FOREWORD

Ethical Leadership: A New Frontier for Design

Christian Guellerin

Executive Director, L'École de design Nantes Atlantique

Former President, Cumulus Association

Emmanuel Levinas writes: "Morality makes us feel sorry for those who are hungry, Ethics obliges us to feed them. ". Ethics requires action, it is no longer a question of think- ing about the world or drawing it as one would like, it is a question of building it. Beyond his position as a giver of meaning, the designer becomes a builder and symbolically returns to the origins of Applied Arts and the work of the hand. How to build tomorrow is the key question.

The place of the designer in tomorrow's organizations is central and decisive for structures that think about their future. We must act to help them design, produce and sell differently. They will be forced to do so by the standards which will undoubtedly be promulgated at a time when political leaders begin to legislate to limit carbon production or are tempted to limit certain industries for the benefit of others

They will also be forced to do so by changes in consumption. The consumer will want to obtain guarantees of responsibility from companies. The consumer will become a citizen-consumer.

The development is interesting because it will revolutionize the UX design approach, which could become an approach much more focused on the consumer who has become a citizen. UX could be re- placed by CX design. The "consumer experience" devotes both the experience, the sense but also consumption which becomes acceptable as soon as it is reasoned. CX design could replace marketing focused solely on profitability

Finally, industrial requirements will change completely in nature, the inability to rely on the renewal of markets to order its activity, will force all companies to ask themselves the question of moving

from product to service. Dishwasher manufacturers will have to move from selling a machine to marketing "hours of operation" of the machine. Designers are called upon to occupy strategic positions because industrial and commercial models are shaken up by innovation and the duty to change all paradigms.

The concept of ethical leadership

Ethics obliges us to act. Design thinking has only laid the foundations for thoughtful design. Nothing will remain except memories of post-it meetings during which everyone feels free of their creativity. Without a scientific basis other than a drawing to justify that creative thinking went in all directions, and therefore had none, it will not be able to survive except as a recreational step in the emergence of the designer towards strategic and management functions.

The role of Design Schools in learning and training must change in nature and prepare students to become entrepreneurs of their own idea. It is a profound evolution of the programs that needs to be done. Most programs are focused on learning techniques, while these will be assumed tomorrow by intelligent robots. Thinking that robots will not be able to create is a mistake. We will have taught them to do it and to take our place in all technical activities. It remains for humans to take the position of manager and facilitator of what machines will be able to do. This is the challenge of tomorrow's design positioning. If the design has become strategic and if the technical tasks are assumed by Artificial Intelligence, if it is a question of giving meaning to science, technology and/or marketing and finance, then design becomes the key function. But this will only be possible if design schools profoundly change their program towards more professionalization, understanding of the economy, organizations and the levers of their development. The challenge of hybridizing disciplines between science, humanities, business and design is becoming imperative. It is the objective towards the strategic functions that should be ordered. Student designers can no longer just create and leave their creation to others, it is about entrepreneurship. They are called to become the leaders of this profound economic revolution more moral responsibility and sobriety. They must be leaders on the condition that they are aware of it and that schools allow them to objectify this result. Or design will only remain on the margins while top-strategic positions are largely open to them. This is the discussion we wanted to open in Nantes by welcoming the Cumulus spring conference 2025 "Ethical Leadership: A New Frontier for Design", as documented in these proceedings.

FOREWORD

Celebrating 35 Years: Design for a Planet-Centered Future

Lorenzo Imbesi

Full Professor, Sapienza University of Rome
President, Cumulus Association

The Cumulus Nantes Atlantique 2025 Conference represented a landmark moment in the history of our association—a celebration of 35 years of global design education collaboration, and a bold reimagining of design's role in addressing the pressing challenges of our time. Hosted in Nantes, a city that embodies the spirit of innovation and cultural richness, and graciously welcomed by L'École de Design Nantes Atlantique, this gathering brought together more than 500 participants from across the world, creating an unprecedented space for dialogue, reflection, and transformation

This anniversary conference was not merely a commemorative event, but a pivotal moment of transition and renewal. At its heart was the unveiling of the new Cumulus Design Declaration - a transformative document born from years of collaborative co-design processes involving our entire global network. This declaration articulates our evolved vision, marking a fundamental shift from human-centered to planet-centered design. It recognizes our profound interdependence with all life on Earth and challenges us to transcend anthropocentric paradigms, embracing a holistic perspective that acknowledges the complex relationships between human and non-human entities in shaping sustainable futures.

The conference provided a fertile ground for exploring critical dimensions of contemporary design education and practice. Through keynote presentations, panel discussions, workshops, and exhibitions, participants engaged with urgent questions about sustainability, equity, and the ethical responsibilities of designers in an era of climate emergency,

social upheaval, and technological transformation. The discussions reflected a commitment to redefining design's foundational principles—its starting points, objectives, and values - in ways that respond to the interconnected crises of our planet.

Particularly significant was the Design Cultures for Peace initiative and the Gaza resolution, unanimously voted by the General Assembly. This historic decision demonstrated our community's unwavering commitment to fostering dialogue and understanding through design education, even amid geopolitical tensions and conflicts. It affirmed that Cumulus stands for more than academic collaboration—we are advocates for peace, justice, and positive change through design. In moments of global division, our association chose to unite in solidarity, recognizing that creativity and education can serve as bridges toward reconciliation and mutual respect.

The proceedings collected in this volume capture the intellectual richness and diversity of perspectives shared during this extraordinary gathering. They include theoretical explorations, innovative pedagogical approaches, speculative projects, and practical strategies that collectively point toward an expanded understanding of design's transformative potential. These contributions invite us to question established norms, embrace complexity, and imagine alternative futures where design actively contributes to ecological regeneration, social justice, and cultural understanding.

As we reflect on these 35 years of collaborative journey and look toward the future, the Nantes conference reminds us that our strength lies in our global community - in the connections we forge across geographical, cultural, and disciplinary boundaries. The legacy we continue to build together, rooted in inclusivity, diversity, and shared commitment to meaningful change, provides a foundation for addressing the challenges and opportunities that lie ahead. In a world that demands urgent action and profound transformation, design education, when practiced with care, intention, and planetary consciousness, can truly serve as a catalyst for building more sustainable, equitable, and harmonious ways of living together.

Cumulus Association

The Cumulus Association celebrated its 35th anniversary during the Cumulus Spring Conference in Nantes. It is the leading global association of art and design education and research. Cumulus represents a dynamic ecosystem for internationalization and global mobility, knowledge exchange, and collaboration in art and design pedagogy, research, and practice. The 400 Cumulus member institutions are leading the way in art and design education around the world. Originating from 71 countries, they demonstrate the importance of collaboration in a 21st century higher education landscape that is increasingly complex and global.

L'École de Design Nantes Atlantique

Founded in 1988, L'École de design Nantes Atlantique is a partner institution of the Nantes St-Nazaire Chamber of Commerce and Industry. Our institution operates under the authority of the Ministry of Higher Education and is an associate partner institution of Nantes Université, with support from local authorities, including Nantes Métropole and the Pays de la Loire regional authority. L'École de Design Nantes Atlantique is situated on the Île de Nantes in the heart of the Quartier de la Création. This unique architectural setting fosters creativity, learning, and global awareness. As a research and innovation centre, the school has created five Design Labs, platforms for research, training and innovation through design, supervised by 350 teachers and professionals ::

- Care Design Lab (health, care and social innovation)
- City Design Lab (urban and territorial change)
- Digital Design Lab (digital innovation)
- Food Design Lab (new eating habits and the food system)
- Media Design Lab (media, information, communication and entertainment)

By grouping all of its activities on the same site, in particular its research and innovation laboratories, the school has strengthened its ability to respond to the challenges of today's world: changes in lifestyles and practices, new services brought about by digital technology, changes in cities, ageing populations and attention to others, new economic models, environmental and social issues, etc.
This unique site offers a working area of 11,600 m2, including more than 1,000 m2 dedicated to manufacturing spaces and digital workshops. Structured around an agora, a central space for socialising, the environmentally designed building is located in the heart of a creative eco-system. Fortified by its 1000 corporate partners and 4000 alumni, l'École de Design Nantes Atlantique is historically linked to the professional world. It prides itself on its project-based teaching methods and offers a wide range of opportunities for companies to recruit people who are particularly sensitive to technological, societal and environmental changes: internships, apprenticeships, prospective studies, workshops, projects in partnership with companies on real-life issues, professional designers as speakers and lecturers.

To promote the cultural and creative development of its students, L'École de design Nantes Atlantique has chosen to expand to the four corners of the world. It is located in Shanghai (China), São Paulo (Brazil), Montreal (Canada), Cotonou (Benin). It has also developed partnerships with more than a hundred universities around the world to encourage its students to immerse themselves in the international scene. Each year, our international programs welcome students of some 40 nationalities to the campus.

THEME AND TRACKS

In the last three decades, the design field has seen significant transformations, marked by diversification, complexity, and integration with various sectors, including technology. Initially focused on form and function, design has expanded to drive social, ecological, cultural, and digital innovations. Two major revolutions – digital and service – have reshaped the discipline. Today, with environmental challenges and advancing AI, designers face a critical juncture, necessitating reevaluation of practices and theories. This includes adopting multidisciplinary, innovative, and ethically responsible approaches.

The 2025 Spring Cumulus Conference in Nantes welcomed more than 500 participants that have explored and exchanged during more than 3 days new design ethics through six tracks: Care, City, Food, Digital, Media, and Design & Entrepreneurship.

1 Care and Public Innovative Action Issues: Managing new ethics of public design

Care ethics aim to « mend our world » by improving relationships and enhancing democratic practices (Tronto, 1993). Over the past few decades, social designers in the UK, Scandinavia, the US, and France have developed participatory practices and public service co-production to innovate public administration and governance. This participatory shift in governance has introduced new methods for public engagement and democratic debate to advocate for justice (Di Salvo, 2022). Various analytical frameworks have been developed, focusing on creativity, innovation impacts, and stages of transformation in projects and work cultures (Salinas et all, 2024). We call for new analytical taxonomies on design for policy to evaluate contexts like hospitals, urban bodies, or community centers, ensuring elderly well-being. Our aim is to review public innovation landscapes through social, economic, and political impacts,

exploring design-led strategies, governance, and impacts through co-design practices or collaborative management, and evaluation. Designers' roles in public sector transformation and ethical leadership are ought to be highlighted (Buchanan, 2020).

Buchanan, C. (2020) What is strategic design? An examination of new design activity in the public and civic sectors. Doctoral thesis. Lancaster University, UK.

DiSalvo, C. (2022) Design as Democratic Inquiry: Putting Experimental Civics into Practice. The MIT Press.

Salinas, L., Yarrow, L., and Lagedamont, M. (2024) Critical service design for government innovation, in Gray, C., Ciliotta Chehade, E., Hekkert, P., Forlano, L., Ciuccarelli, P., Lloyd, P. (eds.), DRS2024: Boston, 23–28 June, Boston, USA. https://doi.org/10.21606/drs.2024.532

Tronto, J., 1993, Un monde vulnérable. Pour une politique du care. Paris. La Découverte

2 Regenerative City and Territorial Development: Co-designing benefits for People and Natur

The dominant model of urban and territorial development, based on infinite growth and the ever-expanding human settlements, has exceeded planetary limits, particularly in terms of climate, biodiversity, and other natural resources, and has exacerbated social inequalities (Stockholm Resilience Institute, 2022). In France, this has led to land artificialization at a rate of three to four times higher than demographic growth (Ministère de l'Écologie, de l'Énergie et de la Mer, 2017).

To address these dead-ends, transforming and regenerating existing cities is a key lever for ecological and social transition, as 80% of the cities of tomorrow already exist (Leconte, Grisot, 2022). Regenerative design aims to go beyond sustainable design principles to foster the co-evolution of natural and social systems (Blanco, 2022) and calls for systems perspectives and a territorial approach (Attia, 2016; Brown et al., 2018; Zhang, Skitmore, De Jong, Huisingh, & Gray, 2015; Cole, Oliver, & Robinson, 2013). 11

We call for contributions analyzing methodologies, processes, projects, and outcomes of design and co-design linking public authorities, urban citizens/citizen groups, and professionals such as designers, urban planners, landscape architects, architects and/or developers. It involves questioning equitable territorial development that incorporates the needs of all, including the special needs of disadvantaged populations, while promoting sustainable cities and territories (Harvey, 2012; Glasser, 2011; Gehl, 2010; Florida, 2002; Sennett, 1992). It also explores the current and emerging roles of designers for city and territory shaping and transformation that include notably regenerative design, inclusive design, nature-inspired design, resilient design, circular design, speculative design, etc.

3 Digital Ethics: From UX to Ecosystems, from AI Ubiquity to AI Acceptability

As the digital landscape rapidly evolves, designers are at the forefront of creating experiences that significantly impact individuals, societies and the environment. This track explores the ethical dimensions of digital design in this dynamic context. User Experience (UX) designers balance usability, accessibility, and privacy concerns. The ethical and environmental implications of digital ecosystems extend beyond individual interactions, addressing governance, trust, and accountability. We will explore how designers can navigate these complexities to foster ethical digital ecosystems that prioritize user welfare, environmental and societal good, showcasing frameworks and case studies that promote equity, frugality, trust, and inclusivity.

Artificial Intelligence (AI) is now ubiquitous, influencing many aspects of life. Ensuring AI's acceptability requires addressing ethical issues like bias, fairness, and transparency, its impact on labor and the environment. The development of frameworks is needed for the responsible design, development and deployment of AI technologies, including for robotics

and IoT devices, from testing AI's datasets to measuring its environmental impact.

Advancements in virtual and extended reality bring new dimensions of user engagement and unique ethical concerns, such as user safety and psychological impacts. How do we design innovative and responsible immersive experiences? This track offers a platform for critical reflection and discussions on digital ethics, inspiring designers to lead with ethical principles and shape a just and desirable digital future.

4 Food Transition: Food Serenity and Environmental Challenges

This theme calls for contributions focused on the food sector, which is undergoing a significant transition due to pressing environmental challenges. Both society and consumers bear a substantial individual, corporate, and social responsibility to future generations, necessitating the urgent embrace and initiation of this transition without further delay.

Designers play a crucial role in shifting the mindset around food consumption and production, which is the most impactful and challenging leverage point. We frame this discussion around the question: 'How can designers valorize and emphasize food serenity to contribute to environmental preservation through their methods and practices, while also ensuring that design takes a leading role in driving this food transition?

The theme of Food Serenity involves a focus on enhancing food well-being (better eating habits), embracing sobriety (such as low energy consumption, local sourcing, slow food principles, and sustainability), improving food access (through policy and food safety), and ensuring transparency (regarding the origin and production conditions, food ethics of highly processed foods, and the acceptance of alternative protein sources). »

The concept of Food Serenity challenges designers to balance individual

well-being in relation to consumption with environmental and societal responsibility. Designers working on food-related topics are imagining sense-making new food production models, driving innovative processing methods, facilitating the adoption of sustainable eating and consumption habits, and developing visions for regenerative food systems of the future. Using design methods like a transdisciplinary systemic design approach can stimulate a paradigm shift by acting on different levels: Micro (individual), Meso (companies), and Macro (public sector). In the future, this will empower designers to position their impact and take on a strategic leadership role in the food sector.

5 Informational Issues: Information and Interaction Design & Trust in Information

We are calling for contributions on the role of information and interaction design in building public trust in information and in the media (in all their forms: press, newspapers, audiovisual, social media, digital platforms) relaying this information. It examines how user experience, graphic interface and visual presentation influence the perception and understanding of information.

It also examines devices that encourage user engagement in knowledge and critical thinking, or conversely that exploit user attention and related ethical issues. It looks at how they contribute to economic and information service models. It explores the current and future roles of designers in shaping and processing information and knowledge, and how new digital product teams are being structured.

6 Design Entrepreneurship - From Designers to Leaders : Cultivating Ethical Leadership by Design-Driven Entrepreneurship

This track explores the transition of intercultural designers and entrepreneurs from « designing » to « leading. » We will investigate this evolution from hands-on design to leadership roles, and the requisite dependencies on shared understanding with greater agency in diverse co-creation networks. The track will also examine how the planet can serve as a literal and metaphorical boundary object for intersubjective understanding.

We will highlight the unique perspectives designers bring as their ethical influence increases, identifying and addressing gaps in their capacities to fulfill this new frontier. Discussions will focus on the dilemmas of maintaining creative essence while assuming leadership responsibilities, in addition to changing organizational models by ethically evolving with new tools, shared language, and creative cultures. The track encourages research on how trained designers take on leadership roles outside traditional design disciplines, particularly as they extend into entrepreneurs. We will discuss the power of purpose in designing more ethical businesses, including the levers of equitable business models, sustainable practices, and public-private partnerships.

CALL FOR PAPERS PROCESS

A call for papers & contributions opened to the design community early September 2024, for researchers, doctoral candidates, educators and design practitioners.

Track	Abstracts received	Abstracts selected	Final submissions	Final submissions selected	Selectivity rate
Care and Public Innovative	116	66	50	46	40%
Regenerative City	121	54	39	37	31%
Digital Ethics	136	62	40	36	26%
Food Transition	44	29	20	20	45%
Informational Issues	65	20	17	16	25%
Design Entrepreneurship	91	65	44	34	37%
General	573	296	210	189	33%

53% of the 189 final selected contributions are from Europe and 47% outside of Europe. Here the top 5 countries:

- **21% China (39)**
- **19% Italy (36)**
- **12% France (22)**
- **10% United-States (19)**
- **5% United Kingdom (10)**

KEYNOTES

Cynthia Fleury

Professor of the « Humanities and Health » Chair at the Conservatoire National des Arts et Métiers, is also an associate professor at the École des Mines (PSL/ Mines-Paristech). Her research focuses on the tools of democratic regulation.

She is the author of several works, including Dialoguing with the East (PUF, 2003), The Pathologies of Democracy(Fayard, 2005; Paperback 2009), The End of Courage (Fayard, 2010; Paperback, 2011), The Irreplaceables (Gallimard, 2015), and Here Lies Bitterness (2020).

She has taught for a long time at the École Polytechnique and Sciences Po (Paris). She was the president of the NGO Europanova, which organized the Citizens' Convention for Europe (the largest gathering of European civil society). She currently serves as its vice-president. Upon joining the CCNE (National Consultative Ethics Committee) in 2013, she became its youngest member. She is also a founding member of the European Network of Women Philosophers of UNESCO. As a psychoanalyst, she is the patron of ICCARRE (the intermittent treatment protocol for HIV) and a member of the emergency medical-psychological unit of SAMU (CUMP-Necker).

After founding the Chair of Philosophy at the Hospital (Hôtel-Dieu Paris), she is now the holder of the Chair of Philosophy at the GHU Paris Psychiatry and Neurosciences. Cynthia Fleury was chosen to be the associated personality of Les Champs Libres in Rennes from 2018 to 2021.

Federico Casalegno

Federico Casalegno is Executive Vice President of Design at Samsung Electronics. He heads the Samsung Design Innovation Center (SDIC) in San Francisco, CA, Next-Generation Experience Planning Teams in Seoul across business units and head of Design and AI.

Federico leads global multidisciplinary teams in the USA, Asia, and Europe to design new generations of experiences and envision future products. As a designer, innovator, and social scientist, he focuses on the impact of networked digital technologies on human behavior and society, and designs products, services, and meaningful experiences to improve people's lives.

Before joining Samsung, Federico was an Associate Professor of Practice at the Massachusetts Institute of Technology, teaching at MIT and MIT Media Lab. He also founded and directed the MIT Design Lab and the MIT Mobile Experience Lab. He previously worked at Motorola, Inc. and Philips Design, envisioning and creating innovative product experiences. He has been awarded honorary professorships at the Glasgow School of Art, University of Glasgow, and the Jiangnan University

School of Design in Wuxi, China. He has published several scientific papers in peer-reviewed journals, along with books and articles, and he has won several awards for his design and innovation work.

Federico earned his PhD in Sociology of Culture and Communication from the Sorbonne University in Paris, France, with a focus on mediated communication and social interaction in networked communities and smart cities.

Gjoko Muratovski

Gjoko Muratovski is an award-winning designer, researcher and innovation consultant working with a wide range of universities, Fortune 500 companies, and various governments from around the world. By combining design-led innovation, social sciences, and strategic foresight with agile and lean management principles and evidence-based research, he helps organizations become human-centric, socially responsible, and future-proofed. Throughout his career he has held numerous leadership and high-profile appointments at various institutions. He was invited to join various thought-leading organizations such as the Forbes Councils, Stanford Institute for Innovation in Developing Economies, Oxford University Society, Oxford Digital Leaders Network, Yale Higher Education Leadership Summit, and the White House Presidential Innovation Fellows Program. Muratovski was elected as a Fellow of the Design Research Society (FDRS) for his contributions to the field of design research.

Fabien Grégoire

Born in Nantes in 1976, Fabien Grégoire is a French designer who has spent a significant part of his career in Japan. A graduate of l'École de Design Nantes Atlantique in 2001, he worked as a freelancer for companies such as Staub and Visteon before joining KENWOOD in 2002. During his time in Japan, Fabien distinguished himself in advanced design, pushing the boundaries of both hardware and software design in collaboration with various Japanese and international companies across high-tech, automotive, entertainment, professional solutions, and healthcare industries. He had an impressive career at JVCKENWOOD, rising from design director to a top executive role. After a brief stint in consulting, Fabien joined Saint-Gobain in 2024 as Head of Experience Design for HPS (High Performance Solutions) to shape new digital business opportunities.

Rohit Priyadarshi Sanatani

Rohit Priyadarshi Sanatani is a design researcher and a PhD fellow in Design Computation at the Leventhal Center for Advanced Urbanism (LCAU) at the Massachusetts Institute of Technology (MIT). Rohit's interests lie in empirical and data-driven lines of inquiry into the experiential qualities of urban environments – such as perceived beauty or safety. His recent work has focused on the creation of design assistance and evaluation tools that help designers and planners systematically engage with such complex and often subjective aspects of the public realm. His projects have been presented across multiple research platforms globally.

An architect and urban designer by training, Rohit holds a dual MS in Design Computation and in Computer Science from MIT. He has also worked with the MIT Senseable City Lab on projects involving large-scale urban visual analytics. Prior to MIT, he was associated as Assistant Professor at the Department of Urban Design, School of Planning and Architecture (SPA), New Delhi, and was involved in multiple masterplan development schemes across India.

Antoinette Lemens

Born in the Netherlands with an English father and a Norwegian mother, Antoinette Lemens pursued her studies in Belgium, Spain, and England. She began her career at a creative agency in London before joining Concept Group, a design agency in Paris. For four years, she worked for Kenzo, handling the brand's visual identity and communication on an international level. She became the General Director of the international group Novamark before founding her own company, Jobs in Creation, which specialized in recruiting creative talent. In 2004, she joined Aquent and became responsible for key accounts internationally. She left this firm in 2009 and founded her new company: Lemens & Partners, specializing in the recruitment of top creatives internationally in the fields of luxury, fashion, and design.

A keen observer of personalities and behaviors, she is also highly attuned to trends and locations. She organizes and leads Retail Tours for many brands. From Paris to Berlin, New York to London, she and her team discover the most original boutiques and concepts, unique décor, and exceptional experiences.

Antoinette Lemens is also deeply involved in the design industry and has held

the position of General Delegate of the "Association Design Conseil" for over 25 years. This association aims to promote design and its various disciplines to public authorities, professional associations, and advertisers. She is very involved in international juries for design competitions in fashion, luxury and in the industrial sector. She is also very invested in promoting young talent and works closely with design schools.

Sihem Jouini

Sihem BenMahmoud-Jouini, associate professor at HEC Paris and researcher at GREGHEC, specializes in the management of innovation, disruptive innovation and design in the transformation of organizations. She teaches project management, innovation and creativity, and directs several academic programs, including the MS X-HEC Entrepreneurs and Executive MBA majors. Her research focuses on the organization of exploration and new product development processes. She has published numerous articles and books on these subjects and is a regular speaker at international conferences. She works with companies and institutions such as Thales, Valeo, Air Liquide and Danone.

Matthieu Aquino

Matthieu Aquino is a co-founder of two global design organizations at Fortune 100 companies—3M and PepsiCo. Over the years, he has built performance-driven design functions that have significantly enhanced both organizations' innovation and growth. With expertise across all design disciplines – branding, packaging, product and interior design, digital experiences, and brand activations – Matthieu has led transformative initiatives in a variety of industries, including consumer electronics, hospitality, retail, architecture, art, fashion, and both professional and consumer goods. Currently, Matthieu serves as Vice President of Global Foods Design, Brand & Customer Experience at PepsiCo, where he oversees a $55 billion portfolio of brands. Originally from a small town near Versailles in France and deeply connected to his Italian heritage, Matthieu is a true global citizen. He has lived and worked in key markets across three continents and has established Design Centers in more than ten cities worldwide, enriching his leadership experience in building corporate capabilities. Matthieu has also served on multiple design award panels, was elected to the Advisory Board of the international design school IED and earned over 450 design awards with his teams at PepsiCo.

Stéphanie Roland

Stéphanie Roland is a Brussels-based visual artist and filmmaker. Hovering between documentary and imaginary, her films and installations explore the invisible structures of the Western world, the large scales of time, and hyperobjects. She draws her inspiration from a wide range of subjects, from environmentalism and politics to geology and the cosmos.

Having graduated from Brussels' La Cambre and studied with Hito Steyerl at the UDK Berlin, she completed a course in France at Le Fresnoy – Studio national des arts contemporains. Her projects regularly feature in exhibitions at internationally renowned institutions: Venice Biennale, Centre Pompidou, Louvre Museum, Benaki Museum, Haus der Kulturen der Welt, Botanique, Kampala International Art Biennale, Wiels, and ISELP. Breda Photo, Belfast Photo Festival,Encontros da Imagem, BIP Liège and MOPLA Los Angeles are some of the photography festivals in which she has participated.

Her films have been shown at international festivals such as Visions du Réel, FID Marseille, Festival dei Popoli, ZINEBI Bilbao, FEST New Directors / New Films, Rencontres Internationales Paris / Berlin,

Curtas Cinema and PÖFF Shorts Tallin black nights, to name but a few. Her first film,Podesta Island, won the Alice Guy prize at the FID Marseille while her second, Le cercle vide, won the TËNK prize at the Visions du Réel festival in Nyon.

The Cumulus PhD Network: Nurturing Emerging Voices in Design Research

The Cumulus PhD Network represents a distinctive initiative within our association, dedicated to supporting and empowering the next generation of design researchers. Established as a separate and dedicated platform, the PhD Network provides current doctoral students with a unique opportunity to present their ongoing thesis research and engage with the international design education community at a crucial stage of their academic journey.

Unlike traditional conference tracks, the Cumulus PhD Network operates as an independent call for papers, specifically designed for PhD students who have not yet completed their doctoral studies. This initiative embodies Cumulus's commitment to fostering emerging scholarship and creating meaningful spaces for intellectual growth and exchange. The format encourages doctoral researchers to submit their work as single authors, presenting their research topics independently and receiving valuable feedback from peers and established scholars within the global design

community.

The PhD Network track distinguishes itself through its inclusive and flexible approach. Rather than constraining submissions to specific themes or predetermined tracks, it welcomes research across the full spectrum of design disciplines and methodologies. This openness reflects the diversity and richness of contemporary design research, allowing emerging scholars to explore questions that range from theoretical investigations to practice-based inquiries, from pedagogical innovations to speculative futures, from sustainability challenges to technological transformations.

At the Cumulus Nantes Atlantique 2025 Conference, the PhD Network

once again demonstrated its vital role in nurturing academic excellence and building connections across generations of researchers. The presentations offered by doctoral students revealed the intellectual vitality and critical thinking that characterize emerging design scholarship. These contributions not only enriched the conference program but also provided glimpses into the future directions of design research, showcasing innovative methodologies, interdisciplinary approaches, and fresh perspectives on pressing contemporary issues.

The papers collected in this section represent the diverse research interests and rigorous inquiry of our doctoral community. They reflect the commitment of young scholars to addressing complex challenges through design thinking, and their determination to contribute meaningfully to the evolution of design knowledge and practice. By providing this dedicated platform, Cumulus continues to invest in the future of design education, ensuring that emerging voices are heard, supported, and integrated into our global conversation about the role of design in shaping better futures for our planet and all its inhabitants.

A total of 78 proposals were submitted for this track, of which 31 were selected.

Track chair: Lorenzo Imbesi, professor Sapienza University, Cumulus president

Cumulus PhD Network Chairs by Track

Social and Community Design: Teresa Franqueira, University of Aveiro, Satu Miettinen, University of Lapland,

New Design Frontiers: Roberto Iñiguez Flores, Tecnológico de Monterrey, Smart Tech, AI & Futures: Lorenzo Imbesi, Sapienza University of Rome Viktor Malakuczi, Sapienza University of Rome

Visuality, Culture & Heritage: Anne Pikkov, Estonian Academy of Arts, Durability & Sustainable Design: Monica Di Ruvo, Cape Peninsula University of Technology

Ethics, Identity & Inclusive Design: Miaosen Gong, Jiangnan University

Urban Systems & Regenerative Strategies: Nicola Morelli, Aalborg University.

Sciences du design 10th anniversary

To mark the tenth anniversary of Sciences du Design and the publication of its twentieth issue, the journal's Editors invited the world's French-language design research community to Nantes on June 3, 2025, for an exceptional symposium ahead of the Cumulus Spring 2025 Conference Ethical Leadership: A New Frontier for Design.

The aim was both to celebrate French-language design research, whose dynamism is evident in the 20 issues published by Sciences du Design, and to explore the new territories of design research and their potential for transforming our world in crisis.

On this occasion, the Sciences du Design editorial team welcomed the French philosopher Cynthia Fleury for the opening lecture as guest of honor.

An exceptional call for contributions has been launched. The entire French-language design research community worldwide was warmly encouraged to join us for this exceptional event, which represents a rare and unique opportunity to meet face-to-face.

Symposium Chairs

Stéphane Vial	Université du Québec à Montréal (Canada)
Marie-Julie Catoir-Brisson	Audencia SciencesCom (France)
Zoé Bonnardot	École Supérieure de Design de Troyes (France)

Scientific committee

Zoé Bonnardot	École Supérieure de Design de Troyes (France)
Marie-Julie Catoir-Brisson	Audencia SciencesCom (France)
Jocelyne Le Boeuf	L'École de design Nantes Atlantique (France)
Sébastien Proulx	École de technologie supérieure, ÉTS (Canada)
Stéphane Vial	Université du Québec à Montréal (Canada)

Cumulus Design Declaration

Reaffirming design's commitment to inclusivity, collaboration and planet-centred innovation amidst global challenges.

The present Cumulus Design Declaration has as its precedent the Kyoto Design Declaration of 2008, which was proposed to express the responsibility of design in an era marked by the challenges of sustainability and globalization. The Cumulus Association has been the platform for this, and over the years the values of the Declaration have been adopted by its members and partner institutions, such as international companies, governments and sister organizations. Given the pace of change and the contemporary challenges we face as a society, the association set out to revisit the Kyoto Design Declaration and reaffirm design's commitment to society and the planet. This has been done in an open and collaborative way by means of a two-year process involving surveys, workshops and discussion forums for the participation of associates representing 400 educational institutions and more than 40 institutional partners worldwide, all accompanied by semantic and data analysis to co-create an evolved version of the original Design Declaration.

From Human-Centered to Planet-Centered

We are in need of a paradigm shift from human-driven development to planet-centred design as the basis for an interdependent coexistence between humans and non-humans. The history of how we have

impacted our planet leads us through the current Anthropocene epoch, which significantly questions how we can design with meaning and consciousness. Every design action has an impact on the entire system of life we call Earth, our only home. As humans, we recognize symbiotic conditions with other living systems to promote healthy interactions and regenerative efforts. The position of a forward-looking collective society shapes a way in which lifecycles, patterns and the rhythm of nature resonate with our consumption, health and development.

Rethinking Sustainability

The Sustainable Development Goals (SDGs) have led to massive changes in policy and production with the aim of achieving a better future. These goals make it clear that the role of design is critical to creating a more inclusive, connected and resilient society. Universal access to resources, food, places and information requires a wide range of design strategies and tools, but also a paradigm shift towards a new contract with nature. Climate emergencies, economic fluctuations and natural disasters reveal challenges that require alliances across institutions, disciplines, civil society and governments together with the design community to promote regenerative cultures. Design can redefine itself and take on new roles, from creating responsible products, services and systems to leading creative action towards the necessary transitions.

Inclusiveness and Togetherness

Unity is about diversity, respect and openness to different cultures and traditions. Conviviality must be redesigned to promote social justice and to strengthen trust. Ongoing collaboration across borders, sectors, disciplines and cultures is needed to expand the value of design. Interconnected communities of designers in future societies will face the next challenges, such as mass migration, gender issues and inequality. Design needs a permanent agenda promoting empathy and care as drivers for peace.

Design in Plural

We are experiencing a global citizenship promoted by an interconnected economy, with constant cultural exchanges and information flows that

mainly go from dominant regions to the global south. Every region of the planet has its own uniqueness and values; decolonizing design needs to happen thus ensuring that innovation benefits localities. More than ever, we need to reconnect with diverse knowledge, from indigenous wisdom to science, to thrive as a multitude of species, and increase the impact of design in urban and rural environments, learning from every culture and tradition. A pluriversal approach is needed, represented by a deep responsibility to each community and the different ways of being in the world.

Disruption with Rapidly Changing Technologies

Emergent technologies are changing geopolitical and social conditions rapidly. More than ever, art and design universities, creative youth, designers and other professionals should offer their ability to understand and engage with change as a resource for our society. Artificial intelligence, synthetic biology and cognitive sciences are transforming our way of living and what we understand as humans. Information surveillance and related augmented technologies are post-human realities. Designers are well positioned to seize the opportunities offered for this disruption by envisioning possible futures and working in transdisciplinary teams that enable creativity in preferred directions and thus promote critical thinking as well as design action.

We hereby promote this declaration in accordance with our mission: we are a dynamic forum for the exchange of knowledge and best practices, and a committed advocate for the positive role of designers and artists in shaping a better world.

The Cumulus Declaration was signed and endorsed during the opening of the Ethical Leadership: A New Frontier for Design conference in Nantes, June 4.

Cumulus Design Conversations

A French perspective on design, at the crossroad of global challenges and growth

The Cumulus Design Conversations between research, education, business representatives and design practitioners on June 5, 2025 highlighted design as a driving force for transformation: how to rethink education, skills, academic alliances, and industrial partnerships to prepare a new generation of committed designers? What attitudes, tools, and languages can make design a lever for collective resilience?

Three main axes had structured the discussions:

- Ethical leadership in design: how can designers become influential actors of change?
- Skills of tomorrow's designer: what critical, technical, and collaborative abilities are needed to act in complex contexts?
- The role of schools in the transition: how to transform curricula and pedagogical cultures to meet the challenges of the 21st century?

Chair: Florent ORSONI, L'École de design Nantes Atlantique

Keynote Speech: Gilles ROUGON, World Design Organization, APCI

These conversations took the form of roundtables featuring key French actors from academia, industry, and the design ecosystem. Two major topics were addressed:

1 – Climate Change and Resilience — The key role of ethical design leadership

Climate change demands a profound transformation of industrial and social practices, where resilience becomes essential in the face of growing geopolitical and environmental constraints. Can design play a pivotal role in developing sustainable, eco-responsible models adapted to an ever-evolving world? This panel explores how various industries collaborate with design to address these challenges, showcasing concrete and innovative solutions.

Speakers : Clara BOVE, User Research and Design Lead - AXA DC, Katie COTELLON, Head of Design and User Experience - Saint Gobain, Nicolas BUCHE, Business Innovation Manager - Orano, Emmanuel THOUAN, President of APC.

Fruitful Conversations #1

Keynote witnesses: Srini SRINIVASAN, COO Design Innovation Institute Shanghai (China) & Past president WDO, Joseph PRESS, Dean at NACAA (China)

2 – AI and the designer — Rethinking intelligence & creativity in the age of machines

Artificial Intelligence (AI) is transforming industries, professions, and our understanding of what it means to be human. For designers, this shift raises critical questions: How does AI challenge traditional practices and create new opportunities? What role does the designer play in maintaining human-centric values in an increasingly automated world? This panel explores the intersection of AI, design, and humanity, addressing the balance between innovation and ethics, and examining how design can lead in shaping responsible and sustainable futures.

Speakers: Jerome FERRARI FROMAGER, Design & User Xperience Director - Orange, Georgios – Alexandros TSALTAS, IP & Learning Specialist - European Union Intellectual Property Office, Anne ASENSIO, Vice president, Design Experience - Dassault Systèmes, Quentin LE PAPE, Founding Designer - ComandAI

Fruitful Conversations #2 : Design Education and Resilience

Keynote Witnesses: Christian GUELLERIN, General Director, L'École de design Nantes Atlantique (France), Yongqi LOU, Vice President, Tongji University, Fabienne MUNCH, Professor and Chair, Ohio State University (USA)

EPILOGUE : Design the French way !

From the Olympics to Notre-Dame — 2024 Icons : three highly renowned design contributions to emblematic events of 2024 in France

Mathieu LEHANNEUR, Designer of the Paris 2024 Olympic and Paralympic torch and cauldron, Ionna VAUTRIN, Designer of the Notre-Dame de Paris chair, Aurélien MEYER (Atelier Blam), Designer of Zeus, the mechanical horse from the Paris 2024 Olympic opening ceremony.

Session In partnership with APCI, French Association for Design Promotion

Chair: Stéphane GOURET, L'École de design Nantes Atlantique

Students Workshops

Two international student workshops took during the Cumulus week in Nantes.

The Carousel workshop to unit through design & storytelling

To celebrate the 15th anniversary of the Carousel network, our students in space design, product design and UX design collaborate with students from four other European design schools (Spain, Poland, Belgium, and Scotland) on the theme of storytelling. Together, they found, shared, and interpreted stories through objects, spaces, and digital interfaces. The stories they created aim to bring communities together around historical, cultural, personal, local, and international experiences, using the city of Nantes as a common thread.

Team:

Richard Firth, Edinburgh Napier University (Scotland)

Sofie Rumbaut and Katrijn Sabbe, Howest (Belgium)

Robert Plundra, Warsaw Academy of Fine Arts (Poland)

Paolo Susteric, Elisava, Barcelona (Spain)

Zélia Darnault, Xavier Drouaud, Florent Michel, L'École de design Nantes Atlantique (France)

With the participation of Bernard Stelandre (Ready to Shake, France)

Innovating with New Technologies

Students from the school and from NACAA, the French-Chinese design institute created in partnership with the China Academy of Art develop innovative concepts around themes such as artificial intelligence, brain-computer interfaces, healthcare robotics, AR/VR, and more. This workshop focused on designing projects that address real-world industrial challenges proposed by major Chinese tech and robotics companies (Alibaba, BrainCo, Rokid, etc.).

Team: Joseph Press, Jaimie Bautista, Anaïs Jacquard, Simon Lozac'h and Marine Belluet.

Type Directors Club Exhibition by ECV Nantes

Founded in 1946, the New York-based TDC (Type Directors Club) was created to promote the art of typography and the quality of typeface design. Its mission is to bring together graphic designers and typographers from around the world in order to support and uphold typographic excellence in both print and digital media.
For over 15 years, ECV Nantes has hosted the TDC's traveling exhibitions, which tour the globe with a single goal: to showcase the very best in contemporary graphic and typographic design.

Synthetic Memories Exhibition

Exhibition by the students of L'École de design Nantes Atlantique
Design in the Service of Memory in the Age of Generative AI
The Synthetic Memory exhibition explores how digital design and artificial intelligence are transforming our relationship to memory and history. Created by students from the Digital Design Lab at L'École de design Nantes Atlantique under the direction of artist Stéphanie Roland in partnership with Stéréolux, this exhibition is part of the InnovART III program by Campus France in Argentina and the international CUMULUS Nantes 2025 conference.

Design Cultures for Peace

A roundtable examining the important role of international design organizations in times of conflict. This session brings together design leaders to discuss how our global networks can respond ethically and effectively when faced with geopolitical tensions and humanitarian crises. The discussion will explore how design organizations can maintain open dialogue across divides, support affected communities, and advocate for peaceful solutions while respecting cultural sensitivities. Participants will share perspectives on balancing institutional neutrality with moral responsibility, and developing collaborative frameworks for design's contribution to peace-building efforts.

A timely conversation about the challenges and opportunities facing international design networks as they navigate complex global conflicts while upholding their educational and humanitarian missions.

FAISTOS Meetup

Co-organised by the City Design Lab at L'École de design Nantes Atlantique and the cluster FAISTOS, the meet-up aims to explore the fertile crossroads between research, innovation, artificial intelligence (AI) and design in order to rethink and to reshape how cities and regions are made. As ecological and social transitions and public expectations redefine our living spaces, the integration of emerging technologies, particularly AI, offers opportunities to imagine and model sustainable and inclusive environments.

Speakers :
Arpi Mangasaryan, Doctoral Student, École nationale supérieure d'architecture de Nantes
James Auger, Researcher, Director of the Design Department at ENS and Co-Director of the Centre for Research in Design (École normale supérieure Paris-Saclay)
Pascal Terracol, Professor, École nationale supérieur d'architecture Paris-Val de Seine, Head of architecture & Intelligence Chair
Vincent Dubois, Doctoral Student (CIFRE), Agence Qualité Construction / Université Paris Cité

Working groups

At each Cumulus conference, working groups gather around key design-related topics. These groups bring together people from diverse backgrounds — researchers, educators, professionals, and students — to share expertise, exchange practices, and embrace a plurality of approaches.

The following working groups convened during the conference:

- Design for Placemaking
- Women in Design
- Cirro
- Global X International Affairs
- Design Education for Social Change
- PRE AI Digital Culture
- Leadership & Strategy
- Food Think Tank
- Art and Design Teacher Education and Pedagogy
- Contemporary Art
- New Spaces / New Interiors
- Extraterrestrial
- Systemic Design in Design Education
- Design for Health, wellbeing and Aging
- Fashion& Textile
- Service Design
- Research Vectors in Design and Art
- Intellectual Property

Adapting Healthcare Design for Innovation: A Co-Design Approach to Transforming Facilities

Manon Berthereaux

University of Rennes, PREFICs, Rennes, FRANCE

* m.berthereaux@a-i-a.fr

ABSTRACT | As the healthcare sector evolves rapidly, so too must the methods for capturing and integrating patients' experiences within drawing and development. To accommodate this dynamic environment, hospitals must be designed with flexibility for future expansions, developments, and to allow innovative practices in the near future, even not envisioned at the study phase. However, a paradox arises between the inherent uncertainty required for innovation and the structured professional practices of architects and engineers who design these facilities. This research explores how incorporating design methodologies and engaging designers in the planning and development stages of healthcare facilities can transform project outcomes. Through an in-depth case study of an architectural project, we demonstrate how implementing a co-design approach can drive meaningful project evolution. In this example, the co-design process involved a close collaboration between architects, engineers, and a medical team. This collaborative framework enabled the project team to re-evaluate and refine the entire patient journey, breaking down the different stages and touchpoints. By integrating design thinking and creative expertise into the facility design process, projects can adapt and evolve, impacting the program, spatial configurations, and user experiences. Such a co-design approach yields multifaceted benefits, including economic efficiency, improved management, technical advancements, and enhanced social impact.

KEYWORDS | Design / Healthcare facilities / Methodology / Organization

1. Introduction

On an international scale, hospitals are increasingly involving users, particularly patients, in decision-making processes to address challenges and related issues (Ahmed et al., 2014; Pomey et al., 2015). However, projects' transformation can often be restricted by the constraints of a built environment.

For example, since the early 2000s, French healthcare facilities, particularly emergency departments, have experienced a continuous rise in patient visits[1] and are facing challenges in accommodating the increasing patient flow, resulting in overcrowded services (Rapin & Garnier, 2022). To address this, existing structures must adopt greater agility in managing patient flows and adapt to evolving needs. Meanwhile, future building projects must proactively design pathways to ensure both efficiency and flexibility, addressing patient journeys and professional practices alike.

My doctoral research focuses on exploring ways to involve users in the design processes of healthcare facilities to develop solutions that are both relevant and innovative, while enabling adaptability in hospital services, practices, and technologies. I hypothesize that such an approach can drive the evolution of projects in their programming, spatial configurations, and usage, offering benefits across various dimensions: economic, managerial, technical, social...

2. Theoretical background

For nearly two decades, healthcare facilities have used patients' feedback collected through questionnaires to evaluate their services. For instance, surveys conducted by the British National Health Service (NHS)—including the Picker Institute Questionnaires and the National GP Patient Survey—highlight that service congestion often negatively affects the experiences of individuals (Ahmed et al., 2014). There is often a blurred distinction between "patient satisfaction" and "patient experience" (Ahmed et al., 2014; Anhang Price et al., 2014; Friedel, 2023). On the one hand, patient experience is frequently positively associated with other dimensions of healthcare quality (Ahmed et al., 2014). On the other hand, satisfaction has inherent limitations, as it reflects the gap between a respondent's expectations and their actual experience. As a result, a poor experience may still show relative satisfaction if initial expectations were quite low.

Moreover, a highly competitive context prevails : 2,976 hospitals and clinics[2] recorded at the close of 2022, in France. In their efforts to distinguish themselves, healthcare facilities frequently focus on assessing criteria such as safety and quality of care, with a focus on evaluating satisfaction and improving practices (Elliott et al., 2010). However, patient feedback collected through these channels can underscore concerns related to organization, pathfinding, space, or usage—factors that are not always adequately

addressed, often stem from various contextual factors (e.g., economic constraints, human resources, spatial considerations, etc.). The study and analysis of these elements would offer valuable insights for enriching and improving the quality of the patient experience, thereby contributing to the enhancement of the institution's reputation.

In this framework, certain institutions – or, more broadly, specific healthcare systems – focus on how to incorporate elements derived from patient feedback. On an international scale, particularly in Montreal, significant developments can be observed in approaches conducted to hospital and healthcare system transformations. These include the increasingly systematic incorporation of patients into decision-making processes and the establishment of a patient-partner status (Pomey et al., 2015; Karazivan et al., 2015). This dynamic, which seeks to enhance the status of the patients, presents an opportunity for them to actively participate in hospital transformations (Akrich & Rabeharisoa, 2012; Jobin, 2022), and is grounded in the recognition of patients' experiential knowledge (Jouet et al., 2010; Las Vergnas, 2011; Côté et al., 2017), which complements the academic expertise of healthcare practitioners.

While healthcare facilities appear to recognize the value of collaborating with multiple stakeholders, the integration of users remains to be adequately structured and supported in order to facilitate hospital transformations (Jobin, 2022).
Following the example of its growing application in innovation research, design and its participatory and collaborative methods are increasingly relevant in the healthcare sector (Cartoir-Brisson & Royer, 2017; Gravereaux, 2018; Delanoë-Vieux, 2023). It is observable that some hospitals are gradually integrating design and designers, with some even creating design-driven innovation research units within the hospital. Here are a few examples, though not exhaustive: Caroline Jobin at Brest's University Hospital, Loélia Rapin at Montpellier's University Hospital, and Nawel Gabsi-Bernard at Bordeaux's University Hospital.

Like many other organizations with varying scales and objectives, hospitals and the healthcare sector are constantly seeking innovation. However, innovation relies on an initial context that embraces uncertainty (Ben Mahmoud-Jouini et al., 2016) in order to provide a distinctive solution. But before proposing an answer, it is essential to accurately identify the problem at hand to ensure that a genuine need is being addressed, thereby avoiding "wicked problems" (Simon, 1973; Buchanan, 1992). One approach to innovation research is to adopt a methodology grounded in a concrete research context, as is common in the Humanities and Social Sciences or in design methods derived from these disciplines (Cartoir-Brisson & Royer, 2017). By recognizing the context and its stakeholders—users—as experts (Findeli, 2010 in Rapin & Garnier, 2022) who can and should shape the objectives and methods, design approaches offer collaborative frameworks, ranging from participatory to highly inclusive, to develop solutions that effectively address identified needs.

3. Research gap and objectives

Beyond user consultation initiatives, there is a contradiction between the dynamic driven by facility managers to transform and innovate within hospitals, and the current professional practices of those designing these buildings (Ben Mahmoud-Jouini et al., 2016; Le Roy et al., 2018). This leads to a second paradox: the uncertainty (1) required in

the context of innovation, and (2) inherent in consultation and co-design methods, such as those employed in design; versus the linear processes and methods of architects and engineers. In project management through design, with design being fundamentally a "discipline of project management" (Vial, 2021), the field and its stakeholders—whom the designer considers "experts in what they experience" (in Rapin and Garnier, 2022, Peyrard & Chamaret, 2025)—can guide the project according to their needs.

If hospital innovation units often focus on solving organizational or usage-related challenges, they are sometimes constrained by the built environment, limiting the modularity, flexibility, or adaptability of spaces and their functions. Could certain of these challenges be identified and addressed during the project's phases, before the buildings become operational (Fig.1)? This question forms the basis of an initial hypothesis, prompting an investigation into the design methods used for these facilities.

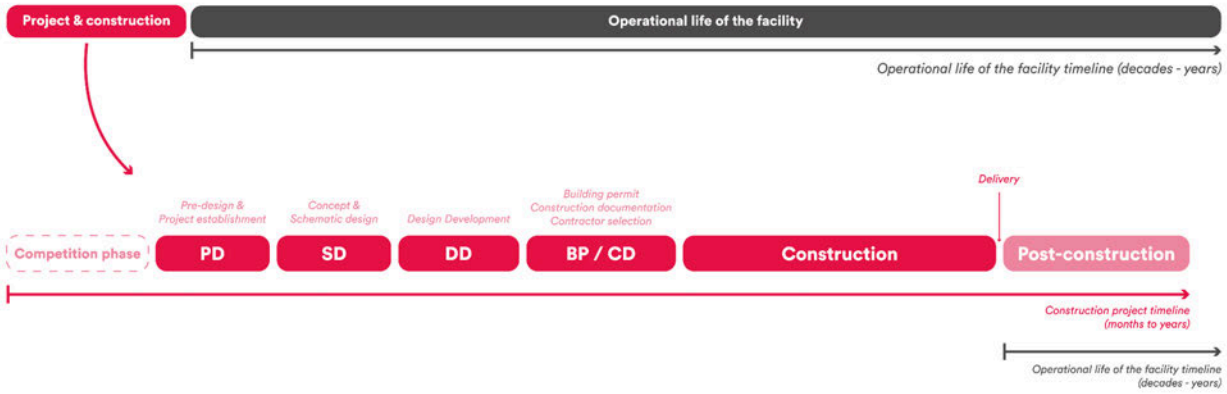

Figure 1. Schematic representation of a standard architectural project timeline. This diagram is based on the findings of brief interviews conducted with members of the AIA Life Designers firm, focusing on the project phases in which they are involved, and according to the main professional groups engaged.throughout the process.

As part of my doctoral research[3], I aim to investigate the discourse on support frameworks and the informational and communicational mechanisms required to implement an approach that integrates users within the design process of healthcare facilities. This study is grounded in methodologies and tools derived from design, as well as the Social Sciences, with the objective of contributing to the continuous improvement of the architectural quality, the functionality, and the usability of these buildings.

Through this doctoral research, and especially in this paper, the first objective is to demonstrate how integrating users into the design process not only transforms the architectural project but also enhances the solutions provided. In the example presented here, the architects utilized design tools and methods to foster a collaborative environment and co-design a solution.

[3] Manon Berthereaux is a designer and doctoral candidate specializing in the integration of design approaches in the healthcare sector. Currently pursuing a PhD in Information and Communication Sciences, she explores how healthcare facility designers adopt and incorporate design methodologies into their projects. As a designer-doctoral student, Manon Berthereaux's research tends to compare academic research with concrete experimentations in order to understand how far professional practices can develop such innovative and human-centered solutions, contributing to the creation of healthcare spaces that are more functional and adapted to user needs.

The second objective is to show that design is a structured, tool-based approach that enables both user consultation and integration into the design process, making it particularly relevant in the context of innovation and the improvement of both overall quality and functionality, notably in healthcare facility design (Bate & Robert, 2007).This paper provides an opportunity to focus on a practical case of managing an architectural project with a design-driven approach on the extension of the Yves Le Foll Hospital Centre in Saint-Brieuc, France.

Finally, the third objective is to analyse the existing info-communication dynamics within the organization, as well as those that could be integrated, to foster a user- and usage-centred project approach and to enrich current professional practices.

4. Methodology

4.1. Context

In response to a call for proposals to redesign the hospital in 2017, the AIA Life Designers firm[4] was selected for its proposed approach as the Design Authority, hereinafter referred to as the Project Management Team. Indeed, this team aimed to submit their architectural proposal to a panel of users, including a few end-users such as patients and their relatives. They also sought to present their sketches to that panel while also exploring and integrating ideas inspired by users' feedback.

To achieve this, the Project Management Team relied on co-design tools and methods derived from the design thinking approach (Rowe, 1991; Simon, 1996; Brown, 2008; Brown & Katz, 2009). A process involving successive phases of divergence and convergence, commonly referred to as the "double diamond" method from “design thinking” approach, was used here. More broadly, while efforts have been made to position design thinking as a tool to drive user-centred innovation, this approach is increasingly being scrutinized for its outcomes (Laursen & Haase, 2019; Bonnet, 2019), often reproducing problems rather than proposing solutions.

The design process was driven by a collaboration between the Project Management Team and the Hospital healthcare teams, referred to hereafter as the Client Authority. Grounded in the principles of co-design, this approach was implemented from the very beginning of the studies. The Project Management Team intended to design a project that was both human-centred and functional.

4.2. Approach

The approach employed here was structured in three phases: a first phase of discovery and exploration of the topic; a second phase of refining and focusing within a specific context; and a third phase of proposals, accompanied by iterative feedback and adjustments leading to the delivery of the project.

[4] AIA Life Designers is a French architecture and engineering firm whose main activity is designing healthcare facilities in France and abroad since 1965

Ten working groups were established, bringing together architects, engineers, healthcare professionals and management staff. The goal was to guide all groups in focusing on three key areas: the main lobby, the daycare hospital unit, and the ambulatory surgery unit.

The first two phases were carried out through several workshops.
Beginning with a broad theme, the first workshop encouraged participants to envision the Hospital's future in the medium term. They were invited to rethink the services, spaces, and uses. Nonetheless, one of the main objectives was also to create a specific moment for reflection and creativity, outside the professional frameworks of any of the stakeholders. The approach sought to move away from a professional perspective and return to a more human-centred one. After revising the design based on feedback from the first workshop, the Project Management Team organized a second creativity workshop centering the discussion on the specific case of the Yves Le Foll Hospital. Finally, all of these reflections were analysed and translated into spatial concepts, marking the third phase of the process.

4.3. Preliminary results

The Yves Le Foll Hospital extension produced the following preliminary outcomes, which should be further supplemented by a phase of evaluation that compares the intended objectives with the actual use of the spaces.

Figure 2.1. Plans of the Yves Le Foll Hospital Centre of Saint-Brieuc that were initially proposed during the competition phase. It shows only two systems were suggested to take care of patients in daycare hospital units of medicine and oncology. *© Manon Berthereaux from AIA Life Designers plans*

Figure 2.2. Plans of the Yves Le Foll Hospital Centre of Saint-Brieuc that were finally designed integrating expertises of both the Project Management Teams and the Hospital healthcare Team. Several systems to take care of patients in daycare hospital units of medicine and oncology can be seen, from the most intimate to the most open. *© Manon Berthereaux from AIA Life Designers plans*

First, the evolution of the design from the competition phase (Fig. 2.1.) to the final delivery is noticeable (Fig. 2.2.). The daycare hospital unit underwent the most significant changes, transitioning from the initial design proposed to the final design delivered. The final design reflects the values identified during the co-design workshops, which, as a reminder, aimed to develop a project that is both "human-centered and functional.". Furthermore, the project teams successfully fulfilled their advisory role by recommending a diverse range of patient care approaches, ranging from highly private (individual rooms) to more open settings (the "bubble" or the "alveolus") (Fig.3) . The designers were able to leverage their experiential expertise gained through years of practice in designing healthcare services and buildings (Bourdeloie & Douyère, 2014, in Kogan, 2016).

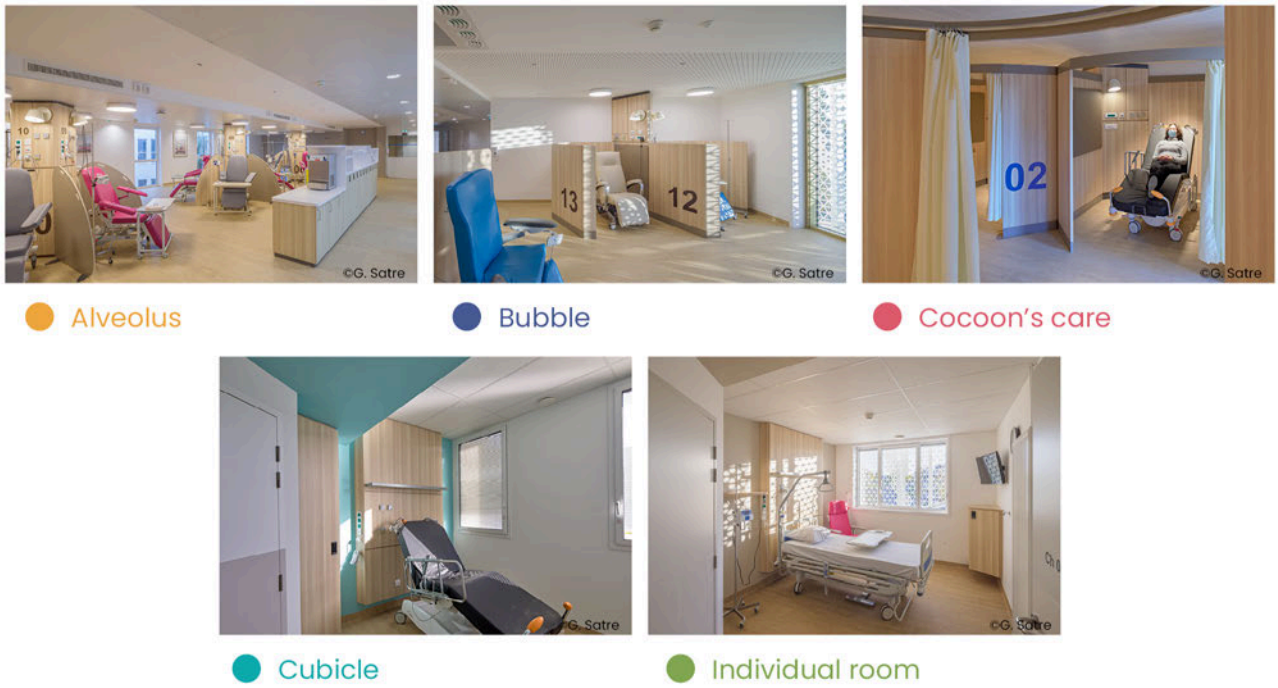

Figure 3. Various systems that were developed and built to take care of patients in daycare hospital units of medicine and oncology can be seen, from the most intimate to the most open. *© Guillaume Satre*

The inclusion of healthcare professionals in the project facilitated internal organizational transformations within the hospital. Collaborative work and discussions fostered dialogue among hospital staff regarding the impact of the extension on their daily work practices.

In the hospital environment, high staff turnover is a common challenge. Documenting the design process was crucial in promoting both acceptance and understanding of the project's objectives. This documentation served as a mediation tool between the teams participating and newly arrived staff. Furthermore, anchoring the project in the expectations expressed by the field contributed to support acceptance of certain transformations.

On the project management side, experimenting with a more collaborative approach helped stimulate the creativity of the teams, both in terms of aesthetic proposals and in finding solutions to usage-related issues. It also provided an opportunity to observe that implementing this approach does not necessarily result in significant cost overruns or delays in the project timeline.

5. Discussion

The first range of limitations is related to the various dynamics among stakeholders.

5.1. Stakeholders' dynamics within the user's panel

The first level of analysis focuses on the composition of the user panel engaged in the design process.

In the case of Saint-Brieuc Hospital, the panel was composed of various hospital staff members, including medical staff and department heads. While this composition allows for an exploration of quality of work life for these individuals, the representativeness of the group seems questionable. While healthcare professionals are included, it seems that one important group of users is missing from the table: the end-users such as patients and their relatives.

This contradicts the efforts made to recognize the patient as an expert, with experiential knowledge, and as an active participant in their own health journey (Akrich & Rabeharisoa, 2012; Pomey, 2015). The reasons behind the selection of users for the panel should be further explored, beyond the explanations provided so far, such as the difficulty in contacting patients.

While the design-driven approach encourages an examination of the dynamics and interactions among stakeholders within the project (Paquienséguy, 2019; Martin-Juchat & Bonnet, 2023), these dynamics seem to be biased in the context of the case discussed in this paper.

5.2. Stakeholders' dynamics within the hospital teams

Then, the relational dynamics between hospital stakeholders, as well as between them and the design teams, require investigation.

The approach adopted here relies on collaboration between the hospital teams and the design teams. This was made possible by (1) the design teams' willingness to adjust their project management process and (2) the Yves Le Foll Hospital's team who was receptive to the proposal and motivated to implement it. The success of this approach also depended on identifying key stakeholders who were convinced of the value and scope of this co-design work. The project contractors thus found a true ally and counterpart in the project owner team, which included a member of the hospital's medical staff.

From the hospital's perspective, the presence of a key stakeholder within the teams ensured effective project follow-up and helped minimize the sense of exclusion that hospital staff may feel in such situations (Gravereaux, 2018). It also supported the gradual transition of healthcare professionals toward organizational change.

However, we must question the effective implementation of a similar approach in a context where the project owner, and thus the client, does not actively support the initiative (Rapin & Garnier, 2022; Delanoë-Vieux, 2023; Schweitzer et al., 2023).

5.3. Stakeholders' dynamics within the conception firm

The last level of analysis focuses on the relationships between the actors within the design firm.

For the Saint-Brieuc project, the relational dynamics are shaped by a unique framework. In fact, the two collaborators who led the implementation of the approach have been working together for over twenty years. Both come from the same architectural background, with one having acted as a mentor and trainer to the other. They share a common vision of healthcare architecture, the pursuit of innovation, differentiation from competitors, and the importance of usage.

In addition, these two collaborators held key positions as project leaders in managing the project—one as the architecture project manager and the other as the interior architecture project manager. Due to their hierarchical roles, the project managers were able to promote their vision and enforce the implementation of the approach across the design teams, reflecting a top-down management (Gravereaux, 2018). This prompts the question of whether the adoption of a co-design methodology through design is only possible with the support and commitment of project managers who believe in its value and relevance.

5.4. Linear processes of conception teams

This brings us to examine the limitations of the current professional practices among healthcare facilities' designers.

Here, the design firm comprises a diverse range of professions covering the entire design spectrum. This structure enables the organization to maintain continuous oversight throughout all phases of the project, from initial concept to final delivery. Team members are staffed based on a predefined schedule and assigned tasks aligned with their specific expertise. While there is coordination and exchange between various disciplines, the overall organization remains characterized by a siloed structure. Although this does not necessarily impede innovation, a siloed approach can complicate communication and collaboration (Bento et al., 2020), which is also highlighted by some of the employees of the conception firm.

Additionally, there is a standardized sequencing of the stages in the process and project management, a practice rooted in the traditions of architecture and engineering (Ben Mahmoud et al., 2016). As previously mentioned, this approach conflicts with a fundamental aspect of innovation research: uncertainty. Can design then serve a dual role: (1) as a mediator and guarantor of transdisciplinary collaboration among design stakeholders (Gentès, 2017); and (2) as a catalyst for innovation in response to a injunction for creativity (Kogan & Andonova, 2019; Bonnet & Martin-Juchat, 2022)?

5.5. Designing “for”, “with” and “by”

Beyond linear processes, the current mindset of architects and engineers relies on a “designing for” dynamic. This involves projecting the perspective of a project stakeholders onto the usage and needs of users.

The approach implemented here introduced a more integrative dynamic by proposing to design "with" healthcare professionals. While this represents progress, a more inclusive collaboration with a representative panel of users could perhaps take the process a step further, especially by recognizing the expertise of patients (Bate & Robert, 2007, Akrich & Rabeharisoa, 2012 ; Paquienséguy, 2019). Despite some advancements, from the patients' perspective, project management still follows a "designing for" approach.

This raises the question of whether it would be possible to implement and systematize an inclusive co-design process that involves designing "with," "by," and "for" users in the context of healthcare facility design.

6. Conclusion

Based on the elements presented, incorporating a co-design method into the project design process has led to architectural proposals that better align with user needs and expectations. However, the representativeness of the user panel remains questionable, as patients were excluded from the decision-making process. Including patients could provide additional insights or even challenge perceptions of use held by other stakeholders.

From a methodological standpoint, this case demonstrated the feasibility of designing a healthcare facility by employing methods and tools derived from design practices. However, these theoretical approaches warrant scrutiny considering the limitations and critiques associated with design thinking and its outcomes.

Although the context presented here was favourable for implementing a collaborative approach, further research into the internal and external conditions influencing the deployment of similar methods within design firms could provide a more nuanced understanding and enrich the preliminary findings outlined earlier.

About the Author:

Manon Berthereaux is a designer and doctoral candidate specializing in the integration of design approaches in the healthcare sector. Currently pursuing a PhD in Information and Communication Sciences, she explores how healthcare facility designers adopt and incorporate design methodologies into their projects.

As a designer-doctoral student, Manon Berthereaux's research tends to compare academic research with concrete experimentations in order to understand how far professional practices can develop such innovative and human-centered solutions, contributing to the creation of healthcare spaces that are more functional and adapted to user needs.

ANCHORING IN TERRITORIES
for public design approaches

ADAPTATION - ACCESSIBILITY - CONNECTIONS - DURABILITY - EXCHANGES

INTRODUCTION

What if the territorial scope was an underestimated dimension in a good public design approach ?

6 design students asked themselves what Good Public Design was during a 5-days workshop in November 2024. They were specifically asked to explore this subject under the scope of the territory.

Following their analysis, territories are a portions of space outlined by stakeholders, of which limits evolve depending on the context. This context can be administrative (official frontiers), natural (defined by geographical elements like rivers), human-related (structured by socio-economics habits) or planned (related to a project's aim).

A territory's contour is often vague, evolving, and even biased, for it depends of local perception. There is no special method to define it : each project has to adjust its approach depending on its subject specificities and involved players.

Territory can be seen both **as an object of study or a material** for a given project.
So what is the role of a territory in a public design conception process ?
How does this territorial perspective redefines a public design approach ?

METHODOLOGY

In order to comprehend the impact of **territorial anchoring** in a public design approach, students went through several research steps.

UNDERSTANDING TERRITORIAL PUBLIC DESIGN
Formulation of hypotheses
- Public design definition
- Understanding territorial implementation : notions of scales, reproducibility...

→ research →

FIGURING OUT THE SIGNIFICANCE OF TERRITORIES
Reading, interviews
- Quick overview of public design literature
- First encounter with professionnals

→ analysis →

BRINGING TOGETHER DIFFERENT PERSPECTIVES
Good practices and difficulties
- Four 60-minuts interviews with public designers with experience with different scales (from town to state)

→ comparing →

CONCLUSION
Graphic synthesis
- Synthesis of good practices and difficulties
- Clustering steps of a territory oriented public design.

DESIGN TOOLS AS LEVERS TO ANCHORING A PUBLIC DESIGN PROJECT IN A TERRITORY

In order to be successful and adopted, a project must be anchored in a given context and must take care of cultural, social and economic specificities.

Project team has to develop a deep understanding of its territory (on administrative / geographical / human-related etc. levels), throughout the project. Design tools can be helpful as they allow to activate collective intelligence.

The route illustrated below sums up some big steps of good practices in order to root an innovation in the territory it is supposed to address :

First, it is important to understand how competences are split between local authorities. For instance in France, different administration layers will deal with very different jurisdictions :

Town	Metropole	County	Region	State
• Primary schools • Social centers • Local mission • Waste management	• Economical, social & cultural development and spatial planning • Urban design, habitat planning...	• Secondary schools • Road maintenance • Health & disability • Social integration, business promotion	• High schools • Higher education & research • Employment, training and learning • Rural affairs • European policies	• Social politics • Education staff • Public health • Solidarity organization • Pilotage of national agencies : environment, employment, retirement...

1 TARGETTING THE PROJECT

Re-examining the project order is essential to the pertinence of the result.

Then it is important to define for the first time the territorial limits of the project.

Always think about checking other territories, all through the project (7)

"Designing for territories requires a great affinity for human and social context and for users profile" Olivier Irrmann (4)

"Coming back to field studies makes you discover or remember whole parts of misunderstood life of citizens, or misunterstood work from your own colleagues" Olivier Irrmann (4)

2 KNOWING YOUR TERRITORY

Take an appropriate time to watch the territory and make a state of the art of your topic

Find the end-users and professional users evolving around your topic.

"While territories are different, sometimes problems remains the same" Sabine Zadrozynski, service designer

RECOMMENCER AVEC LE TERRITOIRE DE DEPLOIEMENT

3 UNDERSTANDING THE TERRITORY

Meet and absorb

Trusting and involving territory stakeholders will give access to their knowledge, and will make designers accept not to control everything, and share empowering tools instead (9)

Some tools to understand better a territory's organization : system or sensory map, immersion, field research, residence...

4 DESIGNING WITH PEOPLE

Anchor a project by taking into account the involved realities, thanks to collective intelligence tools, by focusing on lived experiences.

Co-creation formats : Creative sprints, workshops...

ITÉRATION

Being a designer also means connecting initiatives, understanding other existing ideas and being capable to transfer. That's why it is crucial to document a method so others can be inspired from it.

"Design puts back local in public action" Olivier Irrmann (4)

5 IN-SITU TESTS

Check and challenge the first solutions

Tools to experiment in the territory : prototypes, provotypes, quick-and-dirty models...

"Territories will always feed your processes" Sabine Zadrozynski, service designer

6 SETTING UP THE PROJECT

Finish up the installation
Document the approach

7 DEPLOYMENT

Consider the project's scalability, or its adaptability on other territories

EVALUATE

Evaluate the impact of the project on its territory

"A good design is a design that empowers people and considers the system and networks it becomes a part of" Sabine Zadrozynski, service designer

TIPS AND VIGILANCE

Here are the biggest steps in a project, based on the students' reading and interviews.
In this part you will find both key-points and points of vigilance for anchoring a project in its territory.

1 TARGETTING THE PROJECT

If the initial contract covers a important territory (a whole state, or a significant region) :
→ **Find a smaller territoty scale** in order to get closer to your users, and to identify with them the problematics that will end up being common to other territories.

Avoid duplicatas : several similar approaches are sometimes led in parallel in two different territories :
→ **Create links with other actors** so visions and knowledges can be crossed, and projects can fertilize each other instead of being unwillingly reproduced.

"We need territories to help focusing on the real problems" Sabine Zadrozynski, designer

2 KNOWING YOUR TERRITORY

Because of the plurality of actors, identifying stakeholders and finding the right contacts might me time-consuming :
→ **Understanding the background and the specificities in the territory** thanks to desk research will develop your comprehension of issues and influences

If the designer is rooted in a territory, attention must be paid to biases
→ **Always renew knowledges and confront points of view**

"Consider institutional cultures to adopt the appropriate attitude in the project : this can be done by analyzing literature search" Joachim Savin, designer

3 UNDERSTANDING THE TERRITORY

It may be difficult for a project team to make itself understood, and to establish a trust framework :
→ Identify and **verbalize the common goals shared by design teams and territorial actors**.

It is important to not get too biased by interviews of local actors :
→ **Cross different perspectives** (professional and end users, technical staff and management staff) **and sources** (interviews, observation, literature research...)

Integrating this multiplicity of actors representing a whole system takes time :
→ **Organize and plan** meetings and immersions, to get all the useful information in time.

4 DESIGNING WITH PEOPLE

Specificities of the users and stakeholders of a project must be taken into account when designers create their collaboration tools :
→ **Adapt design methods and tools to the specificities of people and places**

Budget might represent a difficulty for some administrations :
→ **DIY prototyping with modest materials** mustn't necessarily be avoided. A simple prototype will only lead the project team to anticipating deployment and adaptation.

"Finding a hyprid terrotory for the project is essential for the coherency of its installation. The geographical zone, the economy, users and their stories must be taken into account." Marie-Anaïs Bluteau-Borg, designer

5 IN-SITU TESTS

Project viability will be guaranteed by :
→ Implication of users and stakeholders in a test phase
→ Testing the project on different territories (if the project is to be developed on a different scale).
→ Keep close to the initial shared initial stakes.

6 SETTING UP THE PROJECT

Identify key actors who will carry the project and its solutions once the designers are finished :
→ Rely on the **actors networks** built during the previous project steps (Understanding and Designing)
→ Design team might remain a resource for sensibilisation and formation, as design understanding will facilitate transversality and identification of common languages.

Be prepared to gaps between en idealized project and its realization : when taken up by new actors, most of the times a project will be transformed several times :
→ **Protect the project** with documentation to not lose the initial purpose
→ **Lean on actors networks, communicate with them intensely and through multiple channels**
→ **Capitalize on your project** so other territories / actors can inspire and benefit from it

"Not a single local project can avoid a network implemantation, now seen not as an addendum, but as a core focus of the project." La 27ème Région (3)

7 DEPLOYMENT

Differences will be observed between territories, especially in the language used, and on a more global cultural level :
→ **Accept modifications and agree on concessions** to test and adapt a project to different territories

Rethink project governance if needed : you must keep a balance between an efficient management on this new scale, while maintaining a true local connexion :
→ **Identify the relevant project leader on the new territories :** they will need to manage a complex division of tasks and to cast specific skills to make the project take root.

"A design project creates an environment where communication and sharing becomes a common basis again, and where collaboration betwen peers replaces, at least for a given time, hierarchy-based coordination. Olivier Irrmann (4)

CONCLUSION

This research shows the importance of **territorial anchoring preparation**. This anticipation will imply a careful analysis of dynamics at work in the territory (financial stakes, cultural specificities, relationship between actors), so the territory can be described beyond its geographical dimension. Then, in addition to constituting the context of a project, **territory might be seen both as the object of the transformation of a project, and an infinite source material for the designer's work**.

Beyond a solid desk research gathering both quantitative and qualitative data, field immersion will give a project team a good momentum for territorial anchoring. It represents the opportunity to **identify the persons who can be mobilized, and to meet future projects users**. Collaborating with field actors is indeed crucial for the project to be relevant to the complex reality of a given territory. More specifically, local actors will allow the project to root in its context and to last in time, but actors from different territories will make the project more likely to be deployed - allowing it to be also more robust.
This inclusion of a wide variety of profiles will be eased by **the use of visual tools and adapted collaborative working environment** - putting design operational skills in the heart of the project process.

Several difficulties seem to remain relatively common though :
- Identifying key stakeholders might take time, as the ability for an actor to carry a project is difficult to anticipate.
- Lack of funding will often be highlighted as a drag on innovation and will commonly ask project teams to invent sober methods and to develop humble solutions.
- It is a delicate choice to find an appropriate territory, likely to gather all the key features (active networks, appropriate scale of intervention, representative users)

By taking time to understand existing initiatives, and by widening shared perspectives, **it becomes possible to conceive and adopt new solutions, rooted and robust, improving the habitability of a territory.**

AMPLIFYING SOCIAL INITIATIVES OF THE THIRD SECTOR IN THE VENETIAN LANDSCAPE

Iuav University of Venice

Alessandro Lodovini
*alodovini@iuav.it

ABSTRACT | This paper explores how social innovation design practices can strengthen Third Sector initiatives, contributing to a more sustainable and equitable society. Through small-scale actions, Third Sector entities form a vast, often unmapped network that actively shapes a sector inclined toward social innovation. In the current context, many organizations leverage digital technology to advance social innovation. However, this process thrives as a participatory and context-sensitive approach rather than a universal model imposed from above. Two main perspectives typically drive this process: a critical stance on risks to individual freedoms and civic rights, and a 'techno-optimist' view that prioritizes technology despite potential impacts. Social enterprises face challenges due to limited resources, funding, or expertise. The iterative nature of design — marked by ongoing problem reassessment and solution synthesis — is particularly suited for experimentation in this field. The 'Amplify Social Initiatives' project, developed by an interdisciplinary research group, represents a social innovation initiative within the third sector. It aligns with a participatory approach by supporting internal solutions for partner organizations while documenting the methodology and results for broader dissemination. The project explores how the combination of social innovation and service design can foster relationships of care, initiate regenerative practices, and contribute to a fair and sustainable society. Tools such as brainstorming, prototyping, and storytelling play a crucial role in generating, testing, and communicating organizational values and visions. Aiming to develop a web ecosystem model, the project supports Third Sector organizations in enhancing their user-centered services by incorporating the latest UX/UI and human-centered design practices. It respects each social enterprise's identity while

ensuring consistent information organization and usability. The research framework integrates design methodologies with analytical models to reconstruct Third Sector processes, evaluating their impact in terms of reliability, efficiency, and alignment. This approach not only provides insights for strategic improvements but also guides communication strategies for initiatives that embody social innovation. This paper presents initial findings from action research conducted with partner organizations and discusses the development of the 'Amplify Social Initiatives' digital ecosystem extension. It also outlines the theoretical framework guiding the project. 'Amplify Social Initiatives' responds by providing a design-driven framework that fosters collaboration, adaptive digital culture, and social innovation. Communication is central to social innovation, not just as information exchange but as a generator of social bonds. By integrating design and technology, 'Amplify Social Initiatives' acts as a catalyst for collective intelligence, reinforcing community-driven initiatives and enhancing their scalability and impact.

KEYWORDS | THIRDSECTOR, SOCIAL-INNOVATION, DESIGN4TRANSITION, DIGITALPLATFORM

1. Introduction

As technology increasingly shapes our *social fabric*, Third Sector organizations face a pivotal challenge: how to harness digital innovation while preserving their fundamental mission of social impact. These organizations, which have traditionally excelled at addressing community needs through direct human interaction (Codice del Terzo Settore, 2017), now find themselves at a critical crossroads. While the digital revolution offers unprecedented opportunities for expanding their reach and effectiveness, many Third Sector entities struggle to bridge the gap between their social mission and technological advancement. Over sixty percent of Third Sector organizations in Italy acknowledge their incomplete digital transition (Italia Nonprofit, 2024). Balancing human connections with digital transition is not just a technical challenge but requires rethinking how social initiatives can thrive in a digital landscape (Cavotta, Grassi & Toschi, 2022).

The number of Third Sector and social private entities particularly in Italy remains substantial, representing socio-economic actors that, by mandate, pursue objectives beyond mere economic profit. These entities increasingly require new professional roles to support social innovation processes, as driven by their statutory mandate and societal function (Campagnaro & Bosso, 2023). Cooperatives, foundations, associations, and citizen groups increasingly acknowledge the critical role of design-thinking methodologies and competencies, particularly in facilitating technology and knowledge transfer and in the development of services within the domains of socio-cultural innovation in which they operate. What emerges is a compelling need for a new design framework as an integral part of social innovation — one that can enhance rather than diminish the human-centered nature of Third Sector work (Seravalli, Upadhyaya & Ernits, 2022).

This essay argues that successful digital transition in the Third Sector requires a co-designed approach that treats social initiatives as the primary drivers of both digital and social innovation. By reconceptualizing Third Sector organizations as *social antennas* capable of weaving social fabric (Bassi, 2013), 'Amplify Social Initiatives' is proposed as a theoretical and practical framework for the social-digital transition, as it integrates the design thinking method (IDEO, 2012) in the context of the Third Sector to amplify its social impact. This perspective not only preserves the sector's essential role in addressing societal needs but also leverages technology to amplify its impact in ways that

strengthen rather than substitute human connections (Binotto, 2010).

2.Objectives and methodology

The process of digital transition usually involves a complex social apparatus comprising three main actors, commonly referred to as the helixes of social innovation: companies, institutions, and research. These actors are typically engaged in social innovation processes. The so-called *fourth helix* model consists of an organized civil society, primarily composed of associations, committees, collectives, and groups of citizens with an interest in the initiatives presented.

The long tradition that sees codesign as a creator of contexts, tools, and procedures through which these different actors can better deliberate and learn from each other (Botero, 2013) makes it a privileged actor to proceed with a transition that brings together the methods, goals, and perspectives of the real *initiatives' makers*. Our approach combines *design thinking method* (IDEO, 2012) and *action research method* – the most appropriate methodology for any design project where the outcome is undefined, as noted by Swann (2002). As previously highlighted, the digitization processes of the Third Sector start with defining a problem whose solution is often far from being predetermined. Due to this characteristic, we have adopted an *anti-solutionist* approach that aims to iteratively frame and reframe the problem. The toolkit and the prototype of the digital ecosystem we propose are intended as *seeds of design* (Botero, 2013): their purpose extends beyond mere implementation and becomes a communicative act to reframe the challenge — understanding the real needs of the social sector for a technology that truly serves its social purpose.

The article describes the theoretical assumptions and the result of the design process that led us to break the linearity of the systematic process of *action-research* making visible the *iterative nature* of design processes (Swann, 2002) by placing *co-experience* at the center of action-research. The objectives of the research are thus to be understood in the dual nature typical of action research: practical problem-framing and co-learning of practices, addressing a specific problem through reflective processes. Findings suggest that design for social innovation in the third sector promotes redundancy and reflexivity (Light & Seravalli, 2019), using collaborative prototypes as useful supports for shared discussion and alignment rather than solving practical problems within organizations.

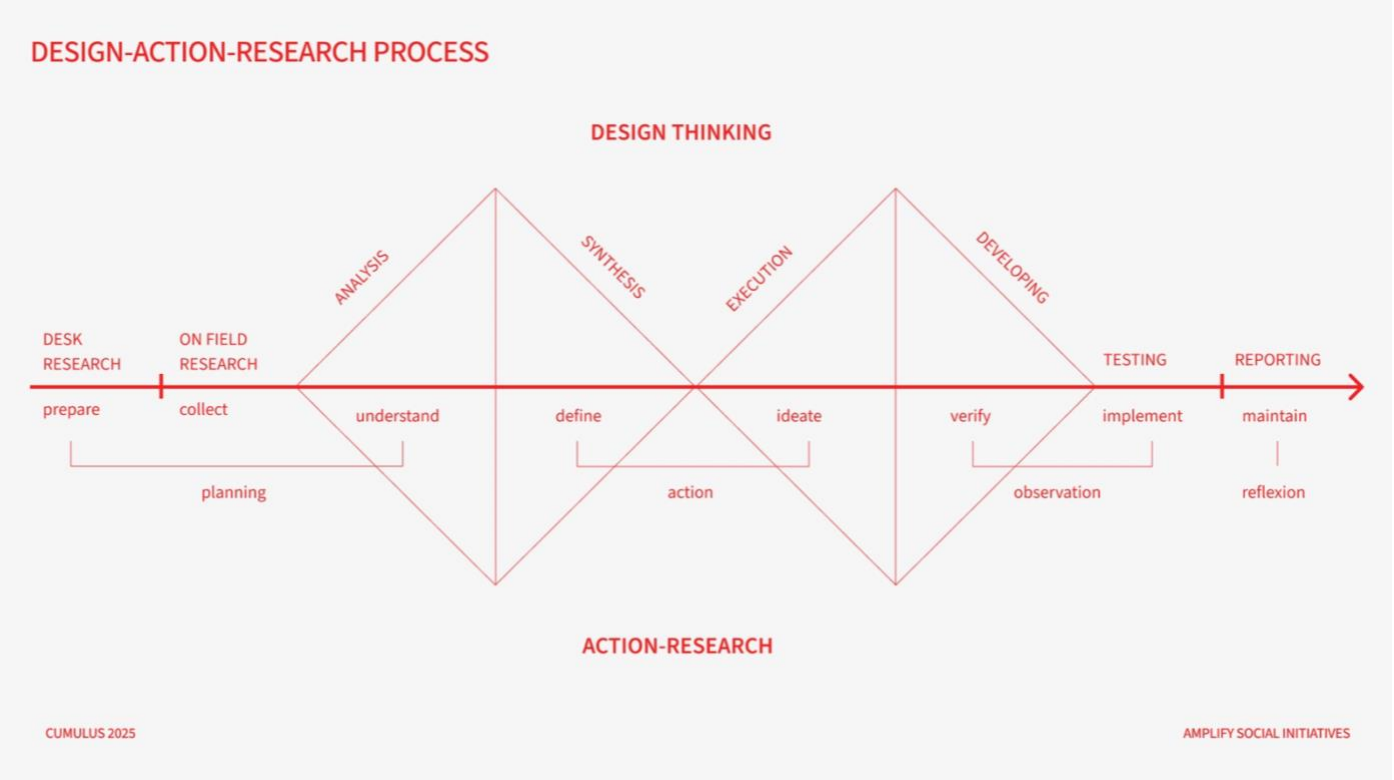

Figure 1. Methodological process diagram reviewed by Design Thinking Method (IDEO, 2012) and The Action Research Method (1993)

3.State of the art: desk research

3.1 Social innovation as the outcome of a design process

Design for social innovation manifests itself as an area of the design discipline concerned with the innovation of what affects *social structures* (Manzini 2014) and that necessarily — and increasingly in recent years — its research domain intertwined with social sciences. Moreover, design occurs when there is a joint invention of a solution to a collective and/or social problem (Zinna, 2020) and when the designer can contribute to rethinking the concrete critical spaces, services and their uses. However, when talking about change in the public sector we should consider it as the interplay between institutional aspects, societal challenges, and individuals' views and actions. So, designing with Third Sector organizations is not only useful in developing concrete outputs but is also and above all an opportunity for *reflexivity* and *rethinking* for the organization itself (Seravalli, Upadhyaya & Ernits, 2022).

Moreover, social innovation is a process in which there is no predetermined relationship between partnership patterns - roles, positions and functions of actors - and outcomes of the initiative in terms of *collaborative dynamics* (Granovetter, 1974). Therefore, in the present research, social innovation is the result of a highly contextual process - and never a *recipe dropped from above*, but rather an *autopoietic* process in which the outputs feed the inputs, in a circuit of social automation, as our framework proposes.
Technology, and particularly the use of digital tools as a vehicle for change, should be considered as a vector of desirable social innovation. It is a well-established belief that design and arts are a crucial way of applying technology and making it socially accepted for their humanistic and social approach to technology: giving meaning and making

things familiar. The social and *convivial approach* (Milani, 2022) to technology - and to transition - was one of the guiding principles we approached our project stakeholders.

3.2 Which digital technologies for which social innovation

Recently, Italy's Third Sector has increasingly engaged in projects that leverage technology to create social added value (Busacca, 2019).
According to a socio-technical paradigm, technologies are the combinations of information, computation, communication and connectivity technologies used to create, use, transmit or deliver electronic data. Technology management enables better decision-making through social collaboration, optimized resource allocation, and information sharing that attracts new potential stakeholders (Cavotta, Grassi & Toschi, 2022).
From a humanistic perspective, technologies evolve similarly to living organism: *adaptation* from function to organ and *exaptation* from organ to function (Milani, 2022). In this sense, digital technologies cannot be thought of as *pills to be assumed*. Equally indispensable is sociology and its qualitative method, because of its ability to grid different parameters, to give them weight and importance, and to draw from these comparisons assessments and predictions about certain social dimensions.

Specifically, this article refers to the branch of design that looks at digital technology to trigger, accelerate - and sometimes curb - certain ongoing social processes. The state of digital technology in Third Sector organizations is reported by Italia Nonprofit (2024), involving 665 organizations divided into the three most prevalent types (associations, social cooperatives and foundations). The report shows that a critical barrier to systematic innovation is the scarcity of resources and time which forces organizations to focus predominantly on present challenges, limiting their capacity for long-term planning and strategic innovation. It emerges that more than six out of ten organizations recognize that they are not yet fully digitalized (66.2%) but are aware that they are on a path of growth and improvement (52.7 percent). The report distinguishes between (1) digital management technologies - thus aimed at internal use - and (2) digital communication technologies - aimed at external audiences. Insights regarding the second category highlight the high use of the newsletter, through which the information conveyed mainly concerns updates on projects and initiatives (92.7%).

The proposed solutions therefore face up to these types of barriers to adoption in the current state of the art, with particular attention to the aspects of digital communication.

3.3 Co-designing for digital transition

Design, as mentioned earlier, can play an *intermediary role* in supporting and orienting these transition processes. The artifacts produced serve as *seeds of design* (Botero, 2013) in contexts characterized by high complexity and limited familiarity with creative processes. Codesign emerges as a crucial methodology for organizational development. *Prototype-based approaches* become extremely useful devices in verifying whether projects adequately address user needs and contextual requirements. This approach is particularly valuable in the digital transition process, where organizations must *navigate unfamiliar technological territories* while maintaining their social mission Campagnaro (2022). The successful implementation of co-design in the digital transition therefore requires an understanding of communication not only as a technical capability, but also as an *expression of phenomena* of diffused or organized relationality (Binotto, 2010). This perspective allows organizations to maintain their social base while embracing

technological innovation as a connector of intelligence and communities. Successful social innovation fundamentally relies on surfacing and transmitting knowledge embedded within individual experiences (Jedlowski & Leccardi, 2003). As Jedlowski (2003, p. 65) observes, the knowledge deposited in subjects' experiences is the source of innovation. While digital platforms facilitate community building and stakeholder engagement, this article reveals that successful digital transition demands more than fixed solutions: requiring an integrated, *evolving pathway* that emphasizes co-design processes.

4. Context analysis: on-field research

4.1 A technological matrix for social innovation needs

From the insights of early desk research, it emerged as the primary horizon of the project to identify a meeting point between the innovation needs of Third Sector entities and technological potential. The project partner enterprises were chosen for some common structural characteristics that allowed us to move in the Venetian ecosystem and for other differences that could give us a varied cross-section of the different possible responses to the same project intervention:

- Corte del Forner, small-sized volunteering association for food assistance;
- Sumo Cooperativa Sociale, medium-sized social enterprise for employment inclusion;
- Comunità di Venezia, big-sized cooperative for therapeutic care.

Not only does each social reality need to be analyzed individually to understand its characteristics and the nature of the service it offers, but technologies also need to be analyzed and synthesized to fully understand their benefits, limitations, risks, impacts, and prospects for the Third Sector (Cavotta, Grassi & Toschi, 2022). Technologies can be clustered according to their *vocation* between social impact-oriented technologies such as amplify project communication, communicate initiatives, do fundraising; and efficiency-oriented technologies - material storage, transparency of the institution, coordination of operators. The aim of clustering is to provide an analytical framework for understanding this relationship, with a *technological matrix for social innovation needs* (Figure 2) in the Third Sector, crossing on the x-axis the parameter *economic efficiency* and on the y-axis the parameter *social impact*. On this matrix we placed some of the technological tools surveyed and others usually used as levers of the digital transition. The construction of the matrix, together with the macro-structural analysis provided by Italia Non-Profit, was essential for us to be able to guide the interviews during the qualitative field survey phase.

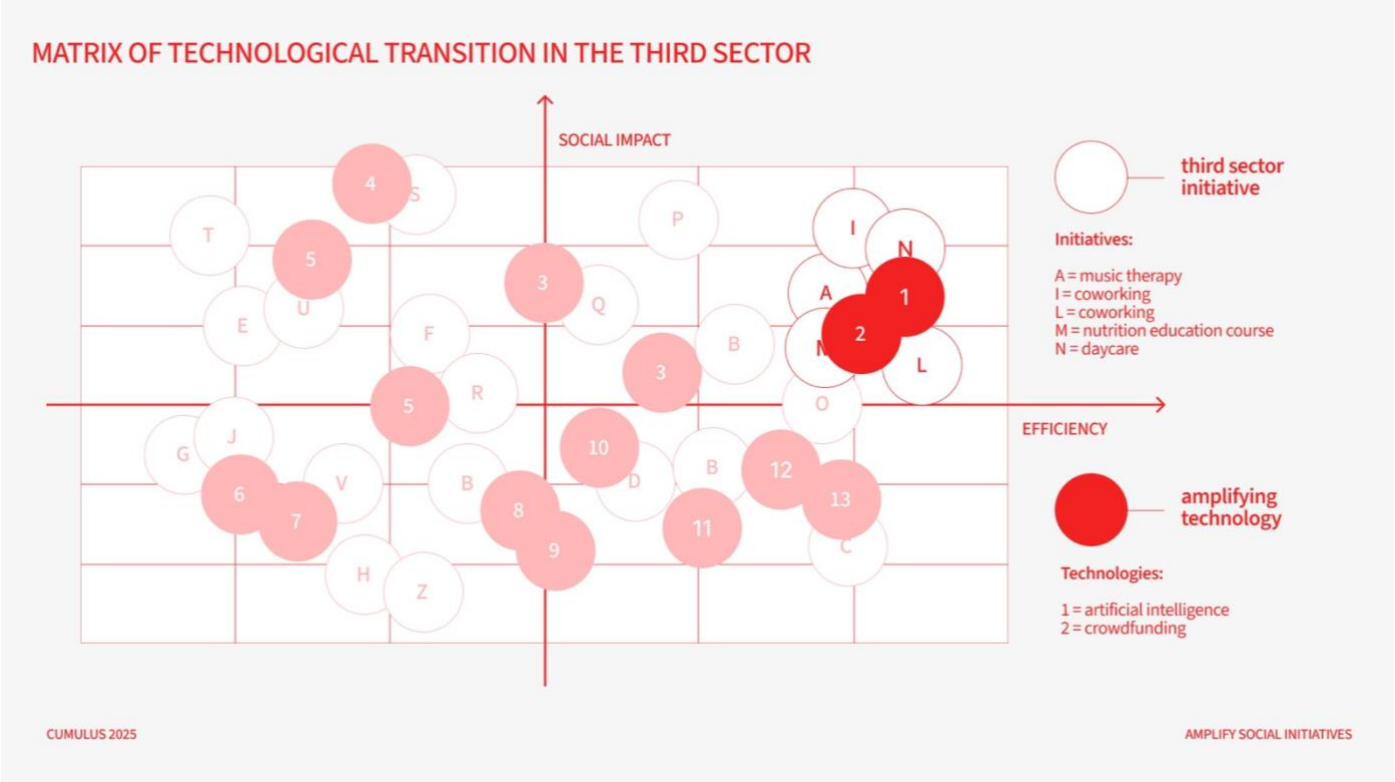

Figure 2. Cartesian matrix diagram (x-axis = social impact; y-axis = economic efficiency) of the relationship between technologies and Third Sector initiatives extracted from the fieldwork, highlighting a link between findings from the qualitative and desk analysis.

4.2 Between social *impact-oriented* and *efficiency-oriented* technologies: qualitative survey

The qualitative survey was conducted in the form of semi-structured interviews aimed at a sample of 6 operators (2 for each entity) belonging to the project partner enterprises. The duration of the interviews, conducted in person at the headquarters of the partner entities, ranged from 1h to 1h30. After transcription of the interviews, we cross-checked the results produced based on a previously designed codebook.
As a result of the interviews, all the entities placed their vocation somewhere between the desire to trigger social change in their target territory and their need to survive in productive and economic terms. It is necessary to note how the questions logically implied the impossibility of untying the two directions. However, as the interviews progressed, it became clear that the frame of the problem was the structure of communication itself.

Dissatisfaction concerns particularly the incapacity of being able to talk about their initiatives and about the inadequacy toward standardized content typical of corporate and marketing communication. Unmaintained and poorly managed websites and social profiles - 47.8 percent are not optimized therefore invisible on the web (Italy Nonprofit, 2024) – are the clearest evidence of the gap between the Third Sector's digitalization needs and the response offered by standardized platforms designed to replicate the private sector's agility and proactivity in response to changes and emerging challenges (Parsons, 2006). The question is not whether to have a web or social presence in the form of a *showcase*, but to define what is important to communicate to the specific target audience and based on that to understand the opportunities offered by the digital ecosystem. These insights guide the new design focus of the project: from an ecosystem

for communicating Third Sector entities to an ecosystem for communicating Third Sector initiatives.
To investigate more deeply this new focus, we scheduled new qualitative meetings in the form of focus groups where we deepen this understanding.
What emerges is that individual initiatives are the core of the social activities of our partners in which they invest the most time and energy. Moreover, for these organizations, embarking on a design journey means deciding to devote even more time, energy and resources to their desire for change The long time spent on problem-framing involves a deep discussion of the initial design question and brings out broader issues and needs that could steer the project towards more articulated and strategic interventions in terms of change and impact (Seravalli, Upadhyaya & Ernits, 2022). This shift becomes particularly clear in the initial stages of the project (Di Prima & Campagnaro, 2023) when members of the organization are asked to tell their stories to the design team, to share principles and values, and to describe the horizon of change towards which they are directed. As a result of the activities, we defined the problem framework and identified the trigger for the second diamond of the design process: using digital tools – described in the next chapters – to strengthen the communication of social innovation initiatives, as explained in the next section.

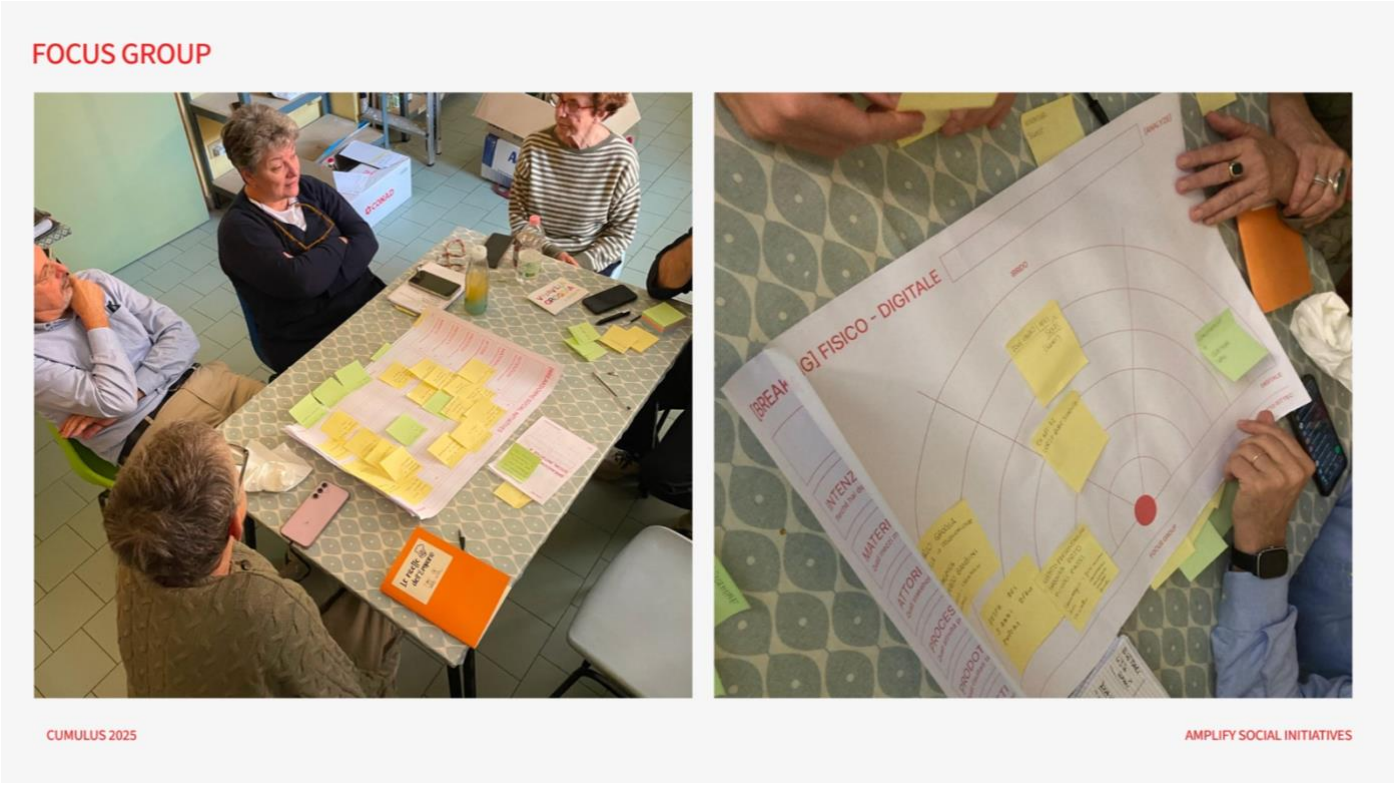

Figure 3. One of the focus group activities where the prototyped tools such as 'brainwriting', 'decomposition of initiatives' and 'mapping of contact points' were tested at the voluntary association 'Corte del Forner', Venice, 22 October 2024.

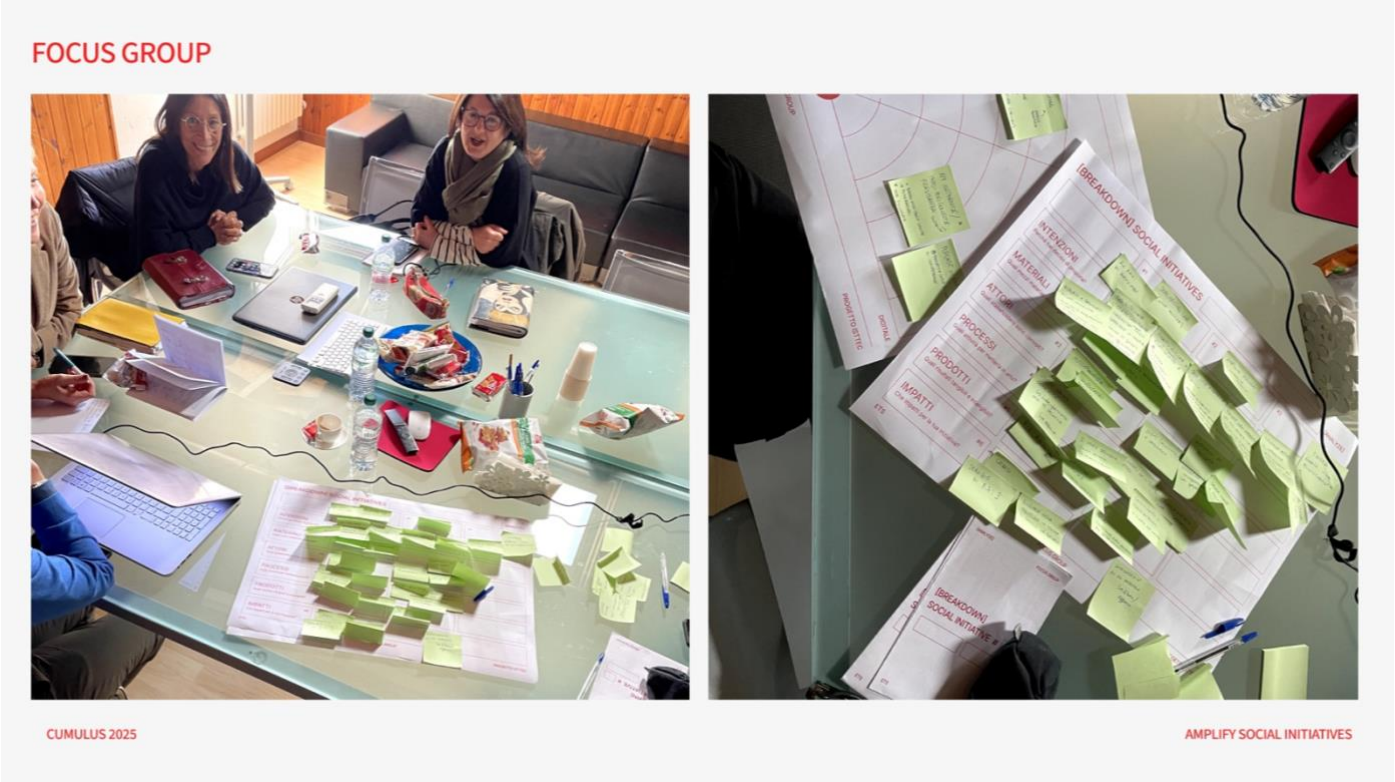

Figure 4. One of the focus group activities during which tested some of prototyped tools such as 'brainwriting', 'breakdown initiatives' and 'mapping touchpoints' at Social Cooperative 'Comunità di Venezia', Venezia, November 12nd 2024

5. A design logical framework to drive social impact

5.1 Social initiative as a driver for social and digital innovation

While the Third Sector possesses inherent innovative potential in social service delivery, its digital and social innovation capacity is significantly constrained by a disconnect between *unconscious design actions* (Manzini, 2014) and *intentional strategic planning* (Vink, et al, 2020), necessitating a fundamental shift from reactive service provision to proactive design-driven innovation supported by systematic frameworks and organizational learning. The resulting approach contradicts the sector's inherent ability to generate social innovation and positive community impact. What emerges is therefore to interpret this transition not as merely a technological hurdle but rather as an opportunity to transpose social impact into a digital context while designing solutions that catalyze transformative processes in welfare, social cohesion, and local impact.
Third Sector organizations demonstrate natural innovative capabilities in developing services for vulnerable populations. However, as Campagnaro (2022) observes, many organizations undertake *unconscious design actions,* responding to immediate needs without recognizing their design capacity or familiarity with design-thinking approaches. Third Sector organizations, in fact, are uniquely positioned to weave these networks of relationships, particularly in an era where globalization tends to fragment social connections (Bassi, 2013). This creates a paradoxical situation where organizations are innovating without acknowledging or strategically leveraging their innovative potential. Adopting the initiative as an object of the research means to revitalize the role of the Third Sector by operating at the level of *sense-making* (Rogers, 1995), identifying a solution which lies in adopting a co-design approach that facilitates both social initiatives and digital integration.

5.2 Initiative as design action

In contemporary literature, design is increasingly conceptualized as a *reflective* and *reformative tool* (Vink et al, 2020) capable of transforming ideas and initiatives into tangible actions with meaningful social impact (Busacca, 2019). The deliberate nature of design action provides a framework for organizations to progress beyond reactive responses toward strategic innovation. Organizations, therefore, should not be perceived as static entities but as emergent realities shaped by flows of action, negotiations, conflicts, and practical activities (Gherardi & Nicolini, 2004). This perspective aligns with the evolving nature of service design, which increasingly emphasizes "designing" rather than "design" to underscore its iterative and dynamic characteristics.

A central challenge in the digital transition of the Third Sector is bridging the gap between intuitive social action and strategic design thinking. Many organizations in the sector unknowingly engage in what Vink (2020) describes as *reflexive reformative actions*, often without recognizing their inherent design capabilities. Transitioning from *unconscious initiatives* to *deliberate design action* represents a critical step in enhancing organizational capabilities. The concept of ecosystem design broadens the notion of agency, recognizing the contributions of diverse actors, including those not directly involved in formal design processes. The following framework combines the *expert design capabilities* (Manzini, 2015) and the *distributed practices* of social innovation to bridge the unconscious potential of social initiatives into intentional co-created design actions.

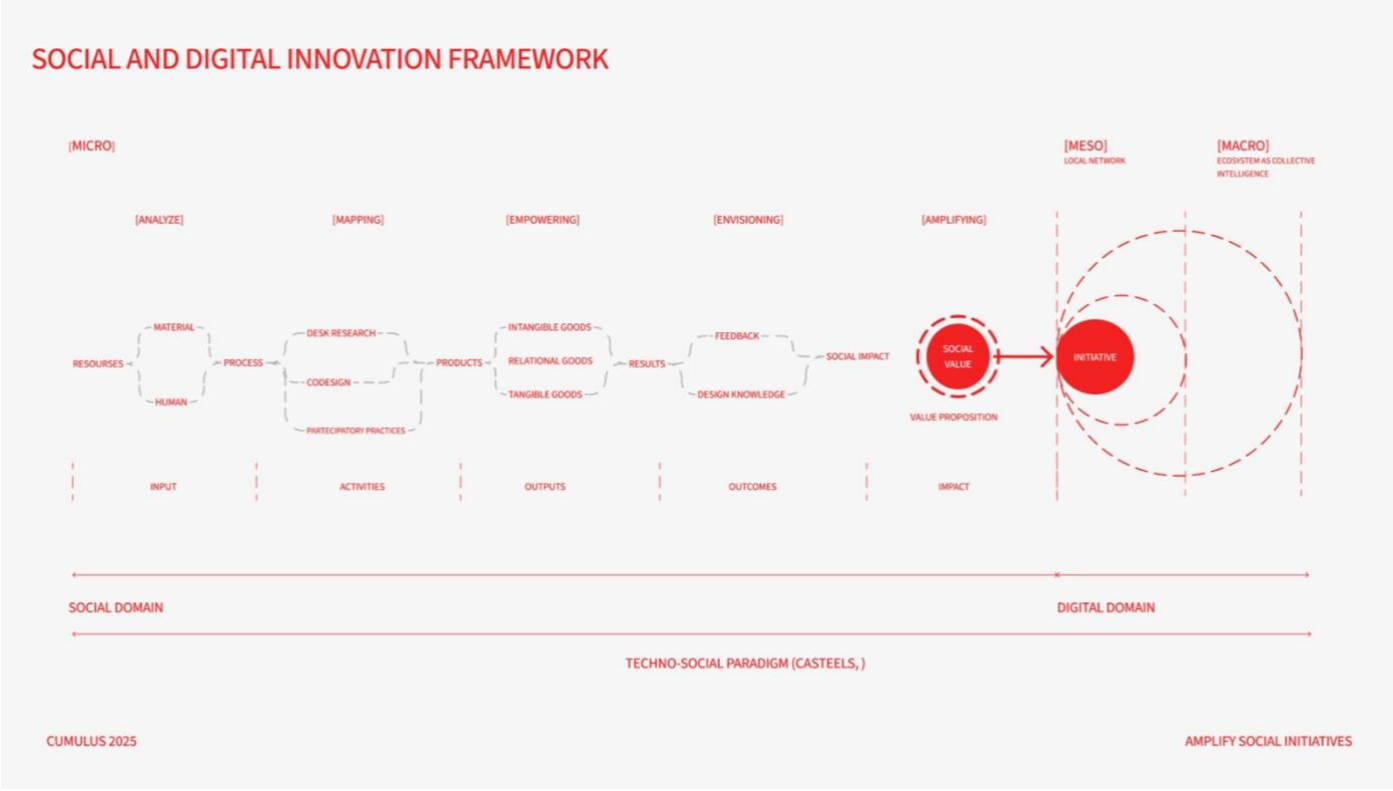

Figure 5. This framework proposes a theoretical and practical model for amplifying the impact of social initiatives in an ecosystemic way. Combining the value chain model with design thinking, it aims to scale up social value in the digital ecosystem through controlled phases.

This framework allows us to examine initiatives through both their design intent and their capacity to generate social value and impact. We propose a *multi-level model* for designing social initiatives that illuminates the complex dynamics in digital transition by strengthening impact awareness through prototyping and communicating initiatives.

While design initially focuses on solving specific problems and creating tangible artifacts or interactions it can also drive deeper cultural, strategic, and systemic transformations. These transformations influence processes, mindsets, and organizational structures (Burns et al, 2006) and mark the transition from *expert design* to *diffuse design*. The primary goal of this framework is to create a common ground between social and digital environments to help organizations reconsider service transformation from a new perspective: fostering a shared multilevel ecosystem that consolidates best practices, resources, and tools.

5.3 From social initiatives framework to digital ecosystem model

At the local level, social innovation emerges through peer-to-peer initiatives and the active engagement of actors, involving territorial observation and community building efforts that foster belonging, solidarity and participation (Bassi, 2011). By integrating the structure of the Design Process Model (IDEO, 2012) with the basic principles of the value chain model, the framework made visible the *iterative nature* of design processes to identify a distinctive value that organizations seek to achieve by focusing on their activities. In doing so, the micro level highlights the main steps towards the co-creation of social value within a social initiative, contributing to be a fundamental analytical phase to understand the actors, resources, processes, and agents involved in the creation of relational products.

The meso-level bridges global and local knowledge through bidirectional innovation transfer. Initiatives generate relational products, fostering shared responsibility in local participation. This, in turn, strengthens community members' sense of belonging and forms the foundation for an infrastructural network that aggregates data on a global scale. At the intersection of the micro and meso-levels, two key mechanisms emerge. First, social learning and critical mass mechanisms (Rogers, 1995) drive the development of collective knowledge and enhance meaningful participation at the micro level (Mulgan, 2017). Second, *social capital* and *relational products* (Bassi, 2013) establish the foundation for trust and long-term relationships, enabling effective collaboration in public spaces—ranging from individual initiatives to broader initiative networks.
This level represents the institutional dimension. The role of the digital ecosystem is to enable processes that were previously inconceivable, activating community agency by empowering audiences to solve problems using their own skills and resources (Mulgan, 2006). It manages networks across multiple levels, fostering collaboration and innovation. Consequently, the role of design evolves from merely creating solutions to orchestrating processes, enabling systemic approaches that integrate infrastructures, resources, and users.
At the macro level, digital innovation focuses on social accountability, impact measurement, and the dissemination of best practices (Mulgan, 2017). When effectively managed, these global processes generate social capital, enhancing collective intelligence and knowledge-sharing across communities. The following digital ecosystem we conceptualize for social innovation further amplifies these effects.

