designs were well received at the Boner Center, and the seniors were particularly interested as they saw the flood of young adults installing their work on delivery day.

The center staff and clients talked with the students, and everyone seemed to enjoy participating in the work together. Hopefully, our students' work and their messages will have a positive impact on the Boner Center senior community.

COMMUNITY ENGAGEMENT STRATEGIES

12.9% of Central Indiana residents age 50-59 were food insecure in 2020.

In 2022, America's Health Rankings Senior Report ranked Indiana as 42nd overall for enrollment in the Supplemental Nutrition Assistance Program

DESIGNING TRANSITION FOR CUSTOMER FOOD JOURNEY

Mirja Kälviäinen

The Institute of Design and Fine Arts, LAB University of Applied Sciences
mirja.kalviainen@lab.fi

ABSTRACT | Long-term research around customer-driven Service Design for environmentally sustainable consumption has also been applied to Customer Food Journeys to enable the necessary change in food consumption. Consumer research has typically found an attitude-behaviour gap hindering sustainable behaviour change (White & Habib, 2018). Tools based on consumer research contain the idea, that consumers would need environmentally sustainable solutions as services that blend effortlessly with their everyday lives (Kälviäinen, 2019). This is especially evident with our daily food consumption amid everyday life's pressures. The behaviour change understanding with triggers and nudges deriving from behavioural psychology (e.g., Bucher, 2020), combined with an enabling journey supports crossing over the barriers and motivation with drivers of environmentally sustainable food behaviour. Since one-third or at least one-fourth of the global emissions come from our food systems (Ritchie, 2021), the environmentally sustainable food transition is a critical measure in mitigating climate change. It is even more important in combatting biodiversity loss, with the emerging calculations of food production being the major factor, with approximately 80% of the food agriculture land dedicated to inefficiently feeding meat-purpose animals. The Customer Food Journey design for behaviour change has been a target case with the developed tools for customer-driven service design in various international contexts. The analysis of the food journey workshops with international design students and professionals has verified the wide frame for food consumption encompassing consumers' identities, social-cultural heritage, and networks. In addition, the workshops have demonstrated how the Consumer Food Journey is a long multi-moment journey with a variety of touchpoints, physical evidence, and intervention possibilities. It stretches from the diversity of attitudes and interests with food and lifestyle connections (e.g. health and well-being) to opportunities, information sources, knowledge, and contexts applied in purchasing, to capabilities of cooking, and to measures of avoiding or handling waste. All of this enforces the

importance of solutions encompassing the psychological knowledge of behaviour change described in the Michie et al. (2011) COM-B model as the joint activation of capabilities, opportunities, and motivation. These form the building blocks for behaviour change with Customer Food Journey moments. In detailed touchpoint design, the psychological heuristics and biases of fast thinking are also helpful. (Kälviäinen, 2021). The Customer Food Journey solutions can be applied to food transition requirements by the government, counties, cities, and businesses such as restaurants, food markets, transportation, and even farms or producer networks striving to drive the food transition. For many food businesses, the significant environmental sustainability impact can be demonstrated by measures supporting the food consumption transition towards less wasteful vegetarian nutrition. Instead of a decreased footprint impact of production, an increase in the impact of the handprint is required, allowing less impact on solutions' consumption and leading businesses to good net impact results (e.g., Upright Project). This is not a measure to be achieved by the provision part only, but to function; it requires consumption behaviour change.

KEYWORDS | SUSTAINABILE CONSUMPTION, BEHAVIOR CHANGE, FOOD DESIGN, SERVICE DESIGN, BEHAVIORAL HEURISTICS

1. Introduction

Designer-based development with food-related issues includes food design alternatives for farmers, alimentary industries, and food stores to grow, produce, and distribute food. It can also create novel offerings for consumers to purchase, cook, and eat, transforming the roles of food in people's lives and in social-cultural communities. (Lee et al., 2020). This all points to the design of systems-based production-consumption processes.

Globally even one-third of the emissions come from our food systems (Ritchie, 2021). Transition to environmentally sustainable food is a critical measure in mitigating climate change, even more so in combatting biodiversity loss. Approximately 80% of the food agriculture land is dedicated to inefficiently growing food for meat-purpose animals. Designing sustainable food systems with products, practices, and experiences that minimize environmental impact, promote biodiversity, and support local economies is required. Compared to other environmental impact areas of consumption (mobility, housing, products, and services), food has accounted for less than one-fourth of the consumption's influence on carbon dioxide emissions (Salo & Nissinen, 2017) but emerging research on consumption's biodiversity impact demonstrates food as the most harmful area of consumption.

Designers are professionals in solution desirability and human-solution interactions. In sustainable food design, the interaction focus leads easily to technological solutions (examples of sustainable food design in Castanho et al., 2024). However, acceptability and adapting the new solutions to use are what counts. Consumer research has constantly found evidence of an attitude-behaviour gap hindering sustainable behaviour even when people's attitudes are pro-nature (White & Habib, 2018). Research on environmentally sustainable behaviours has demonstrated that consumers need environmentally sustainable solutions as services that blend effortlessly with their everyday lives. Amid everyday life's pressures this is especially evident with our daily food consumption. In complex everyday life food-related activities happen amongst a multitude of other activities and as a long process such as getting the food, cooking, eating it, and taking care of the leftovers. (Kälviäinen, 2022).

A customer journey framework for environmentally sustainable customer solutions has been developed based on service design combined with understanding and tools from behaviour change psychology (Kälviäinen, 2019). In this paper, Customer Food Journey tasks from ten years of workshops are used to demonstrate how to put the framework into practice. Marchand (2013) describes how strong, sustainable consumption includes the reasonableness of consumption on many levels: taste, purchase, and lifestyle decisions. The analysed workshops have focused on food since people need to eat every day, and food design forces to reflect on sufficiency instead of designing unnecessary products. It also has the potential to truly regenerative design solutions.

2. The requirements, barriers, and drivers for food transition

The ecological food consumption requirements for a hoped-for transition exist in many guidelines. Salo and Nissinen (2017) propose eating sustainably by buying only the necessary amount of food and avoiding waste by using food before expiring dates or purchasing food close to expiring date and restaurants' leftovers. People should buy local and seasonal food and favour local vegetables, beans, lentils, soy, and fish. Less meat

(especially red) and fewer dairy products (especially hard cheeses) should be used.

New recommendations for healthy eating were published in Finland as a food pyramid (Figure 1) in autumn 2024, based on the Nordic recommendations by 300 nutrition researchers. The purpose was to cover environmental sustainability requirements in addition to research-based guidance for a healthy diet. The decrease in the use of red meat supports both purposes. The recommendations suggest a diet based on a variety of vegetables, lentils, and mainly fish as protein instead of other animal meat. (Valtion ravitsemusneuvottelukunta, 2024).

Figure 1. The Finnish food pyramid from the national food recommendations (Valtion ravitsemusneuvottelukunta, 2024).

Diet recommendations serve as food design guidelines demonstrating the direction where to steer consumers' food choices. Attention should be paid to the strong relationship between eating habits, social-cultural traditions, and identity demonstrated by the heated discussion around the Finnish eating recommendations. Eating is a delicate and multifaceted issue. Siltamäki's (2024) column around the Finnish recommendations invited hundreds of even defiant comments. Individual freedom

claims spread on social media, presenting the environmental good as evil when it threatened the personal social-cultural-identity-related habits.

Using only science-based diet requirements does not tackle the environmentally sustainable food consumption challenge. The consumer research findings of an attitude-behaviour gap hindering sustainable behaviour change (White & Habib, 2018) explain the insufficiency of mere information. Behavioural economics sees humas as irrational since instead of following sensible information they behave in predictably irrational and biased ways, especially in quick decision-making situations. (Samson, 2015).

Shu et al. (2017) have combined motivational patterns of human behaviour for ecological products from psychological and sociological models. These patterns include values, beliefs and attitudes, personal and social norms, habits, capability, trust, and context conditions with opportunities, availability, constraints, and costs. Lockton's research team's (2013) analysis of green action-supporting solutions included themes about self-image, getting things done, seeing results, feeling normal, easing guilt, and getting rewards. The supportive solutions favour "social evidence": what peers do or recommend. The symbolic role of consumption connects to identity building with personal interests, such as improving health. Drivers for habit transition and barrier removals should be used when designing positive, long-term consumption solutions.

All of this is detectable in the social-cultural meaning of food entangled with celebrations, hospitality, symbolic or status meanings, and family and local identities. Traditions affect routines and everyday choices, so familiar and well-known food is experienced as pleasurable, safe, and tasty. Individual eating habits are persistent, like eating meat every day. People have health-related ideas and requirements, such as a sporty lifestyle connected to amble need for protein. Ethical and environmental concerns count in food choices, along with worries about animal welfare or nature protection. Finally, economic resources define purchases.

The multifaceted phenomena of eating highlight the importance of a multi-focus strategy to promote sustainable food consumption behaviours. This means research into consumer motivation, contexts, and activities and how consumers could notice and adapt low-impact solutions' new habit requirements. Besides concrete and detailed solutions, influencing consumption patterns and motivation for sustainable behaviour seems central.

Understanding the customer drivers can help design sustainable solutions that exploit interests, and can produce emotional design outcomes of desirability, joy, and affection. Individual and social-cultural drivers can deliver intangible, emotional, and cultural value to customers in addition to practical functionality. Appealing to people's desires for subjective well-being and self-expression can effectively encourage behavioural change rather than negative information. (Muratovsky, 2013). Sustainable offerings attract consumers when highlighting the individual relevance of the functions and benefits.

The psychology for behaviour change has compiled a COM-B model, a simple rule of favourable conditions to change behaviours and ensure crossing the main barriers. The model explains how the joint effect of capabilities, opportunities, and motivation enables behaviour change. (Michie et al., 2011). This model can be reflected to typical design solutions aims. The design tries to ensure ease of use and nurturing the feelings of ability in solutions (capabilities), offer affordances of doing things and acceptability socially (opportunities), and find drives for desirability, appropriating user's interests and providing meaningfulness (motivation). (Kälviäinen, 2022).

COM-B model can be exemplified with the questions for a vegetarian person. Through decades of author's experience, the most common question has been, isn't it difficult? This question of capabilities of not knowing how to cook vegetarian food can hinder motivation and opportunities. The younger generation of vegetarians often claim to hear the doubt if there is enough protein and the request of motivational certainty for the sufficiency of protein. It then moves to capabilities of choosing the protein-dense ingredients and thus to opportunities by provision.

The drivers for sustainability analysed from qualitative interviews with 76 Finnish consumers include support, interests, and obstacles with environmental choices that also reflect the COM-B model. The interviews examined environmentally responsible consumption through the intuitive grouping of 30 images. The images were selected from themes of green consumption in earlier consumer research. Participants depicted their associations, interests, actions, and obstacles in relation to green consumption through the images and their arrangement. (Kälviäinen, 2019).

The results demonstrated in Figure 2 suggest drawing attention to areas of direct or indirect consumer interests when making sustainable choices desirable. The results also highlight how communication should overcome the unclear and contradictory information challenges. Solutions should be easy to find and use. In addition, solutions should be socially acceptable and provide social activities. (Kälviäinen, 2022).

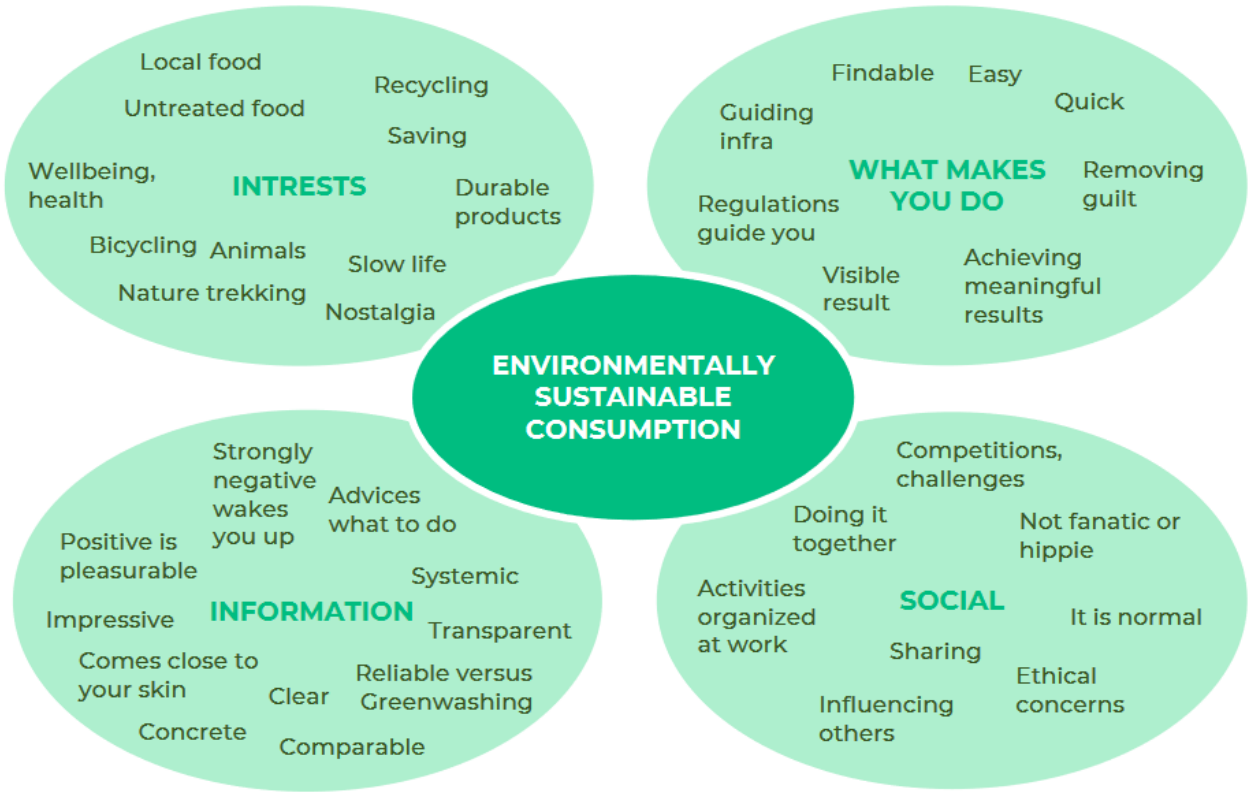

Figure 2. The drivers for solutions of environmentally low-impact consumption (Kälviäinen, 2022, 206).

Environmental performance is not at the top of consumers' minds among everyday pressures. For relevant value creation, sustainability can be indirectly added to consumers' interest in health, well-being, nostalgia, stressless living, nature trekking,

animal welfare, durable products, saving, and recycling. Information should be offered in clear, credible, and understandable ways. Comparisons to things that are familiar and understandable to the customer are helpful. Negative and impressive intimidation should be combined with advice on what you can do. Systemic concretizations help improve people's fragmented understanding.