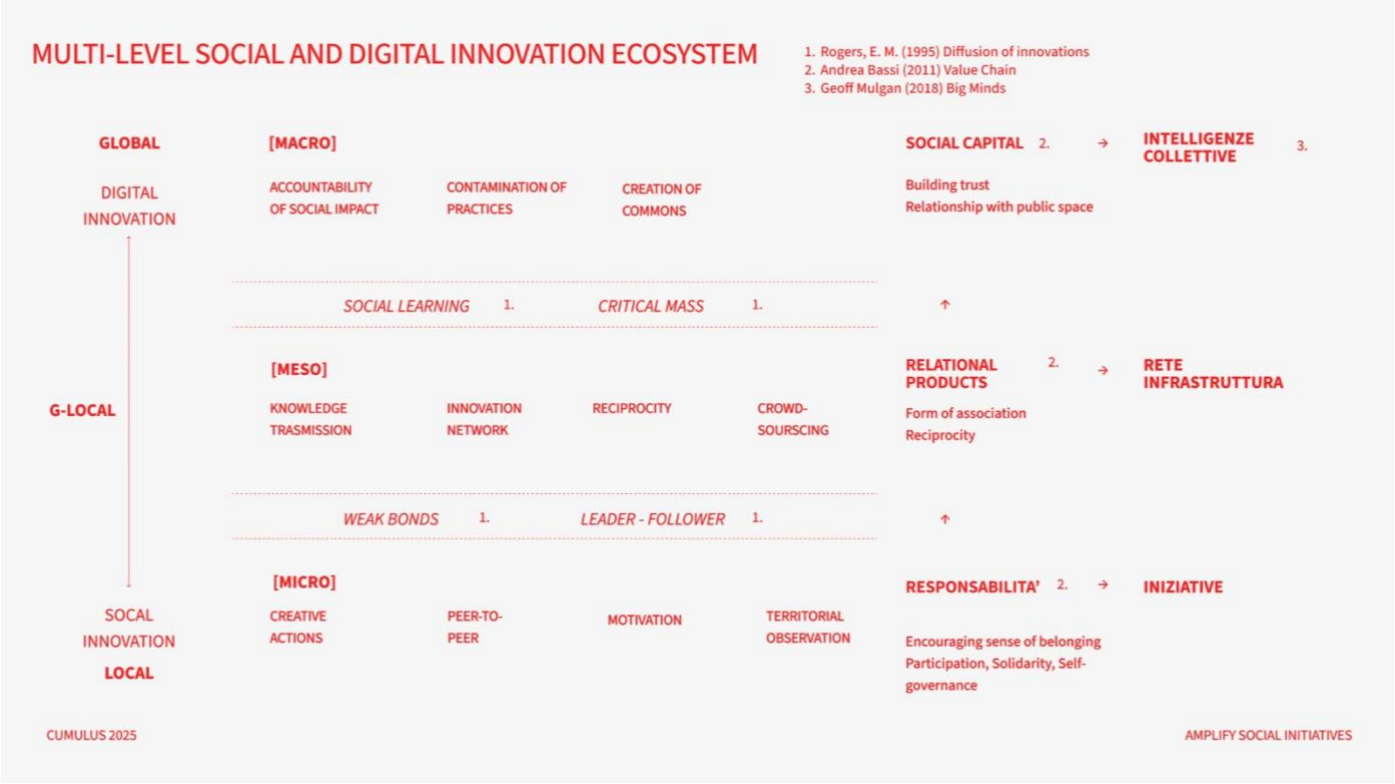

Figure 6. The multi-level social and digital ecosystem aims to scale up social innovation efforts into an integrated digital ecosystem, linking the micro-level (initiatives), the meso-level (network) and the macro-level (ecosystem), enacting virtual practices such as knowledge transmission and social learning.

6. New design focus: 'Amplify Social Initiatives' ecosystem

'Amplify Social Initiatives' aims to explore and give a digital place to the *constellation of design initiatives* (Manzini, 2014) as extensive as it is hidden (Author, 2022) carried out by Third Sector entities. An initiative is defined as any activity oriented toward the production of social innovation, where the latter is to be understood as the possible - and not necessary - outcome of complex social processes in which there is no predetermined relationship between patterns of partnership - roles, positions and functions of actors - and outcomes of the initiative in terms of collaborative dynamics (Granovetter 1974). The framework is designed to be an *operational tool* that guides an idea from the input to the outcome, and relative impacts, through a model of communication for social initiatives.

'Amplify Social Initiatives' is a toolkit platform – with possible analogic extensions - that supports Third Sector organizations involved in the digital transition process. It is a digital repository in the form of a guide, collecting ready-to-use tips, tools, and materials to implement and adapt the presence of digital communication within a social reality. It is suggested that the commitment should focus on creating a community, not only of advocates, but also of designers, to continuously influence this change. The common characteristic of transition design is the presence of *non-traditional design outcomes* (Burns, et al., 2006:21): although there are well-established tools to capture the experience of stakeholders in the service from multiple perspectives, each social innovation experience suggests reinventing the method, and with it the most suitable tools.
To support engagement and build trust in the design process (Junginger & Sangiorgi, 2009), our communication toolkit presented different uses of digital tools: (1) co-learning; (2) crowdsourcing; (3) codesigning. The model to which the platform would like to refer is that of *commons-based peer-production*, capable of harnessing decentralized *collective*

intelligence in open collaboration networks which occurs when experiences are created together or shared with others.

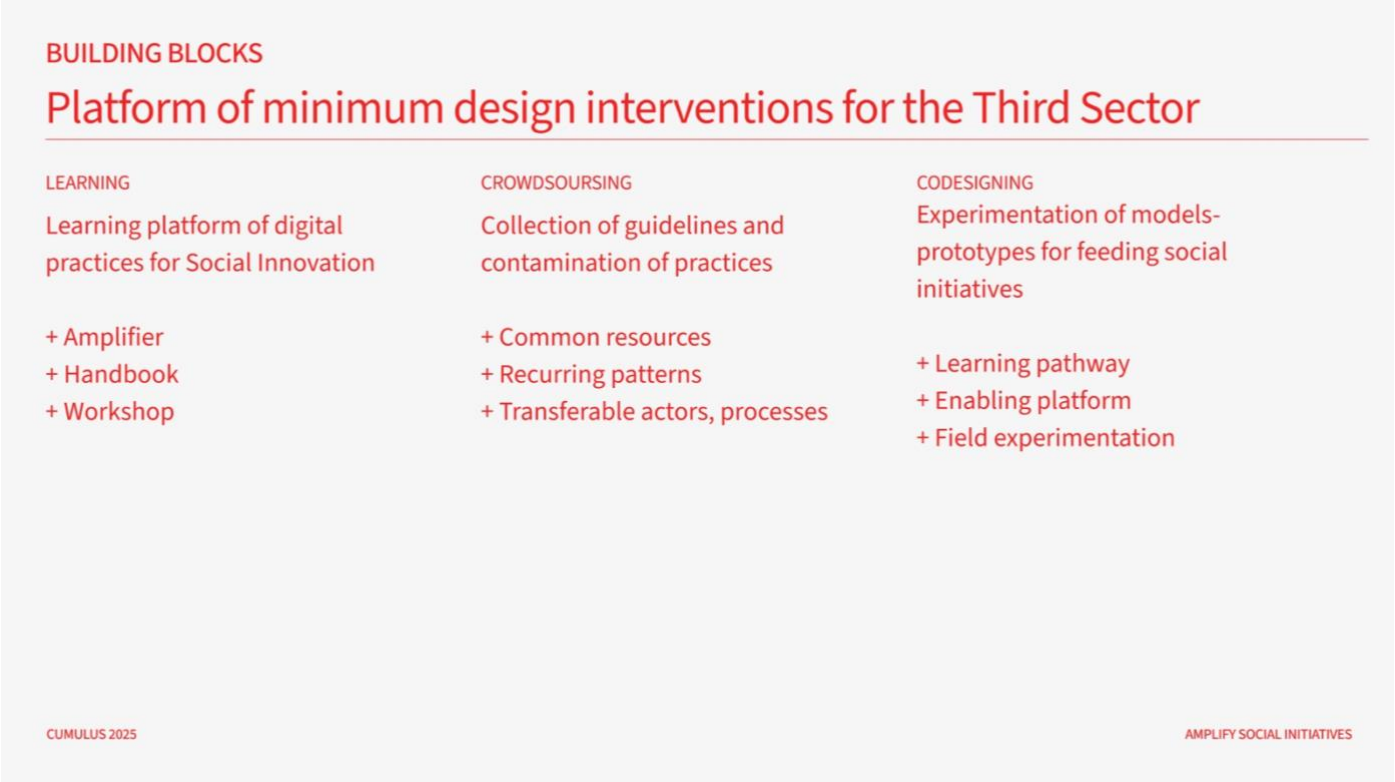

Figure 7. The program establishes a strategic social-digital capacity-building platform that integrates learning, crowdsourcing, and co-designing, utilizing digital infrastructure, educational resources, and interactive workshops to enhance organizational communication and knowledge transfer capabilities.

The toolkit platform emerges as a crucial enabler for bridging the gap between digital adoption and social innovation. By providing a comprehensive set of *tools, guidelines,* and *resources*, the platform enhances the communication capabilities of Third Sector entities, empowering them to navigate the complexities of the digital age. This long-term approach synthesizes user sessions, bridging the divide between grassroots initiatives and top-down digital transitions. By *steering* organizations towards digital adoption, the platform fosters interactions between designers and social innovation processes and facilitates iterative development through co-design thinking methodologies (Swann, 2002).

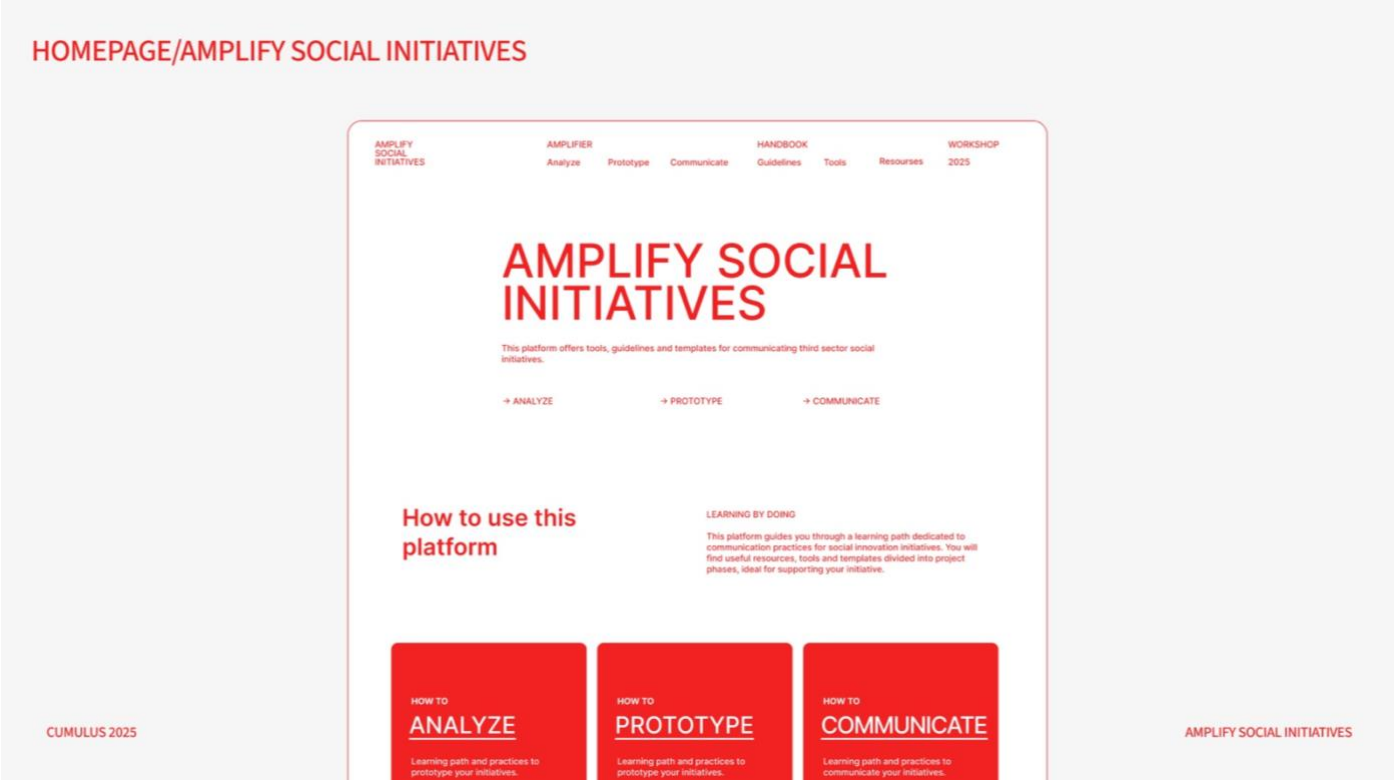

Figure 8. The Amplify Social Initiatives platform acts as an amplifier of social innovation by providing communication tools to increase their social impact.

The platform also integrates a variety of specialized tools to support communication, including editorial outputs such as social media campaigns, newsletters, and podcasts; organizational tools like email marketing and broadcast lists; and fundraising resources such as crowdfunding campaigns and donation drives. These tools are clustered into editorial, organizational, and strategic categories, providing a flexible and comprehensive framework for addressing the diverse needs of Third Sector organizations (Italia No Profit, 2024). By offering templates, guidelines, and resources tailored to each cluster, the platform enables organizations to craft effective communication strategies and amplify the reach of their initiatives. The platform functions as a dynamic *learning process*, reflecting the co-design thinking methodology employed during the research phase. It introduces organizations to a *three-step framework*—analyze, prototype, and amplify—that has been rigorously tested in on-field research.

The 'analyze' phase includes tools designed to deconstruct and map social initiatives, creating communication design frameworks that support the effective articulation of their goals and impacts. It provides an analytical framework without restricting the creative and proactive freedom of participants as a *true experimental tool* (Foster & Iaione, 2016). The result of the analyze phase is the unpackage of social initiative:

- *Brainwriting tool*: participants are invited to bring up as many past and current initiatives of their respective association as possible, proposing to write their title on a post it notes to be randomly stuck on the wall;
- *Breakdown tool*: participants are invited to answer the questions corresponding to the distinct phases of the initiatives and then to break them down into the various components that compose the value chain (human/material inputs, activities, outputs);
- *Mapping tool*: participants are invited to think about each phase of the initiatives and write down the corresponding digital touchpoints involved in the communication of the initiative development process.

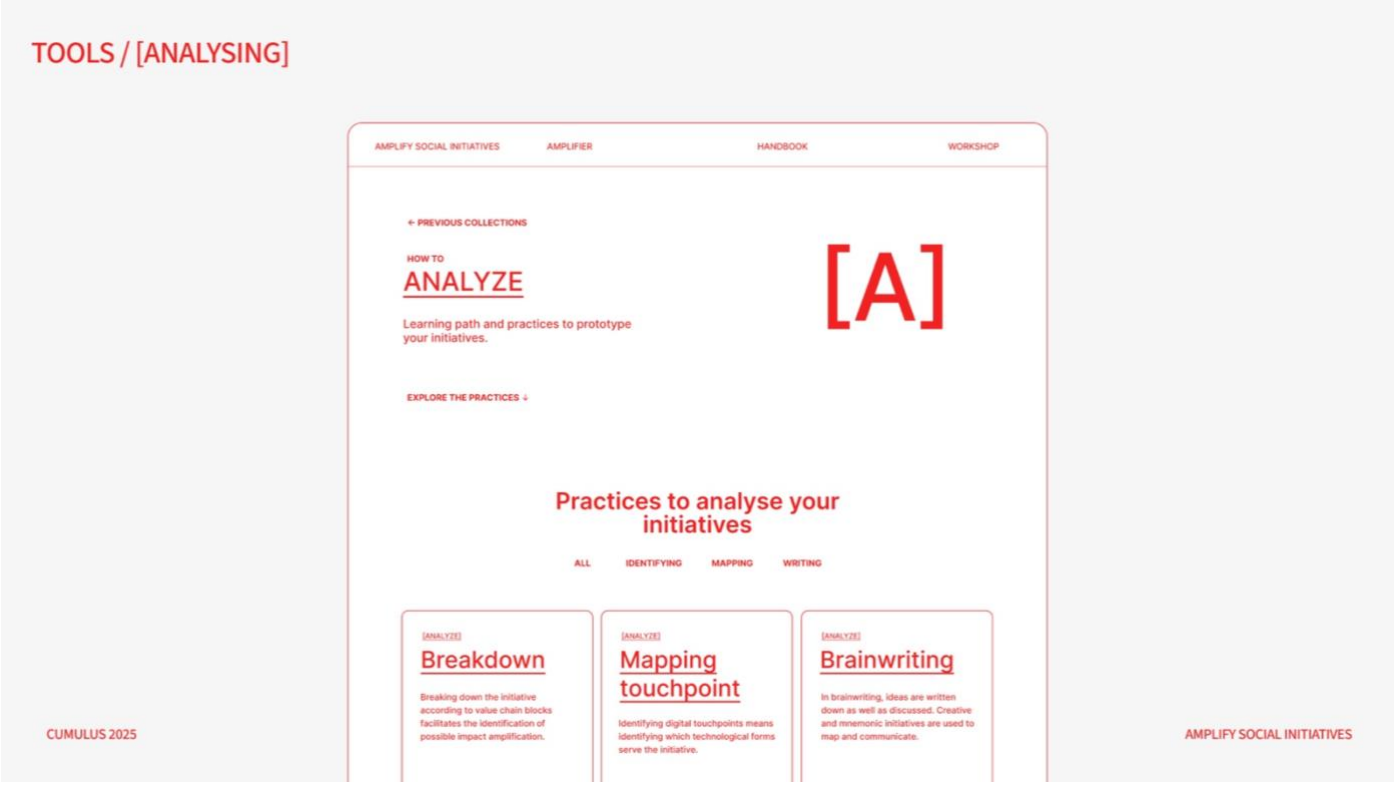

Figure 9. The platform is clustered by collecting all the tools and resources to enhance the methodological and learning approach and content findability.

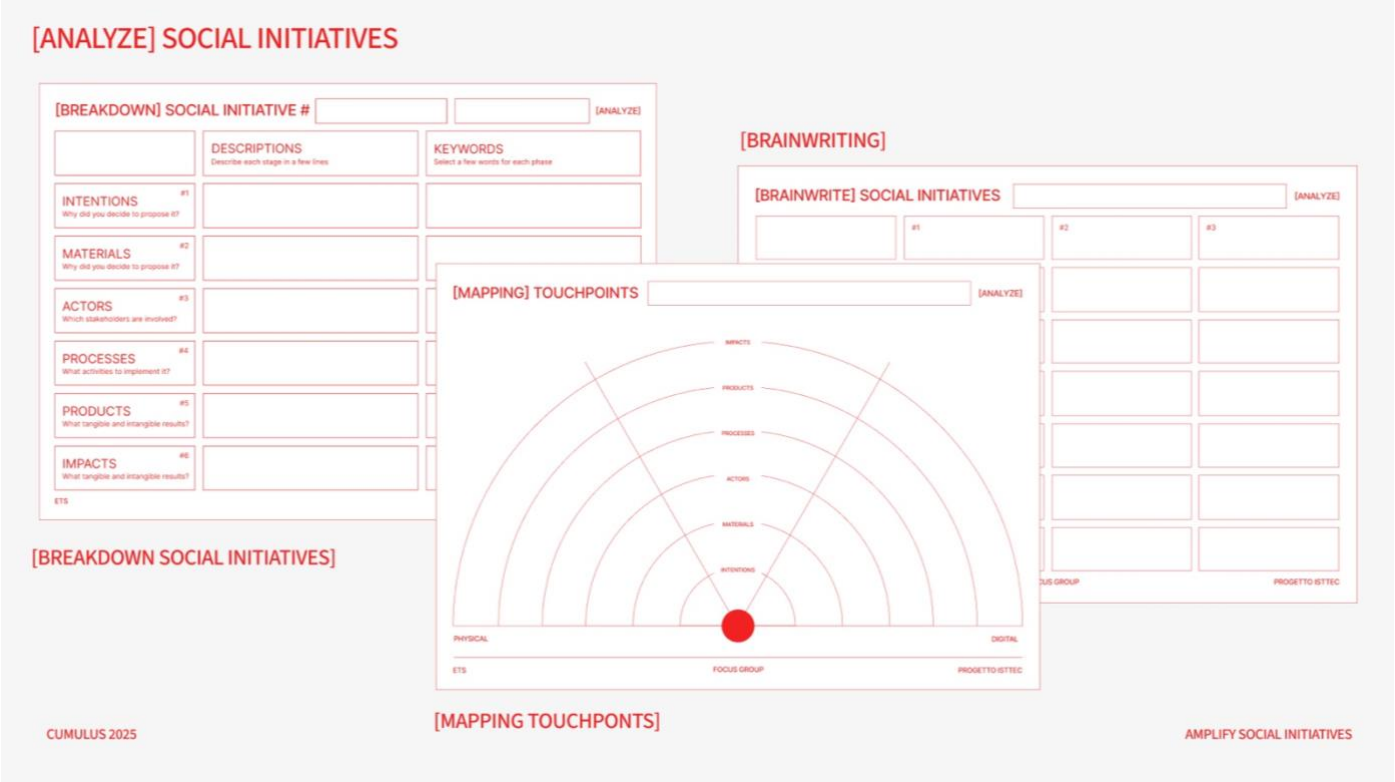

Figure 10. Collaborative design tools such as 'breakdown social initiatives', 'mapping touchpoints' and 'brainwriting' have been prototyped and tested to analyze social initiatives of the Third Sector.

The importance of prototyping underlined by Campagnaro (2022) in these contexts, highlights this iterative process that empowers Third Sector entities to adopt a strategic mindset that integrates digital tools into their operations effectively.

- *Identifying needs tool*: each card presents possible insights into the difficulties faced by third sector actors in unravelling the communication of an initiative, and participants are asked to select some or write down others;
- *Choose technology tool*: each card proposes a 'bio' of the technology (what it is) and a description of how it works (how to use it), so the participants are asked to choose the one they consider more relevant for their initiative.

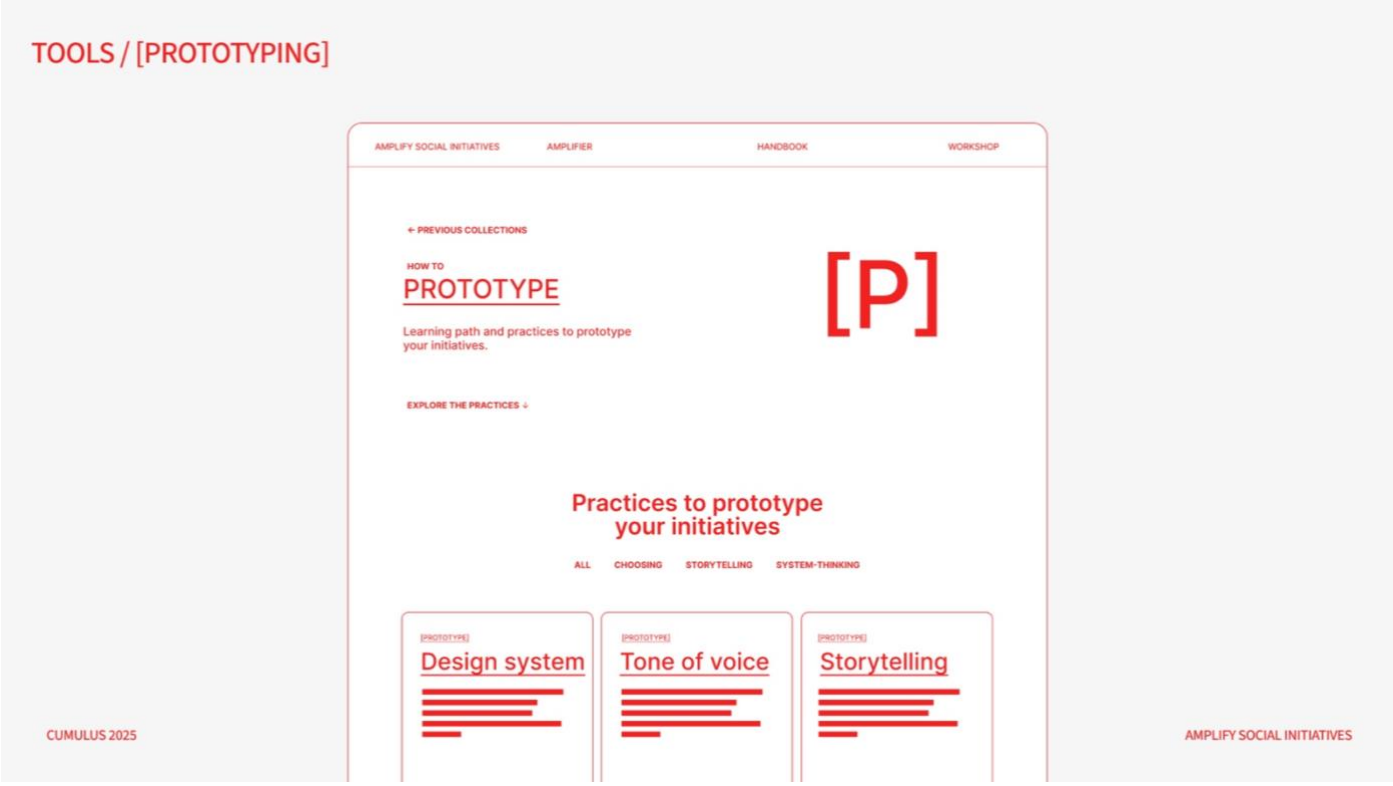

Figure 11. The platform provides intermediate tools for prototyping the initiatives, suggesting non-final outcomes but systemic and storytelling approaches to define their own tone of voice.

Figure 12. Collaborative design tools such as 'choose technology' and 'identify needs' have been prototyped and tested to guide the Third Sector in matching the best technological solution to the related problem associated with social initiatives previously analyzed.

The toolkit platform integrates a diverse range of communication outputs designed to bridge the digital divide and enhance the reach and impact of social initiatives within target communities. These outputs are organized into three main clusters:

- *Editorial oriented tools*: these tools refer to technologies and channels oriented to build a communication of initiatives that is continuous over time (e.g. newsletters, social media, podcasts);
- *Organizational oriented tools*: these tools act as facilitators of certain organizational and internal communication practices of the various service components (e.g. WhatsApp groups, broadcast lists);
- *Strategic oriented tools*: these tools assist in the use of purpose-driven technologies (e.g. crowdfunding campaigns, fundraising events, donation drives).

Such resources enable organizations to design and implement effective communication plans, ensuring that their initiatives resonate with their target audiences and achieve their intended impact. This structured approach not only amplifies individual initiatives but also contributes to overcoming persistent challenges in the sector, fostering greater social innovation and value creation.

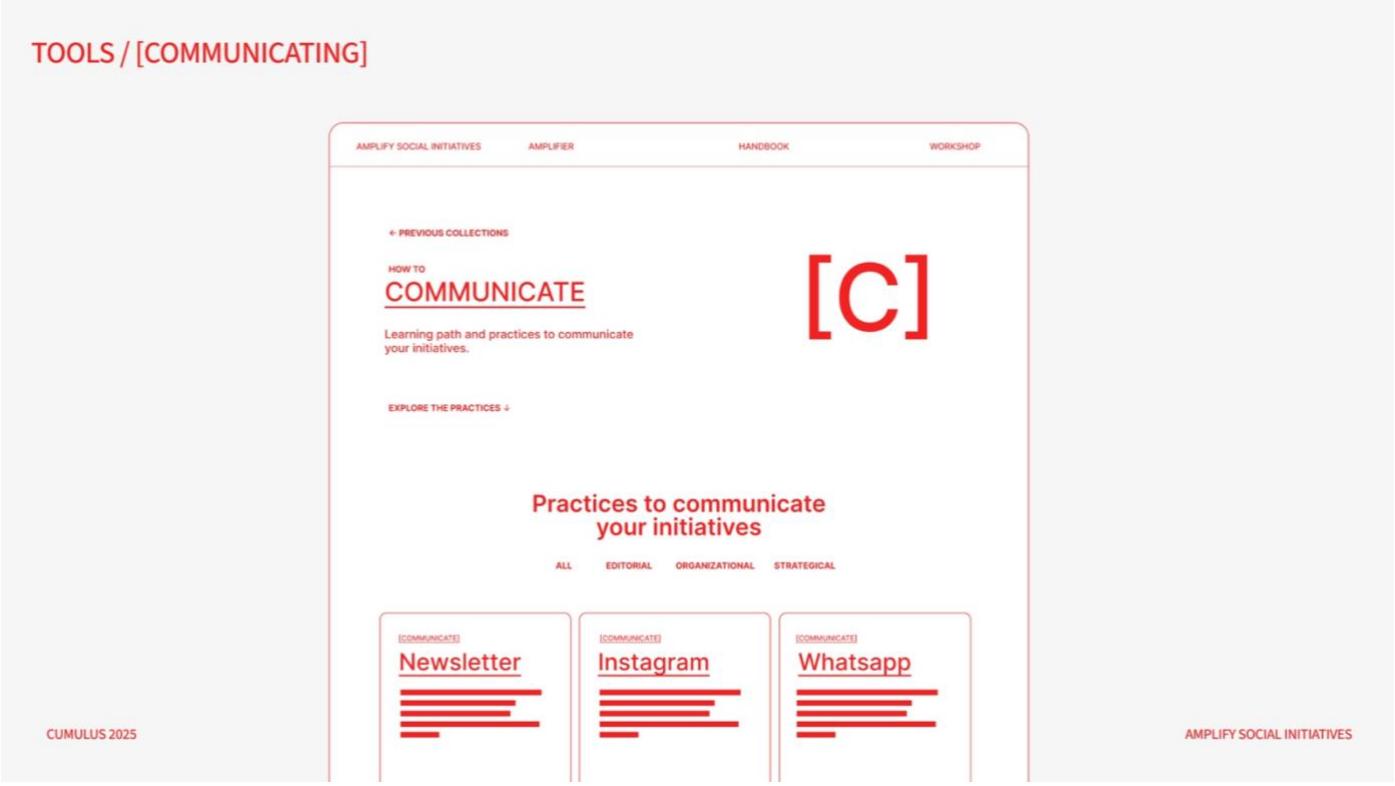

Figure 13. The platform proposes a series of communication outputs and provides specific guidelines for structuring newsletters, social media and organizational communications.

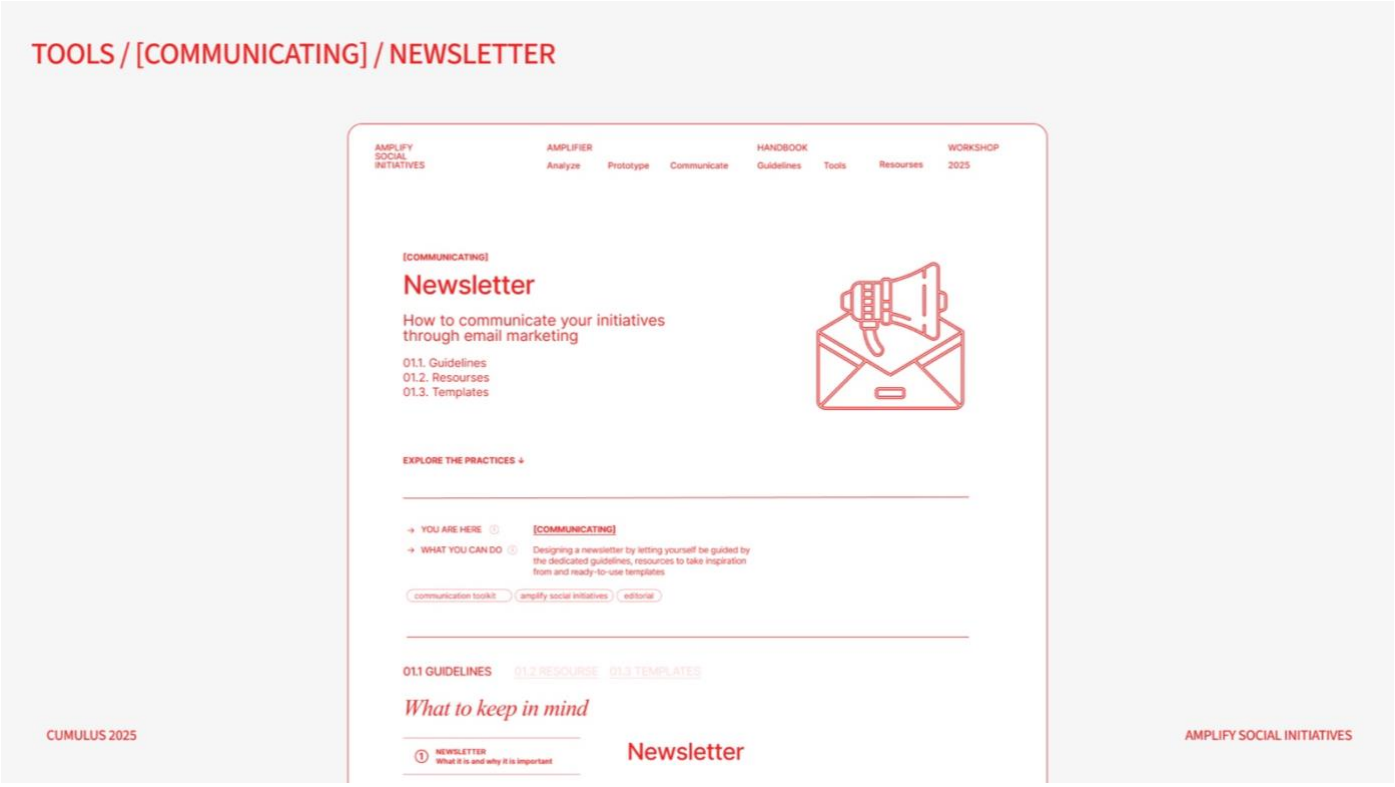

Figure 14. Communication tools provide different ways (guidelines, resources and templates) to guide social initiatives, previously analyzed and prototyped, to create different communication outputs, such as newsletters (for example).

Figure 15. One of the possible communication outputs is the newsletter, for which the platform proposes different tools (guidelines, resources, and templates) to guide its creation, depending on the level of competence and energy available.

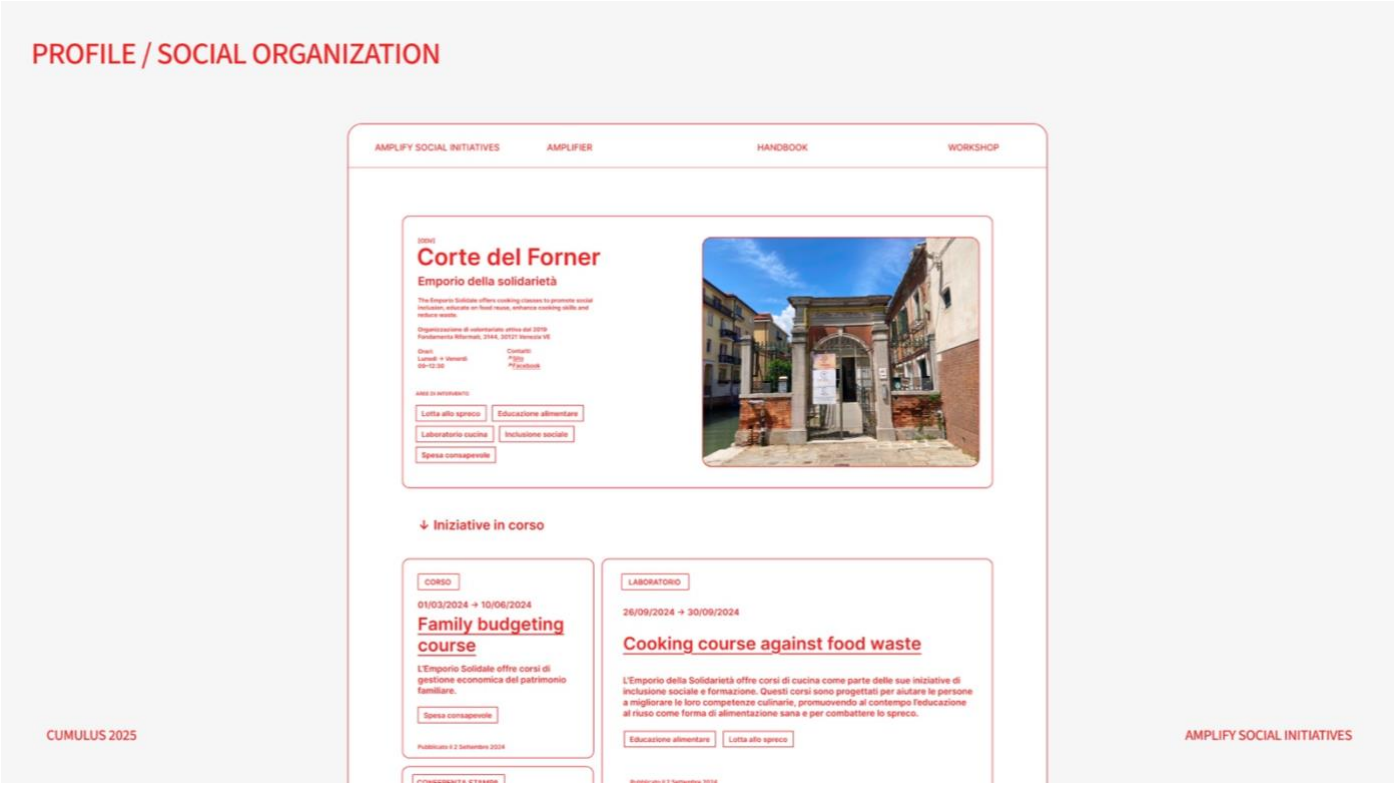

Figure 16. The interface design prioritizes the action-oriented presentation of content, moving from identity-centric models to an activity-based demonstration of organizational values through documented social impact initiatives.

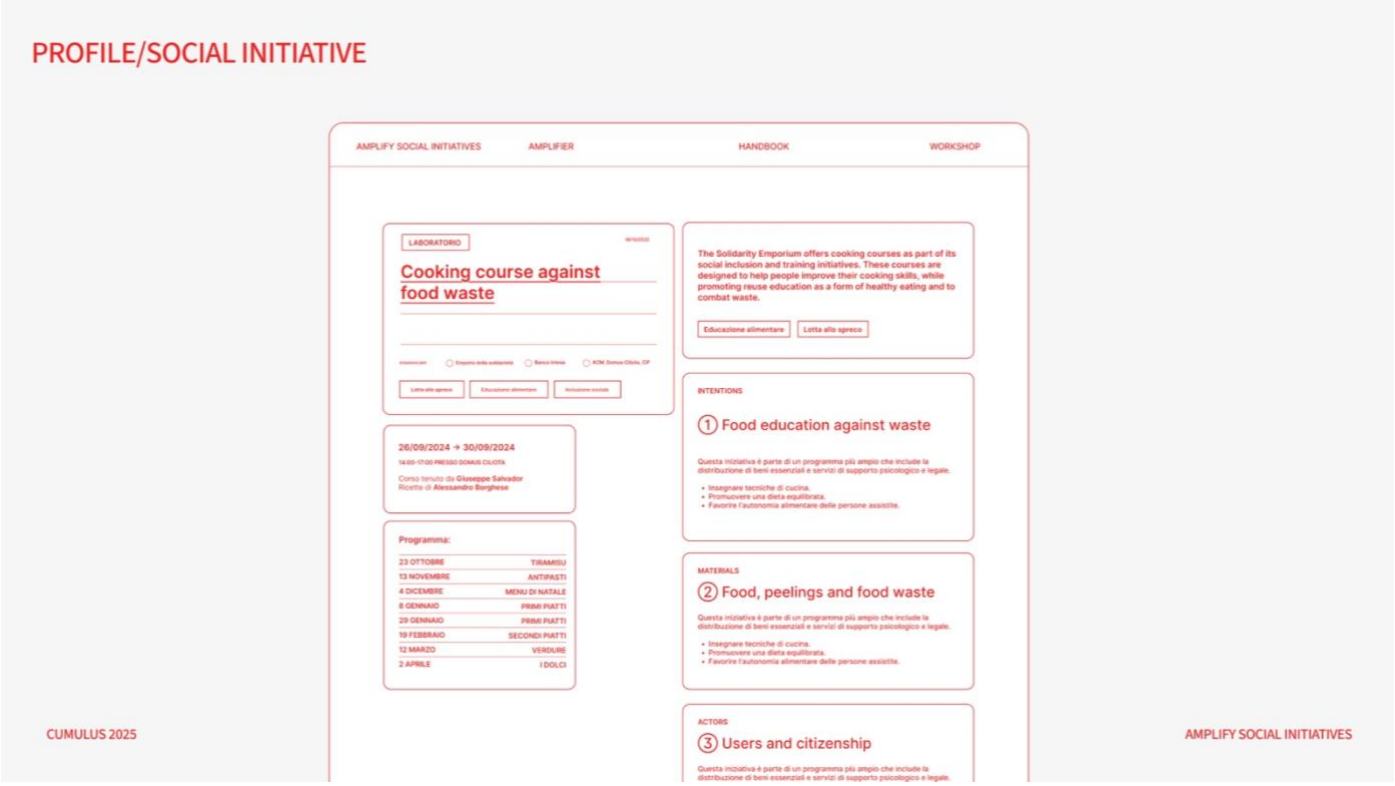

Figure 17. The initiative interface uses the value chain framework to structure and present operational information, enabling an architectural organization of initiative components, serving as modular building blocks for project replication and facilitating a crowdsourcing methodology.

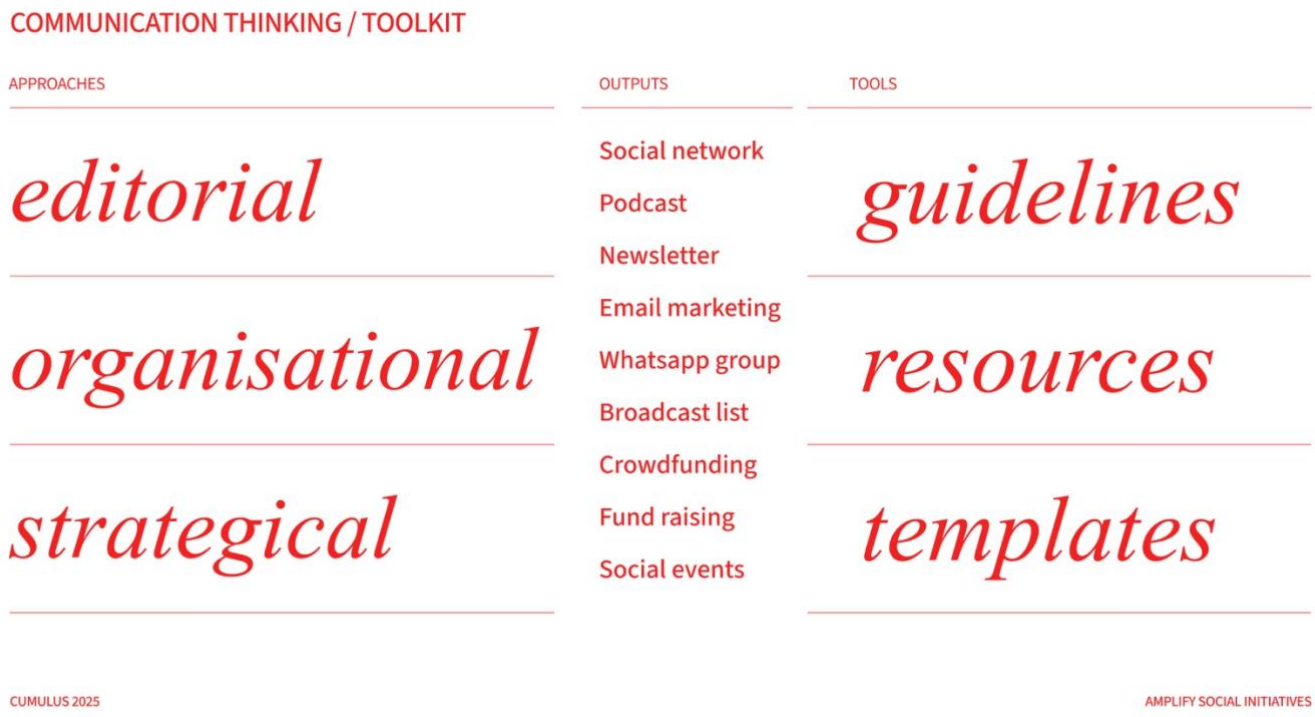

Figure 18. The Communications Toolkit addresses critical operational gaps in the third sector through an integrated digital communications framework. Encompassing strategic planning, organizational development and capacity building, it ideally addresses all these challenges while providing targeted implementation resources designed to increase the impact of existing social innovation initiatives.

7.Initiative as design action

On-field research, in line with the state of the art in the Third Sector, identifies a key barrier to digital transition: intrinsic resistance to adopting digital communication tools, primarily due to constraints in time and digital competence. This challenge is exacerbated by the sector's limited funding and pressing operational priorities (Italia No Profit, 2024). Manzini (2024) observes that successful social innovation demands significant stakeholder engagement, time, and commitment — resources that are often unavailable without robust policy support as our on-field research showed as well.
The limitations of a *technology-first approach* become evident when examining the findings of this article. The assumption that technological solutions automatically improve the communication capacities of the Third Sector overlooks crucial structural and social complexities. This technological determinism, as discussed by Harari and recently expanded upon by Author (2024), fails to account for the sector's unique challenges and limitations. While digital platforms can be a cost-effective infrastructure and enact behavioral change, they cannot independently address the structural and political challenges of supporting long-lasting impact in the Third Sector. As Vink argues (2020), meaningful systemic change requires comprehensive policy frameworks and socio-economic arrangements that extend beyond technological and design solutions. To drive meaningful change, public policies must embody innovative governance. As Manzini and Selloni (2016) propose, policies should form *policy constellations*, or clusters of initiatives, capable of positively interacting with the socio-technical systems they aim to influence. This ecosystemic approach to policy design highlights the need for long-term, socio-political commitment. The introduction of the 'National Single Registry for the Third Sector '(RUNTS) - introduced in the Italian 'Third Sector Reform' (2017) - has increased bureaucratic requirements without providing adequate support for the digital transition, failing to capture the dynamic and evolving nature of the sector and enabling a comprehensive analysis and observation of the sector. This exemplifies the *digital-imperative* main problem: the lack of digital standards and resources to support their implementation. Furthermore, both the literature and field research show that initiatives are at the core of social innovation and reveal a mismatch between the Third Sector entities mapped in RUNTS registry and the actual social innovation initiatives being developed. 'Amplify Social Initiatives' aims to intercept them with a tested theoretical-practical framework driven by design.

As mentioned above, the *quadruple helix model* emphasizes the importance of public governance and its crucial role of synergy between the State and the Third Sector, as well as citizens and local authorities, in promoting a sustainable ecosystem that supports social objectives. Public policies that raise awareness about social problems and support social innovation initiatives (Nesta, 2016) should help address these challenges. This process involves the creation of *collaborative public services* (Manzini & D', 2024) that integrate design-driven stakeholder engagement and local capacity to produce *collective goods* (Crouch et al, 2004). However, without a solid regulatory framework, initiatives are at risk of failure and attempts to be more probable, effective, durable and scalable and to become true *collective benefits*.

The implementation of collaborative tools, therefore, becomes crucial not just for operational efficiency, but as a catalyst for organizational learning and capacity building in which designers are mediators and facilitators, supporting ongoing initiatives and socially meaningful design projects (Manzini, 2014). This approach can help bridge the existing digital competency gap while fostering a more technologically adaptive culture

only in the conception of *digital common* empowering the empowerment of self-governance through a non-exclusive use of resources. Therefore, 'Amplify Social Initiatives' can be considered as a *trigger space* (Ostanel, 2017) not necessarily a physical space but as collector places of social energy. In this way they become at the same time laboratories of co-design and spaces to produce collective services which tend to scale up social innovation and amplify the impact of the often *unmapped* (author, 2022) network of small-scale design actions.

8. Conclusions

In conclusion, communication for social innovation can be conceptualized as a fundamental element in the architecture of social relations, establishing itself as an essential instrument to *produce sociality* (Ascoli, 1999). This theoretical perspective is grounded in the premise that communication is not merely a process of information transmission, but rather a catalyst that generates *social bonds*, thus contributing to the weaving of contemporary *social fabric* (Bassi, 2013). Within the context of social innovation, this conception takes particular significance as it highlights the transformative potential intrinsic to communication itself. Defining communication for the Third Sector as an expression of diffused or organized *relational phenomena* (Binotto, 2010) requires the recognition of its preliminary nature of social roots and the understanding of its capacity to amplify social impact and to evolve in new communicative domains.
This theoretical perspective enables the examination of Communication for Social Innovation in the Third Sector in its authentic dimension, by generating interpersonal connections and social dynamics. Design for social innovation as a *transformative force* emphasizes the role of communication in fostering and sustaining social relationships.

'Amplify Social Initiatives' shows that the design intervention in digital transition necessitates a synthesis between the original datum of community union and the contemporary aspect of technology as a connector of *collective intelligence*. This evolution requires a redefinition of its vocational purpose and consequent methodologies, essentially returning to its fundamental social roots of communication (Binotto, 2010): being social energy collectors on a territorial scale.

Manifesto

— Begin by recognising existing inequalities.

— To highlight, to make perceptible, a new order of ideas.

— Expose the violence inherent in a given order, as they.

— Accounting for what exists, as it concerns what we are facing.

— Have the potential to be disruptive.

We invite you to take a moment of individual reflection
on your professional experiences as designers
— to uncover the values and attitudes that shape
the projects you engage with.

ABSTRACT |

Background: In Canada, 27% of the population over fifteen lives with one or more incapacity (1). As a mean of transportation, airplane is one of the hardest to access for people with disabilities (PWD), with obstacle being either physical (e.g. washroom zone) and/or social (e.g the interaction with other passengers and flight crew) (2-7).
Objectives: To formulate recommendations for the federal agency Accessibility Standards Canada (with the aim of improving the legislation) through the development of inclusive design solutions of the washroom area for PWDs of 6 different airplanes models.
Methods: The methodology employed is an action research based on a co-design approach, comprising four stages: exploration, co-design, validation, and development (8). Stage 1 includes: a) A scoping review, to identify the current international accessibility practices; b) An evaluation of 6 aircraft cabin configurations in full-scale mock-ups using qualitative methods (e.g. walking interviews, co-design sessions) and quantitative tools.
Results: A multitude of practices and standards exist at the national and international levels; however, these practices seem to be far from inclusive. This is an ongoing project and the preliminary results of phase 1 (e.g. barriers and facilitators) will be presented at the Cumulus Nantes 2025 international congress.

KEYWORDS | DISABILITIES, AIRPLANES, INCLUSIVE DESIGN

Since the conclusion of the 20th century, questions of accessibility and inclusion have become increasingly prominent within the discipline of design. These issues are intertwined due to the fundamental understanding that a person's inclusion inherently encompasses access (Lebat 2019). Consequently, these concerns extend beyond the

mere physical accessibility of a space, location, or object, encompassing elements of a social nature (i.e. service and policy) These issues are particularly salient for persons with disabilities (PwDs) (Bianchin and Heylighen, 2018; Case, 2008; Guffey and Williamson, 2020; Moore et al, 2020; Ostroff, 2011). For PwDs, numerous challenges arise in various domains of daily life including transportation (Bianchin and Heylighen, 2018; Case, 2008; Guffey and Williamson, 2020; Moore et al, 2020; Ostroff, 2011). As such, this research focuses on the air travel experience of PwDs, and more specifically on their experience of the lavatories area.

1. The aircraft, one of the least accessible means of transportation

In comparison with October 2023 figures, the Canadian government with Statistics Canada (2024b) has documented a 7% increase in the number of passengers on board Canadian commercial flights for October 2024. However, for nearly a quarter of Canadians aged 15 and over who have reported one or more disabilities (Government of Canada, 2024a), air travel remains challenging to access despite its significance in the social participation of person with disabilities (Bauer, 2018; Brouwer & al, 2019; Darcy, 2012; Evans & al, 2024; Engstrom & al, 2019; Poria & al, 2010). The airplane occupies a significant place in various contexts, including leisure, work, and family (Bauer, 2018; Darcy, 2012). In 2006, the United Nations (UN) *Convention on the Rights of Persons with* Disabilities acknowledged the right of PwDs to have equal access to and enjoyment of the same opportunities as others in all spheres of society.

However, a plethora of obstacles in aircraft for PwDs. These obstacles, resulting as much from human and organizational factors as well as the interaction with the aircraft's physical environment, represent a source of stress and anxiety for PwDs (Bauer, 2018; Brouwer & al, 2019; Darcy, 2012; Evans & al, 2024; Engstrom & al, 2019; Poria & al, 2010). During flight, these obstacles manifest through various means, including, but not limited to, airline procedures, the lack of assistance from crew members, the malfunction of equipment utilized by passengers with disabilities, and the refusal of assistive equipment by staff (Bauer, 2018; Brouwer & al, 2019; Darcy, 2012; Evans & al, 2024; Engstrom & al, 2019; Poria & al, 2010). In terms of the physical environment, obstacles manifest in various ways, including the configuration of the aircraft itself, such as aisle width, seat clearance, clearance around the lavatory area, and the different equipment found on board (Bauer, 2018; Brouwer & al, 2019; Darcy, 2012; Evans & al, 2024; Engstrom & al, 2019; Poria & al, 2010).

One of the most notable challenges in aircraft pertains to the lavatory area, which has proven to be a significant source of complexity and concern for almost everyone (Bauer, 2018; Brouwer & al, 2019; Darcy, 2012; Evans & al, 2024; Engstrom & al, 2019; Poria & al, 2010). The constrained dimensions of the space, the challenges associated with door operation, and the discomfort associated with sitting in such a confined area pose challenges for individuals of all abilities and are particularly problematic for PwDs (Bauer, 2018; Brouwer & al, 2019; Darcy, 2012; Evans & al, 2024; Engstrom & al, 2019; Poria & al, 2010). For many PwDs, accessing lavatories from their seats presents a considerable challenge, often necessitating interaction with crew members, other passengers, and the aircraft's physical environment (i.e., circulation corridor and lavatory waiting area), thereby exacerbating stress in an already anxiety-inducing situation. (ref13). It can also means using the different assistive device present on board (such as the Washington chair), those being remarkably difficult and uncomfortable to operate for both the crew and the PwDs (ref). In the case of persons with a body mass index (BMI) that exceeds the threshold considered to be overweight or obese, toilet use can present challenges

analogous to those experienced by PwDs (Evans & al, 2024). These challenges may render lavatories use impossible and thus having a detrimental effect on personal hygiene and dignity (Bauer, 2018; Brouwer & al, 2019; Darcy, 2012; Evans & al, 2024; Engstrom & al, 2019; Poria & al, 2010).

1.1 Objective

The objective of this study is to formulate evidence-based recommendations for the federal agency Accessibility Standards Canada (with the aim of improving the legislation). As such, this study also aims to understand the experience of PwDs when traveling by air, and to identify the barriers and facilitators present. More specifically, we aim to understand how the lavatories area in the airplane is lived by PwDs and what are the barriers and facilitators in this space. This will enable the development of accessibility solutions focused on PwDs needs. Additionally, it will demonstrate the relevance of an inclusive design approach in the elaboration of recommendations, based on the aforementioned solution, that will inform the development of norms and standards at the Canadian federal level. Furthermore, the largest airlines operating internationally tend to base their operations on the most restrictive legislative measures, suggesting the potential for this research project to have an impact beyond the Canadian context.

2. Methodology

In order to meet the objective, the present study uses a qualitative methodology, more specifically that of action research based on a co-design approach comprising four phases: 1) Exploration, 2) Co-design, 3) Validation and 4) Development (Morales et al, 2012). Phase 1, the exploration phase, is currently underway, and includes a) a scoping review to identify accessibility practices and standards in international and national aircraft, and b) the evaluation of different aircraft cabin configurations using qualitative methods (i.e. focus group and semi-structured interview). This research is supported by Accessibility Canada Standards.

2.1 Scoping review

For this stage of phase 1, the scoping review is done according to the established procedure by Arksey et O'Malley (2005). The first step, a preliminary review of the literature, done in order to select article, allowed for the identification of keywords and descriptors on which to base the scoping review. Subsequently, the various keyword and descriptors identified were discussed within the research team and with a librarian from Université Laval specializing in the various types of literature review in rehabilitation. The assistance of the latter ensured precision and rigor throughout the process. The subsequent implementation of the search strategy occurred in eight databases, including PubMed, Medline, CINALH - Academic Search Premier, CINALH - EBSCO, Web of Science, Embase, GeoBase, and Transport Ovid. This stage of the phase 1 is still ongoing, and preliminary results can be found in the result section of this article.

2.2 Aircraft evaluation

For the evaluation of different aircraft cabin configuration, data will be collected in six full-scale aircraft cabin replicas. These replicas will represent the most prevalent aircraft types used in Canadian aviation by size: wide-body (n=2), narrow-body (n=2), and regional jets (n=2). It is important to note that only a section of the airplanes will be reproduced, comprising several rows of seats in addition to one or more lavatories depending on the airplane model under evaluation. The research project is collaborating with one of the most prominent aeronautical industry manufacturers to construct these scale models. Participants will be recruited using convenience and snowball sampling techniques, and the study will include persons living with different disabilities (i.e. mobility,

visual, hearing, cognitive), obese persons, pregnant persons and persons with autism. The heterogeneity of the sample, in terms of both individuals and their respective experiences, engenders a more profound comprehension of diverse scenarios, a phenomenon that can be attributed to the capacity to establish meaningful comparisons (Pires, 1997). The data collection is scheduled to take place between February 2025 and June 2025.

2.3 Analysis

For the purpose of analysis, the utilization of the mixed thematic coding technique will be prioritized. This technique encompasses both deductive and inductive approaches. For the deductive component, the Disabilities Creation Process (DCP) will be employed, as it fosters a comprehensive understanding of disability by examining the diverse interactions that emerge between an individual and their environment (Fougeyrollas & al, 2019). The Nvivo software will be used for the thematic coding.

3. Preliminary results

Preliminary analysis of the results obtained in the scoping review reveals certain trends within the context of the study. Despite the implementation of numerous legislative measures in several countries (e.g., Canada, USA,) and the presence of certain facilitators, numerous barriers persist for transoceanic, national, and regional flights. As this research is ongoing, the following sections present the preliminary results of the scoping review, while the results of the aircraft evaluation will be presented at the Cumulus Nantes 2025 international conference.

3.1 Some legislative measures are in place

As previously indicated, numerous nations have instituted initiatives to address the obstacles encountered by PwDs. The preliminary analysis of the scoping review results in North America has revealed two recent documents that address these obstacles.
In Canada, in 2015, the federal government promulgated a legislative measure—a code of practice—firmly anchored in the aims of the United Nations Convention on the Rights of Persons with Disabilities. The document, titled *Aircraft Accessibility for Persons with Disabilities: Code of Practice for Fixed-Wing Aircraft with 30 or More Passenger Seats* encompasses a range of issues faced by PwDs in the context of aircraft, including but not limited to ramps, aisle widths, lighting components, and communication (Transport Canada, 2015).

In the United States, the Department of Transportation has required airlines to have at least one accessible lavatory in the single-aisle types of airplanes (narrow-body and regional jet), as outlined in a new piece of legislation dated from 2023 (United States Department of Transportation, 2023). However, the definition of "accessible lavatory" is left to the companies, as the documents do not provide any design criteria based on measurements. The document's scope is limited to persons with mobility disabilities, without addressing the needs of others PwDs. Despite these legislatives measures, it was possible to observed in the preliminary analysis of the scoping review that numerous obstacles persist at every stage of air travel, from planning to the actual flight (Budd & Ison, 2020; Gotti & al, 2024; Smal & Harris, 2012).

Furthermore, the international variability of definitions of what constitutes a "passenger with disabilities" can result in a wide range of experience for PwDs (Budd & Ison, 2020). This variability in disabilities definitions can result in the implementation of services, assistance, or procedures that differ from one flight to another, depending on the country in which the PWDs is traveling (Budd & Ison, 2020). Furthermore, the inconsistency in airline policies can result in discriminatory practices towards passengers deemed obese

that is similar to PwDs (Small & Harris, 2012).

3.2 Lavatories: the most problematic spaces in aircrafts

The various obstacles encountered by PwDs are subject to variation depending on each person's personal situation, experience, and the assistance equipment required. For instance, an individual requiring an assistance dog may encounter discrimination due to the airline procedures related to the animal's presence (Darcy, 2012). Similarly, a person requiring a manual wheelchair may face limitations imposed by aspects of the physical environment (Poria & al, 2010). However, preliminary results suggest that lavatory space, irrespective of aircraft type, represents an obstacle for many PwDs, regardless of disability.

Indeed, for children with disabilities, the use of the lavatories can be a significant source of discomfort and distress (Davies & Christie, 2017). A similar phenomenon is observed among parents or caregivers, who encounter a range of physical, emotional, and cognitive challenges (Davies & Christie, 2017). Among pregnant persons, access to and utilization of lavatories are among the most unsatisfactory equipment found on an aircraft (Chang, 2012). A similar situation is observed in persons utilizing assistive devices, such as wheelchairs, where the distance from seats and the necessity to transfer to the chair are frequently identified as problematic (Chang & Chen, 2012; Davies & Christie, 2017). Persons with a BMI equal to or above what is considered overweight or obese, which encompasses a broad spectrum of body types, are particularly vulnerable to adverse effects related to the use of lavatories (Evans & al, 2024; Poria & Beal, 2017). These effects can compromise not only personal hygiene but also the health of the person (Evans & al, 2024; Poria & Beal, 2017).

4. Discussion

As previously stated, the objective of this study is to understand the experiences of PwDs and to ascertain the barriers and facilitators that exist in the different types of aircraft. The subsequent step will be to develop accessible and inclusive solutions to address these barriers and facilitators. Consequently, the preliminary results of the exploratory review suggest several promising avenues for exploration within an inclusive design approach, particularly with regard to the development of norms and standards that can be implemented on a national scale. Indeed, the argument can be made that a transition from a performance-based standard to a design-based standard within the industry is imperative.

4.1 Design and civic involvement

The identification of discrepancies and disparities within the scope of legislative measures currently in place within the aviation sector offers a number of compelling avenues for reflection on the intentional and legislative levels. Indeed, the co-design approach adopted in this project is, in certain respects, grounded in the democratic principles of a design approach as articulated by DiSalvo (2022). Indeed, it is possible to believe, in light of the preliminary results obtained in the scoping review, that the use of this research approach favors the identification and articulation of the problematic, and therefore the development of legislative measures, through people's lived experience, where the designers then finds themselves in a role of translating needs and no longer in a position of authority through the act of design. Consequently, norms and standards are co-constructed with people, rather than being imposed on them.

4.2 The complexity of the lavatory space

The preliminary results from the scoping review phase of this study, more specifically the

challenges encountered in aircraft lavatories, align with the various dimensions (Environment, Lifestyle, and Personal Factors) of disability as defined in the DCP (Fougeyrollas & al., 2019). Addressing these issues through this model also offers interesting avenues of reflection for designers, particularly when it comes to the capability potential of objects and spaces. The capability approach, on which the concept of the capability object is based, offers interesting avenues for designers (Boylston, 2019). In the context of aircraft, where the physical environment is governed by legal and regulatory frameworks (see ICAO, for instance), the implementation of significant alterations is more likely to entail a design-oriented approach to services or the consideration of onboard equipment. Consequently, as discussed in the preceding section, it can be posited that the designer's role encompasses reinforcing the capabilities of PwDs by incorporating their experiences into the design process.

5. Conclusion

Among the various modes of transportation, air travel remains one of the most challenging for PwDs to access (Bauer, 2018; Brouwer & al, 2019; Darcy, 2012; Evans & al, 2024; Engstrom & al, 2019; Poria & al, 2010). The spatial configuration, the presence of other passengers, and the interaction with crew members can contribute to an anxious and dehumanizing flight experience for PwDs (Bauer, 2018; Brouwer & al, 2019; Darcy, 2012; Evans & al, 2024; Engstrom & al, 2019; Poria & al, 2010). Despite legislative efforts in Canada and the U.S., significant barriers persist, affecting not only mobility but also dignity, comfort, and overall travel experience. The preliminary findings of this study highlight the urgent need for inclusive design approaches that extend beyond regulatory compliance to address the real-world experiences of PwDs. Accordingly, the findings of this research phase will be utilized to identify design criteria that will be employed to develop solutions in subsequent phases of the co-design approach. By integrating co-design methodologies and emphasizing civic involvement, this research aims to bridge the gap between policy and practice. The complexity of lavatory accessibility underscores the broader challenge of designing for diverse needs within confined environments. Consequently, the preliminary results also provide a basis for further consideration of the role of the designer in this context, notably in the development of norms, standard and public policy in the aviation sector.

About the Authors:

Simon Tremblay-Turcotte is a doctoral student in rehabilitation science at Université Laval with a background in design. His research interests focus on the role of materiality in a design approach to disability development.

Ernesto Morales is a full professor at the School of Rehabilitation Sciences at Université Laval. His research interest includes inclusive accessibility and design solutions to improve the quality of life of PwDs with objects, spaces (residential or clinical) or urban contexts.

David Gotti is a doctoral student in rehabilitation science at Université Laval with a background as an occupational therapist. His research interests focus on social participation of PwDs.

Ahmed Hadj Hassen is a doctoral student in rehabilitation science at Université Laval with a background in urban design. His research

interests focus on the role of the physical environment in the inclusion of PwDs.

François Routhier is a full professor at the School of Rehabilitation Sciences at Université Laval and a regular researcher at Cirris. He is also a senior research fellow of the Fonds de Recherche du Québec - Santé.

Community Engagement in Co-designing Design Education: insights from the "School Day" initiatives and the shifting curatorship role of institutions in educational transformation.

Silvia D'Ambrosio[a]*, Andrea Manciaracina[a], Francesca Mattioli[a], Anna Meroni[a], Francesco Zurlo[a]

aPolitecnico di Milano
*silvia.dambrosio@polimi.it

ABSTRACT | Technological advances, fluctuating political dynamics, the unpredictability of global crises and, more recently, other contemporary overwhelming paradigms such as climate change, wars, and economic instability, have forced educators worldwide to rethink their teaching and have required students to adapt to novel ways of learning and things to learn. Institutions-wise, this shift has pushed an ongoing process of questioning the overall instructional framework in which higher education has traditionally existed. We argue that these recent experiences and challenges have been critical triggers for education stakeholders to move from contextual traditions to a period of dynamism, where reflection on undertaken actions may lead to an overall innovation of teaching and learning practices, valuing people's involvement, knowledge, competence, ethics, and relationships.

This contribution presents how the School of Design of Politecnico di Milano, a top-ranking institution in the design field, employed design methods to leverage

diverse competencies developed by different stakeholders to collaboratively re-design future design curricula and the university experience. The re-design process shifted from the traditional institutional "authorship" model, where leaders take the ownership for curricula design and strategic decisions, to an institutional "curatorship" model. In this model, the institution acts as a connected cultural intermediator, curating the design of the educational offer by creating opportunities to co-design educational innovation with various stakeholders. The authors present the case study of co-design activity named the 'School Day' initiative, a day dedicated to reflecting with teachers, administrative staff, and students on the educational offer and co-designing possible future directions together. The focus extends beyond institutional considerations, presenting a strategy to involve the broader educational ecosystem and fostering a continuous dialogue for participatory design. We detail the structural elements, activities, and tools utilised in co-design, collaboration, and designerly ways of thinking employed to rethink future trajectories of instructional design, considering the shared experience of the school's community.
Insights into the co-design process are provided by revealing its agenda through protocols, timelines, and photographic documentation. Data collected within the initiative are reported and analysed, considering subsequent developments and follow-up actions, such as the launch of a new academic program and planned activities with students in the upcoming academic year, among others. Finally, the contribution concludes with a discussion of the nuanced relationship between authorship and curatorship, reflecting on the results of the participatory activity and ongoing institutional efforts in promoting co-design approaches. The emphasis on community engagement and participatory design enhances the educational experience and empowers stakeholders to actively shape the future of education and its organisational change.
KEYWORDS | DESIGN EDUCATION, CO-DESIGN, CURATORSHIP, PARTICIPATORY ACTION RESEARCH, COMMUNITY ENGAGEMENT

1. Introduction

In recent years, global challenges such as technological advancements, political upheavals, and climate change have necessitated a re-evaluation of traditional educational models. As societies face increasing uncertainty and complexity, the field of design education is also undergoing significant transformation.
Historically, design education has followed a structured, top-down approach in which institutions held sole authority over curricula design and pedagogical frameworks. However, in response to these evolving challenges, institutions are now embracing participatory models that integrate co-creation and collaborative methodologies with various stakeholders. This paper explores the shifting role of curatorship as an institutional model for fostering community engagement and innovation in education. Specifically, it examines how curatorship—understood as a move from centralized authorship to distributed facilitation—allows institutions to act as cultural mediators, enabling a more inclusive and adaptive learning environment. By positioning institutions as curators rather than sole authors, this

model acknowledges the diverse expertise and perspectives of faculty, students, and external collaborators in shaping the educational landscape.

Using the *School Day* initiative as a case study, this paper investigates how participatory design methods can empower stakeholders to actively shape educational practices. *School Day* is an annual event organized to facilitate reflection and collaborative envisioning among educators, students, administrative staff, and external partners. The initiative serves as a co-design platform where key institutional actors engage in structured discussions and workshops to identify future directions for design education. The transition from authorship to curatorship is exemplified through this initiative, highlighting how design institutions can innovate their roles and practices by embedding participatory strategies into educational governance. The discussion will be structured as follows: first, we contextualize the rapid shifts in global and educational landscapes, emphasizing why design education must evolve to remain relevant. We then present the core research problem—namely, how institutions can transition from rigid top-down educational models to more dynamic, co-created approaches. This is followed by an exploration of the *School Day* initiative as an operational example of this transformation. The paper details the theoretical underpinnings of this shift, the methodology employed in the research, key findings from the case study, and broader implications for design education.

By presenting a concrete example of contextual innovation, this paper aims to expand knowledge on how design education institutions can redefine their roles and practices leveraging collective intelligence. It contributes to the ongoing discourse on participatory design in education, illustrating how institutions can cultivate spaces for shared decision-making and long-term strategic engagement within academic communities. Ultimately, the study seeks to offer insights into how co-design methodologies can serve as a tool for institutional transformation, fostering a more inclusive, reflexive, and responsive approach to educational development.

2. Background Knowledge

The contemporary educational landscape is undergoing profound transformations driven by rapid socio-technical shifts, technological advancements, and evolving societal needs. Compared to other disciplines, design education is particularly sensitive to these changes due to its inherently dynamic and practice-oriented nature (Rampino, 2022). Historically, design as a discipline has continuously evolved in response to external influences, integrating emerging methodologies, tools, and technologies. Today, these influences manifest in the pressing need for educational models that take adventage of diffuse knowledge, are motivating and engaging for both teachers and students, are more adaptable, participatory, and reflective of complex realities.

2.1 Instructional design innovation in a rapidly evolving context

Given the evolving nature of design practices, design education must not only respond to change but also anticipate and shape it. Curricula must be designed with a proactive approach, fostering an environment where students and educators collaboratively explore, experiment, and redefine pedagogical frameworks. This requires institutions to shift from static educational models to dynamic, co-designed learning ecosystems.

Research on instructional change provides a valuable lens to understand how innovation can be embedded in teaching practices. Castoldi (2021) identifies three distinct relationships between research and educational improvement: research on improvements, which provides external feedback without directly influencing teaching practices; research for improvements, where research acts as a preliminary step to trigger transformation; and research as improvement, where research is embedded within the change process itself, making research and innovation inseparable. This framework is particularly relevant in the context of design education, where iterative learning and reflexivity play a crucial role in shaping pedagogical practices.
Furthermore, the situatedness of curriculum innovation (Mattioli et al., 2023) highlights the importance of understanding how global socio-technical shifts are being tackled within specific educational contexts. Curriculum innovation cannot be seen as a one-size-fits-all approach but must instead be deeply contextualized, integrating both global trends and local educational needs. This perspective aligns with emerging discussions on the necessity of combining top-down strategic frameworks with bottom-up participatory approaches to educational reform.

This paper argues that a significant step in this direction can be the transition from an authorship model to a curatorship model in educational institutions. Traditionally, design education has been shaped by a centralized authorship approach, where a select group of institutional leaders define curricula and pedagogical strategies. However, contemporary challenges necessitate a more inclusive and systemic approach, positioning institutions as curators rather than sole authors of knowledge. This curatorship model acknowledges the complexity of educational transformation and recognizes the value of diverse stakeholder engagement in shaping curricula (Ashton & Couzins, 2015; Ruitenberg, 2015). In this model, institutions act as facilitators of collective intelligence, integrating contributions from faculty, students, industry partners, and administrative staff to co-create learning experiences that are relevant, adaptive, and future-oriented.

This paradigm shift reflects a broader institutional transformation that seeks to embed community engagement and participatory design into curriculum development. The School Day initiative serves as an example of how this transformation is operationalized, illustrating how participatory processes can lead to more responsive and contextually relevant educational strategies. By moving from a prescriptive model of education to a facilitative one, institutions can create more resilient and innovative learning environments that reflect the complexities of contemporary design practice. Therefore, instructional design innovation in the context of design education requires a systemic shift that

embraces participatory methodologies, recognizes the situatedness of curriculum development, and redefines the role of educational institutions as curators of learning rather than unilateral decision-makers. This approach not only enhances the adaptability of design education but also ensures that it remains relevant and impactful in an ever-changing world.

2.2 Reshaping the Institutional School Role in a Situated Context: from Author to Curator of the Curricula Innovation

For decades, the School of Design of Politecnico di Milano—like many other higher education institutions—has operated under a rather conventional governance model of institutional authorship, where curricula, pedagogical frameworks, and educational policies were prevalently defined through top-down decision-making processes. While programme coordinators and course teachers had, obviously, a vaste degree of freedom in defining contents and subjects of their activities, the overall strategy of the School was set by the academic directors, and shared throught the academic institutional boards and governance mchanisms.
This approach, while providing stability and coherence, often resulted in rigid structures that left little room for adaptation, innovation, or the integration of diverse perspectives. As the socio-technical landscape of design continues to evolve, educational institutions are increasingly recognizing the limitations of a top-down model in addressing contemporary challenges.
A paradigm shift towards institutional curatorship is emerging as a response to these challenges, positioning institutions not as sole authors but as facilitators of educational co-design. This shift acknowledges the need for distributed agency, fostering dialogue among multiple stakeholders—including faculty, students, industry representatives, and administrative staff—to collectively shape educational trajectories. In this model, institutions act as intermediaries, cultivating ecosystems where knowledge is co-created, curricula are continuously refined, and emerging trends are critically assessed (Ashton & Couzins, 2015; Ruitenberg, 2015). The distinction between authorship and curatorship in educational governance reflects broader transformations in leadership and institutional roles. Traditional authorial models of curriculum planning tend to centralize expertise, reinforcing a structured and controlled learning pathway. In contrast, the curatorial model embraces participatory design, enabling the integration of bottom-up contributions into strategic planning and curricular development (Oak & Lloyd, 2015). This shift is not about relinquishing institutional responsibility but rather about repositioning it: from a prescriptive approach to an adaptive and responsive one. This transformation aligns with the designerly ways of thinking proposed by Cross (2007, 2011), which emphasize iterative problem-solving, stakeholder engagement, and reflective practice. By embedding co-design approaches (Sanders & Stappers, 2008; Iversen et al., 2012), institutions can navigate complexity while ensuring that design education remains relevant, inclusive, and attuned to real-world needs.

One of the key assumptions underpinning this transition is the recognition of co-design as a means for researching future contextual scenarios in education. The participatory nature of co-design allows institutions to explore, test, and

refine educational models through engagement with those directly involved in learning and teaching. This raises critical research questions:

- *How can community engagement and co-design practices reshape design education to move beyond traditional models?*
- *What is the role of institutions in curating and enabling this transformation?*
- *How might we transition from authorship to curatorship within complex educational communities to foster consensus, generate ideas, and shape strategic directions?*

By shifting towards a situated and iterative approach to curriculum innovation, institutions can move away from static educational frameworks and instead adopt an adaptive learning ecosystem—one that remains responsive to emerging technologies, pedagogical methods, and societal needs.
The transition from authorship to curatorship also calls for a reconsideration of leadership styles and institutional roles. Curatorship implies an active engagement in knowledge mediation, requiring institutions to listen, interpret, and facilitate rather than dictate (Meroni et al 2018). This entails cultivating an institutional culture of reflexivity, where decision-making processes are informed by continuous dialogue and evaluation.

This transformation is evident in initiatives such as School Day, which exemplifies how co-design methodologies can be leveraged to inform institutional strategies. By providing a structured yet open-ended platform for discussing educational challenges and opportunities, such initiatives reinforce the importance of collective intelligence and shared ownership in shaping the future of design education.

3. Methodology

This study adopts a Participatory Action Research (PAR) approach, leveraging the School Day initiative as both a research intervention and a site of inquiry. As a method that bridges research and practice (Baum et al., 2006), PAR actively involves stakeholders in co-designing solutions, reflecting on shared experiences, and iteratively refining actions based on emerging insights. In this context, the research focuses on the School Day 2022 edition, the first organized after the COVID-19 pandemic, a moment in which there was a heightened institutional need for reflection and innovation. By analyzing the outcomes of this initiative three years later, this study explores the long-term impact of participatory co-design approaches on curriculum development and institutional strategy.

3.1 Participatory Action Research as the guiding methodology

The choice of applying Participatory Action Research (PAR) lies in the fact that it is collaborative, iterative, and contextually embedded, making it particularly suited for studying curricular transformation through co-design. It aligns with the shift from institutional authorship to curatorship, as it actively engages educators, students, and staff in shaping design education rather than positioning them as

passive recipients of predefined policies. The School Day initiative serves as both a research intervention and a means for institutional transformation. This participatory setting enabled an inclusive process of educational co-design, where faculty, students, and administrative staff collectively explored, debated, and proposed innovations for the design curriculum. As a structured moment of reflection and future-oriented thinking, the initiative functioned as a living lab, facilitating the generation, discussion, and evaluation of ideas in real time.

The School Day 2022 edition was particularly significant as it marked the first opportunity for institutional dialogue and reconfiguration after the disruptions of the pandemic. This edition provided a unique research opportunity to analyze how co-design methodologies could be implemented within governance structures and how they could inform strategic decision-making. Through PAR and co-design, the methodology was structured around three key principles:

- **Participatory Engagement:** Ensuring that faculty, students, and administrative staff were active participants in shaping the future of design education.
- **Iterative Reflection and Action:** Using feedback loops to refine and iterate proposals, ensuring alignment with institutional priorities and community needs.
- **Long-Term Impact and Institutional Integration:** Tracing the follow-up actions that emerged from the School Day discussions to assess their influence on the university's curricular and pedagogical strategies.

3.2 Data collection

To capture the depth and complexity of the co-design process, a multi-method approach was employed, ensuring a comprehensive understanding of both the participatory experience and its institutional follow-up. The data collection methods included:

- **Documentation of Co-Design Outputs:**
  - Completed workshop templates, brainstorming materials, and session summaries were collected to trace the discussions and conceptual pathways that emerged.
  - Annotated session agendas and co-design artifacts (e.g., maps, post-its, synthesis boards) provided tangible records of stakeholder contributions.
- **Plenary Session Transcripts and Observational Notes:**
  - The final plenary session, where each thematic group presented and discussed its findings, was recorded and transcribed.
  - Observational notes captured group dynamics, discussion patterns, and key points of debate among participants.
- **Photographic and Video Documentation:**
  - Images and video recordings of the co-design sessions documented interactions, spatial configurations, and engagement levels.
- **Institutional Follow-Up Data (2022-2025):**

- Internal reports and meeting minutes from subsequent faculty discussions and institutional planning were analyzed to trace the impact of the School Day 2022 outcomes.
- Interviews with key stakeholders (e.g., program coordinators, faculty members) were conducted to assess how the proposals from the initiative influenced curricula, teaching models, and governance practices over time.

3.3 Data analysis

By integrating real-time data from the 2022 event with longitudinal follow-up evidence, this methodology ensures that the analysis captures not only the participatory experience but also its lasting effects on institutional decision-making. A thematic and comparative analysis was conducted to uncover the key themes and insights from the collected data. The analytical process involved the following steps:

1. **Thematic Coding**:
   - The collected artefacts and transcripts were coded to identify recurring themes, patterns, and insights.
   - Key themes included innovation in teaching formats, inclusivity in educational practices, and the integration of emerging societal needs into curriculum design.
2. **Comparative Analysis**:
   - Outputs from different thematic tables were compared to identify areas of convergence and divergence, offering insights into collective priorities and unique perspectives.
3. **Traceability of Impact**:
   - The follow-up actions and long-term impacts of the proposals were traced over a three-year period. This analysis highlighted the effectiveness of the co-design process in influencing institutional strategies and demonstrated how participant voices were translated into action.

By integrating thematic and textual analysis, the study provided a nuanced understanding of the School Day initiative's outcomes and their broader implications for design education.

4. Case Study: The School Day 2022

The School Day 2022 has been the first structured attempt to experiment with a novel governance model for the School of Design reflecting a new leadership style, emphasizing collaborative governance and participatory decision-making (Fig. 1).

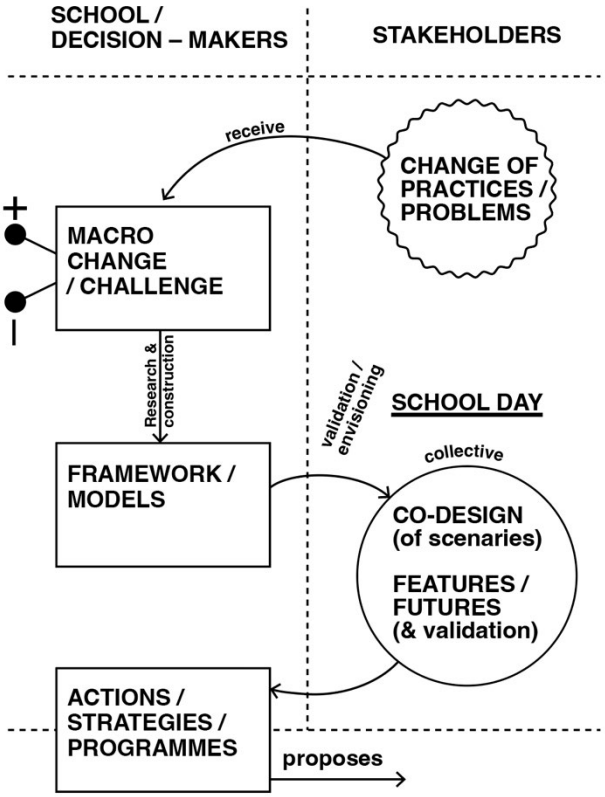

Figure 1. Diagram showing the workflow and involvement of different stakeholders that led to the establishment of the School Day.

Rather than imposing top-down reforms, the institution engages in a dialogical and iterative process that unfolds through a structured methodology. Its purpose is to envision the evolution of the School together with its community, co-define the next steps to take and create engagement around them. The model at the basis of this initiative follows these key phases:

1. **Finding a theme**: Identifying what is relevant, urgent, and a priority for the school's strategy. The process starts by recognizing the most pressing challenges and transformation needs, whether they emerge from within the academy or from its broader ecosystem of stakeholders.
2. **Mobilizing a mixed group of co-organizers:** Engaging faculty, staff, and students who are directly concerned with the theme, have relevant expertise, and are interested in contributing. This ensures that discussions are informed, inclusive, and capable of addressing different perspectives.
3. **Finding experts:** Involving both internal university experts and external contributors who can provide valuable knowledge and stimuli, fostering interdisciplinary dialogue and expanding the horizon of the discussion.
4. **Designing the co-design workshop and training facilitators**: Structuring the event to enable meaningful and generative discussions. This phase focuses on designing the co-design methodologies, ensuring that they encourage participants to think beyond conventional approaches and imagine innovative solutions. Dedicated training for facilitators ensures smooth moderation of conversations.
5. **Gathering the whole school's community for one day:** Creating a space for collective participation, where stakeholders work together, share meals, and engage in cultural initiatives in a convivial setting. The event fosters an

atmosphere of collaboration and informal exchange, reinforcing social cohesion and institutional belonging.

The School Day initiative exemplifies the application of co-design principles within a higher education setting. It serves as an experimental space where facilitated workshops, brainstorming sessions, and reflective exercises capture the complexities of contemporary educational challenges. The tools employed—ranging from participatory mapping to visual storytelling—enable active engagement from all participants, fostering a sense of ownership over the outcomes. Beyond serving as a forum for dialogue, the initiative has demonstrated its potential to drive tangible institutional change: the various editions have influenced curricular innovation, contributed to new academic programs, and strengthened relationships within the educational ecosystem. By embedding participatory design methodologies into the institution's governance model, School Day highlights the transformative potential of curatorial leadership in education, positioning the institution as a facilitator of collective intelligence rather than a prescriptive authority.

4.1 Goals, participants, and structure

The School Day is annualy organised at the end of July, coinciding with the conclusion of the academic year. This strategic timing ensures maximum participation from a diverse range of stakeholders, including academic staff, students, professional, administrative and technical staff and external collaborators. Doing so, it embraces a horizontal, inclusive approach, inviting diverse voices to contribute to the evolution of teaching and learning practices. It runs for the whole day, from 9 a.m. to 5 p.m.

Figure 2. Photo taken on School Day 2022, during the workshop and thematic table activity.

Each School Day begins with a plenary session, which includes:

- **State of the Art and Achievements:** Sharing results and key milestones from the past academic year.
- **Expert Talks:** Featuring external speakers who provide fresh perspectives on education, design, and innovation.
- **Workshops:** Facilitated sessions focusing on specific themes, structured into thematic tables for in-depth discussions and collaborative ideation.
- **Plenary:** Final moment of sharing of all thematic tables by their facilitators.

The workshops form the central component of the day, lasting approximately four hours, interspersed with breaks for lunch and refreshments. These sessions culminate in a plenary, where participants present and discuss their findings, ensuring a collective synthesis of ideas and insights.

Figure 3. Detail photo of one of the thematic tables during the School Day 2022 workshop.

For this paper, we focus specifically on the School Day 2022 as it offers a unique vantage point. The 2022 edition provides the opportunity to analyse its follow-up impacts over three subsequent years, a timeframe that allows us to evaluate the sustained influence of the initiatives proposed during the event. Subsequent editions, while valuable, do not yet offer a comparable longitudinal perspective. The theme for the School Day 2022, **"Innovating the Formats and Contents of Design Didactics at the School of Design,"** sought to address urgent questions about how design education could evolve to remain relevant in a rapidly changing world. The workshops were divided into two macro groups:

1. **Future Didactics**: Six tables focused on reimagining teaching methods, tools, and environments to align with contemporary needs.
2. **Future Curricula**: Six tables dedicated to envisioning innovative curriculum structures and pedagogical strategies.

The event attracted **140 participants**, representing diverse perspectives:

Table 1. Number of participants in the School Day 2022

Participants	N.

Teachers	Structured teachers, researchers, and contract teachers (a portion of these participants were professionals from outside the academic sphere).	121
Students	Student representatives and doctoral candidates.	7
Administrative & Technical Staff	Technicians, administrators, laboratory managers, librarians, and other key personnel involved in academic and operational functions.	12

4.2 Co-design activities and tools

The process was structured into thematic workshops centered around two main topics: **"Future Didactics"** and **"Future Curricula"**. Each topic was further divided into smaller tables, each assigned specific goals and equipped with tailored tools and protocols to guide the discussions.

Figure 4. Photo of one of the thematic tables during the School Day 2022 workshop.

The workshops were based on clear agendas and narratives designed to engage participants creatively while maintaining focus on the objectives. The key goals were to:

- Support collective awareness of the directions being explored by the School of Design.
- Facilitate the creation of implementation scenarios for innovative educational formats and content.

- Encourage the exchange of experiences among participants to enrich the design process.

The activities relied on a combination of structured methodologies and creative exercises to achieve these outcomes.

- **The "Future Didactics" Workshop**

Figure 5. Templates created ad hoc and used for the brainstorming session and discussion within the thematic tables on Future Didactics at School Day 2022.

- **Narrative Approach**: Participants were welcomed into "The Kitchen of Design Education," where they were metaphorically tasked with creating "recipes" for new formats of design education. This playful metaphor provided a creative entry point into discussions.
- **Activity Flow**:
  - Icebreaking and introductions to establish a collaborative atmosphere.
  - Reviewing foundational materials, including "ingredient cards" (Fig. 5) describing key components of teaching methodologies (e.g., flexibility, interactivity, inclusivity).
  - Supporting participants to draft specific "recipes" for teaching methods.

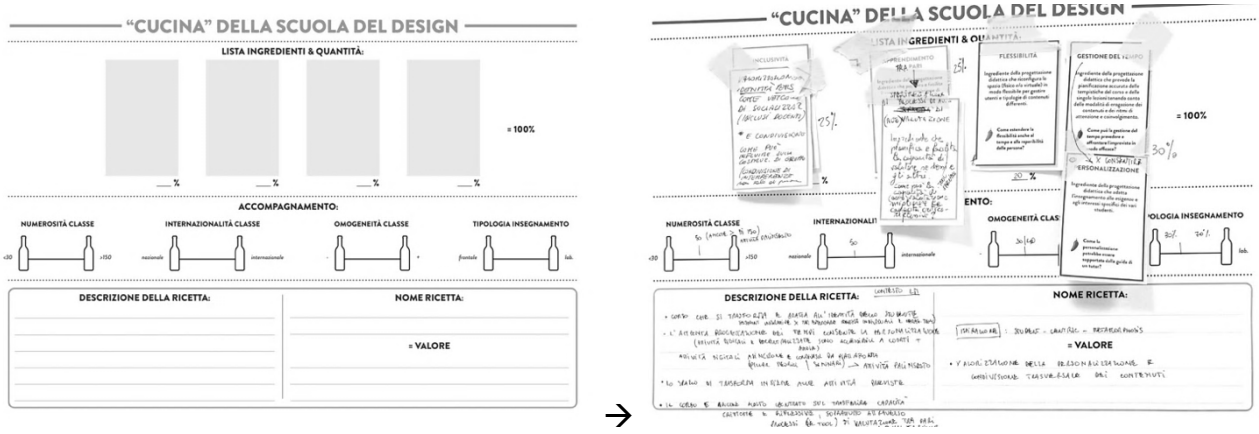

Figure 6. Material and a scan of a completed template at the end of the workshop for the thematic tables on Future Didactics at School Day 2022.

- **Outcome**: Each table produced one or two well-defined proposals for implementing future didactic approaches. These included specifying key "ingredients," their proportional use, and the added value of their combination (Fig 6).

- **The "Future Curricula" Workshop**

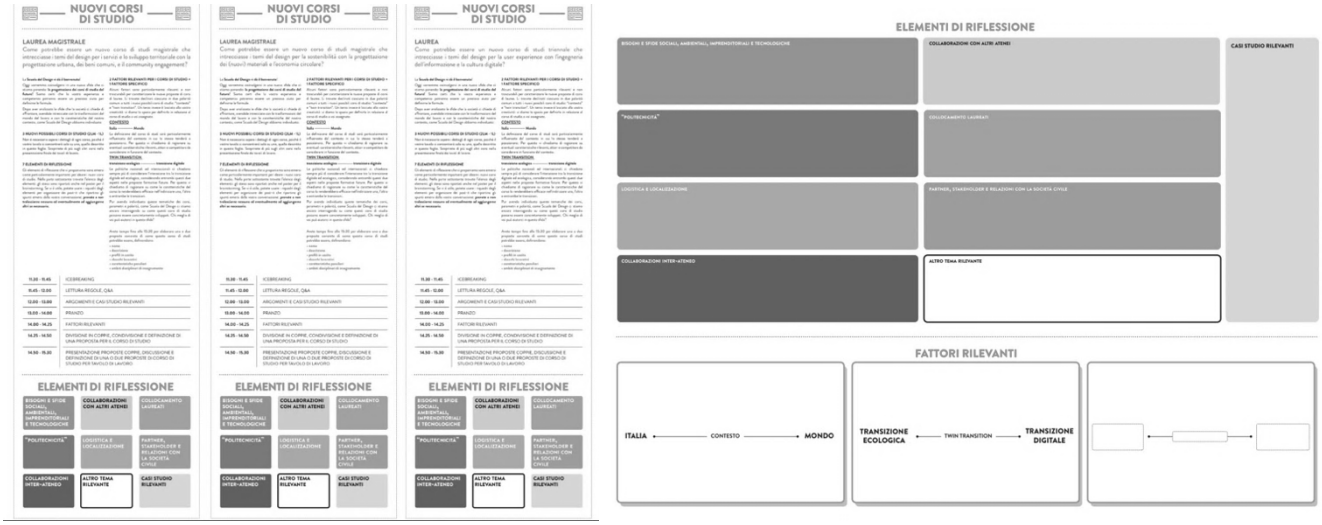

Figure 7. Templates created ad hoc and used for the brainstorming session and discussion within the thematic tables on Future Curricula at School Day 2022.

- **Guided Brainstorming**: The activity started with an open discussion to gather ideas about emerging educational trends and societal needs.
- **Key Tools**:
  - **Poster Brainstorming Sheets**: Facilitators used these to structure the initial discussions, focusing on key themes like ecological and digital transitions (Fig 7).
  - **Course Design Templates**: Each group completed templates outlining the proposed course's name, description, outcomes, and potential career paths (Fig 8).

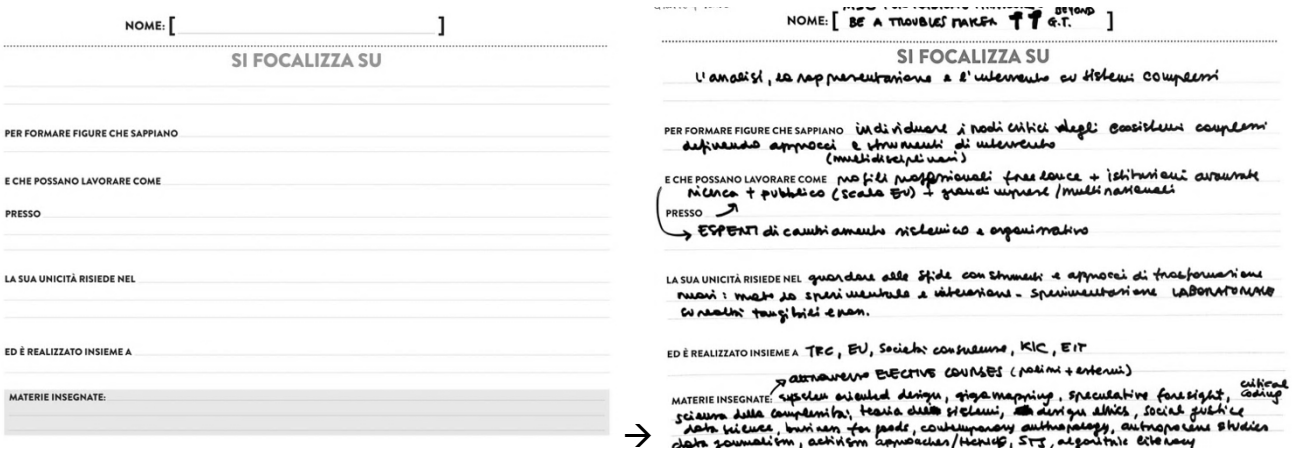

Figure 8. Course Design Template and its scan completed at the end of the workshop for the thematic tables on Future Curricula at School Day 2022.

- **Outcome**: The groups collaboratively finalised one or two course proposals per table, aligning them with the identified educational priorities.

N. Results & Discussion

The findings from the School Day 2022 initiative highlight both the opportunities and challenges of transitioning from an authorship to a curatorship model in design education. By engaging a diverse group of stakeholders—including faculty, students, and administrative staff—this co-design process facilitated a shared reflection on the evolution of didactic methodologies and curricular structures. The results of the initiative reveal key insights into three primary areas: 1) innovative future didactic models, 2) future-oriented curricula, and 3) institutional transformation through participatory processes.

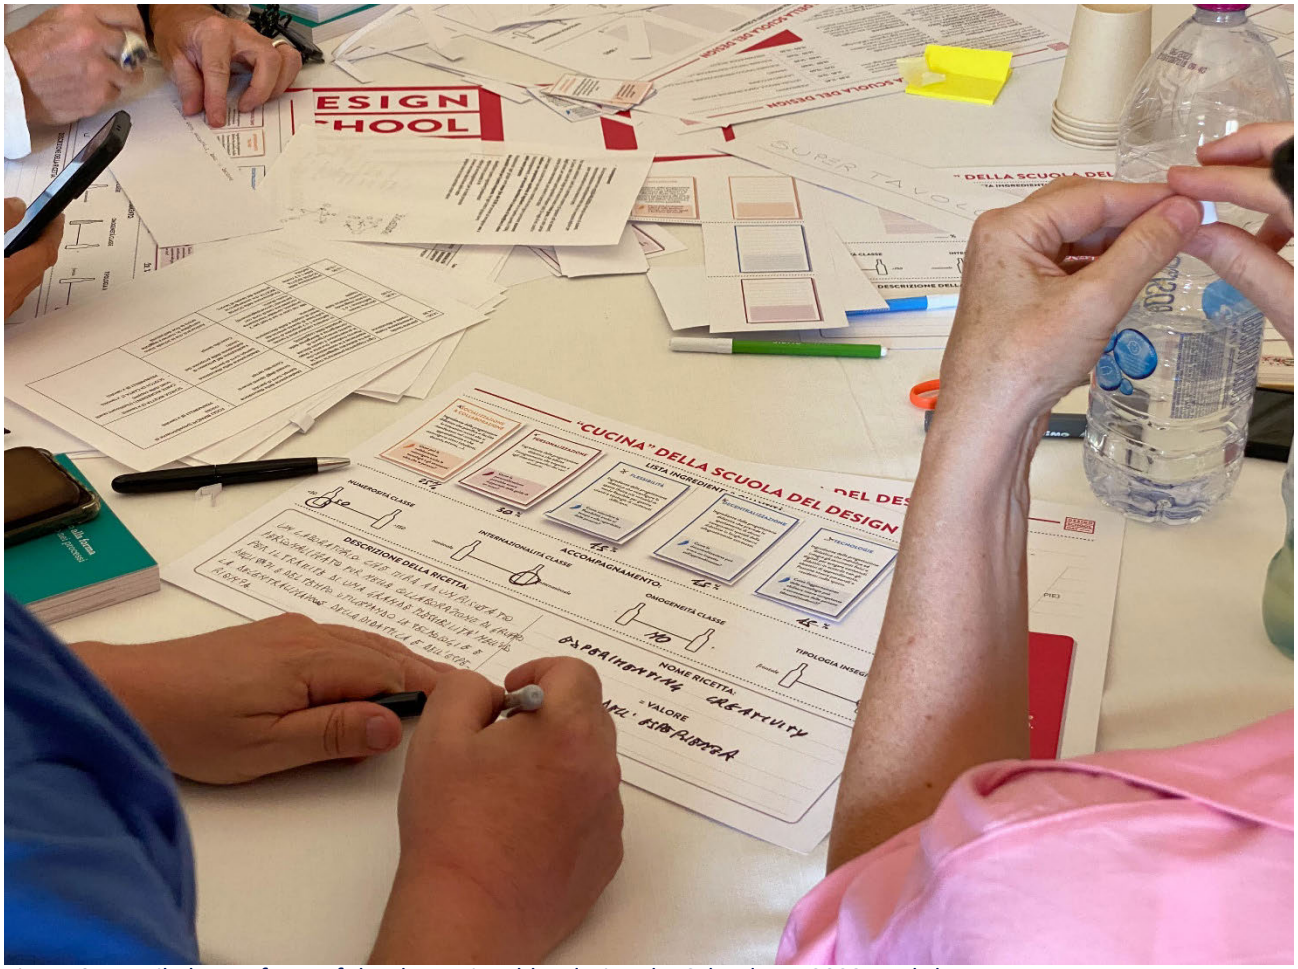

Figure 9. Detail photo of one of the thematic tables during the School Day 2022 workshop.

5.1 Key insights from the "Future Didactics" plenary

The Future Didactics discussions underscored the importance of developing adaptive, inclusive, and experiential learning models that respond to the rapidly changing landscape of higher education (Table 2).

Table 2. Insights emerged from the Future Didactics tables.

Future Didactics	
Key Models/Proposals	**Key Features**
Presence-Based Models (Team 1)	- Small, diverse, and international classrooms. - Peer learning and interdisciplinary collaboration. - Flexible, technology-enhanced labs. - External professional contributions.
High Presence Hybrid Models (Team 2)	- "Student-Centric Metamorphosis": 70% in-person, 30% online. - Personalised learning via shared digital platforms. - "Extended Learning": Decentralised spaces (e.g., museums) for autonomous group work.
Low Presence Models (Team 3)	- “Caponata Blended": Online theory, in-person collaborative sessions. - "Hyper-Cocktail": Decentralised, real-world project-focused learning.
Coordinated Flexibility Models (Team 4)	- "Frutta di Stagione" (Seasonal fruit): Modular, adaptable teaching across academic years. - "Hippocampus": Combines on-campus and off-campus learning using urban resources.
Fully Online Models (Team 5)	- International accessibility and "knowledge addiction" through engaging formats (e.g., podcasts). - On-demand foundational content with collaborative, peer-to-peer learning.
Always Hybrid Models (Team 6)	- "Controlled Hybrid": Precise planning of in-person and online elements. - Personalised, on-demand learning supported by adaptable spaces.

Across the various thematic tables, a common theme emerged: the need for greater flexibility in teaching methods to accommodate different learning preferences and contexts. Presence-based models emphasized the value of small, interdisciplinary, and international classrooms that encourage peer learning, hands-on experiences, and collaboration in technology-enhanced environments. These models highlighted the significance of external professional contributions, reinforcing the idea that learning must extend beyond the academic sphere and into real-world applications. The hybrid models proposed by different teams explored a structured blend of in-person and online learning, with varying degrees of physical engagement. Proposals such as “Student-Centric Metamorphosis” suggested a 70% in-person and 30% online structure, allowing for personalized learning through digital platforms while maintaining strong social and collaborative elements in physical spaces. Similarly, models like “Controlled Hybrid” introduced precise planning of online and in-person components, enabling students to engage in adaptable, self-paced learning while ensuring structured face-to-face interactions. On the other hand, low-

presence and decentralized models pushed the boundaries of distributed learning environments, envisioning education as something that happens beyond the traditional campus. Concepts such as "Caponata Blended" and "Frutta di Stagione" suggested modular, adaptable teaching strategies that leverage urban spaces, museums, and other cultural institutions as sites for decentralized education. Fully online proposals introduced a different perspective, focusing on how digital learning can be restructured to maintain engagement and foster deep learning. A notable example was the "Knowledge Addiction" model, which proposed engaging, on-demand formats such as podcasts and interactive media to create a continuous, self-directed learning experience that extends beyond structured university programs. These findings provide a direct response to our first research question on how participatory and co-design methods can reshape educational models. They illustrate a concrete shift from rigid, top-down approaches to more dynamic, student-centered, and technologically integrated formats. This transformation is not only evident in the new didactic proposals but also in the ways the community was engaged in defining them.

5.2 Key insights from the "Future Curricula" plenary

The Future Curricula plenary discussions revealed how design education must evolve to address contemporary societal, technological, and environmental transformations (Table 3).

Table 3. Insights emerged from the Future Curricula tables.

Future Curricula	
Key Models/Proposals	**Key Ideas**
Digital (Teams 1)	- **Sustainable Digital Design**: Focused on creating ethical professionals capable of designing sustainable digital systems and managing their environmental and social impacts. - **Digital and Interactive Ecosystems**: Trains hybrid professionals integrating technology, design, and social sciences for human-centered digital systems.
Digital (Team 2)	- **Design for Technology-Based Innovation**: A hands-on bachelor program bridging design, coding, and engineering for technological creativity and experimentation.
City (Team 3)	- **FLU (Future, Places, Humanity)**: Blends urban design and community engagement to train strategic and ethical system makers. - **Smart Spaces and Communities Design**: Focuses on systemic design for inclusive, sustainable urban environments leveraging advanced technologies.
City (Team 4)	- **Design for Ecosystems: Communities, Places, and Policies**: Trains designers to mediate complex ecosystems and develop strategic solutions for urban sustainability.

	- **MSC for Radical Thinkers**: Prepares systemic changemakers with tools for analyzing and intervening in complex systems at local and global scales.
Materials (Team 5)	- **Digital Ecological Sustainable Materials**: Focuses on interdisciplinary approaches to sustainable material science and production processes. - **Design for Circular Materiality**: Emphasizes circular economy principles and sustainability in material design. - **Material Sustainability Systems**: Targets system-level innovations linking materials, production, and sustainability.
Materials (Team 6)	- **Materials Design for Sustainable Transition**: Prepares designers to integrate sustainability and material innovation, emphasizing hands-on learning and adaptability to technological and regulatory changes.

Across the thematic tables, participants co-designed new interdisciplinary and systemic educational frameworks, emphasizing the integration of technology, urban innovation, and sustainable material research. The emerging proposals reflected a growing awareness that future curricula must transcend disciplinary boundaries and equip students with holistic, systems-thinking approaches.
One of the dominant themes was the intersection of design and digital innovation, with proposals highlighting the need to integrate sustainability and ethics into digital systems. The Sustainable Digital Design program was conceived as a way to train ethically responsible digital practitioners, focusing on the environmental and social implications of digital infrastructures. Similarly, the Digital & Interactive Ecosystems curriculum aimed to create hybrid professionals who merge design, coding, and social sciences, ensuring that technology remains human-centered and socially responsive. These curricula proposed a stronger focus on AI, data ethics, and systemic digital transformation, reflecting the evolving demands of both industry and society.
Another key area of discussion centered around urban design and systemic thinking, emphasizing the role of designers in shaping sustainable and inclusive cities. The FLU (Future, Places, Humanity) curriculum blended urban planning, community engagement, and systemic innovation, preparing students to become strategic designers capable of addressing complex urban challenges. Meanwhile, the Smart Spaces & Communities Design proposal sought to integrate advanced technologies into urban systems, fostering the creation of digitally augmented, inclusive, and participatory public spaces. Expanding this systemic approach, the Design for Ecosystems program positioned designers as mediators of complex urban networks, helping to shape policy and strategic governance frameworks.
Material sustainability emerged as another pressing concern, with several proposals focusing on circular economy principles and the responsible development of new materials. The Digital Ecological Sustainable Materials curriculum emphasized the interdisciplinary nature of sustainable material science, production processes, and digital fabrication. Similarly, the Design for Circular Materiality program advocated for system-level innovation, encouraging

designers to rethink material flows and ecological impacts. The Materials Design for Sustainable Transition course introduced hands-on, experimental approaches to material research, preparing students for rapidly changing regulatory and technological landscapes.
These discussions collectively reflected a growing recognition that design education must move beyond isolated disciplines and instead embrace a systemic, transdisciplinary approach. By incorporating technology, urban resilience, and material innovation into design curricula, these proposals aligned with the broader goal of equipping future designers with the tools to navigate complex global challenges.

5.3 Summary of Key Findings and Implications

The findings from the School Day 2022, besides the specific outputs related to the topic of "Innovating the Formats and Contents of Design Didactics", reveal how co-design practices can reshape design education through: 1) inclusive and adaptive pedagogies (RQ1), 2) institutional transformation from authorship to curatorship (RQ2), and 3) the activation of shared responsibility within educational communities (RQ3).
The initiative also offers broader implications: it contributes to theoretical discussions on participatory and systemic design in education by supporting a shift from hierarchical to distributed leadership and aligns with the emerging role of educational institutions as relational infrastrucutres; it informs policy by proposing a model for strategic educational planning enabling consensus-building and co-owned visioning; and it supports practice by offering a replicable framework for educational innovation through structured dialogue and community engagement.

6. Conclusions & Future Directions

The School Day initiative has demonstrated how participatory processes can serve as a catalyst for educational transformation, reinforcing the shift from authorship to curatorship within academic institutions. By fostering collaboration, inclusivity, and systemic engagement, this initiative has positioned the School of Design as a facilitator of co-created knowledge, rather than a prescriptive authority. Through structured participation sessions, the initiative enabled stakeholders—including faculty, students, and administrative staff—to collectively reflect on educational challenges and develop strategic proposals for curriculum innovation. This engagement can be seen as beneficial non only for the creation of knowledge, but aso as precondition for the motivated participation in the transformation of the institution through the implementation of the co-designed actions.

Beyond the specific results achieved, one of the most valuable and enduring aspects of the School Day initiative is the way it has evolved into a recurring institutional practice. Each year, the School of Design convenes this important annual appointment, where emerging themes from previous editions become starting points for new discussions, reflections, and co-design processes.

This iterative approach has created a dynamic mechanism for continuous adaptation and institutional learning, ensuring that the voices of faculty, students, and staff remain integral to shaping educational strategies. This ongoing cycle of participatory dialogue and knowledge-building reinforces the School Day's role as more than just a singular event, but rather as a systemic tool for institutional evolution. It has become a structured opportunity to realign academic priorities, critically reassess past outcomes, and formulate new trajectories based on the collective intelligence of the School's community. While the most tangible and concrete results—such as curriculum reforms and new academic programs—are illustrated in Section 6.1, the broader impact of the initiative lies in its ability to sustain an open, evolving conversation about the future of design education.

6.1 Follow-up actions

One of the most significant outcomes of the School Day initiative has been its long-term impact on institutional decision-making. Among the various results is the launch of the new undergraduate program in Interaction Design (offered in English), which was directly influenced by discussions that emerged from the School Day 2022 edition. This new program represents a strategic move towards internationalization and interdisciplinary learning, reinforcing the School's commitment to expanding its global reach and adapting to evolving industry needs.

Beyond curriculum development, the School Day discussions also contributed to spatial and infrastructural transformations within the university. The creation of a new open design lab on Level -1 of Building B2 exemplifies how participatory methodologies can extend beyond educational formats to shape learning environments themselves. This dedicated space was conceived as a collaborative hub for interdisciplinary experimentation, fostering hands-on learning and participatory design research. Such infrastructural developments reflect a broader institutional shift towards flexible, student-centered learning spaces that align with the principles of systemic and relational design.

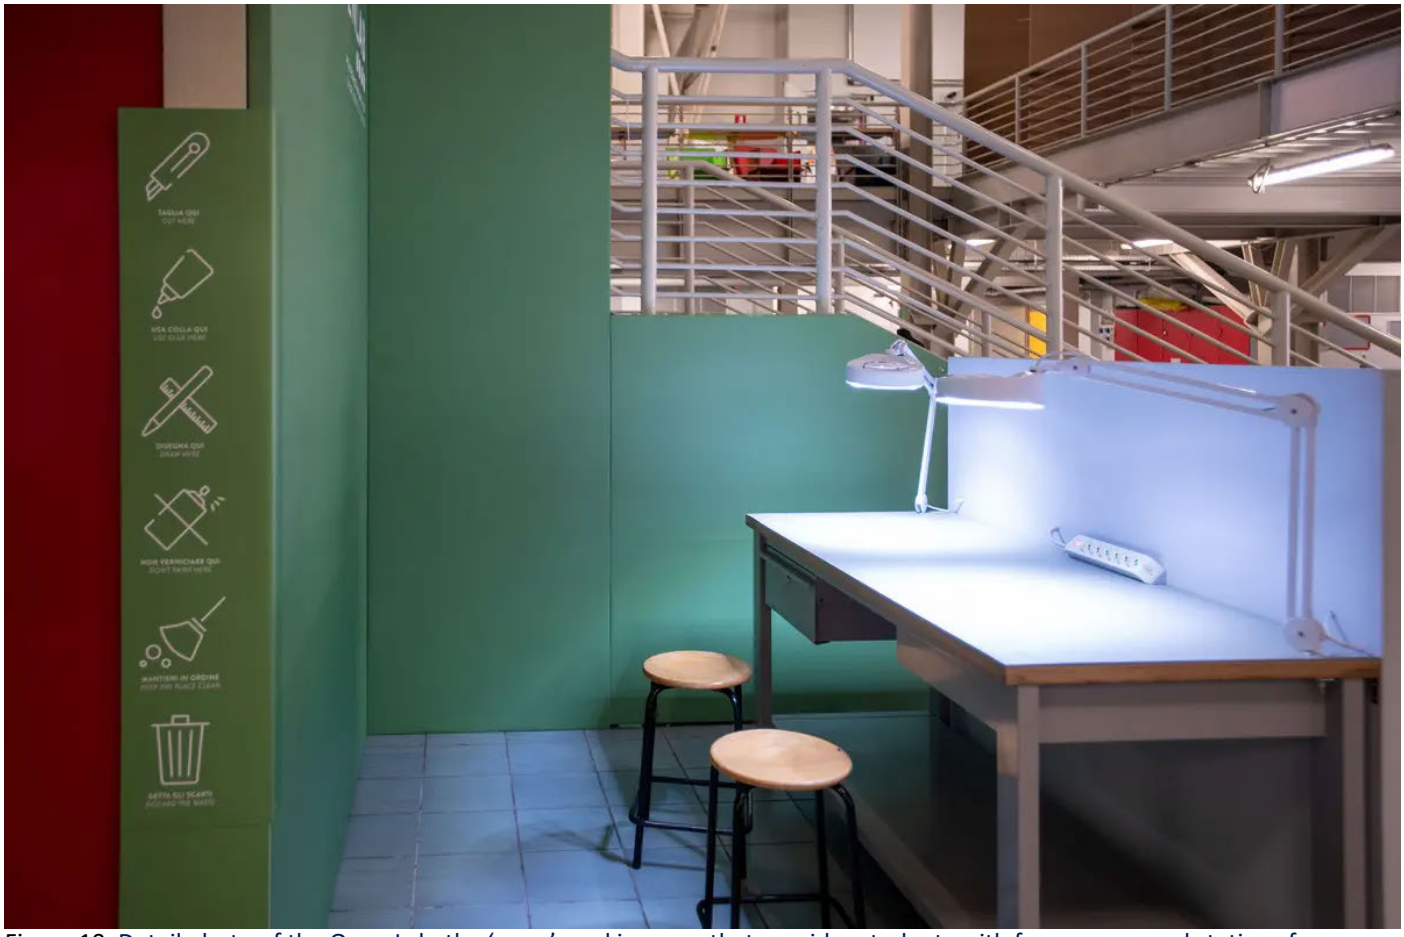

Figure 10. Detail photo of the Open Lab, the 'open' working area that provides students with free-access workstations for autonomous work.