In actual activities, the ease of finding things, accessing them, ensuring help and support for action, and clear visibility of the results provide support. The activities should help achieve tangible, meaningful results, provide rewards, and eliminate guilt. Guiding infrastructure and guiding regulations steer people but also provide social normality. Social interaction to support environmentally responsible behaviour includes sharing, challenges, competitions, and togetherness in your own circles of family, friends, or activities. Positive social responses support and reward behaviours but also produce happiness and satisfaction. The peer's willingness to activate others motivates as this is felt reliable and inviting.

These analysed drivers are backed up by similar research findings in a SHIFT meta-analysis, including social impact, habit formation, individual self, feelings and cognition, and tangibility (White & Habib, 2018). However, the drivers produced by the qualitative user research highlight not only the abstract SHIFT factors but describe some specific issues for customer influence in real solutions. All the themes from the drivers connect to food issues since food is embedded in our general structure of life, encompassing questions of health, well-being, caring for others, social life, knowledge level, time use, and monetary resources.

3. The Customer Food Journey analysis

Many behaviour change researchers have indicated a need for a process-based approach to tackle the transition. The approach for social-cultural sustainability should not be a one-off human-product interaction but solved as a real-life process (Kuijer, 2018).

In addition to sustainable behaviour drivers, the Finnish sustainable consumption research revealed a comprehensive picture of consumers' daily life constructed from busy activities and multiple pressures that related to family, working life, and free time activities setting requirements for time and money. The explaining narrative was that to perform sustainable choices and activities, people need supportive services that blend smoothly into everyday errands. The interests that motivate the initiation of the process should be considered. The solutions should not cause extra pressure but be easy to handle amongst the processes that fulfil the time and daily life. These service solutions should be accessible in the consumers' use context and at the suitable times for them. Their motivational information, and interactions should adapt to the multi-requirement constellations of everyday life. (Kälviäinen, 2022).

In service design, a service can be analysed as a customer journey covering the service process from the customer's perspective, including before the core service, during the core service, and after the core service phases. The journey is formed by service moments and interaction touchpoints and is facilitated with information channels, spatial service scape, and physical evidence of supportive products. The interaction in touchpoints pushes the service process forward. (Stickdorn et al., 2018).

The sustainable food consumption system can be analysed as a customer journey for behaviour change. The customer journey serves as an umbrella with a service style for the service moments and touchpoints where supportive factors steer the consumers toward the desired behaviour. The COM-B model from the previous chapter provides advice for service moments and touchpoints on how to ensure the necessary capabilities, motivations, and opportunities for behaviour change. As an application of a customer journey, a Customer Food Journey provides a multitude of possibilities for design since it holds a wide variety of service moments and touchpoint interactions. The practical Customer Food Journey moments can consist of the following ones:

Needs and wants for eating - planning what to eat - growing your own food - going to a restaurant or shopping for the food - delivery of the food - storing the food - cooking the food - eating the food - handling of the waste and leftovers.

These moments can overlap; alternatives and sub-moments exist, and the timespan can be short or several months when considering gardening. Typical Customer Food Journeys can be combined from the above moments. A need with social-cultural habits typically leads to food purchase planning and shopping, carrying the food home, and cooking it. Another kind of journey is activated when the need is fulfilled by eating in a restaurant. The different moments of Customer Food Journeys are carried out in different contexts and producer ecosystems.

At the beginning the consumers can be attracted by their interests, such as health, status, sociality, saving, or nostalgia. For consumers who enjoy spontaneous, impulsive shopping, designing the stimulus in shops is central. Different starting points and steering for change by place-based solutions are needed. Solutions must work in everyday haste, should dilute the feelings of conflict of information, and seem easy to execute. (Kälviäinen, 2022).

Solutions can be integrated to intertwined everyday activities. Austrian design students proposed an idea to combine commuting to work by train with an opportunity of ecological food shopping at the train station. Work-related mobility by public transport is linked to purchasing environmentally efficient food at a eco food store as an interlinked, by default sustainable food shopping system for the consumer (Kälviäinen, 2022).

The food needs and wants usually start the Customer Food Journey, coloured by the attitudes and social-cultural perceptions of food preferences and means to acquire or eat food. The eating needs are a kind of ongoing process occurring several times a day. The offering should interact with customer activities and places, and times the needs and wants for food occur. So easy discoverability and access to offerings is vital. Positive perceptions and social acceptability support making ecological choices.

In planning what to eat, the acquisition and adaptation of information, accessibility, ease of discovery and use, and social acceptability all play a role. Indirect interests as starting points for motivation support trying to change eating. Instead of scolding information campaigns, information that reaches people by connecting with their interests is appealing. Tackling the interest phenomena first is easier than solving the wholistic complexity of the Food Journey at once. (Kälviäinen, 2022).

One driver of consumer interest was nostalgia, which refers to “food prepared by grannies” or organic vegetables in recipes. Tradition-friendly meals from environmentally efficient ingredients attach the recipes to normality. A vegan challenge type of significant change is not necessary, as change can also start from feeling normal: seasonal food,

healthy food, clean food, or local and frugal food. (Kälviäinen, 2022). The planning phase already requires knowledge of recipes even when cooking is done further along the journey.

Since people tend to follow opinion leaders, celebrity influencers can be asked to offer information and recipes around environmentally sustainable eating in food-related shows and social media. Also, competitions are socially intriguing phenomena, and this human interest can be offered as a show to follow or as a possibility for participation. (Kälviäinen, 2022). Vegan challenges have had an impact in making people at least try ecological diets.

People have ceased to eat meat because of their interest in animal welfare, especially after seeing animal maltreatment (Kälviäinen, 2022). The comments about Finnish national food recommendations demonstrated meat-eating as an identity feature so social acceptability can be of support. Young lads have become enthusiastic about vegan food in Finland under the rough social media theme of Chips and Beer Vegans reflecting their identity.

The drivers of nostalgia and slow life are connected to the enthusiasm of growing your own food or harvesting it from nature. Gardening ensures your food is local and without poisonous substances. As a long-term effort, it is influential in promoting respect for food and taking food waste seriously. The solutions can also be social, as urban gardening often is. The timeline for growing food can be seasonal, but quick ways of growing edible ingredients also exist.

In addition to growing your own food, picking berries, mushrooms, or wild vegetables from nature is a form of acquiring food, together with fishing and hunting. These activities cherish knowledge of what you eat, offer relaxation from life pressures, and grow respect for food and nature. Picking food from garbage bins as an urban mining operation demonstrates how much edible food is thrown away.

In restaurant melas, the main question is selecting one, whether to eat there, for a take-away meal, or a delivery. The restaurants typically do not provide evidence of their portions' environmental or health impacts, excluding some dietary icons such as vegetarian leaves on menus. Interesting try-outs have emerged in the form of carbon dioxide emissions calculators for the ingredients to try out the impact of optional ingredients. These kinds of tools are educational since they improve the customers' knowledge of ingredients' ecological impacts. Restaurants have may opportunities to promote ecological choices with menu development.

Environmentally conscious eating habits can be spread in places that people frequently visit. The schools, universities, and work-related canteens are key actors in offering delicious sustainable food and promoting eating it. In Helsinki University Unicafe restaurants the abandonment of beef was estimated to reduce the carbon footprint by 11%, with accompanied efforts to increase vegetarian and vegan lunch sales by more than 50%. (Salomaa, 2019). The central producers of services can also be educational institutions and workplaces. An MA design project developed a challenge-based application for an existing start-up offering workplace eco-efficiency services. The pilot application consisted of an employee competition around choosing vegetarian choices for lunch.

In their shopping activities, some people plan carefully with specific recipes. Others get inspiration from the shop on what to purchase and prepare. With the latter, design can

increase knowledge and steer choice with food package information. In hasty grocery shopping, the customer does not have much time to concentrate on the product information, so easy-to-find environmentally conscious choices by product placement and general information in the shops are central. Shops can also offer suitable-sized food packages to avoid food waste. (Clune & Lockton, 2018).

Ordinary grocery stores are excellent places for influence because of their social normality. Many supermarket chains have tried to cover a vast stretch of the Customer Food Journey by offering eco-efficient recipes in their magazines and selling soon-to-age products at discounts. Ready-to-use food choices also represent an easy-to-use feature in the environmentally sustainable customer journey.

Online shopping engagement programs are influential, and they already offer carbon emission calculations from the customer purchases. A further step would be demonstrating alternatives for high-impact products and suggesting programs with default eco-choices. Consumer studies show evidence from comprehensive ecological food baskets as a viable option. Such models simplify and concretize the complex issue of environmentally efficient food choices. (Kälviäinen, 2022). How food is carried or delivered home also counts for environmental impact and services with optimized deliveries can reduce this impact. Packages of ecological ingredient with recipes can be a solution in a home delivery.

The storage facilities affect what you can purchase. The right way to store ingredients can be instructed, bearing in mind how to save energy. Nostalgic means, such as keeping food outdoors during the winter, could be re-appropriated to reduce energy consumption. Monitoring systems and optimizing the time-to-use the food at home is a means to avoid food waste.

The popularity of cooking offers many possibilities and influencers to instruct people about ecological choices. Being able and competent is a change-making requirement, so guidance on environmentally efficient cooking is particularly important. The recipes that people already use could be modified to replace high-impact ingredients with low-impact ones, like meat with vegetarian protein. Recipes should also include alternatives and compare environmental performance when using different ingredients. The portions of the recipes can include information on the environmental impacts. (Kälviäinen, 2022).

Eating can happen alone or with others. It can also be designed as an enjoyable experience around sustainable food. In eating, decreasing waste food is central. Behavioural psychology-based interventions can be helpful in preventing people from offering or taking too much food on their plates. Examples are small plate sizes or even leftover scales that work as vice-signalling devices.

The waste issue covers the amounts of food purchased and then left unused, the wasted ingredients during cooking, and the leftovers from meals. The waste problem is also connected to the increasing number of small households, contrary to the big food package sizes typical in supermarkets. The means to avoid waste can be good planning, reminder systems to use the purchased food, and advice on using leftover food. Food-sharing solutions have been piloted by different means, but they face challenges in hygiene and preservation. (Kälviäinen, 2022). The unusable food waste composting operations could be applied to complete the journey.

These Customer Food Journey moments describe the complexity of a food design for sustainable consumption and the multitude of possibilities to enable the consumer

transition. The possibilities increase when moving into the detailed service interaction touchpoints.

The design emphasizes a holistic review of user experience. The principles of behavioural psychology focus on individual decision-making interventions that lead to a change in identified key decisions, where decision support can steer behavioural changes (Bridgeable, 2018). In addition to caring about COM-B factors, understanding behaviour change psychology with triggers and nudges is helpful in service interaction design. The nudge theory has explored various ways to push actors gently into behavioural change. This may involve incentives, selection maps, default selections, avoiding errors, feedback, and simplification of choices. (Thaler & Sunstein, 2008; Shu et al., 2017; Bridgeable, 2018). The designer's efforts do not concern only the physical items, but various behavioural influences have a vital role in the transition concepts.

Psychology and behavioural economics are concerned about the impact of cognitive and emotional biases on human choices that work in quick and intuitive everyday reasoning. These point to the availability of an issue from memory, feelings and expectations in a decision-making situation, attention to something that is emphasized, attachment to the familiar, short-term impact considerations, pressures of social norms and groups, or pressures of reciprocity. These biases and their utilization also involve a lot of opportunities to influence behaviour as a so-called nudge. (Thaler & Sunstein, 2008; Samson, 2015). In a busy everyday life, issues of emotional importance attract attention. Sustainable consumption does not come first to mind, and the complex thinking it may require.

The psychological behaviour change-based heuristics can be applied to development tasks through using some of the ideation cards made from them. Some of the heuristics are more suitable for the customer journey's front end, such as framing the situation with customer interest and others work as rewards after activities have been completed (Kalviainen, 2021). An interaction may contain verbal and visual information or guidance for low-impact choice and use. The user can be strongly steered with feedback, rewards, penalties, or the reduction of alternatives or even forced functions. (Bhamra et al., 2011; Selvefors et al., 2011; Lilley et al., 2018).

Lockton (2018) instructs to study users' mental use situation patterns and knowledge of different systems and their components before influencing a single interaction point. These patterns guide the general experience but are also requirements for the use of psychological heuristics. Different touchpoints should also be carefully designed to prevent communicating in a hard-to-understand, greenwashing or fanatical way (Kälviäinen, 2022). The requirements of understanding and acceptability are also related to the services' overarching styles. These things need to be developed by participatory co-design and tested in real-life contexts.

4. Demonstrations of Customer Food Journeys in design cases

The framework of a sustainability-enabling customer journey that blends easily into everyday life and crosses the attitude-behaviour gap has been applied in several workshops and sustainable service design courses. The focus has often been on food design as a proposition on how to design sufficiency-based, strong sustainability. The framework applications on food design have taken place since year 2016 in Finland, Austria, and China with students and professional participants from around the world.

Many of the workshops lasted only a few hours or days. Mostly, the results have not reached the testing phase in real contexts, but framework learning has later led the participants to apply the framework in real-life projects.

The following is an analysis of concepts created in workshops that demonstrate the application of the customer journey-based behaviour change framework for Food Customer Journeys. The analysis and observations explain how to apply the proposed framework.

The short methods workshops have not allowed customer research; in longer ones, potential segment group representatives have been interviewed. However, the main service journey framework has been complemented with a trend analysis in the form of PESTEL (Political, Economic, Societal, Technological, Environmental, Legal) trends of different areas of society (Çitilci & Akbalık, 2020). This has been included as the purpose of design is to create future solutions. Societal trends include interesting consumption trends for food solutions, such as the increasing numbers of small families and elderly people in many Western countries. Healthy lifestyle aspirations, enthusiasm for culinary experiences, nostalgic traditionalism, needs for frugality and social media influence have provided frequent inspiration. The other areas of PESTEL have also brought some frames and inspiration for parts emphasized in the concepts.

The workshops were initiated by user persona creation or by using given personas from research-based sustainable consumer selection. This supported applying the framework focused on the customer's motivational interests, not on research-based eating recommendations. To cover the COM-B model's combination of capabilities, opportunities, and motivational customer journey aspects, the service moments should contain understanding about the customers' interests and aspirations and their know-how level and contextual situations.

The student's selected user personas have reflected their own life experience as adult students. There have been solutions evolved around the university run producer ecosystems of university-supermarkets-local producers. The university has been the promotor and co-operator for locally grown vegetables and other sustainable ingredients and recipes from them that are made accessible at the campus. One student user solution observed the students' loneliness and tackled the food challenges of small families and the young adults weak cooking skills through joint cooking and eating clubs to share the ingredients and learn how to cook sustainable food from different student cultures. The university was the organizing body because of its interest in improving the students' well-being and decreasing the organization's environmental impact. The university was also a credible collaborator with local grocery shops to provide reasonably priced ingredients.