Additionally, the School Day initiative has influenced institutional networks and international collaborations. One notable outcome has been the establishment of the Cumulus Working Group on Placemaking, an initiative that aligns with the School's growing focus on urban and systemic design approaches. Furthermore, discussions emerging from the initiative have contributed to the intention to launch a master's program in Design for Placemaking, as well as to further developments in the Master in Materials and Sustainability. These initiatives, however, require a long-term strategic investment and will likely take more than five years to fully develop and implement.
Finally, one year after the School Day 2022, the School of Design formalized and shared the "Compendium of Evolved Teaching Formats", consolidating the innovative didactic models discussed during the event. This document serves as a guideline for evolving educational methodologies, ensuring that the principles of flexibility, interdisciplinarity, and student engagement remain central to the School's pedagogical vision.

6.2 Limitations

While the School Day model has proven successful, several challenges remain in assessing its long-term impact. One of the primary limitations is the lack of a formalized impact evaluation framework that systematically tracks how co-design discussions translate into concrete institutional changes over time. Future research should develop methods to assess the effectiveness of participatory

design in shaping curricula and policy, ensuring that stakeholder engagement leads to measurable improvements in teaching quality, student experience, and institutional strategy.
Another challenge lies in the cross-disciplinary transferability of the School Day model. While the initiative has been highly effective within the design education framework, further exploration is needed to determine how co-design approaches can be adapted to other disciplines and institutional contexts. Research on participatory governance in higher education could provide valuable insights into how similar models could be integrated across faculties and universities, fostering a more inclusive and systemic approach to academic innovation.

The School Day initiative exemplifies a transformative approach to educational governance, marking a shift towards a more dynamic, co-created learning ecosystem. By embedding participatory design within academic decision-making, institutions can ensure that curricula remain responsive, adaptable, and reflective of contemporary societal needs. While challenges remain—particularly in terms of impact evaluation, scalability, and institutional integration—the initiative has laid the foundation for a more engaged, collaborative, and forward-thinking educational model.

About the Authors:

Silvia D'Ambrosio, PhD, is a Postdoctoral Research Fellow at Politecnico di Milano. Her research focuses on Systemic Design and Design for Relationships. She facilitates creative, design-driven processes engaging academia, industry, and civil society across local and international contexts.

Andrea Manciaracina PhD in Design and researcher at the Design Department of the Politecnico di Milano. His research focuses on the relationship between visual communication, spaces, and services to implement social innovation-oriented strategies and promote human interaction in spaces.

Francesca Mattioli, PhD, her research focuses on collaborative practices in design education and how to support intercultural competencies development. She is also studying the potential of project-based learning in design for sustainability education.

Anna Meroni, PhD, is Full Professor of Design and Deputy Dean of the School of Design at Politecnico di Milano. She is among the founders of the Polimi DESIS Lab and of the DESIS Association, Design for Social Innovation and Sustainability.

Francesco Zurlo, PhD, Dean of the School of Design at Politecnico di Milano. He is a full professor and expert in strategic design research, focusing on business innovation, human flourishing, and systemic design for transformative impact.

Acknowledgements: We wish to thank all the teachers, students, administrative and technical staff who actively contributed to the School Day initiative with their presence, ideas, and engagement. Special thanks to the design and research team for curating the activities and to Villa Arconati for hosting the event and providing a unique setting for collaborative reflection.

CONFRONTING THE LEGACY OF SLAVERY AT THE UNIVERSITY OF THE SOUTH: AN EMPATHY-BASED, STUDENT-ENGAGED COLLABORATIVE APPROACH.

Battaglia, Laura

ABSTRACT | The legacy of slavery continues to shape the relationship between Southern universities and neighboring African American communities. Institutions like Sewanee (the University of the South), re-established after the Civil War, were largely funded by Confederate slave holders to perpetuate, "...represent, protect, and promote the South's civilization of bondage; and launched expressly for the slaveholding society of the South" (Sewanee, 2024). This historical foundation has contributed to the marginalization of Black citizens who have "...lived and worked in the university community, built the town of Sewanee, and shaped its history" (Roberson Project, 2024).

In response, a multi-phase, cross-university initiative seeks to reconcile this history through a student-engaged memorial design project. By fostering empathy through art and design, the project encourages students to explore the complex relationships between the designer and the user, aspiring to create a memorial that honors the community's experiences and aspirations.

Architect Elgin Cleckley and others emphasize the role in design education, suggesting that empathic designers must view their work as a dialogue, saying, "we see you" and "we hear you" (Cleckley, 2024). Empathy, like other design skills, can be taught, with shared experiences and active listening recognized as crucial in projects rooted in community engagement.

This ongoing study examines the application of empathic design pedagogy across three academic semesters, incorporating reflective writing, archival research, listening sessions, interpretive mapping, shared experiences, and design/build interventions. The journey begins with a remote, community-oriented design studio, followed by a summer travel studio that immerses students in the neighborhood, providing hands-on experience and a deeper understanding of the community's historical and emotional landscape. The project is currently in the final design phase through collaborative work

between students from multiple universities, involving intermittent visits to the community.

Initial feedback from students and community members suggests positive outcomes, while also identifying opportunities for growth. Notably, trust-building exercises evolved from remote classroom interactions to direct community engagement during the intensive summer design/build session, highlighting the transformative potential of shared experiences in fostering ethical design. Additional reflections from both students and community members underscore the need for ongoing dialogue and adaptation, reinforcing empathy as a vital component of the design process. Ultimately, this project advocates for a sustained, reciprocal relationship between students and the communities they serve, deepening connections and enhancing the integrity of the design process.

1. Introduction

Many U.S. universities are beginning to confront their histories of slavery by expanding narratives of colonization, particularly in the American South. A central component of these efforts often includes the construction of a physical memorial—a space intended for healing, reflection, and acknowledgment by descendant communities, university populations, and the broader public. At institutions like the University of Virginia, where the Memorial to Enslaved Laborers was recently completed, such sites foster dialogue and historical recognition. However, these projects are typically executed by professional design firms, with student involvement confined to early research phases. This structure limits opportunities for students to engage in the full arc of care-centered design.

In contrast, the *Sewanee Praises* project presents a new model. Designed entirely by students in close collaboration with the historically Black St. Mark's community in Sewanee, Tennessee, the project embodies a care-based approach to restorative justice and historical reckoning. Rooted in the ongoing reconciliation process at the University of the South, *Sewanee Praises* is described as an "incubator of innovative teaching and research tools" (Roberson Project, 2025). The initiative brings together students and faculty from the University of the South (Sewanee), Virginia Commonwealth University (VCU), and Virginia Tech (VT) to honor the Black citizens of St. Marks who "lived and worked in the university community, built the town of Sewanee, and shaped its history" (Roberson Project, 2024).

While community-based and service-learning projects often offer students valuable real-world experience—especially in client engagement—*Sewanee Praises* was far more than a conventional academic exercise. It served as a platform for revealing the buried history of St. Mark's and confronting the enduring legacies of institutional slavery on university grounds.

Ethically, the process began with deep listening to the individual stories of St. Mark's residents, guided by empathy rather than prescription. The pedagogy privileged inquiry over resolution—seeking instead of determining, asking instead of asserting. This approach cultivated a design process open to discovery and experimentation, free of assumptions about what the memorial should be. By embracing vulnerability, students and faculty worked to unravel the complex and often painful relationship between the community and the university, ensuring the final design was shaped by the aspirations and lived experiences of St. Mark's residents.

Importantly, the relationship between the student designers and university leadership was supportive but deliberately distanced. As DiSalvo (2022) argues, detaching design work from dominant forms of institutional governance—and from the instrumentalism and functionalism characteristic of professional practice—can allow designers to remain attuned to the needs and narratives of the communities they serve. In that spirit, *Sewanee Praises* operated independently of formal university oversight, enabling the academic team to center the voices of their community partners fully and without compromise.

2. Empathy as a design tool

2.1. A brief history

Empathy s a longstanding and multifaceted concept, with definitions that vary across disciplines and contexts. Empathy can be traced back to Ancient Greek philosophy, where Aristotle touched on its aspects in *Nicomachean Ethics*. In the late 19th and early 20th centuries, German philosophers Robert Vischer (1873) and Theodor Lipps (1903, 1906) expanded the concept through the idea of *Einfühlung*, or "in-feeling," which emphasized an emotional resonance with others' experiences. However, it was not until the early 21st century that empathy was explicitly theorized as a design strategy in product and industrial design.

The term "empathic design" was popularized by Leonard and Rayport (1997), who argued that understanding users' emotional and sensory experiences could spark innovation and lead to

more human-centered solutions. In their article *Spark Innovation Through Empathic Design*, they introduced a five-stage methodology: Observation, Capturing Data, Reflection & Analysis, Brainstorming Solutions, and Developing Prototypes. While this approach marked a significant paradigm shift within design disciplines, its application has been largely confined to consumer products and market-driven outcomes. This raises a critical question: How can empathy be meaningfully integrated into the design of public spaces dedicated to healing, remembrance, and reconciliation?

Research in inclusive design methods offers promising pathways. Co-design—originating in Swedish trade union systems design—and participatory design prioritize the active engagement of users in shaping outcomes. Similarly, Human-Centered Design, widely promoted by IDEO, places empathy at the core of understanding and authentically reflecting users lived experiences (Koskinen et al., 2014).

Complementing these methodological frameworks are phenomenological perspectives that explore the embodied and emotional dimensions of space. Heidegger's hermeneutics (*Being and Time*, 1967) and Juhani Pallasmaa's *Empathic and Embodied Imagination* (2015) offer deeper insights into how humans perceive and experience environments through all the senses, suggesting that empathetic engagement with place is both intuitive and interpretive.

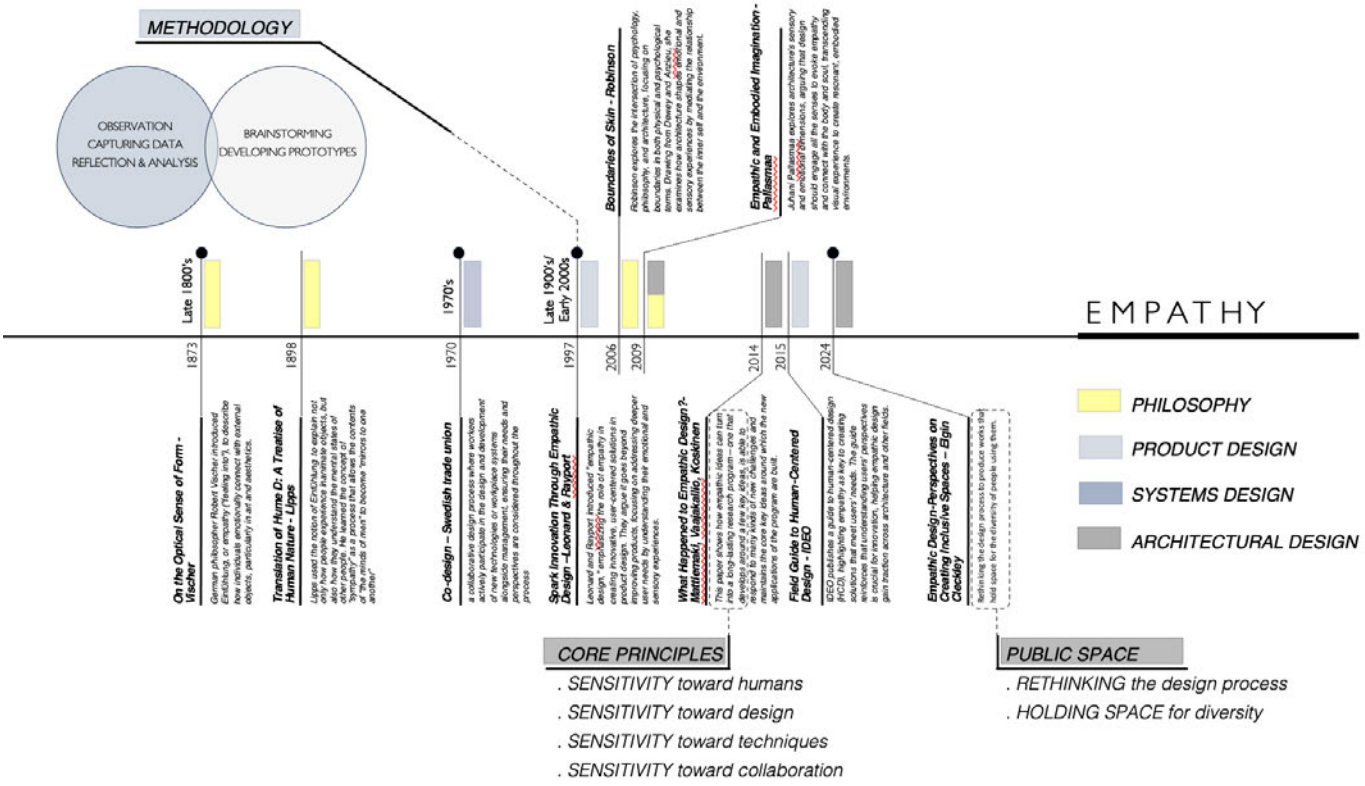

Figure 1. Excerpt from Empathy Timeline, Battaglia Laura, 2025

2.2. An empathic approach for care designers

Designing memorials for historically marginalized communities presents significant challenges for those who are outside those communities. Empathic design offers a pathway to bridge this gap by emphasizing a shared commitment to care—what Tronto (2020) describes as "caring

with" and Lamberty (2012) frames as "accompaniment." Jane Fulton Suri (2003) similarly argues that making sense of unfamiliar experiences requires intentional learning and identification with others. Educator Elgin Cleckley extends this perspective, emphasizing that empathic designers must embrace an "...iterative, evolving process that communicates 'we see you' and 'we hear you' (Cleckley, 2024)."

Equally important to the final memorial design is the process of cultivating empathy within the classroom—this is the central focus of the *Sewanee Praises* initiative. Drawing on methodologies from product design research and participatory design, this work shifts the emphasis away from consumer-driven outcomes toward a deeper engagement with people and place. In working closely with the St. Mark's community in Sewanee, Tennessee, the project seeks to understand their values, history, and lived experiences. At the same time, it fosters a heightened sensitivity among design students—a sensitivity that, as described by Koskinen, Mattelmäki, and Vaajakallio (2014), encompasses attentiveness to people, to the design process, to tools and methods, and to collaborative relationships. These dimensions of sensitivity are used below to categorize the various aspects of the *Sewanee Praises* project.

3. Applications

3.1 Sensitivity toward community partners

The project began in a sophomore interior design studio in the spring of 2024, where students engaged with the St. Mark's community through foundational exercises:

- Establish communication between students and community members.
- Prioritize relationship-building before conceptualizing memorial designs.

One of the primary challenges was the 600-mile distance between the university and Sewanee, Tennessee. To foster long-distance relationships, the team adopted a contemporary take on the tradition of pen-palling—combining Zoom and email with handwritten letters to add a personal, tactile dimension. Each student was paired with a community member, allowing for both group discussions and intimate, one-on-one conversations that encouraged deeper storytelling and connection.

Throughout these exchanges, students remained actively engaged in the act of "making." They created postcard-sized graphic responses and three-dimensional interpretive collages that served as both reflective tools and visual offerings. These early design gestures allowed students to develop a nuanced, sensitive understanding of their partners before beginning the memorial design work. At the same time, they offered community members a tangible sense of involvement—participating in a process that materialized their stories and sentiments into meaningful artifacts.

Figure 2. Sophomore interior design studio interpretive tiles and final design: Tile 1-Lily Corbin . Tile 2 *Fragments*-Elena Curtusan . Tile 3 *Roots*-Camila Rosenbrock

The spirit of engagement deepened during a VCU summer design-build fieldwork studio, in which students traveled to Sewanee for direct collaboration. The studio emphasized empathic design principles and pre-design inquiry, continuing the spring semester's emphasis on listening, reflection, and relationship-building.

The summer studio included shared meals, storytelling sessions, and participation in beloved community traditions. The Memorial Day picnic—a cherished event at the center of the St. Mark's neighborhood—became a touchstone for collective memory and joy. Students and community members bonded over music, dancing, karaoke, and a lively Soul Train line—each a moment of connection that transcended typical academic frameworks.

The studio culminated in the creation of a physical sculpture marking the future memorial site, a piece shaped by the relationships and experiences formed during the week. For many, it marked a turning point. As one community member shared, "It was the first time the memorial felt like a real possibility" (S. Taylor, personal communication, Jan. 20, 2025).

Figure 2. Summer intensive design + build interior design studio at Sewanee University and St. Mark's Neighborhood

3.2 Sensitivity toward design

Students who participated in both the sophomore studio and the summer intensive served as essential links across design phases. Through both remote and in-person engagement, they developed a deep appreciation for the empathic design process—an understanding they carried forward into the fall semester and shared with a new cohort of students. These returning students recognized that personal relationships with community partners were

fundamental to memorial design; they affirmed that meaningful design could not emerge without first listening to and reflecting on the stories of those being honored.

Drawing from Pallasmaa's phenomenological perspective, students found that visiting the site in person was invaluable for cultivating sensitivity toward the spirit of place in their designs. While early digital correspondence and letter writing revealed the community's reverence for the natural landscape, it wasn't until students physically walked through the densely forested terrain of the neighborhood and stood on the edge of the Cumberland Plateau that they fully grasped the emotional weight of those sentiments. This immersive, sensory experience fostered a heightened sensitivity to materials, sound, light, and color that would later inform their design decisions.

Site visits also provided critical opportunities for experiential learning. Students participated in campus and neighborhood tours, which included Confederate monuments on campus and the dual cemeteries—White and Black—connected by the newly constructed Heritage Trail. These experiences deepened students' understanding of the university's entangled histories and its relationship with the St. Mark's community.

It is perhaps no surprise that the stained-glass windows in the university's Episcopal Church later inspired the memorial's design—reimagined not as a passive reflection of institutional legacy, but as a new, vibrant form meant to lift and amplify the voices of the St. Mark's community.

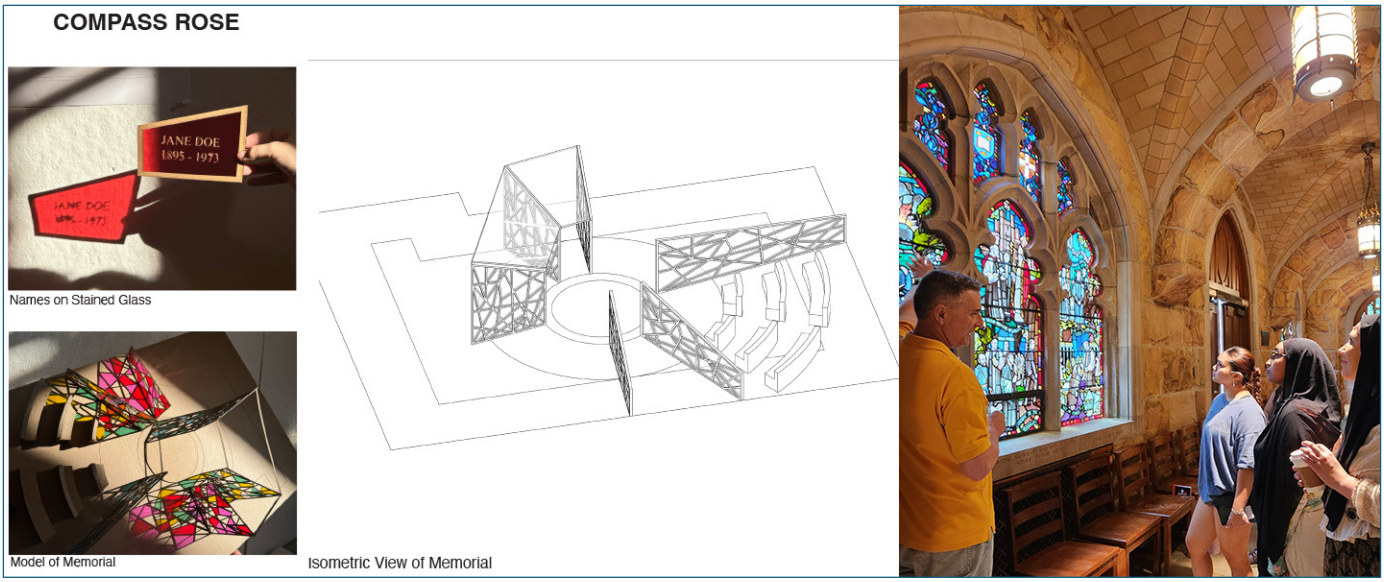

Figure 3. Senior interior design studio concept design: Eiman Rasheed, Sophie Myers, Stasia Torres-Lara . tour of Episcopal Church

3.3 Sensitivity toward techniques

Many academic design studios emphasize students' artistic autonomy and the development of fundamental formal design skills. In contrast, community-based projects require young designers to engage directly with others—through research, dialogue, and relationship-building—fostering empathy, trust, and a deeper sense of responsibility.

The final memorial design for the St. Mark's community emerged during the fall 2024 semester. Its success depended not only on design skill, but also on the ability to translate and embody the community's ethos within the final concept. Following months of collaboration with the St. Mark's community, a new cohort of students from Virginia Commonwealth University (VCU) and Virginia Tech (VT) was tasked with advancing the project. To prepare this group, it was essential to transfer the accumulated knowledge, experiences, and community sentiments from previous phases.

Pecha-Kucha style presentations were made the first week of class, using Zoom to connect VCU, VT and Sewanee University. Previous participants, including students and professors alike, shared deeply personal reflections and lessons learned, highlighting the important aspects of the site, significant community stories, and personal reflections.

VCU students who had previously participated in the spring studio and summer design-build intensive played a key role in guiding the new cohort. Beyond the formal presentations, they contributed to studio visits and participated in design critiques, adding depth, nuance, and continuity to the design process. Their engagement lent credibility to the work and helped ensure that the community's voice remained central.

The fall curriculum was intentionally structured to support this continuity and reinforce the collective commitment to honoring the legacy of St. Mark's. Key strategies included:

1. Establishing Shared Expectations – Upholding high standards for design excellence, empathy and critical inquiry.
2. Cross-University Collaboration – Encouraging interdisciplinary teamwork between VCU and VT students.
3. Studio Exchanges – Facilitating in-person visits that deepen relationships and enriched design discourse.
4. Skill-Based Teaming – Structuring assignments to leverage individual strengths and areas of expertise.
5. Virtual Collaboration – Using platforms like Zoom and Discord to maintain consistent engagement despite geographic separation.

Together, these efforts fostered a learning environment grounded in reciprocity, shared experience, and collective responsibility—ensuring that the final memorial design was both thoughtfully conceived and deeply rooted in community values.

3.4 Sensitivity toward collaboration with community

The final semester served as a powerful experiment in cross-institutional and community collaboration among students and faculty from Virginia Commonwealth University (VCU), the University of the South (Sewanee), and Virginia Tech (VT). As in previous semesters, the studio was anchored by Zoom conversations and in-person visits to the St. Mark's community—one early in the term, and another at its conclusion.

The first in-person visit featured a design charrette, intentionally structured to foster hands-on,

equitable participation. Long, narrow tables covered with rolls of drawing paper were arranged to encourage collective sketching, dialogue, and shared making. Students and community members worked side by side, blurring the boundaries between designer and client. At the end of the session, students facilitated a group reflection to capture emerging ideas and begin forming a shared vision. Throughout the room, drawings and models from prior semesters were displayed—not as static artifacts, but as living documents of an evolving process that continued to honor earlier contributions.

A transformative moment came mid-semester, when St. Mark's community members visited VCU in Richmond, Virginia and VT in Blacksburg. This reciprocal gesture was deeply meaningful. It allowed community members to experience students in their academic contexts and, in many cases, reshaped assumptions about the nature of design education and practice. Just as students had been welcomed into the daily life of Sewanee, this visit offered community members a window into the learning environments where their stories were being honored and interpreted.

Figure 2. Summer intensive design + build interior design studio at Sewanee University and St. Mark's Neighborhood

This exchange underscored the critical importance of presence—both physical and emotional—in building trust and sustaining meaningful collaboration. It reflected an ethic of reciprocity: the understanding that showing up, being seen, and engaging across spaces of difference are themselves acts of care and commitment.

3.5 Sensitivity toward collaboration with each other

Developing and refining a final memorial design with 21 students across multiple universities required a deliberate and highly coordinated approach. Project teams were strategically diversified to explore the memorial from multiple angles—ranging from architectural and landscape design to broader master planning, interpretive programming, and memorialization strategies.

Students were challenged to set aside individual design ambitions in service of a shared vision, working collaboratively toward goals defined through ongoing dialogue with the St. Mark's community. The process emphasized collective authorship, with community priorities consistently guiding decision-making and creative direction.

Figure 4. Final Memorial Design produced by students from VCU Interior Design + VT Architecture

4. Conclusions

4.1. Modes of Communication

Letter writing fostered vulnerability and meaningful connection between students and community members, offering a slower, more reflective form of dialogue. Community partner Evelyn Patton described it as a return to the "lost art" of letter writing (E. Patton, personal communication, Jan. 20, 2025), while student Elena Curtusan remarked that it encouraged a level of openness not easily achieved through other media.

In contrast, Zoom often proved limiting—technological difficulties and the formality of the platform created barriers to authentic exchange. The shift to pre-recorded video presentations enhanced engagement, allowing participants to communicate more thoughtfully and on their own terms. Ultimately, the process underscored the importance of persistence, creativity, and adaptability in fostering meaningful relationships across distance.

4.2 Empathic Design Techniques

Abstract and interpretive projects deeply resonated with the St. Mark's community, particularly due to the in-person engagement that took place during the summer. These face-to-face interactions enriched dialogue and reinforced the significance of the students' work. Community member Shirley Taylor praised the interpretive collages, noting that they demonstrated students' deep listening and sensitivity: "They helped [the community] to see a vision" (S. Taylor, personal communication, Jan. 20, 2025).

Studio techniques used throughout the spring and summer phases are regarded as especially effective in conveying emotion and complexity. Evelyn Patton remarked that the abstraction allowed her to grasp the expressive nature of the projects, remarking that they "unveiled all the different layers of the overall project" and conveyed emotion in ways that felt authentic (E. Patton, personal communication, Jan. 20, 2025).

From the students' perspective, survey responses revealed a shift in design thinking. One student wrote, "I learned to design from a different perspective and not project my personal vision on a design that will represent others" (Student Survey, 2024). These reflections highlight how abstract forms—when grounded in empathic engagement—can serve as powerful tools for fostering understanding and trust within communities.

4.3 The Importance of Presence

Physical presence in Sewanee proved transformative for both students and community members, fostering trust, deeper understanding, and providing a necessary space for difficult yet meaningful conversations. Students consistently reported that in-person engagement—particularly during the summer studio and fall studio visits—was invaluable. Much of their design inspiration originated from direct encounters with the community and the land itself.

Given the St. Mark's residents' profound connection to Sewanee as a place, students were able to gain a more nuanced understanding through immersion in that environment. As Yelenna Angeles reflected:

> "Touring the university and visiting the landmarks that surround it made it easy to visualize the stories that the community members shared with us. I was able to gain a better understanding of what life is like in Sewanee. This environment ended up playing a huge role in my design".

Similarly, Lily Corbin, a sophomore who had previously worked with a community partner remotely, echoed this sentiment:

> "Meeting her in person made it feel real," she wrote in her final reflection. Corbin noted that in-person meetings felt more natural than Zoom calls, adding that face-to-face interaction gave her partner "space to open up" and reassured her that "the students are engaged and listening."

Members of the St. Mark's community shared this sense of connection, particularly with the students who participated in the summer studio. Their curiosity and awe toward Sewanee's natural beauty often sparked nostalgic memories. Shirley Taylor remarked that it reminded some community members of their own childhood: "...when they were young" (S. Taylor, personal communication, Jan. 20, 2025").

Furthermore, physical presence also created a safe context for vulnerability and honest dialogue. One of the most difficult but necessary topics raised was slavery—a heavy and complex subject, particularly for students early in their design education. Some students initially questioned the appropriateness of engaging with such a profound theme or expressed concern about potentially causing harm through their interpretations.

However, these tensions began to dissipate during the summer's initial community storytelling event. What began as an awkward, formal gathering around a table gradually shifted into

smaller, more personal one-on-one conversations. As comfort increased, the group reconvened to share insights, creating a cycle of exchange that fostered trust. This moment became a critical turning point, allowing conversations about race, slavery, and memory to unfold with honesty and openness. The St. Mark's Community Center - long regarded as a space of safety and togetherness – was instrumental in supporting this exchange.

Ultimately, Sewanee Praises demonstrates how empathy - rooted in physical presence and active listening - can fundamentally shape both design education and the processes of memorialization. The project demonstrates how the integration of research, storytelling, and making can facilitate historical reckoning while nurturing community healing.

4.4 Personal Conclusions

I am immensely proud of the students who participated in this project. The sophomore cohort, who enrolled without prior awareness of the studio's distinctive nature, frequently encountered challenges and moments of frustration. Community-based design projects, particularly those grounded in real-world contexts, are inherently complex and often unpredictable. Although this complexity provided a rich learning opportunity, some students appeared insufficiently prepared for the multifaceted demands involved. This gap underscores the need for clearer communication regarding the studio's content and expectations prior to enrollment, thereby ensuring participation by individuals genuinely committed to the project's objectives.

The sensitive themes of reconciliation and remembrance imposed additional emotional and intellectual pressures on students, who often felt a profound responsibility to "do right by the community." In instances where communication faltered, students tended to attribute fault to the instructors, expressing frustration that was frequently rooted in a desire to identify a singular "correct" solution rather than embracing the iterative and emergent nature of the design process. From my perspective, the conceptual work functioned as a crucial intermediary, providing the community with tangible proposals that elicited valuable feedback. Indeed, insights gained from community critiques—both positive and negative—were equally instructive.

With enhanced preparatory measures at the outset, coupled with a more robust commitment to formal race-based training, I contend that engagement with this topic is entirely appropriate for design students. Existing scholarship from other institutions indicates that student participation can serve as a potential catalyst in processes of reconciliation and remembrance, particularly in the context of memorial projects.

Ultimately, physical presence proved indispensable. The students who traveled to Sewanee experienced profound personal and educational growth, and I sincerely hope that the project outcomes have had an equally meaningful impact on the community.

4.5 Next Steps

As the project enters its fundraising phase, the team remains hopeful that the university will view it not through the lens of politically charged agendas, but as one grounded in the politics

of care. In today's polarized and fear-driven political climate in the United States, an ethics-based approach—rooted in empathy, accountability, and relational trust—may seem radical. However, it is becoming increasingly vital for initiatives focused on reconciliation, remembrance, and collective healing.

About the Authors:

Author: Laura Battaglia, Assistant Professor at Virginia Commonwealth University, brings over 25 years of design experience to her teaching. Her research focuses on the ethics of affordable housing, and reconciliation and remembrance through community-based memorial design.

Acknowledgements: I extend my deepest gratitude to my academic partners—Dr. Woody Register at Sewanee University, Kevin Jones, Associate Professor at Virginia Tech—for their thoughtful collaboration and unwavering trust in the process we shared with our students. I am equally grateful to the St. Mark's community for placing their faith in us and entrusting us with the responsibility of honoring their stories.

Most of all, thank you to my students. This project would not have been possible without the dedication of numerous VCU students who contributed across two semesters and a summer session. The senior cohort built upon insights from a VCU Interior Design sophomore studio, along with a select group of undergraduate and graduate students who participated in a traveling summer workshop. Their work exemplifies an extraordinary commitment to an empathic design process—one grounded in deep listening, vulnerability, and a collective vision that placed community at its center. I am continually inspired by their brilliance.

Contact Improvisation and Co-design Practices

YALIU
Tsinghua University
liuya2019@tsinghua.edu.cn

Abstract

Is there a form of design that combines the values of performing playing, democratic practices, and co-production? I thought this contact improvisation and co-design practices workshop might provide us with a model.

In November 2023, under the COVID-19 epidemic, I organized a design workshop in BIFT university, with Ms. Liao Shuyi, co-founder of the Contact Improvisation Group in Beijing, China. 32 college students participated in this workshop, lasted for 2 months, and finally completed a series of pattern design.

Contact Improvisation is the concept originated in the United States in the early 1970s, as both a type of free dance and a flowing conversation through physical contact. There is also an inevitable connection between art and the body. So we transformed contact improvisation into drawing. Participants recorded the feelings of the physical interaction through drawing, leaving behind visual elements. These visual elements laid the foundation for the development of design. This co-design practices brought about differences from individual creations.

Figure 1. Contact Improvisation and co-design Practices, Beijing (2023)

Such a CI- co design workshop during the long-term lockdown of the COVID-19 epidemic may help bridge the gap, and play a role in rebuilding trust between people, integrating into the diversified world, and exploring all the possibilities of themselves and the surrounding environment in a group way.

This is improvising, CI- co design Practices may provide a reference for humans of different races, identities and social perceptions to live together in communities, and solve social problems and influence the ways of living together.

Research objectives

How designers lead in time of emergency, of uncertainty, of rapid decision making new co-production and co-design of solutions under the COVID-19 Pandemic.

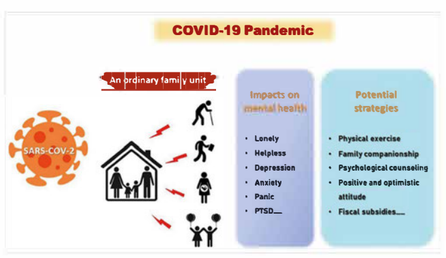

Figure 6. The effects of **COVID-19 pandemic** on mental health and corresponding solutions in different family members.(Wang L, 2022)

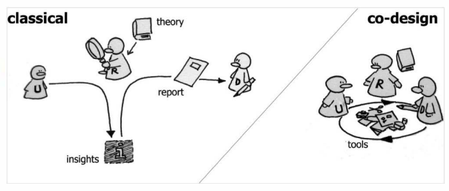

Figure 7. Classical roles of users, researchers, and designers in the design process (on the left) and how they are merging in the **co-design**ing process (on the right). (Sanders, 2008)

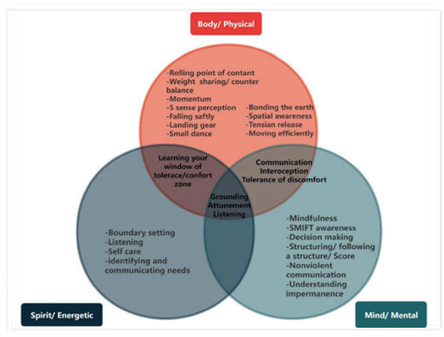

Figure 8. Venn diagram of **CI(Contact Improvisation)** skills as they pertain to body/mind/spirit. (Jackson, K. Jackson, K, 2022)

Research process

The Therapeutic Use of CI: CI dancers often describe transformative effects, including increased self-awareness and emotional maturity(Kaltenbrunner, 1998). CI may also improve interpersonal skills (Jackson, K, 2022).

As a field that stresses the importance of attunement, connection, and creativity, co-design shares many values with contact improvisation (CI). This CI- co design workshop explored the potential of using elements of CI as interventions in co-design.

The rationale：CI- co design workshop (pattern design in print-textile)

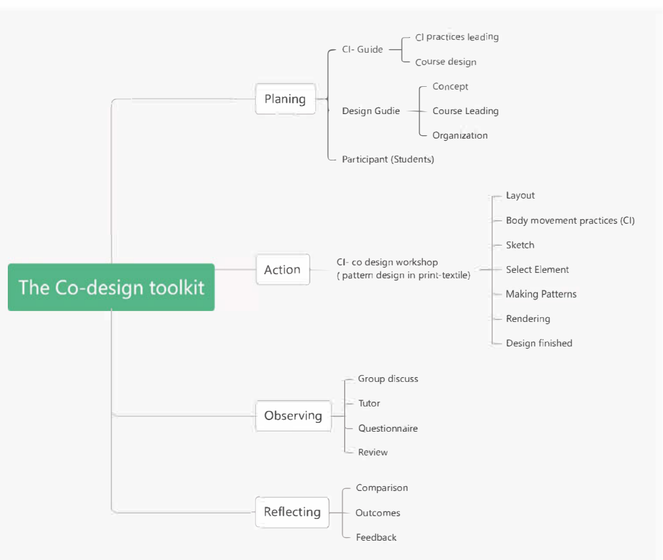

Figure 11. The co-design toolkit: CI- co design workshop (pattern design in print-textile)

Action 2: Sketch (Group work)

Through the practice of CI, we broke the feelings of isolation during lockdown in the covid-19, strengthened the connection between individuals through the physical contact, and felt the support of each other in the mutual relationship, and established the trust of the group, which laid a good foundation for the co-design creation. Then, we started the group work of drawing sketches.

Figure 13. The process of drawing sketches in group work

Obtained results (Design finished and rendering)

32 college students participated in this workshop, which lasted for 2 months, and finally completed nearly 80 patterns for print textile. In this workshop, all the participants learned the professional pattern making skills under the guide of the professional designer. We also organized group tutorials and discussions.

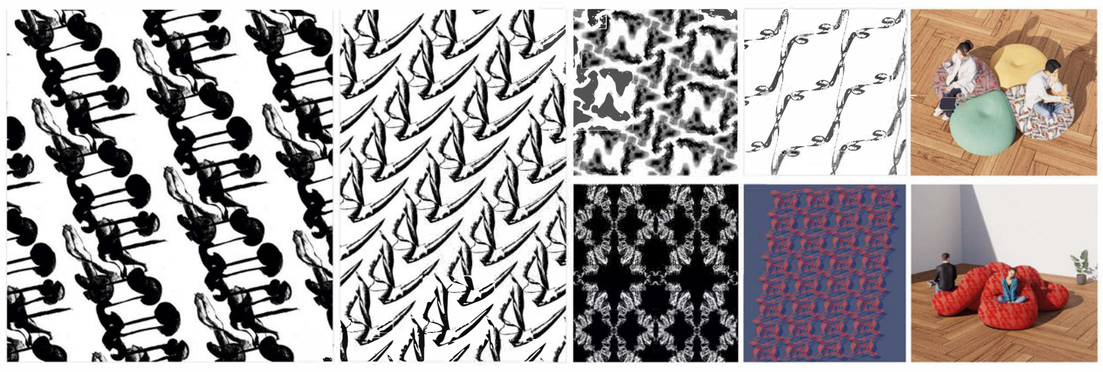

Figure 15. The Process of drawing sketches in group work

Research background

Here is the case study and other use cases of this Contact Improvisation methodological approach experienced in the past (since 1970), especially in art and design.

Figure 2. The impromptu performance that took place in 1972 at the John Weber Gallery in New York. (Photography: Peter Moore)(Singer, 2022)

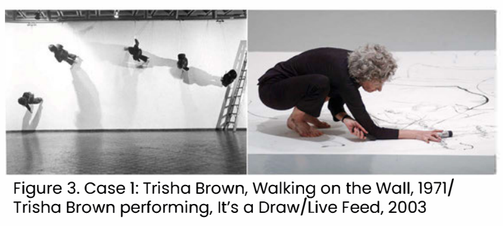

Figure 3. Case 1: Trisha Brown, Walking on the Wall, 1971/ Trisha Brown performing, It's a Draw/Live Feed, 2003

Figure 4. Case 2: A design process with the four stages: Movements, 2D reflections, initial models and final work (Caner, 2021)

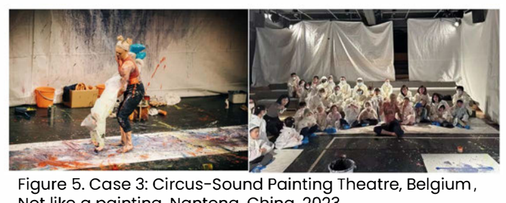

Figure 5. Case 3: Circus-Sound Painting Theatre, Belgium, Not like a painting, Nantong, China, 2023

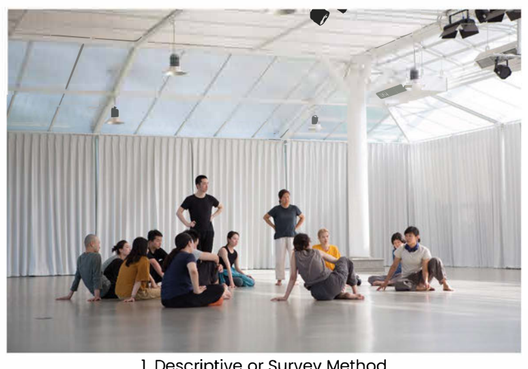
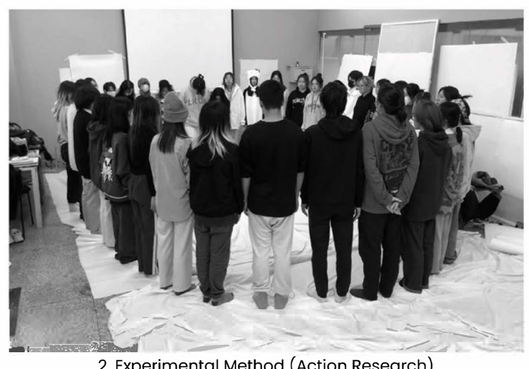
Methodology and tools

How CI(Contact Improvisation) effects and extends the way of co-design? CI is a dance form originating in the 1970s that uses physical contact between partners as thestarting point for improvised movement. Anyone can practice CI, and it's a dance therapy for older people, kids, injured anddisabled people(Nina Dibb,2013), that we no longer focus on the skills but the possibility it enables: What does it do? How can we use it?



1. Descriptive or Survey Method

Figure 9. The author joined the "交叉计划"项目（The Crossing Project）by "十口无团"（Untitled Group）, and workshop in "Beijing Contact Improvisation" (BJCI) in 2022.



2. Experimental Method (Action Research)

Figure 10. Organized CI-co design workshop in 北京服装学院 (BIFT), with Ms. Liao Shuyi, co-founder of the BJCI Group in 2023, Beijing, China (32 college students participated in this workshop, lasted for 2 months).

Action 1: Body movement practices (CI)

The workshop will explore how do the feelings and thoughts behind body movements affect each other? As the presence of the body as a starting point. "contact improvisation" will be the main method of practice, in order to open the awareness of the people around and the environment, then bring this quality into co-design thinking.

Figure 12. Body movement practices (CI) guided by Liao Shuyi

Action 3: Design process (Select element and making patterns)

Selecting Element is the professional ability for a designer, especially in pattern design of print-textile. In co design, designers should adopt two important roles actively: coordinators and facilitators. (Sui, 2003) Also,designers will need to play a role on the co-designing teams because they provide expert knowledge that the other stakeholders do not have.(Sanders, 2008). Here we still need the professional designers or skills to helping making patterns.

Figure 14. The process of selecting element and making patterns

Expected results

Through the practice of CI, we broke the feelings of isolation during lockdown in the covid-19, strengthened the connection between individuals through the physical contact, and felt the support of each other in the mutual relationship, and established the trust of the group, which laid a good foundation for the co-design creation. Then, we started the group work of drawing sketches.

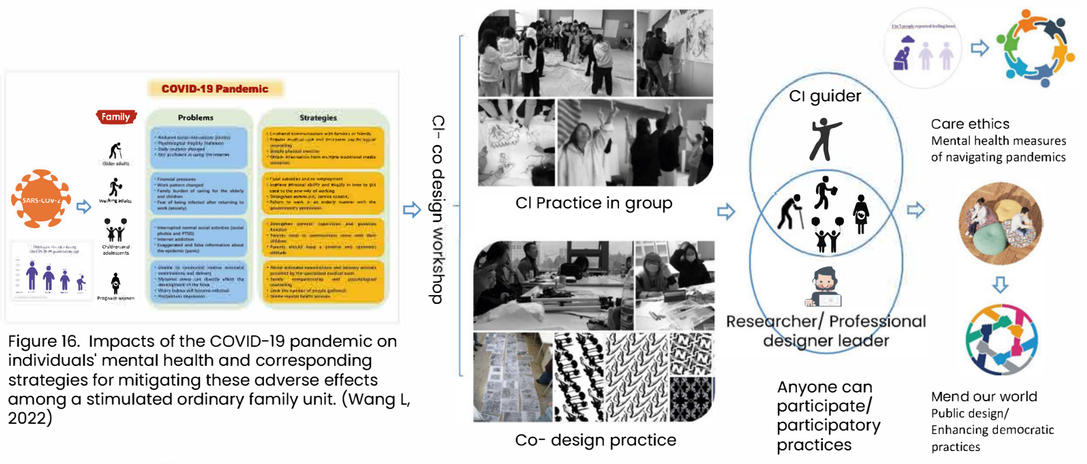


Figure 16. Impacts of the COVID-19 pandemic on individuals' mental health and corresponding strategies for mitigating these adverse effects among a stimulated ordinary family unit. (Wang L, 2022)

ABSTRACT | We are witnessing a significant shift toward inclusivity in the global design paradigm, where thought leaders emphasize collaborative design. Opposed to traditional perspectives that hail the designer possessing awareness of special forms of knowledge and place them in an authoritative position, designers are now seen as integral team members (Herriott, 2023), contributing to a larger context and promoting collaborative good (Costanza-Chock, 2020). The new paradigm advocates for addressing complex global challenges through holistic, socially responsible, and systems-oriented approaches (Lima, 2023) (Norman, 2024). While this conversation about design practice is infiltrating mainstream thought, there is yet to be radical shifts in design pedagogy needed to sustain this momentum. Engaging new generations of designers in social challenges necessitates rethinking their roles in social innovation processes (Tjahja & Yee, 2022). At this juncture, it is crucial for educators to envision a pedagogy for a just design future that embodies a culture of care. Furthermore, there is increasing recognition of the socio-political contexts shaping design, emphasizing that it does not exist in isolation. While many design schools engage with communities, particularly those from lower economic strata, they often unintentionally commodify these people and places, extracting value for student learning without giving back, especially in public space and social innovation projects. <A padding

sentence, will come back> The authors have triangulated their findings from their research and praxis in three areas: a) Pedagogical design for inclusion b) Design for inclusive attitudes, and c) Reciprocal and responsible community engagement. Based on this triangulation, this abstract proposes a new schema in design education—an ethical design pedagogy infused with an attitude of care. This schema embeds aforementioned perspectives on collaborative, reciprocal design in Freire's (1970) and Hooks' (1994) critical pedagogies. The principles of this schema are:
Positionality:
1. Collaborative, Designer-Uncentered Approach (democratic inquiry)
2. Attitudes of Care, Inclusiveness and Equity
Methodology:
1. Cultural Sensitivity, Contextual Awareness and Real-World Contexts
2. Systems Thinking with transdisciplinary and interdisciplinary outlooks
3. Active and Engaged Learning in the Classroom
4. Reflective & Critical Practice (Awareness of Existing Power Dynamics and One's Own Process)
Impact:
1. Education to Drive Industry
2. Reciprocity of Knowledge, Care and Applicability to Real World

The paper outlines practical aspects of applying the proposed schema through two case studies of design studio modules: one in Mumbai, India, and another in Florence, Italy. Both modules were conducted for early undergraduate design students across various streams. By comparing two similar levels of study in distinct socio-political contexts with varying levels of citizen power and agency, the case studies evaluate the schema through student work and reflections.

KEYWORDS | PEDAGOGY, COLLABORATIVE DESIGN, CARE, DESIGN JUSTICE, ATTITUDE

1. Introduction

Design discourse is shifting from hierarchical models toward inclusive, collaborative approaches. Traditionally, designers have assumed expert roles (Herriott, 2023), but contemporary thought leaders advocate for designers as facilitators in interdisciplinary teams addressing social challenges (Costanza-Chock, 2020). This shift aligns with global calls for ethical, sustainable, and socially responsible design (Lima, 2023; Norman, 2024). Despite these discussions, design education has yet to fully transform. Engaging future designers in social innovation requires rethinking their roles within complex socio-political contexts (Tjahja & Yee, 2022). While pedagogy often engages marginalized communities, reciprocity remains a

challenge, risking the commodification of lived experiences.

This paper proposes a schema for ethical, care-centered design education, integrating insights from inclusion-focused pedagogy, designer attitudes, and responsible community engagement. Informed by Freire (1970), hooks (1994), and Giroux (2011), it examines two undergraduate studio modules in Mumbai and Florence to evaluate its applicability across contexts, offering insights into shaping responsible, engaged design practitioners.

Literature Review

The investigation into literature for this paper began with a reflection on "Pedagogy of the Oppressed" (Freire, 1970) and subsequent, critical reflections on the same over the years. Two such reflections and evolutions of the text are regarded as seminal works today - "Teaching to Transgress" (Hooks, 1994) and "On Critical Pedagogy" (Giroux, 2011). Both texts had their unique additions - Hooks' work brought in concepts of intersectionality, love, and emotional engagement in learning. Giroux's work expanded the critique to cultural and capitalistic politics including media, neoliberalism, and political resistance.

Hooks' (1994) Contribution

"Teaching to Transgress" responded to the needs of its time by expanding Freirean critical pedagogy to address race, gender, and intersectionality, advocating for an engaged pedagogy that emphasized personal experience, dialogue, and the dismantling of hierarchical power structures in education. Rooted firmly in feminist ideology, it brought with it discussions of teacher-student relationship grounded in empathy and care.

Giroux's contribution

Giroux's On Critical Pedagogy (2011) took on a more systemic adaptation of Freire's ideas to counter and question the increasing commodification of education under neoliberalism, calling for schools and universities to become sites of resistance where students develop critical agency to challenge systemic injustices.

In the seminal text "The Field of Cultural Production", Bourdieu(1993) discusses the distinction between autonomous and heteronomous pole - the former the concept of prioritization of symbolic capital over commercial success and the latter, the practice of cultural producers catering to market demands, prioritizing economic success and mass appeal. Many like Giroux (2011), highly critique modern neoliberal education as highly market driven and as leaning towards heteronomous pole. Therefore, if design is to shake off the neo-liberal, capitalistic influences, the pedagogy needs to reflect a less market-centered and society-centered approach.

Contemporary Design Literature

In order to contextualise critical pedagogy to design and to focus on the contemporary issues pertaining to design, a literature review of contemporary mainstream literature in design was conducted. Contemporary scholarship emphasizes ethical, non-hierarchical design education,

where designers act as facilitators rather than central authorities (Costanza-Chock, 2020; Lima, 2023). Rooted in designer-uncentered methodologies (Busciantella-Ricci et. al, 2024), this approach prioritizes collaborative, community-led engagement over expert-driven models. Developing new frameworks grounded in democratic inquiry is essential, as the absence of structured methodologies risks sustaining hierarchical and extractive pedagogical practices.
Furthermore, reciprocity of care in design education remains a pressing concern. Many institutions incorporate field visits and community engagement activities as part of active learning, with the aim of learning from real-world co-creation experiences. However, such engagements often commodify the knowledge and labor of marginalized communities, especially when socio-economic power asymmetries exist between students and communities. This is evident in cases where artisanal crafts, street vendors, and low-income workers become subjects of student projects without reciprocal benefits (Buckley & Sabreen, 2017).

Drawing inspiration from the above literature, the authors discussed and meditated on what a contemporary interpretation of these texts would be, specifically in the context of design education. Thus was born the new schema for pedagogy "Cultivating Care" proposed in this paper. The following central concepts emerged as the schema from this review:
With respect to Positionality i.e. how we situate ourselves in design & education, two key observations emerged:

a) Collaborative Design Paradigm and Designer-Uncentered Approach (democratic inquiry): While participatory approaches have long been advocated (Giroux, 2011), their significance in design education lies in challenging dominant paradigms such as designerly ways of knowing (Cross, 2006) and Rams' ten principles of good design (De Jong, Klemp, & Mattie, 2021). Herriott (2023) critiques the overuse of Cross's framework for elevating designer expertise and marginalizing non-designers, while Rams himself acknowledged the evolving nature of his principles. Contemporary scholarship increasingly critiques the myth of singular expertise, calling instead for co-design and community collaboration (Costanza-Chock, 2020; Norman, 2023; Lima, 2023; Authors, 2024). Design is reframed as democratic inquiry (DiSalvo, 2022), where problem-solving becomes collective sense-making. Two of the authors have also proposed "Radical Inclusive Attitudes," an epistemological model advocating for a Designer Un-Centered approach (Buscinatella-Ricci et. al, 2024), which diverges from traditional notions of "design as activism" or "force for good" that may still centralize designer authority if not rooted in the right attitudes.
b) Attitudes of Care, Inclusiveness and Equity: Contemporary design must position the designer within collaborative ecosystems to foster systemic, socially responsible outcomes (Costanza-Chock, 2020). Educational frameworks increasingly embed care and collaboration into curricula, with Tjahja and Yee (2022) advocating for pedagogies that redefine designers' roles through equity and care. To deepen ethical engagement,

Designing for Inclusive Attitudes was proposed as a framework that integrates inclusive design with attitude formation, grounded in the multi-component model of attitudes (Eagly & Chaiken, 1993; Maio et al., 2019). Drawing on Self-Perception Theory (Bem, 1972; Maio & Haddock, 2009), it suggests that behaviors—such as co-design and community engagement—actively shape ethical dispositions. Thus, experiential learning, reflection, and reciprocity are essential to cultivating meaningful, ethical design practice.

With respect to Methodology i.e. how we approach learning & design practice, the following parts of the schema were derived:

c) Cultural Sensitivity, Contextual Awareness, and Real-World Contexts: Design education must move beyond abstraction to engage with socio-cultural realities. Dominant frameworks often impose Western-centric narratives, reinforcing epistemic hierarchies (Escobar, 2018), while universalist models overlook local knowledge systems (Otto & Smith, 2013). Decolonial design emphasizes valuing indigenous and vernacular perspectives (Tunstall, 2023), asserting that design should emerge from societal contexts (Hara, 2015) rather than being externally imposed. Without contextual sensitivity, designers risk creating "techno-sterile solutions" that perpetuate deficit-based narratives (Papanek, 1984). Emphasizing power, privilege, and relationality, design must become collaborative, not prescriptive (Costanza-Chock, 2020; Udoewa, 2022). Bridging theory and praxis requires immersive fieldwork, community co-creation, and iterative feedback, enabling place-based design rooted in complex socio-ecological systems (Manzini, 2015; Deserti & Rizzo, 2023).

d) Systems Thinking with transdisciplinary and interdisciplinary outlooks: Lima (2023) and Norman (2024) advocate for integrative approaches that promote partnerships across disciplines and communities to address global challenges effectively. Moreover, the scope of contemporary designers has expanded to include complexities such as climate change and societal issues. As a result, systems thinking has become even more crucial. However, design education is struggling to adapt to these changes, as demonstrated by the lack of designers in high-level positions within organisations and government (Meyer & Norman, 2020).

e) Active and Engaged Learning in the Classroom - Contemporary research points to the effectiveness of active learning techniques in classrooms (Dixit, Bedekar, Jahagirdar, & Sathe, 2020). Through techniques such as group discussions, case studies, and hands-on activities, students develop a deeper understanding and can better apply their knowledge to solve real-world problems. Research also highlights the positive impact of these techniques on student engagement, retention, and skill development. Authors such as Zimmerman (2014) have extensively explored the role of games in simulating real-world complex systems. In his 2013 article, "Manifesto for a Ludic

Century," he discusses how games serve as metaphors reflecting specific systems, offering players active learning experiences. Therefore, incorporation of games in the classroom to simulate real-life situations can allow students to explore complexities of various situations before and after site visits.

f) Reflective & Critical Practice (Awareness of Existing Power Dynamics and One's Own Process) - Students engaging with marginalized communities often encounter conflicting perspectives that challenge their preconceived notions. Maio & Haddock (2009, p. 34-35) describe attitude ambivalence as the coexistence of positive and negative perceptions about an issue. This ambivalence can create discomfort but is essential in fostering critical thinking and ethical awareness. Encouraging iterative reflection through structured self-evaluation exercises and peer discussions helps students develop more nuanced perspectives on ethical design practices. The seminal work "The Reflective Practitioner" (Schön, 1983) explores how professionals need to engage in reflective practice to navigate complex, uncertain, and dynamic situations. He critiques traditional technical-rational models of knowledge, arguing that expertise is not just about applying predefined theories but also about reflecting in and on action.

With respect to Impact i.e how education translates into broader societal change, the following parts of the schema were derived:

g) Education Needs to Drive Industry - Traditional design education has largely catered to industry needs, reinforcing existing market structures rather than challenging them (Giroux, 2011). Scholars advocate a paradigm shift toward socially responsible, ecologically regenerative, and critically engaged design (Fry, 2009; Manzini, 2015). Embedding systems thinking, critical pedagogy, and ethical frameworks enables students to understand design as a political and economic force (Escobar, 2018). Key strategies include fostering transdisciplinary collaboration, integrating activism, and decoupling design from market constraints. Ethical industry partnerships and models of civic and regenerative design illustrate how education can drive systemic change (Costanza-Chock, 2020). Justice-oriented pedagogy must shape, not mirror, future industries.

h) Reciprocity of Knowledge, Care and Applicability to Real-World: Field visits and community engagement are vital to active learning in design education, enabling co-creation and real-world applicability. However, the commercialization of higher education creates structural barriers to ethical pedagogy, fostering materialistic student mindsets and profit-oriented institutional agendas that devalue socially responsible approaches (Tsiotsou, 2024). Community engagement often risks becoming transactional, particularly when socio-economic asymmetries exist between students and communities, as seen in India's engagements with lower-income groups such as auto drivers, artisans, and street vendors—an issue intensified in Global North–South

collaborations (Buckley & Sabreen, 2017). Ethical pedagogy must counter extractive practices and promote community-led, inclusive design (Costanza-Chock, 2020), prioritizing reciprocity and care over market imperatives (Jacoby, 2015).

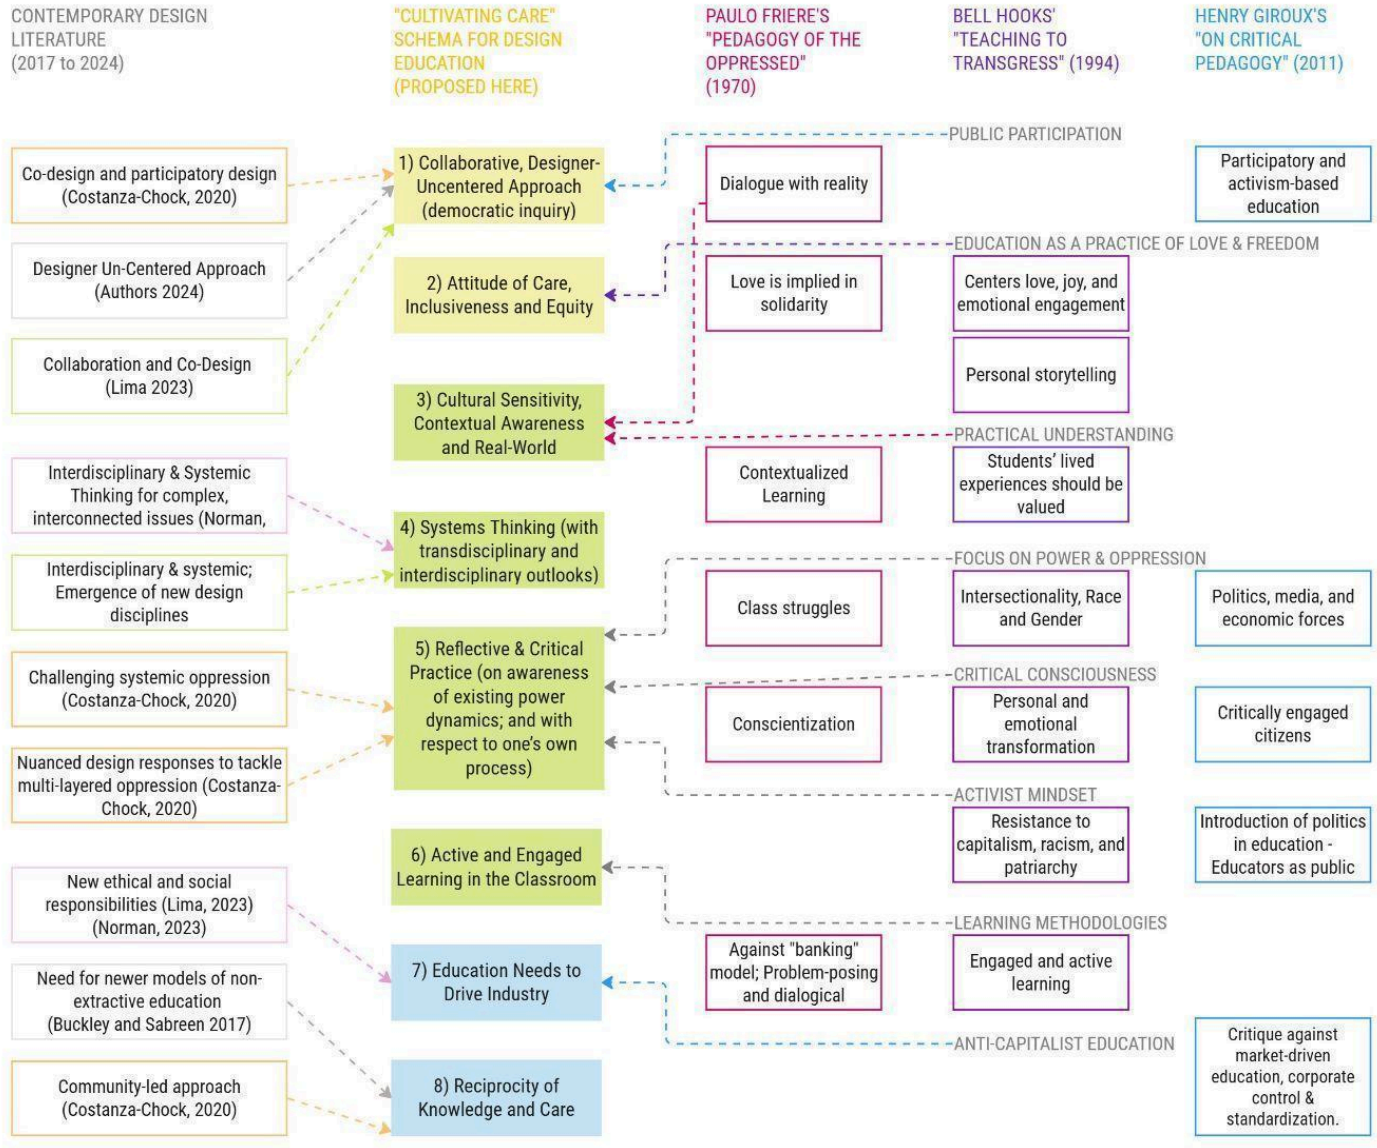

Figure 1. The above figure illustrates the development of the proposed schema based on a comprehensive literature review. The schema, represented by the central eight points, integrates pedagogical frameworks that emphasize critical pedagogy (positioned on the right) with contemporary design literature (positioned on the left). The latter highlights emerging attitudes and ways of being that are essential for the present and future of design.

Research Context

The proposed schema was applied and tested in two pedagogical contexts - through a Design Methods studio at the BITS Design School in Mumbai, India and in a course, namely 'Laboratory of Design II - Eco-Social' divided into two modules (Design for Social Innovation and Civic Design) in Florence, Italy.

Mumbai, India: The Design Methods module at the BITS Design School was conducted as a five-week studio, engaging 105 first-year Undergraduate design students across three sections. The structure of the studio was designed to introduce foundational design

research methodologies and frameworks, systems thinking, and participatory research methods. The module also introduced different types of design process models such as design thinking and the Double Diamond framework, while actively encouraging a critical outlook on these frameworks.
Each section was divided into five groups, totaling 15 groups overall, with an average of seven students per group. This collaborative structure was essential in fostering peer learning, iterative research, and interdisciplinary problem-solving. The studio's pedagogical approach combined fieldwork, hands-on participatory research, and synthesis exercises to encourage students to develop an evidence-based approach to problem definition and ideation. Through semi-structured site visits, observational studies, stakeholder interviews and participatory research, students engaged with real-world design challenges, emphasizing contextual awareness and ethical engagement. This studio was not only an academic exercise but also a pedagogical experiment in fostering ethical design research.

Florence, Italy: The "Design II - Eco-Social" course at the University of Florence is a twelve-week, second-year undergraduate course introduced in 2023-2024, with 24 students engaging in Design for Social Innovation and Civic Design. The course is structured into four sequential stages:

- Introductory Stage – Included lectures on the fundamentals of design for social innovation, civic design, co-design, service design, and speculative design. Students participated in collaborative laboratory exercises to explore key themes.
- Immersive Stage – Hands-on experiences with five local third-sector organizations, each presenting a specific context to explore and a challenge to address. Students designed and prepared toolkits for contextual investigation including engaging with stakeholders.
- Reflective and Defining Stage – Included data analysis and collaborative definition of design challenges to be addressed. This process led to the formation of project groups and the identification of themes for idea development.
- Development Stage – This phase comprised several sub-activities: a) Concept development; b) Review and feedback sessions; c) Final synthesis and presentation

Methodology

After the schema was developed from a comprehensive literature review, the authors followed two sets of methodology - a) To incorporate the schema into pedagogical practice and b) to test the effectiveness of the pedagogy in delivering the schema.

Methodology to incorporate the schema into pedagogical practice

To effectively integrate the schema into a module's pedagogical framework, we employed a multi-layered methodological approach across four distinct categories: (1) Methods Taught In The Studio, (2) Pedagogical Methods/Mechanisms, (3) Attitudes/Environment Created, and (4) Evaluation and Assessment Mechanisms. Each category aligns with principles of positionality, methodology, and impact to foster an inclusive, critically engaged, and reflexive design education.

1) Methods Taught In The Studio:
   The module incorporated a range of research and design methods that aligned with our

schema's emphasis on democratic inquiry, cultural sensitivity, and systems thinking. Participatory Action Research (PAR) (Kemmis & McTaggart, 2005) was a central methodology, positioning students as co-researchers rather than passive learners. Research Through Co-Design (Author 2, Co-author, 2024) was another methodology that aligned with PAR and was incorporated as an optional methodology for students. Additionally, various methods of participant observation including Ethnographic research methods (Pink, 2013), Systems mapping (Meadows, 2008) and Reflective Thinking (Schön, 1983). Table 1, 2 and 3 depict the methods employed and their relevance to the schema.

2) Pedagogical Methods/Mechanisms:
   The modules moved beyond passive learning through participatory methods—employing inquiry-based learning (Pedaste et al., 2015), dialogic pedagogy (Freire, 1970), and problem-based challenges to enhance student agency. Game-based learning (Gee, 2007), simulations (Zimmerman, 2014), and pop-culture role-play (Dune et al., 2016) facilitated engagement, systems thinking, and ethical reflection, aligning pedagogy with collaborative and critical learning outcomes.
3) Attitudes/Environment Created:
   Cultivating care, inclusivity, and equity relied on relational pedagogies (Noddings, 2012) and reciprocal knowledge exchange (Tuck & Yang, 2012), emphasizing co-learning and mutual knowledge construction. Emotional intelligence and reflective dialogue (Goleman, 1995) promoted ethical self-awareness. The Cognitive-Affective-Behavioral (CAB) model (Maio, Verplanken & Haddock, 2019) highlighted the integration of cognition, emotion, and behavior in attitudinal change—principles embedded throughout the pedagogical design.
4) Evaluation and Assessment Mechanisms:
   Assessment methods prioritized process-oriented evaluation (Biggs & Tang, 2011), valuing learning trajectories over final outputs. Reflexive journaling (Bolton, 2010) fostered critical awareness of bias and power, while peer assessment and dialogic feedback (Nicol, 2010) encouraged collaborative critique and perspective refinement. Real-world impact was assessed through frameworks emphasizing social implications (Brown, 2009), reinforcing meaningful design interventions.

This methodological approach embedded the design pedagogy schema conceptually and operationally through concrete teaching strategies, learning environments, and assessment. Centering participatory, reflexive, and socially engaged methods, the framework cultivates critical capacities for students to address contemporary global challenges.

Methodology to test the effectiveness of the pedagogy in delivering the schema

1) Quantitative Content Analysis of Student Work (Krippendorff, 2018; Neuendorf, 2017): A systematic content analysis similar to the quantitative newspaper analysis outlined by Krippendorff (2018) was employed on student work to identify patterns in the absorption and application of the schema's principles. This involved coding final project submissions and intermediate exercise submissions to assess how students engaged with key concepts of the schema such as democratic inquiry, interdisciplinarity and systems thinking.
2) Qualitative analysis of Student Work: This was done to complement the quantitative analysis as a way of meaning-making as suggested by Krippendorff (2018). He emphasizes that content analysis is not merely about counting words or themes but about interpreting meaning within context, making it a valuable tool for both qualitative and quantitative research. To understand the effectiveness of pedagogical methods, qualitative analysis of student work and analysis of reflective student journals was conducted. These were thematically analyzed to capture insights into student perceptions of active learning, engagement with game-based pedagogies, and their evolving attitudes toward inclusivity in design. Reflexive journaling (Bolton, 2010) was particularly useful in tracing how students internalized and critically reflected on their learning journey.

Application In Pedagogy

The detailed breakdown of application of schema through pedagogical methods in both Indian and Italian contexts are depicted in the tables below.

Table depicting methods applied in the teaching and learning space to introduce/reinforce the "Positionality" Section of the Schema - PART 1

BITS Design School, Mumbai, India › **Faculty** - Lakshmi Srinivasan, Khusboo Jogani, Malay Dhamelia (Author 1, 3 and 4) › **Guest lecture & Mentoring** by Daniele Busciantella Ricci (Author 2)	**Collaborative, Designer-Uncentered Approach (Democratic Inquiry)**	**Attitude of Care, Inclusiveness and Equity**
Methods Taught In The Studio	Participatory Action Research; Stakeholder Mapping; Research Through Co-Design (Author 2, 2024)	Ethnographic Research, Contextual Inquiry and allied Methods of Observation, Stakeholder Interviews
Pedagogical Methods/-Mechanisms	Exercises: Reflections on inclusivity in engagement; Getting feedback from stakeholders Mechanisms: Both faculty and peer assessment, Peer Feedback Loops; Student Organisation: Emphasis on Group Work - Collaboration between students made mandatory	Exercises: Analysis of field notes; Student reflected on socio-cultural factors that affected lives and livelihoods of community Mechanisms: Site Visits, Immersive Fieldwork
Attitudes/Environment created	Cognitive: Emphasis laid on learning to look at the community as the experts and the design students as the "learners" (of the context). Affective: Learning to be comfortable with discomfort Behavioural: Emphasis on depth of community participation - lead to students repeatedly returning to site to engage with stakeholders.	Cognitive: Students needed to learn about the site from diverse stakeholders (women, elderly, shopkeeper vs customer, vehicle user vs pedestrian) with different identities and understand their emotional experiences
Evaluation and Assess-ment Mechanisms	Measured through process documentation and insight generation by students. Learning Outcome Assessed: Conduct research to gather nuanced insights into user needs and contextual challenges.	Measured through qualitative community feedback and student response. Learning Outcome Assessed: Conduct research to gather nuanced insights into user needs and contextual challenges.

Figure 2. Table depicting methods applied in the teaching and learning space to introduce/reinforce the "Positionality" Section of the Schema - Part 1.

Pedagogical Methods/-Mechanisms	Simulating a Double Diamond process	earning-by-doing approach; peer-to-peer learning process; learning through the co-design
Pedagogical Methods/-Mechanisms	Providing embedded experiences in collaboration with third-sector entities to address real-world challenges	Students provide contextual observation insights and the communities provide feedback and design challenges
Assessment & Evaluation	Developing strategic scenarios, service concepts, information and communication prototypes, as well as product-service system concepts	Peer-to-peer collaboration and co-assessment of the conceptual results; students provide feedback about the learning process; faculty provide an assessment of the learnings through the final projects

Figure 7. Table depicting methods applied in the teaching and learning space to introduce/refinforce the "Impact" Section of the Schema - Part 2.

Some salient and unique features of the pedagogy are highlighted through text and images below:

BITS Design School, Mumbai, India

1) Game-Based Approach: A "Halloween Heist" of pop culture Brooklyn-99 fame was organized for a day where students analyzed quantitative and qualitative data sets provided to them from two universes - Harry Potter and Marvel Cinematic Universe. These hypothetical datasets that simulated real-world datasets were analysed and interpreted by students to make effective insight and How Might We statements. As students reported the insight-generation stage to be difficult, this was incorporated to make the process more engaging and light-hearted.

2) PAR Mela: Author 2 visited India to deliver lectures on Research Through Co-Design and mentor students on Participatory Action Research (PAR). A PAR mela (mela is a Hindi word for

carnival) was organized to showcase findings from the field to various design experts from industry and academia to create an added impact of the work done by students. It also provided the students with an opportunity to be mentored by experts.

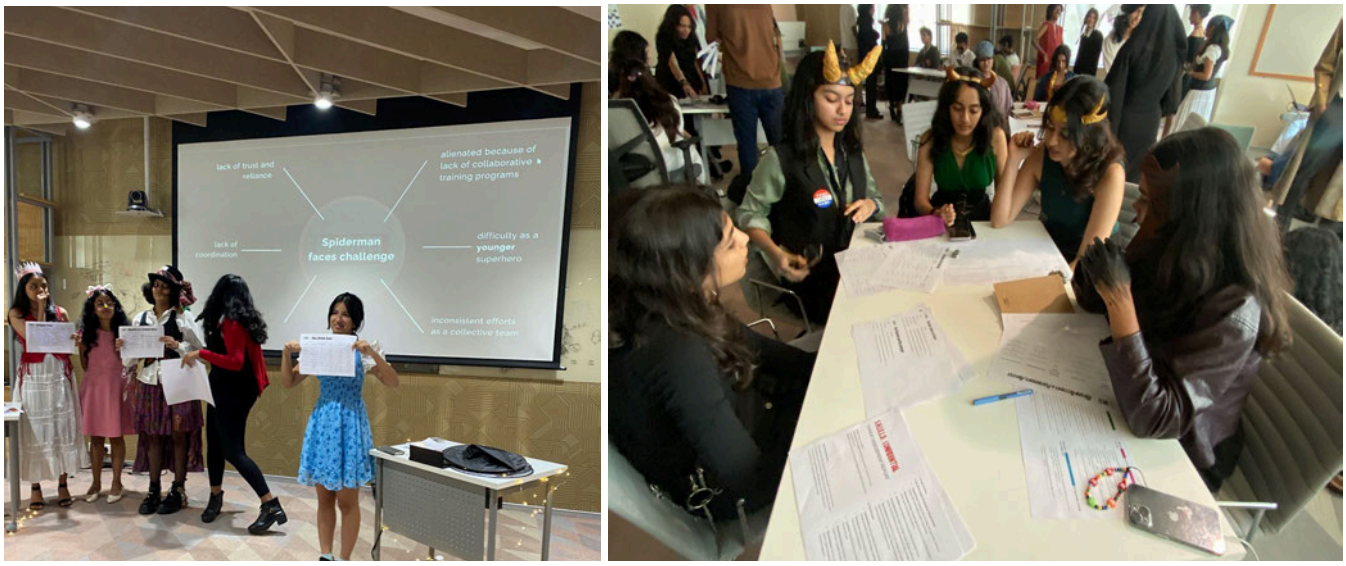

Figure 8: Game-Based Approach – "Halloween Heist" Activity

Students participated in a "Halloween Heist" inspired by Brooklyn Nine-Nine, analyzing hypothetical datasets from the Harry Potter and Marvel Cinematic Universe.

Figure 9: PAR Mela – Participatory Action Research Showcase

The Participatory Action Research (PAR) Mela provided a platform for students to present their research findings to industry and academic experts.

University of Florence, Italy

1) Immersive experiences

Five immersive experiences were organized in collaboration with local third-sector entities. Students actively participated in creating conditions for exploring the contexts using design toolkits they developed themselves, which were iteratively assessed by faculty members and through peer-to-peer review. Additionally, collaborative activities were carried out during the immersive experiences to collect data for defining the design challenges.

2) Open Space Technology

The Open Space Technology (OST) technique was applied after the immersive experiences to collaboratively define: (i) design challenges, (ii) student groups engaged in each challenge, and (iii) specific themes to be addressed by each group. These design challenges guided students in developing their final design concepts and project work, which formed the basis for their final exam materials. The OST approach was a crucial activity in democratically defining challenges by considering the needs and issues of the explored contexts while also organizing student groups based on their individual skills and interests.

Figure 10. Students engaged in the two different immersive experiences, a local urban regeneration project based on cultural welfare (on the left), and a co-housing for social inclusion (on the right).

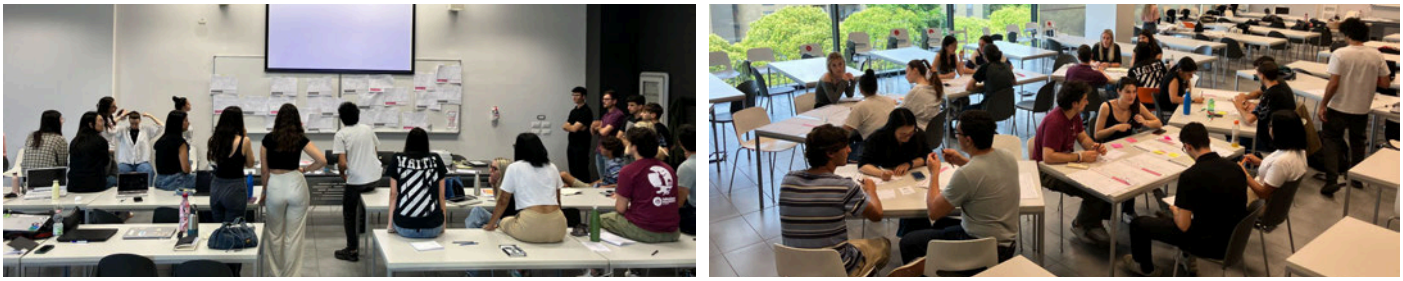

Figure 11. Students engaged in the two key collaborative activities during the OST.

Results & Discussion

Measuring Pedagogical Impact, Mumbai, India

Quantitative Analysis

A quantitative analysis was conducted to understand how various aspects of the schema were visible in student works.

1) With respect to the first two components of the schema, Collaborative, Designer-Uncentered Approach (democratic inquiry) and Attitudes of Care, Inclusiveness and Equity, PAR methods, including semi-structured interviews, and participatory toolkits were employed. Research Through Codesign was employed through speculative scenario-building and mapping exercises.

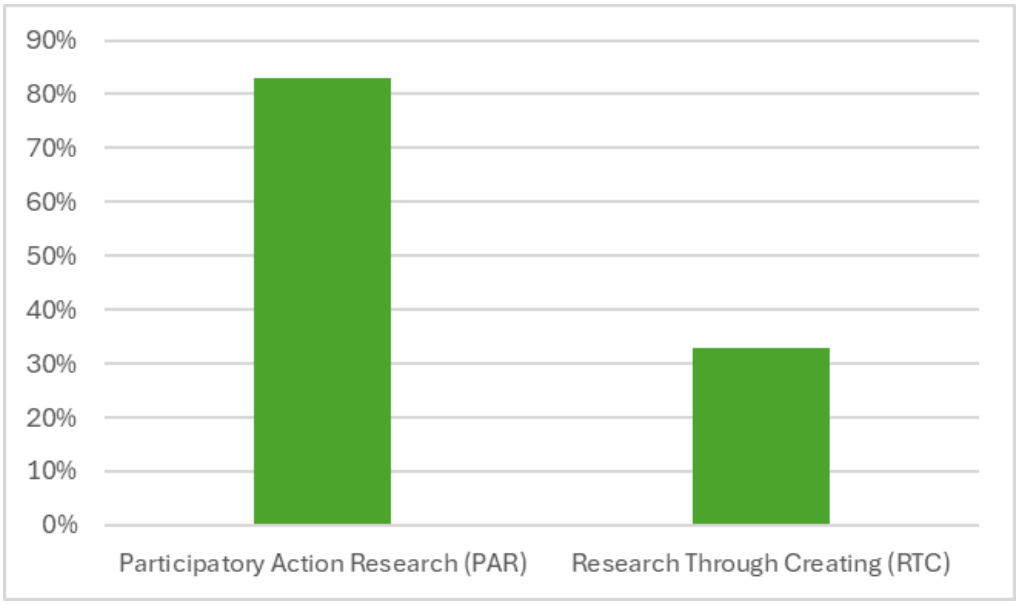

Figure 12. Chart depicting percentages of students employing PAR and RTC in Institution, Mumbai, India

2) To operationalize the third aspect of the schema—"Cultural Sensitivity, Contextual Awareness, and Real-World Application"—the pedagogical approach involved curating site selections based on six distinct thematic categories. These categories were strategically chosen to expose students to diverse socio-economic, cultural, and spatial dynamics, ensuring a comprehensive understanding of design in real-world contexts. The six thematic site classifications were:
    1. Urban Public Spaces & Transit Hubs
    2. Commercial & Informal Business Spaces
    3. Institutional & Educational Environments
    4. Community Spaces
    5. Recreational & Leisure Spaces
    6. Service-Oriented & Repair Economies

By engaging with these varied spatial typologies, students developed a nuanced awareness of place-based design, fostering an appreciation for contextually responsive and socially embedded design practices.

3) The interdisciplinary modes of working along with systems' thinking was visible through various methods students chose to employ from what was introduced to them. Fig.13. depicts the various disciplines students engaged in.
4) With respect to the aspect of the schema, "Active and Engaged Learning in the Classroom", various active learning strategies were employed. Fig.14. gives a detailed breakdown of class hours spent on different strategies.
5) In the subsequent module, all student groups carried their interventions to the site, ensuring a 100% translation of classroom learning into real-world application. This approach reinforced the principles of Education to Drive Industry and Reciprocity of

Knowledge, Care, and Applicability to the Real World, demonstrating the tangible impact of design research when directly engaged with stakeholders.

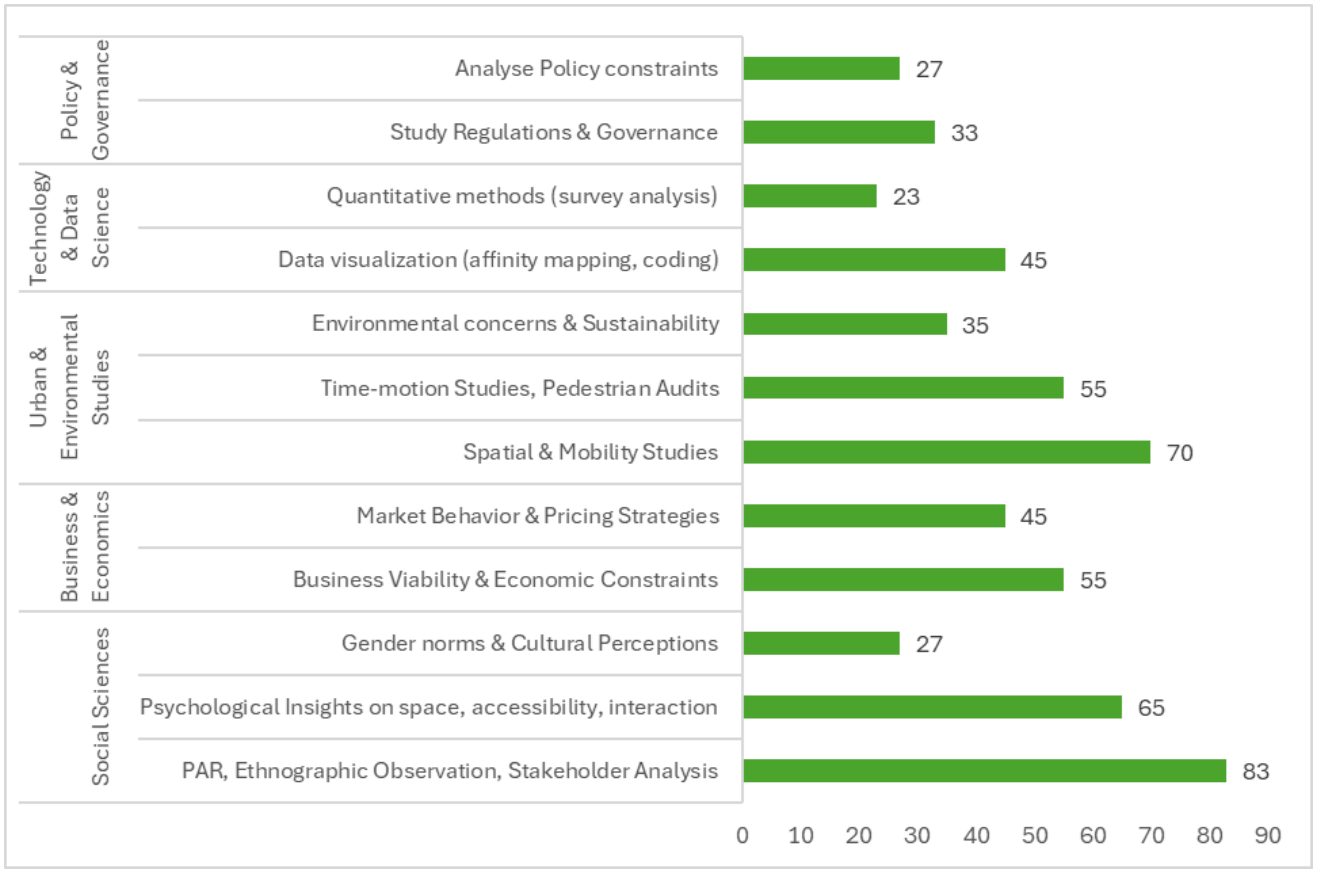

Figure 13. Image depicting percentages of students engaged with other disciplinary perspectives

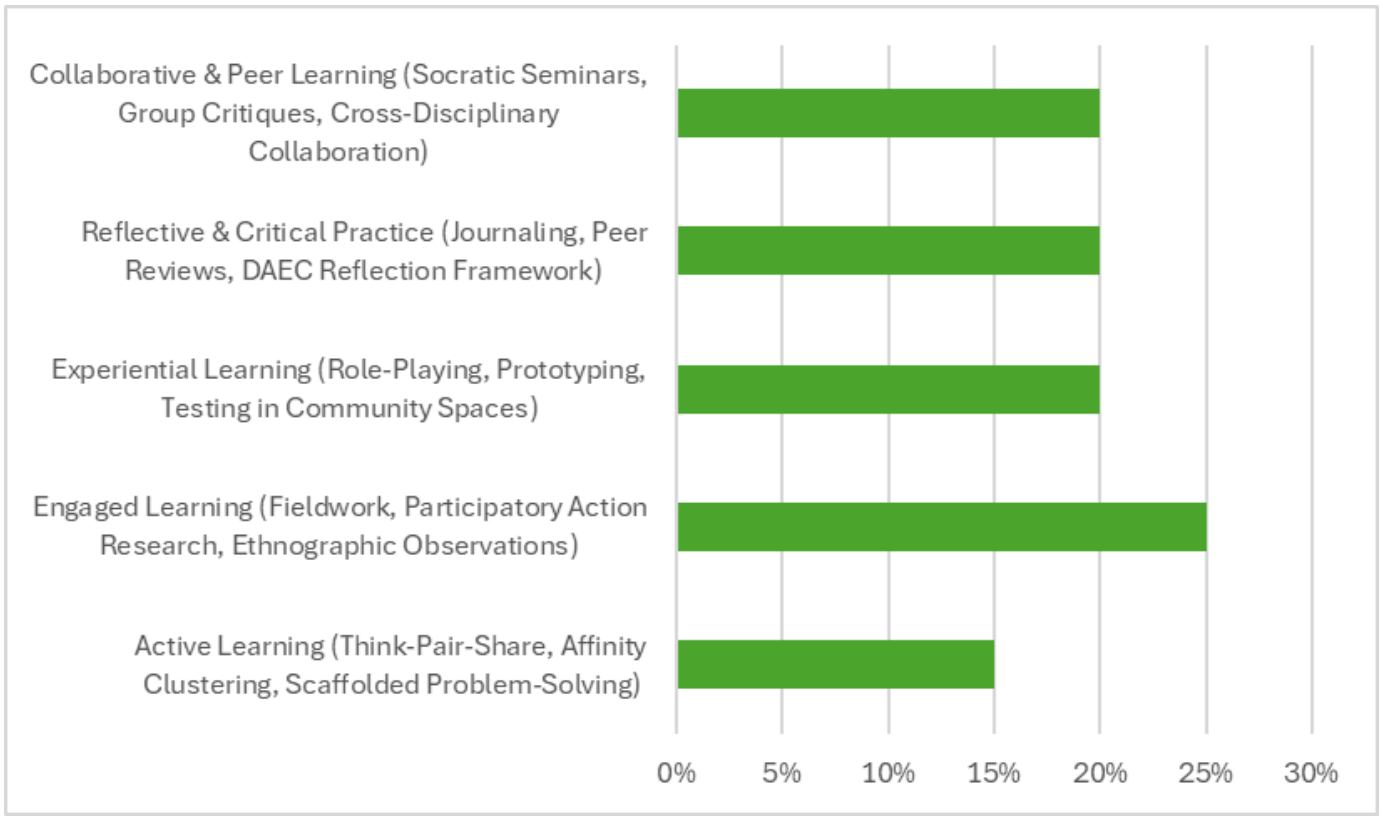

Figure 14. Breakdown of class hours spent on different types of active learning strategies

Qualitative Analysis

We refer to three case studies of student work here to further demonstrate the pedagogical impact as a way of "interpreting meaning within context" (Krippendorff, 2018).

Case Study 1: Waste Collectors' of "Lucky" Street

In Mumbai's urban streets, informal waste collectors and sweepers play a vital role yet face systemic neglect in welfare, safety, and recognition. This project addressed inequities such as unsafe conditions and stigmatization, alongside hazardous waste disposal behaviors. Initially, students viewed improper waste disposers as culprits, but immersive interviews and participatory action research (PAR) revealed deeper systemic causes, profoundly shifting their understanding of street users.

Findings and Insights listed by students:

- The design of the current dustbins required pedestrians to touch the lid and get themselves dirty in order to dispose of waste. Users of the street needed to dispose of waste conveniently without getting dirty.
- Waste collectors and street sweepers faced health risks due to inadequate protective gear and unsafe collection practices.
- Cigarette smokers needed special and convenient disposal systems for cigarette butts. The site lacked this.

This case underscores the importance of ethical reflexivity, as students critically examined their role in advocating for systemic change while respecting community agency. They also recognised design as an embedded mechanism within a larger system encompassing various government bodies, stakeholders and urban ecosystems. Waste collectors' dignity and safer working conditions were prioritized.

Case Study 2: Bus Ridership Challenges and Impacted Urban Mobility

This project investigated declining bus ridership and its impact on vulnerable users, analyzing ridership data, infrastructure gaps, and stakeholder behaviors to identify barriers. Employing mixed methods, students conducted vehicular audits to locate congestion points, interviewed senior citizens about travel challenges, and used quantitative rider counts to reveal usage patterns across demographics including mothers, office workers, and seniors.

Findings and Insights listed by students:

- Travelling in a bus for a senior citizen can be a challenge because the bus infrastructure and vehicles are not built with their physical limitations in mind.
- Accessing toilets in case of emergencies is a challenge for diabetic bus users as it is difficult to locate toilets quickly en route.
- Night-time journeys are a challenge for women because there is limited activity on the street, and intoxicated people, and it is not well-lit.
- Commuting is a challenge for a daily worker because they have limited transit options that are punctual and affordable.

- Knowing what bus to take is a challenge for people as route information is not prominent and accessible.

This project exemplifies the pillars of systems thinking and interdisciplinary problem-solving, with students integrating social, and infrastructural considerations into actionable insights.

Figure 15. Case Study 1 -Students Anjali Lodha and Prisha Modi of BITS Design School, Mumbai conducting interviews and PAR with street sweepers and waste collectors.

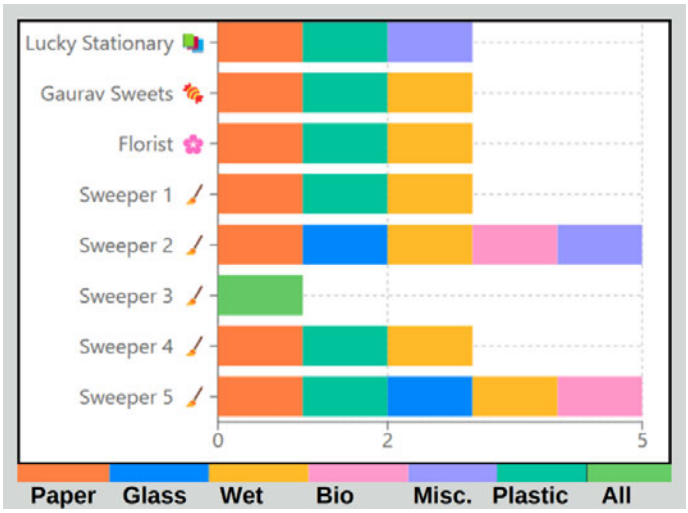

Figure 16. Case Study 1 - Student mapping of types of waste generated by different shops and the different sweepers whose daily work is impacted by the same. Student work submitted by Dhiren N,

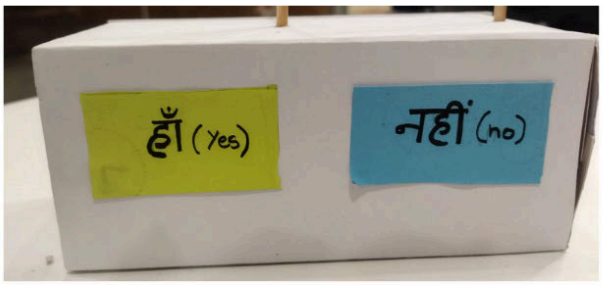
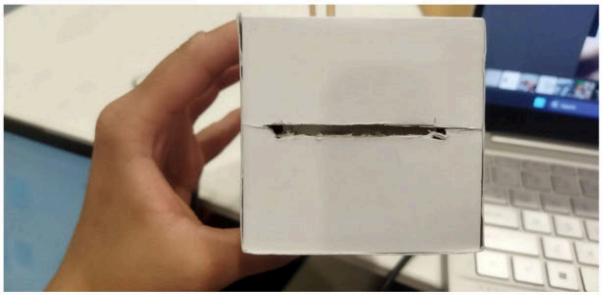
Prisha Modi, Anjali Lodha, Srivaishnavi Lakkaraju, Siddhi Joshi

These are our cue cards colour coded and marked differently for easy identification of our quantitative data.
Blue are aspects on the bus and **pink** are aspects on the bus stop.



The toolkit has two segregations, Yes and no. If a personal has a problem with an aspect they put it in yes and if not then no.



We also added a slit for additional feedback and qualitative data which is not mentioned on the cards. This gave us unexpected and different types of opinions.

Figure 17. Case Study 2 - Participatory toolkit designed to analyse infrastructural issues that impacted bus ridership. Student work submitted by Sharanya Mukherjee, Simona Das, Sara Tripathi, Kujal verma, Harshit Jaiswal, Aarushi Pranavi, Dhruv Srinivas, BITS Design School.

Case Study 3: Investigating Kirana Stores

This research examined daily operations of Kirana stores—small, family-owned retailers vital to local supply chains—focusing on inventory management and data tracking amid a changing retail environment. Students employed systems mapping, time-motion analysis, stakeholder interviews, ethnographic observation, and participatory toolkits to explore decision-making, financial practices, and technology use in depth.

Findings and Insights listed by students:

- Maintenance of the Khaatas is tedious for the store owner due to keeping multiple copies of them in the form of pdfs. This redundant process leads to confusion and discrepancies in data.
- Cluttered placements of products lead to low product visibility leading to reduced impulse purchases.

The findings highlighted both challenges and opportunities for enhancing efficiency and resilience within these micro-enterprises. This study was a prime example of systems thinking that incorporated interdisciplinary understandings where design thinking intersected with finance and project management.

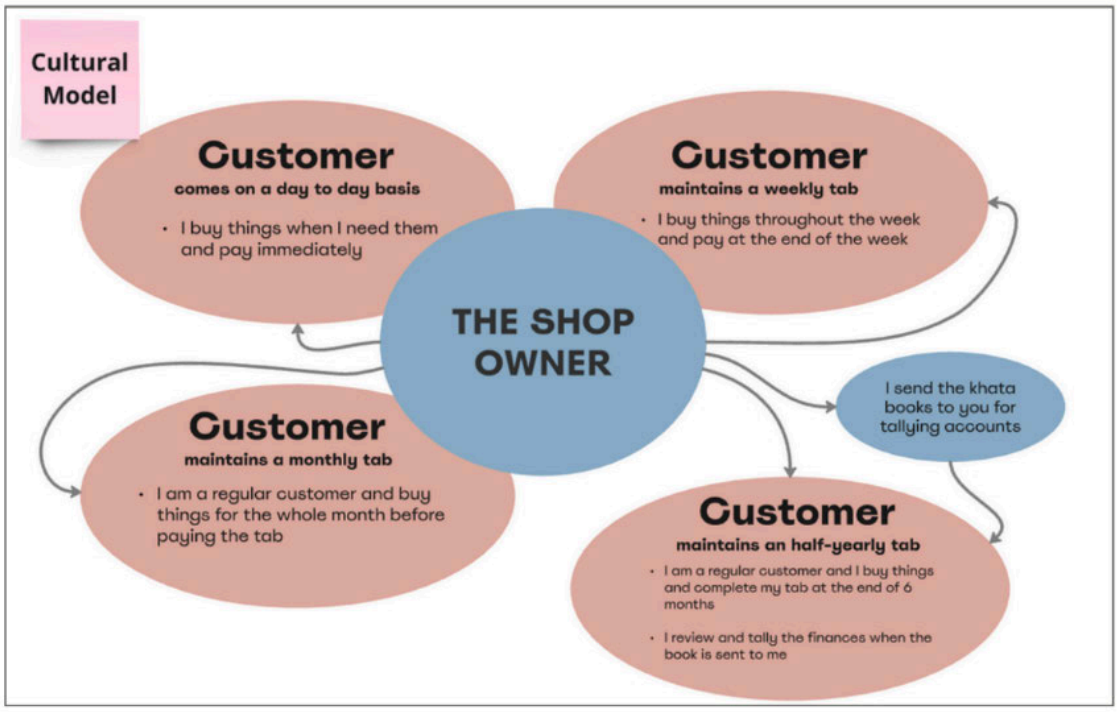


Figure 18. Case Study 3 - A Cultural model showing relations and exchanges made between different types of customers and the store owner that constitute the current system of Khatta-keeping. Student work submitted by Arya, Purvi, Siya, Aneesh, Arnav, Riddhi, Sakshi, BITS Design School

These case studies highlight participatory research's transformative potential in overcoming systemic barriers, emphasizing cultural sensitivity, interdisciplinary problem-solving, and ethical reflexivity. They validate the applied framework by showing how tools like stakeholder mapping and narrative inquiry yield actionable, community-centered solutions. For communities, the projects fostered empowerment and advocacy; for students, they reinforced critical reflection and developed participatory research skills alongside holistic socio-economic understanding.

Table 1. Table depicting incorporation of schema in student projects case studies for Mumbai, India

Observation from Student Work	**Insight wrt Pedagogy**	**Relevance to Schema**
Waste Collectors' of "Lucky" Street		
Student project on waste collectors considered multiple stakeholders' perspectives and analysed it from different lenses.	A combination of contextual immersion mixed with behavioural study and deliberate stakeholder mapping proved effective in this case to make students consider multiple perspectives.	Collaborative, Designer-Uncentered Approach (Democratic Inquiry)

Students' initial assumptions about stakeholders (users of the street) dramatically changed after PAR.	PAR helped students develop greater nuance and cultural sensitivity towards the real-world context they were investigating.	Cultural Sensitivity, Contextual Awareness and Real-World Contexts
Students focused on the most vulnerable and least powerful stakeholder on their site - the waste pickers. They focused their design brief around the waste pickers.	Relevant Methods Taught: Interviews, Stakeholder Maps Explanation: The conversations while making stakeholder maps to mark stakeholder relationships and to evaluate most and least excluded paid off.	a) Attitudes of Care, Inclusiveness and Equity b) Reflective & Critical Practice (Awareness of Existing Power Dynamics and One's Own Process)
Bus Ridership Challenges and Impacted Urban Mobility		
Students employed a combination of different methods to uncover detailed patterns, issues and specific stakeholder needs.	Incorporation of quantitative methods that emphasize systemic understanding and ethnographic methods that encourage empathy with stakeholders can created nuanced and effective contextual immersion and insight generation	a) Contextual Awareness and Real-World Contexts b) Attitudes of Care, Inclusiveness and Equity c) Systems Thinking with transdisciplinary and interdisciplinary outlooks
Investigating Kirana Stores		
Students employed systems' mapping, time-motion analysis to understand store owners' working patterns and provided tech support for financial management.	The nature of the context provided provoked students to employ systems thinking tools and interdisciplinary techniques.	a) Contextual Awareness and Real-World Contexts b) Systems Thinking with transdisciplinary and interdisciplinary outlooks

Analysis of Reflective Journals

Maio & Haddock (2009, p. 28-30) highlight open-ended self-assessment methods, such as reflective journals and belief listing, as effective tools for measuring attitudinal shifts. Applying these qualitative assessment models in design education can help evaluate whether students have internalized ethical design principles. The following quotes from student reflections submitted at the end of the module illustrate this,

Sampoorna Krishna wrote “From viewing our street as just grounds for business, conducting the participatory activities and conducting interviews gave our project’s narrative a parallel storyline of Hope. Awadh uncle, a vendor, spoke to us at length about his life, livelihood and how he does what he does so his children can get a good education and have a good life. Conversing with many stakeholders like this breathed life into our experience of research.”
Siddhi Joshi wrote “Working on this project made me realize how a simple street we often walk on can be seen as a complex site of interaction. For instance, I discovered that sweepers feel emotionally supported when we address their concerns about extra work or injuries from sharp objects during the waste collection process.”
Prisha Modi wrote “I learnt that the whole design research process required no assumptions, biases, and an insight into the different perspectives of different stakeholders to finally gain a problem statement that we can then work on..”
These excerpts also demonstrate how the pedagogy was impactful with respect to incorporating a critical part of the schema “Reflective & Critical Practice (Awareness of Existing Power Dynamics and One’s Own Process)”.

Measuring Pedagogical Impact, Florence, Italy

It is possible to frame results and outcomes - as short and mid-term impact conditions - directly observable from the education experience in Italy. First, students provided several kinds of outputs related to their design studies and processes such as

- 7 design scenario;
- 24 design toolkits (at least one for each student);
- 231 design tools filled throughout the whole course;
- 7 projects (including service and strategic design concepts) that addressed the design challenges discussed in collaboration with the entities that determined the immersive experiences

Second, in terms of the mid-term impacts of the course, students activated three internships on the same topics and one went into a thesis project with the same topics and learnt approaches.
Third, the initial experience in the course provided data that were co-analysed in collaboration with the faculty who taught the course. This analysis aimed to improve the course and develop a revised version for the next academic year. The main insight was that the students were well-prepared in terms of methodologies and process awareness. However, the quality of the final exams needs improvement, particularly in refining details that can enhance the evidence for impactful design ideas. The faculty team is working on strategies to address this gap.

Conclusion

The outcomes from the module conducted in India demonstrate rich, nuanced understandings in student work. Additionally, when the schema was incorporated into the pedagogy through the right methodology, environment and behavioural conditions, most students responded to their contexts with sensitivity and developed a sense of humility and appreciation for the local

communities. This was witnessed through student reflective notes and essays. The case study of the student work in India also highlights the importance of integrating interdisciplinary and transdisciplinary methodologies coupled with tools for systems thinking in the classroom (as outlined in the schema) to enable students to develop holistic, designer un-centered approaches to real world contexts. The case study also demonstrates that while reflective praxis and reflective writing can be perceived as cumbersome by students, consistently engaging in reflective thinking can both enhance quality of work and increase students' cultural sensitivity.

The educational outcomes from the Italy module reveal a tangible and multifaceted impact on students in both immediate and mid-term contexts. The creation of design artefacts—such as scenarios, toolkits, and tools—and the development of real-world projects with external partners demonstrate deep student engagement. Continued learning through internships and thesis work further reflects the course's sustained relevance. Faculty-led analysis of course data has yielded critical insights for curricular refinement. While students exhibit strong methodological grounding and process understanding, their final outputs indicate a need for improved clarity and communication. Faculty efforts to address this gap highlight a reflective and evolving pedagogical approach that seeks to enhance both academic rigour and real-world impact.

Both case studies, thus, effectively demonstrate mechanisms through which the schema can be applied in social design pedagogy. Additionally, they also illustrate through experimentation and the above results, the effectiveness of the schema in delivering what it proposes.

Way Forward

Building on our analysis of student case studies, future iterations of this pedagogical approach will focus on refining strategies for deeper engagement with industry and community stakeholders. Emphasizing reciprocity, we aim to strengthen knowledge exchange between academia and practice, ensuring that educational frameworks remain responsive to evolving socio-economic and environmental challenges. Further research will explore scalable models for interdisciplinary and transdisciplinary collaboration, fostering more inclusive and equitable learning environments. Additionally, longitudinal studies will assess the sustained impact of this pedagogy on students' professional trajectories and critical thinking capacities. By integrating continuous reflection and adaptability, we seek to enhance the transformative potential of design education in addressing real-world complexities.

About the Authors:

Lakshmi Srinivasan is a design educator, researcher, and practitioner with 8+ years of experience in industry and academia. She has a background from the University of Sheffield. Her work spans design research, interdisciplinary approaches to global challenges, including inequality, decolonial practice, climate change, and sustainable development. She has mentored for the JSPF scholarship, and has presented her work in over 13 notable international conferences such as the Include 2022, the Association of Architectural Educators (2023)„ GWO etc. Lakshmi currently resides in India and is passionate about inclusive design education, critical pedagogy, mental health awareness. She also enjoys calligraphy and writing poetry.

Daniele Busciantella-Ricci is an Assistant Professor (non-tenure-track) with over ten years of experience in Design for Inclusion, Co-Design, and Design for Social Innovation. He has collaborated within national and international networks, working with public and private organizations, informal communities, and academic laboratories. A member of the Italian Society of Ergonomics

and Human Factors (SIE), Daniele is also a co-founder of the Italian charity Codesign Toscana, which promotes participatory design within local communities. His research interests encompass social inclusion through Design Research, Research Through Co-Design, Design for Inclusion, Inclusive Service Design, Design for Public Sector Innovation, and Design for Policy.

Acknowledgements: The authors acknowledge all participating students for their dedication and self-initiative. The authors are also grateful for the inputs contributed by Dr. Priti Rao to the students of BITS Design School in their insight generation phase. The authors are also grateful for the contributions of and facilitation by Marco Berni and Riccardo Luciani at the University of Florence, Italy. The authors also express gratitude to Adam Kallish at the BITS Design School for valuable interactions and conversations surrounding the module.

ABSTRACT | The quest for global net-zero emissions has become a fundamental objective, underpinned by the expansion of renewable energy networks. However, the implementation of these infrastructures presents considerable challenges, as they inevitably alter landscapes and disrupt local communities (Esposito et al, 2023; Light, 2021). This paper delves into the case of the proposed electric interconnector between Normandy(France) and Portsmouth(UK). The proposed development has exacerbated disputes among Portsmouth ' s community, the Aquind Limited, and governmental authorities, reflecting a broader clash between national energy strategies and regional needs (Kerridge et al, 2023; Martin et al, 2023). While traditional top-down communication

methods facilitate basic information exchange between stakeholders, miscommunication and entrenched positions continue to hinder consensus on balancing escalating energy demands with the preservation of community identity and environmental integrity. By applying Arnstein ' s "Ladder of Citizen Participation" theoretical framework, the "Pillow Bomb" workshop facilitates dialogue between Portsmouth residents, Aquind Limited, and government representatives. (Arnstein, 1969, p.216-224) This dialogue reveals misunderstandings and latent desires that often underlie conflicting viewpoints. The process underscores the critical role of public participation and democratic deliberation in decision-making, while also promoting equitable solutions in energy infrastructure planning to achieve social justice. The governance-led design approach plays a key role in this process by creating inclusive and transparent platforms for dialogue, encouraging deeper understanding and mutual comprehension among stakeholders (Tsekleves et al., 2022; Liu, 2024; Hoffman, 2022). It empowers local communities and residents, giving them a more active role and greater influence over political decisions that directly affect their lives (Dabaghi, 2024, p.452-469; Manzini, 2014, p.57-66; Schneider, 2020). This study demonstrates the potential of participatory governance to bridge communication gaps and promote more inclusive, equitable energy infrastructure planning. It highlights the contradictions between national energy goals and local environmental priorities, offering an innovative pathway for advancing social justice in the context of the sustainable energy transition. Through fostering community-driven planning processes, the research paves the way for solutions that balance the needs of local communities with long-term environmental stewardship and civil rights.

KEYWORDS | PARTICIPATORY GOVERNANCE, GOVERNANCE-LED DESIGN, PUBLIC DESIGN, COMMUNITY PRACTICE, STAKEHOLDERS

1. Introduction

“The global transition toward net-zero emissions has driven the rapid development of renewable energy infrastructures; however, their deployment often sparks conflicts at the local level”. (Esposito, et al, 2023, p.259-273; Light, 2021, p.102855) While these projects are crucial for achieving sustainability, they frequently disrupt landscapes and impact communities, creating tensions between developers, governments, and local residents. A notable example of such tensions is the proposed electric interconnector project(AQUIND) between Normandy, France, and Portsmouth, UK. Aquind Limited’s proposal outlined plans to: “Install cables designed to transmit 2 million watts of electricity beneath Eastney Beach, and to construct trenches and tunnels from the landing site, extending from south to north, to connect the cables to the National Grid at Lovedean” (Aquind Limited, 2023). This would

enable the flow of electricity between Europe and the UK. “However, the construction of this project threatens to cause several months of power disruptions and extensive damage to the city's infrastructure along the route”. (Portsmouth City Council, 2023) Long-buried toxic materials in landfill sites could be unearthed, further harming an already congested and environmentally stressed city. The author noted that “Although the project holds national significance, local opposition in Portsmouth has been fueled by concerns about environmental degradation and a perceived lack of transparency in the decision-making process“ (Author, 2023). These concerns were exacerbated by a sense of inadequate consultation, which left local communities feeling marginalized and excluded from the planning process. In response, local residents formed a grassroots community group, Let’s Stop Aquind (LSA), organizing various protests, submitting petitions, and leveraging media platforms to amplify their objections. Some artists and designers actively engaged with the cause, utilizing design tools and visual media to express their views, spark public discussion, and mobilize action. “Activities included crafting protest messages through Craftivism, carrying protest posters along the proposed interconnector route, painting rocks within the community and hiding them along the interconnector path in Portsmouth, and digitally projecting a film about political donations made by Aquind Limited directors to Conservative MPs onto the hull in Portsmouth dockyard.” (Let’s Stop Aquind, 2021) “Through these creative art and design interventions, artists and designers transformed abstract political concerns into tangible, collective expressions of resistance.” (Licaj, 2023, p.450-467) By fostering inclusive and accessible forms of activism, they empowered community members to articulate perspectives, ultimately amplifying the impact of their actions in the public sphere.

Figure 1. Spontaneous Poster Protests by Local Residents (left) and Craftivism in Response to the Aquind Interconnector (right).

The tensions between Aquind’s national-scale project and local residents’ environmental priorities underscore the need for a more participatory approach to governance in renewable energy infrastructure planning. This practice-based research project, undertaken as part of the STOP-AQUIND initiative (carried out from March 3, 2022, to December 1, 2023), critically examines the limitations of traditional stakeholder communication and advocates for innovative, design-driven interventions that foster inclusive dialogue and meaningful community engagement. By introducing the speculative design concept "Pillow Bomb" as a tool for collaborative discourse, this paper presents a novel pathway for embedding design justice within the energy transition. It argues that participatory governance can bridge the gap between national energy strategies and local concerns, fostering more equitable, transparent, and resilient planning processes. This approach empowers communities, ensuring their sustained involvement in shaping energy infrastructure development.