The most common user persona chosen to represent the target customer was a male sports enthusiast or health struggler. This type was considered the most challenging segment to steer towards changing eating habits from high-protein meat eating to vegetarian eating. The central provider was set to be a public sector health program or a workplace. The sports and health have been seen as more compelling starting points than sustainable eating. The health and sports interest as the basis for the service made it easy to connect the information, and nudging to the gyms and sports clubs, or social media groups and influencers around exercise. Game-based activities and rewards have been a natural concept part to keep the change process active. These concepts managed also the challenge of initial customer motivation and identity support rather credibly. In more general family-related and frugality interests, it was not easy to find

sweet spots to get customers engaged with a new sustainable service so credibly.

The everyday joggling mothers who have the main duties of taking care of the family meals have also been common user personas in the concepts. This has often included a suburban environment and ecosystem of shops and delivery including an easy way to weekly plan, access, get delivered and prepare the healthy and sustainable family meals though recipe programs or clubs with possibilities for friendships. Even extreme personalization of the family preferences has been suggested through AI compiling family preferences and the sustainable food choices together. The concepts have also included vouchers and discounts for sustainable choices.

A specific support system concept to help family food planners add healthy and sustainable groceries to their food baskets included an efficient weekly shopping list and recipes using sustainable ingredients. The system supported choosing vegetables and less meat and gave new food options with a familiar twist. The support provided research-based facts and visualizations for ease of understanding. A combined meal planning and a shopping list included suggestions for changing or deleting unsustainable choices. It gave the family easy health and environmental impact calculations that supported food choices. The possibility of modifying the settings for family preferences was found to be important, along with the possibility to grade meals and ingredients and favour local products. (Kälviäinen, 2020).

The analysis compiling COM-B issues from different workshop concepts in figure 3, demonstrates how a general Customer Food Journey of attitudes, interests, needs, search, information, planning, accessing, conducting different food preparation activities, and having some kinds of rewards for good deeds is required. It was central that the overarching service umbrella of motivational interests and service style influenced how the information and interactions were designed and presented at different moments and touchpoints.

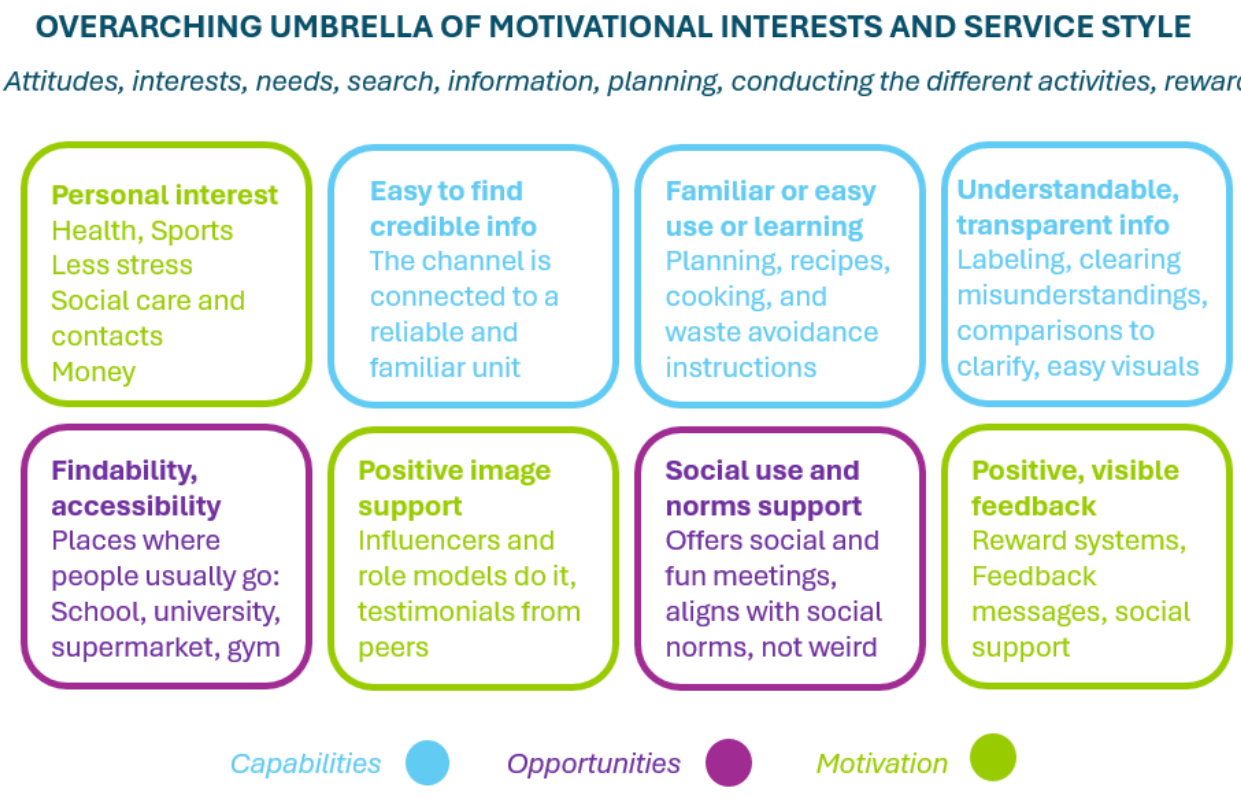

Figure 3. The drivers and aspirations inspired food journey features were collected from the food design workshop projects.

The customer-driven emphasis was initially more relevant than using the previous chapter's actual food service moments. In successful concepts, service moments and touchpoints for driving the journey forward and achieving the activity goals game after customer values, social-cultural aspirations, motivations, and their real-life contexts. If the work concentrated too early on concrete food-related activities and places, the concepts did not reach a convincing level of complexity and motivational stimulus. The combination of COM-B was lacking. The same happened when students from a product design background focused ideation quickly on packaging solutions and missed the behavioural transition focus around food.

An example of a credible food journey-based rather than user-based solution was a bug protein concept that included a peer support interest group in social media built around growing bugs yourself. It was promoted by people's pet care enthusiasm, by local food truck tastings, and by a social influencer using insect granola. The possible disgust was avoided by knowing where the bugs came from and what they had eaten. Packaging was unnecessary other than the kits for growing the bugs. The bug-based protein was promoted as protein for fitness and health. (Kälviäinen, 2020). A similar healthy protein concept promoted fungi protein and created a customer journey for nudging to use mushrooms as important, protein ingredient for meals. Another nice food journey solution was a farm collaborating with school so that the children would participate in farming and have more respect for food. The self-grown vegetables were then prepared in the school kitchen engaging the children to experience how food could be made from them.

The recommended use of the framework for Customer Food Journey concentrates first on the interest drivers for the customer segment and gradually builds the activity type of Customer Food Journey service moments in iteration with the aspirational side. The following detailed design of interactive touchpoints utilizes social-cultural drivers and psychological heuristics to ensure the hoped-for behaviour change. Customer journeys were built to inform, persuade, and support consumers to make selected food consumption changes through social, habit-based, identity-related, emotional, and tangibility-based promotion. Only further along the process is it necessary to consider whether the sustainable change would also require changes in the physical evidence, such as packaging solutions.

The solutions often required a provision ecosystem that could be public sector, university, association, workplace or business centred rather than a single business. Covering the long Customer Food Journey can include many actors and ecosystems and has much detailed design potential. The developed concepts have concentrated on some parts of the journey as sensible concepts. Even a service of few service moments involves many stakeholders and ecosystems of provision, which need to be integrated into customers' decision-making and activity contexts. The information and steering should be available from workplaces, interest-related programs, hobby circles, organizations, or consumer influencers genuinely interesting and credible to the segment group. The providers and stakeholder networks were also specifically asked to be analysed when making the concept suggestions.

The workshop participants who went further in the detailed design also used behavioural heuristics for the touchpoint ideation and design. Typical use was framing the offering as healthy instead of only sustainable. Sustainable choices could be highlighted, recommended by credible influencers, presented as a favourite for many customers, even hidden under a popular food trend, or made to appear rare and valuable. Feedback, discounts, bonuses, and reminders were also applied. The design-professional

background could also hinder the participants in using the heuristics since they settled for eco-labels or visual advertisements without nudging behaviour content. Even if concretization is important, it should perform a task and not suffice with a nice look or hint of greenwashing.

5. Conclusions

The role of design for food transition is relevant, as can be demonstrated by the multitude of service moments on a Consumer Food Journey that allow the design for capabilities, opportunities, and motivation enhancing service moments and enabling touchpoint interactions. Design of physical evidence in service touchpoints is still needed, but these should follow the aspirational, interest-based transition concept that motivates customers with an appreciation of their social-cultural eating habit aspects. The application of the service-based framework does not implicate big divergent-convergent thinking variation, but the interaction of different framings as abductive reasoning explained by Castanho et al. (2024) is vital as means for food design thinking. A solution can be created by iterative framing of aspirations and drivers, nutrition recommendations, Customer Food Journey and COM-B model, and the heuristics of behaviour change to gradually specify a transition journey.

Provision stakeholders and service ecosystems are also important to consider when creating services. Different stakeholders, as providers, change the activity journey. This is also true if the target customer is changed. For all these initial considerations of the service journey, it is not advisable to dash straight into designing an activity-based Customer Food Journey such as planning, shopping, and cooking a meal.

Behaviour change does not happen only by designing a sensible, sustainable customer journey with food consumption activities. Integrating such behavioural theories as the COM-B model with the customer journey and applying the behavioural psychology heuristics help designers ensure the necessary steering for the customer transition. Behavioural heuristics use the learnings from bounded rationality in human decision-making, which marks the way we conduct food decisions and behaviours in the middle of busy everyday life. The behaviour change theories and heuristics remind to design for change in eating or other habits instead of just designing for brands, service activities, spaces, or products. As a customer-driven design input, the Customer Food Journey does not need interventions as only activities; it requires content, feel, and channels that influence how the nudge works.

The Customer Food Journey solutions can be produced and applied to transition purposes by public organizations and businesses, even 3rd sector actors. The solutions often require a network of producers since even a short process of service moments requires several provider participants. Many educational organizations and workplaces try to decrease the environmental impact of the people in their activities, so they can also be the central actors of food transition solutions. Besides a low environmental footprint of production, a handprint increase is required, allowing less impact on solutions' consumption and leading businesses and organizations to improve their calculated net impact results (e.g., Upright Project). This is not a measure to be achieved by the provision part only, but to function; it requires consumption behaviour change.

Fermento: Food Fermentation as a Catalyst of Cultural and Ecological Consciousness

Hongyi Hu[a], Enza Migliore*[b]

aSouthern University of Science and Technology, School of Design
bSouthern University of Science and Technology, School of Design
*emigliore@sustech.edu.cn

ABSTRACT Industrialization has significantly changed the connection between humans and nature, leading to concerns about losing this relationship, particularly in urban settings. Termed the 'Extinction of Experience,' this disconnection has been linked to higher rates of poor personal and neighborhood well-being.
We studied Asian food culture through literature reviews and field research and identified cultural attitudes toward the microbial world.
The research methodology, in addition to literature reviews, field trips, and interviews, involved a workshop on rice fermentation, which we intend to develop further as a research method.
The rice wine fermentation workshop involved four inexpert individuals who had never tried or considered fermentation practices. The workshop was followed by interviews. Participants acknowledged a deepened understanding of fermentation, recognizing an eye-opener on their relationship with the invisible microbiome and, thus, the environment.
The research concludes with the design and prototype of a contemporary fermentation toolkit. Fermento is designed to foster handmade and natural food practices. The main innovation is championing engagement by dynamically visualizing and controlling the fermentation process, aiming to enhance accessibility and comprehension of this transformative culinary art.

KEYWORDS | Fermentation, Microbial Symbiosis, Workshop, Culinary Innovation

1. Introduction

From primitive societies to the advent of the industrial era, civilization gradually led to exploitation and alienation from nature. Despite humanity's tremendous progress and efficiency, we have increasingly less contact with nature, as if it is becoming less relevant.
The food industry, as part of the social industrial framework, has altered traditional methods of food production. However, traditional fermentation practices still persist in many Chinese households. Through fermentation, we unconsciously continue to establish a connection with the unseen world through microorganisms and food materials. What if we could make this connection noticed and aware? Fermentation becomes a potential bridge between humans and nature.
This project encourages people to reestablish a complex relationship between humans and nature by producing and consuming fermented foods. In our social settings, we express ourselves through language, receiving signals from others through auditory and visual senses. During fermentation practices, we cooperate with microorganisms, who send us messages through smell and taste; thus, we generate a true moment of coexistence and openness to embrace natural agency in our intentional design.
In silence, fermentation rebuilds the long-forgotten connection with nature, echoing our undervalued communication with the natural world.

2. Literature review

2.1. Industrialization, Environmentalism, and Sustainable Design

The post-WWII industrial expansion triggered unprecedented urban growth at nature's expense, prompting a global reckoning with anthropocentrism. *Silent Spring* (Carson, 1962) catalyzed the deep ecology movement, advocating biocentric equality in ecosystems (Sessions, 1987). This philosophy influenced design practices, with "green design" emerging in the 1980s as European nations prioritized eco-conscious production (Madge, 1997). By the 1990s, sustainable design evolved into a commercialized framework emphasizing equity and participatory decision-making (Griese et al., 2005). It is notably highlighted that global consumption patterns would dominate future ecological discourse, marking the transition from radical green design to mainstream sustainable solutions (Adams et al., 1991).

2.2. Urbanization and the Extinction of Experience

Rapid urbanization–exemplified by China's urban population surge from 17.9% (1978) to 65.2% (2022)–has severed human-nature connections (生态环境部环境与经济政策研究中心, 2023). Termed the "extinction of experience" (Miller, 2005), this disconnection reduces ecological awareness and exacerbates health issues like depression and obesity (Colléony et al., 2020). Samways (2007) warns that urban environments risk permanent alienation from nature, necessitating interventions to restore ecological engagement for both well-being and environmental stewardship.

2.3. Food Industrialization, Chemical Gaze, and the Dilemma of Chinese Food Industry

Even though designers, ecologists, and people from other backgrounds have put a lot of Industrial food systems prioritize efficiency over ecological engagement, replacing traditional practices with standardized production. Landecker (2019) defines this shift as the "chemical gaze"–a perceptual framework reducing food to biochemical utility, exemplified by industrialized societies' fixation on nutrients over ecological context. This detachment obscures humanity's role in natural cycles, deepening the extinction of experience. In China, where agrarian traditions emphasized seasonal harmony, younger generations now adopt the "chemical gaze," viewing food through industrial metrics rather than ecological interconnectedness.

To counter this divide, fermentation emerges as a cultural-ecological bridge. As Chaberski (2020) argues, microbial processes like fermentation exemplify "performativity beyond human agency", challenging industrial paradigms. China's ancient fermentation practices–integral to soy sauces, pickles, and alcoholic brews–embody a synergy between humans, microorganisms, and environment. Reviving such traditions could mitigate the extinction of experience by reembedding food practices within ecological cycles.

3. Rice Wine Exploration

3.1. Cultural Respect Towards Food Fermentation

The research started with fieldwork in local food industries in a small town near Nanchang City, Jiangxi Province, China.

The first field trip was to a tofu workshop in February.

Figure 1. People working in Fan's Tofu Shop. It was near Chinese New Year, and the family gathered to prepare for the coming festival. Photo by Hongyi Hu on Feb. 3rd, 2024.

Fan's family runs the Tofu Shop. Started by Fan's parents, the shop has a history of over 30 years. During Chinese New Year, every family member must participate in the production of tofu and many other bean products, including Fan's children.

The family makes moldy tofu as a gift for the relatives who visit them during the Chinese New Year. The process takes around a week. After a batch of tofu is made, Fan puts it in a ventilated dark room, covering it with a piece of gauze for five days. After the tofu gets moldy, the family gets together to cover each block of tofu with seasoning powder and jar it.

Figure 2. The process of making a batch of moldy tofu. Photo by the researcher on Feb. 3rd, 2024.

During the process, the family fills the tofu workshop with laughter and chitchat. Tofu making is the family's support and, as every member joins the production process, it has also deepened the connection between different family members and friends.

Two weeks later, the researcher traveled to a Chinese white wine factory in town. The wine factory is named after the town and is famous for its long history. The comments about the wine it produces are quite controversial, as people argue that the wine does not meet their expectations for a wine factory with such a long history.

Figure 3. A well from the Ming dynasty (1368 – 1644 A.D.) excavated at the Lidu Wine Factory. Photo by Hongyi Hu on Feb. 17th, 2024.

The wine factory offers a tour around the relics of the ancient factory. The factory built a new factory near the relics, and the tourists are allowed to watch the staff prepare wine fermentation.

Figure 4. Workers cooling the well-done wheat for white wine fermentation at the Lidu Wine Factory. Photo by Hongyi Hu on

The ancient history of the factory is the key element in its branding. The factory claims to have the most ancient wine fermentation culture in China. Many tourists visit the factory every year to experience its famous history.

3.2. Rice Wine Fermentation Practice

After the field trips' observations, the researcher started to practice and considered how to connect fermentation with contemporary daily life. During this process, the researcher started fermenting rice wine.

Rice wine is one of the most common foods in Southern China. It has a history of over 3,000 years. Many make rice wine fermentation as a family tradition. One of the researcher's family members has a lot of experience in wine fermentation, which benefits our project.

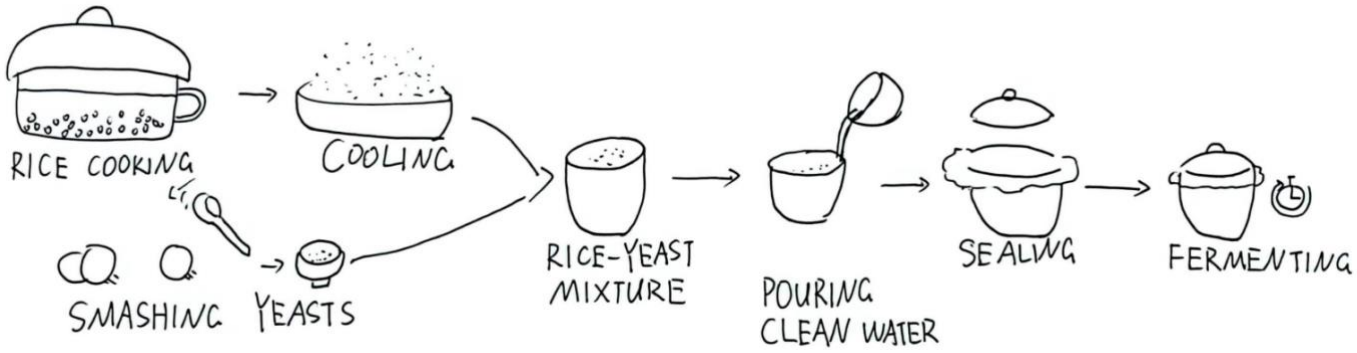

Figure 5. Notes on how to make rice wine fermentation.

Rice wine fermentation is relatively easy to practice, and the food for fermentation is relatively easy to purchase locally.

Figure 6. Rice wine fermentation practice. Taken on Jan. 14th, 2024.

Figure 7. Rice wine fermentation record. Taken on Jan. 17th, 2024.

Due to the widespread cultural resonance and accessibility of rice wine fermentation, we consider it an applicable practice for the majority to join food fermentation and potentially rebuild their connection with nature.

3.3. Workshop and Documentations

After the field trips and the practice, the researcher decided to carry out the process with more people. We aimed to get more people involved in the practice of food fermentation and observe whether this could help rebuild their connections with the surroundings and nature. To do so, we set up a call for a rice wine fermentation workshop, getting some design students involved in making rice wine fermentation and having a taste of each other's production. Each participant would be asked to sign an informed consent form before the workshop, acknowledging that the workshop process will be recorded and used in related publications.

Four participants who had no experience in fermentation work volunteered to join the workshop. Participants were instructed to mix rice with smashed yeasts and seal them carefully. After the fermentation, they gathered again to taste each other's rice wine.

Figure 8. Rice wine workshop. Participants seal the rice and water with yeast. Photo by Amedeo Martines.

During the workshop, another ongoing experiment took place. The researcher collected the microbial samples from the participants' hands twice: once before the workshop and again after. Then, the researcher smeared the samples from each individual into two different Petri dishes, culturing them in sealed environments.

Figure 9. Collecting participants' hand microbiomes. Photo by Amedeo Martines.

The microbial samples were cultured in a warm environment for 5 days, the same duration as the rice wine fermentation.

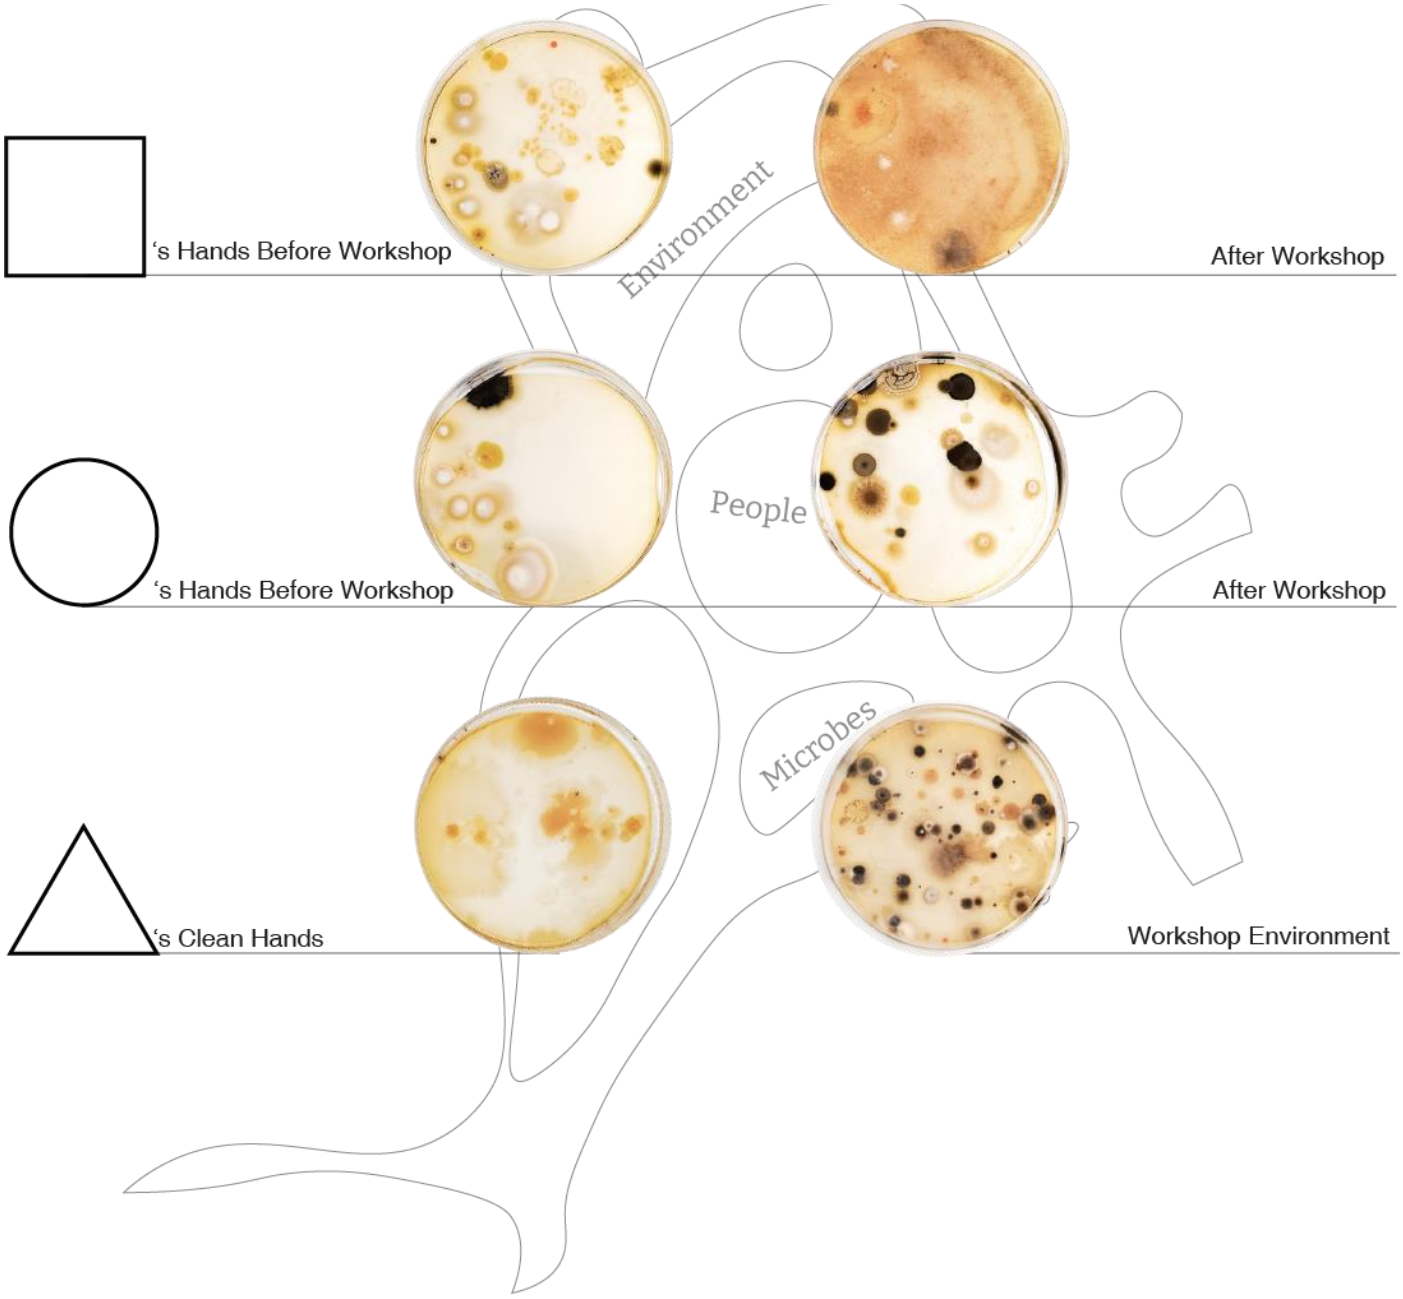

Figure 10. Samples of the participant's hand microbiomes before and after the workshop, each geometry representing one participant. The workshop environment microbiomes are for comparison.

Pictures of these samples were shown to each participant during the next research stage.

3.4. Interviews and Feedback

We conducted one-to-one interviews under the guidance of *Trial Implementation of the Review Method for Scientific and Technological Ethics* (《科技伦理审查办法(试行)》). Three participants agreed to the interviews, and one did not for personal reasons.

All three participants expressed their excitement toward fermentation activities. Two of the participants said it recalled their childhood memories with family.

> "When I was little, my grandmother used to ask me to help her make plum wine. I found it too troublesome and didn't want to get involved." (Participant △)

> “My dad was obsessed with wine making. When I was younger, he would ask me to help him with odd jobs, but I didn't find it enjoyable… But this time, I experienced the fun! I hope to do it again myself. ” (Participant ○)

Speaking of the experience from the workshop, they also showed positive attitudes toward such group activities.

> “I could remember the sticky feeling of rice. I don't like it. My wine also didn't taste as good as I imagined… But what's impressive is the atmosphere when we were all together chatting and messing around while making. ” (Participant □)

> “I realized the food fermentation was never boring. Making wine with friends and family, old and new acquaintances are perfect for a get-together. ” (Participant △)

Another new perspective from the interview is their new connection with their environment. This is brought up after the participants are shown their microbiome samples during the workshop.

> "When I saw the bacteria from my hand in the petri dish, it felt amazing. I never realized that there were so many of them in my surroundings that I had been overlooking. It strikes me to feel the wine tastes better after seeing this.” (Participant □)

> "It's fun to watch these patterns on the petri dish. I don't know much about wine fermentation, but these indicating patterns really helped me connect with those 5 days of fermentation. Shame that I could not see the process.” (Participant ○)

The workshop revealed that participatory fermentation reconnects personal heritage through nostalgic engagement while fostering ecological awareness via microbial visualization. Participants' critiques of process invisibility highlighted a critical gap in conventional practices, emphasizing the need for real-time feedback systems. These insights directly inform future design priorities:

- Translating microbial metabolic rhythms into perceivable information;
- Building accessibility of fermentation activities;

By addressing the tension between microbial agency and human legibility, this research lays groundwork for interventions that transforms passive consumption into active ecological participation.

4. Design Concept and Implementation

4.1. Key Findings

From the workshop and interviews, the main author has summarized two main findings that have driven the design of a fermentation toolkit for bridging contemporary lifestyle to nature through food culture and practices.
The first discovery is that we can make the fermentation process more accessible and engaging through design; and the second point is that we can leverage the microbial

process visualization as the most powerful strategy to raise interest, awarness, and, thus change attitude towards handmade food making.

4.2. Form Exploration

The design development has been informed by the workshop environment and the traditional toolkit for rice wine fermentation.

Figure 11. The space of the workshop is crowded with people and tools. Photo by Amedeo Martines.

Figure 12. A collection of Chinese traditional rice wine fermentation tools.

The idea was to recreate by design circumstances similar to the workshop's environment, where multiple individuals are involved in the fermentation activity. Thus, we designed a work station that allow more people to cooperate in the process.