2. Literature Review

"The term 'governance' originally emerged as a social science concept and was first introduced by the ancient Greek philosopher Plato, meaning 'to guide and manage the people'." (Wanjiru, 2022) Peters explained that "If conceptualized correctly, governance can form the foundation of an important political theory, focusing more explicitly on how the public sector provides guidance and control for society and the economy, thus addressing a range of contemporary issues in both academia and the real world" (Peters, 2011, p.63-72). Levi-Faur argued that "Participatory governance is a variant or subset of governance theory that emphasizes democratic participation, particularly through deliberative practices, with the aim of deepening citizens' engagement in government processes by critically examining the assumptions and practices of traditional perspectives" (Levi-Faur, 2012, p.457-471). "A pivotal framework for understanding participatory governance is Arnstein's Ladder of Citizen Participation, which categorizes citizen involvement into eight hierarchical levels, ranging from manipulation (the lowest) to citizen control (the highest)." (Arnstein, 1969, p.216-224)(See Figure 1) These levels are grouped into three categories: non-participation, tokenism, and citizen power. Non-participation (e.g., Manipulation and Therapy) reflects instances where the intention is merely to educate or cure participants, rather than genuinely involving them. Tokenism (e.g., Informing, Consultation, and Placation) allows citizens to hear and be heard but limits their power to influence decisions. True citizen power (e.g., Partnership, Delegation, and Citizen Control), on the other hand, represents meaningful participation where citizens actively shape policies and decisions. To conclude, participatory governance emphasizes democratic engagement through deliberative practices, aiming to deepen citizens' involvement in governmental processes. Arnstein's Ladder of Citizen Participation serves as a key framework to evaluate the effectiveness of such governance, highlighting the importance of advancing from tokenism to genuine citizen empowerment.

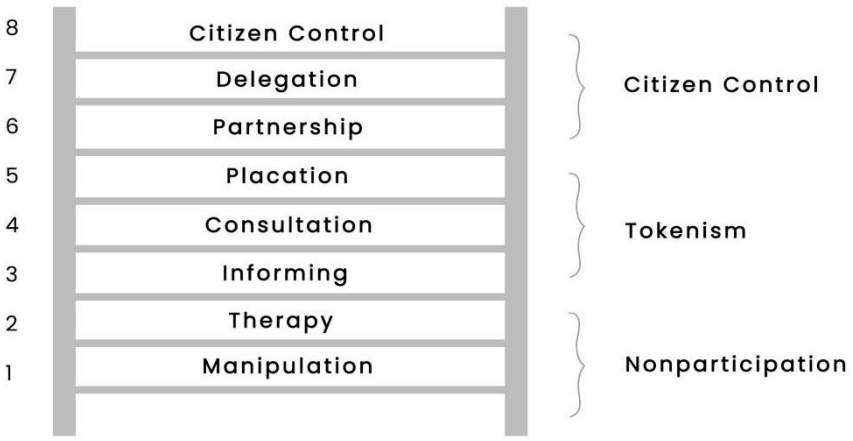

Figure 1. Arnstein's Ladder (1969) Degrees of Citizen Participation.

As scholars turn their attention to the role and nature of participatory governance, increasing evidence shows that its implementation enhances efforts to improve democracy, social welfare, and national quality. Monterroza-Rios et al's research on community design in Colombia demonstrated that "Participatory governance increases residents' sense of collective belonging" (Monterroza-Rios, et al, 2024, p.1-16). Arnstein's framework would prompt a deeper examination of whether this participation lies within the realms of tokenism or genuine citizen power. "Similarly, UNIDO's report on participatory policy-making emphasizes the integration of local knowledge and mutual learning between citizens and policymakers, but the ladder underscores the importance of ensuring such practices transcend tokenistic levels and achieve higher rungs of active

citizen power." (Rodriguez & Komendantova, 2022) "By applying Arnstein's framework, researchers and practitioners can critically assess participatory governance practices, ensuring that they foster inclusive decision-making processes that genuinely empower citizens." (Donaghy, 2011, p.83-102; Martin, et al, 2023, p.80-91) The above research indicates that Arnstein's Ladder of Citizen Participation provides a critical framework for evaluating these practices, underscoring the need to move beyond tokenism and toward genuine citizen empowerment.

In governance theory, Governance-Led Design (GLD) primarily focuses on the strategic involvement of various stakeholders in addressing and solving contemporary social, technological, and cultural challenges through design. "By framing governance as a collaborative and participatory process, GLD invites a critical exploration of future possibilities, ensuring that governance mechanisms are more inclusive, transparent, and adaptive." (Dunne & Raby, 2024) Scholars increasingly combine regional contexts and real-life examples to investigate the practical applications of GLD, gaining a deeper understanding of its potential to foster effective and positive social change. Şahin & Turan, in their study of policy-making practices in Turkey, emphasized "The importance of leveraging local autonomy to bridge the gap between citizens and administrative bodies" (Şahin & Turan, 2022, p.427-443). This process, powered by GLD, promotes a dynamic model for decision-making, which alleviates conflicts caused by information asymmetry and facilitates sustainable, multi-possibility spaces for policy innovation. Similarly, Lanng et al in Denmark found that "The intersection of citizen action and policy-making in rural areas highlights the increasing role of design in fostering effective citizen engagement and policy-making" (Lanng, et al, 2022, p.86-102). This interaction allows for more comprehensive policy development by incorporating community feedback and engaging citizens in the decision-making process, ultimately improving the effectiveness and fairness of policies.

It is evident that GLD plays a crucial role in policy-making by improving decision-making quality, offering innovative solutions, and ensuring that policies are forward-thinking, efficient, inclusive, and feasible. In turn, this fosters progress in both public governance and social development. For instance, in the "Social Studio" project in Scotland, Broadley & Dixon (2022, p.444-465) pointed out "Participatory policy design not only addresses the needs and values of the public but also leverages a broader range of expertise and resources". "The Scottish Parliament fosters a 'safe space' for public engagement by utilizing 'mini-publics', which are composed of randomly selected citizens, thereby enhancing the participatory and deliberative quality of policymaking." (Escobar & Elstub, 2017) McGillivray et al demonstrated that "Participatory design processes, such as design competitions and public exhibitions, foster wider social involvement, improving decision-making and the inclusivity of public spaces" (McGillivray, et al, 2023, p.1-18). Additionally, Mariotti et al's focus group research in Kuala Lumpur reinforced that "Involving future residents in housing design processes strengthens understanding of their needs, contributing to better urban planning" (Mariotti, et al, 2023, p.624-640). Overall, GLD offers a transformative approach to governance by actively involving diverse stakeholders in shaping societal futures. This approach enhances democratic participation, enabling citizens to critically assess and construct more inclusive and sustainable policy implementation methods.

3. Methodology

This study is conducted within the broader context of the NON-AQUIND practice research project, in collaboration with other researchers. It employs a combination of field observation, participatory methods, semi-structured interviews, and the stakeholder

communication dynamics. These methods are designed to examine the underlying causes of conflicts between national energy objectives and local environmental concerns while also addressing the challenges of achieving stakeholder consensus.

3.1. Field Observation

Dabaghi claimed that "Field Observation enables researchers to collect data in the natural environment where the product or service will be used, allowing for a more accurate understanding of real-world contexts and user behaviours" (Dabaghi, 2024, p.452-469). This approach provides insights into how users interact with designs in situ, rather than in artificial or controlled settings, ensuring that the design decisions are rooted in actual use cases. In order to gain a comprehensive understanding of the potential impact of the proposed Aquind electricity interconnector, this study conducted a site visit to key locations along the planned cable route in the Portsmouth area. "The selected locations include Eastney & Milton Allotments Association, Thatched House, Langstone Harbour Fishermen's Association, Fort Cumberland Open Space Car Park, Eastney Naturist Beach, and The People's Memorial." (Stop Aquind, 2022) These areas were chosen for their distinct land use and significance to local communities, as they reflect both residential and the lives of local residents that could be affected by the interconnector's installation.

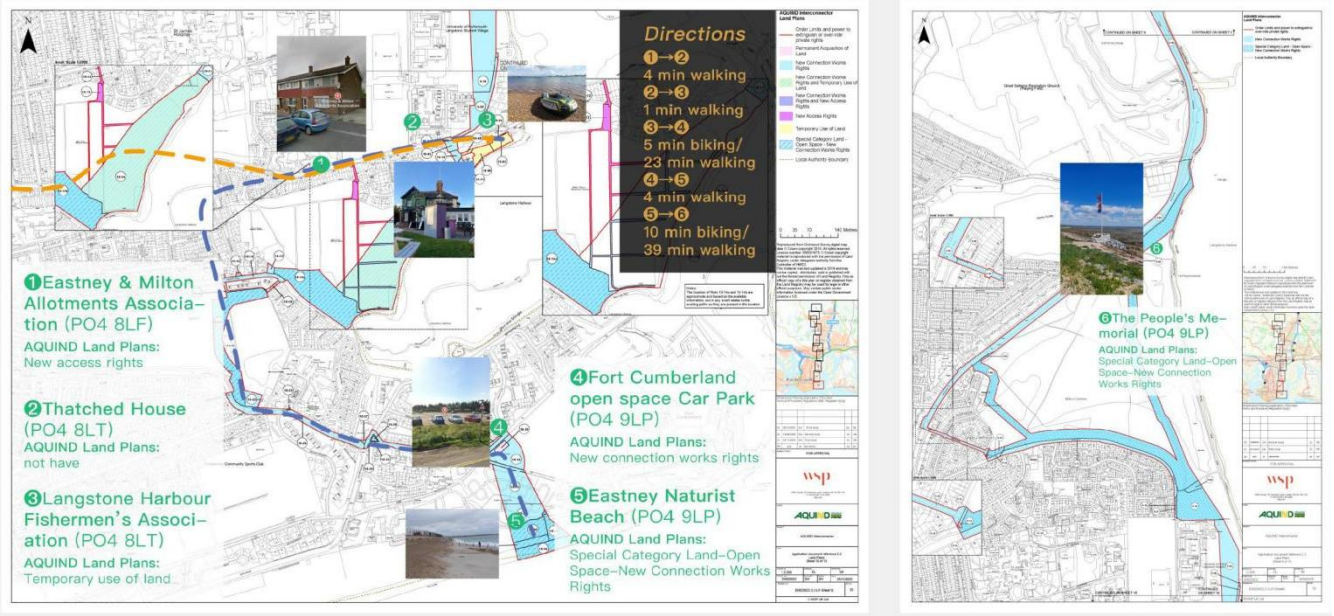

Figure 2. The Map of Key Landmarks Along the Aquind Interconector Land Plans in Portsmouth.

A detailed map was created to illustrate the proposed route of the Aquind cable and to mark its proximity to these locations(See Figure 2). The Eastney & Milton Allotments Association is designated with new access rights under the AQUIND Land Plans, emphasizing its connectivity within the community via walking and biking routes. The Thatched House remains unaffected by any proposed interventions. In contrast, the Langstone Harbour Fishermen ' s Association is marked for temporary land use, likely serving operational needs during project activities. The Fort Cumberland Open Space Car Parkis identified as a strategic site for new connection works, while the Eastney Naturist Beach and The People's Memorial, both classified as "Special Category Land-Open Space," are allocated new connection work rights. The land-use characteristics of these areas include urban allotments, heritage sites, recreational spaces, and leisure zones, which are likely to experience significant changes if the project proceeds. By surveying these areas, the research aims to assess the potential conflicts between the proposed development and the local community ' s concerns about land usage, environmental impact, and the preservation of community spaces.

3.2. Participatory methods & Semi-structured interviews

To better understand the concerns and resistance of Portsmouth residents regarding the proposed Aquind interconnector project, both participatory methods and semi-structured interviews were employed in this study. “These approaches allowed for a comprehensive, context-sensitive exploration of the local environment and its socio-cultural fabric, providing a nuanced understanding of the community ’ s perspectives.” (Manzini, 2014, p.57-66) Through participatory research, a multi-sensory and immersive field methodology was applied to explore key areas in Portsmouth. “This approach visually captured the interactions between ecological landscapes and built environments.” (Schepers, et al, 2013, p.281) Various participatory techniques were used, including Pattern (identifying characteristic textures reflecting local environmental and cultural identities), Haptic (physical interaction with local materials such as beach rocks to deepen sensory connection with the area), Transportation (experiencing different modes of transport to gain contrasting spatial insights), and Record (collecting local materials and documenting auditory features of affected spaces)(See Figure 3). The researcher extracted key elements from five locations along the Aquind electricity interconnector (shown in Figure 2) and combined them with landscape features (e.g., carrots from local vegetable gardens, streetlights) and natural elements (e.g., swans, sea grasses) corresponding to each area. These elements, collected through participatory methods, were integrated to create a spatial map that visually represented the local environment.

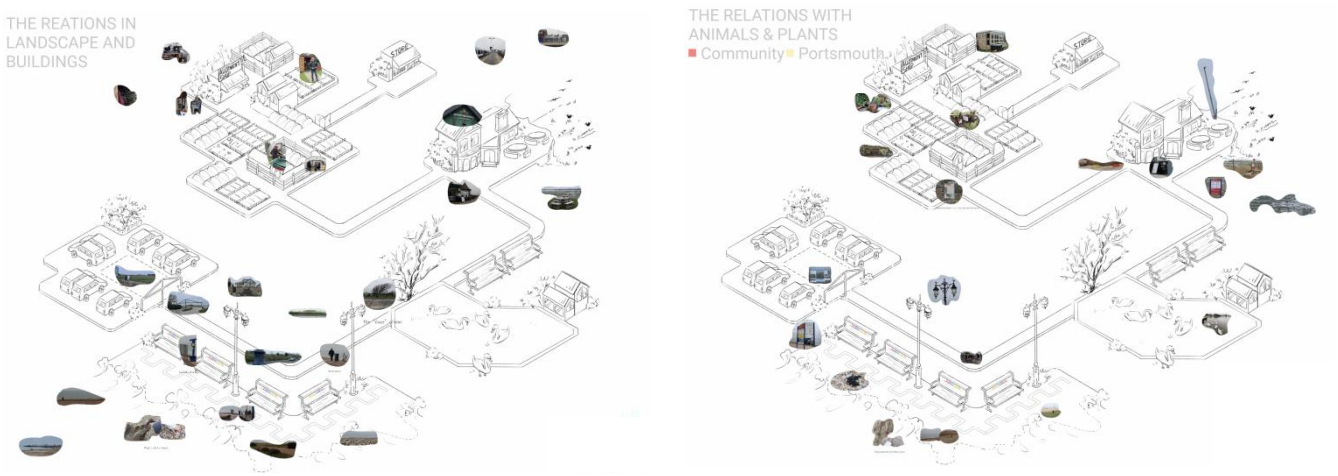

Figure 3. The Spatial Mapping Between Ecological Landscapes and Built Environments in Portsmouth.

In parallel, semi-structured interviews were conducted with 24 Portsmouth residents — selected to reflect a diverse cross-section of the local population directly affected by the proposed development. The sample included long-term homeowners, younger renters, and individuals from both urban and suburban areas. Several participants had actively taken part in public hearings or community protests against the project, while others expressed concern but had not previously engaged in any formal opposition. Interviews were also conducted with representatives from Aquind Limited and local government bodies to gain a broader perspective on the conflicts surrounding the project. These interviews, which lasted 30-45 minutes each, featured open-ended questions and focused on the key reasons behind the community ’ s resistance(See Table 1). Data collected through audio recordings and supplementary notes revealed that poor communication between the government and residents (40%) was a primary concern, followed by environmental disruption (32%), energy concerns (20%), and intergenerational differences (8%). Thematic analysis of the interviews highlighted that residents felt excluded from meaningful dialogue and were particularly worried about the potential destruction of

Portsmouth ' s historic and cultural heritage, loss of biodiversity, and the visual and infrastructural impacts of the Aquind interconnector project. The residents emphasized the need for transparent communication beyond traditional media channels, noting that their concerns were exacerbated by a perceived disregard for their civic rights. "Combining these participatory methods with insights from the interviews provides a solid, contextually grounded approach to understanding local resistance and concerns about the project, and lays the foundation for a more inclusive and transparent model of participatory public governance." (Huybrechts, et al, 2020, p.3-16)

Table 1. Causes of Conflict in the Aquind Interconnector Project: Summary of Semi-Structured Interviews.

Aspect	Details	Insights
Objective	To explore the reasons behind conflicts between Portsmouth residents, Aquind Limited, and government representatives, and to collect narratives about the cultural identity of Portsmouth.	/
Number of Participants	24	/
Participant Profiles	Portsmouth residents, Aquind Limited, and government representatives.	/
Interview Format	Semi-structured interviews with open-ended questions.	/
Key Questions	- What are the main reasons for conflicts between the projecr of Aquind interconnector and the local residents?	-Communication between the government and local residents(40%) -Environmental disruption(32%) -Energy issues(20%) -Intergeneration(8%)
	-Why do local residents organize protests?	-Perceived Lack of Participation in Decision-Making -Opposition to Disruptive Infrastructure Projects -Desire for Alternative Solutions
Duration	30–45 minutes per interview.	/
Data Collection	Audio recordings with supplementary written notes.	/
Analysis Method	Thematic analysis to identify key	/

	patterns and unique insights.
Ethical Considerations	Participants were assured anonymity, / and informed consent was obtained.

3.3. The Stakeholder Communication Dynamics

The analysis of the communication dynamics surrounding the Aquind interconnector project reveals a complex yet predominantly traditional and unidirectional interaction among the stakeholders: Aquind Limited, the government, Portsmouth Council, the Eastney and Milton Allotment Association, and the public(See Figure 4). Aquind Limited primarily communicates with Portsmouth Council and the government through formal official letters and their official website, while their engagement with the public is largely limited to information dissemination via social media. The government, in turn, interacts with local associations and the public through newspapers, official websites, and social media, showcasing a top-down flow of information. Similarly, Portsmouth Council relies on official letters, its website, and notices to convey information, indicating a lack of dynamic communication channels. The Eastney and Milton Allotment Association plays a unique role by combining formal and grassroots approaches, such as attending onsite meetings with Aquind Limited inspectors while also engaging with the public through petitions, marches, and crafting localized advocacy efforts. Despite these efforts, the association still faces constraints in influencing the decision-making process due to the overarching dominance of government and Aquind Limited communication frameworks. Most significantly, the public's voice appears marginalized, as their communication options are limited to reactive measures like petitions or participation in protests, which lack the institutional backing to effect meaningful policy changes. This unilateral flow of information underscores the need for a more inclusive governance model that empowers citizens to participate actively in the decision-making process. "Public discourse must move beyond being mere recipients of information to becoming collaborative contributors, ensuring their concerns are addressed and integrated into project planning and execution." (Tsekleves, et al, 2022, p.101118)

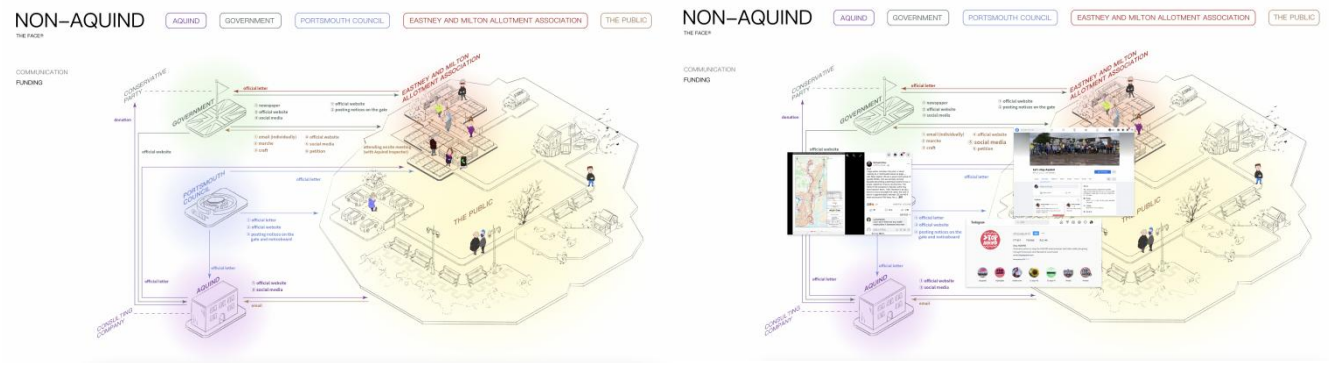

Figure 4. The Stakeholder Communication Dynamics.

4. Results

Building upon the findings and insights derived from these immersive participatory methods, a workshop was subsequently conducted to translate these sensory and contextual understandings into stakeholder engagement tools. By employing design metaphors, the workshop participants were encouraged to reflect on abstract concepts

and potential scenarios that resonated with their lived experiences, facilitating a deeper connection to the project. The workshop, titled "Pillow Bomb," involved 24 participants, representing three key stakeholder groups: Portsmouth residents, Aquind Limted and government representatives. Participants drew lots to assign themselves roles representing positions different from their own within the Aquind Interconnector project. “This diverse participant composition ensured a comprehensive representation of community values, environmental priorities, and economic objectives.” (Morelli, et al, 2017, p.3171-3184)

4.1. Crafting Tangible Metaphors: Props as Stakeholder Symbols

The props used in this participatory workshop were meticulously designed and handcrafted to embody the essence of stakeholder roles and interactions, drawing directly from the local textures, materials, and spatial dynamics identified during the fieldwork(See Figure 5). During the workshop, three key roles were defined based on the Aquind Interconnector project: Portsmouth residents, Aquind Limited, and government representatives. The three characters symbolize respectively core community values (Residents), environmental priorities (Government), and economic objectives (Aquind Limited). These roles were represented through distinct colors-orange for Portsmouth residents, green for Aquind Limited, and blue for government representatives. The props included masks to signify perspectives, pillows to symbolize participant stances, balloons to represent challenges or barriers, and word cards to encapsulate critical values. Masks were intricately hand-painted to symbolize diverse perspectives, with bold patterns and colors reflecting the distinct identities of each stakeholder group. Pillows, representing participant stances, were sewn with precision using soft fabrics and custom-printed covers that visualized key themes such as sustainability, community, and economic growth. The word cards were designed with striking typography and produced through silkscreen printing, ensuring clarity and visual appeal. These cards encapsulated essential stakeholder values and priorities, serving as pivotal tools during the activity. The symbolic costumes, including short-sleeved shirts, were tailored and decorated with hand-drawn illustrations and screen-printed designs to provide participants with a tangible and immersive role-playing experience. These props encouraged participants to embody their assigned stakeholder’s perspective, fostering empathy and deeper engagement with conflicting viewpoints. Botero et al pointed out “Through the tactile and visual elements, participants were able to internalize and reflect upon the diverse interests and priorities of each stakeholder group(Botero, et al, 2020, p.17-34)”. This immersive experience not only facilitated a more nuanced understanding of the project’s social dynamics but also enhanced collaborative problem-solving and dialogue. By physically embodying these roles, participants could more effectively engage in the negotiation of conflicting values, contributing to the development of more context-sensitive and inclusive solutions for the Aquind Interconnector project.

Figure 5. Symbolic Props and Steps to Participate.

4.2. Collaborative Co-Creation-"The Pillow Bomb Workshop"

Held on a bright April day in Milton Park, the Fete featured campaign materials by researchers, and lively discussions among attendees. Participants explored the exhibits, shared refreshments, and exchanged ideas in an engaging setting. As main part of the activity, participants began the activity by attaching balloons to their peers, a symbolic representation of the barriers to mutual understanding that often hinder effective stakeholder dialogue in energy infrastructure planning(See Figure 6). This visual and interactive approach provided a tangible way to illustrate the communication challenges that exist among diverse groups. As the balloons were removed, word cards hidden beneath them were revealed, representing the fundamental values of different stakeholders. The act of "unveiling" these cards symbolized the process of overcoming communication barriers and uncovering the core priorities of each group. Using these word cards, participants crafted sentences that articulated the priorities of their assigned stakeholder roles. This creative yet structured exercise allowed participants to express concerns and values from a specific perspective, fostering clarity and empathy in understanding. Finally, these individual sentences were collaboratively combined into cohesive narratives, reflecting the integration of diverse perspectives into actionable insights, including community engagement strategies, and communication principles that could inform future stakeholder dialogues, mitigate conflict, and guide decision-making in complex infrastructural projects.

The following are some sentence construction examples provided by the selected participants:

- Resident: "I'm concerned that the construction of the cable will disrupt the peaceful environment around my cottages that could harm my back yard."
- Aquind Limited: "We plans to invest substantial money to construct the cable, believing that it will provide the region with more reliable electricity, ultimately contributing to the energy sector's long-term growth."
- Government: "I organized a meeting to discuss the report on the potential impact of the energy project, with the aim to sanction the construction of the cable once all environmental concerns are addressed."

Figure 6. Photos of the Pillow Bomb Workshop.

The participatory workshop "Pillow Bomb" demonstrated notable success in fostering dialogue among diverse stakeholders. Post-workshop surveys, completed by all 24 participants, revealed a significant increase in their understanding of other stakeholders' perspectives. The group included 12 local residents, comprising long-term homeowners concerned about environmental impacts, community activists who had protested against the project, and undecided residents caught between support and opposition. 6 Aquind Limited representatives, including project managers and engineers, explained the company's objectives and technical aspects of the project. Finally, 6 local government representatives, including council members and urban planners, provided insights into regulatory challenges and the balancing act between development and public interests. On a Likert scale from 1 (low) to 5 (high), 87% of participants rated their understanding of conflicting viewpoints as 4 or 5, compared to only 33% prior to the session. "Qualitative responses also emphasized the symbolic props' effectiveness in conveying complex stakeholder values." (Shelley, 2016, p.271-296)

One participant remarked, "The masks helped me visualize how others see the issue, which made it easier to empathize with their stance. It was a tangible way to experience perspectives that were not my own, which deepened my understanding of the conflict and the emotional stakes involved." Another respondent shared, "Unveiling the word cards beneath the balloons was a powerful metaphor for uncovering hidden priorities. It really drove home the importance of communication in resolving these barriers. The process of peeling back layers to reveal what's underneath mirrored how we need to address the deeper concerns of all parties involved." Additionally, the structured activities, particularly the collaborative narrative-building exercise, were instrumental in aligning differing priorities into actionable insights. This exercise allowed participants to move beyond their initial positions and engage in a shared process of meaning-making. Several government representatives highlighted that the process clarified misconceptions they held about community opposition, enabling them to appreciate the residents' concerns in a new light. Portsmouth residents, in turn, expressed appreciation for the government's increased focus on sustainability and their willingness to integrate community values into policy discussions. Aquind representatives explained that the activity encouraged them to explore potential compromises, such as minimizing the environmental impact in exchange for economic benefits. This not only opened avenues for more balanced solutions but also fostered a sense of shared responsibility among all stakeholders.

5. Discussion

5.1. Empowering Local Communities through Participatory Governance

The case of the Aquind interconnector exemplifies the critical need for participatory governance to address tensions between national infrastructure goals and local environmental priorities. Drawing on Sherry Arnstein's "Ladder of Citizen Participation," this discussion underscores the limitations of traditional decision-making processes that marginalize community voices and highlights the transformative potential of empowering citizens to take an active role in governance. "Arnstein's ladder categorizes participation into eight rungs, ranging from manipulation to citizen control, illustrating how power dynamics affect the inclusiveness and legitimacy of public decision-making." (Arnstein, 1969, p.216-224) In the Aquind case, the perceived lack of meaningful consultation placed community members on the lower rungs, such as "informing" and "consultation," where their input held little influence over the project's trajectory. Residents' frustrations were amplified by the opaque decision-making process, which prioritized national objectives over local concerns. Liu explained that "By transitioning to higher levels of participation, such as 'partnership' or 'citizen control,' it becomes evident that shifting from the traditional top-down governance model to a bottom-up approach fosters more equitable collaboration" (Liu, 2024, p.385-387). Through speculative design activities, Portsmouth residents, Aquind Limted and government government representatives co-experience solutions, allowing citizens to move beyond mere consultation to active partnership and shared decision-making. Specifically, workshop participants were encouraged to critically analyze and reconstruct the proposed interconnector plans using tangible design tools, which democratized access to complex technical information. "This approach not only highlighted previously marginalized local concerns but also underscored the value of integrating community insights into decision-making." (Tan, 2023, p.2371) By granting citizens a platform to voice their perspectives and influence project outcomes, the "Pillow Bomb" initiative exemplifies the transformative potential of participatory governance. This commitment to co-creation aligns with Arnstein's notion of citizen control, showcasing a governance model where power is redistributed to ensure transparency, accountability, and equity in planning processes.

5.2. Governance-Led Design in Protest and Collaboration

The "Pillow Bomb" workshop exemplifies how governance-led design (GLD) can mediate tensions between protest and collaborative governance, offering a unique pathway for resolving complex socio-political conflicts. By framing governance as an inclusive and participatory process, the workshop explores how GLD can transform local opposition into constructive dialogue. The step-by-step process exemplifies GLD's core principles by actively involving participants in symbolically and practically addressing obstacles to mutual understanding. Attaching balloons to roles serves as a metaphor for communication barriers, visually representing the challenges that often hinder effective stakeholder collaboration. By removing the balloons and unveiling word cards that symbolize fundamental stakeholder values, the activity embodies the GLD approach of uncovering underlying priorities and promoting shared understanding. "The workshop's critical contributions lies in its ability to channel social protest into actionable policy recommendations." (Manzini & Rizzo, 2011, p.199-215) Particularly, participants co-experienced speculative scenarios addressing key issues such as land use, environmental risks, and community disruption. The workshop's design-led activities empower participants to critically examine contested projects and propose alternative approaches that balance national energy priorities with local environmental concerns. These scenarios were presented as policy briefs to local authorities, bridging the gap between citizen activism and public governance.

“Furthermore, the workshop demonstrated how design can foster empathy and mutual understanding by encouraging stakeholders to visualize alternative futures.” (Corubolo, et al, 2021, p.2471-2486) The crafting of sentences using these word cards encouraged participants to empathize with diverse perspectives by adopting specific stakeholder roles. The collaborative process of integrating individual sentences into cohesive narratives exemplifies the GLD principle of co-creating actionable insights through collective input. This approach not only aligns with the principle of participatory governance but also demonstrates the potential of GLD to transform conflicting viewpoints into shared accountability and innovative solutions for complex decision-making in energy infrastructure projects. By transforming protest into constructive engagement, the "Pillow Bomb" workshop illustrates the transformative potential of Generative Live Design (GLD) in navigating contentious socio-political landscapes. It offers a replicable framework for fostering inclusive dialogue, aligning conflicting priorities, and co-developing sustainable solutions in energy infrastructure planning. This methodology seeks to address complex social and political tensions through design activities such as symbolic balloon removal, role-playing, and co-creation of narratives. Rather than offering definitive solutions, it creates conditions for dialogue, reflection, and mutual understanding. While it does not eliminate the natural variability and contradictions inherent in stakeholder dynamics, it shows how GLD can serve as a catalyst for negotiating diverse priorities and fostering the emergence of more sustainable and socially responsive approaches.

6. Conclusion

Through the research of the proposed Aquind electric interconnector project, it becomes evident that traditional top-down communication methods often fail to address the complexities of stakeholder relationships. These communication gaps result in entrenched opposition and mistrust within local communities, highlighting the need for more inclusive and transparent approaches. The study advocates for a shift from traditional hierarchical governance structures to participatory governance models, emphasizing the integration of local residents' needs and values into decision-making processes. By utilizing the "Pillow Bomb" workshop, community members can transition from lower levels of participation, such as "informing" and "consultation", to higher levels, such as "partnership", in alignment with Sherry Arnstein’s “Ladder of Citizen Participation.” This approach advances their engagement in decision-making processes, empowering them to play a more active role in shaping outcomes. The research suggests that empowering communities to actively participate in decisions that affect their environment not only fosters a better alignment between national sustainability goals and local resilience but also ensures that local knowledge and concerns shape the policies impacting them.

About the Authors:

Author 1 Xueyi Li is currently working toward the Ph.D. degree in Design with School of Design, Hunan University. Her research interests include Speculative Design; Service Design. She also researches how design can help shape social public values and governance norms.

Author 2 Yonghong Liu is a Professor in Industrial Design at School of Design, Hunan University. His research centres on design with business, human-centered design strategy and service system design.

Author 3 Tobie Kerridge is a Lecturer in Design, Director of Research, Department of Design, Goldsmiths, University of London. He is committed to taking a collaborative and speculative approach to design, and in providing empirical and critical accounts of that practice.

Acknowledgements: The related research activity benefited from funding awarded by the Research and Knowledge Exchange Committee in the Department of Design, Goldsmiths, University of London. Appreciation is also extended to the members of Non AQUIND for their invaluable support and contributions.

DESIGN FOR KNOWLEDGE CO-CREATION. REFLECTIONS ON UNIVERSITIES, SOCIETY, AND INTERDEPENDENCE.

Sara Ceraolo[a]

a Politecnico di Torino, Dip. Architettura e Design*
* sara.ceraolo@polito.it

ABSTRACT | The article explores the complex interrelations between universities, society, and design in the context of knowledge co-creation and it discusses design's potential role as an ally in fostering collaborative, inclusive, and pluriversal approaches. Building on the concept of the Third Stream and its recent interpretations, the central argument of the paper suggests that current forms of university engagement and *civicness* are insufficient to address contemporary global challenges adequately.
In the first part, the article contextualises the evolution of universities' civic engagements within the framework of the Third Mission, presenting models such as the Civic, Entrepreneurial, Relational, and Engaged Universities. While these models highlight the growing societal role of higher education institutions, the discussion underscores their limitations in addressing coloniality and epistemic violence in academia and its knowledge production processes. Failing to rethink their role and embrace a more relational and situated understanding of knowledge, universities are missing the opportunity to support community self-determination and autonomy, as shared experiences of knowledge production, interpretation, and dissemination are considered essential for this purpose. Like academia, design, especially participatory design, is undergoing critical reflection, moving beyond simplistic visions of being intrinsically democratic or "good-doer." The discussion of positionality and privilege in design aligns with broader shifts

towards context-sensitive approaches rooted in interconnection and mutual responsibility. Although design has not yet fully integrated critical thinking into its discourse or comprehensively addressed its colonial responsibilities, the paper suggests that its ongoing transformation represents an intriguing opportunity to support the redefinition of collaborative dimensions promoted by academia towards external communities. This potential is also rooted in design's intrinsic emphasis on making and its inclination toward transformation and change. Also, the discussion defines its capacity for a pluriversal understanding of the world and its predisposition towards collaborative and community-based processes as crucial to the task.
The second part of the article examines the fitness of design in addressing knowledge-creation processes. Three key strengths of design in supporting knowledge co-creation are identified: its ability to enable metaphors, its role as a boundary object, and its tacit nature.
Finally, while acknowledging the study's limits and inherent complexities and contradictions, the preliminary results of the research point out that, with the support of design, academia could embrace a pluriversal vision of knowledge, conceptualising reality as an interconnected and diverse kaleidoscope of perspectives. Moreover, while engaging in these processes, design gathers insights that can enrich the discipline itself and reflect on which skills and/or attitudes designers should cultivate to effectively support processes related to the co-creation of knowledge, fostering ethical and more inclusive knowledge systems.

KEYWORDS | UNIVERSITY, KNOWLEDGE CO-CREATION, DECOLONIALITY, PLURIVERSAL DESIGN, INTERDEPENDENCE

1. Introduction

The article presents insights from a more articulate exploration into the complex topics of knowledge co-creation, university-society relationships, and the role of design.

Recently, various circumstances have brought me to the forefront of the opportunity—or perhaps the necessity—to reflect deeper on the connection between the discipline I have chosen as my own, design, and its capacity to respond to the events of the world, addressing inequalities and societal challenges (Campus Engage, 2017). I have felt compelled to observe, with the courage to delve beyond the reassurances that had driven my research and practices until now (Valentine & Farias & Farias, 2024), the ethical dimensions of what I was doing (Sweeting, 2018) —as both a designer and as an individual implicated within the academic context.

The lead hypothesis discussed here is that (1) universities should foster collective experiences of knowledge production (Bolisani et al., 2018), interpretation, dissemination, and memory-making (Kambunga et al., 2020) in order to support

community autonomy and self-determination (Kambunga et al., 2023). This generates two interconnected follow-up hypotheses. The first posits that (2) if universities engage in such collective practices, they are better able to acknowledge their mutual interdependence with society. This, in turn, opens up space for new, situated conversations that challenge traditional boundaries and foster more responsive and inclusive forms of knowledge production. The second suggests that (3) thanks to its inherently relational and collaborative nature, design can be instrumental in these processes—not by assuming leadership, which may reproduce problematic hierarchies, but by offering accompaniment, forming alliances, and fostering kin-ship (Haraway, 2016).

A design perspective on the Third Mission offers significant insights, as it intertwines topics such as organisational design, disciplinary responsibilities, and the development of designers' cultural and critical knowledge and competencies. More precisely, this article aims to contribute to the (inter)disciplinary scientific discussion on university, society and knowledge, offering a preliminary recognition of the most relevant aspects that shape the conversation on the ethical dimension of the phenomena under analysis and the role of design.

In the first part, after clarifying the methodology adopted, the article discusses the evolution of civic engagement in universities, followed by a critical discussion of how topics such as colonialism, hegemony, exclusion, and cultural extractivism influence reflexivity in academia and design. Then, design, particularly in its pluriversal and community-oriented expressions, will be discussed as a possible ally to overcome and bridge the distance between the university and society. After assessing the fitness of the design for this task, the paper will proceed with a discourse on knowledge and knowledge creation processes. Here, adopting stances offered by organisational and management sciences, we will debate whether design, with its practices and principles, is suitable for dealing with knowledge-related processes. Finally, while acknowledging the study's limits and inherent complexities and contradictions, the preliminary research results point out that, with the support of design, academia could embrace a pluriversal vision of knowledge, conceptualising reality as an interconnected and diverse kaleidoscope of perspectives. Moreover, while engaging in these processes, design can gather insights that can enrich the discipline itself and reflect on which skills and/or attitudes designers should cultivate to effectively support processes related to the co-creation of knowledge, fostering ethical and more inclusive knowledge systems.

2. Methodology

This research draws on two primary inputs: desk research and fieldwork. The desk phase is structured around a scientific literature review, initiated through a snowballing approach (Wohlin, 2014) using keyword searches on Google Scholar and Scopus. Keywords included topics such as "engaged universities", "third stream/mission", "knowledge co-creation", "decoloniality & academia", "design & knowledge co-creation". From an initial selection of relevant documents, the study

built a more systematic literature review to compare the most cited authorial positions. However, the systematic citation-based literature review aligned more with academic conventions than with necessity, as the critical perspective of the discourse upheld by this article challenges the limitations within the current scientific literature system and its predominantly colonised nature (Begum & Saini, 2019). For this reason, bibliographies of the most significant articles found were preferred as a springboard for further exploration. This criterion, while sometimes more time-consuming, better ensured that the reflection was supported by authors applying a post-heroic approach (Lupo, 2022), belonging (or presenting a perspective related) to groups that are under-represented, non-homologated or representative of different cultures of scientific thinking and knowledge production.

Although it will not be explicitly discussed throughout the article, the contribution of field research activities, primarily conducted through participatory observation and observational participation (Cardano, 2011), has been essential for understanding the multidimensionality of the phenomena under analysis. During the fieldwork activities, I also had the opportunity to reflect on and confront the positionality of my research and the complexity of advancing critical discourses on academia while simultaneously embodying the role of a researcher who is an integral part of that institution. This dual positioning has required a nuanced engagement on my part with the tensions between critique and a sense of belonging[1], which continues to shape the trajectory and implications of my inquiry.

The fieldwork consisted of personal experiences in co-design and co-creation within my research team (Campagnaro et al. 2024; Campagnaro & Ceraolo, 2022; Campagnaro et al., 2021; Campagnaro & Ceraolo, 2020) and participation in events, discussions, protests, workshops, several conferences and debates. Some of these experiences[2] predate the formal start of the research, serving both as evidence and as motivators for its relevance. In my fieldwork, I have prioritised extra-institutional experiences that critically interrogate the university's relationship with society, which I engaged with through the lens and the concept of design. These activities enabled critical reflection on power and colonial dynamics within institutions, universities, and the broader knowledge society.

3. University and society

To delve into the domain analysed in this work, it is first appropriate to discuss the evolution of universities' civic engagements. Contemporary Western academia, structured around three distinct missions, has evolved over the past fifty years,

[1] Given the ethnographic and sociological nature of these observations, this branch of the study will be explored further in subsequent works.

[2] Illustrative examples from some of these fields can be found in the projects presented in the book I co-authored with Cristian Campagnaro, *Ai margini. Un'antologia di social design* (see references for full details).

reflecting its intertwining with a complex network of interests and relationships (Blasi, 2023). It has shifted from an institution focused primarily on teaching and research to an active societal agent, addressing social, economic, and environmental challenges, shaping what Benson and Harkavy (2000) define as a third revolution.

This (re)evolution process has given rise to several visions of academia, which scholars have primarily translated into four models. Each model is traceable to a different push happening within the Third Mission: the Civic University (Benson & Harkavy, 2000), the Entrepreneurial University (Etzkowitz, 2004 and 2013), the Relational University (Castro-Spila & Unceta, 2014), and the Engaged University (Whitmer et al., 2010; Blasi, 2023). Even if they developed chronologically, these models are not merely stages of a linear progression. They represent the different forms the university has moulded into within broader transformation processes. These transformation processes have been shaped by specific priorities, stakeholders, and external pressures, such as collaboration with industries, social engagement, or the dynamics of networking and interactivity.

The Civic University arose in the 20th century and spread after the Cold War to counter criticisms of universities' detachment from local issues. It promoted active community collaboration to address societal challenges, bridging academic prestige and urban decline. It stemmed from the vision, offered since the early 1900s by scholars like Harper (1905), of the university as a “prophet of democracy”. Describing the phenomenon, Benson and Harkavy (2000) emphasise its dual role as both global and local institutions, highlighting the role of university-school partnerships in addressing inequalities and urban issues.

The Entrepreneurial University model was developed in the 1980s and 1990s in response to economic challenges and global competition, focusing on technology transfer and private-sector collaboration (Etzkowitz, 2004 and 2013; Pausits, 2015). Policies like the Bayh-Dole Act[3] (1980) enabled universities to retain ownership of patents, fostering innovation through patents, spin-offs, and consultancy activities (Bosio & Gregorutti, 2023). Despite its success in economic innovation, critics argued that commercial priorities often overshadow initiatives with greater significant impact (idem).

The third model is the Relational University. Developed recently, it represents an additional evolution, focusing on collaboration between universities and local communities to address complex problems. As described by Castro-Spila and Unceta (2014), it envisions universities as nodes within social innovation networks, fostering partnerships to meet regional learning, knowledge, and innovation needs.

[3] The Bayh-Dole Act (1980) is a U.S. law that lets universities, small businesses, and other organisations keep ownership of inventions created through federally funded research. Before this law, the government often held the patents, and many discoveries were left unused. This encourages universities to collaborate with companies to turn discoveries into products, boosting innovation and economic growth. For further info: https://www.govinfo.gov/content/pkg/USCODE-2011-title35/html/USCODE-2011-title35-partII-chap18.htm

Finally, the Engaged University model, emerging in the early 2000s, integrates elements of previous models, engaging directly with communities and companies to tackle societal challenges. It emphasises transformative research involving citizens throughout the process, from problem definition to dissemination. Scholars like Whitmer et al. (2010) and Gregorutti (2021) highlight its potential to integrate research, teaching, and service, driving meaningful social change through collaborative frameworks.

Within this evolutionary path, the renewed social commitment framed within the Third Mission also supported the growth of new international networks gathering engaged universities worldwide, like the Talloires Network (Hollister et al., 2012), emerging to drive positive social impact[4]. The Third Mission, the responsibility towards people, and the need to contribute to building more just and sustainable societies have become central to the discourse promoted by universities and their boards across much of the world, with a particular emphasis on the Global North.

Yet, the fundamental issue of who holds the power to produce knowledge and how it is created remains overlooked. The engaged—civic, relational, and so on—university is committed to impactful and meaningful interactions with the "outside world". Still, its practices, even the collaborative ones, rarely challenge the university-society divide or place knowledge co-production at the centre of this exchange.

From a critical perspective, such involvement confined within a well-defined framework—designed and governed by the university alone, could ultimately hinder more profound transformations. To frame the question provocatively: are we witnessing a process of futuring, fostering new and inclusive possibilities, or defuturing, perpetuating structures that limit genuine change and reinforce existing power dynamics (Fry, 2009)?

Scholars and critics argue that such contradictions must be faced directly (Borghi, 2020; Kalema, 2019). Studies and theories from decolonial and queer thought, as well as concepts developed within the onto-epistemologies of the Global South, call for and support a thorough examination of the forms of hegemony, exclusion, and cultural extractivism that can characterise knowledge production within university-society relationships.

Going even further, this research holds that, to foster such a change, the criticism of academic practices should not be directed solely at the university institution as a whole. Instead, it would be appropriate for the analysis to be rooted in specific disciplinary frameworks, ensuring that the transformative potential of these

[4] Quoting from the website: "The Talloires Network of Engaged Universities is a growing global coalition of 443 university presidents, vice-chancellors and rectors in 91 countries who have publicly committed to strengthening the civic roles and social responsibilities of their institutions. It is the largest international network focused particularly on university civic engagement." For more info: https://talloiresnetwork.tufts.edu/

considerations is integrated into the dynamics and challenges unique to each field of knowledge.

4. Design as a possible ally?

The task at hand is undoubtedly challenging. However, this reflection does not aim to evoke despair or disengagement. While endorsing a call for staying with this trouble (Haraway, 2016) and diving into a critical examination of the university's inner workings, this article also seeks to propose some constructive ideas, which are, of course, related to the role of design.

As mentioned, disciplines should undergo a critical reflection process (if they haven't already started yet), and design is no exception.

Design is indeed undergoing a transition (Escobar, 2015 and 2023; Kossoff et al., 2015; Tonkinwise, 2015). It is slowly moving beyond the comfort of a naïve and megalomaniac (Tonkinwise, 2019) self-conception as inherently salvific, democratic, and good-doer. This transition marks a shift towards a more profound, culturally grounded, and honest awareness phase (Smith et al., 2020). It resonates with Tony Fry's articulation of the shift from "sustainability" to "sustainment," which underscores the urgent need for a radical reimagining of values and institutions to ensure long-term ecological and social viability (Fry, 2012). In this process, design increasingly interrogates its political and ontological dimensions (Escobar, 2018), particularly within its participatory practices (Akama et al., 2019).

The reckoning requires acknowledging the profound influence of Eurocentric, patriarchal, and neoliberal paradigms in shaping design's historical trajectory. It also entails confronting design's complicity in perpetuating the very societal structures it now seeks to address under the banners of "responsibility" or "engagement" (Escobar, 2018).

Despite being a disruptive call that profoundly challenges both the idea that design has of itself and the rhetoric behind some of its most widespread practices, the change for more critical reflexivity lands on a fertile ground for a transformation: design's inclination toward change (Brown, 2009), its ability to navigate uncertainty, to comfortably inhabit spaces of transition (Campagnaro & Ceraolo, 2022), and its aptitude for exploring the margins - which, bell hooks describes as a place of "radical openness" (2015)- is an immense resource. These attributes can be critical for fostering preferable (Simon, 2019) systems, practices, and sensitivities (Manzini, 2015) and can also be amplified by design's intrinsic emphasis on "making" (Campagnaro & Ceraolo, 2022) and its practical, programmatic and concrete (Mbembe, 2016) orientation.

While design has not yet achieved significant milestones in fully integrating these critical thoughts or conducting comprehensive analyses of its colonial responsibilities (Tunstall, 2023), especially compared to disciplines like

anthropology, geography, or sociology—a particularly concerning issue, also given the limited availability of university courses addressing these topics—its nascent rethinking phase offers unique opportunities. This early-stage reflection aligns design and academia in a possible joint effort to develop more inclusive and collaborative knowledge production practices.

Adopting a design-inspired approach, we now aim to critique current practices while contributing to broader cultural change. The following sections address three key questions within the critical theory discourse, demonstrating the close alignment of reflections happening at the university level as an institution and design as a discipline.

4.1. Coloniality and Privilege

Critical theory is a philosophical approach and interdisciplinary framework that seeks to challenge and critique societal structures, ideologies, and practices, especially those perpetuating domination, oppression, or inequality. Originating from the Frankfurt School in the early 20th century, it emphasises integrating social theory with praxis to achieve emancipatory societal transformations (Devetak, 2013).

Critical theory underscores the importance of examining power, domination, and exclusion that shape the Western world, including the university's role (idem). Calls to ‘decolonise’ universities are not new (Mbembe, 2016). Within the critical theory framework, universities must confront the coloniality embedded in academia and its alignment with Eurocentric and neoliberal logic to call themselves socially engaged. As geographer Rachele Borghi points out, these systems historically linked colonial political goals to how knowledge is defined, constructed, and disseminated (Borghi, 2020).

In the 19th century, knowledge was an enormous power tool, with cultural domination preceding territorial conquest. University and society have always been, indeed, interdependent. Positivism fostered an uncritical trust in science, which extended to societal studies. Universities, therefore, became sites of epistemic violence, producing knowledge that reinforced dominant paradigms. While critical thought has addressed aspects of this history, Borghi (idem) observes that it falls short of adopting decolonial approaches or dismantling the structures of domination inherent in Western scientific knowledge.

Nowadays, under the Third Mission, universities that aim to achieve meaningful societal impact are therefore urged to embrace decoloniality. This entails scrutinising the content of knowledge and its producers, challenging the legitimacy of Western scientists as sole arbiters of knowledge.

Similarly, in design, decolonial perspectives are starting to expose entrenched power dynamics within the discipline’s practices and concepts. Following Escobar’s (2018) critiques, design practices are being made aware of how sometimes they perpetuate neo-colonial frameworks, even under the guise of empowerment. This critique aligns with the concept of coloniality of knowledge

(López-Yánez, 2021; Nimführ, 2022), challenging the assumption that neither design nor academia operates in a politically neutral space.

The reflection on the decolonisation of participatory design also examines how, if undiscussed, co-design practices risk legitimising privilege reinforcing unbalances if designers' roles are not critically examined (Smith et al., 2020). Schultz et al. (2018) argue that designers and academics often replicate the representational dimensions of movements without fostering substantive change, calling for more reflexivity and humility and transitioning from tokenistic inclusion to genuine empowerment.

Scholars highlight the need for an ontological shift in design practice, moving from an "ontology of separation" to an "ontology of relatedness" (Escobar & Maffei, 2021). In a brilliant paper published in 2024, van Zeeland describes this as transforming design from a transactional to a relational practice. Such a shift prioritises collaborative knowledge creation, enabling designers to challenge their complicity within systems of privilege and foster authentic co-creation processes (van Zeeland, 2024). This evolution in design, therefore, aligns with broader efforts to reimagine universities as agents of equitable and plural knowledge production, ultimately transforming academic and societal structures.

4.2. Knowledge, knowledges and the issue of speaking for *others*

Placing decoloniality at the centre of academic discussions requires rethinking the role of researchers and challenging entrenched epistemologies. "All knowledge is situated", Haraway (2013) notes, underlining the impossibility of neutrality or universality in scientific understanding. In this regard, critics discuss that knowledge systems rooted in Cartesian dualism—such as science/emotion and nature/culture—maintain exclusionary frameworks that align with neoliberal values while neglecting their colonial roots.

Dealing with the construct of "researched others" and, in general, processes of "othering" (Muftee & Rosales, 2022; Winschiers-Theophilus et al., 2010) is also problematic, as it reinforces hierarchical divides, silencing marginalised perspectives. Linda Alcoff critiques this "speaking for others" dynamic, highlighting how privileged voices, even with good intentions, often amplify oppressive structures. Borghi (2020), referencing Grosfoguel, critiques Eurocentric epistemologies for representing only a fraction of global perspectives while claiming universality. This imposition prevents marginalised groups from engaging with the world on their terms, who emphasise the need for frameworks that enable ontologies and epistemes outside the Western canon to flourish (Moreira & Diversi, 2012).

This monocultural dominance not only marginalises diverse perspectives but also ignores crucial dimensions such as the historicity of the body, intersectional oppressions, and the voices of women and queer people, especially from the Global South. Knowledge systems in the Global South, which integrate mind, body, heart, and spirit, are often erased. Even in participatory research, researchers

frequently retain control over knowledge creation, producing inaccessible outputs that alienate communities.

Participatory design, likewise, sometimes perpetuates these exclusions by failing to examine critically who defines what constitutes the knowledge and the meanings of the projects. Despite well-intentioned goals, design scholars are acknowledging that design practices often remain constrained by predefined briefs, client expectations, funding requirements, and tight timelines. They are also highlighting that decolonising design requires recognising its inherent plurality—not only in the diversity of its outputs but also in its varied approaches and underlying ontological foundations (Taboada et al., 2024).

Moreover, authors discussing reflexivity within the participatory design reflections are pushing to rethink “inclusivity”, claiming that it must extend beyond demographic representation to include embodied and emotional experiences. Two inspiring concepts are worthy of mentioning in this regard. Albarrán González (2022) introduced the idea of *corazonar*, which emphasises integrating heart, emotions, and collective reasoning into the design process. The researchers explain that “the act of reasoning with the heart in collectivity (corazonar) allows going beyond analytic reasoning; it integrates emotions and our sensitivity for a holistic research approach” (Idem).

The second concept is using *yosotros*, a collective *we* transcending individualism, in participatory design. This approach underscores relationality and shared humanity (Idem).

By embracing *corazonar* and *yosotros*, therefore, promising signals can be traced to participatory design practices to foster equitable and transformative collaboration, build deeper connections, and inspire collective innovation.

4.3. Acknowledging interdependence

Finally, the third point of analysis within the debate of the proximity of academia and design in the critical process of addressing the inequalities around knowledge co-creation is related to acknowledging the interdependence that connects the two to society.

Academia is frequently described as an ivory tower. This image, used to criticise universities' detachment from society, might even reinforce the flawed perception of division. Indeed, universities are not separate from society but embedded within its practices, meanings, and processes. They are integral to broader societal systems, and the separation between "outside" and "inside" academia is misleading. Paradoxically, it would better fit the purpose if it were framed as a “corridor within a building” than a “tower”: an instrumental architectural connection, which is part of something whole. Not detached, not higher, but just a part of the building (society, in our case). So, just like a corridor and its respective building, the university and society are interdependent and need each other more than they might be reciprocally willing to admit.

Interpreting their relationship in terms of interdependency helps to frame knowledge production (as "what universities do") as a collaborative process that bridges people's experiences and organises them into shared understandings with transformative capacity. Without people, universities lack purpose. Without purpose, knowledge is hollow. Without knowledge and its transmission, experiences and people are isolated.

Recognising interconnectedness among actors, spaces, and processes is central to the co-design discourse. Co-design, indeed, thrives in participatory networks that empower stakeholders. As Koskinen emphasises, "relationality is a cornerstone of design research as it is the relational aspect that binds human beings, the environment, and objects into a coherent fabric of meaning" (Koskinen, 2023, p. 15). Relationality anchors co-design in networks and participatory practices, shifting the focus from objects to empowering relationships and sustaining collective agency.

5. Design's strengths: navigating pluriversality & the co-s.

To summarise: discussing knowledge in terms of universality and neutrality can be troubling and could reinforce unfair power structures; instead, it would be more appropriate to conceive the question as a plurality of *knowledges* (Haraway, 2013) and ways of knowing (Cross, 1982). Researchers are also always implicated. Therefore, knowledge is situated, not objective. As Rachele Borghi brilliantly explains:

> "Decolonising involves perceiving reality as kaleidoscopic—resembling more the multifaceted images of a kaleidoscope than the rigid linearity of cartographic projections. The kaleidoscope allows for a reinterpretation of reality, creating new images and envisioning alternative realities. This perspective goes beyond merely adopting different viewpoints; it revolves around initiating actions. The kaleidoscope is a tool that offers multiple, decentralised perspectives without centres or peripheries. By simply rotating, it shifts the coloured fragments within, and new and vibrant constellations emerge. Through this lens, the kaleidoscope reveals the pluriversality inherent in the world-system. (Borghi, 2020, p. 17. Translation by the author).

Reimagining an academic institution that welcomes the idea of kaleidoscopic knowledge (Borghi, 2020) aligns with a pluriversal vision: it means envisioning knowledge as an archipelago of enunciation points, a constellation of decolonial micropolitics and experimentation workshops, grounded in one's positionality and privileges (Idem).

Embracing pluriversality requires changing the lenses through which reality is observed and fundamentally altering the tools used to view, interpret, and project oneself within it. This pluriversal idea of the world and knowledge is, once again, a

familiar concept to delve into wearing the “design shoes”, as the following paragraph will explain.

After that, the second major strength offered by design as an ally within this discourse will be discussed: the participatory, collaborative, and co-creative dimensions already mentioned. The “co-s” question will be addressed in the second paragraph, and the nuances of its meaning and implications will be explored.

5.1. The pluriverse

The concept of the pluriverse, or pluriversality, can be summarised as the idea of a world where many worlds coexist. Escobar (2018) explains that it fundamentally revolves around difference, cautioning against efforts to efface or normalise it. The pluriverse encourages nurturing and embracing diversity—whether biological (hence the focus on biodiversity), epistemic (coloniality), cultural, or, as is increasingly discussed today, ontological.

Among transformative and relational disciplines, design is uniquely suited to navigating a vision that understands reality as a coexistence of interconnected and interdependent worlds (Leitão, 2023). Escobar (2018) notes that design is the transformative discipline (as we already mentioned) best equipped to respond to the call for a world made up of many coexisting and interdependent realities rather than a single, homogeneous, hierarchical one (idem).

A central feature of the pluriversal design approach is its processual and relational nature (Smith et. al., 2024). As Dunford (2020) notes and van Zeeland (2024) discusses, the pluriverse embodies a process, a value, a human capability, a form of social design and a tool. Pluriversal design acknowledges the necessity of engaging with ontological differences: pluriversality is not a synonym for inclusivity nor diversity. Instead, it refers to humans' capacity to build worlds differently (Leitão, 2022; Leitão & Noel, 2023).

Finally, pluriversal design further emphasises dialogue and collaboration among diverse worlds, maintaining a critical stance toward power dynamics. It involves moving beyond an ontology of separation to an “ontology of relatedness”. Such relationships are fostered through participatory practices that include nature as an entity and promote the autonomy and emancipation of the communities involved.

5.2. The “co-s”

Secondly, there is the topic of collaboration. This article intentionally addresses the dimension of co-creation (Sanders & Stappers, 2008) or, more generally, of the “co-s” of design, as the last part of this overview.

This choice is twofold. On the one hand, the discussion on collaboration and participation within design processes is well-known, extensively researched, and represented by numerous esteemed authors (Boyle & Harris, 2009; Steen, 2013;

Meroni, 2018; Manzini, 2015; Björgvinsson et al., 2012; Ehn, 2008; Manzini & Rizzo, 2011; Manzini & Staszowski, 2013; Papanek, 1971). An introduction to the concept is deemed, therefore, unnecessary in this context, and we prefer to limit ourselves to referring to some of these resources for those who wish to contextualise the discussion better.

In addition to this, a nomenclature debate regarding the question of the "co-s" within the design discourse would have been out of place, as co-creation is understood here as a broad umbrella term encompassing a range of related concepts: co-design, co-planning, co-production, and even co-crafting (Campagnaro & Ceraolo, 2022). The idea behind this is that the potential of this variety lies not in describing radically distinct practices separated by clear boundaries or rules but in imagining collaboration as a fluid process (idem). Discussing a design practice that enables the collaborative construction of knowledge means envisioning a discipline capable of all these functions—and even some more. Some are already emerging - co-writing or writing together (Blank & Nimführ, 2023), and others are interesting to envision (co-presenting, co-advocating, co-teaching?).

However, that being said, there is indeed a specific meaning or declination of "co-" that stands before the different design practices that we feel the need to stress in this context: that is the "co-mmunity".

While aiming to avoid any rhetorical drift, for this article's purpose, it is essential to emphasise that discussing knowledge co-creation requires the actors involved to think of themselves as part of a community (Wenger, 2009) or a group, sharing a purpose, embodying reciprocity and care (Contadini, 2021; The Care Collective 2021). This sense of togetherness, which resonates from the idea of conviviality (Illich, 1974) and the sense of belonging to a group taking part in a shared process (Ciampolini, 2019), is seen as the essential foundation through which the collaborative framework and shared sense-making can take shape.

With the emphasis on the community dimension in mind, we can move on with the discussion and explore the matter of knowledge production.

6. Knowledge creation and the role of design

Until now, we have examined how design, with the evolving awareness of its limitations and strengths, can be a suitable partner of academia in rethinking knowledge production. We have also explored the strengths that design has to offer as an ally within these processes. However, we must now address the topic of knowledge itself.

It would be simplistic to assume that participatory design and co-creation are inherently suited to fostering co-produced knowledge. In this regard, Taboada et al. (2024) note that the emergent design culture continues to function within a

Cartesian view of individuals and things despite its emphasis on participation and interactivity.

Also, we will not use this space to analyse the collaborative practices, somehow design-friendly, already carried out in universities, such as living labs or citizens science workshops. Those, while valuable, often lack a proper design foundation and/or a critical perspective on knowledge production dynamics we discussed in the first paragraphs.

Instead, in the following sections, we will discuss whether a pluriversal, decolonised and situated design could legitimately engage with knowledge production using the theoretical framework provided by the field of Organisational knowledge and management science.

Organisational knowledge and management science studies how organisations create, share, and apply knowledge to foster innovation and adapt to change. This field explores the interplay between tacit and explicit knowledge and the processes that explain how it is developed, acquired and transmitted (Argote et al., 2003). Scholars such as Polanyi, Nonaka, and Takeuchi, whose contributions are milestones within this field of studies, offer foundational insights into the field's theoretical ground and the purpose of assessing design's possible role within these processes.

In a nutshell, Polanyi is the "father" of the concept of tacit knowledge (Polanyi, 2009). Criticising positivism, he argued that explicit knowledge is inseparable from tacit understanding. He demonstrated that even formal sciences rely on tacit dimensions, as individual judgment shapes the interpretation and application of explicit knowledge (Polanyi, 2009). Building on this, Nonaka (1994) developed the Dynamic Theory of Knowledge Creation and, together with Takeuchi, discussed the "knowledge spiral" model (1996), which describes how organisations transform individual knowledge into collective knowledge through iterative processes of socialisation, externalisation, combination, and internalisation.

In the following paragraphs, we will investigate three key dimensions within the domains of Organisational knowledge and management science that demonstrate that design is particularly suited to supporting knowledge creation. In particular, we will discuss design processes as a process of metaphor creation and active world-building, the relationship between design and boundary objects, and the proximity between design and tacit knowledge. This short investigation will allow us to finally assess the potential of design as a transformative tool for collaborative knowledge production and will ultimately accompany the discussion towards the conclusions.

6.1. Design as metaphors enablers

Metaphors play a crucial role within the knowledge discourse and, precisely, in the knowledge creation spiral. According to Nonaka, metaphor is essential for converting tacit knowledge into explicit knowledge (1994). Lakoff and Johnson (1980) point out that the essence of metaphor is understanding and experiencing

one kind of thing in terms of another. It follows that while metaphor does not constitute a thought process, it enables new behaviours by drawing inferences from the model of another behaviour.

Moreover, within organisational theory, metaphor is not only a preliminary step in transforming tacit knowledge into explicit knowledge; it is also a vital method for creating networks of concepts (Nonaka, 1994). These conceptual networks generate innovative insights about the future by drawing upon existing knowledge. As Bateson (1973) suggests, metaphor's contradictions and intuitive associations can lead to learning that challenges and negates established assumptions, fostering the development of new paradigms.

This creative, exploratory process is central to design, a discipline that addresses complex problems and imagines innovative solutions by combining seemingly incongruent elements. In design, metaphor transcends its traditional definition as a rhetorical figure, serving instead as a creative, cognitive, and practical tool (Campagnaro & Ceraolo, 2022). The conceptual systems through which we think and act are fundamentally metaphorical: this is particularly significant in design, where imagination and intuitive learning through symbols, prototypes, shapes, materials and gestures are crucial for forming new conceptual and perceptual connections.

The many designerly ways of knowing (Cross, 1982) and design's capacity to transform tacit knowledge into explicit knowledge through metaphors, analogies, and models position the discipline as an appropriate tool for supporting knowledge creation and exchange (Petrova & Campagnaro, 2017).

6.2. Design as a boundary object

Star and Griesemer (1989) introduced the concept of a boundary object to describe artefacts that facilitate collaboration among different social or professional groups. These objects serve as bridges between practices, cultures, or contexts that sociocultural boundaries would otherwise separate.

According to Kanwal et al. (2019), boundary objects play a pivotal role in fostering knowledge co-creation by acting as bridges between distinct social worlds. Their unique capacity to facilitate collaboration across boundaries lies in their interpretive flexibility, enabling them to be understood and utilised differently by various groups while retaining a shared identity across contexts. This dual quality allows actors with divergent perspectives, knowledge systems, and cultural assumptions to collaborate without complete alignment.

Following this line, scholars such as Thinley et al. in 2020 defined design as an "interactive boundary object". They highlighted its role in fostering interdisciplinary interactions by enabling diverse actors to co-create while maintaining their distinct perspectives. As a boundary object, design balances interpretive flexibility and shared meaning, allowing reflexivity and dialogue across disciplines. This process generates novel outcomes by integrating varied vocabularies, practices,

and values, transforming design from a static tool into a dynamic framework for collective problem-solving.

Similarly, as Mark, Lyytinen, and Bergman (2007) highlight,

> "Design as a boundary object possesses four essential characteristics: the capability for common representation, the capability to transform design knowledge, the capability to mobilise for action, and the capability to legitimise design knowledge" (Mark et al., 2007, p. 551).

These qualities empower design to bridge gaps between social worlds, facilitating the sharing and transformation of knowledge.

Thinley et al. (2020) also focus on design's role in enabling interdisciplinary interactions. They argue that "design is an interactive boundary object allowing different meaning structures to co-exist and co-inform actors from multiple disciplines" (p. 5). In interdisciplinary research centres, for example, divergent definitions of design paradoxically enhanced collaboration through shared reflexivity, which valued the contributions of all participants.

From this perspective, design is both a technical tool and a cultural and political mediator. It facilitates collaboration among diverse social worlds, enabling meaningful exchanges and co-creation across boundaries.

6.3. Design knowledge as tacit knowledge

An additional factor aligning design discipline with the broader discourse on knowledge creation is its inherently tacit nature. Design knowledge is often deeply embedded in practice and intuition, making it challenging to articulate or codify fully. These characteristics push the design to cultivate a distinct, almost tacit sensitivity toward capturing content and insights that are difficult to express in words or text.

Whether understood as a manual and artisanal skill or the ability to identify problems and generate innovative solutions or meanings, design capability is frequently *slippery* to codification. While design knowledge can be subjected to processes of exploitation, its foundation remains deeply rooted in personal experience, intuition, and the implicit understanding of context, materials, and processes. In this regard, Polanyi (2009) famously observed that "we can know more than we can tell," which can be interpreted as much of what designers understand and apply cannot be easily articulated or formalised.

This tacit nature is evident in various aspects of design practice. For instance, an experienced furniture designer may intuitively "feel" the correct curvature for a chair without consciously reasoning through every step. Similarly, Schön (1983) highlights how reflective practice enables designers to draw upon tacit insights when deciding proportion, aesthetics, or functionality during the design process. Following Nonaka and Takeuchi (1995), it is also possible to emphasise the role of tacit knowledge in creativity and innovation and, therefore, in design, where

problem-solving seldom depends on unspoken insights cultivated through practice.

The tacit dimension of design knowledge stresses the importance of experiential learning and the transmission of skills through observation, imitation, and hands-on engagement. Finally, this perspective reinforces the unique role of design in fostering knowledge creation, as it bridges the gap between the unspoken and the articulated, transforming intuition and experience into innovative and actionable insights.

7. Closing remarks and future perspectives

Building on the hypotheses outlined in the first paragraph, this article has explored (1) how the call for universities to foster collective experiences of knowledge production, interpretation, dissemination, and memory-making can be enacted both theoretically and practically to support community autonomy and self-determination. In doing so, it has examined (2) the implications of acknowledging the mutual interdependence between universities and society, and (3) the enabling role that design—when approached not as a leading force but as an ally capable of offering accompaniment, building alliances, and fostering kinship—can play in such processes.

In doing so, we have examined various transformative processes currently reshaping both academic institutions and the design discipline, particularly through the lenses of decoloniality, epistemological violence, hegemony, exclusion, and cultural extractivism. These processes often converge in critical zones of friction, revealing the persistent struggle of universities to reconfigure their modes of engagement with society. Moreover, within the dominant discourses on the Third Mission and social engagement, universities often fail to critically question the dynamics of knowledge production, which remain largely under their control. Consequently, society continues to be treated as the "other," kept at a distance and deprived of the capacity to articulate its own knowledge, meanings, and memories.

Although these findings are preliminary, they suggest that the pluriversal vision—which asserts the possibility of conceptualising the world and its structures in plural, overlapping, and multifaceted ways—when combined with the capacity of design to support participatory and community-based knowledge processes, offers a promising pathway grounded in collaboration and ethics. This supports and confirms hypotheses 1 and 2. Hypothesis 3—regarding the capacity of design to support knowledge-related processes—was also confirmed, particularly by exploring the relationship between design and concepts such as metaphors, boundary objects, and tacit knowledge.

Further research is essential to identify and investigate both existing and yet-to-be-discovered practices through which design can be harnessed to help universities foster new paradigms of co-created knowledge. Equally important is

for design to assimilate the lessons emerging from this bridge-building experience between universities and society. Such integration could advance debates on the boundaries, purposes, and competencies that define the discipline. It could also stimulate the development of new curricula and (trans)disciplinary dialogues that connect co-creation experiences with the evolving body of critical discourses and growing reflexivity within the field.

The challenge is broad, marked by complexity and contradictions—yet it constitutes an aspirational horizon that invites further exploration.

DESIGN, HEALTH AND WELL-BEING. A POST-PANDEMIC EDITORIAL PROPOSAL

Úrsula Bravo

Universidad del Desarrollo
ubravo@udd.cl

ABSTRACT | In late 2021, as the COVID-19 pandemic continued to claim millions of lives and disrupt global education and economies, we decided to dedicate an issue of *Base Diseño e Innovación* magazine to health and well-being. We invited design, psychology, and healthcare experts to explore how design can improve health systems and enhance people's quality of life. This effort culminated in the publication of the volume *Design, Health, and Well-being* in 2023. This submission will address the project's background, outline the editorial proposal, and present the publication in print format.

KEYWORDS | DESIGN FOR WELL-BEING, HEALTHCARE, FRUGAL INNOVATION, EDITORIAL PROPOSAL

1. Project Background

Base Diseño e Innovación is the academic magazine of the School of Design at Universidad del Desarrollo. It serves as a platform for interdisciplinary academic dialogue, bringing together experts from academia, industry, government, and civil organizations. The magazine includes sections such as Perspectives, Cartography, Interviews, Opinion, Showcase, and Degree Projects.

In late 2021, as the COVID-19 pandemic continued to impact millions globally, the Base Diseño e Innovación editorial team decided to dedicate an issue to health and well-being. With education, economies, and social structures deeply affected, we sought to assess the impact of design on healthcare before and during the pandemic and explore innovative solutions that had improved lives.

We invited experts in design, psychology, and healthcare to examine how design solutions could enhance well-being and address challenges within health systems. The edition featured contributions from over 40 professionals, including authors, editors, journalists, designers, illustrators, and translators.

This issue highlighted how design can drive positive change in health systems through interdisciplinary collaboration and creative problem-solving, reinforcing its role as a vital tool in addressing global health challenges.

2. Editorial Proposal

Paula Daza, the former Undersecretary of Public Health during the pandemic addresses the relevance of public-private collaboration in facing health emergencies and emphasises the importance of implementing public policies that consider the communities' idiosyncrasies (Figure 1).

Figure 1. The future of public health lies in interdisciplinarity and listening to communities.

Mariluz Soto, Haian Xue, and Emmanuel Tsekleves explore a triadic approach that equips designers with an observational framework and a holistic understanding to guide well-being-focused interventions (Figure 2).

Figure 2. Head, heart and body perspective for health and well-being from design.

Hernán Díaz and Víctor Montre present a conceptual framework for understanding innovation, emphasise the importance of people-centred innovation, and highlight the value of frugal innovation in disadvantaged contexts (Figure 3).

Figure 3. Innovation in health: the power of design to improve lives.

Christian Guellerin argues that to help organizations design, produce, and sell products or services differently, designers must take on management roles in both public and private sectors (Figure 4).

Figure 4. Ethical leadership, the new frontier.

Bon Ku and Ellen Lupton, authors of Health Design Thinking, emphasize that design thinking fosters a people-centred approach, enhancing attentive listening and precise observation of healthcare beneficiaries' needs (Figure 5).

Figure 5. The interdisciplinary approach of Ellen Lupton and Bon Ku.

The Geriatrician Juan Carlos Molina urges designers to lead the change towards a *gerontoculture* that respects older adults, offering health and wellness and areas for leadership (Figure 6).

Figure 6. Design should lead the transition towards a gerontocratic culture.

Rebecca Cain, author of "Design for Well-being", addresses her career as a researcher in transdisciplinary design and the concepts of subjective well-being, sustainability in well-being, and happiness (Figure 7).

Figure 7. Towards systems thinking.

French designer Philippe Starck said that design sparks meaningful conversations. We invited physicians, psychologists, educators, architects, and designers to discuss design's role in driving innovations that enhance health and well-being across different life stages and contexts. This engaging dialogue is just beginning.

About the Authors:

Úrsula Bravo is an Associate Professor at Universidad del Desarrollo School of Design (Chile) and the Editor-in-Chief of the magazine and open-access journal Base Diseño e Innovación. She holds a Bachelor's in Design and two Master's degrees in Education and Humanities. She is a PhD candidate in Education at Universidad Católica de Chile. Co-founder of Design Literacy International Network and member of the Design Research Society. For two decades, she has been interested in exploring the relations between design and education.

b Health Cooperation Group of Western University Hospitals, GCS HUGO
c Ecole de design, Nantes Atlantique
*axelle.chavanon@chu-angers.fr

ABSTRACT | This working paper responds to the call for the reinvestigation of ethical practices in public design, focusing specifically on the design for health approach to addressing unsolicited interruptions faced by caregivers specializing in medical imaging (MIR) and scanners within Emergency Room (ER) settings. Utilizing a co-design methodology, this study aims to identify and mitigate the effects of these interruptions through collaborative, empathetic, and contextually sensitive solutions that respect the ethical complexities of caregiving environments.

Our research involved a multidisciplinary team of 10 designers under the guidance of 4 faculty supervisors. Together, we conducted one day of fieldwork across three public hospitals in Le Mans, La Roche Sur Yon, and Angers. Through direct observations, interviews, and contextual inquiry with Emergency Room caregivers, we gathered insights into the operational dynamics and interruption patterns within these high-stakes healthcare settings. Following the field immersions, the designers proposed solutions that directly respond to the needs identified.

The findings from this study provide a foundation for ethically grounded, co-designed interventions aimed at supporting ER caregivers. These solutions seek to reduce disruption and enhance the quality of care, aligning with a design for health approach that advocates for collaborative design as an ethical imperative in public healthcare

innovation. This work contributes to the broader discourse on ethical practices in design for health and underscores the value of interdisciplinary, co-creative processes in addressing complex healthcare challenges.

KEYWORDS | Task interruption, Radiology, Prevention, Co-design, Care safety

1. Introduction

Tasks Interruptions are an inherent aspect of daily life, and this is also the case in the healthcare sector. Task interruptions have been defined by the French National Authority for Health as the unexpected, temporary or an end to human activity (Brixey et al., 2007). The reason for such interruptions may be the operator's own responsibility, or it may be external. This results in a disruption to the flow of the activity, a loss of concentration on the part of the operator and an alteration in the performance of the act. Any secondary activities that may be undertaken serve to compound the disruption to the initial activity (*guide_HAS 2016*). Task interruptions are complex phenomena involving the people who suffer them as well as those who cause them. To develop a comprehensive understanding of these characteristics, it is essential to consider various profiles, depending on whether the person being interrupted or the one causing the interruption (Brixey et al., 2007). To develop a holistic vision, it is useful to take into account both the person being interrupted and the person responsible of the interruption itself and the context of the interruption (McCurdie et al., 2017).

In the health care field, task interruptions are recognized as a risk factor for serious adverse events and lead to management errors by emergency nurses (Delmas et al., 2020) and within multi-professional teams (Compère et al., 2023). In the field of radiology, several studies have shown that radiologists increase their reading time when interrupted. Moreover it may lead them to the conclusion that a case is normal when it is not. It have been demonstrated that Interruptions reduce efficiency and pose safety concerns for patients when reading abnormal cases (Ratwani et al., 2016) (Wynn et al., 2018) (Williams & Drew, 2017) (Halsted & Froehle, 2008). To the best of our knowledge, no study has been carried out on medical electroradiology manipulators (MERM).

There is also an ongoing consideration of identifying the times when professionals can be interrupted or where interruption could induce less risk of errors for them as well as the patients. The identification of moments of low cognitive intensity, or conversely, of very high intensity, during cardiac surgery, facilitates the anticipation of moments when the surgical team can be called upon without generating disruption (Dias et al., 2018).

It is not feasible, nor advisable, to eliminate all interruptions. Indeed, vital emergencies must be accorded the highest priority, as must all urgent care. In instances where a professional identifies an error in progress, it is imperative that they are able to interrupt a situation or a colleague.

Interruptions have been identified as a cause of adverse events, in particular errors relating to identity monitoring. However, no solutions have yet been devised for imaging departments to deal with this problem.

Interruptions have been shown to have ramifications for both the safety of care and the well-being of workers. Interruptions have been shown to increase cognitive load and have an impact on working memory (Chen et al., 2024). Consequently, these disruptions can induce mental fatigue, stemming from the effort required to transition between tasks and then return to the initial task (Hill et al., 2023).

The quality of care administered to patients in healthcare establishments is a matter of significant public health concern. The extant literature on the subject is primarily based on field observations, and the solutions for preventing and correcting them are inadequate.

The risks and issues are common to all healthcare establishments, even if the layouts and organizations vary from one establishment to another.

Prevention tools have been developed to limit work interruptions. One such strategy involves the recommendation of wearing a vest when preparing medicines, serving as a visual cue to staff that the wearer is not to be disturbed. A study found a statistically significant reduction in interruptions with this highly visual device. However, the extent of this reduction and its likely impact on error rates must be considered against the effectiveness of other interventions, associated costs, likely acceptability and long-term sustainability of such interventions (Westbrook et al., 2017).
In this context, how can design for care be an ethical and relevant solution for devising innovative solutions to the problem of interrupted work in emergency imaging departments?

Utilizing a co-design methodology, this study aims to identify and mitigate the effects of these interruptions through collaborative, empathetic, and contextually sensitive solutions that respect the ethical complexities of caregiving environments.

2. Methods

Hospital design is a discipline that harnesses creativity to solve problems and co-create solutions with the goal of improving patient pathways, enhancing hospitality, designing new care modalities to support treatment, resolving everyday irritants, and addressing forward-thinking issues in hospital planning (French Network of Hospital Design).
Hospital design takes several forms:

- Service Design: Reinventing patient pathways and professional workflows.
- Space Design: Contributing to architectural projects (user experience assistance).
- Product Design: Creating tools that facilitate the work of professionals and healthcare devices for patients.
- Digital Design: Developing digital solutions to improve patient care and support healthcare professionals' work.
- Systemic Design: Creating new processes, organizations, or procedures at the level of a department or the entire institution.

A call for projects aimed at co-designing and experimenting with prototypes addressing field issues identified in the hospitals within the HUGO territorial scope, was launched by the GCS HUGO in February 2023. This initiative paved the way for caregivers' teams from the West region to come together around a project.
The project "SPRITS" (design Solution for the Prevention of Task InterruptionS in Radiology), co-led by three institutions, the Hospital Center of Le Mans, the Hospital Center of Vendée, and the University Hospital center of Angers, was the winner of the GCS HUGO call for projects.
The project references of "SPRITS" benefited from the expertise and support of ten master's students in Care Design under the guidance of 2 faculty supervisors between October 2024 and February 2025.
The challenge of this project lay in the mutual interest of co-constructing a solution that takes into account the concrete needs of users (Cottam & Leadbeater, 2004) while leaving room for the creativity of designers to respond to a multifactorial problem.
The study was constructed in the following stages:

- An immersion day in the three reference hospitals of the project, designed to collect user's needs through various approaches and develop the identified priority themes.
- A co-construction workshop with healthcare professionals to refine the proposals, engage stakeholders in the transformation process, and gather needs, expectations, and desires.

- A final presentation with concrete, prototyped proposals that could be implemented in the three hospitals.

The objective of this approach was twofold: firstly, to enable the student designers to understand the environment, the layout possibilities and the safety issues; and secondly, to enable the MERM and referents to objectify their organization and come up with innovative solutions. Mutual respects, commitment to the project and collaboration have been fundamental.

3. Results

A total of three public health establishments have collaborated to address the shared challenge of disruptions to the work of radiographers in emergency radiology departments. Each site benefited from a day of observation, comprising four hours of shadowing and three hours of interviews with teams (MERM, radiologists, secretaries, etc.) by groups of
3 or 4 students.

This collaborative approach enabled the objective documentation of interruptions and the identification of contributing factors, whether related to the environment, inter-professional interactions, or patient- related factors. Teams of MERM in emergency imaging departments are required to manage interruptions due to the numerous interactions inherent to their professional activities. The root causes of these interruptions have been identified as arising from inter-professional interactions, interactions between caregivers and patients, and the utilization of communication tools to ensure round-the-clock availability. These tools facilitate communication in various settings, including waiting areas, corridors, and the management of patients either on stretchers or on foot, emergency situations, and the management of calls.

Subsequent to the immersive days, three 4-hour working sessions were held at 7-week intervals. The initial session involved the presentation of observations and interviews conducted at each site. The main themes and avenues of work were then grouped together. In the subsequent session, groups of students presented numerous design projects in response to the issue of task interruptions. Each solution was discussed in terms of potential constraints, hygiene problems and, above all, the benefits it could bring.
The third and final session was dedicated to the presentation of the final solutions developed by the students.
Each student group explored a specific design research question:

- How to optimize logistical workflows while ensuring effective communication and coordination between departments?
- How to address integrated task interruptions that contribute to caregiver fatigue and hinder task resumption?
- How to manage the accumulation of task interruptions in order to reduce the risk of medical errors in radiology?
-

In the period between each session, students were at liberty to contact the professionals as frequently as was required in order to enhance their knowledge and gain a more profound understanding of the environment and its constraints.

After a feasibility study and a selection made by the general directors of the hospitals leading the project and the team of caregivers responsible for the project, a study will be conducted to assess the relevance of the proposals on the basis of the evaluation criteria that will be identified by the teams from the 3 sites.

Three key research axes are being considered to evaluate the proposed design solutions:

- Workload and cognitive load: What is the impact of the solutions on caregivers perceived mental load, particularly in terms of reducing irritability caused by interruptions and promoting a greater sense of calm and well-being in the workplace?
- Consideration of the person initiating the interruption. This axis explores whether the solutions provide meaningful responses and foster more empathetic interactions.
- Communication with the patient: How do the proposed interventions influence the quality, clarity, and continuity of communication between caregivers and patients?

4. Discussion

Task interruptions are complex phenomena that require careful consideration of safety issues. In responding to the Design call for projects, the MERM teams and their referents sought to explore a different approach to this problem, with a view to identifying new solutions.
In this project, although the needs of users were explored, the solutions were tested primarily through the prism of the reasons for seeking them. The potential risks to care safety associated with task interruptions were recognised, but further observation was required for MERMs. By conducting this observation on three sites in parallel, the participants (professionals and students) were able to focus the co-conception of design innovations on common findings. While problems specific to each centre were discussed, thes

Furthermore, consideration was given to the integration of the social, human and environmental impact of the solutions' interfaces. During the three successive stages, the following aspects were discussed:

- Experience of professionals and patients
- Care organisation
- Quality of working life
- Social responsibility via the environnemental dimension
- Risk prevention

In the context of this collaborative project, which involves design students, electrocardiography technicians and their colleagues, it is imperative that the solution is compliant with health and safety standards. The emphasis, therefore, must be placed on a simple implementation that facilitates the work of the carers.

"The concept of ethical design raises philosophical, political and social questions"(“Qu’est-ce que le design éthique?,” 2019) (Web, 2017). Ethical design invites us to question the way we approach design. In the hospital environment, the hierarchical structure is vertical. The place of each professional and the grade they occupy is therefore defined. The decision- making system is also vertical, with decisions made by managers and executives being implemented by healthcare professionals. The SPRITS framework, through its co-construction of solutions, transforms this system into a horizontal structure that respects the voice of each entity, including both designers and each stratum of the hospital hierarchy. The question therefore arises as to how hospital design can be integrated in order to foster this openness. While some American hospitals, including Stanford and John Hopkins, have been incorporating in-house designers for several years and are affiliated with a design school, the integration of hospital design in France is a more recent development. Consequently, it is not currently incorporated as a systematic condition, a method that facilitates results through an ethical approach to hospital design.
In the course of this collaborative endeavour, the caregivers were encouraged to adopt a more naïve stance towards the reflections and proposals put forward by the student designers. The posture exhibited a shift from a state of resolution and productivity to one of reflexivity and "out-of-the-box" thinking. In a reciprocal manner, the student

designers were required to heed the expressed requirements and to accord due weight to the voice of the caregivers. Consequently, the proposed solutions were developed through a collaborative conceptualisation process, whereby a common understanding of the issues to be addressed was established. During the various phases of the study, leadership was provided by the students during the initial observations and proposals, by the caregivers when they were required to contribute their expert view of the work environment, and by the teachers to facilitate understanding of mutual constraints (respect for innovative ideas, integration of constraints). Furthermore, the future designers had to adapt to constant changes in hospital teams and human resource constraints, with changes in project managers. It was imperative that sustainable solutions be formulated in order to adapt to these changes, thereby ensuring the long-term viability and independence from professional turnover.
The alteration of perspective is a method of facilitating leadership in design, with financial, ecological and ethical constraints being incorporated into the design project. This approach enables the contribution of ideas by designers and vice versa.

For the study conducted, four different professions were involved: healthcare managers, designers, caregivers specializing in medical imaging, and patients. Indeed, involving professionals from the outset of the project ensures greater adherence to the transformation of care practices and leads to more sustainable, ethical, and contextually relevant solutions. A concomitant investigation into the implementation of this SPRITS system in emergency imaging departments, focusing on task interruptions, will endow this project with an evaluative dimension. Consequently, the notion of co-design is not regarded as a foregone conclusion, a self-evident success, or an imposed ethical model that fulfils existing needs. The results of the forthcoming study will provide valuable insights into the impact of the selected solution.

Designing for the New Old : A Study on Participatory Design in Empowerment Perspective for Healthy Aging Communities

Meiqin Sun, Xuya Jiang, An Sui
Jiangnan University
7220306007@stu.jiangnan.edu.cn

Abstract

In the wave of global population aging, age discrimination and stereotypes severely limit the perception and treatment of the elderly. This research aims to break traditional concepts, reinterpret the connotations of elderly health and well-being, deeply explore the internal resources of the elderly group, sort out the approaches and criteria of design empowerment, seek strategies to enhance the well-being of the elderly and promote active aging, construct an interactive model, and present cases of participatory design.

Research Objectives

1. Analyze elderly's problem-solving resources, build a database for design empowerment.
2. Clarify design's role, make an operable strategy.
3. Build a dynamic model for active participation.
4. Extract models from projects to guide care practice.

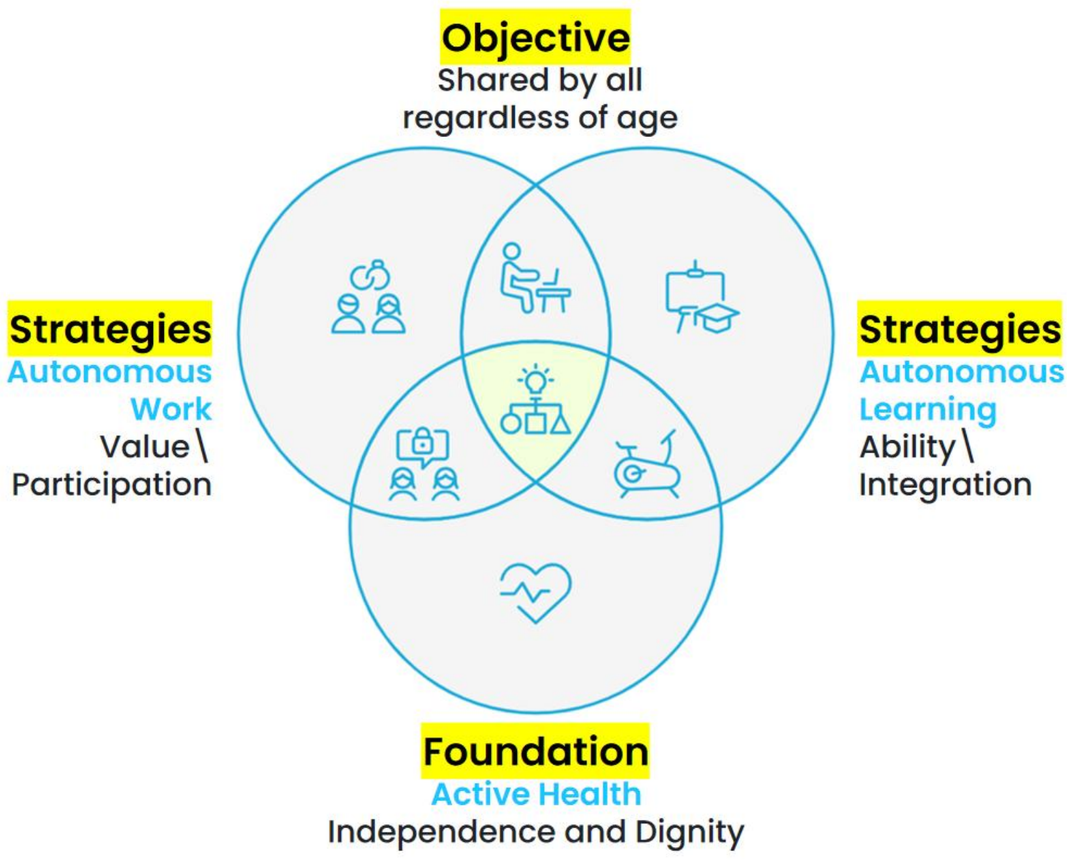

Figure 1 . Active Aging Strategy
Source of the picture.: Self-drawn by the author

Methodology and Tools

1. User Research Methods: Comprehensively employ methods such as in-depth interviews, observation, and questionnaire surveys to collect first-hand data .

2. Data Analysis Tools: Utilize statistical analysis methods to extract key information and identify advantageous resources and potential needs.

3. Design Practice Methods: Adopt the concept of participatory design and organize multiple stakeholders, to jointly participate in the design process.

Expected Results

1. Theoretical achievements: Construct the advantageous resource system of the elderly group and the empowerment-participation interaction model.

2. Practical achievements: Develop a set of methods and process guidelines for participatory design in elderly care communities.

3. Social impact: Enhance the society's awareness and respect for the elderly group.

DESIGNING INCLUSIVE PUBLIC POLICIES: ANALYSIS OF THE LITTERATURE

Pauline Oger[a],

aCY Cergy Paris Université & Signes de sens
*pauline.oger@neuf.fr

ABSTRACT | This article examines the relevance of existing inclusive codesign methodologies for designing more inclusive public policies, in the current context calling for an inclusive transition. The semi-systematic analysis of a corpus of 37 texts reveals that these methodologies are anchored in an integrative rather than an inclusive paradigm, and therefore do not allow for an inclusive (re)design of public policies, towards an inclusive societal transition. Indeed, they do not allow for the representativeness of the entire ecosystem of stakeholders, nor the creation of solutions at the systemic scale of transitions. However, this analysis leads us to recommend working on the prefiguration phase of these inclusive participatory processes - in particular on the recruitment and alignment processes of participants - to adapt them to the scale of designing the inclusive transition of public policies.

KEYWORDS | INCLUSION, TRANSITION, DESIGN, CODESGN, METHODOLOGY

1. Introduction

The law of February 11, 2005 for "equality of rights and opportunities, participation and citizenship of people with disabilities" initiated a shift from the sole obligations of accessibility of the built environment to the more political question of inclusion: encouraging public services to rethink not only the accessibility of its institutions and services, but also their inclusiveness in terms of culture and processes (Ferdman, 2014). This inclusive transition (Ameri et al., 2020), calls for a collaborative redesign for more inclusive public policies.

However, a significant gap remains between “inclusive” legislative ambitions and the effective implementation of these public policies in the field (Ville et al., 2020), in various areas such as education, labor or social rights (Revillard, 2017). This gap raises questions about the design methodologies used to implement this inclusive transition. In the field of design, designers have developed so-called inclusive methodologies, such as inclusive participatory design methodologies also referred to as inclusive codesign: these approaches combine the viewpoints and skills of people with many different perspectives to solve social problems, with an emphasis on its accessible and/or inclusive nature (Szebeko and Tan, 2010). Although relevant, their application at the scale of design of public policies in a context of societal transformations has so far not been described, providing no guidelines for designers to meet the challenges specific to this context. Are these methodologies adapted to the implementation of the inclusive transition of public policies? If not, how can they evolve to respond to it?

This survey contribution (Wobbrock and Kientz, 2019) allows for the semi-systematic analysis (Snyder, 2019) of a literature review of 37 research articles on inclusive codesign methodologies. It explores how these respond or could respond to the methodological issues raised by the call to redesign more inclusive public policies. The combination of two analyses - 1) concerning the way in which participatory and inclusive methodologies respond to these issues and fit into an inclusive paradigm, 2) concerning the contemporary challenges they face - will enable us to suggest new areas of research and experimentation for inclusive design practices.

2. Inclusive transitions: emerging methodological issues for (re)designing public policies

The notion of inclusive transition refers to the concomitant process of transforming the medico-social offers and society, involving all stakeholders in these systems, so that people in vulnerable situations are accepted beyond their differences (Ameri et al., 2020).

This transition aims to switch from an integrative model where vulnerable people, even if they find their place somewhere, are put aside, to an inclusive model where everyone can find their place (ibid.). Accessibility standards are no longer enough: lived experiences have to be thought of as inclusive in their entirety, and more broadly, ecosystems must be inclusive both in terms of culture, and processes (Ferdman, 2014). Thus, the logic of “taking care” of people is replaced by a logic of revising organizations, including public policies, to include everyone (Ameri et al., 2020).

It calls for a broader logic of social transformation (Jones, 2018), concretely embodied in national public policies and their implementation. On a methodological level, it thus requires the design of systemic solutions, transforming current social or political systems to respond to complex societal situations (ibid.). The design of solutions at this scale relies on the participation of a variety of actors representing the entire social system examined (ibid.). Existing codesign methodologies must therefore be functional or adapted to this scale.

Designing solutions at the scale of societal transformations such as inclusive transitions involves the implementation of long-term processes (Ameri et al., 2020), to adapt to the pace of change of the stakeholders. It demands long-term commitment of those actors, and thus requires considering codesign methodologies on a processual and temporal scale (Mosleh and Larsen, 2020; Saad-Sulonen et al., 2018).

To (re)design public policies in the light of inclusive transitions, codesign methodologies must therefore respond to these different challenges: being anchored in an inclusive paradigm, questioning systems and designing solutions on this scale, integrating all the actors representing the ecosystems concerned and finally adapting to the long timescales of transitions. We suggest examining the existing inclusive codesign methodologies through these lenses.

3. Methodology

To study the relevance of inclusive codesign methodologies for implementing the inclusive transitions of public policies, we conducted a semi-systematic review (Snyder, 2019) of 37 scientific articles. They were selected according to the PRISMA reporting checklist approach proposed by Moher et al. (2009), based on the search terms “participatory”, “inclusive”, “accessibility”, “disability” and “design”, in French and English. We kept only the articles that concretely described the use of inclusive codesign and went beyond theoretical discussions. The analysis of the remaining articles made it possible to distinguish two corpus (figure 1):

- [corpus 1] describing the implementation of participatory and inclusive methodologies (30 articles),
- [corpus 2] describing the challenges of these participatory and inclusive practices (7 articles).

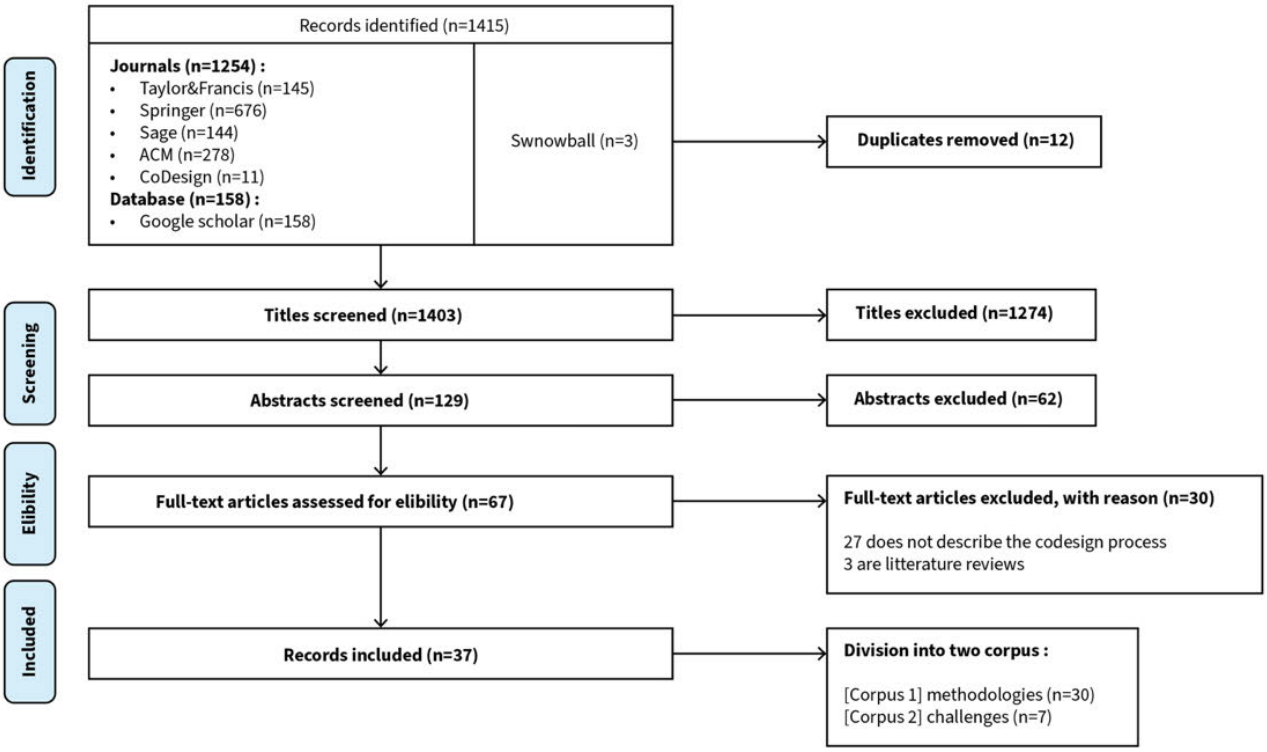

Figure 1: PRISMA flowchart of the review of articles

The various inclusive codesign methodologies presented in [corpus 1][1] were studied using a structured data extraction grid, based on four main criteria extracted from the emerging methodological issues for (re)designing public policies: (1) the scope of stakeholder involvement (e.g., limited to disabled persons and professionals vs. broader publics); (2) the nature of the design activities (e.g., whether they question systemic dimensions); (3) the type and scale of deliverables produced (Jones, 2018); and (4) the temporal framing of participation (as isolated events or part of ongoing processes) (Bødker et al., 2017; Saad-Sulonen et al., 2018)[2]. The thematic analysis (Charmaz, 2008) of these data aimed then to identify their paradigmatic orientation (integrative or inclusive) and assess their relevance to the implementation of inclusive transitions.
These results were then put into perspective with an analysis of the literature listing the challenges that these methodologies must address today [corpus 2]. This analysis took the form of a phasic analysis, aimed at providing designers with a set of points of attention at each stage of the codesign process for inclusive transitions.

[1] [corpus 2] gathers 30 articles: Magnusson et al., 2018; Gupta et al., 2021; Mussi et al., 2021; Metatla et al., 2015; Okamoto, 2009; Sahib et al., 2013; Ramloll et al., 2000; Metatla et al., 2019; Hendriks et al., 2013; González et al., 2020; Gibson et al., 2020; Tucker et al., 2022; Hendriks et al., 2015; Heriott (2015); Wilson et al., 2019; Francis et al., 2009; Frauenberger et al., 2017; Makhaeva et al., 2016; Millen et al., 2011; Frauenberger et al., 2011; Gaudion et al., 2015; Wilson et al., 2015; Bircanin et al., 2021; Hyett et al., 2020.

[2] Due to the short length of this working paper, only the results of the analysis will be presented, not the data extraction table.

4. Results [corpus 1]: methods that are not anchored in the paradigm of inclusive transition

4.1 Different codesign methodologies depending on the disability addressed

None of these methodologies take into account all the specific needs related to disability, while this is necessary in order to gain a global inclusive perspective. Indeed, each article addresses only one type of disability, often identifiable from its title, such as visual or cognitive disabilities (Metatla et al., 2015; Mussi et al., 2021). With the exception of one article (Hong et al., 2023), all the articles described only consider one typology of disability. This reveals a silo approach embedded in an accessibility paradigm, where methods are specific to each disability, rather than an inclusive perspective that would integrate solutions for all types of disability or cross-reference issues under the notion of “specific needs”."

4.2 Low diversity and representativeness of the actors of the ecosystem

The studied methodologies do not integrate the whole diversity of typologies of actors necessary for the design of inclusive public policies. Indeed, the analysis of the described participants reveals that there are four combination of actors:

- people with the same disability (14 articles),
- people with the same disability, accompanied by a member of their family or caregivers (3 articles) or a researcher (8 articles),
- a mix of actors: people with the same disability and other actors of the ecosystem (2 articles),
- a combination of actors of the ecosystem, without people with disability (7 articles).

Only two articles (Hong et al., 2023; Gaudion et al., 2015) present a combination of actors with disabilities and other actors of the ecosystem. However, even if they tend to respond to the necessary diversity of actors for transitions (Jones, 2018), they only integrate actors from the same typology of disability and offer too little representation of the actors in the ecosystem: they only involve designers in innovative projects, and carers or therapeutic actors (medico-social sector), but no actors from the ordinary environment.

4.3 Codesign activities that do not question systems on their whole

The codesign activities presented in these articles do not allow for collaborative reflection or redesign of the public policy system as a whole. Indeed, the majority of articles (22) present codesign activities such as testing solutions (method, tools, services), providing feedback or prototyping a new solution. Participants therefore only intervene at the end of the process, when the work areas, or even the solutions, have already been selected or produced. Two articles (Hyett et al., 2020; Herriott, 2015) present more comprehensive approaches: sharing experiences, choosing a problem and co-creating possible solutions. Although these approaches tend towards being more comprehensive and inclusive, codesign activities do not allow the participants to analyze the systems in their entirety, to determine the issues and imagine systemic solutions.

4.4 Deliverables that are not on the systemic scale of public policies towards inclusive transition

Most of the deliverables outlined in the articles do not tend to support a systemic change in favor of more inclusive public policies as they are not themselves systemic solutions. The study of the deliverables of the different codesign processes, according to the four design domains (Jones, 2018), reveals indeed that the majority of these processes proposes deliverables of the 1st domain -artifacts (12 articles)- and of 2nd domains: products and services (24 articles). Only one article describes potential deliverables in between the 3rd and 4th domain: the improvement of social connections between actors through organizational design in a medical institution (Herriott, 2015). None of these methodologies are thus described as intending to produce 4th domain -or social transformation- deliverables.

4.5 Codesign as an event not anchored in the temporal perspective of transitions

The articles mainly mobilize codesign methodologies as design events or activities (Bødker et al., 2017; Saad-Sulonen et al., 2018) (18 articles), rather than as broader temporal processes developing over time (Saad-Sulonen et al., 2018). This vision of codesign as a long and evolving process is nevertheless necessary on the scale of global transitions such as the design of more inclusive public policies. The few articles (9) tending to consider codesign as temporal processes only detail the classic “project” phase and do not or barely address the preliminary stages of the project (“pre-project” (2)) or the post-project stages (0).

The analysis of [corpus 1] thus reveals that existing inclusive codesign methodologies are not adapted to the design of inclusive public policies in the current urge for inclusive transitions. Indeed, they do not offer an inclusive global perspective as they are specified according to each "families" of disability, they do not allow for the representativeness of all the actors of the ecosystem, and the proposed codesign activities do not allow for collaborative questioning of the entire system studied, nor do they produce systemic deliverables, however necessary to carry out transformations at the scale of public policies. Finally, they are not anchored in a long-term perspective of societal transformations.

5. Results [corpus 2]: Towards the *prefiguration* of codesign processes

In parallel with the previous analysis, we carried out a chronological analysis - called phasic (Saad-Sulonen et al., 2018) - of the second literature review concerning participatory

and inclusive methodologies, describing the current challenges they face [corpus 2][3] or avenues for improvement. This phasic analysis allowed us to adopt the processual and temporal perspective of the methodologies (Mosleh and Larsen, 2020) prescribed for transitions (Ameri et al., 2018). In light of this perspective, the first salient point is the need to focus on the pre-project phase: the prefiguration of codesign processes, which seems to concentrate most of the methodological issues (Figure 2). Indeed, Eyraud et al. (2018) recall the need to collectively plan participatory processes in the most inclusive way possible (Eyraud et al., 2018).

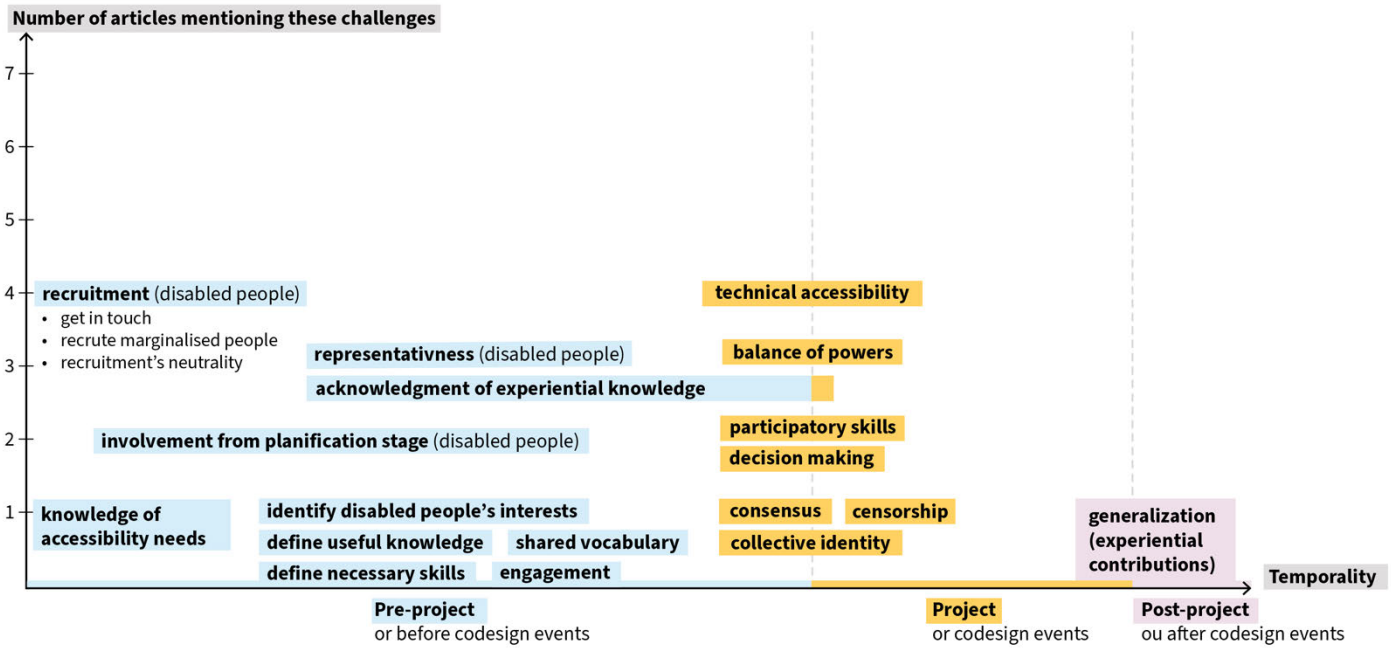

Figure 2: phasic analysis of inclusive codesign methodologies challenges mentioned in [corpus 2].

Two major prefiguration challenges stand out:

- Recruitment of people with disabilities is the most commonly described challenge. The authors indeed describe the issues of mobilizing and accessing audiences other than the usual people (Eyraud et al., 2018), the most willing participants, the usual suspects (Chinn and Pelletier, 2020) or even the "super-users" (Moll et al., 2020). To this end, they share the difficulties of finding new ways of approaching people with disabilities, who are not easily accessible (Eyraud et al., 2018). Recruitment issues also raise questions of representativeness: the authors share major questions such as how can people with disabilities be represented or represent themselves (Eyraud et al., 2018), and how can we counter the assumption that they might be representative of a wider group (Bradbury-Jones et al., 2018)?
- The second most important challenge seems to be related to the planning and alignment phase. The authors indeed describe the necessity for participatory identification of needs and interests (Eyraud et al., 2018). They suggest that everyone, including people with disabilities, should be able to take part in defining their needs and interests (Eyraud et al., 2018). To do so, they also point out the

[3] [corpus 2] gathers 7 articles : Eyraud et al., 2018 ; Chinn and Pelletier, 2020 ; Moll et al., 2020 ; Bradbury-Jones et al., 2018 ; Arévalo Arboleda et al., 2021 ; Arnal and Haegel, 2019 ; Nimbley et al., 2024).

importance of sharing a common understanding of the vocabulary used (Arévalo Arboleda et al., 2021).

6. Recommendations

This semi-systematic study revealed both the limitations of participatory and inclusive design methodologies for implementing the inclusive transition of public policies [corpus 1], and the prospects for improving them [corpus 2]. It showed that:

1. Participatory and inclusive design methodologies are not adapted to the scale of inclusive transitions: they need to evolve to include all “families” of disability or special needs, to include representatives of all stakeholders in the system, to challenge the whole system through codesign exercises, to produce systemic outcomes, all with a long-term perspective.
2. Most of the methodological challenges lie in the pre-configuration phase of the codesign process: improving the recruitment process (access to the audience and ensuring it is representative) and the planning and alignment stage (collective identification of needs and interests).

By combining these two analyses, we can formulate new recommendations for design research. Indeed, their cross-analysis reveals that adapting the prefiguration phase of the codesign processes could help respond to the methodological challenges revealed earlier [corpus 1]:

- Improving (broadening and refining) the recruitment processes could make it possible to involve a wide range of stakeholders representing the entire ecosystem needed to codesign inclusive transitions: people with multiple disabilities or specific needs, and public policy stakeholders, professionals from the mainstream environment, professionals from the medico-social sector and users, each of whom is not necessarily used to taking part in collaborative processes. This multiplication of stakeholders, each with different status and representation issues, complicates the recruitment phase.
- Working on the planning and stakeholder alignment processes upstream of the participatory processes could also make it possible not only to collectively question the system under study and thus be sure of creating solutions that respond to systemic issues, but also to frame the scale of the project.

However, answers to those challenges at the pre-project stage are little or not at all described in both [corpus 1] and [corpus 2].

New codesign tools, dispositive or methodologies are thus needed to 1) ensure an inclusive recruitment of various stakeholders representative of the whole social ecosystem 2) facilitate the alignment of their culture, interests and needs towards a shared vision of the future. It calls for new areas of research on the prefiguration phase of codesign methodologies, to scale up to the implementation of inclusive public policies:

- for design research: to study and describe more precisely the challenges of this stage,
- for design practices: to develop new recruitment processes and tools to implement an inclusive (re)design of public policies,
- for design education: to not only teach the accessibility norms, but also the characteristics of inclusive transition (as a systemic challenge) applied to public policies.

ABSTRACT | Funeral rituals as we know them are tending to develop into other forms of funerals. This evolution raises various issues (land, economy, ecology, culture, design, etc.) that require the mobilization of numerous academic disciplines as well as civil society to rethink our rites and formulate new ideas about death (being dead, being a body, being alive). This article presents the premises of a collaborative research project, CODE. MO, "COmmun DEs MOrtels", funded by the TIRIS program of the University of Toulouse and led by researchers from the fields of design, law, archaeology, lighting sciences and a young societal impact company Coeo. This participatory research dynamic explores new ways of burial for a better environmental, economic, aesthetic and societal impact and aims to create knowledge that enables a better approach to death in French society, along three main axes:
- Health and well-being: Understanding and working on taboos and the invisibilization of the topic of death in society. Redesigning places and objects of remembrance (cemeteries, urns, etc.) and life paths (from life to death to life) in terms of care design and therapeutic renewal.
- Change and societal impact: Mapping, analyzing and measuring the impact (ecological, psychosociological, economic, symbolic) of the current path of the deceased. Development and visualization of pathways to death and alternative pathways with greater impact for the future. Comparison of existing and new funeral practices.
- Sustainable transitions: accelerating sustainable transitions in mobility, energy, resources and industrial change by co-constructing decarbonized burial modalities, proposing new scenarios of use and reformulating our philosophical, cultural and ethical relationship with death.