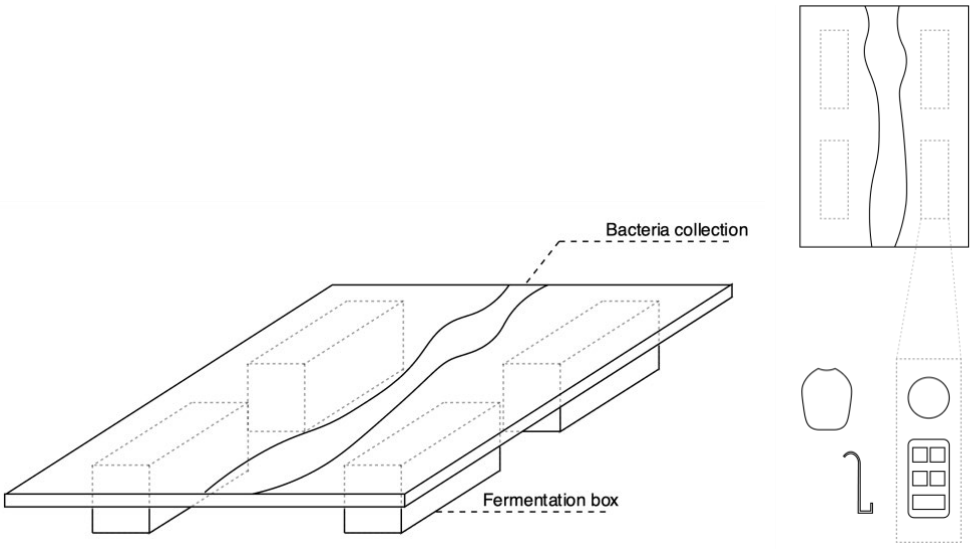

Figure 13. Drafts of form exploration.

After design iterations and reflections, we realized that this option would remain purely speculative and would not find a demand, given the conditions and size required by this option. We intended to make a real impact with our project, which could align with a broad audience interests and accessibility.

4.3. Design Proposal

To revolve around the concept of accessibility and visualization of microbiome, we proposed a series of tools that align with the function of rice wine fermentation, which could also be applied to other food fermentation production.

Figure 14. Design form of Fermento.

The design form of the project consists with two main parts: the wooden platform and the visualizing tools.

The wooden platform is a multifunctional workstation for fermentation production and tool keeping. The embedded heater maintains optimal temperature ranges (25-30°C) for microbial metabolism. The drawer can keep the tools in a sanitary environment.

The visualizing fermentation tools are a microbial activity monitoring and visualizing system. The fermentation monitor, consisting of CO2 sensor and humidity-temperature sensor, is integrated with the stopper. The data is collected at 30-second intervals, and transmitted to the visualizer via Bluetooth. The visualizer processes the data, and displays the microbial activities during fermentation. The visualization is inspired by the records of microbial patterns on the petri dishes. As the fermentation, the visualizer is gradually crowded with multiple circles in deepening colors that slowly move around.

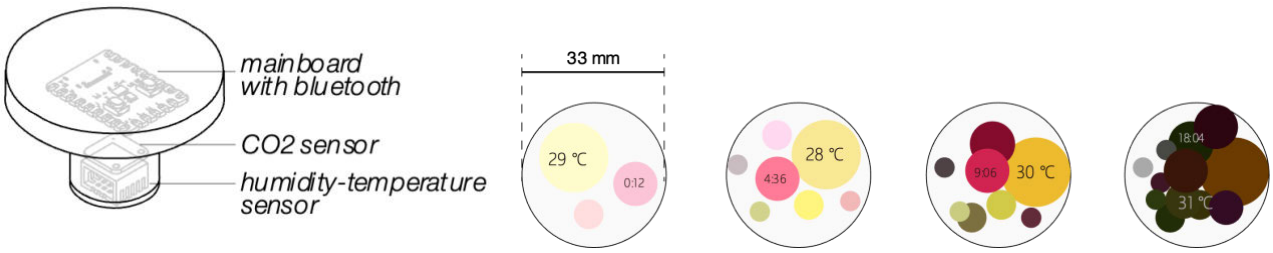

Figure 15&16. Monitoring stopper structure & Visualization of fermentation on the screen.

The visualizer can be placed in different parts of the product. It can be placed on the platform while users are preparing for fermentation, on the monitoring stopper while fermentation is happening, or in a daily scenario where the user is in their routine.

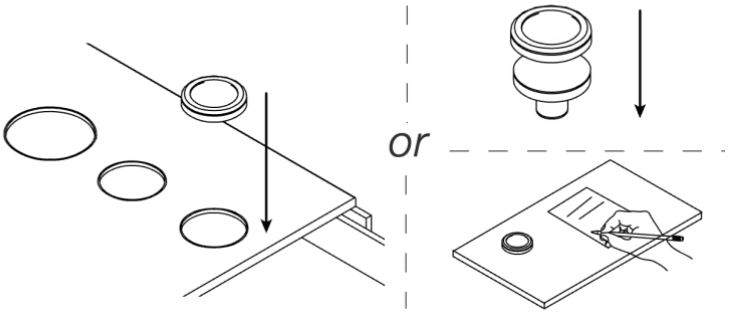

Figure 17. Usage scenario of the screen visualizer. User can put the screen in their home during daily activities.

Another detail was constructed via the observation of the gas pressure in the sealing bottle. After the workshop activity, 3 of the participants sealed their rice wine in a glass bottle, and placed them in a fridge. However, all of the stoppers of the bottles popped out because of the gas pressure caused by the non-stop fermentation process.

Figure 18. Stoppers pop out of the bottle because the fermentation process produces a large number of carbon dioxide.

Inspired by this incident, the design introduces the mechanism of stopper locking, and uses pressure sensor to detect and indicate the process of fermentation.

Figure 19 & 20. Mechanism of the light indicator of the fermentation process. The stopper manages to hold the gas pressure inside the sealing bottle. When the gas pressure reaches 2 atm, the LED ring around the stopper will light up to indicate that the rice wine requires degassing and the expiration date should be checked.

Figure 21. The jar can also be integrated with the stopper to monitor the fermentation process.

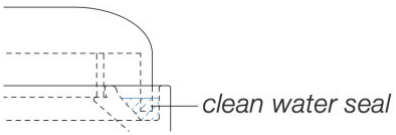

Figure 22. The jar uses the water-seal method to increase its accessibility with simple steps.

The prototype of the design is due to carry out in the near future, followed by a series of user tests.

5. Conclusion

This study proposes fermentation as a vital mediator in rekindling the fractured relationship between humans and nature within industrialized societies. By framing the Extinction of Experience (Miller, 2005; Colléony et al., 2020) as both an ecological and cultural crisis, the research demonstrates how traditional fermentation practices—embodied in rituals like moldy tofu preparation and rice wine-making—serve as embodied, multisensory pathways to reconnect individuals with microbial ecosystems and broader ecological cycles. Through participatory workshops and ethnographic fieldwork, we revealed that hands-on fermentation fosters not only technical knowledge but also a relational awareness of humanity's symbiotic interdependence with microorganisms—a perspective often obscured by industrial food systems.

The design of Fermento operationalizes these insights, translating ancestral fermentation wisdom into a contemporary toolkit that democratizes access to practices based on microbial collaboration. By integrating real-time sensors (CO_2, humidity, temperature) and dynamic visualization interfaces, Fermento bridges the epistemic gap between invisible microbial processes and human agency, enabling users to "dialogue" with fermentation ecosystems. Participant feedback underscored the toolkit's potential to transform fermentation from a passive consumption act into an active, community-centered practice that reconnects individuals with seasonal rhythms, familial traditions, and localized ecologies—echoing the Slow Food movement's ethos (Chrzan, 2004) while

advancing Green Design's participatory imperatives (Madge, 1997).

Theoretically, this work contributes to deep ecology discourse by reframing microbial symbiosis as a site of ecological consciousness. Practically, it challenges industrialized food systems by proposing fermentative re-engagement as a counter-narrative to standardized, disembedded consumption. To overcome the limitations of this study, which are 1) the small workshop cohort and 2) the cultural specificity of case studies (e.g., Jiangxi Province's tofu and wine traditions) we are planning a broader cross-cultural validation. Future research could explore scaling Fermento into decentralized community networks or integrating its principles into urban sustainability curricula.

To summarize, this project posits that fermentation—as both metaphor and practice—can reanimate our atrophied ecological sensibilities. By rendering the microbial world legible and actionable, Fermento invites users to reclaim agency in a more-than-human dialogue, nurturing what Thoreau (1854) termed a "conscious striving toward harmony with nature." In an era of climate urgency, such tactile, culturally rooted interventions may prove to be critical in cultivating the ecological literacy and empathy needed to reimagine humanity's place within planetary systems.

Thelma Lucchese-Cheung, Federal University of Mato Grosso do Sul, Brasil
Filipe Quevedo-Silva, Federal University of Mato Grosso do Sul, Brasil
Hannele Kauppinen-Räisänen, University of Helsinki, Finland

E-mail Corresponding Author : celine.gallen@univ-nantes.fr

1. CONTEXT

Urgent need **to find alternative proteins** to protect the planet and our health (Thavamani *et al.*, 2020).
Insects offer nutritional and environmental benefits, reduce food production costs (Van Huis *et al.*, 2013)
BUT insects are considered **non-edible in Western cultures** (Kröger *et al.,* 2022)
Perceived sensory attributes in insects **strongly increase disgust and reduce their willingness to taste** them (Gallen *et al.,* 2019).

2. PURPOSE

Packaging design is a critical tool to overcome these barriers.
This research focuses on **how to best visually represent an insect on the front of the package** to **reduce disgust** and improve **the expected taste** of the insect-based product.

How does the type of insect drawing on the packaging influence consumers' perception?

3. WHAT WE KNOW FROM PREVIOUS RESEARCH

Mealworm in photo
on cereal bar packaging

Mealworm in drawing

More psychological distance
Less perceived disgust
More expected taste
... than photo

Hémar-Nicolas et al. (2024)

THEORETICAL FRAMEWORK: CROSS-MODALITY THEORY (ELDER AND KRISHNA, 2022)

Graphic design → **Mental representations** (embodied mental simulation) → **Sensory inferences** (taste, flavour, mouthfeel) **Anticipated emotions** (disgust) → **Attitudes and intentions towards the insect-based product**

4. Hypothesis

Visual shape (round vs angular)
Insect type (mealworm vs scarab)

→

Attitude towards packaging
Attitude towards insect drawing
Mental imagery
Anticipated taste liking
Expected orosensory attributes
(sweet, salty, bitter, sour, crispy, sticky)
Perceived edibility
Perceived risk
Perceived disgust
Curiosity towards the product
Perceived healthiness
Perceived environmental benefits

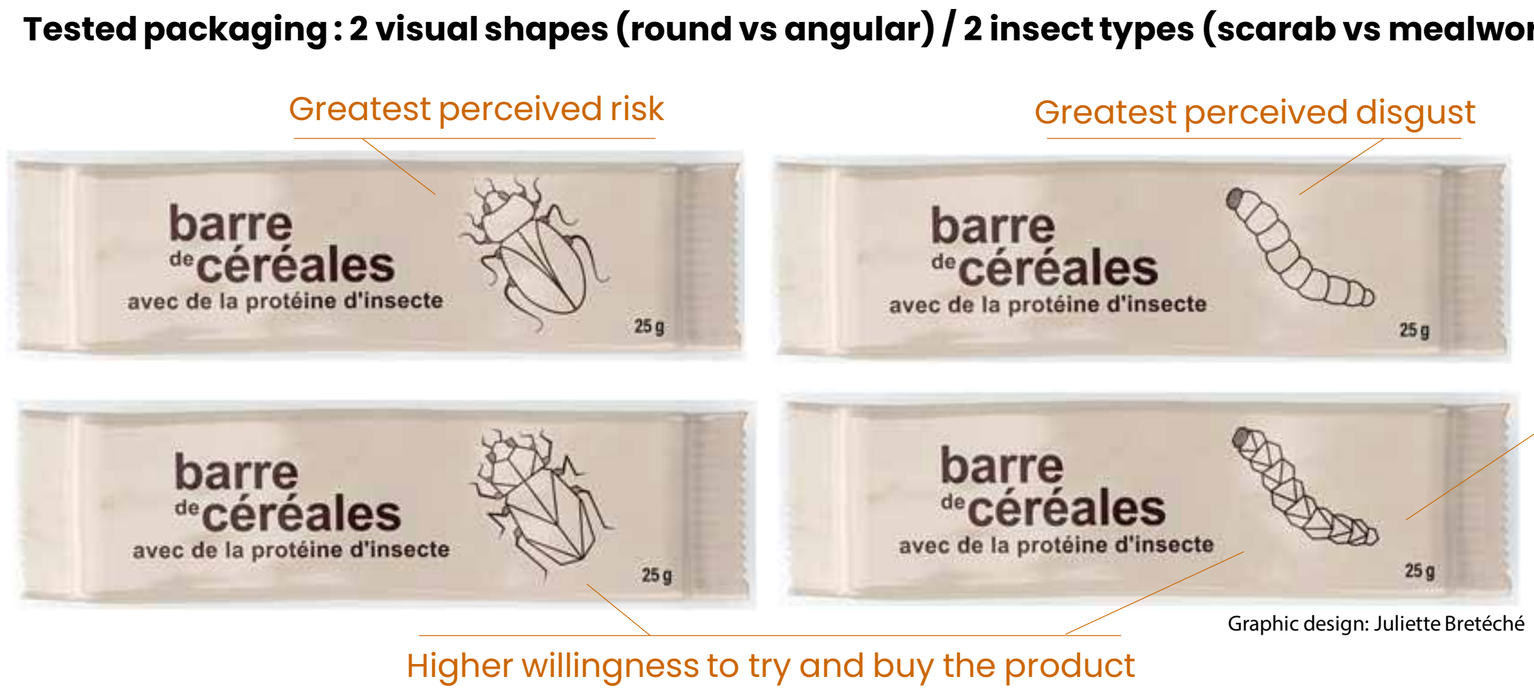
→ **Attitude towards Product** → **Willingness to taste** + **Purchase intention**

5. METHODOLOGY AND RESULTS

Quantitative study
N=1415 consumers
(FR – BR – FN)

Full Factorial Design method and analysis of variance (ANOVA).
Analyse: effect of two factors (2 visual shapes and 2 types of insects - 2 x 2) on the continuous dependent variable (7-point likert scales).
Means compared between groups.

Tested packaging : 2 visual shapes (round vs angular) / 2 insect types (scarab vs mealworm)



Graphic design: Juliette Bretéché

6. IMPLICATIONS FOR RESEARCHERS AND DESIGNERS

Correspondence between the shape of a food's graphic design on the packaging and its perceived taste (Cross Modality Theory, Elder and Krishna, 2014, 2022): graphic design on the packaging generates the formation of mental representations in the consumer's brain, sensory inferences (taste, flavour, mouthfeel) and anticipated emotions (disgust) associated with the product, which in turn influence attitudes and intentions towards the product. **It has been shown that a round shape is associated with an expected sweet taste**.
For insect bars: angular shapes are the most accepted. **Angular mealworm is preferred** (to the scarab) **and perceived to be sweet and the crunchiest in all three countries**.

It's in designers' interest to represent the insect as a larva (without head, wings and legs), and with angular shapes (vs round) to promote acceptance of insects based-food.

*a.boom@fontys.nl

ABSTRACT | Imagine entering a restaurant. But something is off.. It is cold, the light is too bright. The atmosphere is eerie. You have entered through a plastic strip curtain into a narrow corridor leading to a small, sterile kitchen with white, cold tiles and strip lighting.