1. Introduction

1.1 Funeral practices and care

Funerary practices are based on ancient rites that are passed down from generation to generation. These rites transmit a cultural and religious heritage that participates in a history of death and dying. They do not seem to have undergone any major evolution for more than 100 years; the introduction of cremation is the last significant innovation in the recent history of funeral practices (Berchoud, 2007). The moments surrounding death (end of life, funeral, post-mortem events) are much more than a simple farewell. They embody complex mechanisms for preserving memory, both individual and collective, and for coping with loss. In his study on anthropological interpretations of funeral rites, the anthropologist Jean-Pierre Albert (Albert, 1999) demonstrates the importance of funeral rituals for the preservation of collective memory and the essential role of these practices in the transmission of memories and family values.

In what is considered a "classical" scenario, a person's body disappears after death in favor of a burial that becomes a witness to his past life, his human life, which now takes place in the state of the deceased. The traces that the deceased leaves behind (images of the corpse, body remains, burial, objects, anniversaries, etc.) form the testimonial data of the deceased after the funeral has taken place. This collection contains not only physical and geographical traces of existence, but also memories, emotions and relationship and identity connections (image of the dead and emotional charge of the living).

According to the research of sociologist and anthropologist Gaëlle Clavandier (Clavandier, 2009), the body is the material receptacle of individual and collective identity and its preservation therefore has a deep symbolic meaning. The dead person no longer resembles the one we knew. Seeing the dead, expressionless and colorless body is a unique experience that is difficult to describe. Hearing, smelling, touching are some other verbs of sensory actions that are important at the time of the funeral so that the living can keep the person alive in their image and try to erase the corpse by allowing the subject to persist.

In contemporary Western funeral rituals, the care of the dead is important. This care often begins with the care of the deceased body, then with the witness of the living before, during and after the funeral, and finally with the spaces of contemplation and remembrance. These three main stages of the rituals (there may be others) testify to the collective desire to preserve the body of the deceased as a "place of remembrance" and

a "place of commemoration". The treatments are practiced in different ways.

The care of the corpse includes, for example, the intervention of the embalmer, the preparation of the corpse, the mortuary baths, the dressing and embellishment, the gathering of the group around the deceased, etc. These rituals help to construct the dead body as a "place of memory", that is to say that they make it possible to manifest and archive the identity components of an entire life at a certain time – in this case the transition from death to funeral – that one wishes to manifest and preserve through the presentability of the deceased. One could conjure up the idea of a representation of the body through a "witness image", that is to say an image of the deceased that, thanks to care, presents and represents for the living as close as possible to what he or she was before death. However, there are also other rituals to transfer the deceased body into memory.

The choice of a coffin, for example, its padded fabric in which the corpse is placed forever; the choice of granite or marble stone to make the tombstone or the powdered clay for the urn, the investment in a cemetery plot are all actions that show that rituals are not just about caring for the dead body. The question of the place where it remains after death is also important in order to bear witness to the past life (the cemetery house, the final resting place, etc.). The "place of memory" attributed to the dead is the place of visitation, contemplation, remembrance and sometimes the erasure of suffering. The funeral and its decorations are part of the funeral rituals and connect the dead with the living, who care for the place and bring it to life just as much as the deceased. In this sense, caring for the dead means caring for a body, a space, but also for the living.

Carrying the administrative and managerial burden of the moment, successfully organizing a funeral in the image of the deceased, or buying a costume especially for the funeral, participate in a form of respect for the deceased as much as in a form of care for the living. These actions are probably part of a "remembrance of places and beings". The rituals of the last moments, where the body and the spirit of the other intermingle (through the vision of the dead body or through the memories of one's own life, through the identity given to the funeral, etc.), are centered on the bodies and spirits of the bereaved. These rites are about moments - the past (memories of life), the present (moments of funeral) and the future (after body, after death); about the other state (life-death-life); but also about space and especially about dwelling (from the house of the dead to the cemetery as a new home). But these rites also manifest themselves in the care of the emotional and symbolic part of the living, that is to say of the living bodies (how to dress to respect the dead is a question often asked by people who have to go to a funeral).

Death does not mean the end of responsibility towards the deceased. The actions performed after death, such as washing, dressing or funeral, as well as the quality of the place where the body is laid out, can constitute decisions and actions that are supported by a form of ethics. These ethics – of presentation, of image, of space and of the moment – also show that the living have a strong aesthetic significance when a person dies.

1.2 Funeral ritual: ethical and/or aesthetic?

Funeral rituals that stage death through the display of the body of the deceased provide a context in which the question of sensibility can be explored and expressed. In his book "The Revival of Death", Tony Walter (1994) develops the idea that sensitivity to death and

mortality plays a crucial role in how individuals deal with loss and grief in Western funeral rituals. This position emphasizes the importance of everyone acknowledging and accepting the reality of death in order to facilitate a healthy and constructive grieving process on the one hand, and the need for individuals to be able to face their own mortality and that of their loved ones in order to take an ethical and aesthetic approach in these moments of burial on the other.
During the funeral rituals, people are confronted with the reality of death in a concrete way (visiting the deceased, displaying the remains, wishing to see him). The visual confrontation between the living and the body of the deceased is an essential aspect of the ritual. According to clinical psychology researcher Richard Paul (Paul, 2018), embalming not only aims to preserve the beauty and physical integrity of the deceased, but it also allows relatives to remember the deceased as they were when they were alive, thus facilitating the grieving process. The relationship to the dead and thus to death is therefore closely linked to the way society deals with the post-mortem body. This narrative reflects fundamental and collective values and beliefs regarding life, death and human dignity. While the visual confrontation between the living and the body of the deceased is an essential aspect of funeral rituals, Gaëlle Clavandier emphasizes that the respect and care given to the body of the deceased in funeral rituals testifies to the value placed on human life and the memory of the deceased (Clavandier, 2009). By acknowledging and accepting the reality of death, individuals can begin a meaningful grieving process and find meaning in their loss. In addition, this encounter allows loved ones to face the reality of death and express their farewell in a tangible way. However, the confrontation with death can also evoke a complex range of emotions in the ritual participants. The sight of the lifeless body can evoke sadness, fear and even disgust, reflecting, to quote Walter, "the tension between the bond with the deceased and the awareness of their mortality" (Walter, 1994). The presence of the dead body can serve as a catalyst for reflection on one's own mortality. It encourages the living to come to terms with their own feelings of impermanence and finitude.
For all these reasons, the study of the modalities of care and their impact on sensibility may amount to questioning the ethical and aesthetic approaches associated with the representation of death by centering the analysis around a central object, the body.

2. Research question

2.1 Contextualization

According to a study by the Research Centre for the Study and Observation of Living Conditions (CREDOC), there is a growing trend towards secularization and personalization today. Attitudes towards death are tending to be updated (Lehuédé and Mathé, 2024) and funeral rituals as we know them are evolving in a global desire for an evolution of care towards other forms that are more ecological, economical and aesthetic. Burial rituals as we know them are the subject of much debate today. The turn towards other, more ecological, more economical and more aesthetic forms of burial in a global effort to further develop the treatment of the dead, the bodies and the living is a path that is considered in this study. The evolution of funeral practices is indeed a major societal issue (respect for the will, problems of land ownership and overpopulation, multiculturalism and multiculturalism, etc.) that requires the mobilization of numerous academic disciplines as well as civil society (local authorities, funeral actors, families) to rethink our rites (dead, bodies, living) and to create new knowledge and new ideas.

Academic research is therefore now linked to entrepreneurial projects that question the human being as an actor, his environment as a recipient and our notions of death as beliefs.

2.2 Positioning in relation to the state of the art

The topic of death is often dealt with in the humanities and social sciences, but also in the fields of law, life sciences, design and urban planning. Nevertheless, the publications often remain confined to their disciplinary field and the contributions allow for little cross-fertilization and more or less situational experimentation. Furthermore, current contributions are limited to a topic-specific introduction and sometimes lack a critical knowledge base (George, 2002), (Nickpour, 2019). For this reason, the collaborative mode of research has been initiated here, linking academic research with collective and federative issues of the funeral sector and users in an active process of meaning seeking, meaning making and meaning taking (Holloway et al, 2013). These "meanings" given by John Holloway question the individual as actor, their environment as recipient and our representations of death as beliefs.

In this context, a working group has been set up that brings together various disciplinary approaches as well as Coeo, a young company with a societal impact since 2023. One of the actions of the Coeo approach is presented here in the context of the CODE.MO project, "COmmun DEs MOrtels", which involves some of the academics mobilized by the company (mainly from the fields of design, law, archaeology and lighting sciences). Indeed, in order to develop the present remarks in the field of design, it is necessary to show the authors' proximity to the initiative led by Ms. Chenuet and Ms. de Rauglaudre (Coeo) in the context of an entrepreneurial approach that they intend to develop around "funerals inspired by nature through new funeral gestures and rites".

CODE.MO. is one of the actions that are part of a global approach. It aims to create an overarching knowledge on the subject in order to gain shared insights that will allow the approach to death to evolve; French society is considering lifting a legal obstacle to the implementation of new funeral modalities. This global, collaborative and partnership-based research dynamic therefore involves researchers, lecturers, doctoral students, students and civil society (local authorities, funeral and social innovation actors, users). The project, which is funded for one year (2024-2025), cannot address all issues related to death in terms of its temporality - a project often lives at the rhythm of project calls. Therefore, this article focuses on the more specific perspective explored by the field of design, a transdisciplinary discipline that places the user at the center of considerations, in its cross-fertilization with the knowledge of others (law, anthropology, Coeo) and in the perspective of future cross-cutting themes (hypotheses and divisible themes).

2.3 Questions of co-research

In order to find new ways of caring for our dead (treatment, gestures, collective or individual celebrations, representations, languages, design of places and objects, etc.), collaborative research is essentially interdisciplinary and inter-scientific, decompartmentalized and participatory, in order to respond as effectively as possible to the problems of civil society. Points of convergence around common observations and problems thus form the basis of the approach. After several structuring steps for the project, the authors argue in favor of outlining some avenues for current and future research. These avenues reflect the state of the questions that are now being considered

in CODE.MO. and that the design addresses. They address the problem of the representation of death through three approaches: the paths of life to death and their places, the representation of death/the dead and their images, the aesthetic characterizations of death by the living and through their moments of use.

The existence of a demand for other forms of funerals is one of the entries that raises questions here. Such a request presupposes that the rites and places dedicated to burial are not perceived as satisfactory or appropriate by some of our contemporaries. Is such a feeling real? Are there precedents for it? Are there other cultures or human societies that have judged their own rituals to be inappropriate? Only a cross-research can shed light on this question. In our environment, burial sites are not the only ones that are perceived as inadequate. For the anthropologist Marc Augé, for example, a whole series of places are experienced in this way and form a category of their own, the non-places. In his view, non-places are disused spaces with no aesthetic quality (places of passage, rest areas, train stations, etc.). These spaces play an important role in social life, but their image is hardly valued. So are burial and death spaces therefore felt and experienced as non-places? It is a hypothesis which, thought out on a geographical level and according to uses, makes it possible to position it in the contemporary relationship to urban spaces. Moreover, the notion of place, which would indicate a kind of geolocation of death within the city, evokes the question of the way or the path. The deceased is indeed mobile, as funeral rites often take place on a journey (from hospital to home, from mortuary to cemetery, etc.). This mobility characterizes both the crossroads of the deceased and those of the living who accompany him.

In order to answer these questions, a cross-sectional study is underway to examine and analyze the professional career of the deceased. It is carried out through questionnaires and interviews with various actors (bereaved, health and funeral professionals, people who have no experience of the subject), as well as by analyzing the territories of death, collecting and recording data in situ (in places at the end of life, from care rooms to cemeteries). The main challenge is to model, through testimonies and field studies, the different scenarios of use of the journey of the deceased and to identify ways of developing and changing practices, i.e. the emergence of new technologies, ways of living or forms of dying.

The image of the dead that we receive through experience and memory is multifaceted. What do we remember in the moments of the funeral? How do we imagine "becoming dead"? Do the rites impose images of the deceased on us or what images do we imagine of the dead after the rites? These questions concern both the connection between lived experience and imagined experience as well as the representation of a form of aesthetics of death or "after death". Against this background, an axial cartographic modelling was begun. It makes it possible to reference images of death, especially representations of the dead, in different media (community sites, personal photographs, drawings of expression, AI generativity, etc.).

In this approach to the image, the perspective that would give rise to the call for "an ecology of funeral" is another common entry that raises questions. As the question of the impact of current practices (social, environmental, economic) is present in research discourses as well as in local policies and businesses, a cross-cutting research on the values and feasibility of alternative ways of funeral is currently underway. The latter generates new logics and beliefs that affect the representation of the dead body as well as burial sites or memorials. In this part of the project, the collection of data through mapping will be a visual support that can point the way to new imaginaries. What are the possible or dreamed alternatives to "return to earth or dust"? How can we represent and

present the dead body differently?

The challenge, then, is to know how to materialize and then democratize and rethink our modes of funeral. Design as a vehicle of fiction and soft innovation is of public utility to set the levers in motion in relation to our representations. Moreover, the comparative and prospective study aims to link knowledge (law, anthropology, history, biology, politics) to envisage new forms of burial and visualization of death by deploying legal and regulatory tools and analyzing different existing/emerging protocols through comparative law.

Aesthetics and the aestheticization of practices is a final point presented here, bringing together the leaders of the CODE.MO project. As CLMF design (color, light, material, finish) is a field of research being worked on by some of the authors, the senso-chromatic characterizations of the previous research directions are explored, as well as the use of color and its impact in funerary practices. What are the colors of death and dying in France today? What chromatic states do we pass through on the journey from life to death and from death to life? Do the living mourn in black, as history would have us believe? Can CLMF design help the living in the face of death? These questions, born from the feedback and already identified in the initial survey data, form a concern that places the aesthetic characterizations of death in the place of a possible lever for a better acceptance of separation and disappearance.

To answer these questions, a study of "objects" in the broadest sense of the word is analyzed (from the dying and then dead body to the elements that adorn or evoke the presence of the deceased in the various places envisaged in the first entry of the program). These elements that punctuate the path of the funeral, which may seem anecdotal given the gravity of the event, are, it seems to us, the reflection of our practices and our customs, our micro-cultures of mourning and, finally, of a form of care through the search for a form of beauty. What is the real situation? The problem of such a question lies in the individual's ability to project aesthetic qualities through various "objects" that form traces, clues, memories and memory in moments of drama. By cross-referencing regulatory data and historical practices in addition to the current CLMF analysis, the analysis will therefore search for the identity palettes of death and their possible renewals in our future funerary practices through the passages on surveys, referencing and then counter-types.

3. Emerging axes

The problems identified are mainly conceptual, legal and political, epistemic and paradigmatic.

Conceptual problems include the inability to define death in order to accept it as a fact of daily life; the neglect of the distinction between quality of life, quality of death and quality of places at the end of life; the lack of visibility and aesthetics of practices to think the rupture as a "global and personalized project". In this phase, the question arises as to the forms that the burial system takes (design of burial places, spaces and objects, scenarios of practices and experiences at the end of life and death, etc.).

The legal and political problems are related to the fact that burial today takes place in the ground or in ashes. In the USA and Germany, however, new, more ecological burial methods are being developed, such as humusation (terramation or natural organic reduction). This practice is the subject of several scientific publications, in particular on the biological process, the absence of pollutants or contaminants. To date, these

procedures cannot be transferred to France as they cannot be carried out with a coffin, which is currently mandatory. An ANR project called "F-Compost" is also underway with the aim of "co-designing and testing, under real conditions, funeral processes for composting in a natural environment" (CODE. MO is already in exchange with the "F-Compost" project thanks to the work of the Federation around a common dynamic led by the company COEO - Laboratory of Social Innovation of the Funeral Industry). This phase raises the question of the acceptance of other forms of burial (locks and levers for the psycho-sociological and legal acceptance for humusation, communication and the philosophy of dying, etc.).
The epistemic and paradigmatic problems here include the lack of a unifying and overarching instrument to promote shared knowledge. Research into new ways of burial with better environmental, economic and societal impact has led researchers from the fields of law, design and anthropology to join the CODE.MO. project. The cities of Toulouse and Paris have expressed their interest in becoming pilot areas for new funeral services (for humans and/or pets). It is thus the conceptual and practical proliferation that raises questions here to highlight the articulation of sciences and their disciplinary methods in order to jointly construct a reference tool, a common good on the subject. This raises the question of the formulation and reinforcement of the problems previously identified.

4. Methods and preliminary results

4.1 Survey methodologies

In order to answer all these questions, a cross-sectional investigation (anthropology, design, law, civil society) has been underway since January 2025 to examine and analyze the career of the deceased. It will last eight months and will be conducted using quantitative and qualitative questionnaires as well as semi-structured interviews with various stakeholders (bereaved, health and funeral professionals, people who have no experience of the subject). A study on the analysis of places of death using color design methods, including the recording and collection of data on site (public and private places of death, care rooms, burial sites), matching and sensory and chromatic measurements complete the approach. Another part concerns the cataloguing of visual representations. This involves reviewing paper, digital, graphic or cinematographic archives to create a database that will feed the rest of the project. The preferred tool is visualization through axial, lexical and linguistic maps. A final paper surveys the existing literature to identify the strong and promising data within this collaborative research.

These investigations require considerable human resources and linkage and articulation with the actors on the ground. In this first phase, we favor a regional approach (around the metropolis of Toulouse) for places at the end of life (from care facilities to burial sites) that form a possible route or a set of possible paths. The identification and mapping of these paths is the first step and the prerequisite for the survey prior to the in situ study (development of the survey protocol). However, carrying out the survey depends on the accessibility of the site and permission to take photographs. The development of survey protocols must be accompanied by contracts with stakeholders to ensure that the surveys comply with the French RGPD. Public research institutions will take on the role of a trusted third party where appropriate.

4.2 First results

The first phase, conducted through a field survey across the Occitanie region using a semi-structured questionnaire with a quantitative focus, aims to collect individual perceptions of death, of the deceased, of one's own death, and of the funeral moment, in order to construct a collective image. Although the survey is still ongoing, we have analyzed the first 51 responses to identify emerging trends (fig.1). The average age of respondents is 38, encompassing all socio-professional categories, and includes individuals living in urban, peri-urban, and rural areas.

In response to the question "What does death evoke for you?", the primary concepts identified were that of an ending and the sense of an inevitable passage. Secondary concepts included a feeling of emptiness, the idea of renewal, a negative emotional register (sadness, fear, anxiety), as well as thoughts for those who remain and, on a different note, the body's decomposition. Other concepts were mentioned but did not yield significant occurrences in this context (change of state, idea of release, sensorial or chromatic evocations, immateriality, burial places and objects).

In response to the question "How do you imagine a dead person?", the primary concepts fell into the sensorial-chromatic register, bodily transformation, and paradoxically, immaterial entity. These were followed by notions of ending, emptiness, release, and references to burial places and objects, along with the idea of an inevitable passage and decomposition. Other concepts were mentioned but were not recurrent in this context (renewal, memory, circumstances of death).

In response to the question "How do you imagine your own death?", the lack of representation emerged first, followed by negative emotional responses, the idea of an ending, release, and the circumstances of death. Secondary concepts included the idea of an inevitable passage, concern for those who remain, burial places and objects, emptiness, and reflections on one's own funeral. Bodily transformation was mentioned but did not appear with enough frequency to be considered recurrent in this context.

Finally, in response to the question "What do you associate with the moment of the funeral?", the main concept belongs to the emotional register and is closely linked to sadness. Secondary concepts relate to rituals and the gathering of the living during the ceremony. These are followed by farewell, burial places and objects, memory, and the recollections loved ones have of the deceased. Other concepts were mentioned but accounted for only two occurrences, or none at all in the context of this question (such as the sensorial-chromatic register and the notion of ending).

Table 1. Occurrences of concepts according to the different questions.

	Representation of Death	Representation of a Deceased Person	Representation of One's Own Death	Representation of the Funeral
No representation	/	/	18%	/
Farewell	/	/	/	6%
Bodily transformation	2%	17%	2%	/

Circumstances of death	/	2%	14%	/
Decomposition	6%	4%	/	/
Emotional register	8%	/	12%	41%
Inevitable passage	14%	4%	6%	/
Ending	35%	8%	12%	2%
Immateriality	2%	16%	/	/
Burial (places and objects)	2%	6%	4%	6%
Release	2%	6%	12%	/
Memory	/	2%	/	6%
Thoughts for those who remain	6%	/	8%	/
Renewal	8%	2%	/	/
Gathering of the living	/	/	/	19%
Ritual	/	/	/	12%
Sensorial-chromatic	2%	27%	/	4%
Emptiness	8%	6%	4%	/
Other	5%	/	4%	/
Preferred not to answer	/	/	4%	4%

Four levels of occurrence can be observed among the identified concepts :

- Primary concepts: emotional register, ending
- Secondary concepts: inevitable passage, sensorial-chromatic register, bodily transformation, release, gathering of the living
- Tertiary concepts: absence of representation, circumstances of death, immateriality, burial places and objects, thoughts for those who remain, ritual, emptiness
- Complementary concepts: farewell, decomposition, memory, renewal

This conceptual hierarchy suggests a collective representation of death that is

predominantly negative, marked by a strong emotional register. The presence of loved ones then appears to hold particular significance, as does the appearance of the deceased's body. Finally, the lower level of concepts reveals either a lack of anticipation of what comes after death or a minimal degree of foresight. In such cases, social rituals as well as burial places and objects emerge as points of consideration for the respondents.

5. Scientific and societal objectives

The aim of the research is to enable policy authorities to overcome this obstacle by relying on three main pillars (health and well-being, societal change and impact, sustainable transitions).

The first is health and wellbeing. It is about understanding and promoting healthy living and well-being in order to lift the taboo and invisibilization of the subject of death in society, supporting all actors in the sector in a "must die" and anticipating new needs (socio-cultural and political), redesigning places of remembrance (cemeteries, ballot boxes, etc.) in the spirit of care design and nature as a therapeutic tool, and finding psychosocial levers for accepting the idea of a "softer" separation (tools and dissemination).

The second pillar focuses on societal changes and the impact of these new practices by examining global changes and their effects on societies. Mapping, analyzing and measuring the impact (environmental, psychosociological, economic, symbolic) of the current journey of the deceased (from death to final resting place) allows to create and illustrate paths to death and alternative routes with a better impact for the future, in parallel with a comparison of existing and emerging European funeral practices.

Finally, the third pillar focuses on sustainable transitions. The aim is to accelerate sustainable transitions in mobility, energy, resources and industrial transformation by co-constructing decarbonized funeral modalities such as humusation, by proposing new scenarios of use that connect humans and nature (emergence of greened memorial landscapes that comply with zero-phyto prescriptions, the emergence of biodiversity, green lungs and islands of freshness in the city) and by reframing our relationship philosophically, culturally and ethically in the face of death or loss.

6. Conclusion

While death is a universal phenomenon, it manifests itself in a variety of practices that reflect the cultural, social and philosophical values of a society. Funeral rituals not only have a symbolic and spiritual dimension, but are also an important societal issue in the face of changing expectations, beliefs and contemporary environmental challenges. At the heart of these reflections is design as a transversal discipline that makes it possible to rethink and renew funeral rituals in order to adapt them to new ecological, aesthetic and emotional needs.

Thus CODE.MO aims to bring about a change in the way we deal with death, mourning and remembrance by offering more sustainable and humane alternatives to current funeral practices. Through an interdisciplinary and collaborative approach, it aims to question the utility and impact of traditional rituals while paving the way for modalities that are more respectful of the environment and the diversity of individual and collective

aspirations. Investigating the "non-places" associated with the end of life, redefining the funerary space and exploring new practices such as humusation will make it possible to shake up the established codes and reinvent a funeral journey that is both respectful of ecological issues and meaningful.

The expected results of this research promise not only to influence the practices of tomorrow, but also to participate in a broader movement to take responsibility for death that integrates human, environmental and ethical dimensions in a sustainable way. Ultimately, the goal is to restore a just and thoughtful place for death and grief in our society, so that each person can be treated with dignity and respect in their passing, while the living have the opportunity to rebuild themselves in a grieving process that is more responsive to new needs and deeply connected to humanity and nature.

About the authors:

Estelle Guerry Doctor, research engineer (LARA-SEPPIA, UT2J) and teacher at the Institut Supérieur Couleur Image Design (ISCID, UT2J), she develops innovative strategies or services for the benefit of better living/well-being/better aging through the prism of care & color design.

Nathalie Wiart Doctor specializing in organic cosmetics, researcher (LARA-SEPPIA, UT2J) and teacher at the Institut Supérieur Couleur Image Design (ISCID, UT2J), she is interested in materials, aspects and finishes through a designer-colorist approach.

Lohanne Beltra Holder of a Master's degree in design, specializing in creation, research, and innovation in color and material (ISCID, UT2J), she joined the CODE.MO project to develop her future doctoral research related to care design and color. She is interested in representations of death and the journey of the deceased.

Jérémie Élalouf A lecturer at the Institut Couleur Image Design (ISCID, UT2J), his research focuses on the model of nature in design and the problem of the relationship between technology and commodity. His publications include "On the Role of Nature in Modernist Design." *Voix contemporaines*, 2023 and "Machine or Commodity? Outline of an Analysis of the Respective Roles of Mechanical and Commercial Abstraction," *Design, Arts, Médias*, 2023.

Céline Caumon University professor (ISCID, LARA-SEPPIA, UT2J), her research focuses on color models in design practices and for CODE.MO, on the representations, symbolism and coloring of "objects" in the journey from the end of life to the afterlife.

ABSTRACT | Policy design, design for policy, and 'policy design thinking' have influenced policymaking with interdisciplinary and heterogeneous perspectives from design and other disciplines. Whilst public sector policymakers seek creative, design-led methods and tools to enhance policy-making through a design thinking approach, design researchers and practitioners seek a recognised role within these processes. Even though these strands show blurred boundaries, a significant aspect is that they help to define a space of interaction between design and policy-making. Moreover, we see an opportunity to identify lenses that can help interpret, scale, and replicate various experiences within the broad context of policy design, encompassing different perspectives. We believe this is especially crucial for design practitioners and researchers in contexts where this field is not yet recognised and/or explored. Based on this assumption, the research question that this contribution tries to answer is: What framework can define ways to recognise or pursue experiences of design for policy? Methodologically, the authors defined a framework proposal through inductive reasoning, relying on ten years of academic research in design for policy, social innovation, and civic design to select cases. Qualitatively analysed, the selected cases drew our attention to three recurring patterns: (i) the transfer of design culture and expertise to policymakers and public sector actors, empowering non-design-experts to adopt a design-led approach in policy-making independently; (ii) the co-creation of knowledge within policy processes, epistemologically grounded in

co-design, through the Research Through Co-Design model; (iii) the transformation of a context by non-expert designers, intended as active citizens and policymakers who systematically design for policy. Translated into 'entry points' to the design for policy arena, also by means of comparison and connection to other cases taken outside the authors' research groups, such patterns are defined as follows: (i) transferring design knowledge to non-designers for policy-making processes, (ii) fostering knowledge co-creation among the involved actors in policy design, and (iii) recognising existing policy design processes led by non-designers through a design perspective. The framework is discussed with regard to its use as an analytical and strategic tool for positioning design possibilities of intervention within policy processes.

KEYWORDS | DESIGN FOR POLICY, DESIGN KNOWLEDGE TRANSFER, RESEARCH THROUGH CO-DESIGN, NON-EXPERT DESIGN

1. Introduction

1.1 Design and policy-making: an overview of an emerging and plural field

The connection between design and policymaking - in terms of design methods and approaches contributing to the development of public policies - is a subject of current scientific interest for researchers in the field of Design, as well as in Policy Studies, Public Administration and Management ones (Kimbell et al., 2023; Mortati et al., 2022; Van Buuren et al., 2020).

The first hints of this interaction date back to the 50s, when the term 'policy design' was coined in Policy Studies to express the idea of systematic calculation of policy problems, practices, and outcomes (Colebatch, 2018) and, three decades after, an innovative approach for effective policy-making (Peters et al., 2018). Henceforth intended "as a form of design" (Carlsson, 2004), policy-making began to be approached with design thinking as a rational guide for effective policy solutions, especially when tackling 'wicked problems' (Howlett, 2019). Practitioners and academics in the area of Design, on the other side, started exploring the policy field at the beginning of our century (Burns et al., 2006), experimenting collaborations with policymakers and civil servants in order to make better public policies and services - i.e. more capable of understanding public problems and addressing people's needs. In the last fifteen years, the concrete idea of a new area for design practice and research within this field emerged, being explored in various policy domains and through a diverse range of implications of design expertise and different roles for designers (Bason, 2014a; Kimbell et al. 2022; La 27e Région, 2010; Lewis et al. 2020; Mortati, 2019).

Within policy processes, design thus has gained recognition as a strategic lever to address the challenges policymakers are increasingly facing nowadays, characterised by high levels of complexity and uncertainty, and exacerbated by limited resources available to governments (Bason, 2014b; Kimbell et al., 2022). The contribution of design fundamentally lies in the introduction of human-centered and collaborative approaches, a systemic and transformative vision, and an openness to inquiry, experimentation and

prototyping (Bason, 2014b; Blomkamp, 2021; Kimbell, 2016; Kimbell & Bailey, 2017; Lewis et al. 2020; McNabola et al., 2013; Villa Alvarez et al., 2022). Cases in this field have appeared in all continents and at all administrative scales - ranging from local to national and supranational policies - and have concerned several policy domains and policy problems, mainly regarding social issues. Designers' intervention in these experiences varies in terms of contextual situations and policy stages, proving the possibility to take part in all phases of the policy cycle. Moreover, these cases show different degrees of institutionalisation: designers may collaborate with policymakers - for example, inside pluridisciplinary units as policy and public sector innovation labs - but also support grassroots-led policy processes or influencing policy outcomes through forms of design activism (Selloni, 2021; Tromp & Vial, 2023; Vaz et al., 2022; Whicher & Swiatek, 2022). Named in different ways - such as 'policy design' (Bebbington et al., 2022; Blomkamp, 2021; Johnson & Cook, 2014; Vincent & Thévenet, 2013; Whicher, 2020), 'design for policy' (Bason, 2014a; McAuliffe, 2023; Mortati et al., 2022; Rudkin & Rancati, 2020; Vaz et al., 2022), and 'design-led policy' (Blomkamp, 2021; Cairney, 2021; Schmidt & Mortati, 2024), *inter alia* - this "new" space of intersection between design and policy disciplines reveals an increasing but still emerging field of practice for designers and policymakers (Kimbell et al. 2022; Whicher & Swiatek, 2022). Its liability to lexical and semantic plurality (Curtabbi, 2025; Villa Alvarez & Wellstead, 2023), as well as its heterogeneity with regard to purposes, tasks, moments of design intervention, and relationships with institutions and policy processes, reveals this area as a spectrum of practices.

1.2 The challenge of recomposing the diversity of design for policy

The need to represent such diversity and recompose the fragmented knowledge on design for policy seems to be addressed by a few research contributions.
For instance, some researchers from the Public Management domain defined a set of three uses of design approaches in public administration: 'design as optimisation', 'design as exploration' and 'design as co-creation' (Van Buuren et al., 2020). In the authors' idea, the three modes correspond to different purposes: (i) making policy-relevant knowledge accessible to policymakers; (ii) adopting creative tools to help decision makers develop policy solutions; (iii) applying a participatory approach to the whole process of policy-making. One of these authors, together with other colleagues, developed a systematic literature review of consistent Public Administration publications, including one design journal (Hermus et al., 2020). Their work provides a two-level typology of design approaches in public policies: informational approaches and inspirational ones. The two clusters differ in content, context and impact of design - i.e. the use of knowledge, the situation in which design is employed, and the cognitive or practical changes evoked by design. Respectively, the authors claim that design in policy processes can be used with a theory-driven or synthesis-oriented approach, providing evidence or addressing users' perspectives, to create consensus or change.
A work worth mentioning from Design literature is the one by Kimbell et al. (2022), which enlightens the inner fragmentation of this research field, claiming that "differences in ontologies, epistemologies, methodologies, and contexts should be acknowledged", and suggesting the need for a cross-disciplinary investigation between Design and Public

Policy, within which "multiple conditions for, forms of practice and accounts of designing for public policy may emerge" (pp. 10-11). The research directions outlined by this analysis resulted in a broader publication, involving other colleagues from Design and Public Policy fields. Here, Kimbell et al. (2023) present a framework to differentiate the purposes, scopes and agents of design in policy-making, highlighting three relationships between design and policy. Design is presented (i) as "a tool for policy-making" to achieve specific goals and generate solutions, (ii) as a practice of improvising with policy-making and making it more open, or even (iii) as a way to regenerate its approaches. Different types and owners of knowledge are analysed within this framework: in the first case, design is adopted by both policymakers and professional designers, while in the second case, also policy takers contribute as co-designers, and, when "regenerating" policy-making, a more inclusive approach to knowledge is enacted.

Another relevant framework (even if referred to a broader scope than the policy realm) is the one by Brinkman et al. (2023), suggesting a series of strategies for applying design in a public sector context. The authors provide a taxonomy of strategic actions ascribed to four different strategic purposes: (i) building confidence in design; (ii) forming alliances with design thinking advocates; (iii) generating support and political buy-in; (iv) enhancing compatibility between design and the external context.

The analyses just mentioned confirm the demand for approaches that display the diversity of design for policy. They focus on design "agents"[1] and the contributions of design to policy-making processes, particularly in terms of knowledge production and impact on policy as a whole. More importantly, they describe the field as it appears in contexts where its related practices are well-established, resulting in frameworks that may not apply in countries like Italy, where design for policy is still emerging and limited to a few examples in academic research. Based on our research experience, it becomes clear that there is a need for an intermediate acknowledgement of the conditions enabling design for policy, before focusing on the full spectrum of design contributions. Hence, the research question which we attempt to answer through this paper: What framework can define ways to recognise or pursue experiences of design for policy? More precisely, we question the possible 'entry points'[2] allowing the recognition of existing

[1] Within Design literature, the term "design agents" is typically used to refer to those entities and organisations making use of design and embedding professional designers are often embedded, such as centres, associations, networks and clusters (Whicher, 20217) We use the expression to refer to all those actors who, in their professional roles, embody and exercise design practice, acting as *bearers* of design capability (Maffei et al., 2014; Muratovski, 2016). This includes not only professional designers, but also those who design as part of their profession or – as is often the case with civil servants and policymakers in the design for policy landscape – draw upon design tools and methods in their everyday work. We deliberately adopt this broad definition in order to later articulate, throughout the paper, the internal distinctions and implications arising when diverse actors – with varying backgrounds and intentions – engage in design competencies and approaches when making and innovating policies.

[2] For "entry point" we mean both a strategic opportunity and enabling condition for initiating a certain kind of process, and an analytical lens for identifying and interpreting that process, offering a new perspective from which to observe it. The concept of an "entry point" is widely recognised in computing, where it refers to "an address from which a program or subroutine is to be executed" (Collin, 2004). This analogy can inform our use of the term in the context of design for policy. In our

experiences of design for policy not yet labelled as such, and serving as a proactive approach to this new design field where it is not explored. In response, we propose a framework of three 'entry points' that complement rather than replace existing ones, creating new opportunities within those frameworks. This approach underscores the importance of considering how the 'posture' of design agents shapes the purposes and consequences of integrating design practices into policy processes.

2. Methodological approach

Methodologically (Figure 1), the three "entry points" framework mentioned emerges from an inductive process by analysing and connecting academic research, supplemented by further cases. We belong to two different academic groups having in common social design subjects and action-research initiatives both in the field of social inclusion, and belonging to two Universities placed in two different regions in Italy: the Innovation in Design & Engineering Laboratory (IDEE Lab) within the University of Florence, in Tuscany, and the Social Design Lab (SDL) from Politecnico di Torino, in Piedmont. SDL is mainly concerned with social cohesion challenges related to severe adult marginalisation, such as housing insecurity and food poverty among people experiencing homelessness (Campagnaro & Ceraolo, 2022). The group adopts a transformative and participatory approach, fostering alliances with local stakeholders, particularly Public Administrations, to engage in policy-oriented processes. In parallel, part of the team of the IDEE Lab is also engaged in experimenting with co-design, service design, as well as product-service system design for social change processes, collaborating with third sector entities and local public bodies.

Our two groups share a common interest in social design and design for policy. Through discussions, we recognised that the heterogeneity of our research experience was not easily identifiable within the design-for-policy arena[3]. This led us to a reflective process to determine whether we were already engaged in design-for-policy practices or how to actively participate in such initiatives. As a result, we initiated a collaborative reflective process (Figure 1) to explore our research question, focusing on how to recognise or pursue design-for-policy experiences. This process involved three stages: (i) collecting cases from

interpretation, the "address" signifies an access point—an enabling condition through which one may enter a design for policy process. Crucially, this entry point is not necessarily part of the process itself, but rather a situational or contextual factor that facilitates engagement with a design for policy setting.

[3] With the term "design-for-policy arena", we refer to the concept of the "action arena" introduced by Ostrom (2005), which encompasses both the "action situation" and the actors involved in it. Ostrom (2019) describes it as "the social space where individuals interact, exchange goods and services, solve problems, dominate one another, or fight." A similar use of the term "arena" in design has been recalled by Gaete Cruz et al. (2023) through the notion of the "co-design arena", which also draws upon Ostrom's framework. Accordingly, in this paper, the term "design-for-policy arena" denotes design for policy as a distinct and dynamic realm—understood in processual and relational terms. It refers to the space in which design practices and designers contribute to policy-making, and where interactions between designers and policy actors—such as decision-makers, policy implementers, and other stakeholders—take place.

our research groups based on direct experience or study, (ii) inductively identifying an initial pattern, and (iii) validating it with examples from other contexts. The following paragraphs detail each stage.

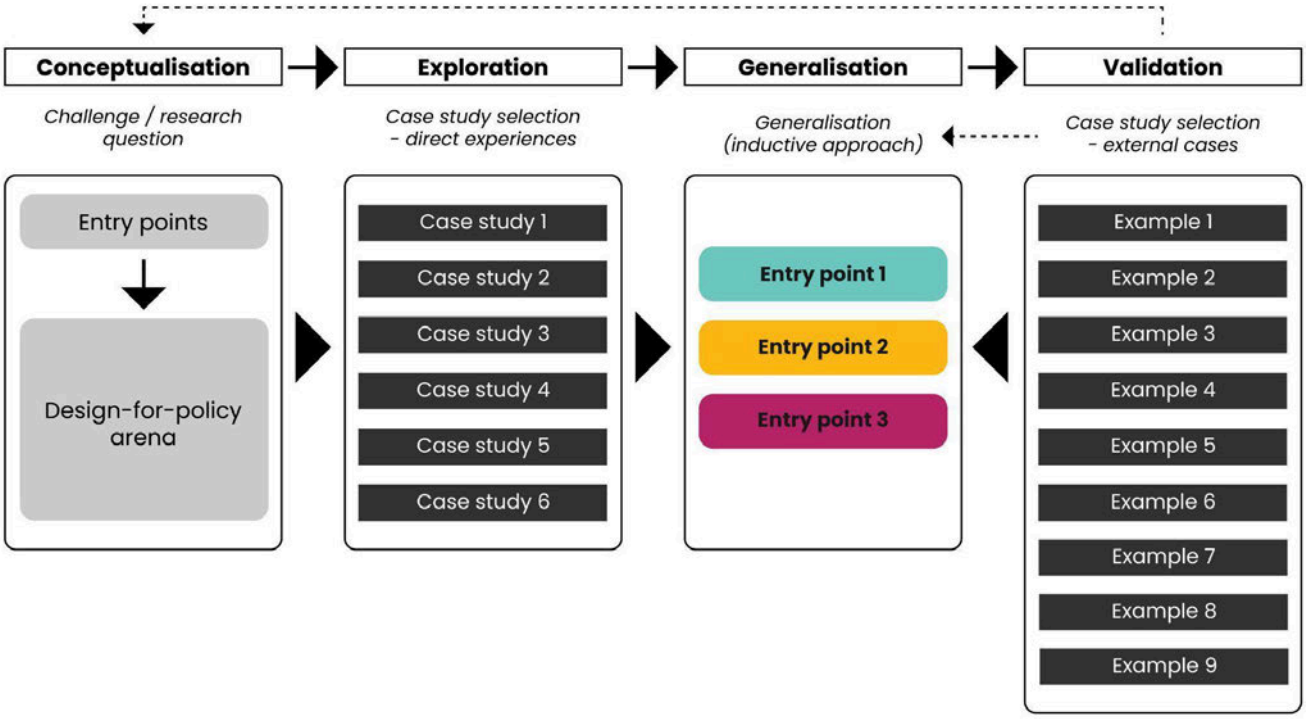

Fig. 1. Methodological approach applied to develop the framework.

2.1 Case collection

Based on our experience in design research, we selected cases according to the following criteria:

- They were carried out in the last decade and were either directly experienced or thoroughly studied by us.
- They were related to design research questions, involved design practice, or reflected specific design stances.
- They were linked to policy-making processes, including collaborations between designers, non-designers, public institutions, and policymakers, as well as involvement in other processes that directly or indirectly influence policy formation and implementation.

The collected cases, summarised in Table 1, vary in terms of topic, purpose, context, duration, designers' roles, and stakeholders involved. They include collaborations with both public actors and civil society organisations engaged in public interest functions, representing both explicit and latent policy dimensions. These diverse, often "hidden" examples were chosen not for being conventionally "successful" but for their potential to initiate a design-for-policy dimension, reinforcing the idea of plurality within the field of design for policy. The following are the selected cases.

Reorienting Turin's system of public services for homelessness

The first case study, launched under the National Operational Programme on Social

Inclusion of the ESF 2014–2020, involve SDL in supporting the Municipality of Turin and third sector organisations in reorienting public services for people experiencing homelessness (Campagnaro et al., 2022). The process has followed a participatory approach, enabled by the legal framework of Codesign (Campagnaro & Di Prima, 2022). Initially, it focused on problem-framing and strategy definition, informing policymakers' introduction of a new intervention within Turin's Social Inclusion Plan. The current phase involves experimentation, monitoring, and evaluation of new service models, with the potential to institutionalise these innovations within the city's social inclusion policies (Di Prima et al., 2025; Campagnaro et al., 2022).

Alimenta

Alimenta is a design-led systemic initiative addressing food poverty among people experiencing homelessness in Turin. Supported by a private actor and a collaboration with three social cooperatives managing six public shelters, the project operates on three levels: food access, capability-building through food-related activities, and academic research on innovative solutions to combat food poverty (Campagnaro et al., 2023; Passaro et al., 2021). Over time, the initiative has expanded into a broader network, fostering a local food system that creatively supplements institutional responses to food poverty. From a design-for-policy perspective, the research group and other stakeholders see Alimenta as a potential reference point for engaging with the City on food policy, showcasing a systemic, multi-stakeholder, and multidimensional approach (Campagnaro et al., 2023; Curtabbi & Campagnaro, 2023).

Design Research Lab

The Design Research Lab (DRLab) was an experimental research initiative at the University of Trento's Department of Humanities, integrating complexity theory, semiotics, and design methodologies—specifically, Service Design Thinking and Design Research. Co-funded by the Provincia Autonoma di Trento, it functioned as a local policy lab to introduce and promote service design culture in strategic sectors, including education, private industry, and public policy. During its first three years, DRLab developed and tested a framework for transferring design knowledge to policymakers and public civil servants (Busciantella-Ricci et al., 2019; Busciantella-Ricci and Ventin, 2020a; Busciantella-Ricci and Ventin, 2020b). This process also fostered recognition of service design as a strategic tool for local policy development (Provincia Autonoma di Trento, 2019; Busciantella-Ricci et al., 2022).

The Healthy Neighbourhoods Hub project

It is a two-year action-research project introducing the Healthy Neighbourhoods Hub (HNH) framework to address urban health within the built environment (Busciantella-Ricci et al., 2024; Macchi et al., 2024; Rinaldi et al., 2025). Focused on two areas in Florence—spanning three neighbourhoods and five districts—the project involved partnerships with local public policy bodies such as the Municipality of Florence and the

Local Health Authority. The research engaged key stakeholders, including local communities, third sector entities, and policymakers, to co-create the HNH framework and develop strategies for building healthy and inclusive neighbourhoods by integrating local knowledge with best practices and literature reviews. The project resulted in a set of strategies, design scenarios, and guidelines to implement the HNH framework (Setola & Rinaldi, 2024), which were incorporated into observations on the Municipal Operational Plan and Structural Plan of Florence.

The Riace model in the DesIA project

The Riace model is a case study in a research project that explored the Design for Inclusive Attitudes (DxIA) (Busciantella-Ricci, 2023; Busciantella-Ricci et al., 2024). Design ethnography methods, including direct observation, contextual interviews, and spontaneous focus groups, were conducted in the villages of Riace and Camini in southern Italy. These villages are known for their immigrant hospitality models (Driel & Verkuyten, 2020; Ranci, 2020; Carbone, 2023), developed by local communities without formal design training. The researchers interacted with the founders, former policymakers and local communities to explore how these models shaped attitudes toward immigrants and how they could inform the DesIA project (DesIA, n.d.) from a design for policy perspective.

The LoveGiver project

The LoverGiver project was also explored as a case study within the same research project mentioned earlier, which focuses on service examples promoting inclusive attitudes towards diversity and inclusion (Busciantella-Ricci, 2023). The project aims to raise awareness about the relationship between sex and disability, serving as an experimental service that promotes the sexual independence of disabled individuals (Morales et al., 2020). It became a key reference in regional policy discussions in Tuscany (Popolla & Scudieri, 2023; Mozione 1228 [Motion 1228], 2023), leading regional policymakers to propose a law to the Italian Parliament (Proposta di legge al Parlamento n. 15 del 21 dicembre, 2023 [Bill submitted to Parliament No. 15 of 21 December 2023]) to introduce the role of operators and educational programmes on emotionality, affectivity, and sexuality.

Table 1. Selection of the cases and their relevance

Case name	Relationship with the policy level	Achieved impact on the policy level
Alimenta 2014-ongoing (case 1)	Long-term institutionalisation of a bottom-up process - aiming at institutionalising the bottom-up process to inform local food policies, expanding the system to the entire city scale	Dialogue with the Municipality, raising awareness on the existence of this process (and its outcomes)
Design Research Lab 2017-ongoing (case 2)	Specially funded by a local government to test the application of service design in strategic sectors and to improve their policies	Widespread introduction of service design in the construction of new policies in some strategic sectors

Reorienting public services for people experiencing homelessness in Turin 2018-ongoing (case 3)	Planned indirect influence on policies - collaborating with policymakers for system analysis and problem-framing - setting new objectives and interventions for the current service system, incorporating them and their principles in the city's social inclusion policies	Recognition of the process and its outcomes by the political side of the Municipality, taking them as a reference for future policy formulation
The Healthy Neighbourhoods Hub project 2022-2024 (case 4)	Local government as a project partner: - Influence policies by involving policymakers and relevant influential actors in action-research processes and co-design events	The main results have been included in a series of observations on the POC (Municipal Operational Plan) and the PS (Structural Plan) of the local municipality (Florence, Italy)
LoveGiver project 2023-2024 (DesIA project time-frame) (case 5)	Guiding the discussion and providing information on the debated topic about the relationship between disability and sex	A regional law approved the role of the figure of the "operator for emotionality, affectivity, corporeality and sexuality for people with disabilities"
Riace's model 2023-2024 (DesIA project time-frame) (case 6)	Piloting the complexity of the refugees' hospitality in accordance with the local needs	The local experience has been recognised as an effective experience at the national level

2.2 The first framework formulation

In the second stage, we adopted an inductive reasoning approach (Trochim, 2005) to identify patterns from our cases, specifically focusing on how they suggest an entry point into the design-for-policy arena. We developed a first hypothesis of the framework (results in Figure 2) by collaboratively noting the factors in each case that could position it as a potential starting point for 'making' design-for-policy. The theoretical construct used for this analysis aligned with two key elements from the academic frameworks mentioned in the introduction: the definition of the actors bringing design capability and the relationship between design contributions and knowledge production to inform the policy process. In the first round, a general code was assigned to each case, followed by a second round where we identified predominant factors that could serve as recurring entry points for design for policy.

2.3. Validation of the framework

To substantiate the initial version of the framework, additional cases drawn from our studies were selected using a typical-case approach (Gerring, 2006), being guided by the three entry points. These cases were identified through: (i) Horizon Europe and Horizon 2020-funded projects, accessed via the Cordis search engine with keywords such as

'design for policy,' 'policy design,' and 'design thinking'; (ii) policy labs, public policy innovation labs, and governmental innovation labs; (iii) impactful literature and repositories that showcase selected examples of design for social innovation (including Manzini, 2015; Amatullo et al., 2021; Manzini & D'Alena, 2024) and community-led social innovation cases (European Commission, 2020; European Social Fund Plus, n.d., filtering for 'Delivering+public+policies' and selecting related initiatives), which particularly focus on the innovation of social policies (Junginger, 2013; Amatullo et al., 2021).
The following paragraph presents the selection of examples we used to discuss and validate the initial version of the framework.

The Interreg Europe project RETRACE (Barbero, 2017) (EX1) exemplifies entry point 1 by promoting systemic design as a method for local and regional policies toward a circular economy. Systemic design experts provided stakeholders with essential knowledge to enhance policymaking and support the transition to a circular economy (Giraldo Nohra et al., 2020). A key output was the creation of a "Systemic design method guide for policymaking," which aimed to equip policymakers with the tools and guidelines to define sustainable interventions (Barbero, 2017).

La 27e Région's project La Transfo (EX2) is an experimental program designed to help public administration departments develop innovation labs. Its goal was to foster a new approach to policymaking that enhances effectiveness and sense-making (La 27e Région, 2015). The program focused on capability-building for civil servants and elected officials, training them in innovation-oriented competencies, including design methods. Designers collaborated with social scientists and city planners to support this process (Amatullo et al., 2021). This example supports entry points 1 and partially 2, representing a pioneering effort to create spaces for experimenting with design for policy and gradually integrating it into the public sector.

As another example of entry point 1, Public Sector Innovation (PSI) labs (EX3) serve as spaces for "applying design approaches to policy-making" (Whicher, 2021, p. 253), integrating design into public administration alongside other disciplines. These labs transfer design capabilities, such as creativity, abduction, and human-centeredness (Villa Alvarez et al., 2022; Lewis et al., 2020), while also promoting multi-actor collaboration (entry point 2). This approach enhances policy outcomes by fostering a more citizen-aware perception of public issues and enabling more effective solution development and implementation (Fuller & Lochard, 2016; Lewis et al., 2020; McGann et al., 2018; Tõnurist et al., 2017).

Similarly (entry point 1), the SEED project (EX4) aims to establish Social Innovation Competence Centers, where multi-actor teams (e.g., researchers, practitioners, policymakers, and civil servants) collaborate to develop public infrastructures that help national authorities better utilise European Social Funds to mainstream Social Innovation as a Public Sector Innovation approach (SEED, n.d.a). The project emphasises capacity-building, with design playing a crucial role in directly influencing policies. The toolbox provided, based on the double diamond design thinking approach, highlights the

project's commitment to using contemporary design as a central element in the development of the Competence Centers (SEED, n.d.b; SEED, 2023).

The SISCODE project (entry point 2) (EX5), funded through Horizon 2020, aimed at "stimulating the use of co-creation methodologies in policy design" by applying bottom-design-driven approaches to influence Responsible Research and Innovation, and Science, Technology, and Innovation Policies (SISCODE, n.d.). This project highlights three key factors (c.f. Deserti et al., 2020; Deserti et al., 2022): (i) co-creation as a central activity for impacting policies, (ii) co-creation labs as spaces for aligning multiple actors' needs in policymaking, and (iii) a design-driven approach to foster bottom-up policy initiatives. Additionally, the creation of the SISCODE Toolbox illustrates the project's commitment to facilitating collaboration in the design-for-policy process.

The Global GovJam (Global Gov Jam, n.d.) (EX6) is a notable example of a co-creation initiative that supports policy design processes (entry point 2). It operates in three key directions: (i) networking individuals, including non-designers, interested in designing policies or services for the public interest, (ii) promoting contemporary service design culture, and (iii) co-designing or simulating the co-design of services and policies, thereby opening new opportunities for local policy development. This event exemplifies how citizen-driven collaborative processes, often led by design, can contribute to proposing new public services and policies.

Community-driven initiatives can also provide valuable insights for policy-making, even if they are not design-led (entry point 3). These social innovation projects, developed by citizens or specific communities, have had a significant impact on policies and are often recognised as inspirational practices in Europe (European Commission, 2020). Examples include:

- The Malopolska Incubator for Social Innovation (EX7), which focused on disability challenges and facilitated the co-creation of innovative products and services. Some of these innovations were upscaled nationwide through support from the Polish Ministry of Investment and Economic Development, demonstrating both community-driven and policy-collaborative impacts (entry points 3 and 2).
- Intercultural Assistants in Czechia (EX8), which aimed to improve migrants' access to public services by introducing a new role in social services. This initiative increased tolerance and intercultural competence among service officers, exemplifying how community-driven efforts can lead to policy innovation (entry point 3).

Finally, the Buurtzorg model (EX9) was developed to address neighbourhood nursing care needs, offering a system tailored to the specific needs of citizens within their local context (Buurtzorg, n.d.). This model has been implemented in various countries, including the US and UK (Gray et al., 2015; Lalani et al., 2019), and is gaining attention from policy levels bridging health and social care sectors (Department for Health and Social Care, 2022;

Rajan et al., 2024; Khan, 2023). Though some authors recognise elements of design thinking in the model (Monsen & De Blok, 2013), it was originally founded by a nurse with different intentions, aligning more closely with entry point 3.

3. Results

From the initial analysis of the selected cases (paragraph 2.1), we identified three relevant patterns that describe the following three entry points in design for policy:

- Entry point 1: Transferring design knowledge to non-designers for policy-making processes;
- Entry point 2: Fostering knowledge co-creation among the actors involved in policy design;
- Entry point 3: Recognising existing policy design processes led by non-designers through a design perspective.

These three elements (highlighted in Figure 2) frame the initial version of the framework, which was refined with the introduction of the examples presented as cases in paragraph 2.3.

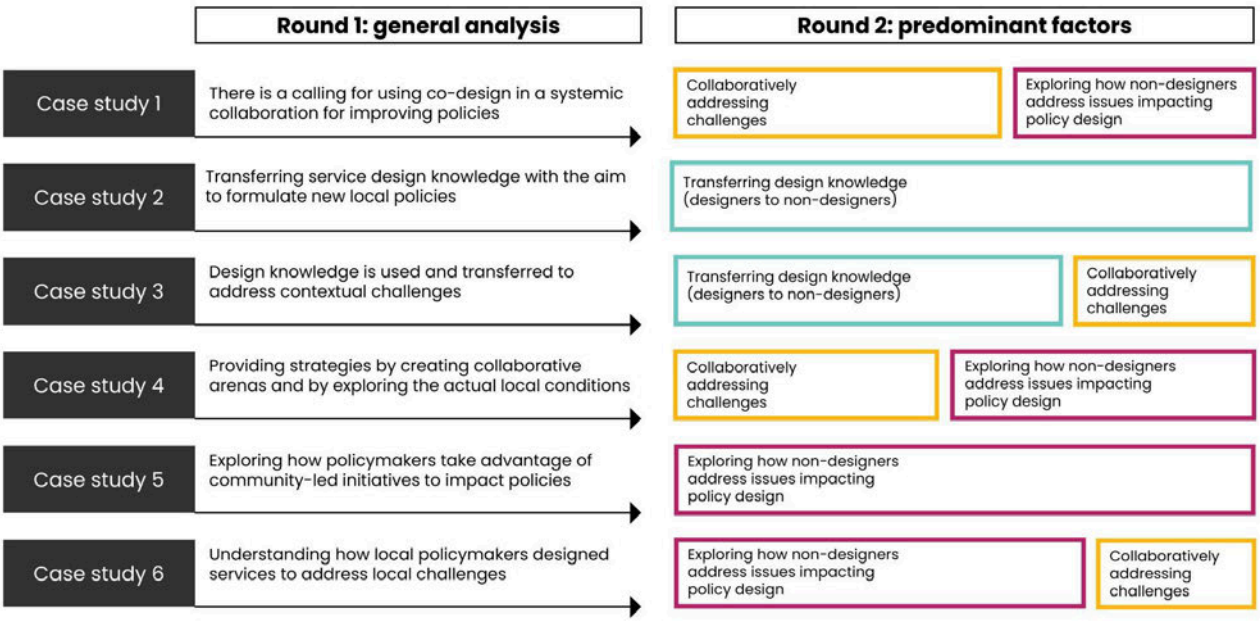

Fig. 2. Entry points identified in the case analysis: The initial version of the framework.

According to the validation process described in paragraph 2.3, the three entry points were refined based on the cases analysed in Figure 2. Specifically, Figure 3 provides a synthesis of 15 cases used to generate and describe the framework. Initially, these cases were identified as cases 1 to 6 (drawn from our direct experience). Later, they were expanded with additional examples that helped refine the patterns and enhance the details for describing the three potential entry points, which are the focus of this contribution.

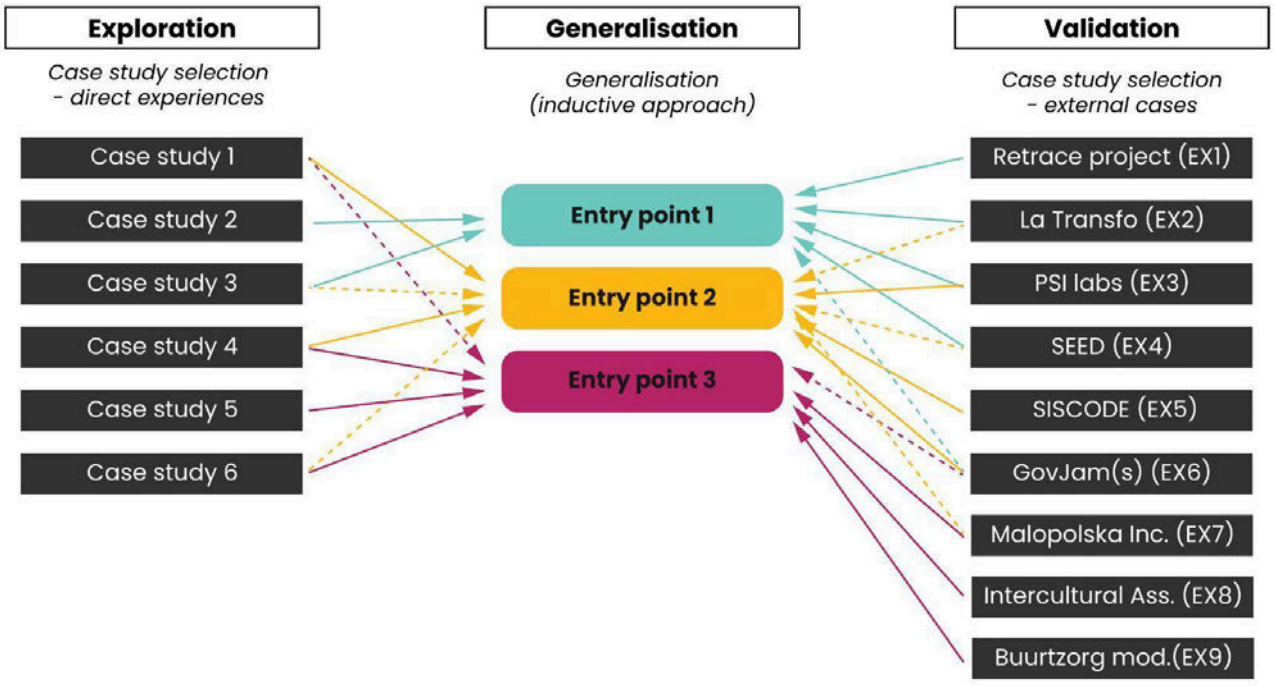

Fig. 3 The distribution of the cases according to the three entry points.

The three entry points correspond to the 'axes' on which design and designers can act to impact policies. In this sense, these entry points can be seen as 'strategies' for triggering design-for-policy initiatives.

Entry point 1 focuses on transferring design culture and expertise to policymakers and public sector actors, enabling them to independently adopt a design-led approach to policy-making. It involves initiatives that build design capabilities to introduce contemporary design thinking in the policy-making process. The study highlights cases 2 and 3, along with examples 1, 2, 3, 4 and 5, as key representations of this entry point.

Entry point 2 is related to co-creation within policy processes, epistemologically grounded in co-design, and exemplified by models such as Research Through Co-Design (Busciantella-Ricci & Scataglini, 2024). Co-design can serve as an entry point for opening a policy arena and addressing a challenge collaboratively, defined as the application of collective creativity from both designers and non-designers at any stage of the design process (Sanders & Stappers, 2008). According to the study presented in this paper, cases 1 and, partially, 3, 4, and 6, as well as examples 3, 5, 6, and partially, 2 and 4, are the most appropriate to represent this entry point.

Entry point 3 focuses on the transformation of a context by non-expert designers, including active citizens and policymakers who engage in designing for policy without formal design expertise. This entry point is characterised by initiatives driven by policymakers aiming to creatively address local problems or challenges, often under constraints of time and resources. While these projects might lack explicit design training, they contribute valuable insights to the design-for-policy field, particularly when explored by design researchers.

Also, many of the initiatives in this entry point fall under community-led projects, which can open new design-for-policy arenas and are frequently found in the field of social innovation. The study highlighted that 4, 5, 6 and partially case 1, as well as examples 7, 8, 9, and partially example 6, are the most appropriate to represent this entry point.

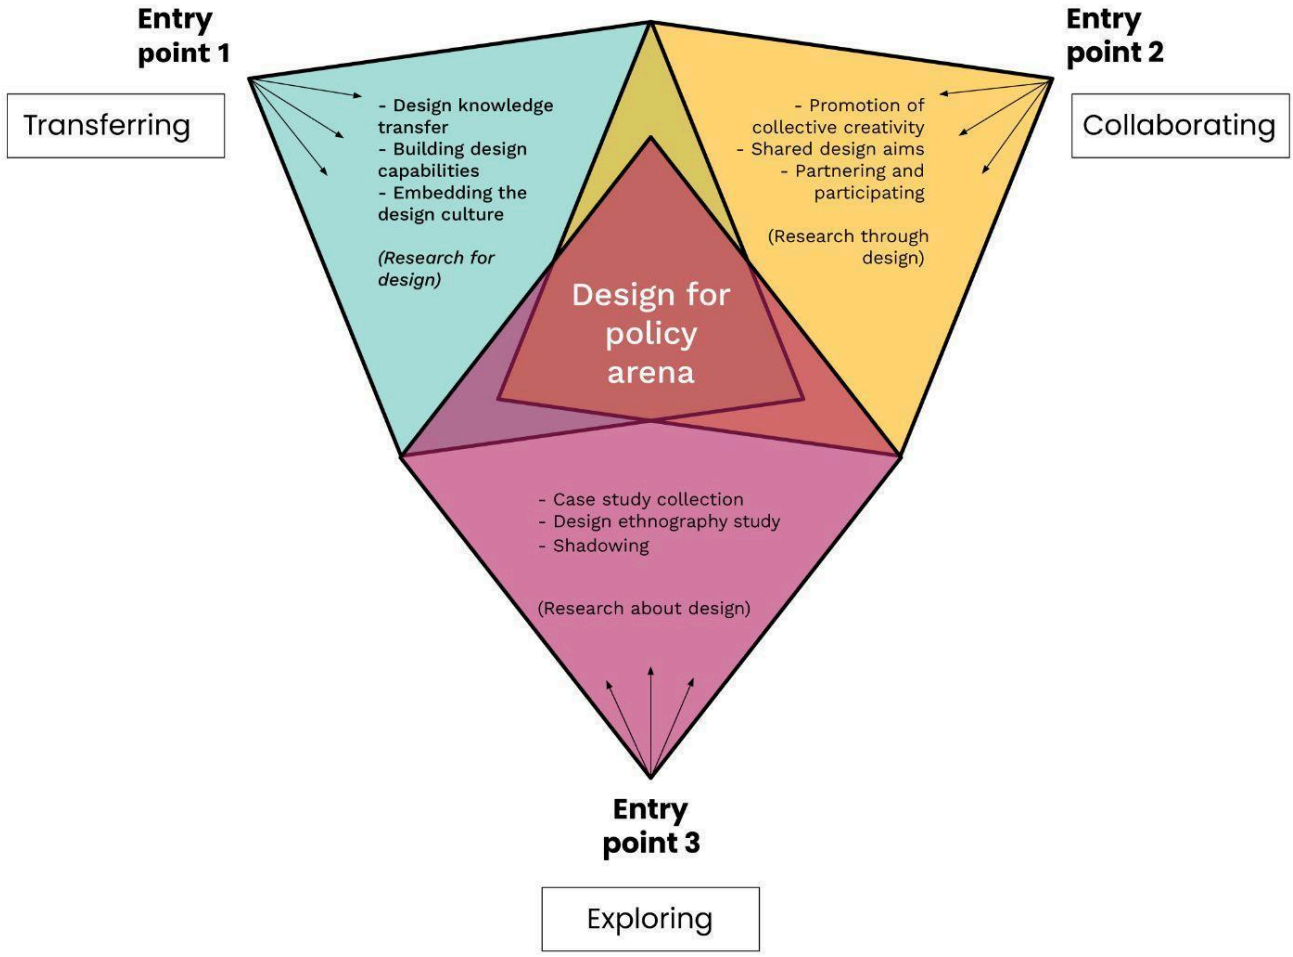

Fig. 4. The three entry points in design for policy.

Analysing the cases clarified the potential functions associated with each entry point for those seeking to access policy arenas. As explored in Figure 3, it is possible to propose several activities that enable the concretisation and implementation of these entry points:

- Entry point 1 involves initiatives that focus on transferring design knowledge to specific policy areas, building design capabilities, and embedding design culture within relevant contexts, aiming to develop a design-for-policy process. From a design research perspective, this entry point can align with "research for design" (Jonas, 2015; Glanville, 2005; Frayling, 1993), emphasising the need to understand what design knowledge is most useful to facilitate entry into the design arena.
- Entry point 2 focuses on initiatives that promote collective creativity, particularly through co-design, and foster discussions around shared challenges with local partners. Key actions in this entry point include engaging local authorities in co-design activities to address common challenges or strategic topics. From a design research perspective, this

entry point is closely aligned with "research through design" (Jonas, 2015) and, more specifically, "research through co-design" (Busciantella-Ricci & Scataglini, 2024) using co-design as the epistemological medium to address the design-for-policy arena.

- Entry point 3 focuses on initiatives that involve case study collection, particularly those exploring projects led by policymakers, civil servants, or third sector entities, as well as design ethnography studies that examine strategic areas for design in policy. It emphasises exploring the contexts in which policies are developed daily. From a design research perspective, this entry point aligns with "research about design" (Jonas, 2015; Frayling, 1993), which involves observing and studying how policy design processes are carried out by policymakers and other stakeholders. The primary interest here is in uncovering new knowledge that enriches the design field, thereby facilitating access to the other entry points and contributing to the broader understanding of design-for-policy processes.

Table 2. Key aspects of the three entry points.

Entry points	Key actors and roles	Priority context	Typologies of interventions	Barriers	Enablers
Entry point 1	- Design researchers/ professionals (senders) - Civil servants and policymakers (receivers)	- Vocational education and training programmes	- Transferring design knowledge - Building design capabilities	- Beneficiaries' mood and backgrounds (e.g. cultural and organisational resistance to change)	- clarifying design contributions, show potential (with success stories and 'proof by example' approach) - starting from policy challenges characterised by low scale and complexity
Entry point 2	- Design researchers/ professionals (partners) - Civil servants and policymakers (partners) - Local third sector entities (partners)	-Multi-stakeholder local development projects	- Solving local problems or addressing local challenges through co-design	-Low/seesawing level of participation of local actors/capability of involving them - Timing and stalemates of institutional processes - Limited transformative power of the process/actors	- Identifying (institutional) frameworks and contexts fostering collaboration - Making the value of design emerge from the process itself / Promoting design contribution in terms of benefits for the process and outcomes,

					rather than in terms of new competences and approaches - Building mutual trust between actors and spaces for reflexivity
Entry point 3	- Design researchers/professionals (observers) - Civil servants and policymakers (observed) - Local third sector entities (observed)	- Policy design and development by non-designers	- Observing and collecting data on how policies are designed by non-designers	- Time and resources for the observation - Possibility to join the process in order to observe it - 'Designerly' value not evident from the outset/delay in identifying the right process to observe	- Being attentive towards social innovation processes at a local scale

4. Discussion and conclusions

As discussed so far, the three entry points can serve as potential gateways to be introduced into the design-for-policy arena. Conceptually, they act as pre-conditional factors or inputs—'triggers'—that help democratise access to the design process within policy-making.

However, it is important to note that a few conditions must be considered when using the framework as a reference. First, acknowledging the ongoing struggle in design research to clearly define who qualifies as a "policy designer" (Whicher & Swiatek, 2022; Vaz & Bosch Gomez, 2022), the selected cases for validation highlighted the challenges in distinguishing roles and boundaries within each example. This partially supports the emerging discussion in the fields of design for policy and design for social innovation (e.g., Kimbell et al., 2023; Amatullo et al., 2021), which suggests that differentiating individual roles may not be necessary, convincing, or even beneficial in such arenas. However, if these differences continue to be emphasised in the literature, this could impact entry points 1 and 3.

Second, keywords such as participation, co-design, and co-creation are becoming increasingly popular in the design for policy field to describe how to address the challenge of creating policies through creative, collaborative, and more democratic processes (e.g., Blomkamp, 2018; Mintrom et al., 2024; Matti et al., 2022). However, it is important to emphasise that the full integration of co-design into the design for policy field can face

challenges (e.g., Mintrom et al., 2024) and may lead to confusion, as seen in the diverse values, meanings, and types of activities associated with the selected cases. Therefore, entry point 2 suggests that design-led collaborations require structured and thorough preparation before entering the design-for-policy arena (cf. Matti et al., 2022).
Third, the examples related to entry point 3 highlight that it can function as a precursor to the other two entry points. We still encountered challenges in explicitly identifying cases or examples where design researchers gather insightful data on how civil servants and policymakers - who are not necessarily influenced by contemporary design culture or buzzwords - design policies in complex social situations. This could be a strategic way to enter policy arenas and contribute to enhancing contemporary knowledge of design for policy.
This also opens the discussion on the entry points as a series of strategies for introducing entities engaged in design or design research into the design-for-policy arena. As mentioned in the introduction of this paper, existing literature has suggested frameworks for strategic actions to enable design thinking in the public sector (Brinkman et al., 2023). However, the framework by Brinkman et al. (2023) focuses on a taxonomy of strategies that assumes design thinking is already established within the entities it targets. Consequently, similar to this framework, 'Enhancing compatibility' and 'Building confidence' correspond to entry point 1 of the framework presented in this paper, while 'Forming an alliance' and 'Generating support' align with entry point 2. However, entry point 3 is not explicitly represented, and entry point 2 is not clearly emphasised as a strategy in the framework. Entry point 3 underscores the importance of design in navigating approaches such as those recognised as 'community-led'—including the radical ones (e.g., see Udoewa, 2022)—and cautions against adopting a design-ego approach when understanding design for policy, as this may risk trivialising the role of design.

With regard to existing frameworks on design for policy (e.g., Brinkman et al., 2023; Hermus et al., 2020; Kimbell et al., 2023; Van Buuren et al., 2020), our set of entry points shares a common focus on identifying who carries design expertise within policy-making processes. Additionally, it reorders some key elements found in those analyses. First, entry point 1 highlights a design for policy approach aimed at innovating policy-making on a broad scale—by training policy professionals and equipping them with new skills and knowledge. Second, entry point 2 aligns with literature emphasising the participatory nature of the policy process, with a focus on fostering a more inclusive and democratic generation of solutions and interventions. Finally, the inclusion of entry point 3 allows us to address the diverse perspectives found in the literature, which examine whether design contributions come from expert designers or from non-designers involved in the process. Regarding the differences and distances from existing frameworks, it is important to note that the entry points presented here do not focus on well-established contexts of design for policy but on the ways to create these kinds of spaces. Our proposal is not intended to substitute or advance existing frameworks; rather, its goal is to encourage reflection on how design researchers can enter these frameworks. In this sense, it identifies possible access channels or 'triggers' through which design can be engaged and solicited to contribute within policy processes. For example, the framework can serve as a reference

for designers and, particularly, for academic entities engaged in design research, helping them understand how to structure research projects aimed at influencing design for policy. Embedding these entry points within the work packages of design research projects may increase the likelihood that those organisations establish touchpoints and find opportunities to enter the design-for-policy arena.

Entry point 1 encourages collaboration between designers and public administration bodies, focusing on the need to develop innovation-oriented capabilities and understanding how these efforts, even indirectly, relate to policy-making. Entry point 2, on the other hand, invites designers to explore opportunities for co-designing with public and private stakeholders to address shared public issues, while critically examining the impact of this collaborative action on policy outcomes and the governance of the process. Finally, entry point 3 may inspire designers to explore other fields looking for approaches that display a 'designerly' sensibility and could inform policy design actions, learning from non-designers on how to approach design for policy.
From a more analytical perspective, these entry points can serve as lenses for designers to identify and uncover cases not yet recognised in the design for policy discourse. By examining these cases through the proposed entry points, designers may gain new insights into the impact of policies, while also opening up fresh research avenues and reflections.

According to the research question, entry points 1 and 2 help identify existing experiences of design for policy that have not yet been labelled as such, while entry point 3 creates a space to proactively approach this emerging design field of where it is underexplored. The three entry points should be seen as potential entryways into the design-for-policy arena, and more than one entry point— or even all three— can be used simultaneously to establish the necessary conditions for projects that enable a promotional entity to enter the design-for-policy sphere.
In contexts where design for policy is primarily dominated by a few powerful entities, this framework can serve as a tool— potentially even a political one— to raise awareness about how certain design and research skills can be instrumental in breaking down seemingly closed barriers.
An expected impact of this framework is that it could encourage a reflexive approach, prompting a re-evaluation of past and future design research projects through the lens of the three entry points. This shift in perspective may influence how projects are designed, both for design research and practice and for policy purposes, potentially transforming the way design engages with policy processes moving forward.

4.1 Limitations and perspectives for future research

This study, however, has limitations that also point to avenues for further research. First, the cases and examples presented here need to be examined through more exploratory research, ideally involving design-for-policy experts, policymakers, and civil servants, complementing and balancing the current approach with a more field-based research perspective. Second, the framework should be developed in collaboration with other academic institutions and social innovation entities to facilitate an iterative validation

process of the three entry points, and potentially introduce new ones. Third, a more deductive approach should be adopted in future research to strengthen the identified patterns. These aspects are still in an early stage, primarily because field-based research has not yet been developed due to a lack of time and funding to support such projects. Moreover, initiating these activities requires a solid theoretical foundation, one that needs further discussion and refinement. Feedback gathered in contexts such as this conference can play a valuable role in helping to strengthen the theoretical framework and optimise the planning of future research activities.

ABSTRACT | Design for policy is an emerging field that, in some contexts, still fights for being acknowledged (Kimbell et al., 2023; Mortati, 2019). In this scenario, we propose a framework of three "entry points" for design for policy: (i) transferring design knowledge to non-designers, (ii) fostering co-creation among policy actors, and (iii) recognizing non-designer-led policy processes. In parallel, the Theory of Change (TOC) (Anderson, 2005) has gained attention as a tool in design for policy (Cole, 2022; Compton et al., 2019; La 27e Région, 2024).
We propose a 90-minute activity to align the TOC with the authors' framework to explore how TOC can help pursue the conditions suggested by the three entry points to design for policy. Participants will be divided into groups, role-playing the following actors: (i) designers, (ii) policymakers, and (iii) policy takers and other stakeholders. The three groups will be guided to use the TOC collaboratively within a given policy scenario. They will engage in co-constructing a TOC, facilitated by a 3D version of the instrument, built following the LEGO® Serious Play® method.

KEYWORDS | DESIGN FOR POLICY, THEORY OF CHANGE, DESIGN KNOWLEDGE TRANSFER, RESEARCH THROUGH CO-DESIGN, NON-EXPERT DESIGN

X-format proposal

Design for policy is an emerging field for Design research and practice identifying the space where design approaches and methods innovate policy-making towards a more open, democratic and experimental process (Bason, 2014; Kimbell et al., 2023; La 27e Région, 2015). Although practices pertaining to this field have expanded in many - especially Western - countries, in some contexts they still remain niche, if not 'invisible', hardly or never acknowledged. This is the case, for instance, of the Italian scenario, where, apart from a few academic entities (Deserti et al., 2020; Giraldo Norha et al., 2020; Mortati et al., 2016; Mortati et al., 2019), this field seems to be uncharted. We have then proposed three possible 'entry points' to approach this area, as viable ways to start 'doing' design for policy where this is neither acknowledged nor consolidated: (i) the transfer of design knowledge and expertise to non-designers within policy processes, (ii) the co-creation of knowledge among policy actors, and (iii) the recognition of non-designer-led policy processes. In our vision, these entry points represent conditions to be created in order to make design for policy possible and accessible. Therefore, we expect such conditions should be envisioned through a transformative design process. Hence the idea of connecting this perspective to the Theory of Change (TOC), a tool to design change that has recently gained a growing interest from researchers and practitioners in the field of public innovation and policy (Cole, 2022; Compton et al., 2019), even being questioned to sustain complex challenges (La 27e Région, 2024).

The hypothesis we would like to verify through this X-format is that TOC can be a meta-design tool to help designers - as well as non-expert designers - conceive the enabling conditions highlighted by the three "entry points", define the transformative trajectories - traced through impact, outcomes, outputs, activities and inputs - that might generate the expected change for making design for policy possible. In this sense, each entry point should correspond to a different TOC that we need to build together with the research community engaged or intrigued by the topic.

On a practical and methodological level, we propose a workshop session of 90 minutes where participants are divided into three groups, according to the three "entry points" as changes to achieve. Within each group, participants are involved in a role-playing activity to relate with a different core actor in policy-making: (i) designers, (ii) policy makers, and (iii) policy takers. They are guided by facilitators and supported by written instructions to help interpret their roles, with the aim of collaboratively developing a Theory of Change (TOC) using the LEGO® Serious Play® method (n.d.). This approach enables them to "build" their vision of change in relation to a fictitious policy scenario that provides context for the assigned "entry point". Participants are exposed to questions around the different points of view and interests of each category of stakeholders, the conditions enabling design for policy processes, and their precariousness. The three resulting TOCs are collectively discussed, reflecting on their similarities and differences, as well as on the challenges, dark points, needs and hopes they disclose.

The ultimate goals and takeaways of this session concern (i) unveiling interrogations, barriers and triggers around the possibility to start practising design for policy, (ii) enabling participants to picture themselves as potential "policy designers" (Whicher, & Swiatek, 2022; Vaz & Bosch Gomez, 2022), and (iii) endowing them - and us authors - with actionable paths to achieve this possibility.

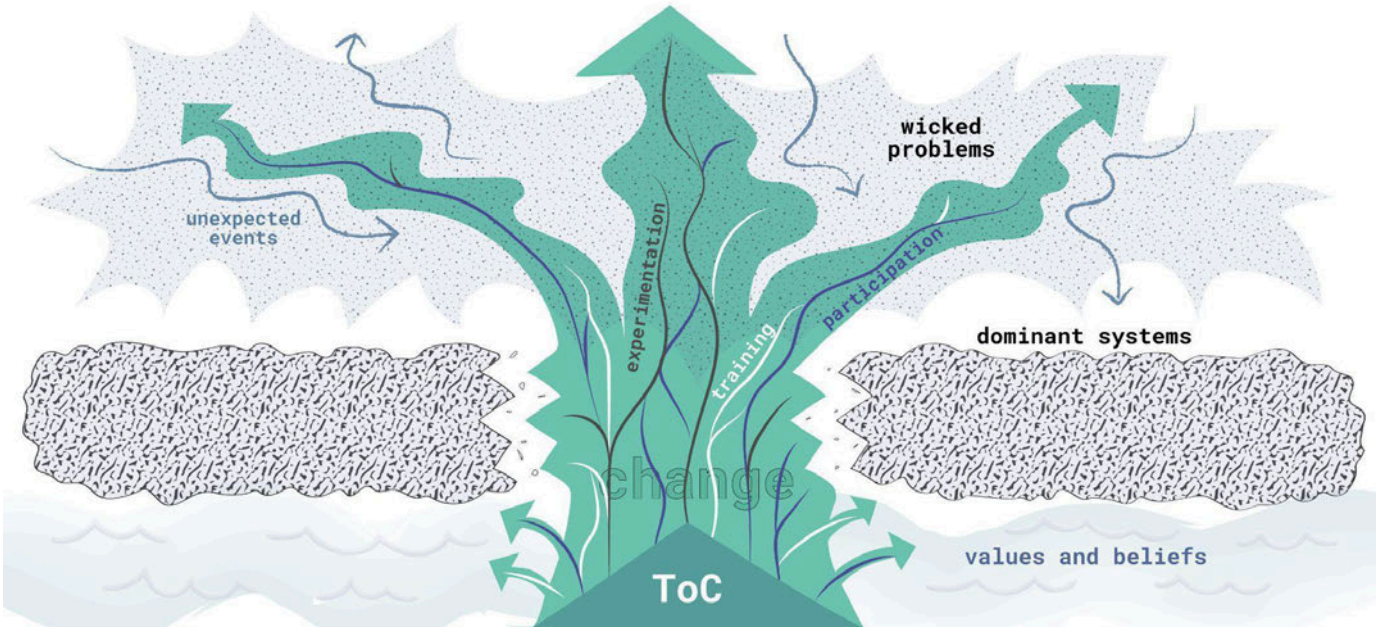

Figure 1. Strengthening TOC to challenge status quo and pursue complex public innovations; Illustration by one of the authors of the X-format proposal, created for a programme called "Pushing the Boundaries of Public Sector Innovation" (2023).

FROM INTERVIEWS TO PLAYFULNESS - a child & youth-centred design approach to policy-making

Line Gad Christiansen*[a], Karen Feder[b],

a Kolding School of Design, Lab for Social Design
b Kolding School of Design, Lab for Play Design
*lc@dskd.dk

ABSTRACT | There has been a tradition of professionals creating the child- and youth-policies in municipalities in Denmark, containing the risk of not including the direct perspective of children and young people. There are a tendency of involvement of children and young people being through e.g. teachers or by involving primarily high-performing participants through e.g. youth councils which presents a risk of diverse and relevant perspectives being excluded.

In a collaboration between Kolding School of Design and the municipality of Ringsted, it has been possible to study how children and young people can be included on a more equal basis, by implementing more relevant and playful methods for user involvement. Approximately 7000 of the municipality's children and young people, between 3 and 25 years old participated in the study.

Methods adjusted to the context and participants, have shown potential to highlight perspectives that might not have been found by the typical approaches.

The study points to the potentials of using playful methods and the combination of different approaches, to gain insights for policy-making. It also indicates the benefits of collaboration between design and policy, for a more democratic approach to policy-making.

KEYWORDS | CHILD- & YOUTH-CENTRED DESIGN, PLAYFUL METHODS, POLICY-MAKING, PROCESS FACILITATION, DEMOCRATIC PROCESSES

1. Introduction

Sometimes, we do things simply because that is how we have always done them, and because everyone else does it that way. This might well be the case with the development of child and youth policies in Denmark. The traditional process involves politicians and administrative staff in municipalities formulating the values underpinning the municipality's work with children and youth, as well as outlining the vision for the next 5 to 10 years. Over the past 5–10 years, many municipalities have expanded this approach by involving municipal practitioners, such as managers, teachers, and social workers, to gather their input on the policies and ensure their relevance for the staff. This is in line with Buchanan (2020) arguing that the co-design practice in e.g. the public sector has great potential and relevance, however it is currently underdeveloped and not without challenges (Buchanan, 2020). Bason (2014) states that there has been an increase during the last decade, focusing on the values of implementing design approaches in policy-making. This is supported by Binder et al (2015) pointing to potentials by a higher participatory and democratic involvement in policy-making. It also lies within the sustainable development goal to `leave noone behind´, emphasising the importance of involving all children and young people across needs and prerequisites, which is a value in the Universal Design approach (Mace, 1997). Generally, for children and young people, there has been a tendency of still gaining insights by-proxy (Drew et al., 2010) or through high-performing children and young people, e.g. by focusing on student councils or volunteers (Li, 2020), possibly due to the sensitive nature of such a target group as well as typical methods not always being appropriate and hence the process of involvement might seem more challenging. Many municipalities have hence chosen to include children and young people through interviews and focus groups within youth councils and similar forums. However, no municipality has aimed for all children and young people in a municipality, to express what is important for them and their specific age group—until now. Ringsted Municipality has reimagined and innovated the approach to developing its child and youth policy, by giving more than 80% of the municipality's children and youth a voice, making their input the primary foundation for the municipality's child and youth policy.

The term "child and youth policy" is defined by Danish municipalities as a description of the overall value base for a municipality's initiatives for children and young people. It aims to create cohesion across the municipality's professional areas and divisions. The policy articulates the municipality's shared values and vision while setting goals and directions for ensuring the quality of services and initiatives for the children and young people residing in the municipality. The intention behind a new child and youth policy in Ringsted Municipality was to base it directly on the voices of children and young people. The goal was to involve as many children and young people aged 0 to 25 as possible, potentially up to 10,000 individuals. The youth school, 'Ung Ringsted', was tasked with facilitating a transparent involvement process and collecting data from the children and young people, to shape the new policy. Based in a child- and youth-centred design approach (Feder, 2020), involvement methods were developed in smaller working groups and further refined by two researchers from Kolding School of Design, specializing in child- and youth-centred design methods. The process began on October 1, 2024, and is expected to conclude in June 2025.

This paper studies the process and share the findings from the involvement of children and young people in the municipality of Ringsted. The study is based on a curiosity on how playful (Christiansen, 2022) and child- and youth-centred design methods (Feder,

2020) can lead to a more honest and nuanced glimpse into the lives of children and young people, becoming the voices and foundation for politicians and decision makers in a municipality.

2. Facilitating playful child- and youth-centred design methods

The data collection focused on different areas, like public institutions such as daycare facilities, schools, and the youth sector, but also including special and private offerings. Different approaches and methods were developed for each age group to reflect the most relevant ways of communicating and expressing their perspectives. Instead of using traditional data collection formats like interviews and surveys, often designed for adults, the project employed child- and youth-centred design methods to capture the voices directly of this demographic—which often tends to be represented by proxies such as parents, teachers, or other professionals (Drew et al., 2010). For the 0–1-year-old children, it was however still deemed necessary to use by proxy, through parents and daycare professionals, but it was an aim with the project, to ensure as direct input as possible. Kids from 8eight public and 6 private schools, 3 special needs schools, 24 public and 2 private daycare centres participated along with the other initiatives as mentioned above.

Different kinds of methods were used in the process. In daycare facilities, the activity "My City" was conducted across all municipal daycare centres over four weeks. The aim was to gather children's input on what matters to them in their city and showcase diverse family structures. After reading the book 'Fanni Builds a Sand City' aloud, children added two pictures to a shared poster. Adults documented their thoughts on notes attached to the poster. Inspired by a theatrical performance about a fictional character's life and family, children also drew their own families and homes to share.

In schools, methods varied across three age groups. In lower primary grades, activities focused on "All About Me," starting with the story about the friendly alien Mio who wants to learn about being a child in Ringsted. This was to support the children imagination and using narratives (Murray, 2008) and a "shared third" to enable the children to reflect more freely about the aspects being asked of them, but also to provide a context (Nitecki & Chung, 2016). A combination of a pamphlet and colouring book was developed focusing on aspects of the children's lives, that the child can fill out with drawings and descriptions dependent on their writing skills and preferences. These were supported with among others, an activity where they created their dream room at home from craft materials and cardboard boxes. Middle-grade students created posters, comics, or schedules for the ideal school day as well as filling out probes developed specifically for the context, called Mind-bags, based on Play Probes (Christiansen, 2022) with inspiration from Cultural Probes (Gaver, et al., 1999) and Design Probes (Mattelmäki, 2006; 2008).

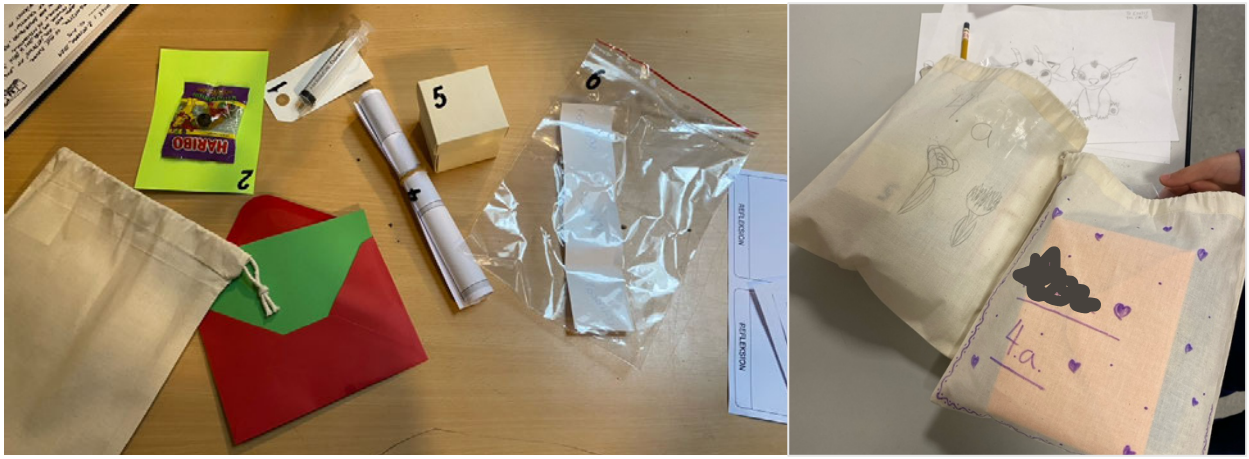

Figure 1: Mind bags and its content on the left. A girl shared her decoration of the exterior of her Mind bag on the right.

Upper-grade students wrote essays, opinion pieces, and collages, incorporating practical/creative subjects and with emphasis on the students taking ownership over the topics they had chosen, finding content and determining how it should be presented. Additionally, some schools used other playful tools such as built structures with play materials and went on a "picture-safari" taking Polaroid photos of meaningful school spaces. Class debates were also held. Student councils from grades 4–9 worked on age-specific tasks during a council day, while members of the joint student council interviewed younger students at their schools.

Surveys were conducted in special education settings with the support of trusted adults. In the specials needs area, the methods varied from place to place dependent on the specific needs, some of the children and young people also filled out the Mind bags and used other playful methods as mentioned above. Others used more traditional methods, such as informal interviews conducted by pedagogues that the child or young person already knew. For the special needs area, it was deemed necessary to completely follow the recommendations from the professionals who knew the children and young people, rather than pushing for using new and playful approaches. Hence an emphasis lied upon onboarding the pedagogues and other professionals working with the children and young people, to a high extend and employing methods involving playfulness or materials when possible.

In the youth sector, workshops were held in secondary education institutions focusing on youth well-being and policy-making as part of civic studies. Young people co-designed peer-to-peer surveys distributed to all within youth education and those aged 18–25 in an online format, from the online survey around 25% of the approximately 3200 young people in Ringsted municipality replied. Follow-up focus groups were conducted at selected institutions. For the students from special education surveys and the other approaches were facilitated by familiar adults, followed by focus group interviews. Additional methods included dilemma games about youth well-being and debates involving RUF – Ringsted Youth Forum and local politicians at a music festival.

3. Analysis of the everyday life

The analysis was done by Ung Ringsted staff, by grouping and thematizing the data, and after building insights, it was then presented to the participants involved, for feedback, confirmation and supplying information. An advisory board and researchers from the Kolding School of Design contributed to this phase. The analysis presented insights on the everyday life for children and young people in Ringsted municipality, including aspects such as school/daycare, free time and general mental health. This showed how the different age groups of children and young people emphasised a focus on different things, such as more time for being creative in school, more flowers and colours in daycare, more room to play for the youngest and specified areas for young

people that they can claim as theirs. More and appropriate support from adults in their everyday lives and easier access to activities was also themes highlighted in different ways. The findings were communicated to children, youth, municipal staff, politicians, and citizens through various formats, including a transparent exhibition space in a container near the city hall, which served as a hub for activities and updates.

Figure 2: The transparent exhibition space close to city hall, before it was taken into use

4. Glimpses into the lives of children and young people

The use of child- and youth-centred design methods emphasizing engaging and playful expression revealed nuanced and profound insights into the lives, interests, and needs of children and young people in Ringsted Municipality. The following section will briefly introduce selected insights that points towards what the children and young people had focused on as important for their everyday life.

Children in kindergarten pointed to a need for a more colourful environment as well as more flowers in the kindergarten. They also focused on a desire for more play-areas, not necessarily specific to playgrounds, but on a more general level. The middle-grade school created dream-schedules that revealed a preference for later school start times and no homework after school hours. The young people's transportation needs highlighted the importance of regular bus service between rural areas and the city centre, reflecting the youths desire for independence and mobility for social, educational, and extracurricular activities. Generally, an emphasis across age groups, were on being a part of their peer-community as well as the physical framing that can facilitate such a community. Interestingly there were a lack of focus on technology, as it did not take up much attention from the participants. Specific examples from selected age-groups are presented below.

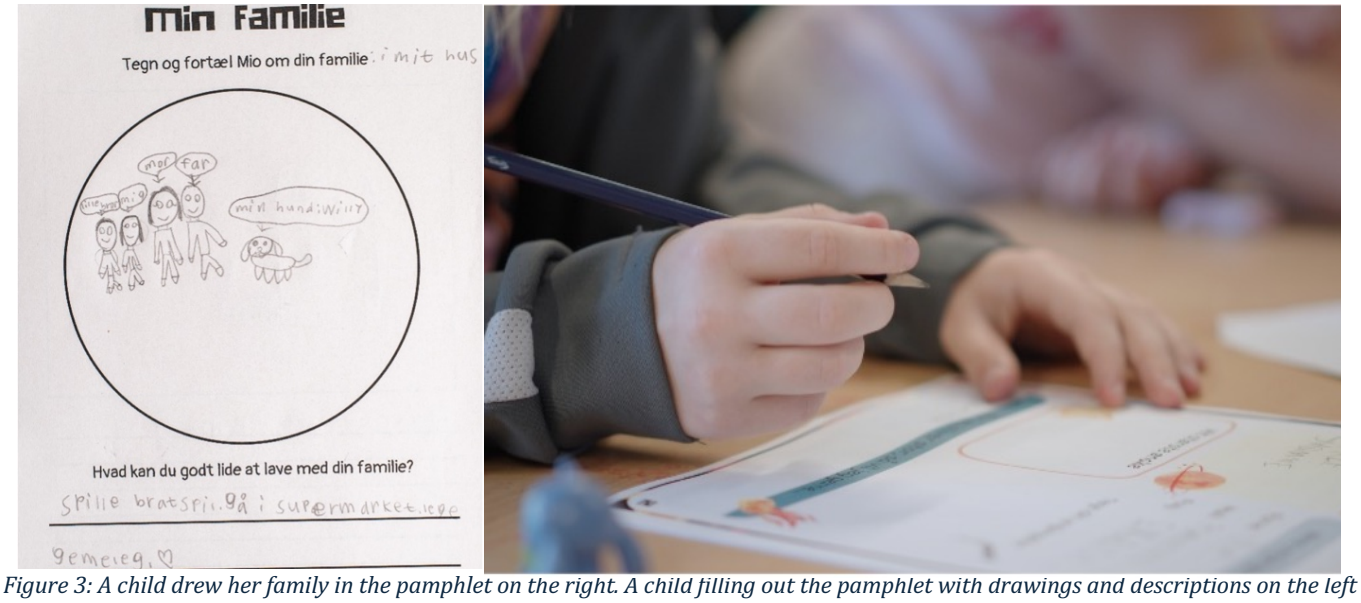

Figure 3: A child drew her family in the pamphlet on the right. A child filling out the pamphlet with drawings and descriptions on the left

In middle school, children aged 10–13 years were given the opportunity to create their own dream-schedules for what they considered an ideal school day. It became clear that a good day for the children starts later than 8 a.m., which is the standard start time in Danish public schools. As an example: “having more time with my mom and dad in the morning, we usually are so busy and do not get to talk together” as stated by a 10-year-old girl. Furthermore, a good school day does not end with homework to be completed after school hours. Most children out of 200 expressed this preference. However, the analysis process struggled to identify the underlying reasons for these preferences, prompting further investigation through follow-up interviews and peer-to-peer activities.

Figure 4: Collection of dream-schedules for a school day

While it may be generally expected in Denmark that school days should or can only start at 8 a.m., the study showed that children desire a different approach. Whether it is feasible to implement this change or explore alternative options to meet the children’s needs and preferences will now be a matter for policy-makers to address. The children also highlighted a wish for more creativity taking presence in school, both through music, art, craft and cooking as well as more time for movement through gymnastics or similar activities.

In secondary school, young people aged 13–17 years created campaigns in groups. Around 100 campaign posters were created with 2-4 participants in each group. The campaign posters pointed towards the following main areas: a need for stronger social bonds through activities, such as camps or trips, with emphasis on the relations peer-to-peer but also youth-to-teacher was important. Another aspect that they highlighted was more support for when young people are not thriving mentally. They also put a focus on the need for a space for young people; a clubhouse, area, room or something that they

can make as “theirs”. It also became evident that young people living outside the city centre strongly desire regular bus services connecting the outskirts to the town centre. Upon deeper analysis of the data, it was clear that this demand was not simply a matter of complaining or entitlement but rather a reflection of the critical role buses play in the everyday lives of children and young people. Buses enable young people to meet friends outside school hours, collaborate on homework, and participate in social activities. Additionally, they allow access to extracurricular activities and sports clubs across the municipality, even on non-school days. Reliable bus service is also essential for maintaining part-time jobs, especially in the evenings or at irregular hours. These are things adults often take for granted because they have access to cars—something children and young people in Denmark typically cannot drive until the age of 18. The bus, in this context, became a symbol or representation of the young people’s broader need for transportation, mobility, and simply being able to move from point A to point B as a natural part of life. These young people do not expect their parents to drive them everywhere; rather, they aspire to act as independent individuals.

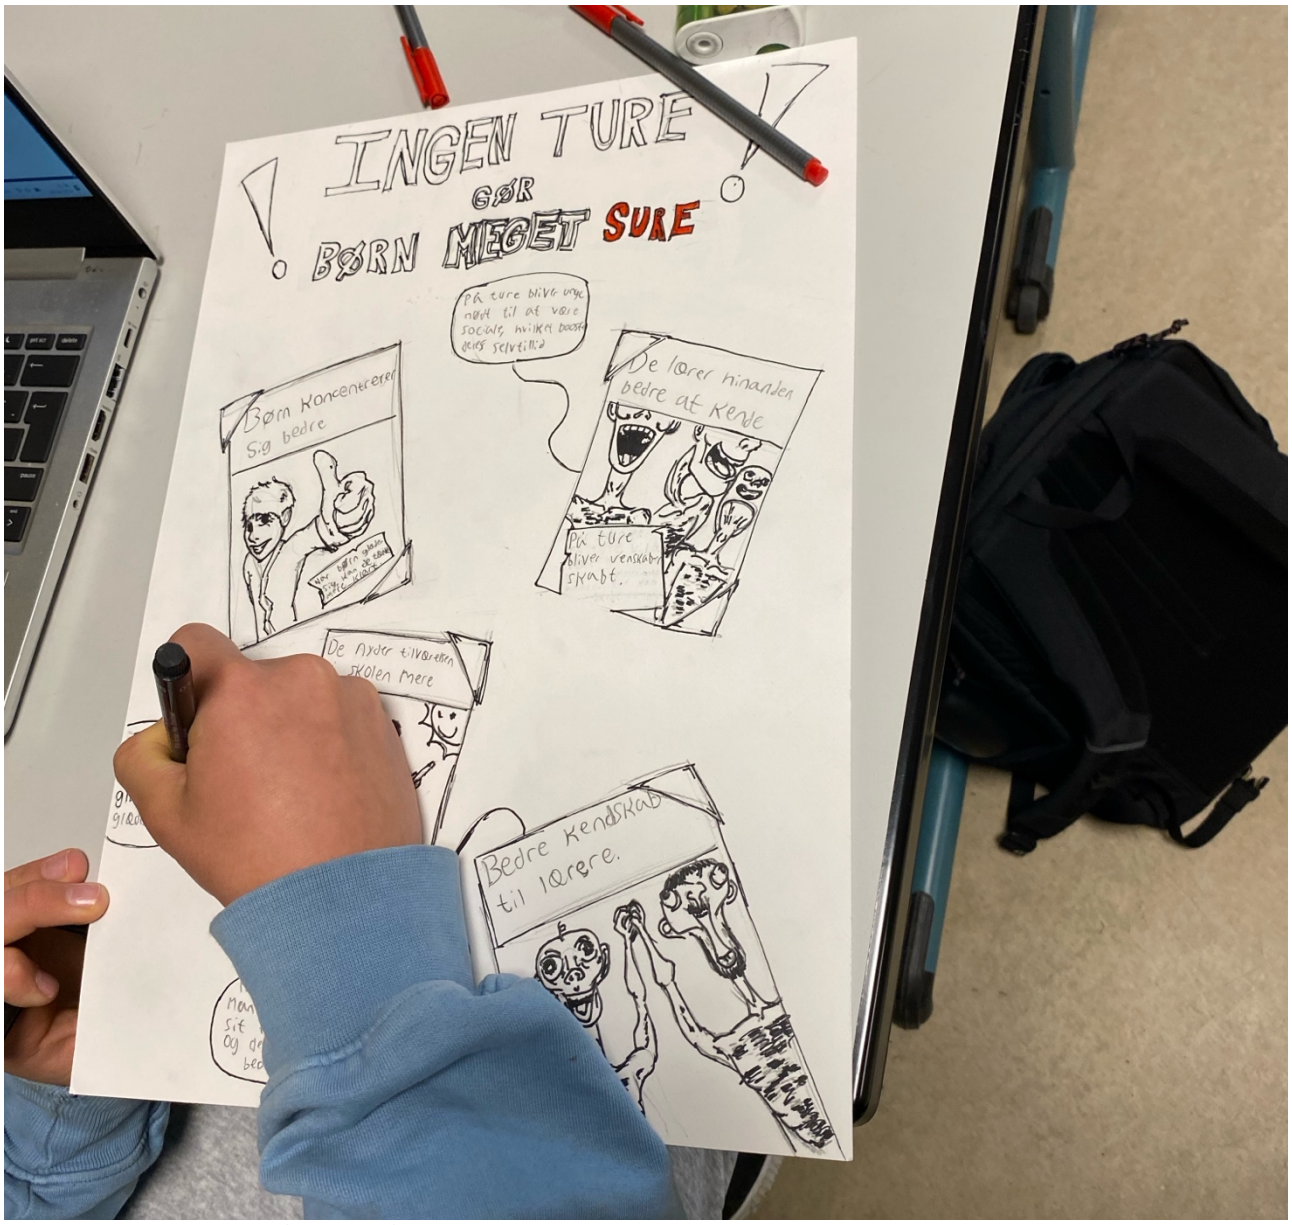

Figure 5: Campaign creation from one of the groups

5. Next steps

In the upcoming phase of the project, staff at Ung Ringsted will work on transforming the insights into communicable material. In Danish municipalities, it is customary for a child and youth policy to take the form of a written document outlining a set of overarching principles or values, possibly supplemented with illustrations, headings, and quotes. However, there is a risk that such a document remains static — posted on municipal websites but not actively communicated, implemented, or continuously developed. In Ringsted Municipality, the aim is to challenge this traditional format and explore new approaches to what a child and youth policy can be. The intention is to create a policy whose format directly reflects the insights gathered in collaboration with the municipality's children and young people. This might involve something more tangible, experiential, or interactive—such as an experience trail, a board game, or even a bus. Additionally, the municipality wants the policy to be perceived not as a final, static product but rather as an organic and dynamic framework that evolves and actively engages with the citizens of Ringsted.

6. Conclusion

The study has shown how it is not necessarily unwillingness to involve children and young people in the making of new policies, but to some extent the unawareness of relevant methods to do so that might keep them from doing so or instead relying on less nuanced methods that might provide a more two-dimensional image of a topic. This calls for more collaboration between the public sector and designers, and this study therefore presents findings from such a collaboration towards the inclusion of a specific target group in a more democratic approach to policy-making. Having a playful approach to data-gathering methods when working with children and young people can support their participation, evoke curiosity and make the participants engage more, while also provide valuable insights to the policy-makers.

FULL INCLUSIVE PARTICIPATION (FIP) APPROACH: DESIGN PROCESS CASE STUDY IN URBAN MOBILITY

Domagoj Bui, Heekyoung Jung, Yong-Gyun Ghim, Alejandro Lozano Robledo

University of Cincinnati
buidj@ucmail.uc.edu

ABSTRACT | Inclusive design minimizes product and social issues by considering a full range of human diversity (Microsoft, 2015; Connolly & Hyland, 2020). However, proposed specialized methods are underutilized in practice (Holmes, 2018) due to varied concerns. Urban mobility is an important subject because it affects people's daily lives and excludes a growing number of groups (Molina & Garcia, 2013; Creger et al., 2018). How do we adopt inclusive design into mainstream projects and teams? This research identifies strong inclusivity and pragmatic implementation. We devise and explore Full Inclusive Participation (FIP), combining conventionally used design methods with equitable and participation of experience experts in the design team throughout the process. The first case study compares an example of a mainstream designer team to the FIP team, comprising designers and people with visual impairments. The process was captured, participants were interviewed, and mobility design experts evaluated the solutions. The findings contrast many previous sources regarding efficiency and implementation and show a positive impact on designers' inclusivity, confidence, and knowledge. Team management challenges and implementation conditions still need to be explored. Open-source tools could be used while parallelly familiarizing more designers with the approach.

KEYWORDS | Design Process, Inclusive Design, Full Inclusive Participation, Urban Mobility

1. Background

Design and designers have the power to influence interactions, which means that design is often the source of mismatches but can also fix them. This is because the traditional process often oversimplifies user understanding and user diversity through methods such as 'personas' instead of engagement (Holmes, 2018). Accessibility is often used to tackle these issues and is vital for some individuals. However, education gaps, noise in the system, tools unfit for design (Holmes, 2018), overlooking of the psychological aspects and dignity, and disregarding people who do not experience recognized disabilities (Lim et al., 2016) prevent its effective use outside legal obligations.

Inclusive design can be used to minimize product and service issues and grow organizations and communities by considering a full range of human diversity in the design process (Microsoft, 2015; Connolly & Hyland, 2020). Building on the positives, many new inclusive methods are being proposed, from exclusion audits, expert appraisals, user trials, usability studies (Waller et al., 2009), exclusion calculations (Goodman-Deane et al., 2014), extreme user interviews (Brown, n.d.), and critical user forums (Dong et al., 2005). However, despite its potential and decades of research, inclusive design remains underutilized in practice (Lim et al., 2016; Holmes, 2018) because of a lack of knowledge and proper tools for effective practice (Goodman-Deane et al., 2014) and a profound difference between this proposed theory and what can be done in practice (Dong, 2002). As user involvement is described as a key component of human-centered design and inclusive design (Sanders & Stappers, 2008; Hodson et al., 2023), researching inclusive participation is a logical direction. Participatory design (PD) or co-design represents collective creativity in the entire design process (Sanders & Stappers, 2008), but its inclusive involvement is not adequately explored (Raviselvam & Wood, 2021). This is important as a more inclusive process with user participation should lead to more inclusive outcomes (Petronelli, n.d.), which are noticeably missing in many products, services, and systems in our society (Microsoft, 2015; Naumoska, 2024).

There are many design disciplines, especially urban planning and design, and subjects, such as digital technology or health and wellbeing, where this is a far-reaching issue, and the lack of inclusivity can influence other facets of individuals' lives and group and societal levels (Fletcher et al., 2015; Costanza-Chock, 2020). The pressing need is expressed in urban spaces and mobility, with many research and pilot projects observed exploring inclusive design and PD in policy and planning. However, rarely can we find examples focused on wider implementation instead of generating knowledge or where it spilled into the design part of the process. Urban mobility could be important as a subject because cities are complex spaces of ownership and power struggles (Molina & Garcia, 2013), with an example of predominantly minority and worker urban neighborhoods being demolished for urban renewal in the US (Kramer, 2018), and mobility is one of the key areas affecting people's daily lives, with the World Health Organization identifying it as a significant contributor to disabilities. With the lack of inclusive design, social factors of exclusion are amplified, mobility disadvantages are created (Durand et al., 2021), and the urban space is unequally deformed by the continued car-centric approaches to planning and design that exclude or mismatch a rising number of groups (Mattson, 2012; Creger et al., 2018).

In conclusion, the inclusive qualities and methods of the design process can be linked to its inclusive outcomes. To design solutions to mobility mismatches and solve complex issues in cities, after decades of studies, we should have inclusivity in mainstream

projects (Bontoft & Pullin, 2003; Holmes, 2018).

2. Methods

2.1. Research Approach

How can we achieve inclusive design adoption by designers and organizations working on mainstream projects? To address the gaps and avoid the pitfalls of past research, this study identifies that the process should stay strongly inclusive and adopt pragmatism for usability and implementation. We devise and explore the Full Inclusive Participation (FIP) approach. The exploration starts with its definition as combining full participation, which is equitable and has agency in the team, with inclusive choice of participation groups to engage those usually excluded by the design subject, and all of this in the entire duration of a design process that is conventionally or predominantly used in that particular field. Could the FIP approach address both the quality of inclusive design in a broader range of projects and its barriers to utilization in teams and organizations?

As the first step of the exploration, the study framework aims to compare the mainstream designer team with only designers to the FIP team comprising designers as process experts and excluded users as experience experts, using the same process and methods to design a solution (Figure 1). This will provide insights into the similarities and differences between the FIP and the conventional process and, thus, the initial themes for further exploration of the conditions for implementation. To understand the conventional mobility design process and the place of inclusive design, we conducted a preliminary study with four diverse mobility design experts: a public transit designer, a car designer and lecturer, and two public transit mobility planners. They contributed some varied insights, which opened the question of usability conditions of the FIP in different disciplines and projects but with glaring commonalities. Accessibility is mainly adhered to through mandatory ADA guidelines and policy and is seen as a hassle due to that format. On the other hand, while understood and valued, inclusivity and participation are not considered outside of specialized purposes due to a lack of time and resources. Finally, they all think inclusivity and users should be a more significant part of the process and should be involved from the brief generation. The final contribution that all mobility design experts agreed to is to evaluate the designs proposed in the main study as a part of the debriefing interview.

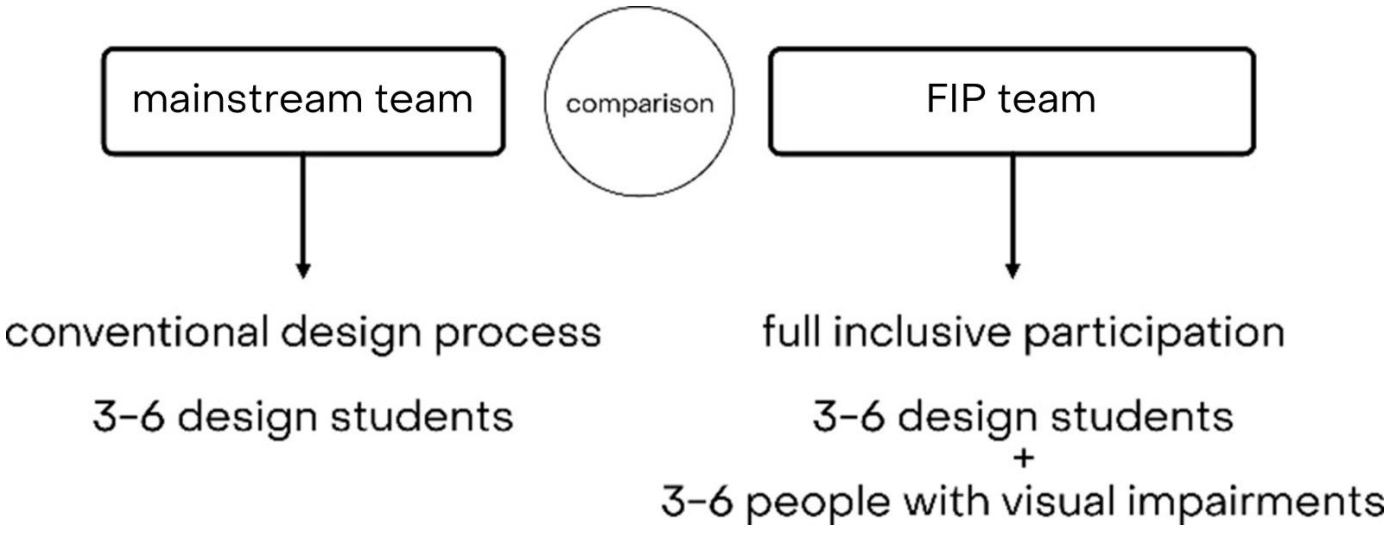

Figure 1. The case study comparison framework with processes and participants, where the FIP approach and experience experts as participants are added to the conventional process.

2.2. Data Collection Methods

The first case study was done with persons with visual impairments as experience experts in urban mobility, and it was for a project for a local public transit service provider in Cincinnati, Ohio, USA. Two participant profiles are recruited for this study: design students with professional experience and bus users with visual impairments. In the first group, six students were recruited, and in the latter group, six legally blind persons. This disability was chosen through the purposeful sampling approach (Lim et al., 2016) as one of the groups experiencing the most extreme exclusion in mobility, with 79% reporting problems in employment or education because of mobility disadvantages due to public transit travel issues (Bleach et al., 2020). Further diversity, such as having different excluded groups in the same team, is not considered in this case study but is proposed for future case studies. Additionally, due to the specific nature of the chosen participants, the study uses a custom ChatGPT facilitation tool developed by the primary researcher to assist teams with project information, methods, and communication. Its impact will not be evaluated in this study. The organization's Internal Review Board approved this study for human subject research.

According to the preliminary study, the case study's mobility design process consists of four phases (Figure 2): Planning – where the teams integrate experiences and refine the brief; Research – where they analyze trends and factors and craft user journeys; Ideation – where teams generate a volume of ideas and evaluate them; and Prototyping – involving iterating and refining ideas into a solution. Both teams follow these methods, and the goal and process framework are outlined in the initial brief, but the key difference is the added FIP approach in the FIP team.

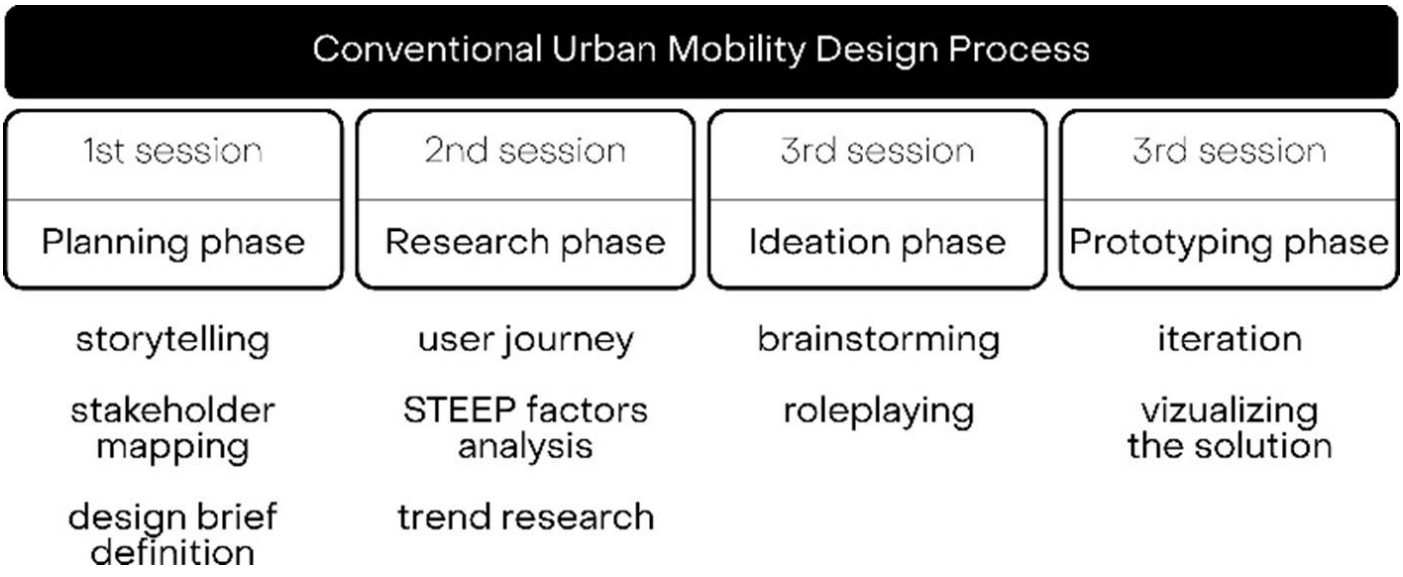

Figure 2. The design process used by both teams in the case study with one phase per working session and listed methods proposed by the facilitator (team lead).

The design process case study was conducted over four three-hour sessions for each group. They were provided access to sheet paper, stationery, the internet, a digital whiteboard, facilitation, and food and water. The groups met at different times in February

2024, and the investigator was always present. The facilitator fostered group dynamics like a team lead in an organization practicing design. Logistics, facilitation, and data collection were all planned not to interfere with the process.

2.3. Analysis Framework

To explore the impact on the process, designers involved, and outcomes, (A) the process was captured, (B) participants were interviewed in each stage, and (C) mobility design experts evaluated the solutions' design qualities, inclusivity, and feasibility. All three were analyzed for both teams and compared.

A.
Data collection was done through process photography and material collection. The group comparison was made session by session and then over an entire process.

B.
Qualitative data was gathered from participants using semi-structured interviews with the same four open-ended and three closed-ended questions at the case study's start-, mid-, and endpoint:
1) What do you think about today's session and the methods used?
2) What do you think about the progress that the team is making?
3) What do you think about the possible solutions?
4) What do you think, and how do you feel about inclusivity now?
5) Did you feel included in this process, and when?
6) Did you feel excluded in this process, and when?
7) Would you participate in a design team or process like this again, and why?

C.
The solutions from each group were evaluated on their inclusivity, form, functionality, and feasibility by interviewing mobility design experts from the preliminary study through semi-structured interviews with blind solutions presentation.
Thematic analysis of qualitative data was done by coding inductively in the first and deductively and contextually in the second phase, allowing for analytical comparison between codes, study groups, and interview sessions. Those connections were explored using visualizations and data sheets to compare co-occurrence, interview occurrence, frequency of mention, and overall volumes. Everyone participated in all sessions except one exclusion expert user being absent during Research and another during Ideation, while the AI facilitation tool was used on only a few occasions without much impact on the process.

3. Initial Findings

Systemic and varied differences were observed between the compared groups in each phase and method, confirming the first part of the hypothesis.

3.1. Per Data Collection Method

A.
The FIP team followed the proposed study framework more closely but with less self-

awareness and more facilitation to articulate project goals and design process, which means additional complexities were introduced that affected time and collaboration efficiency and could add to team preparation and management. The team's language and approach to methods and solutions were notably more empathetic and inclusive than the designer team. Expectedly, the users in the FIP team were most engaged during the planning and research phases, while designers from both teams peaked in ideation. This shows that both participant groups organically adopted their respective roles in the team, and designers' roles were not disrupted. Figure 3 shows how the sessions looked like and operated in the two teams.

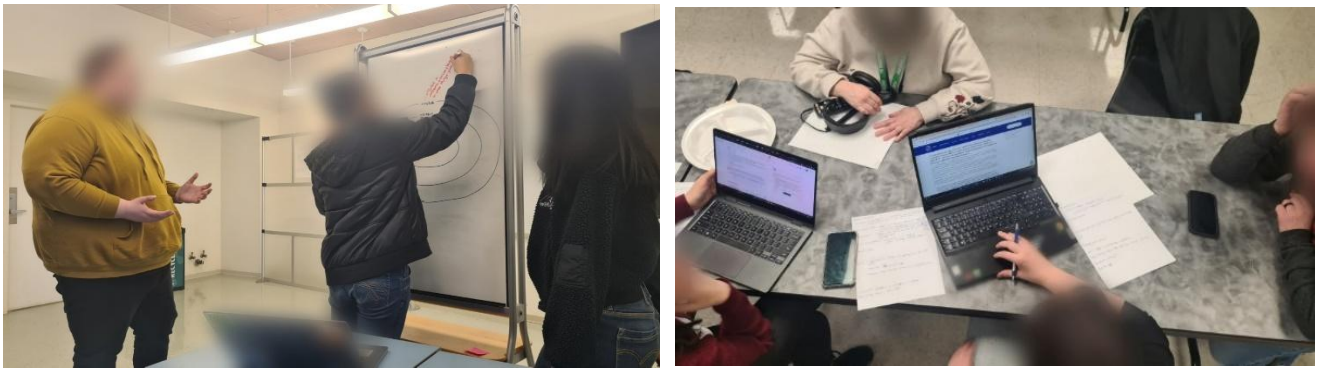

Figure 3. Photographic material from the sessions. Mainstream designer team (left), and FIP team (right).

B.

B.1. On the Design Process

Designers from both teams viewed the design process as mainstream or used by them, confirming the preliminary study. In comparison, due to the FIP, continuous participation was mentioned to increase designer understanding of the topic space, and empathy to eliminate the need for more process structure and specificity and increase productivity in planning and research. The FIP approach also facilitated user understanding of design.

B.2. On Team Collaboration

The case study depended on teamwork and collaboration more than anticipated due to time constraints. The conversation was a key element, especially in the FIP team, where it changed how designers considered users, from 'users' whom they 'design for' to 'experts' whom they 'design with'. This confirms that the approach is strong in inclusive design goals.

B.3. On the Impact on Designers

Comparatively, the FIP approach positively impacted designer participants as professionals and humans and boosted their knowledge and confidence in this case and for future inclusive and mobility design projects. This could be a benefit even outside inclusive design, allowing better team preparedness for different projects and topics. The FIP team designers considered its use in their practice and design disciplines, which is a positive sign for implementability with design practitioners.

B.4. On Challenges

The designer team's challenges centered on limited time, lack of user interviews, and insufficient topic understanding. Conversely, the FIP team struggled with tool use, technological issues, and barriers to collaboration and creativity. Challenges often stemmed from the case study's design, like time constraints or an imbalance of users to designers in the team. They highlighted the need for thorough preparation and

facilitation, which could require additional effort from team leaders or organizations.

C.
Two experts from the preliminary study evaluated the solutions (Figure 4), which were different with their target stakeholders and design media choices. The first expert appreciated the designer team's broader scope and important issues but found it superficial and unclear. The second expert found it well-executed but unengaging and not as inclusive enough. For the FIP team's solution, the first expert observed that it is less systematic but more inclusive. They highlighted the functionality and feasibility of manufacturing costs. The second expert critiqued its unfinished aesthetics and appreciated a more inclusive and implementable product with greater potential. The first expert also thinks they have equal value, while the second expert deems them too different to compare. Both explained their guesses of which solution is the work of which group as a recognition of their own bias. Those insights can help frame the opportunities and limitations. They conclude that there is a specific value to the FIP approach that should be further explored.

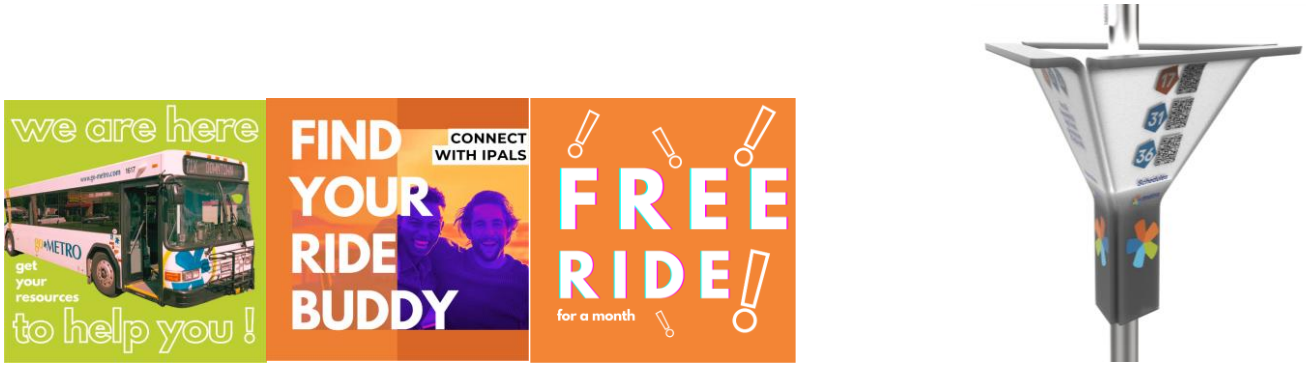

Figure 4. Design solutions. The mainstream designer team (left) created an information campaign focusing on social media and ride buddy programs to bring the information to new and diverse riders. The FIP team (right) created a multisensory and low-cost signage pole retrofitting system to increase environmental visibility, presence, and safety for more potential and current riders.

3.2. Insights

These findings contrast many previous studies and industry practices regarding the ease of inclusive design adoption and implementation – as participation and inclusive design do not have to be more costly or time-consuming, inexperienced users can adapt to an expert design process quickly and designers inexperienced in a certain subject can learn more quickly, developing specialized methods is not necessary for participative design, and constant participation appears to have significantly more worth than intermittent user interviews or workshops. However, this is connected to specific conditions for implementation – the number, diversity, and experience of team members from each participating group, tools and materials that can be used, number and experience of leads or managers, scope and complexity of the project, and the context of the organization were all mentioned by participants and experts.

4. Discussion

Researchers agree that most design disciplines and even project subjects are connected or similar enough, which means advances in usability and adoption of inclusivity could

continue into all other fields where designers are a part of a project. That common denominator is the practitioners - designers.

With this in mind, the innovation of connecting conventional methods and inclusive participation throughout the process was linked to increased designer inclusivity, awareness, learning, and confidence – in their work, profession, and personal lives. These insights open the conversation about FIP as a more powerful tool for inclusive and other corporate, educational, and societal goals. The approach could empower both designers and communities by making designers better equipped for the job market and the challenges of the future, and vulnerable groups could acquire new skills and decision-making voices (Accting, 2022). The explicit willingness and ease of adoption by both participant groups is a positive development for the pragmatism and adoption part of the FIP approach.

We can conclude that knowledge generation is still needed, albeit through the lens of practice and wider adoption. The observed novel themes in inclusive design theory and conditions of implementation need more focused exploration to determine the scopes of inclusivity, participation, and facilitation, the concrete impact on organizations and team leads, the choice of tools to be used, and compatibility with different design processes and disciplines. Due to its explorative nature, the case study had limitations. Further studies should involve mobility design experts and actual organizations practicing it, as well as explore implementation in more complex design projects, organizations' employment and community outreach practices, and designer education.

Some of the proposed steps to further research are already underway with the help of a public transit agency, an organization employing staff with visual impairments, and a university lab, who are interested in implementation or contribution as stakeholders. The wide array of possible case studies to address specific conditions of implementation will be addressed by developing and sharing open-source tools to reach real-world environments and projects more quickly and in a more decentralized and democratized way. This could also familiarize more designers with pragmatic approaches to inclusive design.

ISSUES TO CO-DESIGN PUBLIC POLICIES FOR INCLUSIVE EDUCATION: PERCEPTIONS BASED ON EXPERIENCES IN A PUBLIC UNIVERSITY OF HEALTH IN BRAZIL

Cláudia de Souza Libânio[a]*, Emanuele Konig-Klever[a],

Federal University of Health Sciences of Porto Alegre (UFCSPA)

*claudiasl@ufcspa.edu.br

ABSTRACT | Inclusive education in public universities of health is crucial to foster environments that reflect the diversity of society and seeks to promote equal opportunities for all. Ensuring inclusivity and respect for diversity in these educational institutions is a step toward reducing social inequalities and advancing social justice, on a broader scale.
However, while public universities of health should be spaces for democratic debate and the construction of collective knowledge, there are still significant barriers in place. These include limitations in access, discriminatory attitudes, unequal opportunities, and a lack of respect for the community diversity. These challenges hinder the advancement of social justice within these educational environments.
In this sense, the objective of this study is to present perceptions and identify issues to be worked on by educators, students, researchers, public policymakers, and citizens, with the goal of co-designing public policies that promote inclusive education in public universities of health, reduce prejudice and exclusion, and elevate the debate around social justice in Brazil.
This paper is an experience report, following a qualitative approach, based on the experiences of educators, students, and researchers in an educational environment of a public university of health in Brazil.

Key findings suggest strategic issues to be worked on and co-design by educators, students, researchers, policymakers, and citizens to promote inclusive education in Brazilian public universities of health.
Additionally, the study establishes a strong relationship with concepts of diversity, equity, inclusion, and accessibility, along with inclusive design principles to guide the co-design of Brazilian public education policies, highlighting the impact of these issues on social, economic, and political aspects of health education. The study emphasizes the importance of multidisciplinary, participatory, innovative, and ethical approaches to fostering inclusive education in public universities of health.
The findings underline that public universities of health need to encourage community engagement and democratic debate around inclusive education, which is essential for driving meaningful change.

KEYWORDS | INCLUSIVE EDUCATION, CO-DESIGN, PUBLIC POLICIES, PUBLIC UNIVERSITIES OF HEALTH

1. Introduction

Inclusion has been a widely discussed topic in recent years, driven by social movements, public policies, and international commitments, such as the United Nations (UN) Sustainable Development Goals (SDGs). Specifically, Goal 4 (Quality Education) emphasizes the importance of ensuring inclusive, equitable, and quality education, promoting lifelong learning opportunities for all. Furthermore, Goal 10 (Reduced Inequalities) highlights the need to reduce disparities within and between countries, promoting social, economic, and political inclusion for all, regardless of age, gender, disability, race, ethnicity, origin, religion, or economic status (UN, 2025).
Especially in the context of universities, inclusion and justice serve as the foundation for social networks and interpersonal relationships (Mutanga, 2017), as well as foster the collective participation of everyone in the educational process (Dias Ferrari & Sekkel, 2007) and expand skills, making all people, regardless of their conditions, more economically and culturally productive (Nunan et al., 2000). Additionally, inclusive education programs reduce historically existing inequalities in society (Gorges et al., 2018).
In Brazil, several policies and laws are designed to ensure access to education and reduce social inequalities. These include programs to expand access, affirmative action policies, student assistance initiatives, and accessibility regulations. For instance, Law 10.098/2000 (Brazil, 2000) requires the removal of communication barriers and the implementation of technical solutions to make communication and signage systems more accessible for people with disabilities, including in educational environments. Likewise, Law 13.146/2015 (Brazil, 2015), the Statute of Persons with Disabilities, mandates that the State should guarantee quality education by ensuring an inclusive educational system at all levels of learning.
However, while an inclusive approach is crucial in higher education and there are politics related to the topic, there are still major gaps in its implementation, particularly in terms of architectural accessibility and faculty preparedness to create an environment where all students can engage in academic activities on equal terms (Garcia et al., 2018). Carneiro and Bridi (2018) point out that merely ensuring access for people with disabilities to universities is not enough, as the barriers throughout the educational journey are even greater, with a series of exclusionary mechanisms. The educational infrastructure of most universities remains inadequately equipped to support diversity, primarily due to the

limited availability of accessible resources, the absence of content in alternative formats, and the persistence of attitudinal barriers and exclusionary practices (Jarus, 2022; Beyene et al., 2023).
Within health universities, fostering inclusion is crucial for promoting educational equity and equipping future professionals with the competencies to effectively address the needs of a diverse population (König-Klever et al., 2023; Verbree et al., 2023). The healthcare field can benefit from professionals with disabilities, who bring unique insights and competencies. However, they often encounter numerous challenges, particularly during their training, which can hinder both their success and the profession's access to diverse talent (Walker et al., 2023). Jarus et al. (2022) emphasize that, to ensure health students, regardless of their limitations, feel legitimate and a sense of belonging, inclusive policies and practices must be prioritized in the education system.
In light of this, incorporating the concepts of DEIA (Diversity, Equity, Inclusion, and Accessibility) into health education is essential to ensure equal opportunities and improve the quality of care. Integrating DEIA into healthcare professionals' training helps create a more inclusive environment, sensitive to patients' needs, and promotes better interpersonal relationships. This approach prepares professionals to address diversity in care, helping to reduce inequalities and fostering a culture of respect and equity. Implementing DEIA policies in educational institutions is crucial to training leaders who are more prepared and committed to social justice in healthcare (Rosenkranz et al., 2020).
This vision aligns with the concept of inclusive design, a design philosophy that considers the needs of individuals, particularly those with reduced functional capabilities, during the product design process (Persad et al., 2007). Inclusive design is based on key principles: centering people in the design process, recognizing diversity, offering multiple solutions when needed, ensuring flexibility of use, and creating convenient and enjoyable solutions for all. These principles aim to make environments, products, and services more user-friendly (CABE, 2006), and to make them accessible and achievable by all people, encompassing all forms of diversity (Medeiros et al., 2015). To expand the target audience for products and services, inclusive design considers the desires, needs, expectations, and experiences of everyone (Burgstahler, 2001; Pattison and Stedmon, 2006; Goodman-Deane et al., 2014). The successful implementation of ID strategies requires a deep understanding of population diversity, as well as responses to this diversity, which can be addressed through informed design decisions (Waller et al., 2015).
In this sense, the objective of this study is to present perceptions and identify issues to be worked on by educators, students, researchers, public policymakers, and citizens, with the goal of co-designing public policies that promote inclusive education in public universities of health, reduce prejudice and exclusion, and elevate the debate around social justice in Brazil.

2. Method

This paper is an experience and descriptive report, following a qualitative approach, based on the experiences of educators, students, and researchers in an educational environment of a public university of health in Brazil.

2.1. Overview of University and Students

This report concerns a discussion regarding activities placed at the Federal University of Health Sciences of Porto Alegre (UFCSPA). UFCSPA is a public institution dedicated to teaching, research, and outreach, with a focus on comprehensive healthcare activities.

The university offers 16 undergraduate programs, 64 medical residency programs, four professional health area residencies, nine specialization courses, and 12 *stricto sensu* graduate programs, all in the health field (UFCSPA, 2025). 50% of the student vacancies are destined to individuals who have completed high school in public schools and for students from low-income families. Furthermore, UFCSPA is supported by the Brazilian government through a program that offers vacancies to students from developing countries in Africa, Latin America and Asia. Also, low-income students have support of food, transportation, housing and school materials (UFCSPA, 2025). Nowadays, UFCSPA has 4.250 students, 400 professors, and 200 technical staff. The university does not have an official mapping with data of students, technical staff or professors with disabilities, reduced mobility or specific vulnerable conditions. This is because the current informatized system does not have specific fields for students to inform these conditions in university forms or documents. What is currently available is a mapping conducted by the NID (Inclusion and Diversity Committee) through active outreach to students with disabilities or reduced mobility. This process is still fragile and quite informal, as it is unable to reach students who do not declare that they live with these conditions. Based on the NID's registry, it is known that there are 54 students with disabilities in the university. There are no records for technical staff or professors' disabilities, nor students with reduced mobility or those living in vulnerable conditions.

2.2. Activities Developed

Regarding the activities carried out, they took place in four subjects. Specific meetings with the Committee of Inclusion and Diversity (NID), experts, and members of the university community were also considered complementary and thematically activities, reinforcing the topics addressed in the course.
The subjects concerned design and inclusion of three healthcare courses: two subjects in two undergraduate programs and two in one master's program. The classes took place in 2024. Two subjects occurred in the first semester of 2024. The first one was entitled Accessibility in Health for Medical Physics, and the second one was called Technologies for Inclusion and Accessibility in Healthcare for Health Management undergraduate program. The other two were developed in the Master of Information Technology and Healthcare Management (PPGTIGS). Both courses were taught by a university professor who is also an author of this paper. In the first semester of 2024 occurred Design and Accessibility in Health. Design and Technologies in Healthcare for Inclusion took place in the second semester of 2024. All the subjects are offered every year, for three months and can be taken by students from other master programs (UFCSPA, 2025). All the subjects have a focus on aspects related to DEIA in healthcare contexts.
The undergraduate students are from the courses of Medical Physics and Health Management, and the graduate students are from Master of Information Technology and Healthcare Management. Medical Physics is an undergraduate program that aims to train professionals to work in health prevention and promotion processes by applying concepts, laws, models, and methods of Physics for disease diagnosis and treatment (UFCSPA, 2025). The Health Management undergraduate program aims to train professionals focused on strategic management in health systems, with a systemic vision, an entrepreneurial mindset, and a critical-reflective capacity (UFCSPA, 2025). PPGTIGS is dedicated to conduct research and investigate techniques, methods, and standards related to Health Management, as well as train health professionals to effectively use various information technologies in the health sector and contribute to advancements in health practices and policies. (UFCSPA, 2025).
Meetings with the university community contemplated students, technical staff, professors and rectorate in academic meetings and roundtable discussions about

specific problems or future actions regarding DEIA in the UFCSPA community. In most cases, these meetings consisted of NID members, professors, students and staff who acted as representatives of groups or directories of the university. The Inclusion and Diversity Committee (NID) actions regarded meetings among members of NID and meetings between NID and university community for specific actions proposed by UFCSPA. This Committee is composed of professors, researchers, staff professionals and training students.

2.3. Data Collection and Analysis

The data collection was carried out through field notes and photographs. To develop this study, we initially conducted a literature search, which allowed us to identify the main points related to the themes of accessibility and inclusion within the context of health and education. Based on this search, a set of concepts was constructed to guide the thematic analysis. Next, we carried out the planned activities, observing and documenting interactions through notes, field diaries, and photographs to develop the analysis. In the section called results, we present them organized into categories.
The data analysis was carried out using thematic analysis (Braun & Clarke, 2008) with an inductive approach. While we had support from the literature for the definitions and key concepts analyzed, the categories emerged from what was observed during the activities based on the data collected.

2.4. Structured Plan for Subjects

To organize each subject, we used a plan consisting of a formal structure proposed by the authors, as in figure 1: presenting concepts, cases and examples; researching and exploring; reflecting and analysing; exploring the practical context; proposing an action plan; and concluding with a final discussion and reflection.

Figure 1. Sequence of teaching and learning steps for the subjects

As students were from health areas, generally, they had never heard about design concepts. So, in the beginning of the subject, we started **presenting** concepts and the main ideas of design for health. In the meanwhile, during classes, we covered topics such as DEIA, principles of universal design and inclusive design (CABE, 2006) as well as Brazilian laws, standards, and policies. We presented different types of disabilities, challenges, and barriers faced by these individuals as well as possible opportunities they must have to live a better life. In the subjects that deal with technologies, we presented and included assistive resources and technologies throughout the entire process and discussions.
So, during the first classes, we made theory-driven and discussion-oriented classes and encouraged students to **research** and explore the topics, by doing exploratory research exercises. To engage the students, we encourage discussions about people with disabilities, vulnerable populations and the context of people living in LMICs. We invited people with disabilities to voluntarily participate in the classes, sharing their contexts, the

barriers they face, and their life challenges with the students. Students were stimulated to **reflect** about their context, their families and friends, and their academic and professional environment, trying to identify similar situations faced by them within these spheres. They are stimulated to criticize the current reality and reflect on their role as individuals in a society and how we can be agents of change.
After presenting, researching, and encouraging reflection on the topic, the context of the practical intervention is introduced. At this time, students are motivated and started to **explore** the university environment, researching, visiting and talking with the community. The focus of the intervention is the university environment of UFCSPA, physical or virtual. The students are organised into groups and encouraged to identify the problems and critically analyse the challenges and barriers faced by the community in the current academic context and think about how an inclusive university environment can be.
Students also carried out a practical activity, within their groups. The proposal is for them to put themselves in other people's shoes, that is, to follow a predefined route using a wheelchair, being blindfolded while using a white cane, or using crutches. The idea is for them to develop empathy, learn to see from others' perspectives, and seek to understand realities beyond their own.
They organise data, photos, and reports collected for discussion within the groups. Based on this, they begin the **proposal** for intervention through group work that involves students, people with disabilities, and the researchers involved. The professor supervises the task, always encouraging collaboration through co-participation. In this sense, we discuss people's behaviors, public policies and methodologies, technologies, products and services we could use in an inclusive higher educational context. The ideas that emerge are recorded and discussed, resulting in proposals for intervention as an action plan with educational public policies. There is no prototyping of final products, as these are not design students. What is generated are action plans for intervention proposals, based on the learning and class discussions.
The proposals are **discussed** among all those involved, in a large group. A final report is developed, with a structured action plan, and this document is submitted to the university administration and leaders (program coordinators and the dean) during a debate held in the final class. This document outlines the current problems identified and the possible ways to address these issues, through educational public policies, the attitudinal approach of the individuals as well as products, services, technologies, and information provided. In this way, by the end of the course, the aim is to encourage discussion and reflection among the students on the topic, while also seeking to change the behaviour and the reality of the university, promoting more inclusive, accessible, equitable, and diverse academic environments.
The next section, we present the results structured in categories.

3. Results

The Inclusion and Diversity Committee (NID) includes subcommittees that work on specific issues, such as gender and race, as well as accessibility. NID members meet monthly. However, there are smaller meetings of specific groups for developing research, responding to community demands, monitoring specific actions, and participating in events or selection process committees.
Meetings of NID members bring together a larger number of experts and individuals interested in the topic, who have knowledge in the field and recognise the importance of diversity, equity, inclusion, and accessibility within the university environment and society as a whole. The discussions are more in-depth and frequently include the participation of users directly impacted. People with disabilities, reduced mobility, or in vulnerable situations are closely connected to NID and therefore actively participate in many of the

committee's initiatives.
Another important aspect has been the increased representation of professors from undergraduate and postgraduate courses at UFCSPA. This has led to a greater understanding of the specific context of each course, the identification of students to support who had not previously approached NID, and the strengthening of relationships with course coordination. Consequently, problem analyses have become more accurate, and this process includes the collaborative reflection about the problem, who are involved, and the development of solutions, approaches, and truly inclusive practices, which are treated as a priority.
Meetings with the academic community to address university needs involve students, technical staff, professors and rectorate. These meetings were seminars or roundtable discussions about specific problems or future actions in the UFCSPA community. Problems and future actions range from course curriculum, behaviours of professors and administrative staff, to construction work and maintenance of physical and virtual environments. In these meetings, NID members bring to the table discussions regarding DEIA trying to reinforce the importance of having an inclusive university environment where everyone could feel included and respected. Many of the other participants were part of the administrative and support staff and did not necessarily recognise the importance of DEIA or have knowledge about it. The participation of NID members in these meetings was achieved over the years and, today, is seen as relevant, although it makes some people uncomfortable. This participation has become increasingly relevant as university matters must take DEIA issues into account. However, in some discussions, discomfort was noticeable when addressing these topics, as practices adopted for the majority of people generally tended to follow standard solutions. Considering additional specifications to enhance inclusion and accessibility requires more reflection, work, and adjustments to the standard, which are often avoided.
During the course sessions, several practical suggestions emerged, leading to concrete intervention proposals. To address attitudinal barriers and foster more inclusive education, participants proposed the development of a teacher training program focused on the importance of inclusion. This program would present quantitative data on students with disabilities and reduced mobility and include the voluntary participation of students with disabilities in selected training sessions to share their experiences. Additionally, a mapping of physical barriers across the institution was conducted, resulting in an action plan submitted to the engineering department. The plan outlined suggested modifications to be implemented in the short, medium, and long term. A structured mapping of incoming students with disabilities or reduced mobility is also underway, coordinated by NID. Based on this data, opportunities for dialogue and socialization are being organized with these students to better understand their needs and guide institutional actions.
The following section will discuss the results and practices used in these activities, highlighting perceptions and identifying the issues to be worked on by educators, students, researchers, public policymakers, and citizens. This aligns with the importance of co-designing public policies that promote inclusive education in public health universities, reduce prejudice and exclusion, and elevate the debate around social justice in Brazil.

4. Discussion

The following section presents a discussion of the results, aiming to reflect on the practices and outcomes derived from the activities carried out. This section is organised as follows: contributions of design education and design practice in the context of a

healthcare university, relevance to design public policies with people with disabilities in universities of health and designing public policies.

4.1. Contributions of Design Education and Design Practice in the Context of a Healthcare University

The design practices and education developed made clear the barriers and exclusions experienced by people with disabilities, as well as contributed to the inclusion of users and those directly impacted in discussions and in the design of the university environment. The main barriers identified were related to physical accessibility within the university environment. Although the infrastructure includes some spaces adapted for wheelchair users, access to many entrances is hindered by stairs, and not all areas have tactile flooring. Additionally, in terms of communication, the university lacks Braille signage and auditory signals. Even though there are staff members at the university trained to support individuals with various disabilities, it can be challenging for a person with a disability to navigate the environment independently during their initial contact with the space.

The formulation of effective public policies requires the identification of these barriers and the analysis of data that highlight the inequalities faced by different social groups. The cases, the arguments of people with disabilities, and the Brazilian standards addressing design that were used in the classes reinforced the ideas and proposals. One of these regulations is the Law of Accessibility to buildings, furniture, spaces, and urban equipment, which in its latest revision added the content of the seven principles of universal design to its text (ABNT NBR9050, 2020). Another design concept worked on in class was the principles of inclusive design, where students were able to realise the importance of DEIA for the university context of health courses and for society as a whole. Bringing people with disabilities into the classroom, into activities, and meetings where they could actively participate also contributed to reflection, empathy, problematisation, and the subsequent search for ways to make the university environment more inclusive.

The development of public policies must come from a participatory approach, ensuring that decisions are built with the direct collaboration of the people affected. The theory and relevance of co-design, involving those directly impacted, were presented to the students. This participation and involvement sparked reflection and critique about current public policies, and the students were motivated to debate and propose new ideas, together with people with disabilities.

People with disabilities also emphasised the sense of belonging and satisfaction from being heard, having their participation in the community recognised, with their ideas, feelings, and values considered. According to Simplican et al. (2015), community participation of people with disabilities generates the involvement in community activities that promote the development of interpersonal relationships. This recognition also aligns with issues related to social justice, which guides public policies focused on equity and the guarantee of rights. By the end of the subject activities, it was possible to observe, through the students' statements, attitudes, and stances, the gradual development of a relationship of trust and respect among the participants. Building a more inclusive environment in the university health context can drive broader structural changes, influencing institutional and governmental policies.

The combination of several techniques used in the sequence of teaching and learning steps, as shown in figure 1, was also assertive, as the set of actions carried out in the classroom enabled students to understand, sensitise, and engage with the theme throughout the entire work of the subject. Moreover, the use of active methodologies in teaching and learning favours the understanding of the challenges and barriers faced in

the implementation of inclusive public policies.

4.2. Relevance to Design with People with Disabilities in Universities of Health

In all the subjects, we brought people with disabilities who voluntarily made themselves available to participate and co-design in some moments of the classes, such as discussions, debates, interviews, testing and criticizing the ideas and solutions. Rajapakse, Brereton and Sitbon (2019) define co-design as an established field of inquiry that involves people with a variety of interests and skill sets to design together. Sanders and Stappers (2008) add that co-design is a collaborative process that involves different participants contributing their experiences, knowledge, and creativity.

The participants' disabilities were studied and taken into consideration to ensure their effective and respectful participation. Possible barriers to communication and participation were identified, and appropriate devices, technologies, and flexible approaches were selected to prevent and eliminate these barriers or potential discomfort during the proposed activities. Labattaglia, Reay and Nakarada-Kordic (2023) state that accessible co-design accommodates and encourages multiple modes of communication and participation. Allowing participants to engage with a co-design method or activity in any way or style was found to be the most accessible way to approach co-design (Labattaglia et al., 2023). This approach aimed to guarantee the proper, ethical, and respectful inclusion of people with disabilities or reduced mobility during activities.

The activities carried out that included people with disabilities or reduced mobility reaffirmed the importance of giving voice to people with disabilities — whether through the sense of belonging it generates, the broadened perspective on different realities, or the increased accuracy in proposals. This aligns with the guiding principle of people with disabilities: 'Nothing about us without us' (UN, 2004). United Nations (2004) emphasizes that the active involvement of people with disabilities in developing standards is a strong example of how full participation can be implemented, contributing to inclusive societies where all voices are heard and people with disabilities can help shape a better world. Bohn et al. (2023) recommend that the design of these laws and regulations includes participatory processes for different actors, aiming to obtain different perspectives on the same issues.

An important point for analysis is the specific context of health universities, which have a series of particularities in teaching and learning, such as clinical practice activities, the use of specialised laboratories, and hybrid classes (both virtual and in-person formats). These activities take place in environments that involve the use of health-specific products and technologies, requiring reflection and analysis to effectively transform them into activities that consider diversity and are truly inclusive, ensuring accessibility for all. Furthermore, these students will become future healthcare professionals who must develop an understanding of and respect for differences. Meeks and Jain (2018) advocate that disabilities must be fully integrated into diversity and inclusion discussions at medical schools and universities of health. The authors add that diversity and inclusion in the medical student body are associated with greater self-rated preparedness to care for minority patients and a stronger commitment to equitable access to care (Meeks & Jain, 2018).

The activities carried out also highlighted the importance of integrating key individuals into certain administrative sectors, specific areas, or faculty groups. These individuals would be influential persons who are trusted by their teams and can serve as references for promoting and advocating for respect for diversity, as well as for the ongoing pursuit of accessibility, inclusion, and equity within the university environment. While this is a

topic that should be further explored in future research, it became evident in the activities conducted as a potential strategy to be adopted. Another issue that emerged from the activities and warrants discussion is the importance of peer relationships. Fernández-Batanero, Montenegro-Rueda and Fernández-Cerero (2022) reinforce the relevance of peer support as a good facilitator and favour the participation of students with disabilities in classes and academic activities.

4.3. Designing Public Policies

In Brazil, the evolution of regulations can be observed, with some addressing the real needs of people with disabilities or reduced mobility, while others incorporate contemporary concepts and universal design principles, (ABNT NBR9050, 2020), which undergo periodic updates. Bohn, et al. (2023) emphasize that in recent decades, Brazil has made progress in legislation and public policies aimed at inclusion, encompassing inclusive education, healthcare services, and labor market integration. Nowadays, the country has a set of laws, standards and policies that govern accessibility, inclusion, and health, seeking to guarantee the right of access of all people (Bohn, et al., 2023).
At the same time, by the end of the classroom discussions and some meetings, the gaps that many regulations, laws, and standards still present became evident. Certain challenges in public policies in education were highlighted, such as the constant need for updates and improvements in degree programs curricula, the difficulty of accessing some regulations and legislations, as well as the necessary advancements in communicating them. Lee et al., (2021) advocate for incorporating disability into medical education, ensuring that healthcare professionals are trained to provide inclusive and quality care to people with disabilities. About educational policies, Fernández-Batanero et al. (2022) also highlight the necessity of curricular adaptations to contemplate the real needs of the community. Another issue that came up for discussion in activities is the lack of effective implementation of public policies in education. Kelly, Padden and Fleming (2023) said that in Ireland's University there was an 'inclusion implementation gap' and in the case of University College Dublin, they created a culture of inclusion engaging leaders, university community and students. Although the implementation of legislation, standards, and policies was not the focus of this work, the discussion frequently emerged during the activities. Aligning with Kelly et al. (2023), the support from rectors, chancellors, and senior leadership in disseminating, endorsing, and ensuring compliance with DEIA initiatives is another aspect to be considered for the effective implementation of actions and public policies in universities of health.
For the design of public policies, it was possible to perceive the importance of the approach and interactions between users and those impacted with the university community, to ensure that these proposals address their real needs and that all voices are heard. Kelly et al. (2023) add that students can be powerful catalysts for change and their role as 'ally' is integral to the implementation process. As highlighted by Meeks and Jain (2021), inclusive policies are essential to overcome the barriers faced by students with disabilities in accessing and participating in higher education, and they can be active participants of this change.

5. Conclusions and Ongoing Work

This paper aimed to present perceptions and to identify issues to be worked on by educators, students, researchers, public policymakers, and citizens, with the goal of co-designing public policies that promote inclusive education in public universities of health, reduce prejudice and exclusion, and elevate the debate around social justice in Brazil. As

lessons learned, all the activities in this experience report have shown us that design practices and design education can foster reflection, encourage, and provide a more inclusive, equitable, and accessible environment that respects our great diversity. Furthermore, the importance of involving people with disabilities throughout the activities was evident, to ensure that all voices are heard, especially in the university context of health-related courses. Another lesson learned is the importance of co-design, participatory and ethical approaches to fostering inclusive education in public universities of health to enhance community engagement and democratic debate to meaningful change. The work developed with and for people with disabilities shows the community involvement and the behaviour change, focusing actions more on abilities than on people disabilities. The study also showed the difficulties regarding implementation of public policies and how important is the students' role as powerful catalysts for change.

Another aspect observed is the impact of these issues on social, economic, and political aspects of health education and in the society as a whole. The discussions and classroom work began with an analysis of the context of a public health university and its community but expanded to broader spheres of public administration. Students realized that while it is necessary to change our behaviour within the university community, among friends, and with those close to us, there must also be more structural changes at the political, social, and economic levels. These observations enriched and elevated the discussions, allowing participants to recognize their roles as citizens within a society and understand how their actions are essential for social justice.

The findings from this experience can be adapted and replicated in other university contexts, especially those involving health education, by establishing inclusive committees, integrating co-design practices in the classroom, and creating structured opportunities for people with disabilities to contribute to policy-making processes. Other educators and researchers can build on these insights by incorporating active learning methods, participatory approaches, and DEIA-focused discussions into their curricula, as well as promoting interdisciplinary collaboration.

Based on our experience, we recommend that institutions: establish formal mechanisms to include people with disabilities in policy and curriculum discussions; provide continuous training for faculty and staff on inclusive practices; design mapping and monitoring systems to identify and respond to accessibility barriers; and promote the presence of diversity advocates within academic and administrative structures.

For future studies, it is suggested that the topic be explored in greater depth through case studies or other qualitative research methods. Another possibility is to investigate the implementation of actions and inclusion policies within the context of health education at the university level. Moreover, future research should explore methods and tools for measuring and evaluating behavior change and student engagement, as these factors are crucial for understanding the long-term impact of such educational interventions. These future studies could also examine the institutional conditions and leadership engagement necessary for the effective implementation of DEIA initiatives, as well as the role of peer support and collaboration in promoting inclusive learning environments.

ABSTRACT | This research focuses on establishing purposeful collaboration between local authorities, artists, and intermediaries working in synergy. Drawing on insights from the co-creation of the emerging CCI4Change collaboration model and five case studies, the study advocates for a systematic approach to local authority-driven partnerships with artists to achieve enhanced sustainability. The research examines the key factors required to foster collaboration, addressing the key capacities of each actor, local authorities, artists, and intermediaries, while also identifying the prerequisites and obstacles for a purposeful and successful collaboration. The study underscores the importance of motivation on the part of local authority, which must possess the capacity to contextualise the novel collaboration in a

meaningful and strategic way. Artists, in turn, need strong professional artistic skills and the motivation to work in a goal-oriented way. The intermediary's expertise within the CCI (Culture and Creative Industries) community is critical in fostering dialogue and trust between the two parties. The study employs a qualitative approach with a limited number of case studies. While the findings provide valuable insights and offer valid considerations for fostering purposeful cross-sectorial collaboration, they also suggest transferability to similar initiatives. This knowledge supports the application of the CCI4Change collaboration model, as well as other similar models, aimed at facilitating the systemic implementation of novel, local authority-driven creative collaborations to foster community sustainability and innovation.

KEYWORDS | SUSTAINABILITY, ARTS-BASED COLLABORATION, CROSS-INNOVATION, PARTNERSHIPS, ACTION RESEARCH

1. Introduction

The world is facing a climate crisis. Europe is striving to become carbon neutral by 2050, a cornerstone of the European Green Deal (European Parliament, 2021). Art and design are called on to take a stronger stance in providing solutions and redefining their role in addressing ecological and societal conflicts (Ciravegna et al., 2022). Ethical design leadership is crucial in cross-innovation efforts aimed at integrating creative competencies, guided by sustainability principles, UN 2030 goals, and the urgency of tackling wicked problems, and new forms of collaborations are needed to find synergies and unexplored possibilities to enhance sustainability and the green shift (Bandarin et al, 2011; Hasagharar, 2017; Soini & Birkeland, 2014; UCLG, 2018).

A diverse range of skills and approaches from different disciplines is essential for finding new solutions and creating robust knowledge, e.g. research with and for society via stakeholder integration (Nowotny et al., 2003; Weingart, 2017). The research is based on the CCI4Change (CCI as in Culture and Creative Industries) collaboration model, a novel approach created via participatory means (Robertson & Simonsen, 2012; Spinuzzi, 2005). This study explores the essential factors required for fostering a purposeful collaboration between local authorities and professionals in the field of culture and creative industries, and especially artists, within the context of the green shift, sustainability transition and transformation.

The study resonates with the growing interest of both parties, local authorities (city, municipal and regional public officers) and artists from diverse fields of arts: visual arts, performing arts, media arts and more, to explore new ways to collaborate to create positive impacts on the sustainability of their communities. The power dynamics between artists and local authorities are inherently distinct, often leading to discord and misalignment in working cultures, where communication barriers and differing priorities create challenges. Artists play a crucial societal role in critiquing, influencing, and shaping their surroundings, while local authorities hold the mandate to direct societal development and stir citizen behaviour. Despite their respective influence, meaningful collaboration between these two entities remains uncommon. Harnessing their complementary strengths for shared objectives could, however, yield significant societal benefits. To a large extent, artistic and creative actors consist of individuals or small organisations that often occupy a precarious position and operate with limited resources.

In contrast, the local authority is a powerful and strongly structured entity constrained by legal requirements and rigid internal processes to which a collaboration must adapt. To help balance this power dynamic, the role of the intermediary is introduced as a key facilitator, bridging the two parties to enable purposeful and productive collaboration.

2. Research questions

The emerging CCI4Change collaboration model explores the potential of cross-sectoral partnerships between local authorities, professionals from the culture and creative industries (such as artists), and intermediaries, working in synergy to influence citizens' energy consumption behaviours. This study examines the key capacities of each stakeholder—local authorities, artists, and intermediaries—while identifying prerequisites and obstacles for a purposeful collaboration.

3. Key concepts

The study contributes to sustainability sciences by examining the role of the arts in sustainability, as in challenging the power dynamics and facilitating futures visioning (Heras et al., 2021). Cultural actions are commonly integrated into sustainability transitions and are recognised as relevant both for short-term experiments and long-term systemic change (Concilio et al., 2023). Art has some potential to act as a catalyst in promoting environmentally positive values, systemic thinking and sustainability initiatives, and cultural sustainability transformation (Huhmarniemi & Jokela, 2025).

Sustainable development has traditionally been defined by three core pillars—economic, social, and environmental—as outlined in Agenda 21 for Sustainable Development adopted by members in 1992 (Agenda 21, 1992). The role of culture in this sustainability framework is widely discussed: how culture contributes to the three existing pillars as an instrument to achieve sustainability, and cultural sustainability as the fourth pillar of sustainability (Soini & Birkeland, 2014; Sabatini, 2019). A conceptual framework for relating culture with sustainability consists of Culture in Sustainability, Culture for Sustainability, and Culture as Sustainability (Soini & Dessein, 2016). This approach has also been adopted in the UNESCO agenda, which is incorporating the framework in its narratives as: (1) culture as an independent pillar of sustainability; (2) culture as a driver of sustainability containing development assets; and (3) culture perceived as a prerequisite for sustainability (Dobrosława, 2020). The first notions of the role of culture are more adopted, such as acts of preservation and integration of cultural values, traditions, and heritage within broader sustainability efforts. Culture as a driver of sustainability is acknowledged as part of areas like health and wellbeing, urban planning, and the role of culture in awareness-raising for desired change. The third perspective, culture as sustainability, relates to a transformative approach that has yet to be adopted and lacks efficient tools to create the needed change (Siivonen, 2020). However, sustainable development has been widely criticised as a politically charged concept with several weaknesses in its approach (Jackson, 2009; Raworth, 2012).

This study contributes to sustainability sciences and the role of arts in sustainability, as in disrupting power dynamics and facilitating futures visioning (Heras et al., 2021). Cultural

actions are commonly integrated into sustainability transitions and are recognised as relevant for short-term experiments and long-term systemic change (Concilio et al., 2023). Art, especially social and pedagogical artistic practices, can initiate sustainability transformations, a systemic change, and shift towards a into sustainability orientation (Huhmarniemi & Jokela, 2025). However, there is a lack of standardised methods among public, private, and non-governmental sectors for monitoring and evaluating their progress in integrating culture into development-oriented initiatives (British Council, 2020).
When artists are invited to move beyond their traditional domains to collaborate with professionals from other sectors and adapt their objectives accordingly, these interactions have been examined within the contexts of health and wellbeing, social sciences, corporate environments, and frameworks of organisational learning. Artistic interventions in organisations, or arts-based initiatives, integrate elements from the art world into non-arts-based organisations to foster learning and innovation (Darsø, 2004; Berthoin Antal, 2012; Schiuma, 2011; Schiuma, 2017). However, there has been limited research on collaborations between artists and local authorities.

Huybrechts et al. (2017) state that participatory design and design in the public realm operate primarily at the micro level, yet they generate many direct and indirect effects on meso- and macro-level institutional frames. As an emerging collaboration model, the CCI4Change responds to the call for research, art, and design to support the necessity and potential of more systemic radical transitions, making them accessible to a wider audience to adopt. It also highlights the role of cultural organisations and universities in demonstrating leadership by actively engaging with radical transition practices in their urban or regional contexts through action research and research-by-design (Loorbach, 2022).

Systemic approaches are crucial for investigating the factors that enable productive collaboration between local authorities and artists. Such an approach can generate the necessary number and quality of initiatives to identify actions that have the potential to tap into leverage points within the system, and through limited interventions, create significant impacts (Meadows, 1999).

4. Methodology and data gathering

4.1. Action research

The research framework is based on action research. Action research is participative and collaborative. Its methods involve action, evaluation, and reflection in an iterative cycle (Cohen et al., 2017; Mc Niff, 2013; Avison et al., 1999). This methodology is increasingly being applied to foster sustainability transformations (Bradbury, 2022) and the sustainability impact of arts and culture (Jokela & Huhmarniemi, 2018; Jokela et al., 2019).

The data is collected through two parallel processes. Firstly, data is gathered from the service design process conducted to develop the CCI4Change collaboration model. Secondly, data is drawn from five case studies that tested the collaboration model in practice. Therefore, the model provides a comparative framework for all five case studies, each of which follows the same structured approach outlined by the model, contributing significantly to the research.

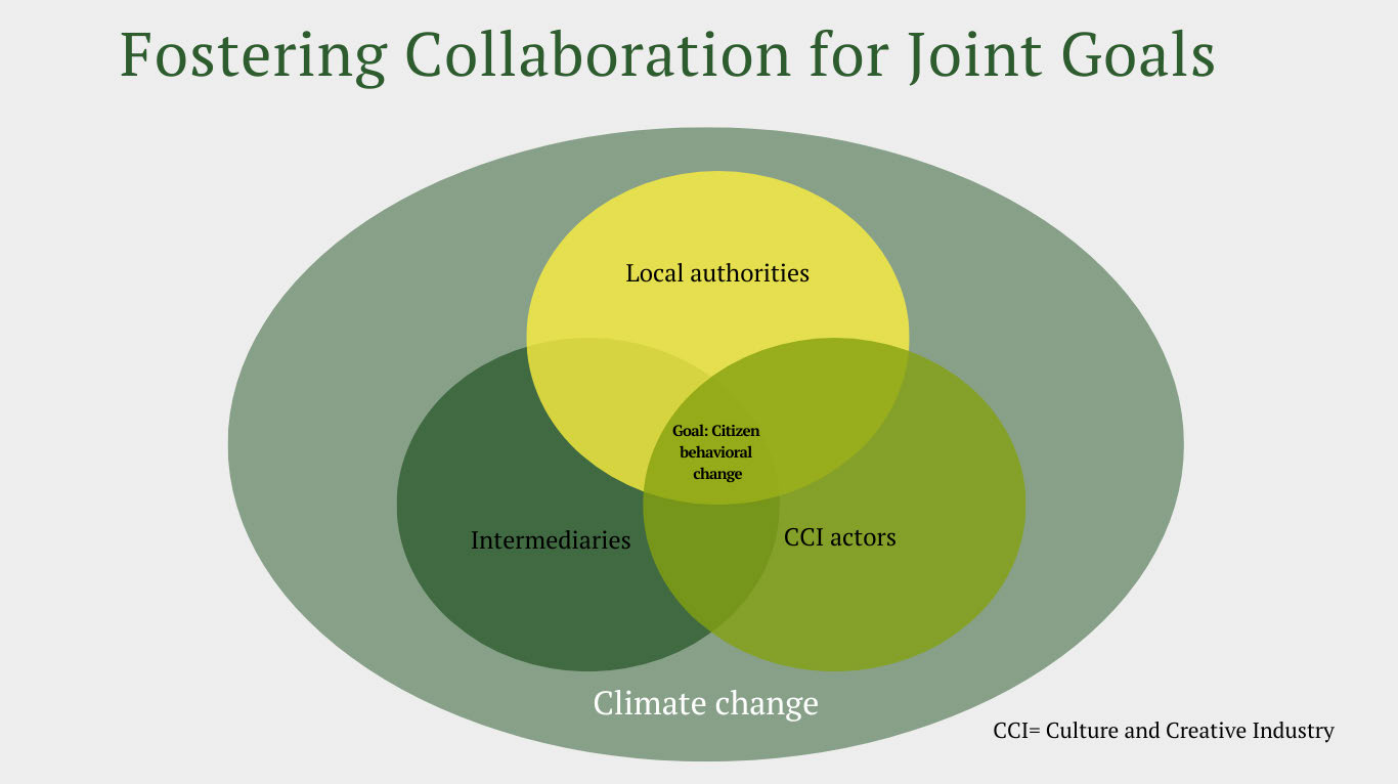

Figure 1. Framework of the CCI4Change Collaboration model.

The research stems from the CCI4Change collaboration model (Figure 1). Despite the CCI4Change collaboration model not being within the focus of this study, it is essential to understand the framework it provides for the research premise, highlighting the roles of the local authority, artist, and intermediary. The research data is derived from the context of the CCI4Change collaboration model, which aims to support local authorities by providing a tool to influence citizens' energy consumption behaviour through the skills and approaches of artists and creatives. The model is based on three key stakeholders—local authorities, CCI actors, and intermediaries—whose ability to work together may be crucial for fostering sustainable solutions. This development work and the research were conducted as part of the EU Interreg Baltic Sea Region Program co-funded project 'CCI4Change: Facilitation of Citizens Energy Consumption Behavioural Change in Baltic Sea Cities and Municipalities' implemented in Latvia, Finland, and Sweden (August 2023, July 2025).

Aligning with the action research approach, the researchers were integral partners of the co-creation and its working groups and facilitated, designed, observed, and participated in the process. While participating and co-designing, they observed and took field notes. The researchers observed the entire service design process and were involved in all co-creation workshops as participants.

4.2. Service design tools

The action research utilised diverse service design methods (Stickdorn et al., 2018). The objective of the service design process was to develop the CCI4Change collaboration model and to test it across five practical case studies. Additionally the objective was to produce a toolkit to support the adoption and dissemination of the model. Co-creation, grounded in participatory principles, provided a central approach that actively seeks to

understand the perspectives of users and stakeholders (Vargas et al., 2022; Spinuzzi, 2005). Various service design methods were employed to gather user insights throughout the process (Stickdorn et al., 2018). A key element was a series of co-creation workshops (September 2023–April 2025), where the model was developed and prototypes were tested at different stages in collaboration with users and stakeholders both in online and onsite settings (Figure 2).

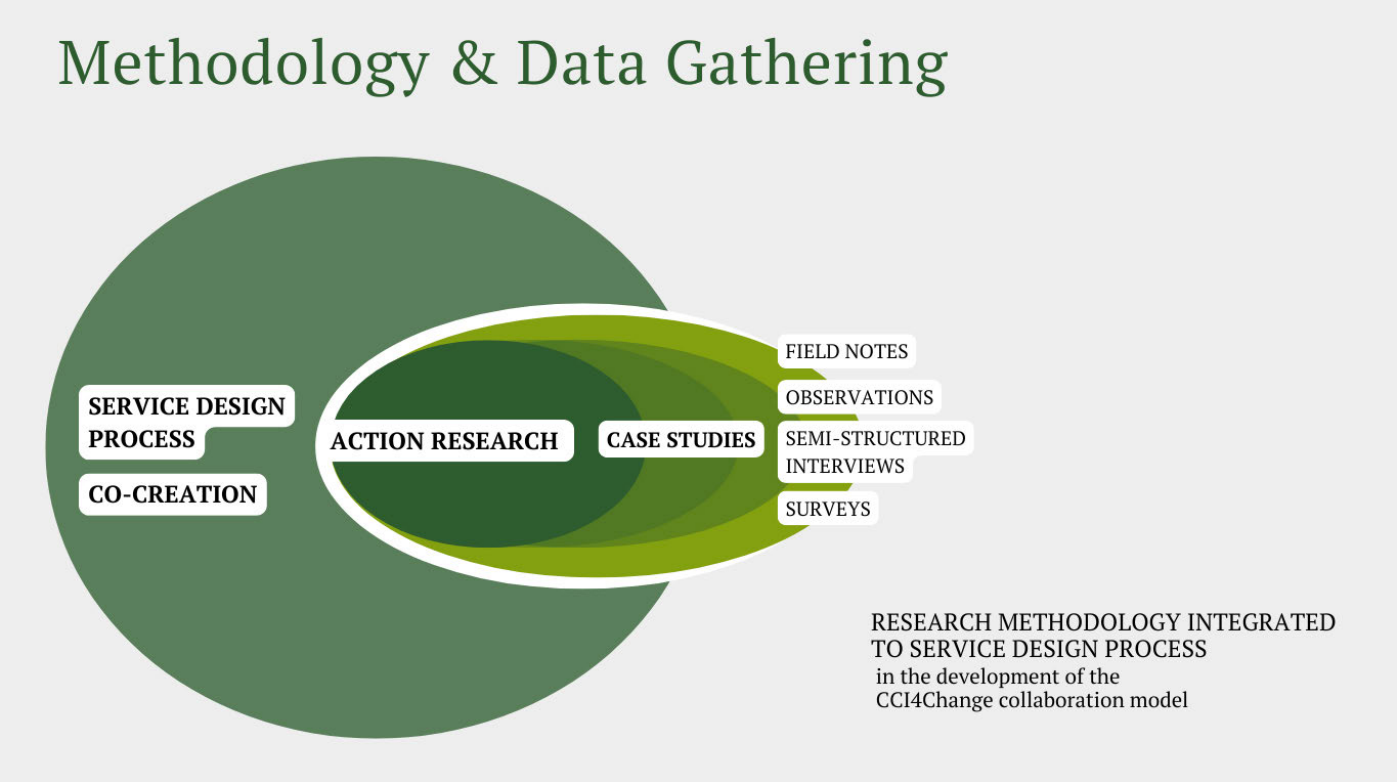

Figure 2. Methodology and data gathering.

Twenty-two individuals from Latvia, Finland, and Sweden contributed to the co-creation. These were grouped into three groups. Firstly, the local authority representatives were public officials mainly working in management or expert positions in cultural departments at the city, municipality, and regional levels. Local authorities also included a director from the city urban development department as well as experts in sustainability and climate issues. Secondly, the intermediaries represented organisations of various kinds, an NGO creative hub, an international public cultural institution, and a public business development agency. Thirdly, a participant group of six artists, as introduced in the case studies, contributed to the research. In addition, five individuals from the universities contributed to the working groups.

User insights and data were collected throughout the process using interviews and surveys to triangulate data-gathering methods (Stickdorn et al., 2018). Semi-structured interviews were conducted with the participant groups of local authorities and artists, which enabled collecting rich qualitative data (Ibid.). In addition, data from the artists participant group was collected through a survey.

4.3. Data analyses

The analysis and conclusions are shaped by the data collected from the co-design process and the five case studies examining the commonalities experienced in them. The results were analysed using an affinity diagram, and the findings were visualised in persona canvases that were created to define key characteristics of the local authorities, artists, and intermediaries—their actions, skills, capacities, and motivations for the collaboration. Additionally, it explored the perceived value and future potential of the model, along with prerequisites for the collaboration as well as barriers that hindered effective collaboration. This process involved identifying key topics, themes, and focus areas that emerged during the co-creation sessions and within the case studies, as well as addressing questions, concerns, and priorities that were emphasised throughout the process. The visualisations served as tools to summarise the key findings capturing the shared experiences and insights of users in the three participant groups. Rather than reflecting individual participants' perspectives, the visualisations synthesise data from multiple stakeholders to present a broader understanding of the collaboration dynamics, thus providing the basis for the analysis.

In this research context, key capacities refer to the essential skills, instincts, abilities, processes, and resources that actors in the collaboration need to possess as relevant for purposeful collaboration. The prerequisites for collaboration refer to the conditions that must be met beforehand and that influence the efficiency of the collaboration. Obstacles are factors that hinder collaboration and negatively impact its success. The case study format was chosen to provide data for comparative analyses across the three contexts and to validate the emerging operational collaboration model (Flyvbjerg, 2011).

4.4. Case studies

The case studies tested the CCI4Change collaboration model in practice, representing a completed collaboration between the three parties (local authority, CCI actor, and intermediary).

All five case studies followed the same process structure and goals provided by the collaboration model from its start to closure. In brief, the collaboration began with the local authority and intermediary preparing to launch an open call for creatives, defining the criteria the applicants were expected to meet. The activities proposed by the creatives were intended to utilise artistic or creative practices to address the goal of reducing energy consumption, ideally in collaboration with civil society by engaging local communities. The outcomes of the creative process could take various forms, such as video, animation, comics, performance, temporary installations, and exhibitions. The expectation was not for artists to provide ready-made solutions to energy-consumption issues, but rather to guide citizens in discovering approaches for behavioural change through creative engagement. The timeframe for the projects was approximately four months, with a financial reimbursement of around €10,000. The open calls were competitive, and proposals that best aligned with the predefined criteria were selected for implementation. Local authorities and intermediaries chose the projects with an emphasis on new thinking and innovative approaches. These artistic pilot projects serve as the case studies for this research.

The study refers to culture and creative industry actors, particularly as artists due to the professional background of the actors represented in the case studies. In summary, the

fields of art and professional backgrounds of the artists participating in this study are music and sonification, cultural productions, ceramic art, game design, media and video art, community art practices, and art installations.

A. Duncan Geere & Miriam Quick: 'On Standby' sonification art
Duncan Geere and Miriam Quick, founders of the Loud Numbers data sonification studio, created a musical composition derived from data collected from individuals about overnight energy consumption. Geere distributed smart plugs that monitored the energy consumption among the participating citizens of Malmö, who collected and shared data. Using data-sonification techniques, this data was turned into a music composition that was 10 hours and 40 minutes in length. The aim of the artwork was to raise awareness of and stimulate discussion about energy use through the simple process of observing and quantifying the electric appliances' energy footprint, which is set to prompt self-reflection of one's own consumption. The activity was enabled by the local authority in the Skåne region and was supported through intermediary functions provided by the creative hub STPLN.

B. Ifö Centre: Zero Sum Residency
Ifö Centre is a free culture house initiated by artists in an old ceramic factory in the small village of Bromölla in southern Sweden. The closed factory property is managed by the international NGO Ifö Centre Association of Arts and Culture, covering 43,000 m², and is being repurposed as a site for art manufacturing and more. hosted a residency for artists with the focus on the Agenda 2030 goals, where creative approaches and solutions for energy saving were produced and discussed together with art exhibition audiences through ceramics and works of industrial design. Teresa Holmberg, ceramic artist, curator, and producer of the Ifö Centre, organised the residencies. The activity was enabled by the local authority Skåne region, and was supported through intermediary functions provided by creative hub STPLN.

C. Tatu Heinämäki & Camilla Pentti: Community Energy Game: 'Energeezer'
Tatu Heinämäki is a visual artist, game designer, and media arts teacher, while Camilla Pentti is a visual communications professional and game designer. In the city of Kotka, a video game was developed that specifically addresses the issue of energy consumption and encourages its reduction. In total, 29 high school students took part in 'game jams' giving their ideas to the development of the final video game. The main goals of the activities were to inspire the children who participate in the development and to raise interest among the citizens of Kotka for the game and to communicate about the energy consumption theme through video gaming. In March 2025, the video game became open to all citizens of Kotka, inspiring future discussions around energy consumption. The activity was enabled by local authority City of Kotka, Finland, and supported through intermediary functions provided by business development organisation Cursor.

D. Banja Media Ltd: Video Pilot: 'No, that's not how you save the world'
Banja Media's pilot activities were produced together with children of various ages in Kotka schools, producing short, humorous yet informative videos on energy saving, circular economy, and sustainable development. The videos represent educational material provided for the children and co-created with them. The goal was to promote shifts towards more sustainable behaviour and to inspire viewers of the videos to think how energy-saving can be possible. Petri Pietiläinen—a professional in children's art and culture and an author—played a key role in organising the video production, writing the scripts, workshopping with youth groups, and acting in the films. The activity was enabled

by local authority City of Kotka, Finland, and supported through intermediary functions provided by business development agency Cursor.

E. Fonds INITIUM: 'Neighbourhood House'

INITIUM is a professional arts and culture platform focused on community art projects. It employs theatre and other artistic methods in sustainable initiatives supporting social, educational, and cultural efforts in Latvia and Baltics. In the Kauguri neighbourhood of Jurmala, a site-specific location for the artistic activity, the team created an environmental installation that aimed to spark discussion on energy consumption, highlighting citizen agency. Within a period of four months, the INITIUM work in Kauguri engaged with 170 inhabitants through brief inquiries extending to in-depth interviews. The activity was enabled by the local authority Jurmala municipality and supported by the Northern Dimension Partnership on Culture as the intermediary of the collaboration. The first author of the research acted as the intermediary between the local authority and the artist in this case study.

5. Results

A comparison grid categorises the features, functionalities, and characteristics of local authorities, intermediaries, and artists within the collaboration. This comparison is based on data collected using service design tools, including the Tree of Change, which focuses on the actions, operations, and connections of each actor, as well as key persona templates, where each actor is represented as a persona with specific characteristics, skills, capacities, values, actions, motivations, etc.

Table 1. Comparison grid.

Category	Local Authority (LA)	Artist	Intermediary
Role in Collaboration	Initiates, coordinates, and supports pilot projects. Mediates between CCI and community. Aligns with city strategies. Provides access to communities and practical support.	Designs and implements pilots. Develops creative methods and tools. Engages citizens. Collaborates with local authority and intermediary.	Provides funding, capacity building, and knowledge transfer. Facilitates communication and outreach. Acts as translator and bridge between different stakeholders in the collaboration.
Key Functions	Open calls and contracting. Coordinates multi-department involvement. Communicates with citizens. Promotes sustainability and transformation through culture. Collects citizen	Proposes and executes creative projects. Engages with civil society and diverse audiences. Creates impactful storytelling formats in versatile art forms	Organises training, workshops, and mentoring. Builds networks. Guides CCI towards transformative action. Ensures competence and project quality. Collects citizen experiences and

	experiences and feedback.		feedback.
Methods & Tools	Strategic planning; public procurement; collaboration across departments; questionnaires	Installations; games; art workshops; exhibitions, community art; digital storytelling.	Training webinars; workshops; questionnaires; communication strategies and campaigns.
Citizen Engagement	Provides infrastructure for participation and dialogue. Supports community access to activities.	Facilitates co-creation with citizens. Uses participatory methods and artworks. Implements art-based processes like games, installations, community art, and workshops.	Designs outreach strategies. Builds interest and organises events. Encourages citizen feedback.
Communication & Storytelling	Shares stories of coordination and mediation. Promotes CCI capacity in sustainability. Documents implementation and creative process. Shares results in networks and with the public.	Tells impactful narratives on chosen topics via different art forms. Communicates through engagement and raising awareness. Documents their own creative process.	Tells story of process and capacity-building. Harvests learning to support dissemination. Documents implementation and creative process. Shares results in networks and with the public.
Outputs & Impact	Strategic alignment with city goals. Greater CCI visibility. Community empowerment. Use of toolkits, open calls, and creative procurements in development processes across departments.	Creative pilots, exhibitions, games, community art, installations, and artworks as behavioural change tools. Strengthened connections between CCI and community. Strengthened sense of belonging via community art engagement of citizens.	Toolkits, capacity-building frameworks. Enhanced support models for CCIs. Insights for scaling and replication.
Sustainability Focus	Embeds pilots into city sustainability strategies; long-term engagement.	Drives behavioural change through creativity by designing and taking energy-related content into action.	Facilitates learning and continuity through toolkits and guidelines.

The identified key capacities of the local authority, artist, and intermediary are derived from each party's ability to fulfil the roles outlined in the collaboration grid, which presents functions of a purposeful collaboration in the CCI4Change framework. While these functions are not the focus of investigation in this study, they serve as a foundation for further examining the key capacities each party contributes towards achieving a successful and efficient collaboration aimed at a shared goal.

5.1. Contributions of the local authority

What does the local authority need to drive an innovative collaboration with artists? The artistic products, skills, and knowledge are often unfamiliar (if not foreign) in the organisational domain (Schnugg, 2014). The study indicates that the local authority requires specific capacities to enable innovative forms of collaboration. According to our findings, these capacities can be grouped into three categories: 1) individual motivation, 2) social skills, and 3) the ability to contextualise the work *(valorisation)*.

The individual motivation of the local authority to work with artists is pivotal. This intrinsic motivation paves the ground for collaboration and all efforts needed to advocate and legitimise its value. This entails an interest and curiosity in artistic work and the benefits from gained expertise related to the role of the arts in citizen engagement, sustainability, and innovation.

Social skills and capacities are indispensable for building meaningful collaborations—firstly, with an intermediary party; secondly, in a cross-sectoral manner within the local authority organisation's diverse departments; and thirdly, in external engagement with the artists and other actors to expand the range of stakeholders and the impact of the collaboration. The local authority needs to integrate the collaboration into other relevant contexts and strategies of governance and build credibility for the artistic activities. In this way, the local authority needs motivation and the skills to support the impact of the collaboration. In other words, the local authority valorises the collaboration with its authority by contextualising the artistic work in a way that creates meaning. The value of the collaboration is created through the local authority's abilities to recognise the meaning and communicate it.

As a prerequisite, the study suggests that an existing and established relationship between the local authority and its creative community provides fertile ground for initiating innovative models of collaboration. A lack of dialogue or existing communication platforms between the local authorities and the creative community can be foreseen as an obstacle for initiation of an innovative collaboration. The collaboration builds on trust between the parties, which is built through continuous exchange and dialogue between the local authorities and the artists.

The obstacles to the collaboration are connected to the prerequisites. The collaboration is cross-sectoral, not only through the involvement of the intermediary and the artist, but also due to its overarching theme (energy consumption), which intersects with multiple departments within the local authority's organisation. The collaboration between diverse local authority departments is crucial. In all five case studies, the collaboration was driven by the cultural departments. But when the collaboration proceeded, it became closely related to other departments such as strategic planning, urban development, and climate action. Also, departments such as technical infrastructure, education, and communications were involved. The role of the local authority officer responsible for the collaboration as a manager and developer of the cross-departmental connections is vital to enable shared ownership between the departments and potential impacts beyond the ones limited only to the cultural department. Another prerequisite considers the readiness of the local authority for creative explorations and innovative approaches. In corporate settings of artistic interventions, the top managers can significantly influence success by actively legitimising the time employees dedicate to engaging with the arts and reinforcing their importance of the actions for the organisation (Berthoin Antal et al., 2019). The case studies indicate this need of management endorsement to support the

legitimation of the artistic actions inside the local authority organisation and, more widely, to raise awareness and promote sustainability and transformation through culture.

One observed obstacle for the collaboration relates to the theme of the collaboration: energy consumption behavioural change of the citizens. At the time of the case studies, there was a lack of clarity regarding the overall responsibility of the local authority in facilitating this change. This uncertainty results in insufficient strategic support to validate the relevance of the collaboration. Since the local authority's role in addressing this issue remains largely unclear, the importance of exploring new means of working toward this goal may be overlooked. This increases the risk for the collaboration to lack strategic backing and remains an experimental curiosity. This finding can serve as a suggestion for the local authorities to use exploratory artistic collaborations to work with goals and topics, in which the local authority responsibility is clear and well-defined.

5.2. Contributions of the artist

As with artistic interventions in organisations (Berthoin Antal, 2012; Lehikoinen, 2013), successful collaboration demands a high level of expertise and capacity in the participating artists. The artist creates the content that drives citizen engagement and designs a process with the potential for the desired change, making the artist's contributions to the collaboration fundamentally relevant.

The artists in the case studies exhibited a large set of capacities that are grouped into four categories: (1) strong professional artistic expertise and practice; (2) motivation to work in a goal-oriented way; (3) capacity to align with collaboration goals while maintaining artistic integrity; and (4) the ability to apply creative methods with communities and create outreach.

The strong professional artistic practice was highly relevant, providing the basis from which to align with the specific framework and goals of the collaboration provided by the local authority. The high level of professionalism led to a winning stance when competing for a collaboration, resulting in winning the open call with one’s tender or proposal.

The artists demonstrated a clear motivation to engage with broader societal and ecological issues, aspiring to generate positive sustainability impacts. Collaborating with local authorities on these issues was seen as highly motivating for the artists, and a shared understanding between the local authority and the artists—that contributing to sustainability through one's work is meaningful—provided a common ground for the collaboration, free of discord. The artistic and creative professional skills are the core competence and contribution that artists bring to the collaboration. However, the capability to comprehend the motivations and needs of the local authority is essential, as it requires contextual skills such as stakeholder awareness and an interest in exploring the relationship between the arts and society (Lehikoinen, 2013; Lehikoinen & Siljamäki, 2023). Also, the skill to adequately adjust to the collaboration and the working culture of the local authority was needed to enable the collaboration.

Citizen participation and the evolving role of citizens in public sector innovations are widely discussed (Agger & Hedensted Lund, 2017). The artists adapted their artistic methodologies to align with collaboration goals, such as community engagement and

energy consumption. As professionals in creativity, artists may also possess the skills and tools necessary for citizen engagement (Warren & Jones, 2015), which was evident in the case studies. The artists showed no struggle in creating meaningful engagements with the community and working with the energy consumption theme through their artistic methodologies. However, amplifying the potential impact of the creative work lies with the local authority, supported by the intermediary, in recognising the significance of the artistic contribution and how it can generate further influence. This also presents the potential risk that the local authority and intermediary may lack the necessary skills or resources to seize the opportunity to develop the impact of the artistic work, apply the approaches and solutions it offers, and further promote its findings.

A prerequisite for the collaboration is the artist's sufficient organisational structure (e.g. operating as a company, foundation, or association) and a proven track record of previous projects and initiatives. This relates to the artist's ability to produce and market their own work, which is a common requirement for sustaining a professional artistic practice.

The obstacles encountered were related to the conditions of the collaboration regarding its timespan and financial resources. While the local authority prioritised citizen engagement, a longer collaboration would enable the artists to foster deeper engagements with the communities. Community engagement takes time. Also, financial constraints posed obstacles. The artists indicated that with greater financial resources, the activities could be expanded to create more impact. Limited financial resources pose a potential risk that the goals of the local authority (energy consumption behavioural change through citizen engagement) are not truly met but only addressed in a superficial manner.

5.3. Contributions of the intermediary

The capacities of the local authority are closely intertwined with the intermediary. As with artistic interventions in corporate settings, the role of the intermediary is also indispensable collaborations between the local authority and the artist (Sandberg, 2016). The case studies provide clear evidence, as corroborated by both local authorities and artists, that strengthing intermediary capacities is essential for fostering purposeful and productive collaboration. The case studies also demonstrate that the intermediary is not necessarily an organisation or a single person, but rather it is a function that must be fulfilled.

The intermediary capacities as contributions are grouped into five categories: (1) Intrinsic understanding of the creative field; (2) Motivation and expertise in artistic cross-collaborations; (3) Knowledge about the local authority context; (4) Skills to facilitate the collaboration; and (5) Ability to support the artististic process.

Aligned with studies of intermediaries in the corporate organisational context (Berthoin Antal, 2012; Grzelec & Prata, 2013), the intermediaries need to be knowledgeable and credible in both domains: the world of art and local authorities. The case studies indicate that the capacity to serve this function stems from inherent expertise in the creative sector, which relates to the identified prerequisites for the work. The intermediary needs to have access to the CCI community (or knowledge of how to arrange the necessary access) and the ability to reach the artists relevant for the collaboration. The study shows that the collaboration provides a meaningful and inspiring context for the artist's work. This needs to be understood in contrast to the more traditional assignments where the

artists need to independently construct or reinforce a contextual framework for their work. Without such a framework—a bridge to the surrounding world and society—the artwork may be isolated and lack dialogue, engagement, and broader societal relevance. The intermediary plays a pivotal role in building this context of relevance and dialogue, translating and expanding it from the local authority to the artistic one, ensuring the appeal of the collaboration and that the mission of the work can be well understood by the artists.

As a prerequisite for the collaboration, the intermediary has expertise in artistic work in cross-collaborative settings, and with this experience, provides relevant support for the process. The artist and the local authority may initially collaborate in this kind of set-up, but the expertise of cross-collaborations of the intermediary provides needed support for the process. The intermediary understands the local authority priorities, constraints, and working processes, as well as supports the artist in a sensitive yet goal-oriented manner, recognising their precarious position and the essential nature of artistic freedom. The capacity to apply the 'arm's-length principle' while also providing clarity and guidance to help artists align with the goals of the collaboration.

With the combination of essential capacities, the intermediary facilitates the collaboration and takes into consideration the require the needed agreements and negotiations for securing fair work for both parties. The intermediary is able to facilitate discussions about the goals and expectations for the collaboration. The case studies showed that artistic freedom is a strongly emphasised core value of the collaboration, acknowledged and respected by all parties and brought into discussion by the intermediaries.

There were three acknowledged obstacles in the collaboration. Firstly, obstacles occurred when the intermediary was not capable of fulfilling the function with the needed requirements. This resulted in an unclear division of roles and responsibilities between the intermediary and the local authority, leading to ambiguity and not contributing to a productive collaboration. Secondly, obstacles occured when the intermediary was too distant from the actual collaboration of the local authority and artist, leading to expanded responsibilities for the local authority.

5.4. Summary

The research examined the key capacities required to foster purposeful collaboration by outlining the capacities of each stakeholder—local authorities, artists and intermediaries—while identifying prerequisites and obstacles for the collaboration.

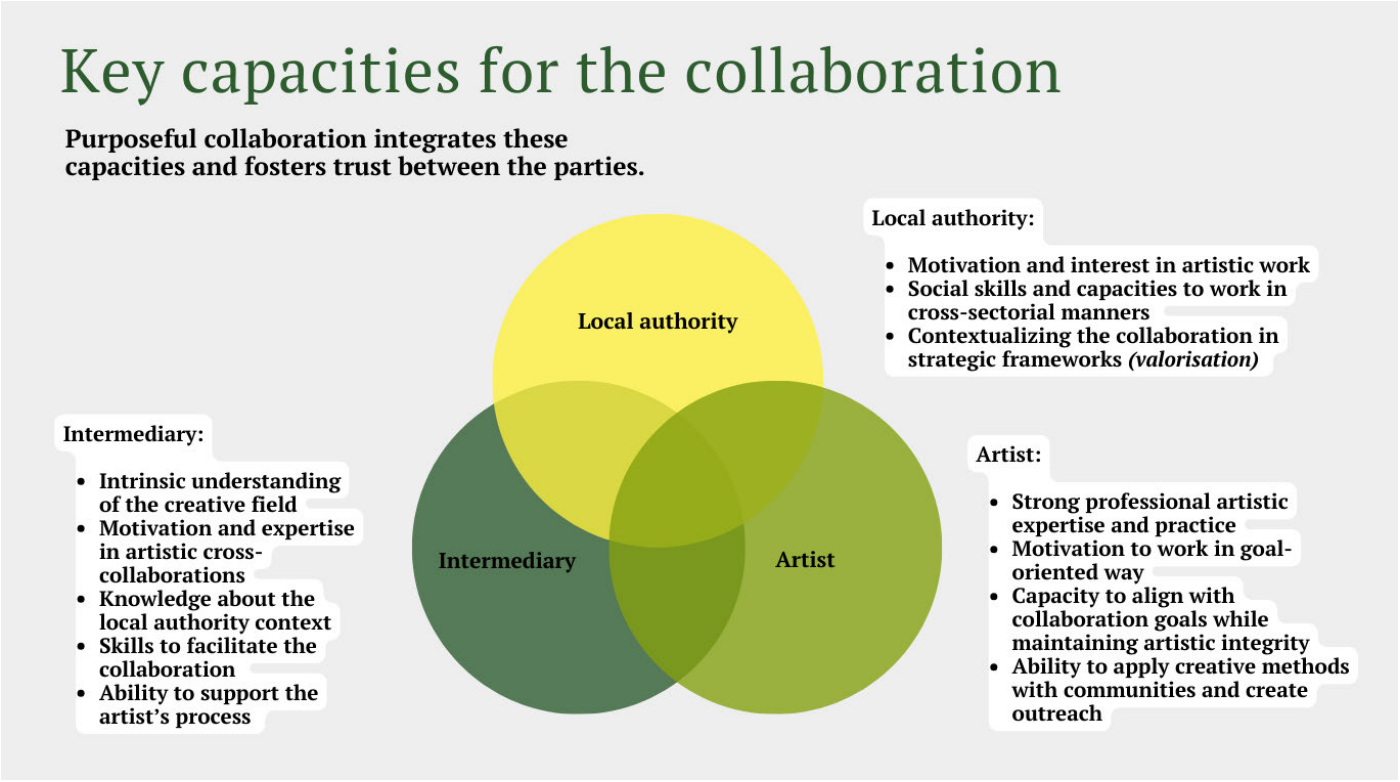

Figure 5. Capacities for the collaboration.

The capacities of the three key actors in the collaboration model relate to motivations to explore artistic cross-sectorial collaborations and work towards sustainability. The local authority plays a pivotal role driving the collaboration and managing its cross-sectoral nature and opportunities within the organisation to enhance its relevance. The capacities of the artists relate to their strong artistic practice and motivation to adjust the practice to the collaboration goals. The intermediary has the expertise and credibility to serve as a bridge builder, understanding the motivations of both parties and supporting the artist's work within the collaboration framework.

The identified prerequisites for collaboration are related to organisational capacities of the parties and access to the CCI communities. As the case studies illustrate, the high quality of professional artistic skills is fundamental for an efficient collaboration, and access to relevant creative communities is vital to ensure the collaboration engages artists with the necessary capacities for the collaboration. The capacity of cross-sectorial collaborations within the local authority organisation is a prerequisite supporting the efficiency of the collaboration.

The obstacles to the collaboration stemmed from difficulties in identifying supportive strategies and policies to underpin the work. The case studies employed a three-party collaboration model, but unclear roles and responsibilities among the participants hindered efficiency. While the artists themselves did not encounter significant barriers, they noted that increased time and financial resources could enhance the effectiveness of achieving the collaboration's goals.

6. Analyses

The study indicates that trust plays a pivotal role in fostering purposeful collaboration. In the case studies, the artists were granted full autonomy and confidence in their ability to produce high-quality artistic content while simultaneously meeting the goals set by the local authority. In turn, both the local authority and the intermediary were committed to respecting and encouraging artistic freedom and expression. The arm's-length principle was recognised by all involved parties as a fundamental prerequisite for establishing a trustworthy and inspiring collaboration. For local authorities aiming to integrate innovative collaborations with artists, the setup must not only consider artistic freedom but embrace it as a source for potential change, innovation, and impact. Supporting the building of trust can be considered a primary objective of the intermediary's role in the collaboration.

The value of the collaboration to all parties is clearly demonstrated in the case studies, and the collaboration seen as essential and inspiring. To enhance the ability of local authorities to foster collaborations with artists working towards sustainability, it is essential to recognise the capacities involved and address potential obstacles. Ensuring that these collaborations are purposeful and suitable for integration into local authority operational systems requires deliberate support and strategic planning. Further investigation is needed into how the creative outputs, processes, artworks, and approaches developed by artists can be supported, and how their value can be better understood and expanded. Additionally, the relevance, impact, and value of collaborations between local authorities, artists, and intermediaries in the context of sustainability need deeper exploration and research.

As this study concludes, the co-creation process of the CCI4Change collaboration model remains ongoing, and additional data may contribute to future research. This study did not focus on the usability or impact of the CCI4Change collaboration model, and therefore, this limitation does not pose a concern.

7. Conclusion

This study focused on identifying the roles, characteristics, capabilities, and connections of three entities: local authorities, artists, and intermediaries. This study employed a qualitative approach with a limited number of case studies. While the findings are not broadly generalisable, they provide valuable insights and transferability to similar initiatives and offer valid considerations for fostering purposeful collaboration between local authorities and artists with the support of intermediary parties. This knowledge supports the application of the CCI4Change collaboration model, as well as other similar models, aimed at facilitating a more systemic implementation of local authority-driven collaborations to enhance sustainability in communities, together with artists and creatives.

About the Authors:

Krista Petäjäjärvi is a PhD student at the University of Lapland, Faculty of Arts and Design. She serves as an expert in arts-based innovations at the Northern Dimension Partnership on Culture (NDPC). Her research and expertise centre on cross-sector collaborations involving artists and the role of intermediaries for enhanced sustainability.

Heini Haapaniemi's research at Aalto University, School of Arts, Design & Architecture, focuses on interdisciplinary pedagogical practice, co-design and knowledge work at the intersection of technology, design and art in the design university context. She works in the Creative Industries Research Unit, South-Eastern Finland University of Applied Sciences.

Anu Vainio (MA) is a service designer and lead designer at Future Experience Lab, South-Eastern Finland University of Applied Sciences. She specialises in co-creation and user-centred methods, with a recent focus on sustainability and planet-centric design in innovation projects.

Acknowledgements: This research was supported by the Interreg Baltic Sea Programme (2021-2027) as part of the project 'CCI4Change: Facilitation of citizens energy consumption behavioural change in BS cities and municipalities'. We thank the project partner organisations in Latvia – Northern Dimension Partnership on Culture and Jurmala Municipality; in Sweden – Skåne Region and Föräningen Stapelbädden (STPLN); and in Finland – the South-Eastern Finland University of Applied Sciences (XAMK), the city of Kotka, and Cursor Oy.

Funding: The research is carried out within the context and funding of the EU project 'CCI4Change: Facilitation of citizens' energy consumption behavioural change in BS cities and municipalities' as part of the Interreg Baltic Sea Region Programme (2021–27). The total project budget is 470,000€ with 80% EU funding and 20% co-financing from project partners.

Data availability statement: The datasets generated during and/or analysed during the current study are available from the corresponding author upon reasonable request.

UNLOCKING CO-DESIGN
for public design approaches

COLLABORATION - PARTICIPATION - CO-CREATION - METHODS - COMMON - EMPOWERMENT

INTRODUCTION

Coming from syndicalist movements striving to transform firms in 1960s Scandinavia, **collaborative design (or co-design)**, is now everywhere in creation, where it seems to fully blend in a globally praised participative conception culture. But co-design indeed appears to be trivialised to such an extent that it might be now difficult to distinguish it from any participative approach (co-conception, co-creation), or even any approach in the spectrum of workshop facilitation.

More specifically, co-design is an approach to a design project seeking to **"involve users from the beginning of a project to its end"**, as explained by Loélia Rapin, PhD candidate at Nantes Université, Sensipode, and L'École de design Nantes Atlantique.

So if a co-creation workshop or a UX research process integrates users at some point, at some degree, through some methods, it must still be differentiated from a co-design approach that will manage to involve user throughout the whole design process.

This being said, how should a design team manage users involvement in such a long and technical process ?

METHODOLOGY

In order to comprehend the impact of users involvement in a public design approach, students went through several research steps.

Interviews with 3 designers

- **Swanny SERRAND** - Public service designer, Rennes métropole - 60'
- **Rémy TESSEYDRE** - Service designer; Landscape project & citizen participation PhD, État'LIN- 45'
- **Loélia RAPIN** - PhD candidate, Nantes Université, Sensipode, L'École de design Nantes Atlantique - 60'

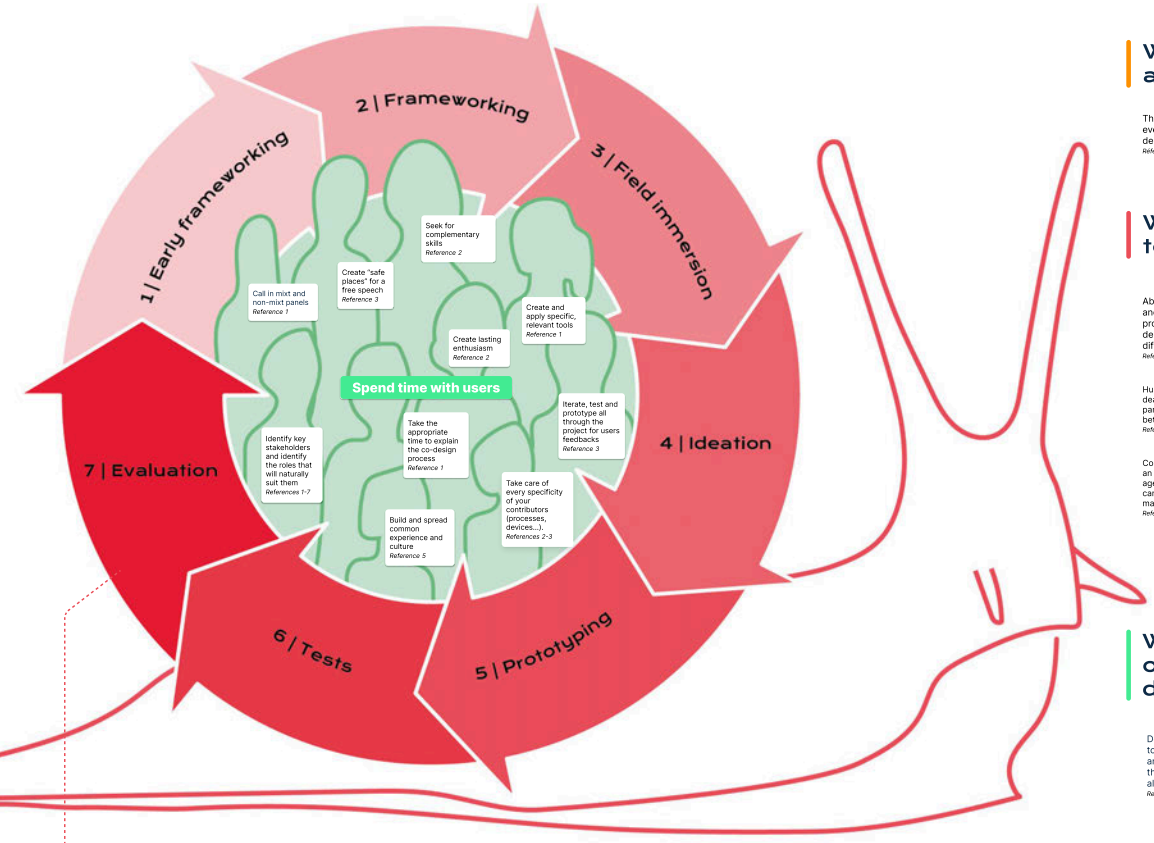
Topics of the interviews :

- Defining co-design
- Successful projects criteria
- Good practices to drive a co-design project
- Obstacles to a co-design project
- Limits in co-design projects
- Designer's part in a co-design project

Analysis process

- Interviews and literature retranscription
- Culstering by categories : obstacles, clichés and good practices
- Reformulation of statements and stakes
- Compiling good practices in a design project timeline

Co-design is like a snail...



What are the clichés to contradict about co-design ?

- Thanks to co-design, everybody can be a designer *Reference 1*
- Co-design is universally applicable *Reference 7*
- Co-design equals concertation *Reference 2*
- Tout le monde peut participer de manière égale *Reference 7*

What are the common obstacles to an efficient co-design process ?

- Absence of experience and skills on the specific project makes the decision-making more difficult. *Reference 1*
- It is delicate to feel when distance must be taken with users' feedbacks. *Reference 1*
- Multiplicity of actors makes the project hard to manoeuvre. *Reference 2*
- It is complex to both manage a project, and let it be managed by other actors. *Reference 3*
- Human factors must be dealt with : sceptical participants, disagreements between stakeholders... *Reference 1*
- Any human-related unplanned event will have a big impact *Reference 3*
- A workshop might not fit the targeted users *Reference 1*
- The result will always be uncertain : co-design will remain difficult to promote *Reference 8*
- Co-design might be used as an alibi to quietly impose an agenda : designers must be careful with possible manipulation *Reference 3*
- Users expectations towards co-design must be spelled out *Reference 7*
- Sharing a good and consistant level of information requires special care *References 6-7*
- The reason for users to take time to participate is often unclear *Reference 1*

What is actually the role of a designer when design is collaborative ?

- Designer knows how to deal with dissent and consensus (even though setbacks may always happen) *Reference 3*
- Designer has to play a function of pedagogue, diplomat, or intermediary. *References 2-6*
- Le designer doit adapter son langage et vulgariser son propos *Reference 2*
- Designer will clarify every term - and call a spade a spade *Reference 3*

7 steps for a co-design project

1. Early frameworking

Good practices :
- Identify the project's goals, pick a first set of methods as appropriate as possible. *Reference 7*

Obstacles :
- Co-conception projects must be frameworked with very few marks. *Reference 2*
- Lack of time. *Reference 2*
- Lack of funding (both for methods and for the result...). *References 7-2*
- Hierarchical and administrative inflexibility. *Reference 1*
- A method can come with its own set of constraints. *Reference 1*

2. Frameworking

Good practices :
- The actual level of participation to the final decision must be clear and precise (explanatory charter). *Reference 1*

"We're asked to participate only to sweeten the pill" *Reference 1*

- Involve users from the very start. *Reference 1*
- Plan users sollicitation. *Reference 7*
- Define together the study framework, the right stakeholders, and the good practices. *Reference 1*

"Bring people together, provoke opportunities" *Reference 1*

Obstacles :
- Hard to convince and mobilize stakeholders. *Reference 2*

3. Field immersion

Good practices :
- Adapt methods to the field and its global context. *Reference 1*

"Adapted tools are necessary for people to share an opinion with all the necessary information" *Reference 1*

- Keep close to your users. *Reference 1*

"Organize quality time with the different professions and with users" *Reference 1*

Obstacles :
- Failing to mobilise important users. *References 2-4*

Clichés :
- Users always know what they want. *Reference 7*

4. Ideation

Good practices :
- Boost creativity with appropriate exercises and general organization. *Reference 1*

"One of the limits with collaborative workshops is the injunction to make a lot of them. I sometimes thought that it was the wrong format with the tools and target I had then". *Reference 1*

Obstacles :
Dealing with constraints (technical, financial, legal) in the same time participants develop ideas. *Reference 7*

Clichés :
- "Users ideas are always the best". *Reference 1*
- "Anybody can conceive". *Reference 1*

5. Prototyping

Good practices :
- Ease communication with the designer's visual skills. *Reference 1*

"When we were making tests, people would better project into the future, they would involve more and would share more insight" *Reference 1*

- Test pragmatic solutions :
  - reassuring
  - involving
  - projecting
  - modify

Reference 1

"We test very pragmatic prototypes ; they are reassuring for participants and they make projection easier" *Reference 1*

7. Evaluation

Good practices :
- Evaluate and compare impacts expectations versus reality. *Reference 1*
- Share results with users. *Reference 7*

"Show involved users that the time spent sharing experiences through co-design is valuable" *Reference 1*

Obstacles :
- Resistance to change. *Reference 7*
- Disappointment with project's outcome.
  - not meeting expectation
  - not fitting with the field

  Reference 7
- Lack of analysis time and follow-up time. *Reference 7*

Clichés :
- "Co-design costs are always absorbed" *Reference 7*

... it takes its time !

Co-design is a global collaborative project approach, integrating users to every steps of the design process thanks a wide set of methods. It is based on experience sharing, careful attention and collective intelligence. Beyond these empowering methods, **co-design allows project teams to elaborate solutions answering precisely to actual needs**. Co-design will induce a slower attitude, guaranteeing a better understanding of users' needs. It will also give the opportunity to experiment deeper trust between different stakeholders, who will discover together iterative processes and uncertainty in projects.

In co-design, designers add to their conception and coordination skills, **a key role in project mediation**. They adapt tools and methods initially inteded to be used by designers, so each participant contribute in an appropriate manner, according to his/her abilities and needs. Designers will have to slowly and constantly propose **adaptations in methods, tools and solutions** to be validated by the collective that is gathered to realize the project.

So even though co-design has the potential to deal with complex projects, it is important to remind that a radical and global co-design positioning does not suit every project, or planning, or territory. A co-design approach must be launched when a project team believes that **efficiency does not necessarily come with rapidity**, and when everyone is about to accept to share some power with a group - in **exchange for key insights, true use of experience knowledge and renewed team commitment**.

ABSTRACT | Municipalities' growing interest in Smart Cities drives technological interventions that enhance logistical, energy, and spatial processes while impacting social and cultural structures. Creating moral smart cities requires according to Wernaart the active involvement of concerned parties at the design table. Or as DiSalvo noted, "Designing becomes a way to care, together, for our collective futures."

The Moral Smart City project seeks to develop a strategy for fostering continuous citizen engagement in decision-making regarding emerging technologies within the city, utilising the Moral Data City Hunt (MDCH) method. This method, developed by the Moral Design Strategy research group at Fontys University of Applied Sciences, combines empirical ethics, linguistic analysis, and comparative social science. A key component is design fiction, which is applied in a "mobile moral lab" to highlight future technology applications and the associated moral dilemmas. Residents interact with this lab, influencing the moral settings. These interactions help map the ethical preferences of different resident groups, contributing to a dynamic, techno-moral urban compass.

This article aims to provide the rationale for addressing 'value friction' in moral technological dilemmas for local governments within a pluralistic democratic rule of law, and describes the methodological design choices involved. By mapping friction, the MDCH gathers insights into pluralistic values in society, and the feedback loop helps facilitate the urban transition from citizens' often limited understandings and abstract perceptions of emerging technologies to a collaborative process of co-design and inclusive discussions. The pilot study of this Moral Data City Hunt method was launched in several Dutch municipalities as of May 2025.

KEYWORDS | #SMART CITIES, #MORAL DATA, #DESIGN FICTION, #CARE ETHICS, #PUBLIC ENGAGEMENT, #DESIGN FOR POLICY

1. Introduction

The 'smart city' is rising; municipalities increasingly use 'smart' technologies to streamline public infrastructures, make processes more efficient, and tackle complex challenges in public spaces and services. Although cities may implement these technologies with laudable goals in mind, technology is not necessarily a neutral tool toward these ends; technologies affect the city in foreseen and unexpected ways (Veen & Visser-Knijff, 2022).

Changing moralities bring possibilities for new technologies. New technologies, in turn, can modify societies (Wernaart, 2021, p. 14). Products and services based on algorithms, artificial intelligence, and robotics may severely impact public values. Cameras - whether in a smart doorbell, crowd control, or a scanning car - may affect the freedom to assemble, express one's opinion, and move freely without being tracked.

Since innovative city technologies can lead to objectionable and unwelcome effects, local governments have a responsibility to reflect on the societal impact and ethics of these technologies. Next to municipality officials creating 'moral smart cities' requires the active involvement of other parties (Wernaart, 2022). Therefore, this working paper outlines the theoretical foundations for developing the Moral Data City Hunt (MDCH): a research design that gathers the relevant stakeholders and perspectives necessary for reflecting on the potential impact of smart city technologies while providing these actors with accessible tools and scenarios to assist inclusive decision-making.

This paper aims to position the MDCH method within other 'design for research' methodologies and identify its novel methodological contributions. It argues that one of the MDCH's main contributions is its application of 'value friction' in social design and ethical research. The paper also states that gathering insights into the pluralistic values of citizens helps local governments govern smart ánd caring cities.

Although the Fontys University of Applied Science Moral Design Research group developed and deployed the method in 2022 (Veen, van & Wernaart, 2022; Wernaart et al., 2022), the interdisciplinary method based on empirical ethics, design fiction, linguistic analysis, and comparative social science had not previously been underpinned by scientific theory. In addition, the method itself is a design, but it has not yet been explained from that perspective.

The paper first addresses, in section 2, the MDCH's rationale and theoretical foundation. Section 3 of this article, 'Design for research', explains the design approach and describes the implementation and specifics of the MDCH.

2. Rationale and theoretical foundation

The rationale of the Moral Data City Hunt is that researchers traverse through the city to engage with as many citizens as possible by inviting them into a moral lab. This is an environment where the audience is shown what new technologies could mean for the future of a city, can interact with this vision, and decide on the moral implications of that future technology. By employing empirical ethics and conducting open interviews with language analyses, it is possible to identify the social friction inherent in the use of new technology. This valuable input enables policymakers and companies to develop a clear strategy for addressing this new technology. The Moral Data City Hunt is thus about future thinking, citizen engagement, and applying ethics to emerging smart technologies. This

section connects this rationale to existing literature and previous research of the research group Moral Design Strategy, and applies these insights to the research design of the MDCH.

2.1 Smart Cities Futures

Many local governments are aware of the transformative power of new technologies yet remain uncertain about how to respond to potential unforeseen effects (Veen & Visser-Knijff, 2022, p. 150; Yigitcanlar et al., 2021). New technologies often promise explicitly positive futures. These powerful and upbeat promises may obstruct critical reflections on the consequences of these scenarios (Lilley et al., 2004; Andersson, 2022). Additionally, thinking about the future can be somewhat tricky. People easily get caught in extreme future visions where one scenario "appears to be unthinkably bad, the other unimaginably good" (Candy, 2010, p. 1). Additionally, it appears to be challenging for many to consider the long-term future implications (Meadows et al., 1972).

The future is the domain of ideation and imagination (Candy & Kornet, 2019), and it is important to allow for various perspectives, not just two extreme visions. Imagining various possible futures provides space for dialogues on desirable futures. It creates room to talk about which worlds we do and do not want and opens up the moral conversation about the role of technology in society.

However, to access those potential futures, we need specific skills. Ahvenharju and colleagues (2018, 2021; Lalot et al., 2021) describe 'future consciousness' as "the human ability to understand, anticipate, prepare for, and embrace the future." Employing the concept of future consciousness helps us recognize the interconnections between technology and our surroundings. Future consciousness expands our imagination in time and space, enabling us to care for others. According to futurists, future consciousness skills are a prerequisite for good decision-making, which is important for the MDCH method (Masini, 1993; Polak & Boulding, 1973). Equally significant, awareness of future consequences can increase civic engagement (Bruderer Enzler, 2015; Strathman & Joireman, 2005).

2.2 The Moral Authority

Civic engagement in smart city decision-making is not self-evident. Van Veen and Visser-Knijff (2022) claim that the public debate about technology and its possible consequences is often vague and that only a handful of people are in a position to engage with it. Wernaart (2022) further questions this lack of inclusivity by introducing the concept of 'moral authority,' into 'Moral Design', which shares similarities with 'design justice.'

Users play a significant role in design and technology research. Users' perspectives are essential for creating products that prospective users will adopt. Additionally, user perspectives help counterbalance the influence of other stakeholders and groups in the development of technologies, such as scientists, engineers, politicians, and financiers (Wyatt, 2003, p. 69). However, not everyone who gets exposed to technology is a user. Wyatt (2003) introduces the non-user as an actor who, by choice or necessity, does not use a specific technology yet is still affected by it. Oftentimes, non-users belong to 'the moral authority.' They are actors who experience the effects of a particular technology firsthand (Millar et al., 2017; Wernaart, 2022). The notion of 'moral authority' aligns with the 'design justice' concept. According to Carl DiSalvo (2022, p. 4), "design justice privileges those who are most affected by the products of design" instead of "placing the agency of invention and action in the hands of designers." In line with these ideas, Wernaart (2022)

argues that 'the moral authority' should be invited to the design table. Following this claim, the MDCH aims to assist design and designers in bringing the views and experiences of the moral authority to the forefront.

2.3 Value Friction & Empirical Ethics

In their decision-making, humans switch between various ethical frameworks, and groups of humans may carry different sets of key values (Aliman & Kester, 2019). Importantly, cities are pluralistic societies; their inhabitants hold diverse opinions based on various lifestyles and differing values. In democracies, not only do the views of the majority count, but also the voices of minorities and marginalised groups. Smart city technologies are increasingly utilising AI and automated systems. It is difficult for automated systems to account for complexity. These systems are often programmed to make choices based on consequentialist ethical structure and specific sets of values. AI can also learn from data, find patterns, and develop "new rules"; yet, this is based on the rules it was programmed with. Unlike humans, who can abstract and apply concepts to unfamiliar data, AI strictly follows its programmed rules, potentially leading to harmful outcomes (Aliman & Kester, 2019; Gros et al., 2025)

For effective governance, designing AI and smart technologies that focus on human morality is essential, ensuring they can adapt to societal values and mitigate risks (Heijnen et al., 2024). Aliman and Kester (2019) address this problem with their work on 'augmented utilitarianism' (AU) and argue that AI systems should reflect society's pluralistic values in decision-making. Although AI systems are currently incapable of such complex decision-making, Aliman and Kester created AU as a framework for future responsible AI. AU adds several ethical frameworks and scientific findings from psychology and other fields to augment consequentialist programming. Ideally, when applied in heuristic models, AU enables researchers to adjust parameters and experiment with various outcomes in ethical decision-making. By doing this, researchers can identify different ethical boundaries for various sets of parameters. These boundaries can then be applied to develop the AU framework further.

Inspired by AU, the MDCH includes multiple perspectives and value sets to locate crucial ethical boundaries in society and do justice to its diverse voices. The MDCH starts by presenting citizens participating in a MDCH session with a specific future scenario. Next, the participants can change certain parameters connected to different values in the scenario to influence the scenario outcomes. By doing this, researchers can map conflicts between the preferred values of various participants. We call these conflicts between the participants' preferred values 'value friction'. It is a central notion in the MDCH because it reflects citizens' potentially conflicting views and interests. This focus on 'value friction' aligns with AU's aim for ethical boundaries. By targeting value friction, the MDCH contrasts with design approaches such as Value Sensitive Design and Design for Social Impact, which take key universal values as a starting point.

By mapping friction, the MDCH gathers insights into pluralistic values in society that help designers, developers, and policymakers make decisions in smart city projects. This way, the MDCH provides a techno-social feedback loop that collects a variety of viewpoints, enabling designers to utilise these viewpoints at various stages of the innovation process. The feedback loop also helps to facilitate the urban transition from citizens' often limited understandings and abstract perceptions of emerging technologies to a collaborative process of co-design and inclusive discussions.

3. Moral Data City Hunt - Design for Research

The Moral Smart City project aims to develop a strategy for continuous citizen

engagement in decision-making about emerging technologies in the city, using the Moral Data City Hunt (MDCH) method (Veen, van & Wernaart, 2022; Wernaart & Arets, 2024; Wernaart et al., 2025; Arets et al., 2025), developed by the research group Moral Design Strategy. It combines empirical ethics, design fiction, linguistic analysis, and comparative social science to study the 'moral design of emerging technology at the same time. Based on previous interdisciplinary literature, the Moral Smart City project aims to intertwine the research design of the MDCH with concepts such as Future Consciousness, Moral Authority, and Value Friction. This research project was launched in May 2025. Here, we outline its research aims and methodology.

The Moral Data City Hunt (MDCH) method was developed hands-on based on insights from the applied research experiences of the Moral Design Strategy research group at Fontys University of Applied Science (Wernaart et al., 2022; Veen, van & Wernaart, 2022) to address key aspects that are often overlooked in other ethical research approaches. The study's structured research design reflects the methodological foundation, shown in Figure 1 - Overview of the Moral Data City Hunt.

Using a Moral Lab, an online or offline environment where the audience can experience a future that shows what new technologies could mean, helps participants stretch their Moral imagination. The MDCH method is inspired by the four stages of individual ethical decision-making of Rest (1986), which are noted in five pink text bars:

- Recognising the moral issue by using a [Bottom-up approach] (see Figure 1),
- Making a moral judgment based on [Agreement and friction] and with the help of [stretching moral imagination],
- Establishing moral intent based on a [heterogeneous group of citizens], and
- Moral acting uses society's value frictions on [techno-ethics in politics] or policymaking.

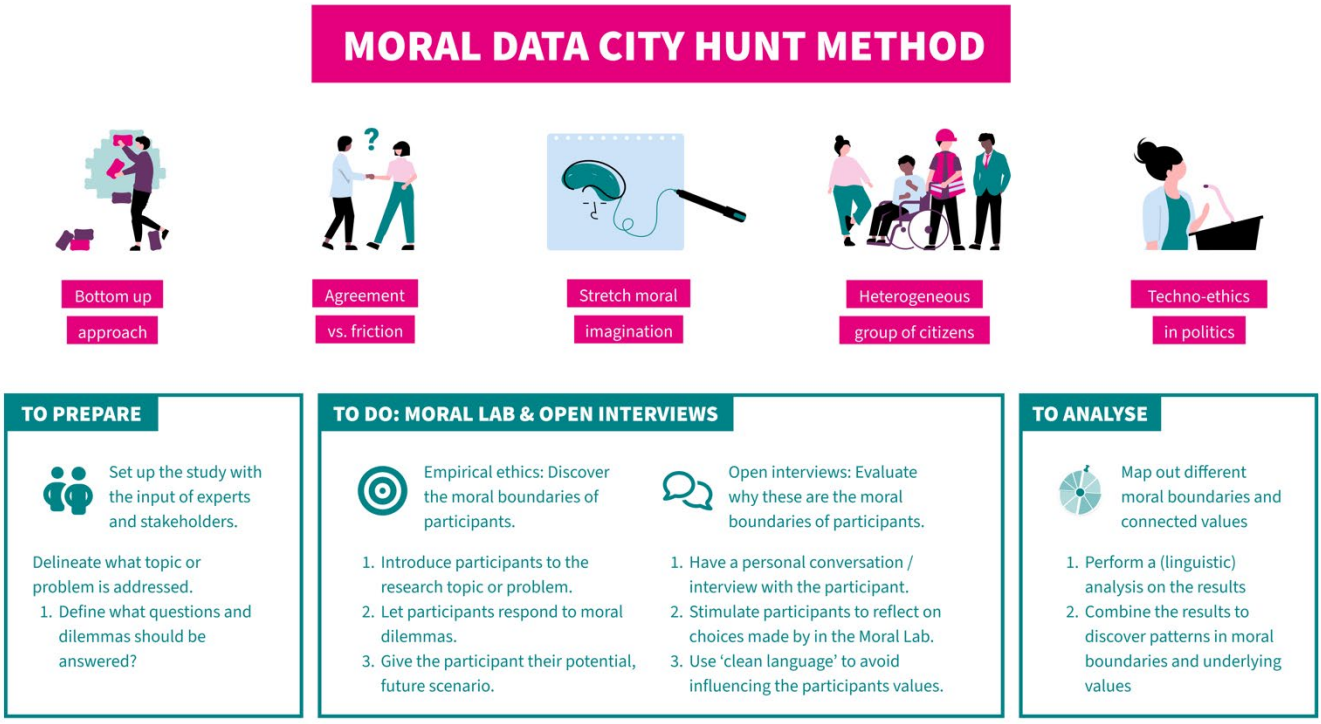

Figure 1. Overview of the Moral Data City Hunt Method. Image: Anika Kok (2024).

The process begins by preparing the research [To Prepare] shown in Figure 1, which involves clarifying the problem and formulating key research questions.

In conducting the research, the box [To Do: Moral Lab & Open interviews] empirical ethics will be done by introducing participants to the research problem, letting them engage with ethical dilemmas, and exploring potential future scenarios based on their choices. In the second part of this box, research participants will reflect on their decisions in personal interviews guided by neutral language to minimise bias. These open interviews will complement research insights on moral decision-making.

Finally, the research data will be analysed [To Analyse] by linguistic analysis of the collected data. A map will be conducted showing the moral boundaries and values, recurring patterns, and ethical considerations across participants. This structured yet flexible approach increases the chances for the MDCH to effectively capture diverse perspectives, foster ethical reflection, and contribute to broader discourses on techno-ethics in society.

3.1 To Prepare the MDCH: case selection and moral dilemma definition

The Moral Data City Hunt starts by preparing research on a particular smart technology within the city. The municipality will choose this technology based on their own needs or understandings, for instance, questions from citizens, an Emerging Issues Analysis (Dator, 2018), a request from the city council, an innovation trajectory, or any other possible origin. The technology can be a new emerging smart technology, such as drone technology. However, it could also be a new application of an already existing technology in the city, such as facial recognition in cameras used in public spaces. If the technology has been chosen, it must get a context within the city, determine how the future might look, and how this technology would probably affect the city's inhabitants.

In the preparation phase of the MDCH method, a hybrid framework for design and futures research, Ethnographic Experiential Futures (EXF), developed by Candy and Kornet (2019), will be used. It is designed for working with individuals or communities and helps examine ‘existing’ or generate 'new’ images of the future. The EXF also helps to make these images more accessible, legible, and discussable via tangible, performative, or other mediation strategies.

The EXF uses four steps for future action research; see Figure 3, The EXF cycle of Kornet and Candy (2019).