You look around and open a door. Yes, it is in fact a restaurant. Different seating arrangements fill the open space accompanied by chandeliers hanging from the ceiling. Except the candle lights are dimmed. Upon a closer look you see that the candles are replaced by serving tongs that hold minded-meat hot dogs. You slowly walk around. You take a chair from the table and position yourself to sit down. However, you have never seen a chair like this before. It mirrors the shape of a horse saddle. Once you have awkwardly placed your legs on both sides of the saddle chair, a man in a white, blood-stained butcher's apron enters the room and serves you a piece of meat, "enjoy your meal" and walks away.

Welcome to Fat Pony!

Fat Pony is a quintessential example of Experience Design. Everything within Fat Pony, from the butcher's kitchen to the chairs to the manner of serving has been specifically designed to prompt the audience to examine ethical questions around our consumption in general, and the consumption of horsemeat in particular. Why do we consume what we consume? Who leads us to believe that what we consume is normal? Can we trust those? Does it feel comfortable? By offering such a thought-provoking dining experience that triggers the audience's reflections, emotions and interactions, Fat Pony serves to initiate and facilitate debates on societal issues in which ethics plays a significant role.

By offering a vital opportunity to engage with issues of transparency, trust, and social responsibility, Experience Design is the optimal medium for designers to display ethical leadership. By completely immersing the visitors in the experience and subjecting them to a range of feelings and emotions, it has the power to alter ethically questionable narratives that have been normalized in society and accordingly create a lasting impact, not only on individuals but also throughout society writ large. After all, has the consumption of horse meat by now become something we no longer 'just' accept?

This is where the crucial role of Experience Design comes in to trigger societal change. By continuously exploring how to move an audience and influence one's state of mind and behavior, designers not only leverage Experience Design for trivial public engagement but direct their visitors towards ethical and resilient societies and as such manifest themselves as ethical leaders.

KEYWORDS | EXPERIENCE DESIGN, ETHICS, ETHICAL LEADERSHIP, MULTI-DISCIPLINARY, SUSTAINABLE

Figure 1. Visiting a local butcher shop as part of the preliminary investigation.

Figure 2. Entering the restaurant via a cold room strip curtain and through a narrow corridor in the designed small kitchen.

Figure 3. Sitting on horse chairs, eating horse meat, at one of the hoofed tables. In the background left a photo of the design process, investigating sitting positions reminiscent of sitting on a horse.

MOBILE KITCHENS IN DESIGN EDUCATION: A SITE FOR NEW MODELS OF MAKING AND GATHERING

Amanda Huynh*[a], Joey Shin Yee Cheung*[b],

aDepartment of Design, The Ohio State University, USA
bEmily Carr University of Art + Design, Canada

*huynh.310@osu.edu

ABSTRACT | This paper examines the role of mobile kitchens in design education, highlighting their potential as innovative pedagogical tools for community building, material exploration, and sustainability. Through three case studies across North American institutions, the research investigates the impact of mobile kitchens as spaces for collaborative learning and social engagement. These kitchens, developed organically over six years, support activities like food-based workshops, biomaterial experiments, and community meals sourced from local, community-supported agriculture.

The mobile kitchens serve as platforms for addressing social issues such as food insecurity and climate crisis, allowing students to explore food as a material for design and communication. Each iteration of the mobile kitchen was co-designed to meet the specific needs of its institution, promoting cross-disciplinary collaboration and hands-on learning. The study also examines how these mobile units facilitate connection and dialogue outside traditional classroom settings, fostering a sense of community and cultural sustainability. We argue that mobile kitchens in design education are more than just functional tools; they represent a shift towards experiential, community-focused learning, where food, design, and social practice intersect to address pressing global challenges and directly engage students with real-world issues.

KEYWORDS | FOOD DESIGN, MOBILE KITCHEN, DESIGN EDUCATION, COMMUNITY WELL-BEING

1. Introduction

The implementation of mobile kitchens within design education environments represents an innovative convergence of social practice, community building, and material exploration in contemporary design education. This paper explores the role of mobile kitchens as dynamic pedagogical tools that foster collaborative learning environments and hands-on experiences in material exploration and sustainability. The transformative impact of shared mobile kitchens is examined across three qualitative case studies, each situated in a different institution.

Over the past six years, three separate mobile kitchens have been designed or adapted, built, and implemented in different post-secondary art and design education settings across North America, in addition to one non-profit organization. The small territorial unit of a university campus within a city provides a unique opportunity to examine a diverse range of activities and interactions (Fassi et al, 2024) as they relate to larger food and social systems.

The first mobile kitchen in this series was developed in 2018 as part of a senior capstone project for an undergraduate industrial design degree in Vancouver, Canada by Joey Shin Yee Cheung. The design was prototyped and revised through a series of 11 co-design experiments that invited community members including students, faculty, and staff to stage food gatherings in different spaces on campus. The resulting kitchen design provided a hardwood cooking surface on four locking casters with two collapsible leaves on either side, a double burner induction cooktop, air fryer convection oven, and basic cookware. Components of the mobile kitchen are easily modified based on the needs of a particular workshop, class, or event. Designed to accommodate the dimensions of interior architecture such as doorway widths, the kitchens can be placed anywhere with access to a power outlet.

The second and third mobile kitchens were built in 2020 and 2024, respectively. They are successors to the first, with adaptations to their specific universities in Brooklyn, New York, and Toronto, Canada. To date, these kitchens have been used by community members for weekly meals (made from campus area community-supported agriculture), bioplastic experiments, candy casting workshops, natural dye processing, off-site public events, and a dumpling workshop that facilitated a discussion about multilingual experiences in design studio critique. A mobile kitchen, even when rudimentary, empowers students to use food as a material to address complex issues.

In the context of making tangible prototypes, mobile kitchens can be an addition to the existing infrastructure of a school (e.g. woodshop and metal shop) and act as their own labs, but are also a site of convivial assembly, supporting the studio culture in all other making spaces. Mobile kitchens become a site of gathering and promote a spirit of collaboration and an on-going network of community care. (McCarthy, 2022) Mobile kitchens in design education are not merely ancillary tools; they embody a shift towards experiential, community-oriented learning in contemporary design education. Through using food, the connection to the social issues of climate crisis, migration, food insecurity, and health and well-being enable students to become informed citizens engaged with the cultural and ethical dimensions of their design work.

2. Context

Cheung designed the first iteration of Mobile Kitchen 1 (MK1) at Emily Carr University of Art + Design employing methods of social practice and community engagement as a response to the issue of food scarcity at a new campus location. Cheung was born in Vancouver, raised in Manila and Hong Kong, and is a 2nd generation settler of Chinese descent with a migration journey. Cheung drew inspiration from their culture and lived experience where food had the ability to bring communities together and sustain relationships. In megacities with pervasive food insecurity, street vendors and food stalls offered affordable, accessible and culturally relevant food options regardless of socioeconomic status. Manila street cart food options include “inihaw” (charcoal-grilled) and “tusok-tusok” (literally, pierce-pierce) and Hong Kong dai pai dong 大牌檔 (cooked food stalls) food options include dip tau fan 碟頭飯 (rice plates), siu mei 燒味 (roasted meats), toasts, sandwiches, varieties of pastries and many more. These food carts and stalls create a lively gathering space, reflecting the rich and diverse culinary heritage of both megacities, and serve as a source of inspiration for the mobile kitchen project.

MK1 was designed as a platform for cultivating community through collaborative cooking and shared eating. The kitchen was designed to offer a space and tools to create meals while also meeting the need for connection and community. MK1 explores how the act of cooking and eating as a collective can strengthen relationships with community members and enable conversations around food insecurity, culture and identity, migration, and health and well-being, issues that campus community members experience day-to-day. MK1 is a site for nourishment and exploration, disrupting the dominant culture within the art and design institution by creating an environment where students and staff can convene outside of the classroom and create connections in an unstructured setting.

MK1 was designed in conjunction with the Social Practice Kitchen, a collective of students focused on social well-being through food. Co-developed with other artists to deliver a series of community engagements at Emily Carr University of Art + Design, Cheung explored the intersections of art and design by pairing industrial design and Social Practice and Community Engagement (SPACE) in their project. Through their involvement in the students’ union as a representative of the design department and as the Board of Governors student representative, Cheung used prior knowledge of plans for the campus to relocate as the focus of their capstone project because of the various student-facing issues associated with the move. The site of the new campus in a newly developed neighborhood with limited access to affordable, accessible and culturally relevant food options was a significant concern. The institution contracted one vendor to provide food for the entire institution with limited and costly menu options. This site-specific issue was chosen as an opportunity to address the potential risk of food insecurity while also testing a new approach to connecting people and building community.

3. Methodology

3.1 Prototype through Co-Design

The Social Practice Kitchen (SPK) was a series of community engagements that complemented MK1 and was a collaboration between art and design disciplines. These engagements employed a co-design process and served as a starting point for research into the form and subsequent functions of MK1. In the co-design process, volunteer cooks ranging from students to staff were engaged through SPK to understand their needs around tools, storage, and space.

A simple prototype was created using a cart constructed from plywood with supplies such as a portable cooktop, pots, pans, and other cooking tools that were placed in various configurations to test for functionality. Additional components such as hooks or shelving were added based on feedback over the series of 11 SPK engagements, and research into the aesthetic considerations began once sufficient feedback was gathered.

Observations were documented through written notes and photographs collected as part of the project process. Participants also shared stories of their personal experiences which were documented through written notes. A combination of quantitative and qualitative data analysis methods was used. Quantitative data analysis made use of the number of meals and participants to inform frequency and allocation of resources for subsequent interactions while quantitative data analysis made use of the feedback around food preparation and cooking, along with personal stories, to inform the functional and aesthetic elements of the kitchen.

3.2 Engagement and Recruitment Methods

MK1 featured three actionable engagement methods: daily usage, events, and workshops. Daily usage included use of MK1 within the industrial design studio space where students would cook for themselves and others on an as-needed basis. Events included SPK engagements within the Critical + Cultural Practice (CRCP) studio space where community members across the institution could access the mobile kitchen on a weekly schedule over the lunch period. Workshops included demonstrations of MK1 at the 2018 graduation show, and as a three-day pop up at the 2018 International Conference for the Arts in Society. All three engagements included ethnography as the research methods done through observations and interviews prior to, during and after each interaction with the kitchen, along with photography, to gather data from participants through shared meals and social interaction between participants.

MK1 was situated in the industrial design studio where peers were invited to use the prototype for daily use, and provide suggestions for subsequent iterations. SPK events took place in the CRCP studio space and were promoted throughout the campus via posters and word of mouth. Interested volunteers contacted the SPK team at events or over email and signed up to prepare a meal for a specific week. Volunteers would plan meals, request a reimbursement for associated costs if needed, and were responsible for procurement and transportation of ingredients. The SPK team provided additional support where needed, but volunteers were responsible for all preparations leading up to the scheduled SPK event date. Workshops such as the demonstrations and pop-ups underwent an application and approval process with organizers to promote the initiative and share the experience with visitors. This required a menu to be prepared in advance and approved by the workshop organizers and campus administration to ensure

compliance with health and safety protocols.

3.3 Aesthetic Considerations and Final Design

With feedback from the SPK events, further research was made into the aesthetic considerations of MK1. The physical constraints of the new campus along with the diverse backgrounds and lived experiences of volunteers lead to the choice of a simpler aesthetic that could compliment the space and community members. As a result, precedent research of art and design movements was done to explore which aesthetic would best represent the mobile kitchen and its intended purpose. The De Stijl movement was chosen for its abstract, pared-down aesthetic centered in basic visual elements such as geometric forms and primary colors to serve as the foundation of MK1. The simplified design ensured that MK1 could be adaptable to any environment and the use of primary colors, much like the foundations of the color spectrum, represent fundamental elements of the community building experience. MK1 was built using local western maple with a natural finish to create a warm and welcoming atmosphere in contrast to the concrete interior of the new campus - with the intent for the kitchen to develop a patina over time with continued use.

The final considerations for the design of MK1 were informed by the physical space constraints of the three engagement sites: the industrial design studio space, CRCP studio space, and cafeteria area. Dimensions were calculated to fit through hallways and in various rooms during transport, incorporating folding bracket shelves on the working surfaces to minimize the kitchen's footprint when not in use. MK1 allows engagement from every direction to maximize working surfaces, as each side of the kitchen can be accessed for different activities such as ingredient preparation, cooking, and serving.

Figure 1a and 1b. Front and back views of Mobile Kitchen 1. Image credit: Joey Shin Yee Cheung

4. Mobile Kitchens as Design Lab

4.1 Social Practice Kitchen

Based on the learnings through the co-design methods above, MK1 was then implemented as a complete mobile design to support gatherings. The SPK community engagements consisted of 11 events where volunteers signed up to cook a vegetarian or vegan meal for the collective community. Meals were typically culturally relevant to the volunteers and were initially funded by micro grants from the institution with options for

community members to donate additional funds. Volunteers included students, administration staff, librarians, and one security guard. The events also served as an opportunity for students to connect with other groups on campus to have conversations and build relationships outside of their usual interactions.

Table 1. Social Practice Kitchen (SPK) Events

SPK Event	Title / Major	Contribution
Event 1	Fine Arts Major	Maghmour
Event 2	Fine Arts Major	Black bean soup, bread, avocado and sour cream
Event 3	Film Major, SPACE Minor	Ddukbokki and green onion pancakes
Event 4	Ceramics Major - Visual Arts Major, Curatorial Practice Minor	Tofu pudding - eggplant stew
Event 5	Student Development Advisor - Admins Assistant - Director of Counselling - Live Musician	Lentil soup, butternut squash salad, naan - sweet treats (i.e. cookies and cupcakes) - pizza - live music
Event 6	CRCP Major - Industrial Design Major and SPACE Minor - Film Major and SPACE Minor	Spinach potato balls
Event 7	Industrial Design Major	Zahra bi tahineh
Event 8	Fine Arts Major - Animation Major	Sinigang and rice
Event 9	Continuing Studies Major - Security Staff	Ratatouille - Paratha and rice kheer
Event 10	Visual Arts Major - Visual Arts Major	Spinach rolls - Arepas and guacamole
Event 11	Librarian	Chickpea pasta - potato salad - channa daal with potatoes - cinnamon apples

At the start of each SPK event, volunteers would share details about their relationship to the meal and conversation topics would emerge organically. The variety of meals showed the diversity of lived experiences at Emily Carr University of Art + Design and contributed to the range of topics that were discussed including migration stories, cultural beliefs and traditions, and important food memories that shaped identity. Other more nuanced conversations were also held around social norms and political crises that affect the daily lives of the community, both locally and in their home countries, particularly around the effects of climate crisis and sustainable food practices. Volunteers would share stories about their experience sourcing ingredients and the need to adapt through substituting with similar flavors when ingredients were not available or accessible due to the costs associated with importing or the limited availability of the ingredient outside of their home countries. Conversations were not programmed and were consent-based, which allowed for ease in participating and trust-building over time. Though meals were culturally relevant, recipes were also modified to be accessible and took into consideration various dietary restrictions while also keeping costs low. The resulting meals had elements of familiar and comforting flavors while staying relatively

nutritious and healthy.