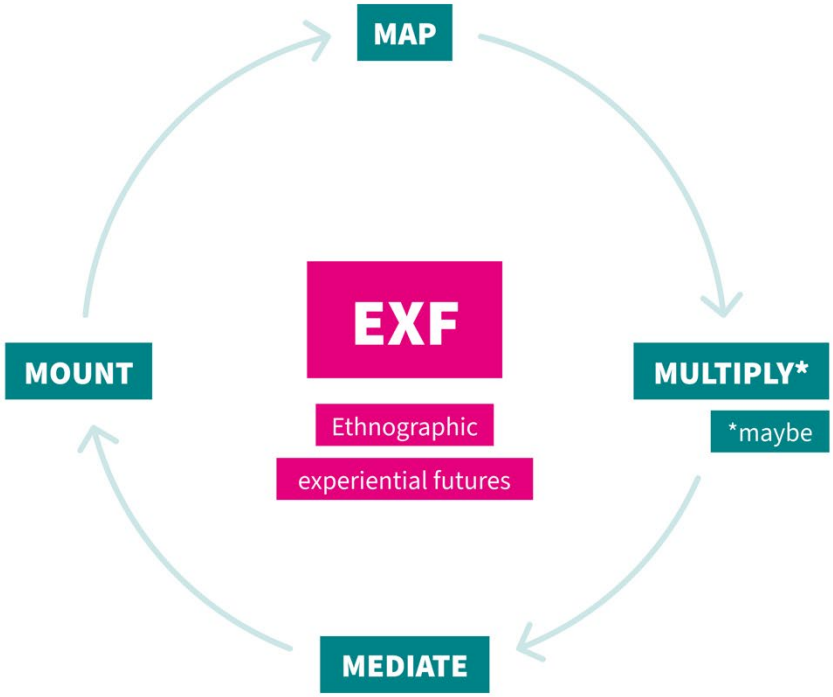

Figure 2. The EXF Cycle, by Kornet and Candy (2019). Image: Anika Kok (2025)

In the MDCH, case selection begins with the first step of EXF [Map] (see Figure 2), which explores the technology, its developments, and the possible influence on the city. The case selection will be based on the existing images and anticipatory assumptions of technological experts and the experts around this technology within the municipality. These individuals will likely be asked for advice when implementing this technology within the city. The aim is to describe the probable future of this technology in the city and explore the opportunities and threats these experts recognise, as well as the moral choices behind these opportunities and threats. This probable future can be perceived as the future that might seem most probable for all stakeholders: citizens, city officials, and various organizations working there. The delivery of this step is a text of the case: the probable future of a particular smart technology and its three most important moral dilemmas.

In the next step [Multiply], the previous assumptions and images will be reframed with alternative futures; in the MDCH, eight different possible perspectives on the future of this smart technology in the city will be created based on two possible choices for each dilemma. See Figure 3.

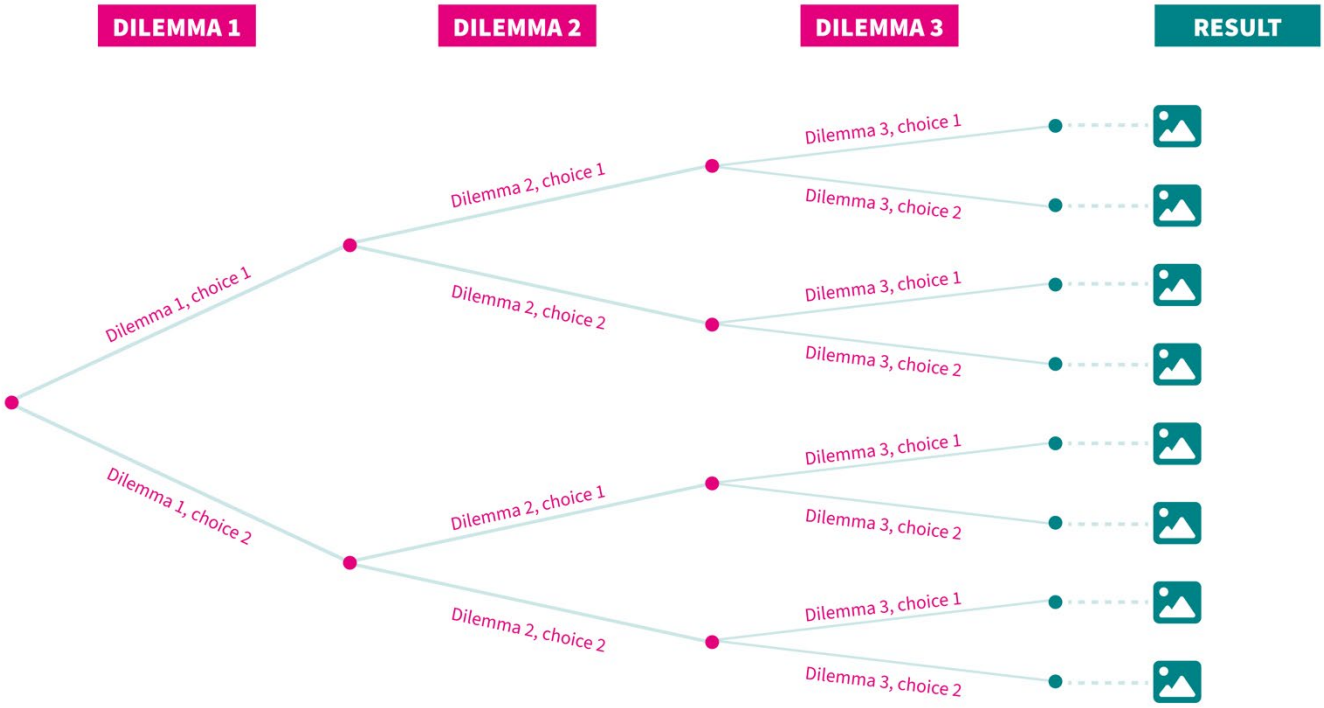

Figure 3. Overview of all the futures needed to create three dilemmas with two possible outcomes. Image: Anika Kok (2025)

In the step [Mediate] in Figure 2, future ideas are translated into experiences: tangible, immersive, visual, or interactive representations. The MDCH case, the probable future, and the moral dilemmas are prepared to make them understandable to a large audience via design fiction. In the research phase of the MDCH, participants will be shown their 'preferred' future based on their moral decisions. All the possibilities of this morally preferred future must be prepared; see Figure 3.

In the research phase [Mount] (Figure 2), empirical ethics will be conducted by introducing participants to the case and the probable future of a particular smart technology. This will allow them to engage with ethical dilemmas and explore their potential future scenarios based on their choices. In personal interviews, the participants will reflect on their presented 'desired' future and Moral Lab decisions.

Then, the circle will be closed by returning to [Map], recording and analysing the responses to create a new vision of the future.

3.2 To Do – inside the moral lab: empirical ethics

During the experiment, participants use an application designed specifically for this study. This application includes a page for informed consent, demographic questions, and the previously discussed ethical dilemmas. Each dilemma is presented using a visual representation of a possible future scenario. The depicted future dynamically adapts based on the participants' choices, allowing them to observe the implications of their decisions in real-time. This interactive feature enables participants to reflect on and potentially revise their choices if the future does not align with their expectations or preferences.

Figure 4 presents the application's current design iteration. Further development and refinement will shape the final design of the first functional version.

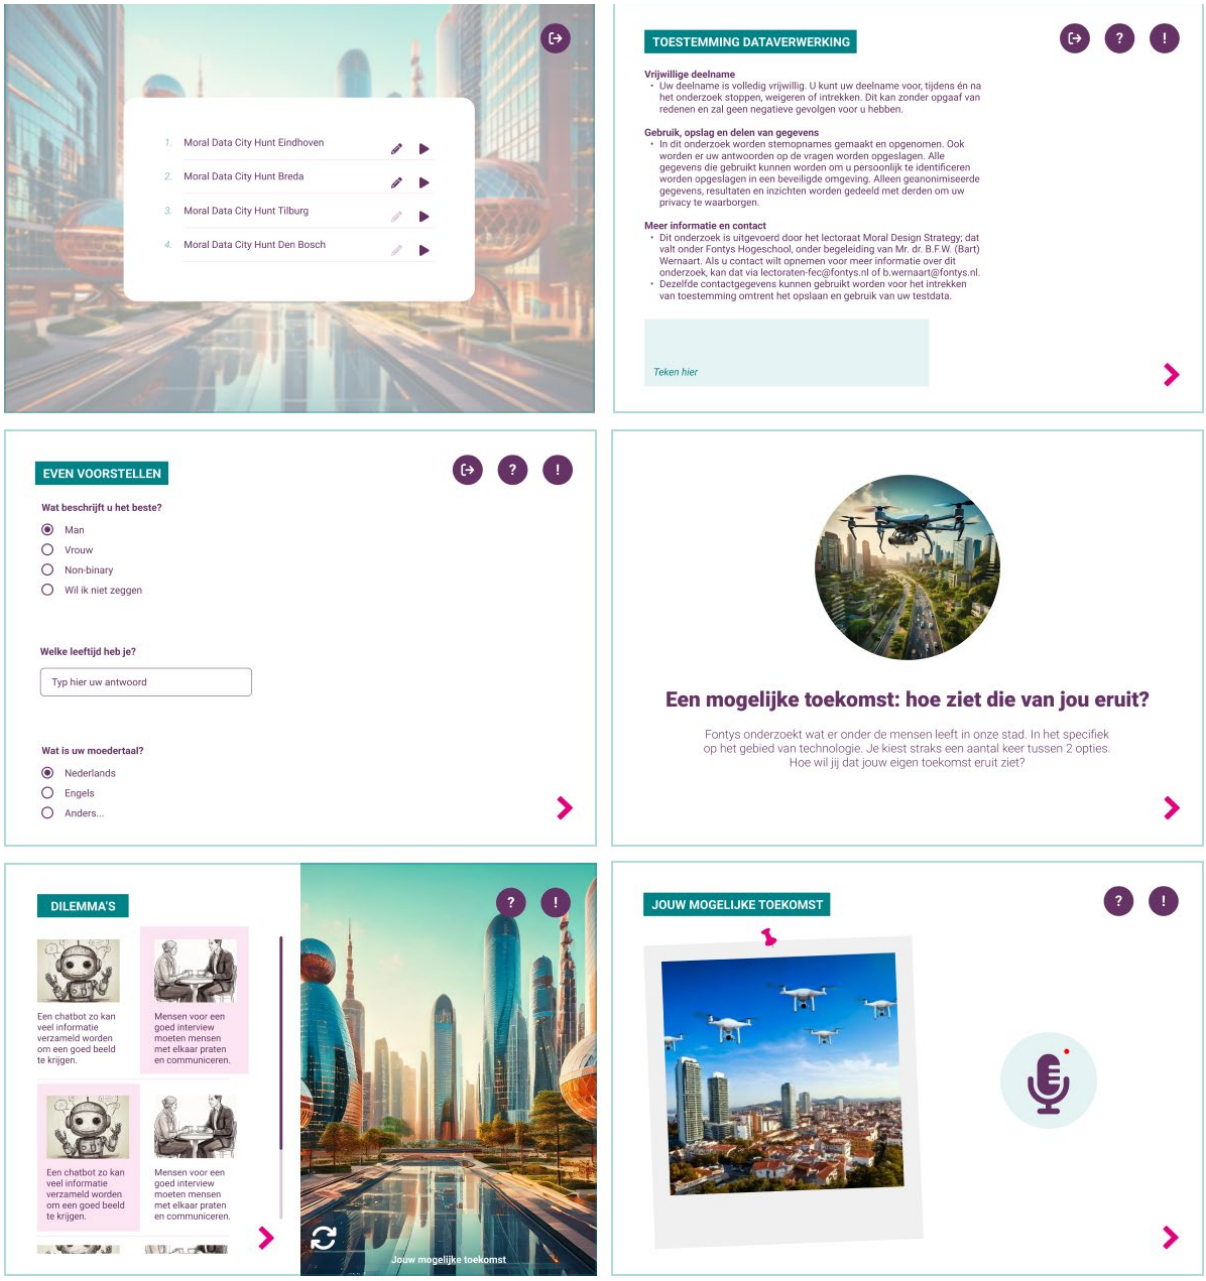

Figure 4. Design iteration of the research - application of the MDCH. Image: Anika Kok (2024).

Open interviews will complement research insights on moral decision-making. Participants will reflect on their Moral Lab decisions in personal interviews, guided by neutral language to minimise bias. After participants reflect on moral dilemmas and shape a visual representation of their preferred future, a short interview will be facilitated to explore their perspectives.

3.3 To Analyse - Mapping Value Frictions

The interviews combine a survey with linguistic analysis. Both methods have limitations: Surveys or focus groups often fail to capture individuals' nuanced gut feelings, while linguistic data mining can lack real-world context. The MDCH approach combines personal engagement with linguistic analysis to understand better which values drive the participants' perceptions.

The linguistic data analysis is rooted in Schwartz's Value Theory, a widely recognised framework for exploring personal values and their interconnections (Schwartz, 2012). Research demonstrates that people's words in natural conversations often reveal their

underlying values more effectively than direct self-reporting (Boyd et al., 2015). The Personal Value Dictionary (Ponizovskiy et al., 2020), a validated tool linking language to Schwartz's value framework, explores these insights. Combining personal engagement with language analysis gives insights into how participants envision their future and why they desire it.

4. Conclusion, discussion, and next steps

This analysis positions the MDCH method within 'design for research' methodologies. While not exhaustive, it provides a foundation for understanding its core objectives and relation to existing approaches. The MDCH adds the concept of 'value friction' to the social design practice and ethics research. This value friction will be mapped in an overview of the many different visions, opinions, discourses, and underlying values about moral and technological issues of a city's inhabitants.

The Moral Data City Hunt pilot project will launch in five Dutch municipalities in May 2025. After the pilot research, the design will be adapted to new insights. A second research round will take place in 2026. At the end of the Raak project Moral Smart City, the aim is to design a techno-moral decision-making framework for decentralized authorities; the findings of the MDCH method will be connected to different stakeholders in the Smart Cities trajectory to construct a consistent and scientifically solidly anchored whole.

To properly understand, analyse, and apply the concept of value friction in designing a smart city, the Moral Smart City Project continues its research. In the design research, the project group will investigate methods for conducting surveys with as many people as possible in the city. Parts of the Moral Data City Hunt need more scientific substantiation, starting with the value dictionary as a data-analysing tool. More research will also be done on interviewing participants as openly as possible. Finally, researching the continuous feedback loop in the MDCH is also of interest.

By employing speculative design, empirical ethics and conducting open interviews with language analysis, it is possible to identify the value friction inherent in the use of new technology. By mapping friction, the MDCH gathers insights into pluralistic values in society. The feedback loop helps facilitate the urban transition from citizens' often limited understandings and abstract perceptions of emerging technologies to a collaborative process of co-design and inclusive discussions. Friction helps develop design principles that are not the result of a compromise but rather something better. This valuable input enables policymakers and companies to develop a clear strategy for addressing this new technology.

This project focuses on 'the transformation of the future' by helping governments collect insights to create cities that are not only smart but also caring. With the rapid spread of AI and the likely imminent introduction of Generative AI in all fields, the urgency of designing from human morality and the fundamental principles of a democratic rule of law only increases.

About the Authors:

Linda Hofman is a PhD Candidate and future researcher at Moral Design Strategy at Fontys University of Applied Science and the Institute for Logic, Language and Computing at the University of Amsterdam. Her "Moral Smart City" research aims to develop a techno-moral urban compass for inclusive, sustainable decision-making.

Anika Kok is a user experience designer and researcher at Moral Design Strategy of Fontys University of Applied Science. She has ICT & Media Design (BSc) and Industrial Design (MSc) degrees. She combines research, strategy, and design to create innovative and sustainable user experiences.

Afra Willems is a researcher at the Ethics & Technology research group at Saxion University of Applied Sciences. She received a degree in fine arts (MFA) and philosophy (MSc). Her research interests revolve around ethics and aesthetics in the arts and design.

Marieke van Vliet, who has a PhD in Neuroscience and is an IT Business Analyst, is part of the Moral Design Strategy research group at Fontys University of Applied Science and founder of Brain Palace. She is interested in how technology can contribute to enriching the experiences of human life.

Bart Wernaart (PhD) Professor Moral Design Strategy & Leading Lector COE Sustainable and Circular Transitions at Fontys University of Applied Sciences. Head of Research, Fontys Business and Communication. Conductor, drums, vibraphone.

Acknowledgements: We thank Dr. Sebastian De Haro's constructive feedback and Mendy Franken for her support during this project. We would like to acknowledge all members of the Fontys research group, Moral Design Strategy, who have contributed to the methodology since 2022. We would also like to thank all the municipalities, knowledge partners, students, and other stakeholders of the Moral Smart City and MDCH participants so far.

Funding: This publication is an outcome of the Moral Smart City; Towards an inclusive strategy for techno-moral decision-making in decentralised authorities, project number RAAK.PRO05.013, which is

funded by the Dutch Research Council (NWO).

ABSTRACT | In response to the climate crisis, governments are under increasing pressure to drive transformation across all sectors, from services to policies. This study examines the increasing influence of "design for policy" as a novel approach to policymaking. The aim is to explore how design can meaningfully contribute to climate policy innovation by proposing a structured analytical framework that positions design thinking within this critical policy domain. An integrative literature review is conducted to analyse climate policy through three key dimensions: goals, challenges and processes, adopting the heuristic developed by Kimbell et al. (2023). Three main insights emerge. First, as climate policy goals are often complex and contested, design should be able to negotiate trade-offs, integrate mitigation and adaptation strategies, and support the mainstreaming of climate action in other policy domains. Second, climate policy faces multi-level challenges in terms of spatial, temporal, and institutional differences among the actors involved. Design should facilitate coordination, stakeholder engagement, and the redefinition of roles and responsibilities. Third, the climate policy process requires balancing scientific legitimacy with political feasibility, navigating a shifting political agenda and expanding current measurement indicators. Design should support the rethinking of climate policymaking towards long-term, institutionalised processes of knowledge co-creation; adopt a systems-oriented perspective; and introduce alternative, human-centred indicators. While limited by its theoretical scope, this study offers a practical framework for collaboration between researchers and practitioners working at the intersection of design and climate policy.

KEYWORDS | PUBLIC SECTOR INNOVATION; POLICYMAKING; SUSTAINABILITY TRANSITIONS

1. Design in the climate crisis

On a warming planet, environmental changes are expected to impact socio-economic systems, leading to less favourable conditions for human development and prosperity (Rockström et al., 2009). Vulnerable populations, who have contributed the least to the current climate crisis, are likely to suffer the most and require enormous adaptation efforts, which they often lack the resources and capacity to undertake (Bosello et al., 2009). Governments around the world will need to find strategies to mitigate climate change while adapting to extreme weather events, mass migration and unprecedented environmental conditions (Khan and Roberts, 2013). Although adaptation and mitigation measures have become core elements of public policy and financial resources have been mobilised - see, among others, the European Commission's policy and research programmes such as the European Green Deal and Horizon Europe - the pace of climate policy innovation at all levels of governance appears inadequate when compared to the latest scientific projections of future climate impacts (Jordan and Huitema, 2014). The nexus of climate change, policy and innovation gives new meaning to the recent expansion of design-oriented approaches into the public sector as forces capable of disrupting and innovating traditional administrative structures, processes and policies (Blomkamp, 2018). Governments are not new to applying design principles to public sector services, especially regarding new ways to develop participatory practices and public services co-production (Sanders and Stappers, 2008). In the context of public sector innovation, a variety of design approaches—such as design thinking, service design, and user experience design—are being promoted as a promising development for several reasons. First, design is said to foster creativity and develop the innovation skills of public officials at different levels of government, from national to local. Second, it has been argued that design can integrate insights from different expertise, sources and actors, cutting across the notoriously siloed structures of public bodies and increasing the chances of successful service implementation (Hermus et al., 2020). It is only since the late 1990s, however, that design thinking gained significant attention for policy making (McGann et al., 2018). More recently, the application of design thinking in this public policy developed into a distinct body of literature under the umbrella concept of 'design for policy', coined by Bason (2014), which refers to the adoption of a design approach by policymakers to solve complex policy challenges (e.g. climate change). The initial exploration of design for policy points to three key contributions. First, it offers rich, user-centred research methods that help to uncover the root causes and systemic nature of policy issues (e.g. climate change). Second, it enables collaboration by facilitating co-creation among diverse stakeholders within the policy cycle through visual tools and creative processes (e.g. visual artefacts). Third, it makes policy tangible by designing concepts, services, and experiences that enhance usability, engagement and emotional connection (e.g. prototypes). The recent proliferation of Public Sector Innovation Spaces (PSIs) has accelerated the interest in and spread of design for policy, with some authors suggesting that the PSIs and their toolkits are on their way to becoming a pervasive part of the social infrastructure of modern public organisations (Carstensen and Bason, 2012). However, some authors have questioned whether design thinking can meet the challenges faced by policymakers, whose sectoral knowledge in a specific field of intervention is intertwined with a deep understanding of the politics of policy making. This research aims to explore the potential contributions of design for climate policy by providing a structured analytical framework that situates design for policy characteristics within such a critical and highly political policy domain.

According to Kimbell et al. (2023), the initial conceptualization of design for policy, based on traits like human-centeredness, creativity, anticipation, visualisation, and prototyping, arguably overstates design's uniqueness compared to other disciplines that foster

innovation or integrate lived experience into policy (e.g. sociology, anthropology, future studies). Furthermore, critics highlight design's naivety in addressing politically contentious decisions, scalability, governance models and policy mixes (Clarke & Craft, 2019). While design for policy emphasizes innovation, it tends to neglect how policy processes handle barriers like political feasibility and decision-making, making it less adaptive to address the conflictual nature of democratic instances (Howlett, 2020). This is further discussed by Villa Alvarez et al. (2022), whose research examines the design activities of PSI spaces and maps them to the policy making phases and stages defined by Howlett (2009). Their findings indicate that design is less present in the decision-making stage and in stages where formal decisions are made, such as: getting an issue on the formal agenda, consolidating a policy, legal-administrative processes, and policy feedback and termination. This may be because these stages are inherently political, conflictual and involve decisions made primarily by authorised decision-makers (e.g. elected representatives empowered to make binding public decisions). Unlike the initial traits that marked the concept of design for policy, its characteristics appear to be multifaceted, depending on how and where it is applied, by whom, and its implications for policy making. Kimbell et al. (2023) proposed a heuristic model to make sense of this complexity. The authors distinguished three propositions: the first relates to design as a "tool for policy making", where it supports the achievement of predefined policy goals; the second refers to design as a "practice of improvising within policy making", where it fosters adaptability and openness in response to unfolding policy challenges; the final proposition frames design as "regenerating policy making", where it enables a fundamental re-envisioning of policy making process itself. When applied to climate policy, these different propositions of design for policy take on a critical perspective. The scale and urgency of the climate crisis demand bold action, yet governments frequently exhibit risk aversion, opting for procedural strategies that mitigate political fallout rather than addressing the root causes of climate change (Howlett, 2014a). Design professionals and researchers who wish to contribute to realising the full potential of design in the context of climate policy should consider the characteristics of such a critical endeavour. To this end, the research applies Kimbell et al.'s heuristic to analyse climate policy through three dimensions: goals—linked to the first proposition, design as a tool for policymaking; challenges—corresponding to the second proposition, design as a practice of improvisation in policymaking; and processes—reflecting the third proposition, design as regenerating policymaking. In this regard, three research questions are derived to guide the analysis as illustrated in Figure 1.

Design for policy characteristics	Purpose of design	Example	Design outcome on public policy	Design for climate policy - Research questions
Design as a tool for policy making	to support achieving specified goals of policy making	Design toolkit	Supporting to solve specific **goals**	What are the **goals** of climate policy?
Design as a practice of improvising within policy-making	to enable policy-making to be more open in the face of unfolding events and experiences	Living labs	Enable policy making to tackle unfolding **challenges**	What are the main **challenges** of climate policy?
Design regenerating policymaking	to facilitate the re-envisioning of policy making	Creative futuring	Re-envisioning the **process** of policymaking	What defines the **process** of climate policy making?

Figure 1. The proposed analytical research framework, adapted by Kimbell et al. (2023)

This study provides a concrete analytical grounding that can inform future contributions within the broader field of design for policy, as well as among design practitioners seeking to address the climate crisis. First, the three focal areas—goals, challenges, and process—are investigated through an integrative literature review (Lubbe et al., 2020). Second, the findings are discussed considering Kimbell et al.'s heuristic model. Finally, the paper outlines key implications for design theory and practice.

2. Methodology

The production of literature on climate policy has proliferated in recent years (Boasson and Tatham, 2023). While this has advanced research across disciplines, it has also introduced significant complexity, particularly in identifying the key challenges of climate policy and climate policymaking. Given the aim of this study, which is to explore the potential contributions of design for policy by providing a structured analytical framework that situates the characteristics of this developing discipline within the context of climate policy, an integrative literature review was conducted. Specifically, this research adopts the integrative review methodology outlined by Lubbe et al. (2020), which is particularly suited to synthesising different forms of knowledge and developing theory in emerging fields. The review triangulated evidence from academic literature, national and international policy reports, discussion papers, and institutional documentation. Data sources included peer-reviewed databases such as Google Scholar, Scopus, and Web of Science. The following search terms were used in various combinations to capture relevant content: "policy design", "climate policy challenges", "climate policy goals", "policy-making process", and "design for policy". Literature selection followed an iterative

screening process based on relevance to extract information useful for providing a clear picture of climate policy goals, challenges and the policy-making process. Particular attention is paid to refining the classification of these three aspects under review. As Bailey (1994) noted, the lack of clear classification inhibits advanced conceptualisation and reasoning, which may be one of the obstacles in attempting to define the potential contribution of design for policy to climate policy. Classification, defined as the process of grouping entities based on shared characteristics, relies on the careful identification of key dimensions or variables. A poorly defined classification framework risks compromising analytical clarity and leading to ambiguous definitions of the specific relationship between design and climate policy. With this framework in mind, the following sections explore how design intersects with climate policy goals, challenges, and processes.

3. Climate policy: goals, challenges, and process

3.1. A complex phenomenon: climate crisis

The latest report from the Copernicus Institute claims that 2024 saw unprecedented global temperatures, marking the second consecutive year of record-breaking events after the exceptional 2023 (Copernicus Climate Change Service, 2024). Notably, 2024 was also the first year in which average temperatures exceeded 1.5°C above pre-industrial levels, the threshold set by the Paris Agreement to significantly reduce the risks and impacts of climate change. It was marked by the breaking of several global records, for greenhouse gas levels, air, and sea surface temperatures. These conditions contributed to extreme weather events, including floods, heatwaves and wildfires. Human activity, primarily through the emission of greenhouse gases, has been identified as the primary cause of global warming and its devastating and dramatic impacts (Calvin et al., 2023). Reversing the current climate crisis will require far-reaching and unprecedented changes in all sectors of society. This is because climate change is a complex phenomenon that links natural and built ecosystems with biodiversity, human societies with diverse forms of knowledge and values, cultures with traditions, and ecosystem health with human well-being and sustainable development. Actors involved in implementing climate change adaptation and mitigation measures operate at different spatial and institutional scales and represent different sectoral interests, which adds to the multifaceted nature of climate change (Ryan, 2015). Recently in Europe, there has been a shift in public sensibility towards recent European Commission initiatives on ecological transitions, such as the European Green Deal, highlighting the problem of the social desirability of this transition (Fondazione Symbola, 2024). Given this recent turmoil, it is inescapable that social, economic and political factors must be considered when identifying, designing and implementing solutions against climate change. This is true not only for policy, but also for science: the Global Sustainable Development Report (United Nations, 2023) advocates a transformation driven by and within science, recognising that scientific progress on climate change should also foster social innovation, and calls for scientists, policy-makers and diverse societal actors to work together at the science-policy-society interface, translating knowledge into policy and policy into effective climate action. The hybrid nature of climate interventions—spanning science, society, and policy—creates significant challenges in formulating and implementing effective climate policies, and in the definition of their goals (Sabel and Victor, 2024).

3.2 Climate policy goals

Climate policy refers to sectoral or overarching policies that lead to lasting reductions in emissions and adaptation to extreme environmental conditions because of rising global temperatures (Nascimento et al., 2022). Since it first emerged as a critical issue for global policymakers, climate policy has been largely synonymous with energy policy, mainly in terms of mitigation efforts and less so in terms of adaptation, as energy supply is dominated by fossil fuels, the main source of anthropogenic greenhouse gas emissions (Klein et al., 2005). It is only recently that climate policy has received significant attention in its two main components: mitigation and adaptation. It is noteworthy that these two components may exhibit a range of interactions, including competition, reinforcement, or even the overcoming of one by the other (Klein et al., 2007). Climate change mitigation is designed to minimise the extent of climate change and refer to anthropogenic intervention to reduce the sources or enhance the sinks of greenhouse gases (IPCC, 2001). Whereas climate change adaptation is intended to minimise risks and seize upon new opportunities. It refers to adjustment in natural or human systems in response to actual or expected climatic stimuli or their effects, which moderates harm or exploits beneficial opportunities (IPCC, 2001). The first two key goals of climate policy are therefore to control greenhouse gas concentrations in the atmosphere - the focus of mitigation measures - and to prepare for and reduce the adverse impacts of climate change while taking advantage of opportunities - the focus of adaptation interventions. Climate policy however should not only be concerned with the design of adaptative and mitigative interventions. A primary concern should also be to address development and equity issues, as policy implementation is intrinsically linked to socio-economic development (Fondazione Symbola, 2024). Failing to acknowledge this societal dimension might further decrease the chance to diffuse innovative approaches to tackle climate change (United Nations, New York, 2023). Finally, despite the centrality of mitigation and adaptation in the definition of climate policy itself, some authors have argued whether finding the perfect balance or mix of both measures should be the primary objective of climate policy. According to Klein et al. (2005), rather than directly implementing mitigation and adaptation measures, climate policy should facilitate their integration into sectoral policies (e.g., transport, trade, and energy). This perspective aligns with the broader recognition that climate policy cannot function in isolation (Tol, 2013). Instead, it must be an integral and complementary part of all relevant policies to ensure its relevance as climate conditions evolve and their consequences become more visible (Biesbroek et al., 2010). Lastly, the successful implementation of climate policy is closely linked to the extent to which governments can learn about mitigation and adaptation capacity at all levels of government and in all processes, and to create mechanisms and incentives for mainstreaming climate action (Tompkins and Adger, 2005; Berrang-Ford et al., 2014). If climate policy and sustainable development are to be achieved in an integrated manner, it is essential to explore the determinants of response capacity that shape policy options and their links to socio-economic and technological development pathways (Swart et al., 2003). The landscape of climate goals appears complex and multifaceted. Figure 2 summarises the five key goals derived from the literature review.

Climate Policy Goals	Description	Literature
Control atmospheric greenhouse gas concentrations.	Focus of mitigation; aims to reduce sources or enhance sinks of greenhouse gases.	IPCC (2001); Klein et al. (2005); Nascimento et al. (2022)
Prepare for and reduce adverse climate change impacts, and exploit emerging opportunities.	Focus of adaptation; adjusting systems in response to climatic stimuli to reduce harm or exploit benefits.	IPCC (2001); Klein et al. (2007); Nascimento et al. (2022)
Address development and equity issues.	Recognizes socio-economic factors as key to climate policy success and innovation diffusion.	United Nations, New York (2023); Fondazione Symbola (2024)
Facilitate development and implementation of mitigation and adaptation within sectoral policies.	Encourages integration into broader policy areas like transport, energy, and trade.	Klein et al. (2005); Biesbroek et al. (2010); Tol (2013)
Create mechanisms and incentives for mainstreaming climate action (responsive capacity building).	Emphasizes learning, capacity building, and policy integration at all levels of governance.	Swart et al. (2003); Tompkins and Adger (2005); Berrang-Ford et al., 2014;

Figure 2. Climate policy goals landscape

3.2 Climate policy challenges

Among the many challenges posed by climate policy, Berrang-Ford et al. (2014) identify good governance as a critical and central condition for enabling climate-resilient development through individual and collective action. This aspect emphasizes the necessity of coordinated efforts between governments, civil society, and the private sector to implement greenhouse gas mitigation and adaptation measures supporting sustainable development. However, coordination does not come effortlessly. Mitigation and adaptation operate at different scales—mitigation falls under international policies and is analysed through macroeconomic models, while adaptation takes the form of local, project-based activities with site-specific relevance, embedding a microeconomic perspective (Bosello et al., 2010). In addition, the identification of the actors involved or to-be-involved and their responsibilities remains ambiguous for both mitigation and adaptation. Klein et al. (2005) note that mitigation primarily involves the energy and transportation sectors in industrialized countries, as well as the energy and forestry sectors in developing nations, with the agriculture industry also playing a major role. These sectors are closely linked to national planning and policy making. Adaptation, on the other hand, encompasses a wider range of sectoral interests, including tourism, health, water supply, coastal management, urban planning and nature conservation, with decisions being taken from the micro level - such as by individual farmers - to the macro level - for example by national agencies. The characterisation of stakeholders engaged in climate policy can be approached through various lenses, including their organisational structure (e.g. public or private or a mixed combination), the level of decision-making involved (e.g. political, strategic planning or more operational implementation), the spatial scale (e.g. local, national, international or supranational), the time span of interest

(e.g. short to long term - particularly in the difference between mitigation and adaptation), and their function within a network (e.g. single actor, stakeholder regime or multi-actor constellations) (Klein et al., 2007). Differing perceptions of responsibility between actor groups and between different levels of governance further limit the implementation of effective responses to climate change adaptation (Mees et al., 2017; Ulibarri et al., 2022). For instance, although inclusive governance is regarded as a key condition for facilitating climate-resilient development, Petzold et al. (2023) study revealed that individuals and households—who implement nearly 64% of adaptation measures—are the least involved in co-designing responses with other actors (private sector, governments at various levels, academia, and civil society). This is a key concern, as the study by Biesbroek et al. (2010) and Mees et al. (2012) also emphasises that climate policy implementation cannot take place in isolation, but requires the coordinated efforts of public and private actors at all levels of government, making it a multi-level governance challenge. Finally, a persistent obstacle to adaptation and mitigation, despite the growing attention to climate change in policy and science, is the widespread lack of understanding of the climate problem and its potential impacts on daily life among the multitude of actors that characterise climate change issues (Lorenzoni and Pidgeon, 2006; Lorenzoni et al., 2007; Baiardi, 2022). Figure 3 synthesizes the four main challenges that emerged from the literature review.

Climate Policy Challenges	Description	Literature
Mitigation and adaptation measures can be mutually reinforcing or detrimental to each other.	Mitigation is global, long-term, and macroeconomic; adaptation is local, short-term, and microeconomic. Resource scarcity can cause friction between the two.	Klein et al. (2005); Klein et al. (2007); Bosello et al. (2010); IPCC (2023)
Actors involved operate at different spatial, temporal, and institutional scales with unclear roles and responsibilities.	Different sectors and governance levels are involved, with conflicting perceptions of responsibility and ambiguous mandates.	Klein et al. (2005); Klein et al. (2007); Mees et al. (2017); Ulibarri et al. (2022)
Implementation requires coordinated, multi-level governance.	Effective climate policy requires collaboration across public and private sectors and all levels of governance.	Berrang-Ford et al. (2014); Biesbroek et al. (2010); Mees et al. (2012); Petzold et al. (2023)
Lack of understanding of climate change and its impacts among diverse stakeholders.	Despite increased attention, many actors lack awareness of the relevance of climate change to their daily lives, which limits their engagement and commitment.	Lorenzoni and Pidgeon (2006); Lorenzoni et al. (2007); Baiardi (2022)

Figure 3. Climate policy challenges landscape

3.3 Climate policy process

Climate adaptation and mitigation strategies must be grounded in robust scientific evidence to be effective in addressing the climate crisis. The process of designing climate policy requires a careful translation of scientific data into actionable insights for policymakers. This translation process, in turn, depends on strong coordination and collaboration across scientific, policy, and societal actors. The latest IPCC report has

identified appropriate decision-making, coordination processes and structures as enabling conditions for responding to climate change effectively (IPCC, 2022). Furthermore, the systemic, long-term and cross-border nature of the climate crisis requires the flexibility to leverage multiple models of decision-making across different contexts and time. Integrated, agile, evidence-based and collaborative policy action is seen as a key attribute to increase political buy-in, avoid inertia and policy stagnation, and balance short- and long-term goals and needs (Kaur, M. et al., 2023). The nature of adaptation and mitigation decisions changes over time as climate might change in less unpredictable ways, also affecting the process of designing climate policy. For example, some decisions may have started with relatively simple measures, such as the adoption of low-cost supply and demand options in the energy sector, and evolved into complex intervention plans and strategies (see for instance the "Piano Clima" of the city of Rome in Italy, Comune di Roma, 2024). As previously discussed, the complex nature of climate change necessitates a thorough examination of climate science, systemic thinking, and multidisciplinary approaches. However, political actors might appear reluctant to implement policies that may lead to unpopular choices, which could potentially affect their chances of being re-elected. It has been observed that a significant discrepancy between the implications of climate science and the outcomes of climate policy can render current and planned policies inadequate in achieving the goals of the Paris Agreement (Meckling et al., 2015). The tension and struggle to produce practical outcomes for policymakers while maintaining legitimacy and scientific credibility further undermines the capacity of governments to address climate change (Niederberger, 2005; Sarewitz and Pielke, 2007). Translating scientific knowledge into a policy framework is not easy. The analysis conducted by Ryan and Bustos (2019) in Latin America highlighted how the fragmentation and lack of integration of the knowledge available on the different aspects of climate adaptation issues deeply affect their usability in policy processes. It appears that co-creation and collaborative modes of knowledge production in the field of climate adaptation do not tend to sustain over time. Climate change knowledge and co-production processes tend to be project based, fragmented, and linked to specific initiatives rather than to institutionalized long-term policy making or planning processes. Boundary organisations represent a key role in this regard, as they are specialised entities established to facilitate the dissemination of accessible scientific information in a more coherent manner (Gustafsson and Lidskog, 2018).

Jordan and Huitema (2014) adopt a more holistic approach to understanding the process of climate policy innovation, covering the source of new policy elements ('invention'), their wider entry into use ('diffusion'), and their projected and/ or real effects ('evaluation'). Invention of policies happen mainly through the activities of "policy entrepreneurs", who are politically relevant actors that are capable of overcoming process challenges such as shifting political agendas, political argumentation, capacity limitations, eventually finding new connections between politics and policy problems. Diffusion is defined as the process through which inventions circulate and potentially enter common use via learning, transfer, and adoption. Here, the primary issue is that information is poorly coordinated at the national and international level, with many different organisations contributing knowledge in an ad hoc fashion (Biesbroek et al., 2010). Finally, in the evaluation of new policies, a key challenge lies in defining the right metrics to assess their effectiveness. Traditional evaluations often focus on tangible outcomes, such as greenhouse gas emission reductions. However, this approach risks neglecting broader societal benefits that are equally important in assessing the overall impact of climate policies (Sudmant et al., 2024). In conclusion, five characteristics describing the climate policy-making process can be derived from the literature review and summarized in Figure 4.

Climate Policy Process' characteristics	Description	Literature
Duality of producing practical results while maintaining legitimacy and scientific credibility.	Tension between producing actionable policy and preserving scientific integrity; politicisation risks.	Niederberger (2005); Sarewitz and Pielke (2007); Meckling et al. (2015)
Lack of continuity in knowledge co-creation processes limits sustained policy-research relationships.	Knowledge creation tends to be fragmented and not embedded in long-term institutional frameworks.	Ryan and Bustos (2019); Gustafsson and Lidskog (2018)
Invention of new policies must navigate political dynamics and capacity limits.	Policy entrepreneurs must overcome agenda shifts, political resistance, and resource constraints.	Jordan and Huitema (2014)
Diffusion of climate information is poorly coordinated and often ad hoc .	Multiple actors produce and share knowledge in fragmented ways, limiting national-level coherence.	Biesbroek et al. (2010); Jordan and Huitema (2014)
Evaluation needs to go beyond GHG metrics to include societal impacts.	Effective evaluation must consider both environmental and social outcomes of climate policy.	Jordan and Huitema (2014); Sudmant et al. (2024)

Figure 4. Climate policy process landscape

4. Design for climate policy

In the public sector, policy and design activities are in constant dialogue. Public policy emerges from the efforts of governments to transform socio-technical systems. These systems are addressed either through direct intervention in the production, consumption and dismantling of products and services, or through indirect intervention in the internal processes of government that facilitate these creative processes. These efforts can be designed to a greater or lesser extent, and the goals and purposes sought to be achieved through such design are broad and varied (Howlett, 2014b). In design terms, policy defines the typologies of services and products, the relationships and interactions that are considered possible, encouraged or discouraged in each human system (Junginger, 2013). Therefore, in the context of the public sector, design is both the realisation and materialisation of policy as products and services and the formalisation of the policy-making process. Neither design nor policy can be considered in isolation. Design for policy is an emerging discipline that explores this intertwined relationship. Three distinct propositions of design for policy have been identified by Kimbell et al. (2023) to describe this relationship: design as a tool for policymaking; design as a practice of improvising within policymaking; and design regenerating policymaking. According to the authors, the outcome of the first proposition is to support the achievement of predefined policy goals; that of the second is to promote adaptability and openness in response to unfolding policy challenges; and finally, the outcome of the third proposition is to enable a fundamental rethinking of the policymaking process itself. These three outcome spaces, namely goals, challenges and process, were examined in the context of climate policy, as the aim of this study is to provide a concrete analytical basis to facilitate a better understanding of the contributions of design for policy to the climate crisis for both practitioners and researchers. Through an integrative literature review, each outcome space has been examined, and a set of characteristics has been identified.

4.1 Design as a tool for policymaking

The first proposition, 'Design as a tool for policy making', suggests that the contribution of design to policy is to support the achievement of specified policy goals and effective policy implementation (Kimbell et al., 2023). In this context, policy making is conceptualised as a distinct form of technical expertise operating within a defined worldview. The relationship between design and policy is characterised by the application of design to facilitate the generation and delivery of solutions to existing goals. For instance, in the study by Quilty et al. (2024), design is used as a powerful tool to deepen stakeholder understanding and stimulate new thinking in net zero projects at the district level. The authors developed a set of cards to be used in design ethnography workshops at Monash University in Victoria, Australia, as part of a project that combines design anthropology and transition management approaches to explore innovative pathways to net zero at the neighbourhood level. The result of the study shows how design artefacts might be a powerful tool for accelerating the implementation of existing climate policy goals, while also favouring a widespread understanding of climate change and its consequences. This example addresses one of the five climate policy goals that emerged from the integrative literature review: controlling atmospheric greenhouse gas concentrations. As illustrated in Figure 5, new research questions arise at the intersection between the initial proposition identified by Kimbell et al. (2023) and the climate policy goals identified. These involve defining strategies, interventions, products or services that could facilitate the creation of policies to effectively manage emissions, anticipate and respond to climate impacts, incorporate equity and development concerns, integrate adaptive and mitigative capacities into other policy domains, and establish mechanisms and incentives for the mainstreaming of climate action. Possible contributions of design to climate policy could include setting a shared vision of possible adaptive and mitigative futures for human and non-human actors; opening up climate policymaking to groups at risk of exclusion and marginalisation due to climate change; designing instruments and tools that integrate climate actions across policy domains; and embedding design techniques and methodologies to create engaging climate action capacity-building efforts at different government levels.

Kimbell's et al. (2023) proposition	Climate Policy Goals	Design for climate policy RQ	Expected contributions of "Design as a tool for climate policy making"
Design as a tool for policy making	Control atmospheric greenhouse gas concentrations.	How does design contribute to the definition of policies that can control atmospheric greenhouse gas concentrations?	*Set a shared vision and imagination on possible mitigative and adaptive futures for human and non-human actors.*
	Prepare for and reduce adverse climate change impacts, and the exploitation of emerging opportunities.	To what extent can design prepare for and mitigate the adverse effects of climate change and take advantage of the opportunities it offers through policy-making?	
	Address development and equity issues.	How could design address development and equity issues in climate policy?;	*Open up the field of climate policymaking to groups at risk of exclusion and marginalisation due to climate change.*
	Facilitate the development and implementation of specific mitigation and adaptation options as part of sectoral policies (e.g. transport, trade, energy, etc.).	How could design facilitate developing and implementing specific mitigation and adaptation options within sectoral policies (e.g. transport, trade, energy, etc.)?	*Design of instruments and tools to facilitate the integration of climate actions across other policy domains.*
	Create mechanisms and incentives for mainstreaming climate action across all governmental levels and processes (responsive capacity building).	How does design create mechanisms and incentives for the mainstreaming of climate change into all levels and processes of government (responsive capacity building)?	*Include design techniques and methodologies to create engaging and compelling climate action capacity-building efforts at different government levels.*

Figure 5. Design as a tool for climate policy's RQ and expected contributions

4.2 Design as a practice of improvising within policy making

The second proposition identified by Kimbell et al. (2023) describes 'design as a practice of improvisation within policy making'. In this context, design enables policy making to be more improvisational and experimental in the face of complexity and uncertainty. Policy making is understood as a responsive process in which policy must necessarily negotiate between different worldviews (e.g. different stakeholder interests). Design and policy interact here in such a way that design is used to modify and extend existing policy, based on engagement with lived experience and diverse positions and expertise, thereby bridging the gap between policy and implementation. In Salinas (2022), "world-building preferable futures through critical service design" are introduced as a participatory approach to local policy design. The context of application is the Climate Studio initiative at the University of the Arts London (UAL), which brings together citizens, organizations, and government actors to engage in collaborative, place-based climate action. Through workshops and scenario-building exercises, participants co-created policy challenges and solutions, challenging traditional linear policy processes and fostering multi-stakeholder alignment. This example addresses one of the four climate challenges that emerged from the integrative literature review: the complexity of multi-level governance models. Figure 6 summarises the findings of the review and suggests research questions

for practitioners and academics. In this context, design for policy should address the antagonistic and interdependent mitigation-adaptation relationship. Furthermore, integrating different interests across multiple spatial, temporal, and institutional scales should be emphasised as a critical aspect of research. This should not overlook the need to design multi-level governance models or the difficulty of mobilising and sustaining public interest in relation to climate change. Design could contribute to climate policy-making challenges by enabling the integration of systemic design practices to bridge the gap between mitigation and adaptation actions, facilitating the development of a shared language and common understanding of the roles and responsibilities of various stakeholders, enabling cross-collaboration through participatory design that activate multilevel, multi stakeholder governance models, and fostering knowledge transfer between the scientific community and non-scientific recipients in climate policy-making.

Kimbell's et al. (2023) proposition	**Climate Policy Challenges**	**Design for climate policy RQ**	**Expected contributions of "Design as a practice of improvising" within climate policy making**
Design as a practice of improvising within policy making	Mitigation and adaptation measures can be mutually reinforcing or detrimental to each other.	How can design-led approaches facilitate the integration of mitigation and adaptation policies at global and local scales, ensuring coherence between long-term strategic goals and short-term, context-specific actions?	*Enable the integration of systemic design practices in policymaking to bridge the gap between mitigation and adaptation actions.*
	Actors involved operate at different spatial, temporal, and institutional scales with unclear roles and responsibilities.	How can design help clarify the roles, responsibilities and expectations of different actors operating at different spatial, temporal and institutional levels in climate policy?	*Facilitate the development of a shared language and a common understanding of the roles and responsibilities of the various stakeholders involved in climate policy-making.*
	Implementation requires coordinated, multi-level governance.	Which design process can support the coordination and alignment of public and private actors to promote a multi-level climate governance model?	*Enable cross-collaborative innovation through participatory design that activate multilevel and multistakeholder governance in climate policymaking.*
	Lack of understanding of climate change and its impacts among diverse stakeholders.	How can design for policy enhance public understanding of climate change by translating abstract scientific knowledge into tangible narratives that resonate with everyday experiences and motivate sustained engagement?	*Facilitate knowledge transfer between the scientific community and non-scientific stakeholders involved in climate policy.*

Figure 6. Design as a practice of improvising within climate policy making's RQ and expected contributions

4.3 Design regenerating policy making

Finally, the third proposition, defined by Kimbell et al. (2023) as 'design regenerates policy making', appears to be the most ambiguous and multifaceted type of relationship between design and policy. Within this third proposition, the purpose of design is to challenge or unsettle assumptions embedded in policy making and enable revitalisation of stalled policy processes. Here, policy making is understood as a generative or even agonistic space where policy emerges from the decentring of different worldviews.

Design and policy thus interact here in such a way that design is used to re-imagine the basis for policy making, challenging the way policy issues are framed, and policies are designed and implemented. Lähteenoja et al. (2023) illustrate how design can contribute to reinventing policy making at the strategic level to shape innovative national sustainable strategies. The authors examined the dynamics of co-design in the formulation of a national sustainable development strategy in Finland. The study highlights the instrumental, attitudinal and intellectual contributions of design to policy formulation, complementing sustainable transition expertise with design methodologies. This study exemplifies how design can innovate policy-making processes. As Kimbell et al. (2023) have highlighted, this is the most recent and complex use of design in policymaking, perhaps because it touches on complex political issues and strategic decision-making processes, challenging the status quo of how policy is designed. In this regard, the findings of the literature review pose new questions for design practitioners and researchers, as summarized in Figure 7. These focus on balancing science and politics in design for climate policy, and on fostering co-creative processes that are institutionalised and sustained over time to avoid incoherence. Furthermore, new research should explore ways to facilitate the development of a new generation of climate policies that can navigate evolving political agendas with a forward-looking approach. It is also critical to explore both the vertical diffusion of climate knowledge within a country and the horizontal diffusion across nations, as well as considering other metrics and measurement approaches beyond GHG emissions to understand the impact of climate policy. A set of suggested design contributions include: the creation of boundary objects, spaces, and experiences to allow interconnection between science and politics in climate policymaking; redesigning the policy cycle to permanently embed knowledge co-production processes on climate change issues; embedding speculative design and future foresight in the innovation process to create a more forward-thinking approach; democratising access to scientific knowledge that is understandable and relatable to increase awareness and participation in climate policymaking; and extending the current measurement approach in climate policymaking by introducing new human- and planet-centred metrics.

Kimbell's et al. (2023) proposition	Climate Policy Process	Design for climate policy RQ	Expected contributions of "Design regenerates climate policy making"
Design regenerating policymaking	Duality of producing practical results while maintaining legitimacy and scientific credibility.	How can design for policy mediate between scientific knowledge and political decision-making to ensure both practical relevance and scientific legitimacy in the development of climate adaptation and mitigation strategies?	*Design boundary objects, spaces and experiences to allow for interconnection between science and politics in climate policymaking.*
	Lack of continuity in knowledge co-creation processes limits sustained policy-research relationships.	What design strategies can support the institutionalization of co-production practices in climate policy, moving beyond one-off projects toward embedded, long-term participatory governance?	*Redesign the policy cycle for climate policymaking to embed knowledge co-production processes on climate change issues on a permanent basis.*
	Invention of new policies must navigate political dynamics and capacity limits.	In what ways can speculative and future-oriented design practices support the invention of adaptive climate policies that remain resilient in the face of shifting political agendas and institutional capacity limitations?	*Embed speculative design and future foresight in the innovation process of climate policymaking to create a more forward-thinking approach.*
	Diffusion of climate information is poorly coordinated and often ad hoc.	How can design-led visualization and communication tools be employed to improve the coherence and accessibility of climate knowledge across national policy networks and organizational boundaries?	*Democratize the access to scientific knowledge that is understandable and relatable in order to increase awareness and participation in climate policy-making*
	Evaluation needs to go beyond GHG metrics to include societal impacts.	What role can design play in developing new frameworks and indicators for evaluating climate policies that account for both quantitative outcomes (e.g., GHG reductions) and qualitative societal benefits?	*Extend the current measurement approach in climate policymaking by introducing new human and planet centred metrics*

Figure 7. Design regenerating climate climate policy making's RQ and expected contributions

5. Conclusions

Climate change can be understood as a particularly complex form of a "wicked problem," as defined by Rittel and Webber (1973). Its causes are diffuse and deeply rooted, while its impacts span social, economic, and environmental domains. Design has long been recognized as a promising approach for addressing such multifaceted challenges (Buchanan, 1992). The recent expansion of design into the realm of public policy - referred to as "design for policy" (Bason, 2014) - raises important and urgent questions about the intersection of design, policy, and climate change. This research offered a structured analytical framework that situates design for policy within the critical and highly political domain of climate policymaking. Three key areas are considered: climate policy goals, challenges and process. These are derived from the heuristic developed by Kimbell et al.

(2023). The model describes the relation between policy and design through three propositions: (1) design as a tool for policy making, where design supports achieving specified policy goals; (2) design as a practice of improvising within policy making, where design fosters diversity and openness in response to unfolding policy challenges; and (3) design regenerating policy making, where design facilitates a fundamental re-envisioning of the policy-making process. Through an integrative literature review, climate policy goals, challenges, and process are scrutinized and a set of implications for design for climate policy are derived. The first cluster—goals—suggests that design should contribute to the development of strategies, interventions, and services that help reduce emissions, design adaptation to extreme events, address equity and development concerns, and integrate adaptative and mitigative efforts across policy domains. The second—challenges—highlights the need for design to address the interdependence and often conflictual relationship between mitigation and adaptation, support multi-level governance models, and foster broader public engagement across spatial, temporal, and institutional scales. The third—process—underscores the importance of balancing scientific legitimacy with political feasibility, sustaining knowledge co-production processes between experts and policymakers, and identifying new indicators for climate policy that can capture the complexity of climate interventions. Design should enable institutionalized knowledge co-production processes, support the emergence and diffusion of systemic and future-oriented policy innovations, and contribute to developing evaluation frameworks that go beyond GHG metrics to also include societal impacts.

While this study offers a conceptual contribution by mapping climate policy characteristics against Kimbell et al.'s heuristic (2023), it remains theoretical in nature, relying exclusively on literature rather than empirical data. The lack of case study validation limits the ability to assess how design operates in real-world climate policy contexts. Moreover, the integrative review, while broad in scope, may have overlooked relevant grey literature or emerging local initiatives not captured in major academic databases. The categorization into three clusters - goals, challenges, and process - serves as a useful analytical device, but inevitably simplifies the complexity and interdependence of climate policy issues. Finally, a more thorough investigation of the suggested design contributions for climate policy is needed to reflect both on the positive and negative impacts that the application of design thinking may have in this context. Future research should empirically test and refine this framework through participatory design methods and comparative analyses across geographical and governance contexts. This will help build a more robust foundation for the theory and practice of design for climate policy. Ultimately, this paper lays the groundwork for future collaborations between design practitioners and climate policy experts, as further research will enable a more practical and contextual understanding of design's role in this critical domain of public policy making.

MEMORY AND TEMPORALITIES IN HERITAGE SPACES: MANAGING PUBLIC DESIGN IN HOUSE-MUSEUMS.

Chiara Rubessi*[a], Gianluigi Viscusi*[b],

a ISIA Roma Design, Italy
b IEI, INDIG, Linköping University, Sweden
*chiara.rubessi@edu.isiaroma.it

ABSTRACT | This article explores the preservation and management of memory in heritage spaces, focusing on house museums. It examines how design and preservation decisions influence public interactions with history and culture. Central to this investigation is the concept of "memory maintenance," which considers how maintenance strategies and their temporalities shape design and public engagement. Drawing on theoretical frameworks such as artifact-maintainer associations, temporal enactments, and care ethics, the study highlights how memory is curated as either a "performance" (e.g., cinematic settings) or a "display" (e.g., events disconnected from historical origins). The analysis addresses the value dynamics emergent from maintenance and design practices. It reveals differences in how various areas of heritage sites are cared for: some spaces are maintained for temporary events, while others are meticulously preserved to reflect historical authenticity or align with curated narratives. These decisions not only affect the physical state of heritage sites but also shape the narratives presented to the public, influencing how visitors engage with and interpret history.

The case study of Villa Necchi Campiglio, a 1935 house museum in Milan, is a key example. The Villa's maintenance practices demonstrate the intersection of historical preservation and contemporary design choices. Some areas are carefully restored to evoke the Villa's original identity, creating an immersive experience of historical authenticity. Others are adapted for modern usage, such as hosting events that cater to current cultural and social needs. This duality illustrates the complexity of balancing the past with the present in heritage management. The study emphasizes the broader implications of these practices for public governance and leadership of cultural heritage institutions in the management of shared

historical narratives. By coupling the temporal to the ethical dimensions of maintenance and design, the article argues that institutions must navigate the tension between preserving historical authenticity and meeting contemporary community needs. Accordingly, the effective leadership and governance of heritage spaces require an acknowledgment of these competing demands, ensuring that cultural preservation remains relevant and accessible to diverse audiences.

In conclusion, this article underscores the significance of "memory maintenance" as a lens for understanding heritage management. It advocates a thoughtful balance between preserving historical narratives and addressing present-day social and cultural needs. By doing so, heritage institutions can foster a deeper connection between the public and the spaces they inhabit, ensuring that cultural memory remains a living and evolving entity.

KEYWORDS | MEMORY, CARE, HOUSE-MUSEUMS, MAINTENANCE, DESIGN

1. Introduction

As many countries in Europe and globally reassess their relationship with cultural heritage, the management of house museums has gained renewed relevance and significance (Young, 2007), going beyond merely conserving artifacts to serve as custodians of the intangible legacies of lifestyles, traditions, and domestic spaces. Accordingly, maintenance is receiving increasing relevance and attention from both academics and practitioners.

In line with Shannon Mattern's (2018) perspective, maintenance is not simply a technical practice, but a vital operation that ensures the longevity and functionality of spaces and infrastructures, while ascribing a profound social and cultural role to them. This paper explores how maintenance practices in house museums shape and transform our engagement with cultural heritage. Through the adoption of theoretical lenses of care studies (Tronto, 1993) and maintenance studies (Jackson, 2014; Pontille & Denis, 2022), we argue that these practices extend beyond the scope of material preservation to embody processes of active care, thus influencing how history is curated and experienced. From this vantage point, maintenance is positioned as a dynamic social practice that constructs meanings, fosters identities, and facilitates relationships with heritage. Accordingly, adopting this perspective on maintenance promotes an inclusive and evolving vision of the past, aligning it with the needs and realities of contemporary contexts.

The case considered in this study, Villa Necchi Campiglio, is a noteworthy historic residence located in Milan, Italy, built in the 1930s on commission by the Necchi family, one of the most influential bourgeois families of the time. Designed by the architect Piero Portaluppi, the Villa perfectly exemplifies the Italian Rationalist style. Its sober and functional aesthetic reflects the elegance and good taste of the "Milanese" bourgeoisie during that period. The Villa spans four floors and is surrounded by a large garden adorned with centuries-old trees, fountains, and meticulously maintained green spaces. Inside, the rooms are decorated with fine furniture and valuable artworks, which testify to the era's taste and culture while maintaining practicality. One of the Villa's distinctive features is its large swimming pool, a symbol of elegance, luxury, and leisure typical of bourgeois residences in Milan.

Villa Necchi Campiglio is not only an architectural landmark but also a performative "repository of history" (Battaglia et al., 2020; Cobb et al., 2020). Accordingly, while preserving memories related to the social and economic life of 20th-century Italy, since 2001, the Villa has been transformed into a museum, managed by FAI (Fondo Ambiente Italiano), with the aim of also promoting the cultural and artistic heritage of the Necchi family and the period in which the Villa was built. Furthermore, nowadays, it is a highly appreciated tourist destination, where visitors can admire the architecture and furnishings while immersing themselves in the authentic atmosphere of the past.

2. Background and motivations

In recent years, the debate surrounding house museums has seen significant contributions from global institutions such as the International Council of Museums (ICOM, 2024), through its International Committee for Historic House Museums (DEMHIST, 2024), as well as country-specific organizations like the National Trust for Historic Preservation in the United States (2024). In particular, DEMHIST has facilitated the exchange of best practices for managing house museums, emphasizing the importance of preserving the connection between the historical identity of the residence and the visitor experience, thereby transforming house museums into

spaces of living memory. Furthermore, for example, in the United States, the National Trust for Historic Preservation has promoted house museums as narrative spaces where personal stories are intertwined with national history, encouraging emotional engagement. This ongoing dialogue has enriched the global understanding of house museums as dynamic, interactive sites of memory.

2.1. Memory, space, and temporality in house museums

Memory, space, and temporality in house museums are fundamental components that define their cultural and historical value. In a house museum, time and space become tools for managing memory, serving as expressions of a past that crystallizes within an intimate, domestic environment. Unlike traditional museums, where objects are often isolated from their original context, in house museums, objects and the furnishings arranged within the rooms remain connected to the design of the spaces and the stories of their inhabitants, evoking a temporality that oscillates between past and present (Brighenti & Kärrholm, 2019).

In summary, the unique nature of house museums offers the opportunity to understand the material component, which is continuously evolving, as well as the slow, multi-temporal processes that characterize these houses, creating an environment where time and space intertwine to generate new, meaningful experiences.

2.2. Maintenance studies, care, and house museums

Maintenance studies is a stream of research that, when applied to house museums, provides a dynamic approach to heritage management, emphasizing the importance of daily care in preserving both the material and immaterial dimensions of historic spaces. Jackson (2014) highlights that maintenance is a form of knowledge and care that goes beyond mere repair, fostering continuous renewal of the material world. This also reflects the need for ethical dimensions of maintenance through the lens of care studies (Tronto, 1993). As to these issues, Pontille and Denis (2022) argue that maintenance is an act of care that preserves intangible values and practices. At the same time, Assmann and Czaplicka (1995) describe cultural memory as an active construction process that requires nurturing historical narratives and practices, transforming approaches to exhibition design and interaction with the public (see also Borsotti, 2017). As to this issue, a study by Xu et al. (2024) focuses on the immaterial aspects of maintenance as a practice that safeguards the invisible elements of a place: its meanings, memories, and the experiences it represents.

The study presented in this paper aims to address existing gaps in the study of house museums by integrating perspectives from maintenance studies, design practices, and the temporality of heritage. In particular, it seeks to understand how cultural institutions manage the balance between the historical preservation of heritage and the contemporary needs of communities.

3. Research Method

The study adopts as a theoretical stance the “constitutive entanglement of the social and material in everyday life” (Orlikowski, 2007, p. 1435) through the concept of *sociomateriality*, mainly referring to streams of studies that see organizations, actors, artifacts, and technologies as an emergent and “mutually dependent ensemble” (Orlikowski & Scott, 2008, p. 433). Accordingly, sociomateriality is “the space where human (social) agencies and material agencies are intertwined” (Leonardi, 2012).

In this context, the study considers material ordering and the care of things (Denis & Pontille, 2015), the various associations between artifacts-maintainers (Latour, 1984), and the different temporalities they enact (Barad, 2014) through the theoretical lens of *agential realism* (Barad, 2007). According to this perspective, Barad (2003, p. 815) states that "phenomena are the ontological inseparability of agentially intra-acting 'components'" or "relations without preexisting relata" (Barad, 2003, p. 815). The concept of "intra-action" does not presume the preexistence of the entities involved in a given interaction but rather a material configuration of the observation *apparatus*, which enacts an "agential cut," meaning "a local resolution within the phenomenon of the inherent ontological indeterminacy" (Barad, 2003, p. 815).

Taking this theoretical background into account, relevant for the discussion of the results, the study is nonetheless an inductive qualitative research based on data from the Villa Necchi Campiglio case study (Eisenhardt, 1989; Eisenhardt & Ott, 2017; Gioia et al., 2013; Glaser & Strauss, 1967).

The investigators conducted a preliminary study in 2022 on the Villa Necchi Campiglio house-museum in Milan, Italy, designed by architect Piero Portaluppi in 1935 for the Necchi Campiglio family, part of Milan's affluent bourgeois industrial class of the 1930s. The study was based on an initial analysis of the house museum's historical documents and aspects related to the site's maintenance, followed by an initial set of four interviews with the Villa manager, the lead architect, the Villa keeper, and the lead gardener. The informants made up the core permanent staff selected through theoretical sampling (Glaser, 1978, 1992, 2005; Holton & Walsh, 2017; Shepherd & Suddaby, 2016; Suddaby, 2006).

Accordingly, the primary data used in the early stages of the study presented in this paper are audio recordings of interviews (average length forty minutes) and the investigators' notes, together with secondary data from publicly available online sources, such as news, magazine articles, podcasts, etc. Data analysis follows the coding steps in classical grounded theory: open coding, selective coding, and theoretical coding (Glaser, 1978, 1992, 2005; Holton & Walsh, 2017).

4. Results

At Villa Necchi Campiglio, maintenance emerges not only as an exclusively technical practice aimed at the conservation of historical objects but as an active process of production and transmission of cultural meanings. The analysis of the data allows to ascertain how certain representations of memory are curated compared to others, enacting the way in which cultural heritage is experienced and interpreted by visitors. Maintenance activities are managed and understood as spaces that do not simply preserve historical objects but that produce and transmit cultural meanings. The analysis grounded on the data collected at the Villa Necchi Campiglio leads to an early theorizing around the central concept of "memory maintenance," subsuming how maintenance strategies and their temporalities shape design and public engagement. Accordingly, the "memory maintenance" at the Villa Necchi Campiglio points out a set of temporalities enacted in the heritage spaces, which are the temporal stratifications linking the past to the present and impact the leadership of the Villa management for decisions about conservation, exhibition, and communication to the public.

In particular, the management and design choices of spaces are the expression of a complex balance between the need to preserve a historical legacy and the need to make this heritage relevant for contemporary communities. For example, Villa Necchi Campiglio in 2009 became the film set for Guadagnino's film "I Am Love," chosen as the scenery for the upper-middle-class protagonists of the film, and later for the 2021 movie "House of Gucci," directed by Ridley Scott,

about the Italian fashion brand family. For these occasions, maintenance activities required an additional effort to secure not only the architecture but also the objects and furniture of the Villa, while the choices of the fittings highlighted certain parts of the Villa, such as the swimming pool, and omitted others, such as the service rooms. In this sense, the maintenance choices are not neutral but actively participate in the construction of narratives that enact various and alternative space-time configurations, shaping the way in which the museum interacts with memory, the public, and the social context. As to this issue, the data analysis allows for the identification of a set of time configurations enacted in the Villa's spaces that aim at the "maintenance of memory": *Present "Perfect," Present "Continuous," Past "Perfect,"* and *Future "Imperative"*.

The actual exhibition of the original furniture and artworks constitutes the present framework of the historical past of the Villa, whose memory is kept alive through maintenance activities. Thus, the spaces that hosted activities in the past are nowadays presented as they used to be. In this case, the present hosts the past through its art, sense of beauty, and taste (so, a *Present "Perfect"*). In general, this is the time-space configuration of the house as a museum.

Then, some of the Villa environments are used for special events like the ones of the Salone del Mobile annual fair of design and furniture in Milan (see, e.g., Todd, 2022). This time configuration points out the enactment of the Villa as a space for action and activities that are happening nowadays and eventually will continue to happen, like being a venue for an event or similar other events occurring yearly (so a *Present "Continuous"*).

Another time-space configuration is enacted by the use of the Villa as a filming location for stories that are set in alternative (past) times to the current one or even to the history of the Villa, although connected to its actual historical profile ("All of these luxurious, modern features made the Villa one of the iconic residences of the period," FAI, 2024). So, this configuration enacts a "*Past*" that is *"Perfect"* not only at a (linear) time level but also adapted to different (hi)stories, nonetheless translating and complying with the present "perfect" in terms of its art, sense of beauty, and taste.

Finally, there is a time-space configuration concerned with the plans for the future development of the Villa, for example, as a garden further extending the original flora of the Villa (so, a *Future "Imperative"*).

5. Discussion

The study's preliminary results provide a situated understanding of the multiple temporal configurations that emerge in spaces dedicated to the "memory maintenance," examining how these different temporalities are interwoven, kept separate, or hierarchized. This process also reveals how science and technology (e.g., in film settings) intervene in the materiality of the associations between various artifacts and their maintainers in the care and appropriation of spatial-temporal representations. Also, these associations are characterized by *attention* to the *fragility* of the artifacts maintained in the different space-time configurations (with a parallel to the attentive care that is paid by maintainers of airplane wings and engines, as pointed out by one of the informants who had experience in both types of maintenance).

In particular, the research highlights the diverse associations between artifacts, maintainers, and exhibitions that shape the representations and configurations of the house's enacted time (*Present "Perfect," Present "Continuous," Past "Perfect,"* and *Future "Imperative"*) that have evolved through ongoing maintenance work over the years. Specifically, these associations

provide insights into the potential benefits and design challenges in the museum's spatial planning, organization, and upkeep, which are essential for conveying cultural, historical, and social meanings.

How does the multiplicity of times unfold in the specific maintenance settings? How are these different times combined, kept separate, or hierarchized? What tensions and confrontations arise from their coexistence? How are maintenance times (and, above all, the time of the materials from which things are made) lived, measured, and/or organized? What types of design are involved in these processes? What kinds of knowledge are developed regarding the rhythms of maintenance and the temporalities of matter? As to these questions, Villa Necchi Campiglio represents the "time of the bourgeoisie," with design choices that have shaped this historic residence, a symbol of bourgeois prosperity in the 20th century. However, at present, Villa Necchi Campiglio experiences a period of continuous updating and transformation, with the Salone del Mobile held annually and film sets bringing renewed attention to the beauty of the Villa's interior spaces. Here, architecture and design are tools that reflect not only the material heritage but also how these spaces can be lived in a sustainable manner without losing their authenticity.

Looking to the future, the design choices of the Villa's caretakers aim to preserve the beauty of the expansive outdoor garden through a conscious and respectful approach, where attention to the fragility of the environments requires ongoing care. This led, for example, to the creation of the project *Un ambiente per l'Ambiente* ("An environment for the Environment"), an immersive installation open to the public for free (NEO, 2022), located in the original garage of the Villa. The installation narrates the relationship between nature and history at the heart of the city. The project aims to promote a holistic vision that integrates design, maintenance, and sustainability to ensure heritage preservation for future generations.

6. Conclusion

This working paper addresses the complex dynamics of cultural heritage, with a particular focus on house museums and the case of Villa Necchi Campiglio in Milan, Italy. European societies are nowadays facing the challenge of reflecting on the implications of how historical narratives are constructed and preserved. By placing a strong emphasis on the maintenance and care of these spaces, the aim is to highlight not only their role in conserving objects but also how they contribute to cultivating and safeguarding the heritage of collective memory. Thus, house museums are not simply custodians of objects; they are vital spaces where the stories of people and cultures intertwine, offering opportunities for meaningful and engaging experiences while fostering an active dialogue between past and present within communities. By analyzing maintenance design practices, we uncover how they are intrinsically connected to the care of heritage and how they contribute to defining the historical identity of these places. Daily maintenance activities not only preserve the materiality of the spaces but also play a crucial role in constructing meaningful experiences for visitors.

As to this issue, the research presented in this paper has discussed the unfolding of multiple-time configurations enacted in spaces that aim at "memory maintenance" and how the intra-acting in these different times are combined, kept apart, or hierarchized, on the one hand, in the materiality of the associations of the diverse artifacts-maintainers, on the other hand, in the appropriation of spaces-time representations that enact the maintained-house museum.

The outcomes of this research aim to provide practical tools for cultural heritage professionals, guiding reflection on how maintenance practices can influence the perception of memory within house museums. Emphasizing the importance of everyday care in preserving both the material

and immaterial aspects of these spaces, the research presented in this paper intends to expand the understanding of their role as active sites of memory. Accordingly, effective leadership and governance of heritage spaces require an acknowledgment of the competing demands associated with different time-space configurations, ensuring that cultural preservation remains relevant and accessible to diverse audiences.

In conclusion, this article underscores the significance of "memory maintenance" as a lens for understanding heritage management for effective leadership and governance of heritage spaces. Moreover, the paper aims to create a critical and informed dialogue on the preservation of memory within house museums. Although preliminary, the results aim to offer practical tools for cultural heritage professionals to develop a governance model that balances historic preservation while promoting a collaborative and multidisciplinary approach. Through engagement with both the academic community and practitioners, we aim to foster a more nuanced understanding of how maintenance, care, and memory intertwine in these unique heritage spaces.

ABSTRACT | This paper presents the initial outcomes of *OSMOSI*, an action-research project investigating socio-cultural hybrid spaces in Italy, with a specific focus on the regions of Lombardy and Sicily. The project aims to assess the impact of these spaces in terms of social innovation, economic sustainability, and the built environment, through a series of research actions. Adopting a design-driven mapping approach, outlined in this paper, the study combines desk research, surveys, and interviews. Through this methodology, 80 hybrid spaces were identified across Lombardy and Sicily. The analysis focuses on their identity, operational context, management model, economic model, and spatial quality. The paper first introduces the OSMOSI project and explores the concept of socio-cultural hybrid space, defined as a place of urban experimentation and social inclusion enabled by creative and cultural activities. It then details the development of the mapping process and the criteria adopted for the selection of the spaces under study. Preliminary findings from the mapping process are also presented, including accessibility as a key issue, the identification of primary and secondary functions, and the geographical distribution of the spaces. This study is intended to serve as a valuable resource for scholars engaged in investigating these multifaceted interactions, providing a framework for analysing socio-cultural hybrid spaces across varied urban contexts.

KEYWORDS | CULTURAL HYBRID SPACES, URBAN REGENERATION, DESIGN FOR SOCIAL INNOVATION

1. Hybrid Spaces as incubators for urban experimentation and social inclusion

The ongoing transformation of urban spaces has become an essential part of addressing the challenges cities face in the 21st century. The Italian context reveals a significant shift in the use and function of public spaces in urban areas. According to the Italian Ministry of Economy and Finance, approximately 10% of Italy's public real estate is currently unused, a situation exacerbated by the effects of digitalisation and the consequences of the COVID-19 pandemic (Diana et al., 2022). This trend has led to the growing "de-functionalisation" of public interiors—previously vibrant civic spaces that are now underutilised, such as government buildings, educational institutions, and cultural centres (Pimlott, 2018). As cities evolve, there is an urgent need to rethink how these spaces can be revitalised and repurposed. The regeneration of these disused areas has the potential to foster social inclusion, economic sustainability, and urban renewal, making them key assets for community development.

In this context, hybrid spaces have emerged as a powerful tool for urban regeneration. They are not only a phenomenon limited to public interiors; former industrial buildings, farmsteads, kindergartens, churches, movie theatres, offices, gatehouses, and markets are among the places they frequently revitalise and reactivate (Inti et al., 2021), emphasising cultural aspects. In recent years, they have grown in a number of European cities. For example, the municipality of Amsterdam maintains a desk that handles the online mapping of abandoned areas under municipal ownership. These areas are given to associations, organisations, and socio-cultural entrepreneurs. Recently, Berlin has seen several bottom-up movements to reclaim abandoned spaces or buildings, which have regenerated local economies with a focus on solidarity-based welfare (Trapanese & Mariotti, 2022). Hybrid spaces address the physical transformation of cities and serve as dynamic hubs that foster social interaction, community empowerment, and cultural exchange. These spaces often emerge in response to urban fragmentation and social exclusion, acting as incubators for creative practices and social experimentation (Manzini, 2021). Characterised by their multifunctional and adaptive nature, they blend cultural, social, and economic dimensions and provide fertile ground for innovation and social cohesion (Krasilnikova & Klimov, 2020).

OSMOSI is an action-research project that seeks to explore the impact of socio-cultural hybrid spaces in Italy, focusing specifically on the regions of Lombardy and Sicily. Coordinated by the Polimi DESIS Lab Research Group within the Department of Design at Politecnico di Milano, and the co-coordinated by the University of Palermo through its Department of Architecture. Additional contributions come from the Department of Architecture, Built Environment and Construction Engineering and the Department of Management Engineering at the Politecnico di Milano, as well as the Pedagogical and Psychological Department at the University of Palermo.

The research is supported by two key hybrid spaces located in the two regions under analysis: BASE Milano, in Lombardy, and Farm Cultural Park, in Sicily. The project aims to contribute to the expanding body of knowledge on the impact of cultural hybrid spaces, offering a framework for their development and replication in other urban settings. Ultimately, the goal is to establish a model that can guide public administrations and other stakeholders in creating new cultural hybrid spaces that are socially, economically, and environmentally sustainable.

This paper provides a detailed review of the initial phase of the OSMOSI project, focusing on the process of mapping these hybrid spaces. The goal of this paper is to provide a protocol for design-drive mapping of socio-cultural hybrid spaces through a set of exploratory and survey tools. The paper outlines the structure of this process and presents preliminary findings, which will inform the next phases of the research.

2. Defining Hybrid Spaces socio-culturally based

Hybrid spaces serve as bridges between evolving social dynamics and cultural practices. The concept of hybrid spaces in urban contexts refers to many existences that inhabit the city. These spaces consequently act as points of reference for such multiplicities. They are cultural institutions in the city that do not merely respond to the needs of local communities but are also shaped by urban regeneration processes and the ethical and political transformations of culture (Lo Stato dei Luoghi et al., 2024, p. 28). The Stato dei Luoghi is Italy's first network of culturally based hybrid spaces. It unites groups and individuals dedicated to reviving metropolitan areas via cultural revitalisation. For the past few years, the network has been conducting a definition process to identify and classify spaces that fit the definition of a "socio-cultural hybrid space."

These spaces are characterised by:

- **A strong cultural identity:** Addressing contemporary themes through art and culture, including residencies, public art, festivals, exhibitions, seminars, theatre, concerts, community-led cultural projects and launches.
- **Multifunctionality:** Combining cultural activities with other sectors. Unlike traditional cultural spaces, these places integrate multiple uses.
- **Plural audience and activities:** Encourage interaction between different communities and combine cultural production, participation and aggregation with social engagement.
- **New models of decision-making and co-creation:** Emphasising participatory governance and artistic collaboration as tools for social and civic innovation.
- **Innovative economic sustainability strategies:** create opportunities for youth entrepreneurship and cultural and creative industries by exploiting the multifunctional nature of these spaces.
- **A role in social cohesion and inclusion:** actively contributing to stronger, more connected local communities.

As previously stated, a primary characteristic of these spaces is their multifunctionality; they are no longer merely spaces for exhibitions or performances but rather dynamic ecosystems where multiple fields intersect, ranging from professional training to social engagement, from social innovation to artistic research. The socio-cultural hybrid space is defined by its integration of multiple functions, thereby attracting a diverse audience and facilitating interactions between individuals who would otherwise never have had the opportunity to meet. It is therefore recommended that socio-cultural hybrid spaces prioritise the 'unexpected person' rather than exclusively targeting the typical audience (BASE, 2023).

As emphasised in the BASE Milano Manifesto, plurality in socio-cultural hybrid spaces is not confined to the diversity of a cultural programme; it encompasses a re-definition of power structures, governance models, and decision-making processes. The concept of plurality, therefore, is translated into the ability to "make space" for communities and individuals who have been traditionally excluded from public arenas, thereby fostering co-curation pathways and active listening practices. The diversity of activities and services that characterise socio-cultural hybrid spaces present challenges on a physical level. As a space that fosters plurality and consequently serves minorities, hybrid cultural spaces must ensure accessibility in terms of cultural production and spatial distribution. This necessitates the creation of environments that are physically, sensorially and cognitively inclusive, ensuring that individuals of diverse abilities and backgrounds can fully engage in cultural activities without encountering barriers or exclusions. In this sense, accessibility cannot be regarded as a mere technical requirement but rather as a political design that redefines the very notion of public space.

3. The mapping process for socio-cultural Hybrid Spaces

3.1 Mapping as a tool for recognition and implementation

Mapping hybrid spaces is crucial for recognising their impact on cities and communities and understanding their role in urban and social transformation. Additionally, mapping facilitates the creation of networks that promote collaboration and resource-sharing among hybrid spaces, strengthening their collective impact. This process also provides public administrations and stakeholders with valuable data to design policies and strategies that support the development of new cultural hybrid spaces.

The need to map them has emerged through two key initiatives: an Italian national-level survey, which collected data on 845 cultural spaces across Italy, and a city-level initiative in Milan, which documented 26 local spaces.

The first initiative is the Call to Action, which was launched by “cheFare”, an agency for bottom-up cultural transformation. Between February 2020 and

December 2021, cheFare collected data on 845 hybrid spaces nationwide through an open public survey. The initiative aimed to capture the spread and characteristics of new cultural centres by gathering reports from space managers, operators, and visitors. While the data is not entirely objective - relying on voluntary self-reporting - it provides a valuable first snapshot of a growing national phenomenon. The mapping highlights the widespread presence of hybrid cultural spaces and their impact on local communities. As reported in the results document, more than a definitive study, this initiative is a starting point for further research, encouraging universities, networks, and public institutions to engage in more detailed and structured investigations.

The second initiative is part of creating the "Hybrid Spaces Network" in Milan and includes the Socio-cultural Hybrid Spaces survey conducted in 2021, which involved 26 Milanese entities. The survey produced a geographical map of these entities and collected data on their legal status, space typology and ownership, types of activities, and involved actors. As the Director of the Urban Economy, Fashion, and Design Project Department at the Municipality of Milan, clarified during an interview for the OSMOSI project, this initiative "was not merely a mapping exercise but rather an urban policy aimed at identifying and supporting de-functionalised spaces.". It resulted from a bottom-up process initiated by a group of hybrid spaces. This collective effort produced a document outlining their characteristics and their role as privately managed yet publicly relevant spaces. Moreover, this document also included their requests to the municipality for official recognition and the development of policies suited to their specific form.

The OSMOSI mapping aims to provide a detailed overview of socio-cultural hybrid spaces in Sicily and Lombardy, considering their environmental and socio-economic contexts, and to contribute to the comprehensive framework that can guide public administrations and stakeholders in supporting and developing new cultural hybrid spaces. The mapping follows a design-driven approach to data collection, ensuring it creates a comprehensive and contextualised representation of hybrid spaces while demonstrating its potential for replication in other contexts.

The mapping process was developed through a mixed-method approach, combining desk research, surveys, in-depth interviews, and follow-up activities. This methodology aimed to comprehensively understand hybrid spaces by integrating quantitative and qualitative data. The survey was delivered to 80 spaces (62 in Lombardy region and 18 in Sicily region). It was designed as the core data collection tool and it was structured into eight sections, each exploring different dimensions of hybrid spaces. To ensure the survey's effectiveness and relevance, it was developed through an iterative process (Figure 1) involving multiple phases of testing and refinement. Initially, in-depth interviews were conducted with professionals in the field and with the support network of BASE Milano (in the Lombardy region) and Farm Cultural Park (in the Sicily region). These interviews and a literature review aimed to identify key indicators that would later shape the questionnaire, ensuring its alignment with the real needs and characteristics of hybrid spaces. Once the preliminary version of the survey

was developed, it was tested with the representatives of BASE Milano and Farm Cultural Park and refined to better capture the complexity of these spaces.

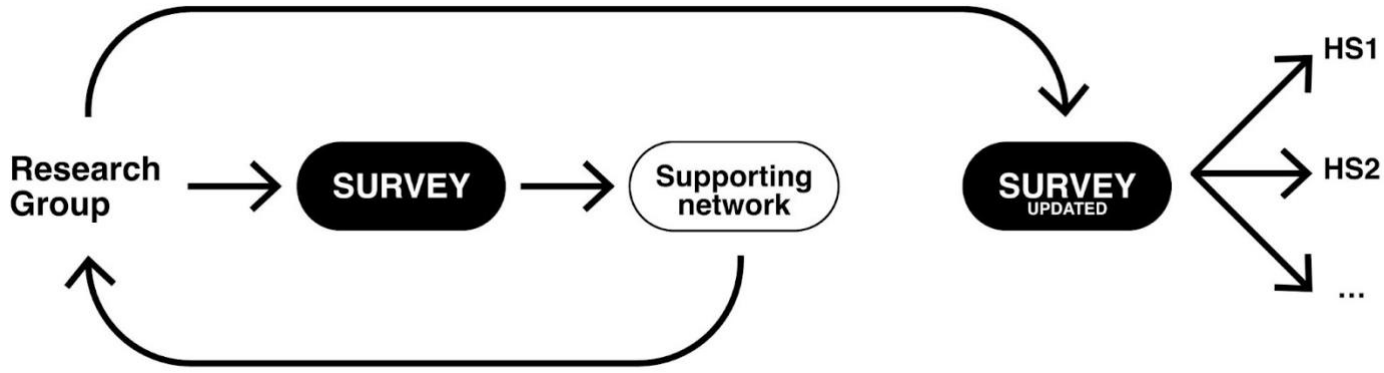

Figure 1. Graphical visualisation of the iterative process used for the survey ideation.

1.2 Mapping indicators for assessing the Social, Economic, and Environmental Impact

Identifying indicators for measuring the social, economic, and environmental impact of the socio-cultural hybrid spaces requires a theoretical framework considering these dimensions' interconnected nature. The questionnaire used for the mapping was based on the three dimensions of sustainability (Social, Economic, and Environmental) and an Identity Profile of the space, which serves as an overview of each space.

This tool offers a flexible approach to capturing the multifaceted nature of these spaces. The Identity Profile covers history, mission, and integration into the socioeconomic and urban context, helping assess how these spaces emerge and interact with their surroundings (Manzini, 2015). Social innovation focuses on the people and activities that shape them, including value propositions, openness, and participatory activities, aligning with co-creation and participatory urbanism theories. Social sustainability is linked to equity, cultural accessibility, and community engagement, emphasising network creation and participation (Dempsey et al., 2011). Economic sustainability examines funding and governance models, highlighting the diversified financial resources sustaining these spaces. Finally, environmental sustainability looks at the spatial configuration and environmental impact, assessing aspects like thermal, acoustic, and visual comfort, which align with research on sustainable architecture and adaptive reuse (Bullen & Love, 2011). Combining them is necessary because sustainability is not a static condition but a dynamic process that evolves based on contextual, cultural, and institutional factors (Folke et al., 2005). The result is an online questionnaire comprising 8 sections and 46 questions, with closed and open-ended responses.

Below are the sections with the main topics of the questions:

1. **Contact Information** (Full name, role within the organisation, email address)
2. **Identity and History of the Space** (Name, location, self-definition, founding year and initial conditions, promoters, legal status, affiliated organisations, ownership of the space)
3. **Size and Context** (Square meters, number of staff and visitors, geographical context, nearby similar spaces)
4. **Value Proposal** (Vision, mission, social innovation as outcome)
5. **People and Content** (Collaboration network, target audience, main activities and functions, participation, and community engagement)
6. **Accessibility** (Physical barriers, sensory and cognitive accessibility, plural communication, economic accessibility)
7. **Resources and Management** (Revenue sources, turnover, net income, amount of public/private funding, relationships with public administration)
8. **Built Environment** (Floor plan, spatial performance, acoustic, thermal, and visual comfort)

4. Insights and findings from the iterative mapping process

The iterative design-driven approach adopted for the development of the questionnaire has already produced significant insights, some of which are summarised in this section.

One of the key outcomes of this process was identifying a critical gap in the original survey framework: the need for a dedicated section on accessibility. Inspired by the principles of Un'IDEA Manifesto by BASE Milano, this section was integrated into the questionnaire to provide a more holistic perspective on accessibility. It expands the analysis beyond physical and cognitive aspects to include economic, gender, and cultural inclusivity, reflecting socio-cultural hybrid spaces' diverse and evolving nature.
Defining the spaces to be mapped requires first establishing a shared definition of hybrid spaces among the researchers and the partners. As mentioned before, a key reference in this regard was "Ibridazione: nuove politiche per la rigenerazione culturale dei luoghi [Hybridization: New Policies for the Cultural Regeneration of Places]", a project by "Lo Stato dei Luoghi" in collaboration with the "Direzione Generale Creatività Contemporanea" of the Ministry of Culture and the "U-Rise" Master's Program at IUAV University of Venice. Building on this framework, along with insights from literature and interviews, we developed the definition of an "osmotic space" to guide the selection process. That meant that we looked at spaces with these characteristics: spaces formerly used for a different purpose before being regenerated and assigned a new function, spaces that host activities spanning multiple functions, and at least one of these functions is of a cultural nature. Another key factor in the selection process was the permeability of the spaces - specifically, how accessible they are to the general public. This aspect was assessed by considering whether entry required payment, consumption, or membership, leading to a nuanced classification of different levels of permeability.

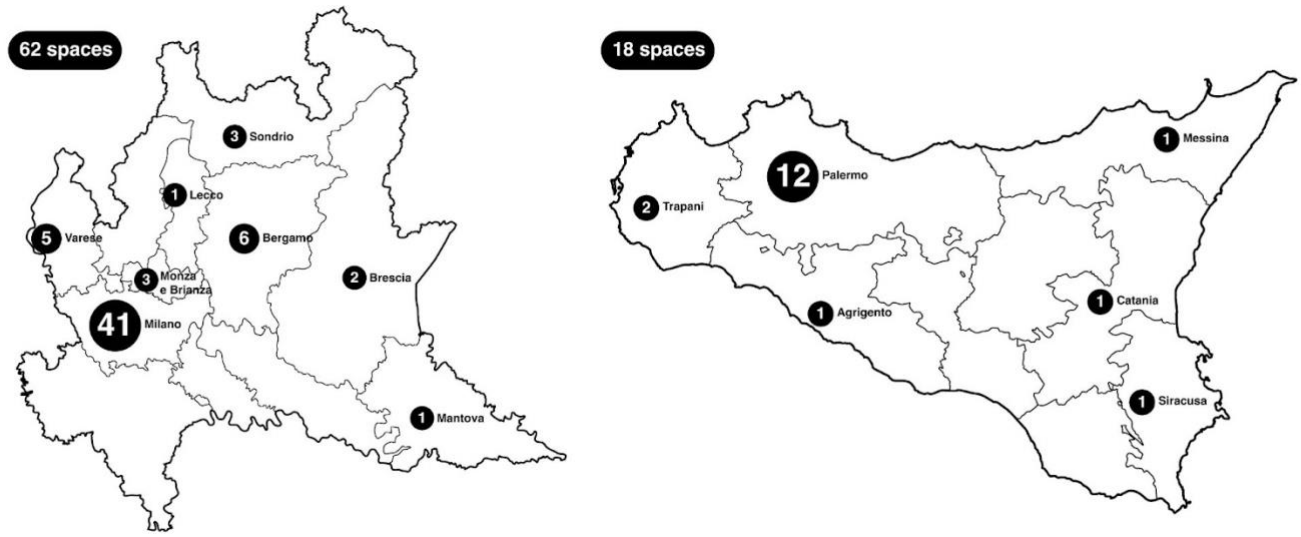

Figure 2. Graphic visualisation of the distribution of socio-cultural hybrid spaces in Lombardy and Sicily regions.

Figure 3. Graphic visualisation of the distribution of socio-cultural hybrid spaces in the city of Milano (Lombardy region).

As shown in Figures 2, we have identified 62 spaces in Lombardy and 18 spaces in Sicily, the majority of which are located in the regional capitals, highlighting how the phenomenon is predominantly concentrated in large urban centres, particularly in the peripheral neighbourhoods of these cities. In Figure 3, we can see that in the city of Milan, some clusters can be identified: a cluster in the northern area, a cluster in the north-eastern area and a cluster in the southern area of the city.

However, the phenomenon is also emerging in more remote and rural areas, a development that reflects the broader role of socio-cultural hybrid spaces in revitalising not only urban areas but also peripheral and rural contexts, where they contribute to processes of regeneration, inclusion, and innovation (Ostanel, 2017). As new spaces are established, the list remains open-ended, underscoring this phenomenon's dynamic and evolving nature.

From an initial overview derived from the desk research, which will later be confirmed by analysing the mapping results of the 62 socio-cultural hybrid spaces in Lombardy, primary functions and secondary functions attributable to the socio-cultural hybrid spaces being mapped were defined. The correlations between the different spaces and the primary and secondary functions can be appreciated in Figures 4. An initial analysis of these correlations shows that the

functions most frequently performed by the spaces (associating both primary and secondary functions) are those of cultural talks, workshops, musical events, restaurants, art exhibitions and formation courses.

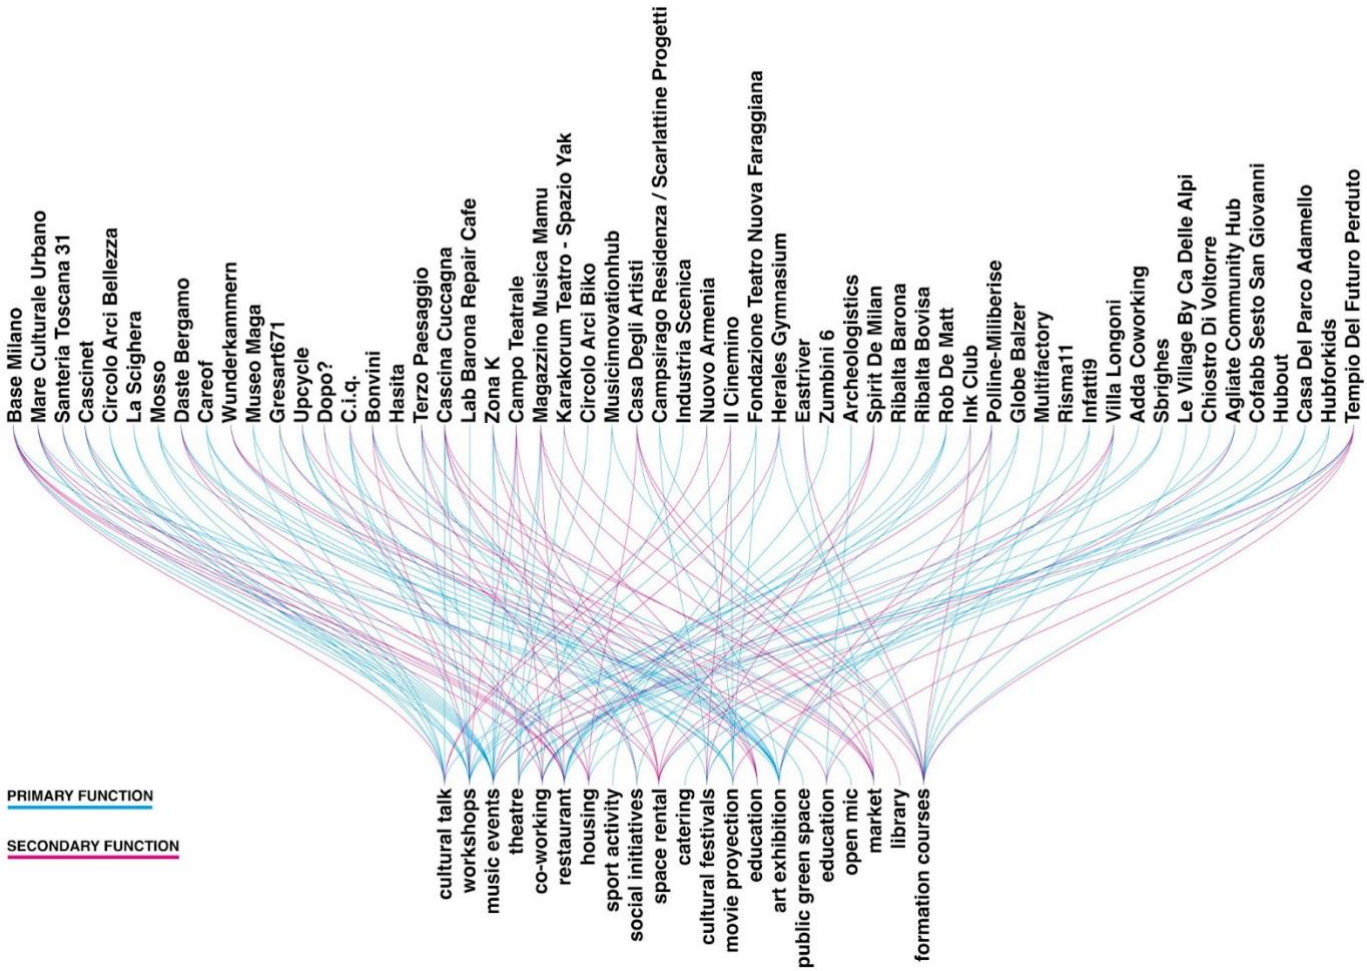

Figure 4. Graphic visualisation of primary and secondary functions concerning the mapped spaces in the Lombardy region. Socio-cultural hybrid spaces (in the upper part) and functions (in the lower part).

5. Conclusions

This study presents a few limitations: each socio-cultural hybrid space is characterised by a high degree of specificity, making it difficult to formulate generalisations. Additionally, since the mapping activity is constrained by the project's timeframe, and new hybrid spaces continue to emerge, some may not be included in the current sample. Furthermore, the two regions under investigation —Lombardy and Sicily—are marked by very different socio-cultural, economic, and administrative conditions. These contextual differences significantly influence the analysis and require nuanced interpretation of the results. The choice of Lombardy and Sicily reflects an intention to explore diversified scenarios, and future studies could extend this mapping model and protocol to other Italian regions, as well as to international contexts, to further test its applicability and relevance.

The paper reflects the emerging ethics of public design through the structure of the 'questionnaire' tool, which integrates multiple dimensions of accessibility in its various sections. Specifically, it includes questions related to:

- Plural language that uses inclusive communication modes that guarantee representation and comprehensibility for different identities and sensitivities through the adoption of different linguistic strategies, the avoidance of exclusionary or stereotyped terms or expressions, and the creation of a communication that enhances all people through assisted reading tools.
- Cultural accessibility is based on the commitment to guarantee the right of access, participation and involvement in cultural life for all persons, regardless of their physical, sensory, intellectual, psychic or communicative characteristics. Cultural accessibility is a continuous learning process that requires people's involvement and implies the construction of spaces of expression and self-narrative that enable communities to bring about social transformation.
- Physical accessibility is achieved by designing safe, inclusive, and barrier-free cultural spaces, ensuring barrier-free spaces for people with mobility impairments, eliminating sensory barriers, and creating flexible and adaptable environments that can be easily identified.

Different roles of the designer emerge from the paper. In fact, the designer can act as:

- Facilitator and thus able to guide and support the processes of co-creation, collaboration and innovation within research activities. His or her role facilitates decision-making and research processes, ensuring that the activity realised (the questionnaire discussed) is effective, user-centred and achievable.
- Tool designer who does not directly create final solutions but develops tools, methodologies and frameworks that enable stakeholders to effectively perform or co-design the required activities, thus acting as an enabler of innovation.
- Process designer who structures the sequences of activities, interactions and decisions that define the realisation of the activity, pursuing the goal of making processes more efficient, intuitive and capable of generating value for all stakeholders involved.

The importance of regenerating disused public spaces through cultural and creative enterprises has become increasingly recognised. As highlighted in Italy's National Recovery and Resilience Plan, there is a strong emphasis on transforming public spaces to serve social, cultural, and educational purposes. It advocates for implementing environmental criteria in the design and renovation of public buildings, which is also relevant to cultural spaces. Regenerating these spaces addresses the physical decay of urban environments and creates opportunities for social interaction and cultural exchange, reinforcing the notion that "culture heals" (Satta, 2023). Integrating environmental, social and economic considerations into the design and renovation of cultural spaces fulfils two key

objectives: preserving the physical integrity of urban environments and cultivating a strong sense of community.

About the Authors:

Laura Galluzzo PhD in Design, associate professor at the Department of Design, Politecnico di Milano. Coordinator of the *POLIMI DESIS Lab* within the international DESIS network. She deals with the relationship between Spaces and Services (S+S) design with a focus on temporary interventions, domestic and urban transformations and participatory processes.

Elisa Cinelli PhD Candidate in Design at Politecnico di Milano and member of the *POLIMI DESIS Lab* within the international *DESIS network*. Graduated in Interior and Spatial Design with a thesis examining homelessenes accomodation. Her doctoral research focuses on rethinking urban public spaces through the lens of young children's rights, needs, and perspective.

Andrea Manciaracina PhD in Design and researcher at the Design Department of the Politecnico di Milano. His research focuses on the relationship between visual communication, spaces, and services to implement social innovation-oriented strategies and promote human interaction in spaces.

Mathew Spialtini is a Research Fellow at Università degli Studi di Milano and a Research Collaborator at the Polimi DESIS Lab, Politecnico di Milano. He holds a Master's in Product Service System Design (2024), with a thesis on multispecies design in hybrid urban spaces. He is also a Teaching Assistant at the School of Design, Politecnico di Milano.

PLAY TOGETHER: Designing Parenting in Prison.

Loredana Di Lucchio*[a] & Giorgia Tempestini[a]

a Sapienza University of Rome

*loredana.dilucchio@uniroma1.it

ABSTRACT | The paper reports on a multidisciplinary research action that was set up in response to a university call for Third Mission projects.
The aim of the multidisciplinary project entitled "Fathers and Sons" is to improve the quality of time, however limited, that children spend with their parents in prison, by designing a physical and psychological meeting space for them.
Specifically, this multidisciplinary project, which brings together experts from the fields of architecture, psychology, humanities, theatre and law, is aimed at fathers in prison with children aged between 3 and 7. The work was divided into three distinct phases: 1) the analysis of the literature on parenting in prison and play; 2) the design phase of different types of toys; 3) the evaluation of the products created through workshops with inmate fathers of an Italian prison.
In particular, the role of design is to develop a series of toys designed on the basis of the existing literature on play and parenting in prison. In fact, play is not a mere recreational activity, intrinsically motivated and unfinished, but an essential element for the child's development and the establishment of healthy and functional relationships (Neale, 2020).
More specifically, studies investigating the links between play involving fathers and children suggest that play with fathers may contribute positively to children's social, emotional and cognitive outcomes (Amodia-Bidakowska et al., 2020).
The central element of parenthood is 'generativity', the ability to responsibly care for what has been generated, providing care and support to ensure psycho-affective maturation (Erickson, 1982). Becoming a parent is therefore an ongoing process that requires skills, knowledge and flexibility depending on the stage of life that parents and children are going through (Cassibba et al, 2008).
Being an imprisoned father therefore falls into the category of parenting at risk, as the condition of imprisonment makes some basic assumptions of parenting disappear (Sala & Zampieri, 2020; Dargis & Mitchell-Somoza, 2021). Indeed, imprisonment interrupts or

modifies the two-way and reciprocal nature of the communicative and interactive relationship between parent and child, and does not allow the parent to exercise physical,
L. Di Lucchio & G. Tempestini
spatial and temporal continuity.
This condition is becoming the object of attention and discussion by institutions and associations, which are increasingly promoting prevention and promotion processes aimed at ensuring that the detained person is able to cultivate relationships with their children in an appropriate and functional manner, with the secondary aim of also reducing the likelihood of recidivism and building a greater sense of social responsibility (Nardone, 2016).
Indeed, several authors have argued for the importance of thinking critically about the physical spaces and environments within correctional institutions, which are rarely designed to be child-friendly (e.g. Peterson et al., 2015; Arditti, 2008). However, few studies have explored how activities should be designed during the time that inmates and children have the opportunity to spend together. Using a co-design approach and participatory design tools, the research also helps to understand how design can play an active role within a multidisciplinary team to improve a more ethical management of social issues.

KEYWORDS | DESIGN FOR SOCIAL INNOVATION; PARENTAL FUNCTIONS; PLAY & RE-EDUCATION

1. Introduction

The world of design and the prison context seem to be two worlds that are apparently totally at odds: the former is focused on the search for beauty and the greatest possible comfort through creativity and innovation; the latter, on the other hand, is aimed at finding minimally functional solutions that allow those who have to live it to survive. The encounter between these two worlds has not been studied in the scientific literature, especially with respect to the improvement of certain aspects of prison life that seem to be, for the institutions, marginal. Despite this, it is important to reflect on how much the meeting of these two contexts can produce benefits at different levels: firstly, a benefit for the inmates who live their daily lives within the prison context, secondly for the people who work within it, for the inmates' families and for society as a whole who benefit from improving the inmates' lifestyle and from caring for certain spaces that they too have to share.

When this happens, design becomes a bridge between the 'inside' and the 'outside', in which the production of new skills, new stimuli, and new aspirations allows the 'outside' to understand how there is an 'inside' that should not be forgotten and that is part, albeit sometimes forgotten, of our society. The 'Play Together' project is part of a much broader initiative involving various departments of the Sapienza University of Rome, in which teachers, researchers and students from Architecture, Design, Psychology, Law, Humanities and Public Health collaborate. The interdisciplinarity of the professionals involved in this project has been a fundamental asset, allowing the issue of parenting in prison to be addressed from a broad and multifaceted perspective. The convergence of various areas of expertise made it possible to analyze every aspect of the issue, ensuring solutions that were not confined to a single field but could integrate effectively. This approach enabled not only the design of games aimed at facilitating the relationship between fathers and their children but also the redevelopment of spaces dedicated to family visits, making them more welcoming and functional. Moreover, collaboration among experts allowed for an in-depth study of the emotional and relational dynamics involved, identifying strategies to foster more spontaneous communication between parents and children, minimizing the constraints imposed by the prison environment. Psychologists contributed by developing activities to mitigate the emotional impact of prison visits on children, while designers focused on creating tools that could facilitate interaction and play in a setting that is often cold and inhibiting by nature. The legal framework was also taken into account to ensure that the proposed solutions were feasible and implementable within the prison system.

This process led to the creation of a structured and replicable intervention model, capable of adapting to different contexts and addressing the specific needs of the families involved. Based on the diverse professional expertise, a central objective was established: to enhance the physical and psychological well-being of incarcerated parents and their children by improving parenting skills. These skills could be tested through a range of activities, from the redevelopment of spaces for family interactions to the design and creation of games and stories for the children.

The work involved three distinct phases: 1) the analysis of literature on parenting in prison and play; 2) the design phase of different types of toys; 3) the evaluation of the products created through workshops with inmate fathers from an Italian prison.

2. Theoretical background: parenthood in prison

Being imprisoned fathers falls into the category of parentinġ at risk, as the condition of imprisonment makes certain basic prerequisites for the exercise of the parental function disappear (Sala & Zampieri, 2020). Prison life automatically interrupts and alters the two- way and reciprocal nature of the parent-child communicative and interactive relationship. An imprisoned father has difficulty in exercising the physical, spatial and temporal continuity that pertains to the role of parent. Thus, he is not in a position to guarantee the

transmission of trust and security to his son/daughter, which are fundamental for their growth. Although the custodial condition does not represent the only form of distant parenthood, it certainly represents the form of distance most marked, on a symbolic and factual level, by value judgements and attributions of merit. The problem, in this case, does not lie solely on the level of the father's distance, which may be physical but not necessarily psychological, but the question inevitably shifts to the reason why the father is distant and the daily absence of a figure essential to a child's development. Family detention can, in fact, alter family dynamics, generating in children a sense of responsibility for caring for adults in the family unit who are not detained (Leeson & Morgan, 2019). Research agrees that when a family member is detained, the harm to children is great (Condry & Minson, 2021). In addition to all that this entails in terms of the growth and development of the child

and the entire family unit, families experience the detention of the parent with a great sense of shame and a desire to keep the detention a secret, leading children to further isolation and the difficulty of having to answer questions about their father figure with suffering and discomfort (Payler et al., 2024). The challenges of the parental role in prison are, therefore, numerous (Dargis & Mitchell-Somoza, 2021). First and foremost, one challenge that needs to be addressed is that of interviews and contact arrangements between incarcerated parents and their children. Institutional policies, which increasingly emphasise the maintenance of family relationships, limit the frequency and quality of contact between detained parents and children. Even the modes of contact, although permitted, are restricted with respect to duration and the list of contacts that are approved and can be contacted. This aspect is closely linked to the issue of communication, which is characterised by very high barriers, such as the monitoring of calls and emails, limited visits or visits made in contexts not always appropriate for minors, high costs for phone calls or emails and distance between the place of detention and the residence of the detainee's family. Another challenge is, from a more relational point of view, the relationship with the child's main caregiver which, presumably, in the case of detained fathers is the mother. Communication between the detained parent and the child often depends on the availability of the main caregiver, who may have to face additional practical and psychological burdens to facilitate such interactions. If the relationship between the prisoner and the caregiver is conflictual, maintaining the bond with the child becomes even more difficult.
One aspect to be taken into consideration when addressing this topic is the beneficial effect that the father-child relationship under these conditions can have on the child himself and the father (Shlafer et al., 2015). Although in-person visits can offer significant benefits, they can also exacerbate pre-existing relational problems. Studies have shown that imprisoned parents often experience high levels of disengagement and low family cohesion even before incarceration, dynamics that tend to worsen following incarceration. Despite these difficulties, numerous studies show that maintaining contact between imprisoned parents and their children offers significant benefits. Constant contact during imprisonment is a positive predictor for family reunification after release and reduces the risk of reoffending. Children also benefit from remaining in contact with incarcerated parents: studies show that this continuity can provide a sense of stability, reduce the trauma of separation and even improve school performance. In contrast, children who do not maintain any contact with the incarcerated parent more frequently report feelings of isolation and anxiety

3. The role of design in the prison context

3.1. Designing spaces and toys

Play is certainly a very important aspect of children's personality development, being not only the main preschool activity but, above all, a learning tool for children (Verkhoturova et al. 2016). Indeed, play is not merely a recreational activity, intrinsically motivated and unfulfilled, but an essential element in the child's development and the establishment of healthy and functional relationships (Neale, 2020). Although the main focus of play is the enjoyment and education of the child, it should not be forgotten that play is an activity provided by adults who teach children how to play and introduce them to socially accepted ways of playing. During early childhood, this role is mainly played by parents who, however, do not always possess the necessary skills to organise play interaction with children. In this regard, there is a contradiction between the need to develop children's play activities at an early age and the unpreparedness of a significant number of parents to perform this role. If we contextualise this discourse to the detention situation, we realise even more that the problem is not only unpreparedness, which the literature has already observed to be a problem in itself, but also the inability to initiate their children into the healthy and functional idea of play, lacking the concrete possibility of creating playful interactions. In this work, the design is precisely concerned with developing a series of toys on the basis of the existing literature, taking the delicate context into consideration. The main focus is on father-child interactions, considering that the literature agrees that the links between fathers' and children's play suggest that play with fathers can contribute positively to children's social, emotional and cognitive outcomes (Amodia-Bidakowska et al., 2020). Several authors have argued the importance of thinking critically about the physical spaces and environments within correctional institutions, which are rarely designed child-friendly (e.g. Peterson et al., 2015; Arditti, 2008). Rethinking physical spaces by

creating more welcoming spaces, with furniture that is more conducive to closeness and decreasing the discomfort inherent in the context, can positively affect the quality of time that father and child spend together.
In these challenges, design plays a crucial role: not only does it allow for the creation of playful tools that are accessible, suited to the needs of both the children and the prison itself, and engaging, but it also enables a simple encounter to be transformed into an experience that is more meaningful and emotionally enriching.
However, few studies have explored how activities should be designed during the time prisoners and children have the opportunity to spend together. The interdisciplinary nature of this work aims to do just that: to intersect the skills of design, architecture and psychology professionals to ensure that an environment that is inadequate for children and hostile to the creation of quality time between parents and children becomes adequate and functional for the development of healthy relationships.

3.2. The Toys

The games presented in this paper were designed by female design students from the Department of Planning, Design and Architectural Technology, under the supervision of Design Professionals and Prison Psychologists. After a careful analysis of the literature relating to the prison context, the father-child relationship and existing games for children aged 0 to 10, the students set about creating the games, focusing on certain aspects, including:
• The improvement of the quality of time that fathers and children spend together;
• The implementation of the father's communication and emotional skills with respect to the child's needs;
• The feasibility of the games with respect to the context and the materials allowed within the context;
• The possibility of creating a game that would not only be used during the interview time but could leave father and child with a memory for all the days after the interview and before the one to follow;
• The consideration of the developmental stages of pre-school and school children.
The games that reached their final version and were then presented to the inmates are described in the following section.
"Let's Shape it!" (Figure 1)
The aim of this toy is to fostering collaboration between fathers and their child allowing them to create something together. The game is based on a very simple but effective concept: the creation of simple images that require the commitment and participation of both. The geometric figures to be used are basic ones, such as the square, the circle, the triangle or the hexagon. To make the experience more engaging, before making the figure, participants have to draw from a pack of cards to find out which figure they are supposed to represent. At the end of the game, a tag can be attached to the picture on which father and son can write whatever they like, their name, the name of the picture or the date on which they made it, so as to have a memento of the moment spent together.
"Mosaichiamo" (Doing Mosaic) (Figure 2)
In this case the aim has been to foster collaboration between father and son. The game has two basic components: the pack of cards with cognitive questions that compete with personal tastes, the emotional sphere and critical thinking, and the mosaic tiles that involve creativity and collaboration. The way Mosaichiamo works is as follows: in turn, you have to draw a card and answer the question, according to the symbol on it you take a tile of the corresponding shape (the player can freely choose only the colour not its shape). Once the card has been chosen, it must be placed where you want on the bottom of the cover. The game ends when the players feel they have completed the entire mosaic. Considering that the purpose of this game is one of cooperation, there is no possibility of winning or losing. (Being a cooperative game, there are no winners or losers).
"Caccia alle sfide" (Hunting for challenges). (Figure 3)

This game takes up the traditional rules of the “game of goose” but introduces a more physical and engaging dynamic: the players, instead of moving a pawn on a board, become the pawns themselves and physically move along the squares of the course, determining their movements by throwing a dice. Each square on the course represents a different challenge to be tackled, depending on the category: motor challenges (challenges involving simple physical activities), emotional challenges (activities designed to help children express their feelings), quiz challenges (simple questions and answers on topics appropriate to the child's age) and riddle challenges (word games that stimulate the child's imagination and logic). The ultimate goal of the game, as in the traditional game, is to get to the final box.