An exemplary event using MK1 was a dumpling workshop during Multilingual Week in spring 2019, a series of events to explore how multilingual students can be supported on campus. In an informal survey conducted by a university lecturer, 63% of the student respondents were fluent in two or more languages. Billed as a "dumpling workshop for social change", the event was run by a faculty member and gathered dozens of students across disciplines to work with their hands rolling out dumpling dough and folding dumplings as a tactic for discussing challenges in multilingual studio classroom environments.

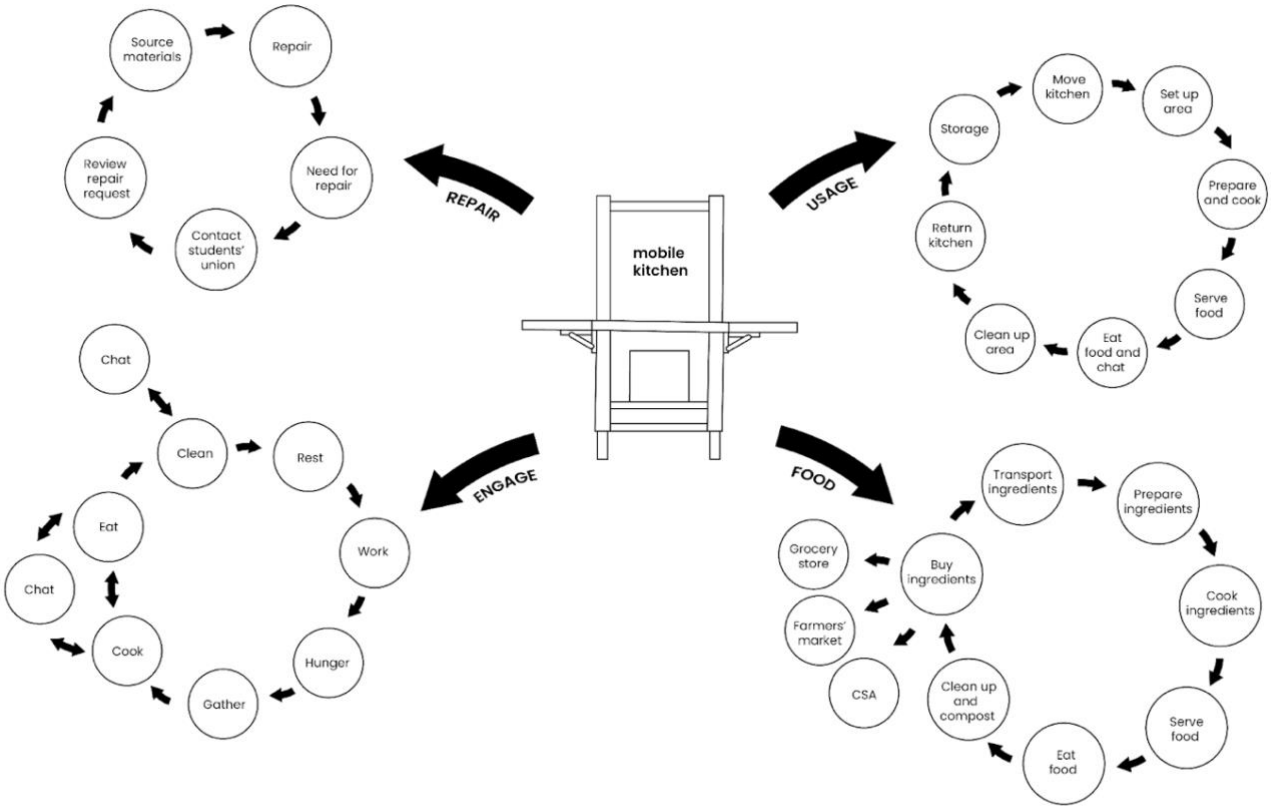

Figure 2. Systems map of typical interactions associated with the mobile kitchen.

4.2 Mobile Kitchen 2

The second version of the mobile kitchen was developed at Pratt Institute in 2019 by Huynh, then a new faculty member at the institution. Huynh planned to develop a new food design and materials curricula, and saw a need existed to develop a platform for those endeavors. Using MK1 as a basis, Huynh took the essential elements of the cart as specified by Cheung for MK1: the induction cooktop, oven air fryer combination, drop leaf hinges, and heavy-duty casters. The design and materials were funded through a small start-up research grant, part of which paid Cheung, the designer of MK1, for their design development work. The mobile kitchen needed to be adapted to the constraints of an older building (built in 1889), its doorway and elevator clearance and the needs of the Pratt teaching, learning, and research community.

Mobile Kitchen 2 (MK2) was constructed in Summer 2020, when most students, faculty,

and staff were off campus due to the pandemic. The design features wood construction and large drop-leaf countertops like MK1 and reimagined the rear panel to be a pegboard for tools and a space for signage. The kitchen was outfitted with a double induction burner, a small oven, basic cookware, and donated utensils and pantry staples. (Figure 3) Unlike MK1, which is sited in a single large building, MK2 exists on a campus with multiple buildings and the design addressed the need to travel across cobblestones and pavement.

Figure 3. Renderings for Mobile Kitchen 2, showing the drop leaf counter space. Image credit: Amanda Huynh and Kai Chuang

The mobile kitchen debuted as a gathering point for weekly "BYOM(ug)" events on campus in collaboration with the School of Design Dean's Office. The mobile kitchen was positioned at the front lobby of the school for several mornings, serving tea and homemade pastries to students returning to campus after the pandemic lockdown. It was the first time that many community members had seen one another since pre-pandemic lockdown, and gathering in person felt novel. Community members were curious about the kitchen and asked about ways to engage with it. MK2 was exhibited at the annual Pratt Institute Research Open House, further promoting it as a site for in-class demonstrations, material experimentation, and communal gathering.

Shortly after MK2 was operationalized, another organization on campus, known as Farm to Campus, started an initiative to bring weekly community-supported agriculture (CSA) produce to be purchased by community members at a low cost. Campus partnerships such as the CSA connected the students through MK2 with produce grown by regional farmers and sourced through GrowNYC, a sustainability resource for all New Yorkers interested in food access, conservation, green spaces, and education. (*GrowNYC | The Sustainability Resource for New Yorkers*, n.d.) The nature of CSA produce is that it is not always predictable, but always local and seasonal. Farm to Campus subscribers are not able to choose what is ordered nor know what is available the following week. Excess food

that was not picked up and would have otherwise gone to waste could be prepared by students. Students have to problem solve around unfamiliar ingredients and experience first-hand the challenges that climate crisis poses on our access to food. Engaging with food through MK2 creates an access point for more complex issues to enter art and design conversations.

A recent example of a public engagement with MK2 was in collaboration with pigment artists and the campus natural dye garden. The Harvest Salon was an event to celebrate the end of the growing season in the dye garden. The event featured a participatory art installation by Narkita Wiley made with indigo dye and inspired by a West African folk tale. MK2 was on site to serve food and drink made with ingredients from the Farm to Campus CSA as well as natural pigments from the garden, with offerings including candied cosmos flowers and beet and marigold pickled eggs. Participants included faculty, staff, students, and people from the surrounding communities, spanning art and design disciplines from industrial design to fashion, artists, and writers.

Beyond event-based engagements, the mobile kitchen is used to support art and design curricula. It is used as the main laboratory space for assignments such as a 3D printed pasta design project, where students work through pasta experiments. As students became more interested in working with biologically derived materials such as bioplastics (plant-sourced, compostable polymers), MK2 became central to their studio projects as a place to combine ingredients for their starch, gelatin, or agar-based recipes. Where MK1 was successful in building community on campus, MK2 is used more as an extension of studio lab space for assignments: biomaterials experimentation required the cook top and work space, a capstone studio focused on nourishment and social change frequently used the cooktop and serving ware for prototyping breakfast foods, and casting principles were taught through demonstrations making sugar molds (similar to sand casting). As food is a material with a low barrier to entry — people encounter it often, it's relatively low cost and available — we can use it to teach iteration and improvisation in making. Through integration with curriculum, MK2 supports using food as both a material and a tool for communication, allowing for student exploration on the topics of food waste, cultural sustainability, community building, social innovation, food security, and service design.

A graduate assistant is employed with additional funding for project documentation throughout the academic year and to assist with outreach, bookings, and maintenance. The kitchen became available for bookings in the same system as other labs and studios such as reprographics lab and fabrication spaces to support curriculum, events, and research. Although not formally tracked, MK2 has been used extensively by disciplines in both art and design and is a familiar site across Pratt Institute's campus.

4.3 Open Source Mobile Kitchens

MK2 was borrowed by Street Lab, a non-profit organization in New York City that works on urban placemaking for one of their events featuring a local business in summer 2022. MK2 was taken off campus and transported in a van to site. Shown in Figure 4, the mobile

kitchen was used by a Thai restaurant for a Thai iced tea demonstration. The kitchen's pegboard was used by the Street Lab team for a community engagement activity to invite passersby for their feedback and to design their own future vision of the street. Street Lab subsequently developed their own version of a mobile kitchen for regular use in 2023 (Figure 5). This kitchen is used to feature local businesses on open streets, offering an outdoor space for food-centered demonstrations and public education, maintaining the spirit of the original mobile kitchen.

Figure 4. Mobile Kitchen 2 in use by Street Lab, a local New York City non-profit, 2022. Image credit: Street Lab

Figure 5. Street Lab's own mobile cart in use, 2023. Image credit: Street Lab

A third mobile kitchen, Mobile Kitchen 3 (MK3), has been built at OCAD University in Eastern Canada as of 2024. Like MK2, it was funded through a small grant application by a faculty member. MK3 serves as a social wellness mobile kitchen that is housed in a design incubator about a 15-minute walk from the campus. The mobile kitchen travels between these two locations supporting curriculum and events. It was developed to explore the

concept of a third space: "the '*third space*' is generally defined as the area between official curriculum and informal knowledge, with skills and dispositions brought in from outside culture." (Potter & McDougall, 2017) In its nascent stages, the aim of MK3 is to highlight cooking as an act of care, supporting students towards more engaged design practices.

Figure 6. Mobile Kitchen 3 presented at OCAD University by Professor Ranee Lee. Image credit: Katya Koroscil

The design plans for Mobile Kitchens 1 and 2 have been made available for students and faculty at peer art and design institutions and non-profit organizations. We openly share a spreadsheet of recommended hardware and equipment such as the induction cooktop and convection oven, with suggestions for improvements.

5. Challenges

5.1 Safety and Concerns

Challenges for mobile kitchens in art and design institutions have included the issue of food safety and safe food handling for amateur cooks preparing food for a community. In the context of galleries and exhibitions, additional food safety requirements may apply. For in-class food-sharing, the scenario is like a typical potluck where different types of food are brought in for sharing. Food safety and cleanliness issues can be mitigated through completing food safety training and supervising cooking activities to ensure compliance with food safety measures. We found that the mobile kitchens ideally require access to running water for preparation and clean-up.

Concerns around fire safety when cooking indoors were taken into consideration and led to the choice of installing an induction burner and portable convection oven as the main appliances to reduce the risk of accidental fires. There were also concerns that sharing wall outlets with other students and staff could lead to a circuit overload, which were alleviated with the addition of extension cords to ensure available power outlets with sufficient wattage capacity were being used across the campuses.

An unanticipated challenge was the perception of competing with existing food service contracts and cafeteria-style food service. We made the case that students should be empowered to feed themselves and framed the mobile kitchens as a site for learning and engaging with community members as opposed to being in direct competition with the

cafeteria-style food service on campus. Concerns were also identified around allergies and recipe modification, and around costs associated with running the kitchen. With MK1, it was found that vegan meals were the most accessible type of food and kept food costs relatively lower for more servings overall. As communities regularly engaged with the mobile kitchens, modifying recipes became a recurring focus for inclusive participation.

5.2 Maintenance and Repair

The biggest challenge to mobile kitchens in an academic setting lies in the need for sustained upkeep, as with any other laboratory. In the systems map (Figure 2), these are highlighted with the “Repair” and “Usage” interactions. Maintenance and repair were accounted for by specifying replaceable components such as portable appliances, along with hardware that would see the most use such as the casters and folding brackets. In our experience, successful stewardship requires a faculty or staff member to see the mobile kitchen through cycles of students, as well as student volunteers or assistantships to support day-to-day operations. While relatively small, these activities require funding over long periods of time.

6. Conclusion

We have had the opportunity to build up 3+ mobile kitchen sites over 6 years and believe our contribution to be significant. From campus to campus, adjustments are made for physical constraints (elevator doors, entryways, types of flooring and terrain) and adapted to the needs of each community. MK1 was focused on food insecurity and opportunities for various community members to convene and connect outside of the classroom whereas MK2 was focused on curricular tie-ins to projects and courses. These mobile kitchens served as pilot models, inspiring the third iteration (and beyond) to create unique adaptations to serve their respective communities. The overarching structure remains—a portable cooktop, minimal utensils and cookware, a small oven, a work surface area, and four wheels.

In the context of tangible prototype-making, mobile kitchens can serve as unique, living labs, integrating into the existing infrastructure of design schools alongside traditional spaces like wood and metal shops. More than just functional tools, mobile kitchens foster a sense of community and conviviality, supporting the collaborative studio culture that extends throughout all making spaces. They provide a space for social interaction and foster a continuous network of care, promoting cross-disciplinary dialogue and engagement. These kitchens represent a notable shift toward experiential, community-focused learning in modern design education. They enable students to connect their work to critical social issues—such as climate change, migration, food insecurity, and health—empowering them to become informed, socially-conscious citizens and designers. By intertwining hands-on design practice with pressing global concerns, mobile kitchens invite students to engage with the cultural and ethical implications of their design choices, transforming the educational experience into one that is as much about making meaningful connections as it is about creating tangible objects.

We look forward to seeing new uses for emerging mobile kitchens as we come to further address the importance of food as a material and the significance of convivial gathering in urgent times.

Promoting Sustainable Dining through Spatial Design Transparency: The Impact of Design Elements and Environmental Awareness

Abhishek Kumar Verma[a], Gargi Datta[b], Snehlata Jaswal[c]

a Indian Institute of Art and Design
b Indian Institute of Art and Design
c Sikkim University
gargi.datta@iiad.edu.in

ABSTRACT | This research proposes to study the impact of spatial design transparency elements such as open kitchens, visible food sourcing, and eco-friendly design on sustainable dining preferences within restaurants. Previous studies have found menu transparency and corporate social responsibility to boost consumer trust and loyalty (Kim & Ham, 2016; Shafieizadeh & Tao, 2020). Research shows that green practices and indigenous sourcing elevate image and consumer loyalty (Chaturvedi et al., 2024; Suttikun & Mahasuweerachai, 2023) and sustainable practices can help build an eco-conscious image (Karagiannis & Andrinos, 2021). However, few studies explore spatial design in restaurants, fostering sustainable dining choices. The sample for this study includes 300 frequent diners at casual and fine dining restaurants in India, regardless of preference for sustainable choices. Using multiple regression, this research explores the direct effects of spatial design transparency on sustainable dining preferences, with consumer environmental awareness as a moderator, as consumers are reactive to transparency and sustainability cues in dining environments (Pozelli Sabio & Spers, 2022; Yang et al., 2022). Findings are expected to provide practitioners with experiential design strategies that encourage sustainability, offer researchers new insights on transparency in spatial design, and help educators in amalgamating environmental awareness into design education.

KEYWORDS | Spatial Design, Sustainable Design, Food Design, Dining Experience, Sustainable Dining Preferences

1. Introduction

Global consumption patterns have undergone significant changes over the years.

Improvement in economic conditions, advent of social media, foreign travel, urbanization are amongst the many drivers influencing the choices of modern-day consumers. Dining establishments, an integral part of the hospitality sector, are at the center stage of this revolution. Today there are multiple dining options available to explore, and due to high disposable incomes, people are dining out like never before. Research shows that green practices and indigenous sourcing alleviate image, enhance consumer loyalty resulting in willingness to pay premium prices (Suttikun & Mahasuweerachai, 2023), influences perceptions and experiences (Karagiannis & Andrinos, 2021), and enhance revisit intention (Chaturvedi et al., 2024).

Today, the global food and beverage sector is envisaged to grow by 5.99% between 2022 and 2028, valued at approximately $7,464.3 billion (Rajan et al., 2024). The Indian food and beverage sector is expected to grow by 14.94%, projected to reach USD 30.75 million by 2027 (Statista, 2024). Despite the trajectory, in this age of information, consumers are also becoming astoundingly aware of the environmental issues and the ill-effects arising due to this surge. The total greenhouse gas emission from the hospitality business today stands at 34%, wherein the food and beverage sector stand as a major stakeholder. The sector is also grappling with a bunch of other issues including deforestation and land use mostly caused by unsustainable sourcing, inefficient energy consumption, food waste, transportation, and packaging (Crippa et al., 2021). It is only fair to state that the need of the hour is to devise some strategic solutions that hold potential to moderate environmental harm while favorably impacting consumer behavior.

Previous studies have highlighted significance of physical spaces as compared to the tangible products contributing to positive buying behavior, termed as the theory of atmospherics (Kotler,1973). The same theory has also been used to enhance image in service businesses like hotels, restaurants, banks etc., famously known as Servicescape (Bitner, 1992). The key aspects of physical space, specifically the environment, spatial layout, and design elements are purposefully constructed to attract consumers and enhance patronage intentions (Wakefield & Blodgett, 1994). Additionally, multidisciplinary research has been conducted in environmental psychology and marketing demonstrating the importance of spatial layouts in creating aesthetically appealing spaces for both consumers and service providers (Ali & Amin, 2014; Kandampully et al., 2023; Rianmora et al., 2023), also in promoting customer loyalty at theme hotels (Chang & Lin, 2024). For hospitality establishments (Apaolaza et al., 2020), beyond design, researchers also laid emphasis on the role of décor elements like - signs, symbols, and artifacts (Marandi et al., 2024), furniture (Lee et al., 2023), and ambience (Chen et al., 2023). These attributes impact the psychological and behavioral intentions of eco-conscious consumers (Li, 2021).

Taking cues from the existing research, spatial design transparency emerges as a significant aspect of the physical environment, especially for service businesses where transparency is key for building consumer trust and loyalty. For instance, Kim and Ham (2016) reported that green initiatives, like sustainable operations and environment certifications, positively influence brand reputation, supporting the relationship between dining businesses and consumers. Further, Shafieizadeh and Tao (2020), discovered that by promoting sustainability policies and community involvement as part of corporate social responsibility (CSR) initiatives will in turn boost consumer trust and loyalty. In another study by Yang et al. 2022, it was discovered that information on recipes and food supply chain enhances customer trust. Furthermore, Pozelli Sabio and Spers (2022) highlighted that transparency in sustainable food chains, such as clear labelling of the ingredients and information about the origin, can enhance sustainable food consumption thereby reducing the harmful environmental impact of alternate food networks.

Despite these insights, much of the existing research focuses either on informational transparency like menu labelling and certifications, or on spatial layout and design elements for hospitality establishments, primarily hotels. In contrast, research on dining establishments exploring the potential of spatial design transparency elements like open kitchens, visible sourcing displays, eco-friendly designs and their impact on sustainable dining preferences remains rather scarce. The present study addresses this gap by examining how spatial design transparency elements influence sustainable dining preferences, with consumer environmental awareness as a moderator.

Consumer environmental awareness has emerged as a significant factor influencing sustainable behavior. As per the global sustainability study (Gathen et al., 2024), 64% of consumers, across USA, Germany, UK, Australia, the Netherlands and India, rank sustainability amongst the top three value drivers across product categories when making purchase decisions. To understand these dynamics, this research leverages the Theory of Planned Behavior (TPB) to understand the nuances of consumer attitudes, societal norms, and perceived behavioral control affecting responses to spatial design transparency in dining establishments. Ajzen (1991), in his research on TPB, established that intention is a strong predictor of behavior, further influenced by attitudes, subjective norms, and perceived behavioral control. Past studies, for instance Chung (2016) found that three constructs of TPB positively impact intentions to re-visit green restaurants and share positive recommendations reiterating the importance of sustainability for dining establishments. Moon (2021) introduced two predictors, past behavior and dining frequency to TPB and explored consumer beliefs impacting green restaurant patronage in Korean context. The findings show that perceived behavioral control emerged as a significant determinant followed by behavior, and societal norms. In a similar study, Shishan et al. (2021) found past behavior and TPB positively influence intention to dine at green restaurants in a UK sample. The results indicate that, apart from gender, the impact of sociodemographic intentions to dine at green restaurants was not significant. In another study amongst British diners, Nimri et al. (2024) gave a new model based on TPB integrating altruism. Control beliefs and altruism emerged as key factors influencing intentions to dine at green restaurants. In fact, in a recent systematic literature review focusing on the last decade, in about 118 publications TPB has been extensively used to explore consumer green behavior and purchase intentions of food products (Rozenkowska, 2023).

Nonetheless, given the environmental challenges in the hospitality sector the significance of this research both for practitioners and academicians cannot be overstated. With inefficiencies in sourcing, energy use, and waste management, the intersection of spatial design transparency and consumer environmental awareness presents an opportunity to address these pressing issues. Visible sourcing displays and open layouts not only enhance consumer choices but also motivate establishments to align their operations with wider sustainability goals such as reducing food waste and promoting local sourcing. Like, Jeong and Jang (2010) explored whether green practices in restaurant's have an impact on brand image and purchase intentions. The results indicate that green practices influence perceived ecological image mostly focusing on the use of recyclable take-out containers, recycling waste, and energy efficient lighting by the restaurants. In a similar study, conducted on a Vietnamese sample Khuong et al. (2023) found that green practices like recycling, composting, energy and water management programs positively enhance consumer emotional attachment and purchase intentions in a dining establishment. In another research Chaturvedi et al. (2024) explored the impact of green restaurant's sustainable practices on consumer satisfaction and intention to revisit. The findings revealed that sustainable practices like food safety, food sustainability practices, food quality, and environment sensitivity have a positive impact whereas willingness to

pay had a sensitive moderating effect. Other studies explored non-physical attributes like psychological factors including concern about the welfare for others (Tan et al., 2018); and communication strategies (Xu & Jeong, 2019) impacting consumer decision to dine at green restaurants. It is evident from the literature surveyed so far that limited research has explored how design features like open kitchen, visible sourcing layouts resonate with environmentally aware consumers, particularly in emerging markets like India.
This work adds to the growing body of literature by making three significant advancements. First, it shifts the application of transparency from an informational to a design-led context, emphasizing the role of spatial features in influencing consumer behavior and advancing academic understanding. Second, it incorporates consumer environmental awareness as a moderating factor, offering new insights into how individual perceptions shape responses to sustainability cues. Third, it provides actionable recommendations for hospitality managers and policymakers to align operations with global sustainability goals and emerging consumer preferences.

1.1 Hypotheses

The following specific hypotheses were proposed:
1. Spatial design transparency elements will influence sustainable dining preferences.
2. Consumer environmental awareness will moderate the relationship between spatial design transparency elements and sustainable dining preferences.

2. The Study

This research aimed to examine the relationship between spatial design transparency elements and sustainable dining preferences, moderated by consumer environmental awareness. For assessment purposes spatial design transparency elements are further divided into two variables, first is spatial design which includes elements like open kitchens, and ecofriendly design and second variable is visible sourcing which incorporates application of organic food, green products, and green materials. The direct and indirect effects were assessed using multiple regression analysis.

2.1 Sample

The sample comprised of individuals who had the means to dine at restaurants. Data was collected from 306 participants who ranged from 20 years to 65 years of age (M = 33.827, SD = .12.253). Among these, 49% were females and 51% were males.

2.2 Test and Tools

Separate scales using responses on a Likert scale (1-strongly disagree to 5 – strongly agree) were developed to study the four variables under study.

To assess sustainable dining preferences, four items were adapted from prior studies of customer intention to purchase green products (DiPietro et al., 2013; Jang et al., 2015; Khuong et al., 2023; Shapoval et al., 2018). Higher scores indicate strong purchase intentions towards sustainable dining in restaurants.

To assess spatial design, a total of 12 items were adapted, four-items for application of recycling and composting management activities: (Jang et al., 2015; Khuong et al., 2023); four-items for application of energy and water management: (Khuong et al., 2023; Wang, 2012); three-items for application of eco-friendly supplies: (Khuong et al., 2023; Schubert at al., 2010), and one extra item was added on the basis of our conceptualization to the item pool. Higher scores indicated greater appreciation for these sustainable elements in spatial design at restaurants.

To assess visible sourcing four items were modified for application of organic food-green products and materials (Khuong et al., 2023; Yusof et al., 2017). Higher responses indicate greater preference for dining at restaurants following sustainable sourcing practices.

Lastly, to assess consumer environmental awareness, eight items were adapted from research on customers' pro-environmental emotional attachment (Jang et al., 2015; Khuong et al., 2023; Yuksel et al., 2010). Higher scores indicated a stronger emotional identification with eco-friendly restaurants.

Further, to ensure content validity all measures were circulated for review by two restaurant managers, and two academicians in the food and beverage sector. Then, after making the necessary changes a pre-test was conducted with ten consumers who dine frequently.
Cronbach's alpha for all the scales used in this study lies between .852 to.963, which exceeds the appropriate level of internal consistency reliability (Hair et al., 2019).

2.3 Method

All analyses were carried out using SPSS 30. Multiple regression was carried out, with all predictors entered together to assess the direct effect of the two elements of spatial design transparency elements spatial design and visible sourcing, and consumer environmental awareness, on sustainable dining preferences. Interaction terms were included in the model to test the moderating role of consumer environmental awareness in the effect of spatial design and visible sourcing.

3. Results and Discussion

The regression model was statistically significant, wherein spatial design transparency elements, visible sourcing, and consumer environmental awareness explained 58.8% of the variance (R^2 = .588, F (3,304) = 144.917, p<.001). The results are shown in Table 1.

Table 1. Regression Results.

Predictor	B	Std. Error	Beta (β)	p-value	Tolerance
Spatial Design	.476	.058	.455	<.001	1.929
Visible Sourcing	.201	.058	.103	<.001	1.929
Consumer Env. Awareness	.284	.045	.307	<.001	1.929
Spatial Design x Consumer Env. Awareness	-.033	.061	-.032	.590	-
Visible Sourcing x Consumer Env. Awareness	-.028	.068	-.028	.680	-

Out of the three predictors, spatial design had the highest impact on sustainable dining preferences (β = .476, p<.001), highlighting the importance of elements like open kitchen, and ecofriendly design. Thus, these results support the first hypotheses of the study wherein spatial design transparency elements influence sustainable dining preferences to a larger extent as compared to consumer environmental awareness, and visible sourcing. These findings are consistent with past studies focusing on the power of spatial layouts, concepts like servicescape, and theory of atmospherics (Kandampully et al., 2023; Kotler,1973; Rianmora et al., 2023) in shaping consumer behavior. In fact, previous research

on hospitality design and consumer experience has shown significance of décor elements like - signs, symbols, furniture and ambience (Apaolaza et al., 2020; 2023; Chen et al., 2023; Lee et al., 2023) in influencing consumer behavior and enhancing trust.

Consumer environmental awareness emerged as the second significant predictor, with a smaller effect (β = .284, p<.001) as compared to spatial design. This finding is in consonance with past research as they focus on pro-environmental attitudes leading to behavioral changes (Ajzen, 1991; Moon, 2021; Shishan, 2021). However, the fact that it has a smaller beta than spatial design highlights the importance of design elements as a significant tool in dining establishments to boost customer trust as compared to consumer awareness. Also, contrary to the second hypothesis, consumer environmental awareness did not emerge as a significant moderator. Collectively, the results suggest that spatial design transparency elements operate at a basic emotional level, influencing behavior directly rather than awareness which operates on a more conscious level of decision making (Jeong & Jang, 2010). The present work shows that sustainability driven behaviors are most influenced by immediate spatial design elements in the restaurants rather than pre-existing environmental awareness or past perceptions.

Further, visible sourcing, was also identified as an influential factor impacting sustainable dining preferences (β = .201, p<.001), in consonance with earlier research showing its impact on consumer loyalty and consumption patterns (Yang et al., 2022).

These findings re-emphasize the importance of past research on significance of the physical environment affecting consumer behavior. Another possible reason for this could be the time and cognitive processing required to understand the sourcing information as compared to taking cognizance of design elements which happen organically.

To sum up, this study offers interesting findings as it emphasizes the significance of spatial design transparency elements as compared to perceived consumer environmental awareness in shaping sustainable dining choices. These outcomes are important for design practitioners and educators because they imply that after all, it is design-based strategies, and not just the environmental consciousness of the consumer, that can lead to sustainable behavior.

Specifically, from a design perspective, the findings of this study indicated that design elements, such as open kitchens and other eco-friendly design features, are more meaningful to practitioners compared to informational transparency in promoting sustainable dining behaviors. Integrating experiential design solutions into infrastructure strategies within initiatives and service contracts in the food and dining sector will create sustainable outputs. In addition, future research can focus on exploring specific design strategies like biophilic design, interactive displays of sustainability principles, and changing design arrangements to drive consumer engagement.

For academicians, this study challenges TPB based theories and implores changes in pedagogy to understand sustainable consumer dining behavior. The findings shift the focus from psychosocial factors to design transparency. It shows that spatial design elements are important which must be taught when studying sustainable dining preferences for restaurants. Future research can explore gender, group, cultural differences, and, long-term behavioral impact of spatial design transparency. Research on specific design elements which have the maximum impact is also warranted.