“La nostra storia in una foto” (Our story in a shot). ((Figure 4)

This game aims to facilitate the maintenance of the family bond through shared storytelling, providing an opportunity to have an engaging moment where children can express their emotions and strengthen their connection with the parent. The game consists of the customisation of felt puppets, which can be dressed up and accessorized, allowing for the creation of characters with which parent and child can identify. By customising the characters, the child can play themselves, the parent or other family members, experiencing different dynamics and roles. By choosing clothes and accessories, the child can continuously change the appearance of the characters according to the narrative context, which will then be immortalised in a kind of ‘family photo’. The characters are shaped neutrally and without specific traits, so that they can be adapted to any context. Clothes and accessories offer endless customisation possibilities, making each game experience unique and meaningful.

“In viaggio con papa” (Traveling with Dad). ((Figure 5)

This game represents a path to take together, full of precious moments of mutual discovery. Inspired by the structure of the Game of the Goose, it has been simplified into a practical kit and made more dynamic to keep the attention of even the youngest children and make the playful experience engaging. Participants, with their own pawns, roll the dice and advance on the board, facing trials of various kinds, divided into two types of cards: the yellow ‘Mime’ cards, invite players to mime different animals, offering a simple and humorous interaction that requires only the use of one's body; the green ‘Activity’ cards, propose motor challenges and gestures to be reproduced, encouraging a more direct and physical interaction with the other players. The objective of the game is to get to the last square first.

4. Workshop at an Italian Prison Institute

4.1. Participants

The workshop participants were selected on the basis of specific criteria to ensure the relevance of the intervention and compatibility with the project objectives.

The inclusion criteria were the following:

- Being parents of children in the age groups 0-6 years or 7-12 years, to ensure that the proposed games were appropriate to the development and interests of the children.
- Having an end of sentence less than or equal to one year, in order to focus on prisoners close to release and facilitate the continuity of the father-child relationship after release.
- Not having been convicted of crimes related to domestic violence or ill-treatment, in order to protect the well-being of the children involved and ensure a safe and constructive environment during the workshop.

In total, 25 inmates took part in the two project meetings. To facilitate more effective interaction and in-depth discussion, the participants were divided into two groups of 10-15 people.

For privacy reasons, the only information available on the participants concerns the age and residence of their children. The children are aged between 4 and 10 years and all reside in Italy, within a family context with the presence of at least one relative. Some detainees were born abroad but live permanently in Italy, while none of the children currently reside in care facilities for minors in fragile situations, such as foster homes or protected houses. This targeted

selection made it possible to work with a group of inmates for whom strengthening the bond with their children represented a key element of the reintegration pathway, making the workshop a significant opportunity to promote affective continuity and relational well-being within the prison context.

4.2. Procedure

After the design phase, the games underwent a rigorous evaluation by a commission of experts composed of psychologists, pedagogues, educators and designers. This multidisciplinary group reviewed each product according to several criteria: adherence to pedagogical and psychological theories, appropriateness to the prison context, functionality and usability, feasibility in terms of materials and available space, and playability, i.e. the ability of the game to actively involve parents and children. Following this review, the games were divided into categories based on their nature and educational objectives: some focused on cognitive development and communication skills, while others emphasised the physical and sensory dimension, encouraging contact and active participation.

The experimentation phase took place through a workshop in the prison, during which a designer presented the inmates with a selection of games designed to foster the father- child relationship during interviews. After an initial explanation of the purpose and mechanics of the games, the participants were given the opportunity to interact directly with the materials, observing their operation and testing their dynamics. The aim was to understand how such tools could facilitate communication, stimulate cooperation and strengthen the emotional bond between parents and their children in a complex context such as prison. Subsequently, a focus group was organized, in which the inmates shared their direct impressions and experiences. The discussion focused on various aspects, including the accessibility of the games, the ease of use, the effectiveness in engaging children emotionally and the ability to make the time spent together more meaningful and peaceful. To ensure a structured collection of observations, participants were provided with an evaluation form which allowed them to note down personal reflections, suggestions for improvement and any critical issues encountered.

The information collected was fundamental to further refine the games, adapting them to the specific needs of the penitentiary context. The feedback made it possible to identify any practical obstacles, improve the game instructions and refine the dynamics to make them more intuitive and engaging. The entire process represented an important opportunity not only to test the toys, but also to enhance the role of prisoners as active co- designers, strengthening the sense of participation and responsibility in improving the experiences of meeting with their children.

4.3. Discussion and conclusion

The theme proposed in this project immediately proved to be appealing to those who worked on it, the direct beneficiaries of the activities, and the institutions involved. The inmates actively participated in all the activities in which they were involved, quickly grasping their deep meaning and recognizing the project’s functionality.

The creation of toys for children sparked immediate curiosity among the inmates, who engaged in in-depth discussions on various aspects, including materials, feasibility, children's engagement, the possibility of playing with multiple participants, and originality. These elements were debated both among the inmates themselves and with professionals. It emerged that penitentiary facilities have very limited availability of toys that can be used with children, and the few that do exist do not allow for continuous interaction with their children. Additionally, there are no toys that allow the child to take a piece home, serving as both a keepsake and a continuity element until the next visit.

This point is particularly significant for inmates, who report experiencing great distress in the waiting time between visits, struggling to find effective ways to interact with their children during phone and video calls, especially when they are very young and still pre- verbal. The

possibility of having a toy that could serve as a discussion topic and involve the child even from a distance is considered a valuable resource by the inmates themselves. This would enhance their parental self-efficacy by providing tools to maintain the child's attention during calls and facilitate communication.
Another crucial aspect highlighted by the inmates is the importance of physical participation in play: the ability to have physical contact, move, and share spaces is fundamental for enhancing the play experience and enabling father-child interaction even when cognitive or emotional resources are limited.
Regarding the usefulness of these toys and the significance of the father-child relationship, inmates emphasized an essential point: the broader impact of the project on social reintegration. The key aspects identified include:
- Strengthening family bonds: Positive parenting fosters responsibility and a sense of belonging, motivating inmates to adopt constructive behavior both inside and outside prison.
- Reducing the risk of recidivism: Feeling needed and appreciated as a parent lowers the risk of self-sabotaging behaviors and social disengagement, encouraging inmates to pursue personal change and reintegration into society. Reclaiming the parental role helps build a future-oriented vision centered on both individual and family well-being.
- Improving social and communication skills: The project provides a shared experience among participants—the role of a father—which involves continuous challenges. Engaging with other inmates in similar situations facilitates open and emotionally meaningful communication.
- Intergenerational impact: By prioritizing the well-being of children, fostering a positive relationship with their incarcerated parent reduces the risk of behavioral difficulties and social marginalization, ultimately benefiting the broader community by creating a more stable and inclusive social environment.
- Restructuring personal beliefs and values: Positive parenting serves as a powerful tool for developing key values such as responsibility, empathy, and duty—essential elements for effective and lasting reintegration into society. Through caring for their children, inmates gain deeper awareness of the consequences of their actions and learn to consider the needs and rights of others, particularly their own children.
These findings highlight the project’s potential to be expanded and implemented in other penitentiary institutions. Moreover, adapting it to different European contexts while considering country-specific legal frameworks and cultural practices could further enhance its impact.
In conclusion, the project has demonstrated a significant effect not only on the father-child relationship but also on the emotional well-being of inmates and their perception of their parental role. The enthusiasm and active participation of the inmates underscore the need for concrete tools to maintain strong family bonds even within the prison system. Furthermore, the project’s positive outcomes—such as the strengthening of parental skills, reduction of recidivism risk, and improvement of social dynamics—suggest the feasibility of extending it to other penitentiary institutions in Italy and beyond. By adapting the model to the specific legal and cultural contexts of each country, it could serve as a valuable tool to support inmates’ social reintegration and improve the well-being of their children, ultimately contributing to a more inclusive society that values and nurtures family relationships.

ABSTRACT | This research explores how discursive design can expand problematization and generate insights into culturally tailored and targeted (CTT) smoking cessation interventions for LGBTQ+ populations. Given the persistent tobacco use disparities facing this population and the limitations of conventional, evidence-based interventions, alternative approaches to intervention development are needed as complements to traditional methods.

We developed and presented two pairs of discursive speculative interventions to three focus groups composed of public health experts and social work, psychology, and chemistry professionals, who often collaborate on developing public health interventions. The concepts ranged from passive, receipt-based quit messaging to more provocative strategies, such as deepfake-driven behavior disruption and two-factor authentication for vaping devices. The objective was to assess whether discursive design could surface new perspectives on CTT strategies, highlight overlooked considerations, and inspire novel intervention possibilities.

Findings suggest that discursive design effectively provoked critical dialogue around the feasibility, ethics, and unintended consequences of CTT interventions. However, participants varied in how deeply they engaged with CTT strategies. Those with knowledge of LGBTQ+ populations reflected more critically on sociocultural tailoring, while others focused primarily on feasibility. Some participants also struggled to suspend their disbelief in engaging with

the concepts, pointing to challenges in applying discursive methods within traditional public health paradigms.

In demonstrating design's potential to contribute to problematizing culturally relevant intervention strategies, this study underscores the value of interdisciplinary approaches in addressing health disparities. It invites public health professionals to reconsider how alternative methods of problem framing can lead to more responsive and innovative interventions.

KEYWORDS | Public Health, Discursive Design, Problematizing, Focus Group, Smoking Cessation

1. Introduction

The tobacco industry has a long history of leveraging design to entice consumers, from iconic advertising featuring the Marlboro Man by Leo Burnett and cigarette "tap-tap" packaging to attractive vaping devices (DiFranza et al., 2003; Wakefield et al., 2002). In contrast, despite growing recognition of the value design brings to public health initiatives (Bazzano and Martin, 2017), its roles often remain limited. Designers are typically brought in late in the intervention development process—relegated to adding the final coat of varnish, rather than shaping the intervention from the start. This disconnect stems from a misunderstanding of design's original capacity to problematize and nurture a particular moral phenomenology (Proulx, 2019; Proulx et al., 2019).

Part of a broader body of research addressing smoking cessation among LGBTQ+ populations—a group with nearly double the smoking prevalence of the general population (Riley et al., 2023)—this research explores how designers can surface new issues and opportunities for culturally tailored and targeted (CTT) public health interventions. Indeed, while evidence-based interventions have made strides in reducing smoking prevalence in the general population, their success in attenuating tobacco use disparities is limited. Therefore, further research remains essential to grow our understanding of the issues at stake and explore alternative intervention methods (Baskerville et al., 2017).

To expand the problematization of, and bolster perspectives on, alternative approaches to reducing tobacco use and dependence among LGBTQ+ populations, we organized three focus groups with public health and allied experts. We gathered experts' reactions to four discursive and speculative design concepts in these focus groups. Drawing on methodologies from Auger (2013), Tharp & Tharp (2013, 2018), and Kinch et al. (2024), the design concepts envisioned uncanny, radical, and preposterous—yet culturally relevant—smoking cessation interventions, intended to provoke critical reflection and foster nuanced dialogue among participants.

This paper presents the intervention concepts, a summary of experts' responses, and a discussion of the value a design perspective brings to the problematization of CTT smoking cessation interventions. Ultimately, our research highlights the potential contributions of design in public health and expands the conversation on culturally responsive strategies to reduce health disparities.

2. Background

2.1. Persistent Challenges in Public Health

Despite ongoing efforts to address public health challenges, many problems persist, with tobacco cessation standing out as a particularly wicked problem (Rittel & Webber, 1973). While the landmark 1964 Surgeon General's report (Lushniak et al., 1964) initiated a new wave of research aimed at developing multilevel, evidence-based interventions to reduce tobacco use (US Dept HHS, 2020), declines in smoking rates have not been realized across all populations, including LGBTQ+ people (Li et al., 2021; Buchting et al., 2017). Emerging literature in LGBTQ+ tobacco control reveals a complex web of psychosocial and environmental factors that contribute to elevated tobacco use rates, including structural stigma (i.e., discriminatory laws and practices), interpersonal minority stress and coping, targeted marketing by the tobacco industry, and social tobacco norms.

Yet despite these realities, LGBTQ+ populations remain underrepresented in public health research: only 0.8% of National Institutes of Health funding addresses LGBTQ+ people—most of it focused on HIV prevention and treatment (Wiedeman et al., 2025)—and less than 2% goes to tobacco research (Hughs et al., 2016), with awarded research projects in decline (Meissner et al., 2022).

2.2. Limitations of an Evidence-Based Approach

These gaps are problematic because evidence-based approaches—often the foundation of public health intervention development—rely on reviewing existing data and scientific literature to help define the health problem; understand the priority population and context; and identify facilitators, barriers, and uncertainties related to implementation (O'Cathain et al., 2019). However, without robust funding for LGBTQ+- and tobacco-focused research, our ability to develop evidence-based interventions to reduce tobacco use disparities among this priority population is limited

Furthermore, while evidence-based approaches are valuable for grounding interventions in established knowledge to support feasibility and effectiveness, they are often based on generalized perspectives. These can constrain our ability to respond to the particularized and nuanced realities of tobacco use cessation in specific populations and contexts. Accordingly, this traditional approach may fall short in producing solutions that fully address the needs of LGBTQ+ populations.

To better address the complex social and cultural factors that drive tobacco use disparities, LGBTQ+ health researchers recommend applying cultural tailoring and targeting (CTT) to interventions (Antin et al., 2024; Patterson et al., 2024). Generally, CTT requires systematically modifying evidence-based interventions to align them with specific populations' psychosocial experiences, norms, beliefs, and actions (Lapinski et al., 2024). Evidence indicates that adding CTT components to evidence-based tobacco cessation interventions intended for the general population can improve cessation rates among minoritized populations (Leinberger-Jabari et al., 2023).

2.3. The Need for Alternative Problematization Methods

While CTT can lead to more culturally responsive solutions, their development often

remains grounded in what is considered 'probable' or 'plausible' (Voros, 2017), shaped by existing evidence. This orientation, rooted in "our current understanding of how the world works" (Voros, 2017), may limit innovation, yielding only incremental advancements (Verganti, 2008) when more novel approaches are needed. So we ask: What else might be possible? What perspectives or pathways remain unexplored, and might they more effectively address tobacco-related disparities among LGBTQ+ populations?

We therefore see a need to explore alternative approaches to problematization—ones that do not *replace* evidence but *complement* it. Methods that foster critical reflection, provoke new questions, and surface underexamined issues early in the process can expand how we conceptualize intervention strategies, uncovering novel insights and ideas that can later be refined and tested through traditional evidence-based approaches. We argue that discursive design is one such method, offering a way to approach smoking cessation from a different angle, unpack the complexities of public health challenges, and expand the space for innovation in intervention development.

2.4. Discursive Design in Public Health

As described by Tharp & Tharp (2013), discursive design involves creating artifacts as "tools for thinking"—designs not intended for real-world, practical implementation but aimed at stimulating reflection and "substantive, values-based exchange" among an audience about an intended discourse (pp.407–408). By leveraging the "visual and experiential" qualities of artifacts (Tharp & Tharp, 2018, p.115), this approach can stimulate "critical assessment" of an idea and "personal or emotive reflection" (p.118). In this way, discursive design can provoke alternative perspectives on problems that evidence-based methods alone may not.

Discursive design can be utilized in applied research, particularly as we envision its use in public health, to create artifacts that probe "subjects' attitudes, beliefs, and values that are otherwise more difficult for researchers to access" (Tharp & Tharp, 2018, p.292). This problematization process, facilitated through design artifacts, fosters a "better understanding of the issue" and ultimately supports the creation of "better products, services, and systems," or, in our case, interventions aimed at addressing health disparities (Tharp & Tharp, 2018, p.292).

3. Research Goal and Methodology

To examine the relevance of discursive design in surfacing new ways of accounting for culturally relevant public health interventions, we developed and presented two intervention concept pairs to three focus groups of public health and allied experts. These concepts—or discursive artifacts—served as stimuli to provoke reflection on the assumptions, limitations, and alternative possibilities of CTT strategies. Drawing on insights from these sessions, which engaged six participants, we analyzed *whether* and *how* the discussions problematized components of CTT and explored the perceived utility of discursive methods. To guide this inquiry, the study asks:

How might discursive design participate in the problematization of culturally tailored and targeted strategies aimed at envisioning innovative solutions for public health disparities?

This working paper presents preliminary findings from ongoing research examining the capacity of discursive design to expand conversations about cultural relevance and surface innovative strategies to address health disparities. In response to emergent insights from the focus groups, the study also proposes hypotheses about factors shaping experts' engagement with CTT problematization. Furthermore, we offer recommendations for refining discursive design methodologies to strengthen their contribution to public health intervention development.

3.1. Discursive Speculative Artifacts Development

A central component of our methodology involved designing discursive artifacts that could provoke critical examination of CTT strategies for LGBTQ+ populations. The development of these intervention concepts was informed by three key areas of literature:

1. Frameworks for developing provocative discursive and speculative designs (Auger, 2013; Kinch et al., 2024; Tharp & Tharp, 2013, 2018; Voros, 2017);
2. Approaches to cultural tailoring and targeting (Kreuter et al., 2003); and
3. Research on the unique determinants of tobacco use among LGBTQ+ populations, including cessation barriers, psychosocial experiences, norms, beliefs, and behaviors from a broad body of public health literature.

A key influence in shaping the artifacts was Kinch et al.'s (2024) playful speculative design framework, which emphasizes exploring the "peripheral design space" they call "the preposterous" (p. 3). This concept originates from Voros' (2017) expansion of Hancock and Bezold's (1994) Futures Cone framework (Figure 1), which defines preposterous futures as "the futures we judge to be 'ridiculous,' 'impossible,' or that will 'never' occur."

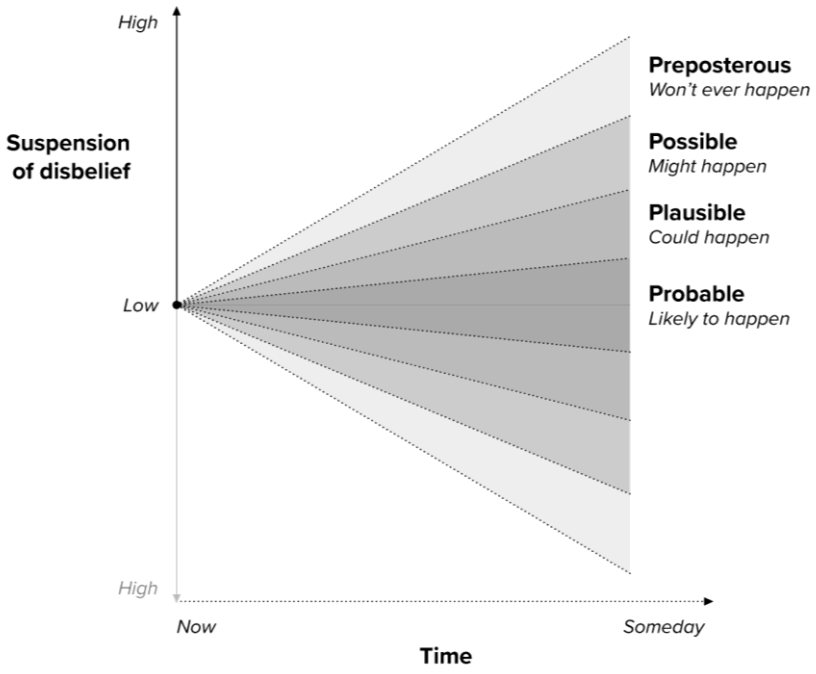

Figure 1. Futures Cone diagram adapted from Kinch et al. (2024), based on Voros' (2017) Futures Cone.

Preposterous alternatives stand in contrast to the 'probable', 'plausible', and 'possible' futures—categories that reflect what is likely, could, or might happen. These futures, we argue, parallel the conceptual space in which most public health interventions are currently imagined: bounded by feasibility, realism, and precedent. Kinch et al. (2024) suggest that venturing into preposterous territory "challenges our conventional thinking and ignites curiosity" by tapping into our imaginative capacities (p. 6). This framing aligned well with our aims: not to propose implementable solutions but to use speculative provocation as a means of problematizing CTT in tobacco cessation—and expanding the range of possibilities considered in intervention design.

To structure participant engagement, we presented the speculative interventions as contrasting pairs: each included one "conventional" intervention—aligned with a probable or plausible future—and one "preposterous" alternative. Each pair was grounded in a shared strategy or context to foreground their contrast. This juxtaposition aimed to provoke deeper reflection through two mechanisms. First, the conventional intervention served as an accessible entry point, offering familiar conditions to help participants ground their understanding—a framing informed by Auger's (2013) "ecological approach."

Second, the preposterous intervention, presented afterward, was designed to amplify cognitive dissonance and evoke what Freud described as "the uncanny," as discussed by Auger (2013), thereby encouraging more critical engagement with the assumptions underpinning culturally tailored intervention strategies. To support this effect, we presented the concepts as high-fidelity visual mockups embedded in narrative scenarios. A step-by-step slideshow guided participants through each intervention's context and application, fostering an immersive experience that encouraged them to imagine the interventions as real, supporting reflection.

3.2. Participant Sampling and Recruitment

Six participants were recruited via professional networks for their expertise in tobacco regulation, prevention, cessation, and LGBTQ+ health. They included public health experts specializing in health behavior and health promotion, epidemiology, and environmental health, along with professionals from social work, psychology, and chemistry, reflecting the interdisciplinary nature of intervention development.

3.3. Focus Group Procedures

Focus group sessions were conducted via Zoom, each lasting 1.5 hours and including two participants to allow for in-depth discussion. Participants signed digital consent forms permitting video and audio recording for transcription and analysis. All sessions followed a similar structure (Table 1).

Table 1. Phases of the Discursive Design Focus Groups.

Phase	**Procedures**
Phase 1: Overview of Discursive Design	Sessions began with introductions and an overview of discursive design and its hypothesized potential for problematizing public health challenges. The concept of "the preposterous," framed via Voros' (2017) Futures Cone, was introduced to explain the rationale for exploring speculative interventions.

	The phase concluded with a session outline, space for clarifying questions, and reaffirmation of recording consent.
Phase 2: Engagement with Discursive Design	Participants engaged in reflection and discussion of two contrasting intervention pairs (conventional vs. preposterous), each presented through scenarios. For each intervention: 1) a theme overview was given; 2) participants viewed a scenario walkthrough; 3) they completed a written reflection; and 4) they participated in a group discussion. The second pair omitted written and verbal reflection for the conventional intervention to allow more time for the preposterous concept.
Phase 3: Wrap-Up and Reflection on Discursive Design	Participants reflected on the value of discursive design for public health, guided by three discussion questions on its usefulness, limitations, and the role of designers in public health.

3.4. Analysis

Focus group transcripts were analyzed thematically using a mix of descriptive and interpretive coding strategies (Adu, 2019b, p. 57) to assess whether participants problematized aspects of CTT—thereby evaluating the method's impact—and to generate hypotheses about factors influencing the depth and focus of their responses.

4. Discursive Speculative Intervention Pairs

4.1. Pair 1: From Passive Cues to Direct Confrontation—Cultural Targeted and Tailored Interventions at the Point of Purchase

This intervention pair explores the point of purchase as a strategic setting for engaging LGBTQ+ people who smoke through culturally tailored and targeted (CTT) interventions. National policies requiring health warnings on cigarette packaging illustrate this setting's potential to prompt reflection at a critical moment of decision-making (Hammond et al., 2007). These concepts are responses to key questions: What other opportunities exist to intervene in this context? How can such interventions be made more engaging and relevant for priority populations?

In terms of tailoring and targeting, the conventional concept (Table 2, Figure 2) uses a peripheral targeting approach, making explicit references to LGBTQ+ identity (Kreuter et al., 2003, p.135). The preposterous concept (Table 3, Figure 3), by contrast, uses deeper sociocultural tailoring—subtly embedding LGBTQ+ values and experiences (Kreuter et al., 2003, p.136) by referencing minority stress and chosen family (Abreu et al., 2023).

Table 2. Pair 1: Conventional Concept Description.

Concept Type	**Description**
Conventional: Receipt-Based Messaging for Inclusive, Peripherally	This intervention uses purchase receipts to deliver culturally targeted cessation messaging. At checkout, receipts print quitline information with inclusive phrasing (e.g., "Quit Tobacco Your Way") that reflects LGBTQ+

Targeted Cessation Support	values of acceptance and inclusion (Abreu et al., 2023). A QR code links to a quitline site with affirming language, LGBTQ+ imagery, and a visible badge indicating counselors have completed cultural competency training. The approach relies on passive messaging and voluntary engagement.

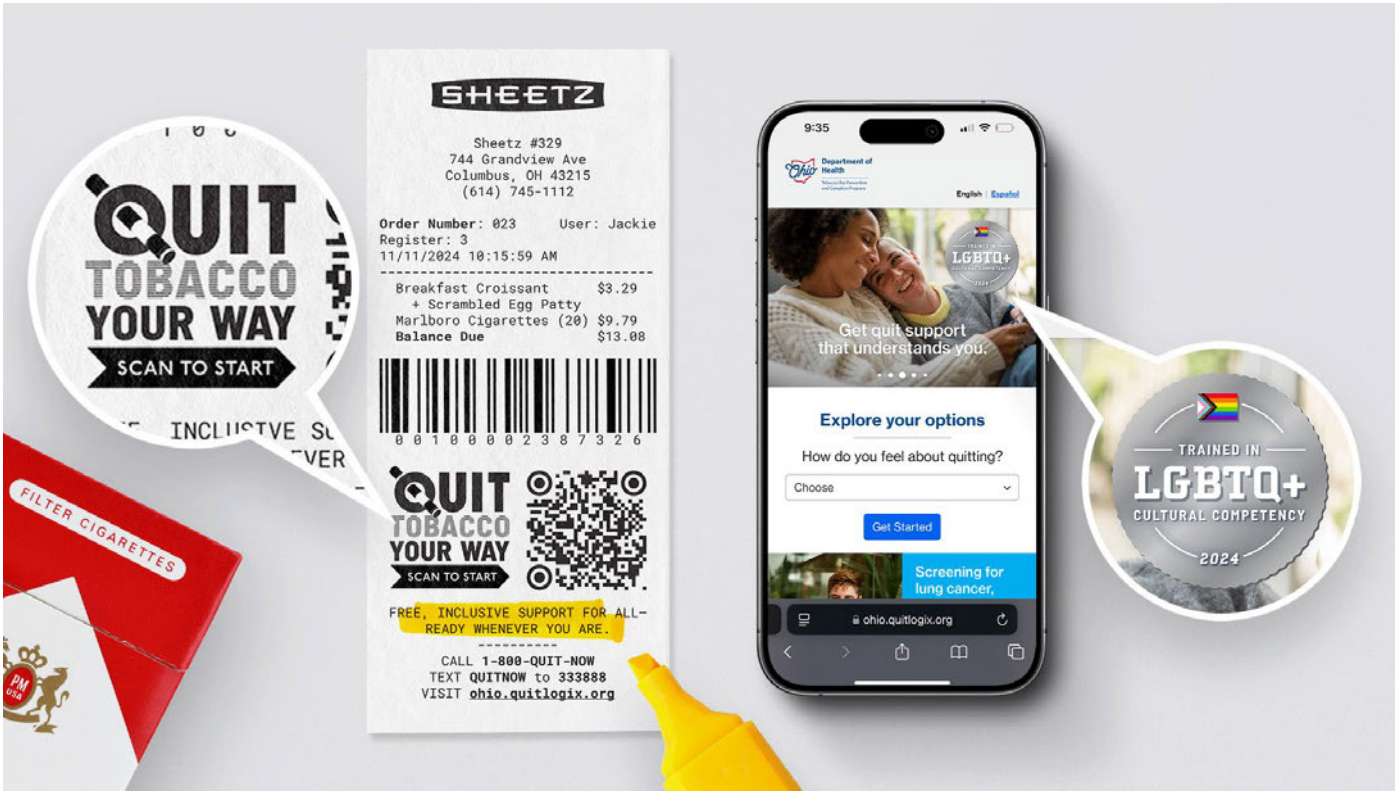

Figure 2. A point of Purchase intervention featuring purchase receipts with culturally targeted quit messaging. A QR code links to an LGBTQ+-inclusive quitline, with callouts highlighting affirming language and a counselor training badge.

Table 3. Pair 1: Preposterous Concept Description.

Concept Type	**Description**
Preposterous: Deepfake-Driven Personalization for Socioculturally Tailored Behavior Disruption	This preposterous intervention imagines a hyper-personalized tailoring strategy using RFID (radio frequency identification) to extract smartphone data at the point of sale. A deep fake video of the customer—generated via facial recognition and stored images—appears on the payment screen, delivering a socioculturally tailored anti-smoking message in their own voice. The message references personal relationships to heighten emotional impact and ends with a forced-choice prompt: "Will you remove the cigarettes from your purchase?" Unlike the conventional approach, this intervention uses intrusive, personalized messaging to confront the customer directly.

Figure 3. ***Bottom left***: A pop-up screen interrupts the purchase with a "Pause Before Purchase" message. ***Top***: A deepfake video uses the customer's likeness, voice, and personal photos (e.g., their home) to enhance the uncanny effect (Auger, 2013). ***Bottom right***: A forced-choice prompt asks whether to proceed or remove cigarettes from the purchase.

4.2. Pair 2: Disrupting Convenience to Challenge Vaping Behaviors—From Motivational to Coercive Sociocultural Approaches

The second intervention pair addresses e-cigarette cessation. Although vaping is often promoted as a harm reduction tool for cigarette use, it carries risks, especially for youth, due to its addictive nature and effects on brain development (Dinardo & Rome, 2019). The issue is particularly relevant to LGBTQ+ communities, where both LGBTQ+ youth (Truth Initiative, 2024) and LGB adults (U.S. Dept. HHS, 2024, p.92) report higher rates of e-cigarette use than their non-LGBTQ+ peers.

One driver of vaping uptake is convenience: vapes are discreet, odorless, and usable in places where smoking is banned (Kava et al., 2021). This pair explores how disrupting vaping's convenience might encourage cessation, contrasting a motivational approach (Table 4, Figure 4) with a coercive one (Table 5, Figure 5), while also examining deeper sociocultural strategies for CTT (Kreuter et al., 2003, p.136).

Table 4. Pair 2: Conventional Concept Description.

Concept Type	Description
Conventional: Supportive, Socioculturally Targeted Signage for Minority Stress-Driven Vaping Cessation	This intervention reimagines no-smoking/no-vaping signage by incorporating culturally targeted messaging with a sociocultural lens. It acknowledges stress—a common reason LGBTQ+ individuals vape—while directing viewers to cessation resources. Placed in LGBTQ+ bars, clubs, and other high-risk settings, the signs balance restriction with support, reinforcing inclusivity and encouraging cessation.

Figure 4. An intervention where no-smoking/no-vaping signage integrates stress-related messaging and a QR code linking to cessation resources—pairing restriction with support.

Table 5. Pair 2 : Preposterous Concept Description.

Concept Type	Description
Preposterous: Two-Factor Authentication as a Friction-Based Disruption to Social Vaping Norms	This preposterous speculative intervention imagines an FDA regulation requiring two-factor authentication (2FA) for vape devices to disrupt convenience and habitual use. When a user presses the activation button, a push notification prompts them to confirm: "Want to vape? Confirm to proceed." If they select yes, they must unlock the vape by holding their phone to their face for the duration of use. These added steps increase social visibility and friction, making vaping more time-consuming. In social settings like bars or workplaces, this verification process applies a sociocultural CTT approach by disrupting LGBTQ+ social vaping norms and potentially deterring use over time.

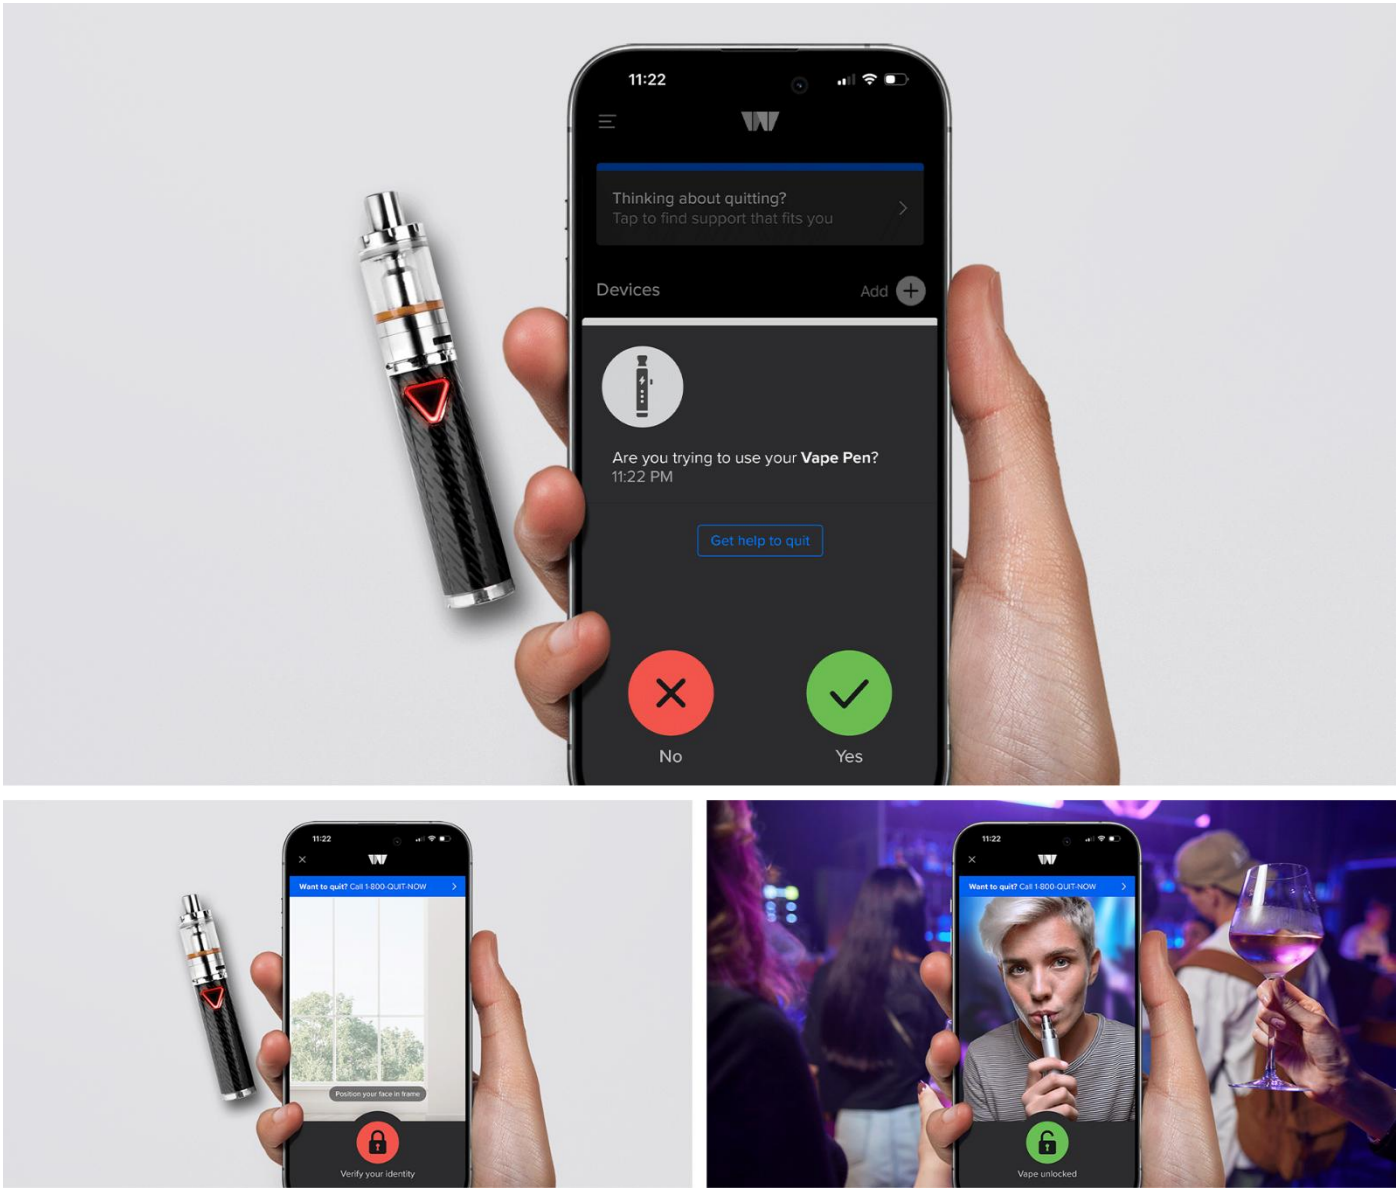

Figure 5. ***Top***: Attempting to activate the vape triggers a smartphone push notification requiring confirmation. ***Bottom left***: Users must hold their phone to their face for the vape to unlock; here, the device remains locked as the face is out of frame. ***Bottom right***: The intervention's visible authentication process disrupts social vaping norms, making use more conspicuous and potentially deterring habitual behavior.

5. Results and Discussion

5.1. Evaluating the Impact of Discursive Design

Tharp & Tharp (2018) note that measuring the impact of discursive design in applied research is challenging due to factors such as unintended consequences, both positive and negative, and variable contexts, which can produce variable responses (pp. 295–296). As such, they argue it is more important for discursive design to *have* an impact than to *measure* it (p. 285). Still, when evaluation is necessary, as in this study, they propose audience reflection as a baseline indicator of success (p. 290). Because reflection can be broad and ambiguous, they also outline a more structured framework of three successive levels of effectiveness for evaluating impact: relevant thinking, responses, and actionable insights. Table 6 summarizes these levels, including definitions, methods of assessment, and their application in this study.

Table 6. Levels of Impact in Evaluating the Success of Discursive Design in Applied Research.

Level of Impact	Primary Impact	Secondary Impact	Tertiary Impact
Indicator of Success	Relevant Thinking	Relevant Responses	Actionable Insights
Definition & Measurement	Occurs when the discursive artifacts "stimulate subjects' thinking [about the issues in question] to the extent that researchers subsequently determine that it is relevant and potentially useful" (Tharp & Tharp, 2018, p.292).	Occurs when participants "respond in ways that reveal information that is germane to the line of inquiry" to the extent that it can be collected and synthesized (Tharp & Tharp, 2018, p.292).	Occurs when the insights generated can directly or immediately "contribute to solutions or design outcomes" (Tharp & Tharp, 2018, p.292).
Application to This Study	Relevant thinking is defined as thought processes that problematize or act as fuel for deeper problematization of CTT in intervention development.	Relevant responses are spoken reflections that problematize or act as fuel for deeper problematization of CTT in intervention development.	Actionable insights are reflections that can directly inform the development of novel CTT solutions.

Since we cannot directly *access* participants' thoughts, our evaluation focuses on two measurable indicators: (1) relevant responses as an observable outcome of relevant thinking and (2) actionable insights derived from these responses.

5.2. Relevant Responses and Actionable Insights

This study first asked whether discursive design can effectively problematize CTT components to envision innovative solutions for public health disparities. Based on our analysis, we believe it can: indeed, participants generated relevant responses and actionable insights. Table 7 illustrates this with a sample of three responses.

Table 7. Sample of participant responses problematizing CTT strategies and corresponding actionable insights.

Intervention Discussed	**Participant Response**	**Aspect(s) of CTT Problematized**	**Derived Actionable Insight(s)**
Pair 1: Conventional Concept	"And then, once they get there [the quitline website], there's potential for cultural tailoring within that program. I guess the one thing that I thought might be difficult is the cultural tailoring because, you know, from the point they scan that code on the	Lack of automatic tailoring at the point of access; difficulty in ensuring a culturally tailored experience when users must self-select	Include an optional intake process upon accessing the quitline website (e.g., a brief survey or user-driven selection tool) to facilitate tailored messaging and resources.

	receipt, you don't know if the person is LGBTQ or any other aspect of cultural tailoring. So it would almost have to be, you know, self-select your tailoring pathway once you get there." (Participant 5)		
Pair 1: Preposterous Concept	"But I was thinking that some of these principles could work really well, again, if it was a more optional, personalized kind of thing. Cause I did find the references to family and things like that very relevant. So, if that's something Robin could input and then get reinforced back out at her […] it's a way of using some of this stuff in a way that's maybe more palatable to everybody involved [laughs]." (Participant 2)	Personalization of intervention content; potential aversion to forced tailoring methods	Implement optional personalization features where users input their own motivators (e.g., family, financial goals) to generate a tailored intervention response.
Pair 2: Preposterous Concept	"I've seen a lot of people vaping in real life at part[ies] or at social gatherings, [and] like outside of diner[s]. And they just vape there. And with their friends. It's not like a family dinner or lunch stuff. So it doesn't really, change much." (Participant 6)	Social reinforcement of vaping in peer settings; potential ineffectiveness of individualized cessation strategies in social contexts	Design interventions that disrupt social reinforcement of vaping rather than disrupting its convenience.

While some responses problematized CTT mechanisms—such as how discursive interventions signal inclusivity or personalize messaging (e.g., Participants 2 and 5)—others focused on broader concerns like feasibility and social context, including the challenge of addressing social reinforcement of vaping (Participant 6). These responses highlight multiple dimensions to consider in CTT intervention design.

Although the sample responses in Table 7 suggest that the discursive artifacts could spark relevant insights for CTT interventions, direct engagement with specific components of tailoring and targeting was somewhat limited. Participants more often raised concerns about feasibility, privacy, and general social acceptability than culturally relevant elements.

This pattern underscores a key strength of the discursive design methodology as applied in this study: by prompting early reflection through contextually situated artifacts, it can surface both CTT-related and broader implementation concerns often deferred until later stages, making implicit assumptions explicit and enabling more proactive, context-responsive problem-solving.

At the same time, the limited focus on CTT underscores the need to examine *what* participants chose to problematize, *why*, and *how deeply and readily* they engaged in

such problem framing. The following two sections outline key themes that emerged from our data and offer hypotheses about factors shaping expert engagement with the discursive speculative intervention concepts. If these hypotheses hold, they carry implications for who should be involved in discursive design sessions and how to support their engagement, both critical for generating meaningful impact.

5.3. Expertise and Problematization: Who Should Be at the Table?

Our preliminary findings suggest that participants' professional backgrounds shaped engagement with CTT problematization. Those with more LGBTQ+ health expertise seemed to offer more nuanced critiques, attending to the degree of tailoring and its broader implications. For instance, in response to Pair 1: Conventional Concept, Participant 2 reflected on the tension between a broad versus population-specific focus:

> "I really appreciated […] the broadly inclusive focus of the receipt. And then, say you did use the QR code and go to the website—would the focus on LGBTQ populations actually potentially create barriers or disrupt in some way other marginalized populations? […] Is focusing on one population the most effective approach versus presenting material in some way that shows inclusion across populations? Also, because of intersectionality in LGBTQ populations […] what subgroups?" (Participant 2)

Such reflections suggest that familiarity with LGBTQ+ issues (or the intended priority population) may support a deeper interrogation of CTT's assumptions and trade-offs. Participants with more experience working with LGBTQ+ populations appeared more attuned to deep tailoring strategies that address psychosocial factors, norms, and behaviors (i.e., sociocultural strategies) (Kreuter et al., 2003, p. 136). In contrast, those with less LGBTQ+ expertise more often focused on whether an intervention *appeared* tailored, relying on explicit, surface markers of inclusion (i.e., peripheral strategies) rather than examining how it was tailored, why it was designed that way, or what the implications might be (Kreuter et al., 2003, p. 135).

We do not call attention to these differences to suggest that one orientation is inherently better or more valid than another. Rather, we emphasize their practical relevance for public health research and intervention development, particularly when assembling expert teams to problematize culturally tailored and targeted interventions. These differing lenses and orientations highlight the importance of including experts with deep knowledge of the priority population to ensure contextual depth in discussions related to that group, while also involving a diverse mix of professionals to surface unanticipated considerations, challenge assumptions, and support more expansive forms of problematization.

This said, while we hypothesize that professional background influenced participants' engagement with CTT by shaping their proclivities towards certain interpretations or focal points—a point we do not claim is novel—we do not suggest it was the only factor. For instance, although the literature draws clear distinctions between peripheral, sociocultural, and other CTT strategies (Kreuter et al., 2003), our findings suggest that these boundaries are often more fluid—and at times conflated—in practice. This points to the need for further research on how such strategies are perceived, interpreted, and applied in real-world intervention development, and highlights the potential of discursive design as a platform for that exploration.

Future research could apply Harvey Sacks' Membership Categorization Analysis (MCA) to examine how participants invoke professional identities in dialogue (Oak, 2009, p. 306)—a particularly relevant approach given that many framed their assessments through disciplinary lenses, often referencing their field. This could yield deeper insight into how disciplinary backgrounds shape problematization in discursive design sessions. Additionally, integrating 'constituent-involving strategies' (Kreuter et al., 2003) into discursive design, such as co-designing or evaluating artifacts with community members, may deepen engagement and ground responses in lived experience.

5.4. Readiness for Speculative Thinking: Challenges and Opportunities

Assembling the right mix of expertise is only part of the equation. Once the right people are at the table, how do we effectively engage them in problematizing a given topic? This section outlines two distinct issues that emerged in discursive speculative engagement with CTT: (1) misunderstandings of speculative framing and the aims of discursive design, and (2) disciplinary constraints on speculative thinking.

First, participants seemed to have varying interpretations of the conventional versus preposterous framing. While some participants appreciated the structured progression from familiar to speculative ideas, others expressed confusion or resistance to the framing. Participant 2, for example, found the scaffolded approach helpful in understanding the purpose behind the discursive speculative process:

> "I think one thing I really appreciated about this experience is that it was scaffolded so well. Like, you walking us through each step and building to it, understanding the purpose behind it and why this big future-thinking kind of approach is important, was really helpful." (Participant 2)

In contrast, Participant 4 questioned the effectiveness of presenting conventional interventions first and challenged the classification of the Pair 1: Conventional Concept as conventional altogether:

> "If the QR code was the more conventional type of intervention, your other two scenarios did nothing but redirect us to go back to the first one. […] So now, if I imagine your methodology presenting these two [preposterous concepts] before the QR code—we might have another reflection on that. […] we would not go back all the time saying like, "Hey, the QR code is a great idea." […] for us—for me—it's not conventional. […] I don't know if presenting [Pair 1: Conventional Concept] at the beginning is shooting yourself in the foot because the [preposterous concepts] seemed really imaginative and far from reality. But the QR code could be implemented tomorrow." (Participant 4)

This response highlights two challenges in how participants engaged with the discursive design methodology. First, some appeared to conflate "conventional" with a lack of novelty or innovation. However, our framing aimed to distinguish between *incremental* innovation within existing systems (i.e., conventional concepts) and more *transformative*, speculative possibilities (i.e., preposterous concepts) (Verganti, 2008; Kinch et al., 2024). Comments like Participant 4's suggest that perceptions of what counts as conventional or preposterous are often relative.

Second, there was a tendency to treat the artifacts as implementation-ready proposals rather than reflective tools, prompting surface-level critiques of feasibility rather than deeper consideration of implications, assumptions, and possibilities. These challenges underscore the need for clearer framing and facilitation in future sessions.

Furthermore, these observations highlight how disciplinary and professional backgrounds may shape participants' willingness and ability to engage in speculative thinking. Some found it difficult to suspend disbelief, reverting to practical concerns or feasibility critiques, possibly reflecting entrenched disciplinary norms, expectations, and constraints. Participants 5 and 6 directly addressed this issue when reflecting on the strengths and limitations of discursive design.

Participant 6, for instance, highlighted practical barriers such as fiscal constraints, time limitations, and the rapidly evolving tobacco landscape as challenges for integrating discursive design into intervention development:

> "Creating a new intervention already takes a lot of money and time. But with this approach, […] it's going to take two or three times more than that, because you have to think from the extreme phase to the realistic phase too. That's why, practically speaking, discursive design as a methodology […] is it really beneficial to take that money and time? Our resources are limited. Like, in research—the tobacco industry is getting changed very rapidly—new tobacco products are appearing right now." (Participant 6)

In response, Participant 5 pointed out how academic environments may discourage risk-taking:

> "And maybe one of the issues is context, too, [Participant 6], because we are in academia, where we are not reinforced for taking great risks […] In industry, there are plenty of places where people are ready to pursue big ideas and have the funding to do it." (Participant 5)

This prompted Participant 6 to reflect on their professional conditioning and how it may have influenced their engagement with the speculative concepts:

> "I'm biased because I'm an academician. So, I'm always taking the most safe, most conventional thing. […] some people want to take a risk—no risk, no gain, so, high risk, high return. So that could be a strength or weakness." (Participant 6)

This exchange illustrates how professional norms can both limit and enable speculative engagement. Future research could explore how such norms shape participation, offering insights to refine facilitation strategies for varying levels of speculative readiness. Addressing these barriers—through shared definitions, refined framing, or speculative warm-ups—may foster discursive design's capacity to generate more nuanced, future-oriented insights.

6. Conclusion

Our preliminary findings highlight discursive design as a promising tool for problematizing cultural tailoring and targeting strategies in developing interventions for LGBTQ+

communities and other populations experiencing health disparities. Public health and allied experts were generally receptive, showing a willingness to collaborate with designers—an encouraging sign for interdisciplinary partnerships that could expand how interventions are conceptualized and implemented.

At the same time, challenges remain in effectively integrating experts into the discursive process. Differences in disciplinary orientations, speculative readiness, and practical constraints shaped engagement and influenced the depth of insight generated.

This research offers a meaningful step toward advancing understanding of design's role in public health and identifies key areas for future research to strengthen its impact—helping position design not only as a visual or creative practice, but also as a critical methodology for public health innovation.

About the Authors:

Nina A Wolf, BFA, is a Master of Fine Arts in Design candidate in the Design Research and Development track at The Ohio State University. Her thesis research explores discursive design and co-design methods to support problematization and innovation in developing culturally relevant public health interventions for LGBTQ+ populations.

Sébastien Proulx, PhD, MASc, is an associate professor in the Department of Design at the École de Technologie Supérieure de Montréal (University of Québec) and adjunct associate professor of Design at The Ohio State University. His research and teaching activities explore social design practices and the role of design in improving public services.

Joanne G Patterson, PhD, MPH, MSW, is an assistant professor in the Division of Health Behavior and Health Promotion at The Ohio State University College of Public Health. Her research, funded by the National Institutes of Health, examines how health communications and marketing affect behavioral cancer risks among LGBTQ+ populations.

Acknowledgements: We would like to thank the students in the LGBTQ+ Health Equity Lab at The Ohio State University for their thoughtful engagement as pilot testers in this project. We are also grateful to the professionals who generously contributed their time and insights as study participants.

Abstract

This poster introduces the Radical Inclusive Attitude (RIA) framework, a design research approach that decentralises the design process, shifting focus from designers to communities. Developed by the RIA collective, the framework builds on decolonising design ethics and participatory processes to address social inequalities and injustice. Inspired by Freire's Pedagogy of the Oppressed, the RIA taxonomy provides a structured methodology to explore power dynamics and inclusive attitudes in design. Through an interactive experience, the public engages with the RIA framework's key components—praxeology, phenomenology, and ontology—reflecting on their role in fostering radical inclusivity. A QR code on the poster leads to an extended digital space for deeper exploration. This initiative seeks to validate and expand the RIA framework by sparking dialogue within the design community, questioning whether radical inclusive attitudes can serve as a manifesto for ethical and impactful design practices.

Keywords: social inequalities, social welfare, complexity, radical inclusive attitudes, prototyping in action

Research objectives

This poster explores how design research is evolving to better understand the underlying factors that drive social inequalities and injustice. To address this, we introduce the Radical Inclusive Attitude (RIA) framework (Fig. 1) (Busciantella-Ricci et al., 2024), which builds on a body of literature that decentralises the design process, shifting the focus away from designers and towards communities (Udoewa, 2022; DiSalvo, 2022; Costanza-Chock, 2020). The framework aligns with the emergent ethics of decolonising design within participatory processes for complex contexts. The RIA framework emerged through a collaborative triangulation of data conducted by the RIA collective, a group formed during the IASDR 2023 design conference to explore how design can foster inclusive attitudes in society (Busciantella-Ricci et al., 2024). In 2024, the collective presented the RIA concept and initial framework at Cumulus 2024 Budapest. Building on two years of design conversations, the RIA collective now proposes a collaborative research experience. This poster invites the public to interact with the RIA framework and collective, engaging in discussions on new cultural models to address social inequalities and the growing prevalence of attitudes that incite hatred and discrimination.

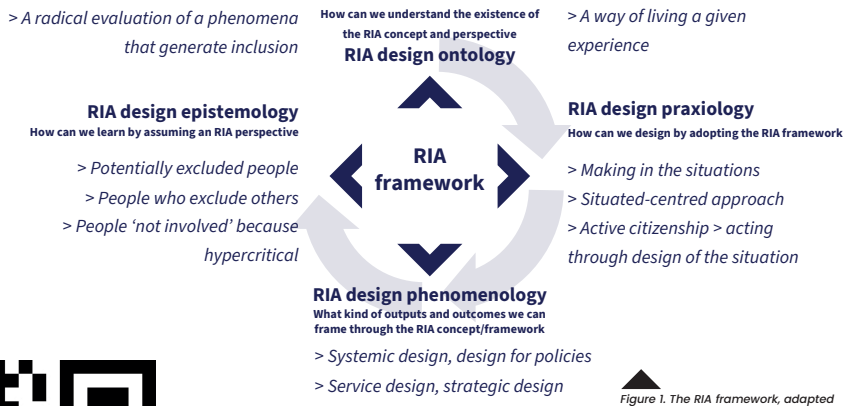

Figure 1. The RIA framework, adapted from Busciantella-Ricci et al. (2024).

www.desia.info/cumulus-2025

By scanning the QR code on the poster, participants can engage with the RIA taxonomy in a reflective digital space, following interactive instructions designed to deepen their understanding (Figure 2).

Methodology, tools and research process

To advance this objective, the RIA framework has been structured into a taxonomy that provides a practical approach to addressing the ethics of social injustice in public design. This involves creating a neutral space where RIA helps social actors—both victims and perpetrators—navigate power dynamics and inherent tensions. The taxonomy draws inspiration from Freire's Pedagogy of the Oppressed (Freire, 1970). We propose a collaborative research process where the conceptual foundations of the RIA framework are made available to the public as a performative and speculative design experience. This allows for collective reflection, validation, and contributions to the ongoing discourse around radical inclusive attitudes.
Participants will be invited to engage with the three core components of the RIA framework:

- **RIA Design Praxeology** – Triggering reflections on how individuals are or could be "making in the situation" through a situated design process to combat social inequalities and discrimination.
- **RIA Design Phenomenology** – Prompting questions about the types of design outputs being used to address these complexities. Are they appropriate? What new design disciplines are needed?
- **RIA Design Ontology** – Encouraging self-reflection on whether participants identify as potential RIA actors. Since RIA is about living a given experience, we ask: What does a radical inclusive attitude mean to you?

In connection with this framework, participants will also explore different actor typologies affected by radical inclusive attitudes, such as:

- Those who are excluded (e.g., due to discrimination, oversight, or neglect).
- Those who exclude others (e.g., individuals or systems that marginalise underserved communities).
- Those who are uninvolved but persuadable (e.g., individuals with controversial views who remain open to discussion).
- To help the public navigate the RIA taxonomy, case studies and examples will be provided, culminating in an interactive question: Who are you?

Expected results

Through this experience, the public will gain hands-on engagement with the RIA framework, applying its principles to ethical decision-making in design for social justice. Specifically, this experiment aims to test whether the RIA taxonomy can serve as a strategic tool for the design community—helping practitioners reflect on their own attitudes toward global challenges and inclusivity. Key discussion points include:

- Do participants agree or disagree with the radical approach proposed by the RIA framework?
- Can the RIA framework serve as a new design manifesto?
- How can it shape the way designers approach social change?

These questions will spark dialogue between the RIA collective and new potential RIA members, further advancing the discourse on radical inclusive attitudes and design.

RADICAL PEDAGOGY, CULTIVATING A CULTURE OF CARE FOR ADVOCACY AND ACTION

Susan Melsop

Ohio State University
*Melsop.3@osu.edu

ABSTRACT | Design educators are at a critical juncture, necessitating the reevaluation of curricula, pedagogical practices and learning theories to provide transformative critical learning experiences that cultivate care and foster ethically oriented designers. In the words of Alistair Fuad-Luke, "[design] has the ability to catalyze societal transformations" (Fuad-Luke, 2009). Indeed, community engaged design for social justice requires an ethically oriented leader-instructor to impart a socio-culturally responsible ethos to students. While practical place-based learning in the field addressing real-world challenges can provide students skills, knowledge, and empathic capacities to be change agents, for educators' questions remain. What are our ethical responsibilities to prepare students to be resilient, adaptive, compassionate, and ethically oriented? While we understand why transition design (Irwin, Tonkinwise, and Kossof, 2015) is paramount in the academy, *how we do it* remains a vital arena for scholarly enquiry.

Radical pedagogy is the theory and praxis of community-engaged design to cultivate citizen designers. Transformative learning experiences working directly with community partners in co-creative activities toward social justice is an effective teaching modality to foster a culture of care, empathic action, and radical relatedness for a more just world. What students learn is as critical as *how* they learn. Educators can foster evolution in critical consciousness and create opportunities for students to develop an ontology of care (Escobar, 2018) and a mindset toward radical relatedness (Gablik, 1991). These ideas align well with principles of transformative critical service-learning (Coffey, Arnold, 2022) which emphasize the interconnectedness of learning, social justice, and community engagement.

As Arturo Escobar describes, “design theory and design education take place at the edges of social theory, conventionally the province of the social sciences and the humanities. It thus makes sense to affirm that the development of an ontological approach to design, one that destabilizes its comfortable niche with naturalized modern orders, demands a recentering of design education in order to bring it fully into the critical social theory space” (Escobar, 2018). This paper describes applied research in the context of design activism for human rights working directly with the National Movement for the Street Situation population (PopRua) in São Paulo Brazil. It offers a theoretical framework combining attributes of an ontology of care with critical consciousness to build a design activist mindset amplifying qualities of ethical leadership. In the place-based design program, students experience design as a co-creative process with a marginalized community wherein the relational modes of knowing, being, and doing are amplified. This is reflected in their writings as politically charged agents for social change and human rights advocates. This paper highlights the praxis and applied research of radical pedagogy. It illustrates the co-creative learning methods employed to cultivate social justice activists through design and offers a novel framework for ethical leadership.

KEYWORDS | DESIGN PEDAGOGY, ACTIVISM, CARE, CRITICAL CONSCIOUSNESS

1. Introduction

Design education is at a critical juncture, necessitating a reevaluation of curricula, pedagogical practices, and learning theories to provide transformative experiences that cultivate care and foster ethically oriented designers. In *Design Activism, Beautiful Strangeness for a Sustainable World*, Alistair Fuad-Luke highlights design's potential to catalyze societal transformations. Similarly, Ezio Manzini declares that “sustainability is a ‘societal journey’, brought about by acquiring new awareness and perceptions, by generating new solutions, activating new behavioral patterns and hence cultural change” (Manzini, 1997). This is particularly true in community-engaged design for social innovation, where the pedagogical approach demands ethically driven educator-activists who are committed to fostering a socio-culturally responsible ethos within students. In other words, the value of instilling in students an ethos of praxis and critical consciousness is crucial in developing socially responsible designers. Praxis—the integration of action and reflection—ensures that students do not merely learn design as a technical skill but engage deeply with the context and social implications of their work. Critical consciousness, as a transformative process, enables students to challenge systems of oppression and to examine the societal structures that influence the way design is practiced and experienced. By fostering this mindset, educators help students become not only skilled designers but also ethical agents of change, capable of addressing complex social issues with empathy, understanding, and a commitment to justice.

While place-based learning provides students with local knowledge and the opportunity to apply design skills to community needs, questions remain. Does the experience also deepen students’ understanding of the critical social, political, and economic issues that shape the lives of marginalized populations? Does place-based learning instill a sense of responsibility to address systemic inequities through design? These questions raise vital considerations for educators: What ethical responsibilities do we have in preparing students to become compassionate, relationally driven design practitioners?

How can we ensure that students are equipped to approach community-based design with a profound sense of social responsibility, critical awareness, and a commitment to creating meaningful, positive change? Moreover, how can we cultivate critical consciousness in students, inspiring them to take action for social justice through their design work? While the importance of transition design (Irwin, Tonkinwise, and Kossof, 2015) within academia is clear, determining how to implement it effectively in the field of design education remains a vital arena for scholarly inquiry. In the words of Arturo Escobar, “what does it mean to take seriously the insights of relationality in design work?”
To begin to address these questions, a place-based, community-engaged learning course serves as a case study to examine how students develop critical awareness through hands-on community work, how they build a sense of ethical responsibility to address social inequities, and how design education can better prepare them to become socially engaged and justice-driven practitioners. This paper presents *Design Matters in Brazil*, an international critical service-learning course in São Paulo, which engages and works with members of the National Movement for the Street Population –or preferably by members simply “PopRua”. Specifically, the paper offers a framework that combines an ontology of care with critical consciousness to foster ethical leadership in design and activism for social justice. Through co-creative, place-based learning students and faculty member engage as political agents for social change and advocates for human rights through design action, embodying a praxis of radical pedagogy. The framework is a visual tool for a pedagogy of transformative social change. It fosters ethical approaches to community-based design that empowers both students and community members to contribute to a more just world, while challenging the *raison d’être of reality* (Freire, 2013).

2. Ethical Considerations for Educators in Community-engaged Design

To equip students with a robust ethical foundation in community-engaged design, educators are advised to thoughtfully curate educational experiences that foster transformative, ethically informed learning. As educators we are privileged to guide students in developing into authentic agents of social change, preparing them to engage with marginalized and underserved communities in ways that are both inclusive and empowering. Central to this process is fostering a sense of humility and a deep respect for others' lived experiences. Educators can foster these sensibilities by creating learning opportunities that encourage students to critically examine their own positionality, biases, and reflect on the complex dynamics of power, privilege, and agency that influence their lives and design practice. This process encourages students to develop a more granular understanding of the specific challenges and ethical responsibilities involved in working with communities. In this way, students are guided to approach community engagement not from a position of superiority or paternalism, but with an openness to listen, learn, and understand the complex realities faced by others. This requires cultivating an awareness that their perspectives are just one part of a larger, more nuanced narrative and that true empowerment arises from elevating the voices and agency of those directly affected by the issues at hand. Such an approach ensures that students not only contribute meaningfully to the work but also honor the dignity and autonomy of the communities they aim to serve. By engaging with these complexities, students are better equipped to navigate the diverse, often layered needs of those they aim to serve, fostering a deeper commitment to socially responsible and inclusive design. Ann-Marie Conrado reminds us to avoid the simplistic notion of "doing good" without critically engaging with the complexities of power, privilege, and agency in our desire to support marginalized communities. For students in the *Design Matters in Brazil* course, this shift in perspective, from seeing themselves as saviors to understanding their role within a broader system of action for justice, was deepened through their learning at CISARTE (Centro de Inclusão Social pela Arte, Trabalho e Educação) and working alongside members of the PopRua. Throughout our engagement with the

PopRua, my colleague and I aimed to guide students from an ego-centric worldview to one of eco-centrism recognizing the interconnectedness of all sentient beings and the collective responsibility we have to each other and the planet. This involves the development of relational ethics (Escobar 2017).

3. Conceptual Framework

A conceptual framework became an essential tool to envision how to cultivate a culture of care that supports advocacy and action. As a working diagram, it offers an ethically grounded roadmap for community-engaged design—one that promotes care, empathetic engagement, and deep, transformative connections. The diagram (Figure 1) identifies co-merging principles and an applicable framework to transform theory into action for design activism. What students learn is as important as *how* they learn (Melsop, 2018) and educators can facilitate the development of critical consciousness, enabling students to adopt an ontology of care (Escobar, 2018) and a mindset of radical relatedness (Gablik, 1991). These principles align well with transformative critical service-learning (Coffey & Arnold, 2022), which emphasizes the interconnectedness of learning, social justice, and community engagement.

Arturo Escobar urges design educators to reconsider design's role, challenging it to transcend the traditional modern frameworks and embrace more socially conscious, critical approaches. In his book *Designs for the Pluriverse*, Escobar argues that design education must move away from the conventional, linear, and instrumental practices tied to modernity, and instead integrate critical social theory into its core. This shift, according to Escobar, calls for an ontological approach to design—one that acknowledges the relational and contextual dimensions of social realities, particularly those of marginalized communities. *Design Matters in Brazil* illustrates how the pedagogical framework, combining critical consciousness with an ontology of care, laid the groundwork for design activism and transition design pedagogy. Transition Design, as defined by Irwin, Kossoff and Tonkinwise, advocates for design that addresses complex, systemic issues by fostering long-term, sustainable change. It recognizes that the systems, cultures, and behaviors currently in place are deeply entrenched and require transformation in ways that account for the interdependencies between communities, environments, and economies. This approach focuses on developing just, equitable, and sustainable ways of living, pushing for radical, forward-thinking change.

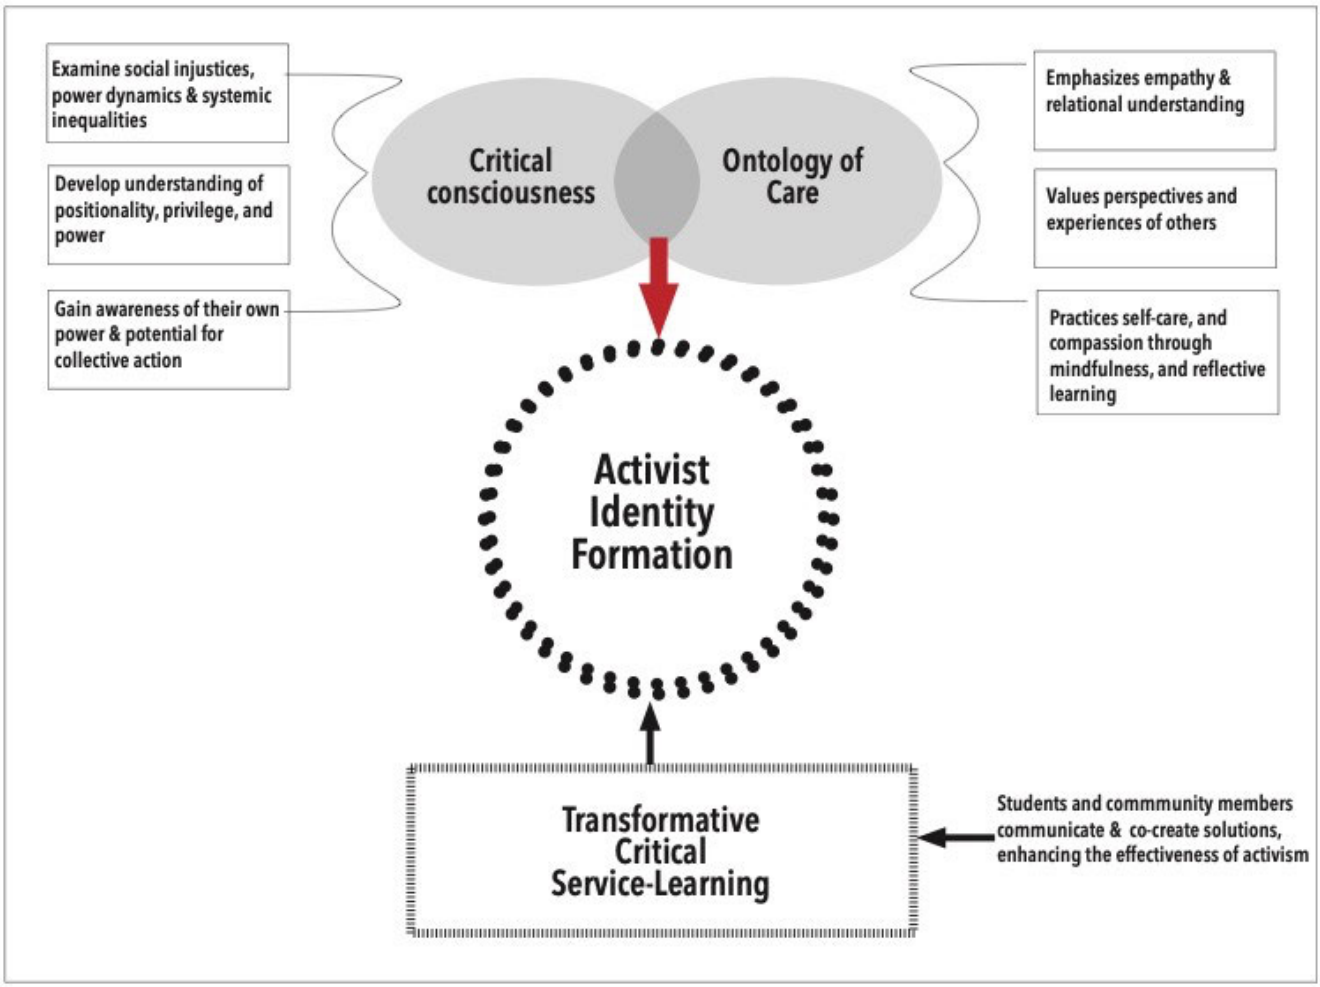

Figure 1: Conceptual Framework integrating Critical Consciousness and an Ontology of Care

4. Context and Partners in Learning and Transformation

As an international, community-engaged design-build course, Design Matters in Brazil reflects a shared vision between two university faculty members, showcasing how design can be operationalized for social and transformative change. Following months of seeding the idea for the international course and subsequent course development, an academic partnership between Ohio State University and Mackenzie Presbyterian University in São Paulo was formed. The year-long process included conversations, a series of meetings, community site visits, and coordinating efforts with Design Possível a local advocacy group for the newly formed National Movement for the Street Situation (MNPR) people.

At the time of our first meeting, MNPR was a loosely organized association of men and women who had come together in solidarity to fight for their human rights and resist the violence they faced living on the streets. In São Paulo, approximately 1.2 million people are homeless or live without adequate shelter (Rueckert, 2017) leaving them vulnerable to social indignities and limiting their access to basic human needs. In the summer of 2004, a brutal attack claimed the lives of several homeless individuals living on the streets of São Paulo (Chu, 2004). In response to this violence and driven by a determination to reclaim their human rights, the National Movement for the Street Situation (PopRua) was formed. By coming together, the unsheltered individuals were able to advocate for their rights through a collective voice. This history begins to illuminate the deep systemic challenges of racial discrimination, social inequity, and human rights violations present in the urban context. Years later—whether as a gesture of goodwill or a political move—city officials offered PopRua a vacant space to use as a day shelter. This expansive 5,000-square-meter structure was an occupiable bridge spanning

an eight-lane highway, with a four-lane road running across its roof. With determination in 2016 a small group of PopRua members began to gather there and self-organize (Figure 2), establishing an informal social network of allies and advocates to their cause.

Figure 2: Site of the design-build course, *Design Matters in Brazil*, CISARTE, São Paulo, Brazil. Photo credit: Melsop

Originally intended to house a metro stop in an urban São Paulo neighborhood, the subway line was never built leaving the vast interior space unused and prone to neglect. When PopRua began using the space it was barren and lifeless. Regardless of its physical condition, PopRua members had a clear purpose for the space; it would "help people exit street living" (Darcy Costa). The goal was to transform the space into a place of belonging, creating opportunities for social integration and community connection. As the acronym suggests, CISARTE (Centro de Integração Social pela Arte, Trabalho e Educação) encapsulates PopRua's vision for the large structure spanning the highway. In conversation, we learned they aspired to transform the space into a vibrant community hub and resource center for unsheltered people, while also providing a venue for cultural activities and social enterprises focused on long-term reintegration and social inclusion.

In conversation, we also learned PopRua envisioned a center that would provide basic needs and offer programs to help individuals transition out of street living. Their vision included creating a space where people could regain a sense of dignity, self-worth and develop new skills through educational and vocational programs. While PopRua articulated a clear idea for the use of CISARTE, they had limited resources to bring this vision to life. An additional challenge for the young organization was that only a small number of people experiencing homelessness were aware that a resource center like CISARTE existed and that basic needs could be found there.

Upon our first visit to the site, what my colleagues and I found was a vast interior with low-ceilings throughout the space. Although equipped with plumbing, kitchen facilities, and water closets, the interior was stark and underdeveloped (Figure 3). The walls were bare, painted only in white, and the floor was old, cracked linoleum tiles. During this visit, we observed broken lights, a pile of recently donated books, and an informal worker who was creatively repurposing trash into art. The space, though functional, lacked the warmth and vibrancy needed to foster a sense of community and purpose. After introductions, we sat down with the founder and coordinator of the National Movement for the Street Situation (PopRua), along with several other PopRua members, who shared their aspirations for the space. Their visions were both practical and poetic in nature. To summarize, they stated: CISARTE is intended to serve as a dynamic resource hub, offering educational workshops, skills training, and access to computers and the internet. The space is also envisioned as a platform for cultural arts and public events—designed not only to benefit unsheltered and vulnerable populations but to foster inclusion and integration for all community members. Their aspirations emphasized both immediate needs and long-term goals for social empowerment and community cohesion. Our design challenges became clear through multiple listening sessions with them.

Figure 3: Photo of interior multipurpose space before design-build projects. Photo credit: Susan Melsop

At this time, my colleague and I recognized the potential of the space as an ideal venue for community-engaged design—offering a unique opportunity to demonstrate to our students, both in Brazil and the United States, how design can be effectively used for social change. After several additional site visits, we —seeking to show our commitment to PopRua's cause—extended an invitation to its members to collaborate on an educational design-build project. We proposed that they welcome us into their space, where we could bring design to life by helping to rehabilitate the interior and support their vision of transforming it into a vibrant hub for social integration. While we were cautious not to overpromise, we were confident that with our dedication to their mission and our students' involvement we could make a meaningful contribution to both the space and PopRua's broader aspirations.

5. A Transformative Critical Service-learning Course based on Shared Convictions

Before introducing the course, the site, or the members of PopRua to students, my colleague and I recognized the critical importance of first establishing a foundation of trust and relationship with the PopRua community. For this we spent months visiting the site, meeting with PopRua members, and connecting with others supporting their cause. During this time, we also expanded our network of builders and design activists, laying the groundwork for launching a community-engaged design-build course with a vulnerable population. This phase allowed us to gain a deep understanding of their aspirations, challenges, and the socio-cultural-political dynamics at play. It also offered an opportunity to demonstrate our genuine commitment to the community's well-being and goals. By engaging authentically with PopRua members, we built mutual respect and open communication, ensuring that when students arrived, they could engage with the community in a manner grounded in the same respect, empathy, and understanding that we had fostered. Without this preparatory work, students' interactions might have been superficial or misinformed, potentially hindering the collaborative design process. Instead, by establishing a foundation of trust, we ensured that the students could contribute meaningfully and sensitively, aligned with PopRua's vision for change.

In 2017, my colleague and I launched the first *Design Matters in Brazil* (DMB) course, a critical service-learning experience that combined remote learning, community engagement, and collaborative design-build. As an international course, it presented several challenges, particularly navigating language barriers. However, we successfully brought together students from Midwest America and São Paulo, Brazil, to address the needs and aspirations of PopRua. While PopRua aimed to transform the physical space of CISARTE into a dynamic resource center and inclusive hub for both the homeless and the broader civilian population, our goal as educators-activists was to guide students in understanding how design can actively contribute to social transformation and justice from the margins.

For two consecutive years during 16-week semesters, my colleague and I challenged students to engage in a collaborative design process aimed at creating social impact. Despite the vast physical distance between our students, student teams from the States and Brazil were united by a shared conviction to design for human dignity and justice. Once students were introduced to PopRua, we employed several methods to support an ethical engagement. The first step was enabling students to self-select the type of design project they wanted to work on. While simple in nature, the pre-determined design projects of benches, bookshelves, and/or wall graphics could take any form, employ different construction methods and materials. Students' only constraint was to meet the needs and aspirations of PopRua for the interior of CISARTE.

6. Methods for Community-engagement

While I was back in the States with my students analyzing case studies of social innovation design, my colleague In Brazil facilitated onsite listening circles, fostering open dialogue and knowledge exchange between students and PopRua members. These circles created a safe, participatory space for all voices to be heard, allowing participants to share their thoughts, reflect on their experiences, and actively contribute to the design ideas for the interior space. The emphasis on listening helped ensure that the PopRua's input was not only valued but also directly integrated into each design project. Complementing this, my Brazilian colleague employed participatory action research methods to investigate both the immediate physical needs of the CISARTE space and the broader aspirations of the people. This approach ensured that design proposals were deeply rooted in the community's collective vision for the future. Through interview sessions, storytelling, and visioning workshops,

PopRua members were invited to share not only their struggles but also their hopes for a better future, forming a rich foundation for co-design.

This onsite and remote design process was structured as an ongoing reciprocal exchange. In São Paulo, students gathered insights and information from PopRua members, sharing the stories and ideas with their design teammates across the ocean to inform design decisions. Meanwhile, American students analyzed the information received and posed further inquiries for their Brazilian counterparts. Although not always a smooth exchange between teams of students working and co-designing remotely from each other, the iterative process and ongoing weekly dialogue enabled student teams to articulate, define, conceptualize, and develop design solutions that were both contextually relevant and socially impactful. These methods together helped create an environment where ethical engagement was at the forefront of the design process, ensuring that students not only contributed creatively but did so in a manner that respected the dignity, agency, and aspirations of the PopRua community.

PopRua members were not passive recipients of the designs; they were actively involved in every phase of the process. Brazilian students and my colleague played a crucial role in fostering this participatory approach by organizing co-design workshops. These workshops were specifically designed to engage PopRua members, spark their interest, and encourage their active participation in shaping the space. Through these creative sessions, students facilitated a two-way exchange of ideas, ensuring that the designs were not only informed by the community's needs but also deeply rooted in their visions, experiences, and aspirations. This collaborative, community-centered process led to more meaningful, sustainable, and impactful design solutions—while also empowering PopRua members to take ownership of the space that would ultimately serve as their resource hub.

This 10-week long remote learning and virtual design exchange culminated in a week-long immersive cultural experience constructing, and installing projects during spring break 2017 and 2018. During March, Ohio State University (OSU) students traveled to Brazil where both groups of students met in São Paulo to bring the prototypes and digital designs to life. It was pivotal moment for both student groups. For the first time, student teams met in person, refined their designs, and gathered materials. They then traveled to the CISARTE site, where OSU students gained a deeper understanding of the challenges faced by this marginalized community. The immersive, place-based experience provided students with the opportunity to collaborate intimately with PopRua members and local builders, fostering a deep understanding of the community's needs and challenges.

The co-creative sessions culminated in the design of various elements, including functional seating, tables, room dividers, and bookshelves. One project deserves special attention: a feature wall that blends utility with symbolic power. The 'poetic inscriptions' project functions as a storage wall on one side, while the reverse serves as a graphic billboard that highlights the voices of PopRua (Figure 3 and Figure 4). With permission from PopRua members, students gathered their aspirations and translated them into visible messages for all to see. These life-affirming words convey PopRua's resilience, determination, and hopes for the future. They stand as a powerful reminder to all CISARTE visitors of PopRua's vision for a more just and inclusive society.

Figure 3: PopRua members and students creating poetic inscription wall graphics. Photo credit: Susan Melsop

Figure 4: Project: Poetic Inscription Graphic Wall with Storage Space. Photo credit: Julian Bertolini

Through direct engagement with the underserved PopRua community, students were encouraged to view design not merely as the creation of products or spaces, but as a means of actively supporting the PopRua's mission for justice, human rights, and dignity. While students cannot directly dismantle entrenched inequities, challenge systemic discrimination, or fully empower marginalized communities, they can contribute by amplifying the social cause of the PopRua. Through their co-design work, they used the interior space as a canvas for transformation, creating objects and environments that directly supported PopRua's mission. Another example of this came about in the form of wall graphics. When PopRua members expressed a desire to foster a sense of belonging within the large multi-purpose space, the student team responsible for wall graphics developed several design proposals. However, none of these initial ideas resonated with the community. To better understand their needs, the students engaged in deeper conversations with PopRua members and discovered that what they valued most was simply 'to be seen.' With input from PopRua, they designed a large mural featuring photographs of organization members—giving the space a visual identity and reinforcing a shared sense of belonging (Figure 5 and Figure 6). This collaborative effort transformed the design process into a powerful tool for empowerment, using art to elevate the environment and strengthen the bond between PopRua and the broader community it serves.

7. Reflections: From Theory to Praxis

As our students engaged directly with PopRua and collaborated with them in the building phase, my colleague and I began to observe how the design process fostered what Freire describes as *conscientização*—the development of critical consciousness. At the end of long construction days, students were eager to reflect critically on issues of marginalization, power, and inequity. Through this process, students not only became more aware of the systemic injustices that shape the lives of marginalized communities, but they also recognized the importance of dialogue, reflection, and action in transforming these conditions. By engaging with the community in this way, students came to understand that design is not merely about solving problems in a top-down manner, but is instead a shared journey of learning, co-creating, and amplifying the voices of those who have been silenced or marginalized. This approach allowed us to move beyond traditional problem-solving design strategies, embracing a more relational and ethically grounded practice that prioritizes collaboration and community agency. This exchange ultimately fostered a sense of solidarity and collective action, key principles in Freire's pedagogy, where both students and community members actively shape the process of change together.

In the words of Paulo Freire, “the more one approaches the objective, challenging raison d’être of reality through action and reflection, the more one can reveal it by entering into it.” This reflects his concept of critical consciousness and the dialectical relationship between theory and practice. Indeed, the praxis of action and reflection was integral to the community engaged course working directly with and learning alongside members of the PopRua in storytelling and creative making. It was not enough to design, build and install objects for the interior CISARTE space, it was critical -indeed radical- for us as educators and students “to penetrate more deeply the prise de conscience of the reality in which they [we] exist” (Freire, 94). Our goal was to go deeper and engage in a critical awareness (prise de conscience) of the social, cultural, and systemic realities that shape the lives of both the students and the PopRua members. In this context, radical doesn’t mean extreme, but rather it points to the need to address the root causes of the issues, to deeply engage with and understand the lived reality of the PopRua. It highlighted the need for students to not just perform design tasks but to take part in a broader, more profound process of awareness, solidarity, and transformation. Through this teaching approach, the course became an opportunity for both critical self-awareness and social transformation by cultivating care for others in their struggles to exist.

This aligns with principles of "transition design," which similarly challenges traditional design approaches by focusing on long-term societal transformation and complex, systemic change. Transition design advocates for a shift in the way design is practiced—moving away from isolated, short-term problem-solving toward a more holistic, collaborative, and ethically grounded approach. It recognizes the need for design to engage with the broader context of social, environmental, and economic issues, addressing the deep-rooted causes of global challenges rather than just their symptoms. Both Escobar’s call for an ontological approach and Irwin, et al’s framework of transition design emphasize the importance of shifting design education and practice toward a more critical, context-aware, and socially responsible paradigm. They argue for a reconceptualization of design as a tool not only for solving problems but for contributing to transformative social change. By destabilizing the "comfortable niche" of traditional design practice, both frameworks encourage educators and practitioners to rethink their role in fostering more sustainable, inclusive, and equitable futures.

8. Results and Outcomes

The objective of *Design Matters in Brazil* was to embody transition design in a pedagogical experiment. With this, the results of the course are both tangible and intangible outcomes, aligning with the course

goal to foster student development in critical consciousness and an ontology of care. The tangible results include the creation of fifteen culturally inspired projects, designed and built with the active participation of PopRua members. These included a directory and wayfinding system, kitchen tables, chairs, bookshelves, storage units, a sound-insulating curtain wall, stools, benches, and vibrantly colored wall graphics, featuring photographic images of PopRua members. The physical transformation of the CISARTE space, from barren to vital, aimed not only to provide functional objects but also to create a sense of belonging for this special community. The active engagement of PopRua members throughout each phase of the creative process allowed for co-creation and collective ownership, enhancing the sense of community and pride. These design interventions serve as tangible markers of solidarity, affirming the importance of relational care between students and community members (Figure 6).

Figure 6: Members of PopRua, students, and instructors among completed design projects. Photo credit: UK

The intangible outcomes, however, are perhaps more significant as they demonstrate how students' critical consciousness evolved through the course. Reflected in their writing journals, the transformative nature of the experience was evident. One student noted that the course “had a huge impact on my life” and expressed a newfound commitment to pursuing social justice through participatory design. This shift in perspective reveals a move from seeing design as a profession to viewing it as a socially responsible tool capable of driving social change. Another student emphasized that the course taught them to see design not merely as a profession but as a way to address hidden societal problems, underscoring the course's impact in cultivating a more compassionate, community-centered, relational mindset. These reflections indicate a deepening of students' critical consciousness, aligning with Escobar’s relationality in design and Freire's concept of conscientização—a process of developing an awareness of the social, political, and economic contradictions and acting to transform those realities.

In terms of an ontology of care, the intangible outcomes highlight a shift in students' understanding of care as not only a personal virtue but as a collective, relational practice. Through their collaboration with PopRua, students came to recognize the interconnectedness of their lives with those of others, especially those facing systemic oppression. The course helped students internalize that care is not

just about providing assistance but about standing in solidarity, advocating for human dignity, and promoting social justice. As students expressed a desire to continue working in social design, their development of critical consciousness and an ontology of care indicates that the course successfully cultivated an activist mindset rooted in empathy, solidarity, and a deeper understanding of the complexities of marginalized communities.

Today, CISARTE serves as a vital hub for both the unsheltered population and community members, fostering interaction and support. The space hosts a variety of community-based programs, public meetings, and workshops throughout the week, offering services ranging from basic needs—such as PPE distribution during the COVID-19 pandemic—to legal assistance and yoga classes. Additionally, CISARTE supports informal entrepreneurial startups, playing a key role in the Latin American social and solidarity economy.

9. Conclusion

Through Escobar's concept of an ontology of care, design students are invited to move beyond transactional design, where they solve problems without understanding the depth of context, and instead engage in a relational process where care is woven into the design process itself. This process requires deep empathy and active listening, but it also demands a reflection on the systemic forces that marginalize communities like PopRua. In this context, students saw how design can transcend the creation of objects or spaces to become a meaningful tool for empowerment and social inclusion. The direct engagement and hands-on, place-based design allowed students to witness firsthand how the co-design proposals positively impact the lives of those facing systemic hardships. By combining virtual collaboration and in-person engagement, the *Design Matters in Brazil* course offered a holistic learning experience bridging gaps between academic knowledge and social action.

In summary, an ontology of care in the context of design activism is not only about creating designs that respond to the material needs of marginalized groups but is also about fundamentally re-envisioning the relationship between designer and community. It is about respecting the humanity of those who have been excluded, standing in solidarity with them, and developing a design practice that is rooted in justice, empathy, and collective care. Through our engagement with PopRua, we –students and faculty– are not just learning design techniques—we are learning to be ethical designers advocates for human dignity, and in the process, we become activist-educators who understand the full weight of design decisions on the lives of those we aim to serve.

RETHINKING SUPPORT FOR ELDERLY PEOPLE: CONTRIBUTION OF AN INTERDISCIPLINARY METHODOLOGY AT THE INTERSECTION OF GEOGRAPHY AND DESIGN ETHNOGRAPHY

Lucile Artignan

University of Angers
ESO Research lab
lucile.artignan.recherche@gmail.com

ABSTRACT | This article presents a methodological approach implemented as part of a doctoral research project on supporting elderly people experiencing a loss of autonomy at home. In the interdisciplinary meeting space between health geography and social design, this contribution aims to offer a critical reflection on the approach deployed to analyze the dysfunctions caused by the demographic transition and the choices made by public policies to meet the needs of the elderly. This research is based on a qualitative methodology inspired by ethnography (Nova, 2021), integrating participant observations and semi-structured interviews enriched with specific and intermediate objects (Wrembel et al., 2021). It enables the identification, mapping and analysis of socio-spatial dynamics between actors at the different territorial scales concerned (Moore, 2008). Based on case studies carried out in two territories, this work aims to question the aspirations of inhabitants, highlights their singularities (Andrès, 2017) and reveals the social and spatial practices, both individual and collective (elderly people, family caregivers and professionals) that operate at the scale of the person's living space and environment to propose tracks of reflection "as to ways of acting with and for vulnerabilities." (Châtaignier, 2023).

KEYWORDS | CARE DESIGN – GEOGRAPHY – METHODOLOGY – AGING IN PLACE – VULNERABILITY – RELATIONAL APPROACH

1. Introduction

This article is part of a doctoral research project that explores the spatial dimension of relational dynamics involved in supporting older adults who are experiencing a loss of autonomy and wish to remain at home. We propose a reflexive examination of the methodological approach, which draws on the intersection of two disciplines: design and geography.

Population ageing is one of the major challenges of the 21st century. Although it affects all countries, the dynamics of ageing vary significantly depending on national contexts (Bonnet et al., 2021). This phenomenon is intensifying due to the combined effects of several factors: increased life expectancy, declining mortality, and the gradual decrease in fertility.

In France, this phenomenon has intensified since 2011 with the retirement of the « baby boomers. » The aging of the French population is expected to continue significantly through 2040, driven by a marked increase in the number of people aged 75 and over[1]. This demographic transition raises numerous social and economic challenges. It calls for a profound transformation of the healthcare and social care systems to meet the evolving needs of older adults, shaped by aspirations and lifestyles that differ from those of previous generations. Several public opinion surveys reveal a growing desire among older people to age in place. In 2022, 94% of them reported wanting to remain at home for the rest of their lives[2].

In this context, and in response to demographic challenges, French public policies have consistently reaffirmed—since the publication of the Laroque Report (1962)—their commitment to promoting aging in place. This approach is seen as a way to preserve the dignity, freedom, and autonomy of older adults. However, it raises numerous challenges.

For older adults, aging in place involves numerous challenges. Without claiming to be exhaustive, we highlight a few key issues: these relate to their health, the evolving needs associated with the loss of autonomy, the financial costs of care, and the adaptation of their living environment. Home modifications and access to local shops and services become essential conditions for continuing to live at home. Family caregivers are also frequently called upon and must cope with significant physical and emotional strain. It is therefore essential to develop appropriate forms of support to assist them in their daily roles. Lastly, a central issue concerns the attractiveness and sustainability of care professions, which are currently facing considerable strain: a shortage of trained professionals, difficult working conditions, and a lack of recognition. All these challenges vary according to social, spatial, and territorial contexts—variation that is largely shaped by the decentralization of gerontological action, a process that, far from being uniform, results in diverse responses depending on the territory (Argoud, 2007).

This research aims to analyze, across several territories, the relational dynamics at play around the living environments of older adults. In this perspective, it seeks to explore

[1] Algava, É., & Blanpain, N. (2021). 68.1 million inhabitants in 2070: A slightly larger but older population than in 2021. Insee Première

[2] IFOP. (2022, April). Seniors' expectations regarding their place of residence: A study commissioned by ARPAVIE.

residents' aspirations and representations, to shed light on their specificities (Dautrey, 2018; Andrès, 2017), to examine how they experience aging, and to situate these experiences within the broader dynamics and interplay of actors (Gumuchian et al., 2003) operating at different scales. The objective is to identify what contributes—or could contribute—to the well-being (Bailly, 1981) of the individuals being supported, as well as their caregivers, whether professional or informal.

In order to grasp the diversity of dynamics at play and to understand the specificities of each context, we chose to conduct our fieldwork across several territories. These areas differ notably in terms of population density, the socio-demographic characteristics of their inhabitants, and the availability of services. Two study sites were selected: the Hauts-de-Seine department and the Loire-Atlantique department. This comparative approach aims to identify, through a cross-analysis, the points of convergence and divergence between these distinct territorial contexts.

The methodology used for the investigation lies at the intersection of two approaches: geography — the core discipline of this research — and design, the discipline from which I come.

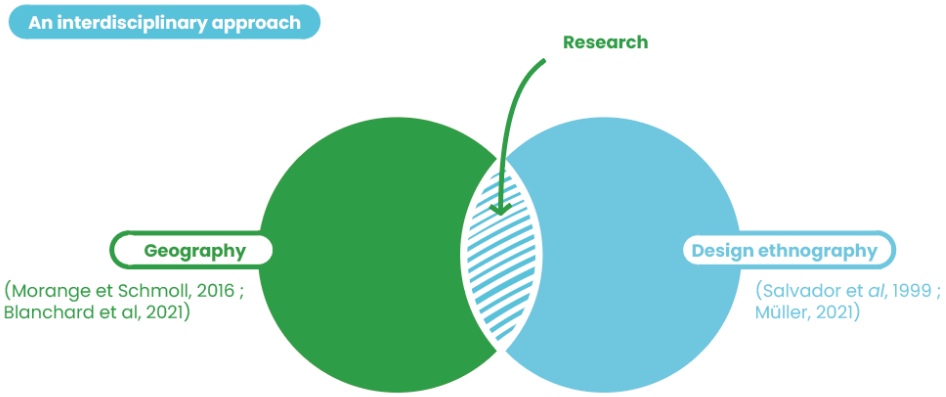

Figure 1. A representation of the interdisciplinary approach at the intersection of geography and design ethnography

Through this article, we offer a reflective analysis of the methodological approach developed within the framework of this research. Special attention will be given to the methods used, the tools developed, and the stance adopted throughout the investigation. The article explores the dialogue established between design and geography. To what extent does the integration of these two approaches contribute to renewing investigative methods with actors, shedding light on their lived experiences, and making visible the dynamics specific to each territory? We will attempt to understand how design positions itself, engages, and interacts with geography in this research process.

Several questions guided the construction of this approach. In connection with our research problem, we questioned how to listen to, collect, and present the voices of elderly people, their informal caregivers, and professionals, taking into account the uniqueness of their trajectories, the diversity of their experiences, and the multiple

relationships they have with aging. We also asked how to capture their daily lives in all its complexity, gaining access to what unfolds in the intimacy of the home — repeated gestures, rhythms, discreet arrangements. How can we understand the representations they have of their living space and territory? How can we make visible the complex interplay of actions, interactions, and territorially coordinated efforts? And finally, how can we engage in dialogue with the discourses of the different actors?

First, we will revisit the specificities of the methodological approach implemented, clarifying the disciplinary foundations in which it is rooted. We will then present the methods employed – observations, interviews, mental maps – as well as the tools that accompanied their implementation in the field. Finally, we will offer a critical discussion on the contributions and limitations of this interdisciplinary approach.

2. An interdisciplinary approach grounded in users' experiences

The field study, conducted between July 2022 and July 2024, led us to develop a structured methodological approach in several chronological stages. It followed three major phases: an acculturation phase, an exploration phase, and then a deepening phase. These different stages gradually evolved our approach. At each of them, we had to adjust the key elements of our approach, ranging from the strategies implemented to establish contact with the field to the selection of the sample, including the choice of methods and tools used, as well as adjusting our posture as a designer-researcher. These adjustments were largely influenced by the ethnographic challenges (Fassin and Bensa, 2008) encountered on site, which led us to modify our research setup.

The method relies on a qualitative approach (Morange and Schmoll, 2016). The approach was thus conceived as a constant back-and-forth between, on the one hand, the theoretical frameworks drawn from scientific literature, and on the other hand, the empirical materials collected on the field.

This process is part of a reasoning mode typical of design: abduction. This form of thought, which dynamically articulates induction and deduction, allows the object of study to be built progressively, openly, and sensitively to the complexities of reality (Catellin, 2004). It allows the emergence of hypotheses by giving a significant place to intuition, imagination, and creativity (Berger, 2017).

This reasoning mode has affinities with Grounded Theory (Glaser & Strauss, 1967), in that it considers that the field directs the questions and nourishes the analysis. Aware of the criticisms sometimes directed at these inductive approaches, we chose to use triangulation as a lever to strengthen the robustness of our approach. On the one hand, by diversifying the viewpoints collected from the involved actors; on the other hand, by combining different methods and tools to examine the same object.

2.1 A methodological approach at the Intersection of Geography and Design ethnography

Social geography enabled us to study the spatial dimension of the relational dynamics between the actors involved. As Morange and Schmoll (2021) point out, this approach uses a plurality of tools based on listening, observation, and a detailed description of lived situations, allowing for the understanding of social interactions in their spatial contexts. The objective, as emphasized by Blanchard et al. (2021), is to provide a better

understanding of contemporary societies and the daily challenges faced by individuals, with a view to improving their living conditions.

To complement this approach, we used methods from anthropology and ethnography, commonly employed by designers (Nova, 2015), in order to grasp the everyday life of actors in all its complexity. While social geography helps us identify the spatial dynamics and configurations at play, ethnography allows us to get as close as possible to the practices, routines, and adjustments made in ordinary situations. Drawing on ethnography as described by Mauss (1947), and more specifically on ethnographic design (Salvador et al., 1999; Müller, 2021) — characterized by its transformative intent — we aimed not only to document existing practices, but also to identify tensions, latent needs, and to map opportunities (Nova, 2014) with a view to designing new products or services.

To benefit from the specific contributions of each approach, we used three frequently employed methods, which we adapted to the realities of our fieldwork: participant observation, semi-structured interviews, and mind mapping. This methodological foundation was gradually enriched with other methods, such as transect walks and guided tours (Nova, 2022), in response to the demands of the field. Furthermore, we integrated visual and creative methods (Catoir-Brisson, 2018), which opened new avenues for understanding and mediation with the participants.

The methodological approach we implemented falls within a multi-scalar perspective, where scales are not seen as fixed entities, but rather as categories of practice, shaped and mobilized by the actors themselves (Moore, 2008). Our investigation was thus structured around three levels of analysis, identified based on the interactions observed in the field. The aim of this approach is to understand how the various actors — elected officials, professionals, institutions, citizens — mobilize scalar categories to frame the issues of ageing and ageing in place, assign responsibilities, legitimize claims, or prioritize courses of action.

At the micro level, our investigation focused on the living environment of the older person, including not only all the everyday caregivers (family caregivers, home aides, healthcare professionals, etc.), but also the environment they inhabit, from the home itself to nearby services and local shops.

At the meso level, we observed and analyzed the practices of the actors involved in the implementation and organization of local support services (home help services, home nursing services, orientation offices, etc.).

Finally, at a broader scale, our attention turned to the institutions responsible for political orientations and regulatory frameworks (departmental councils, regional health agencies, etc.), in order to understand how public policies shape and guide local practices.

2.2 Participant observation

Participant observation played a central role in our research. Originating from ethnological tradition, this method relies on prolonged or repeated immersion in the studied situations, thus allowing the researcher to grasp the atmosphere, the logics of action, and to become immersed in the social context in which the actors evolve. In social

geography, observation is considered an essential tool for analyzing, in situ, social and spatial practices (Morange & Schmoll, 2016). From this perspective, participant observation enabled us to analyze how actors, at different scales, appropriate and transform the spaces they inhabit or operate within. Whether referring to the older adults themselves, caregivers, or other professionals, this method allowed us to identify the modes of coordination involved in home care situations by observing gestures, words, tensions, and adjustments, which are often not verbalized during interviews.

We carried out our observations with various actors involved in home care — older adults, informal caregivers, home helpers, nursing assistants, nurses, sector managers, social workers, elected officials, etc. — which led us to invest in a wide range of places: from the homes of older adults to the premises of home care organizations, including various everyday spaces. This diversity of observation sites made it possible to grasp the actors' daily lives in all their complexity. It enabled the analysis of their professional practices within organizations, both during organized coordination meetings and informal daily exchanges, as well as during their home interventions, in a more intimate setting with the older person.

The choice of tools used for this investigation was guided by the realities and constraints imposed by the field. Several elements shaped our reflection and methodological choices.

First, the need to adapt our tools to the mobility of the care workers, who frequently move from one home to another, was a key criterion. Therefore, we favored tools capable of capturing, on the move, the different dimensions of their daily routines. Next, we made sure to design tools that could reflect, by integrating the temporal dimension, the different moments and activities of the day. This includes individuals' movements, exchanges, daily gestures as well as those specifically related to "care work." These tools were also designed to consider the range of perspectives of the various actors involved, by capturing their gestures, interactions, and perceptions at each stage of their intervention.

We used several observation tools depending on the situations encountered. The field notebook, one of the key tools in our approach, was carefully structured beforehand to facilitate our observations. It includes various elements, such as an observation guide and a journey map, allowing the data to be organized fluidly. Divided into several sections, it allows for note-taking both during and after the observation, whether in handwritten form or using a more sensory approach. Drawing, in particular, was used to depict the actors' postures and attitudes, thereby adding a visual and creative dimension to our observation.

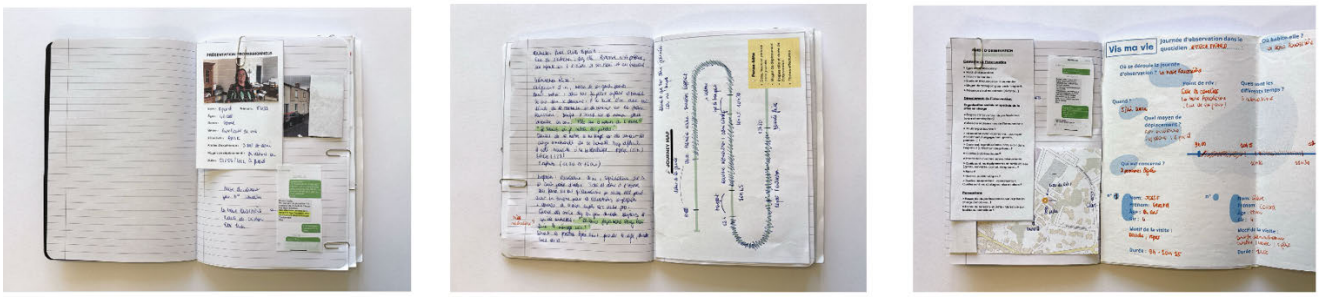

Figure 2. Photographs of the observation notebook (journey map ..)

These observations were enriched by visual tools such as photography and video, used not only to facilitate the memorization of scenes but also to illustrate the experiences and issues faced by the actors in the field. Photography, in particular, makes it possible to quickly capture daily life on the move, and thus complements the observations carried out through drawing.

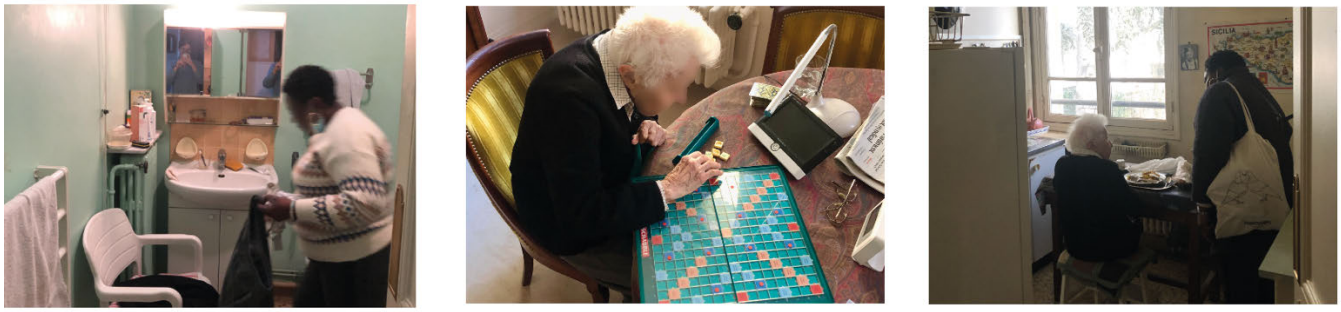

Figure 3. Photographs of the observations

Finally, we included pre-filled observation sheets to record the different times of coordination and consultation between actors at various scales. These sheets aim to identify the participants, the topics discussed, any divergences, as well as the modes of exchange (verbatim, dialogues, postures, etc.) and the solutions considered. To enrich our observations, we chose to conduct semi-structured interviews, forming the second pillar of our investigation framework. These interviews took various forms depending on the contexts.

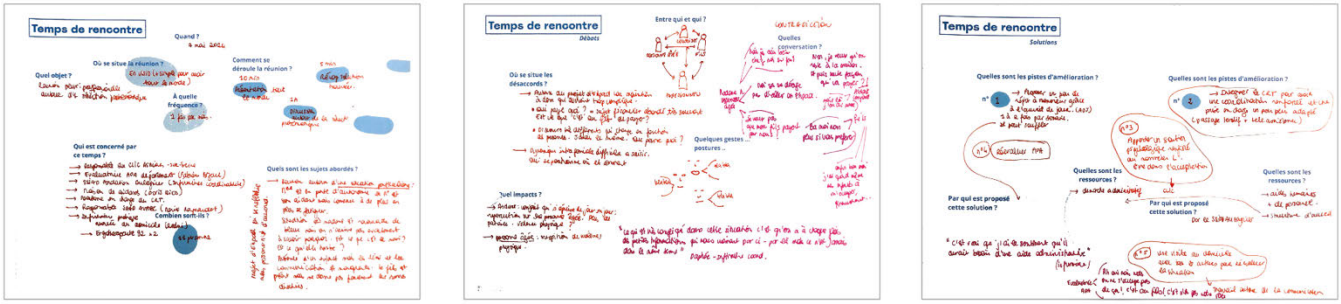

Figure 4. Photographs of the pre-filled observation sheets

2.3 Interviews

In total, 89 interviews were conducted at different scales of observation. Thus, with so-called institutional actors, we carried out standard semi-structured interviews. In contrast, with field professionals, family caregivers and older people, the interviews took more the form of life stories, in the sense that these participants shared their “lived experience” (Bertaux, 2016). Moreover, with some professionals, limited availability led us to replace — or complement — formal interviews with informal conversations, gathered during participant observations.

Like participant observations, the interviews were conducted in a variety of contexts, to adapt to individuals’ constraints and preferences, and to foster conducive exchange

conditions. To address availability challenges, we also offered videoconferencing as an additional option.

We thus left participants free to choose the setting of the exchange: at home, in public places (cafés, parks…), at their workplace, alone or accompanied. In some cases — especially when dealing with distrustful participants (older people) — the interviews were conducted in pairs. These modalities were adjusted according to the profiles encountered. With family caregivers, interviews were conducted, whenever possible, outside the home or in the absence of the person being cared for, to allow freer expression. For professionals, travel time sometimes provided the setting for informal discussions about their working conditions. Interviews with older people mostly took place in their homes. The home is, in fact, a space of intimacy and reflexivity, conducive to personal expression. It is, as Serfaty-Garzon (2003) points out, a place of self- knowledge, of one's capacities and responsibilities — a privileged setting for understanding how individuals inhabit their daily lives.

2.4 Time of arpentage

Given the heterogeneity of situations encountered in the field, we chose to include a methodological step prior to the interviews: a time of arpentage (Nova, 2022), conceived as a preliminary phase aimed at exploring each actor's environment through the use of all our senses (sight, hearing, smell, etc.). The goal was to anticipate future interviews by developing an initial sense of proximity with the person and their living environment. This arpentage, conducted both remotely and on site, consisted of walking through the area to grasp its sensory features. At the end of each exploration, a "sensory map" of the environment was produced. This visual tool proved particularly useful in contextualizing the observed situations and refining the analysis of the later interviews. Remotely, this step used geographic tools (Géoportail, Géoclip, etc.) to establish an initial territorial diagnosis. On site, the exploration was done on foot, for about thirty minutes, guided by a field notebook, maps, and a guide of arpentage.

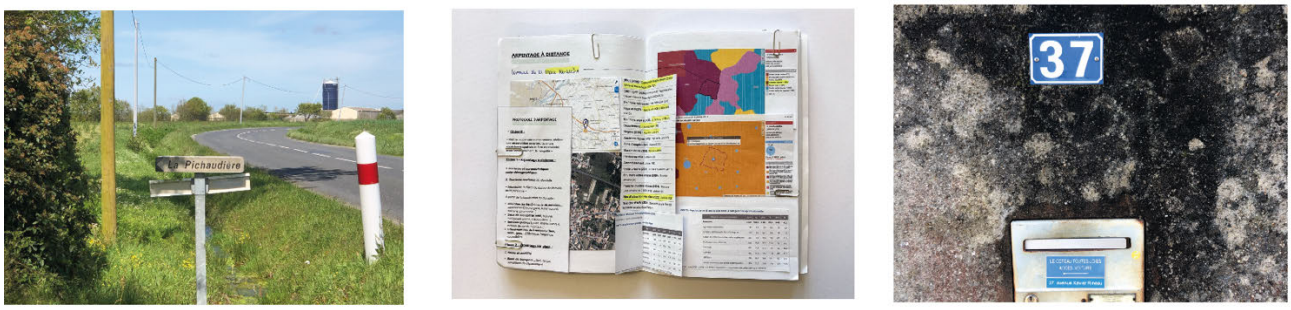

Figure 5. Photographs of the arpentage

Following this step, we focused on conducting semi-structured interviews. These lasted between 20 minutes and 3 hours and 30 minutes, depending on each person's availability and disposition. The conversations were guided by interview guides, designed as flexible frameworks to structure the discussion while allowing for spontaneity and adaptation to the specificities of each situation.
To encourage individuals to express themselves and to foster trust, several creative and visual tools were used (Catoir-Brisson, 2018). Initially, all interviews were conducted using paper interview booklets, similar to the observation notebooks. This methodological choice followed concerns expressed about the use of computers, which some

participants perceived as intrusive. The notebooks also allowed for the insertion of photographs, used to illustrate or enrich the information gathered, and compared with the sensory maps produced during the arpentage phase.

For older adults and caregivers, the game Dixit was used as a conversational entry tool to help initiate dialogue and create a setting conducive to speaking. By engaging the imagination and emotions, it enabled participants to talk about what they appreciated in their daily life and how they envisioned "home." This approach was introduced in response to difficulties encountered at the beginning of some interviews, when certain individuals would spontaneously say: "I have nothing to tell you." This phrase, heard on multiple occasions, reflected a form of hesitation toward the act of narrating one's own experience — something the game was specifically intended to ease.

Figure 6. Photographs of the Dixit game used during the interviews

Moreover, mapping was used as an intermediary object throughout the interviews, in line with the work of Bassereau et al. (2015). Maps of the territory, printed at different scales, were presented to the participants in order to illustrate their statements and to better understand their spatial practices. This tool proved particularly useful for facilitating discussions with older adults, caregivers, and professionals, by making their movements, landmarks, and territorial anchors visible.

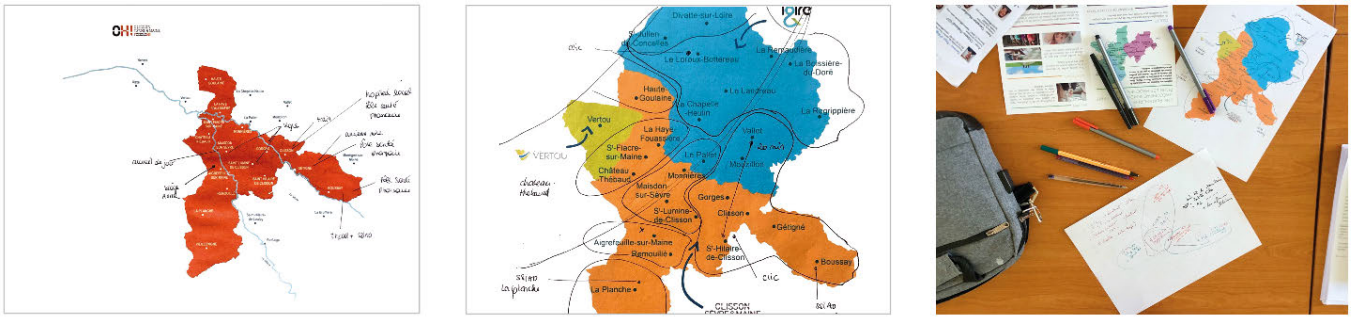

Figure 7. Photographs of the intermediary objects used during the interviews

In order to confront the discourse of older adults with their actual practices, we supplemented the interviews with commented walks. This method allowed us, as Nova (2022, p. 109) points out, "to question the potentialities and constraints offered by the person's environment." By accompanying them in their daily lives, we were able to concretely observe the difficult situations they face.

Finally, we used the mind map as a spatializing technique during the interviews. This

approach aimed to gather a graphic and spatial representation of the territory, as perceived and experienced by the participants. By providing a medium to bring different representations into dialogue, the mental map fostered a richer and more nuanced understanding of the lived environment. Lynch (1960), a key figure in the field, greatly contributed to the development of this method, demonstrating the legitimacy of visual analysis of the urban landscape. We applied Lynch's technique by presenting participants with a blank A4 sheet of paper, on which they could draw their own vision of their territory. The instruction given was: "Can you represent, through drawing, your territory?" A total of 43 mental maps were collected.

Figure 8. Photographs of the mind maps used after the interviews

The articulation of the different methods was adapted according to specific contexts and the actors involved, which led to variations in the order in which they were applied. During our investigation with professionals, interviews were conducted first, in order to gain an initial overview of the situation before planning the observations. In contrast, for older adults, who were more apprehensive about our presence, we first established a connection through observations carried out during the home visits of professionals. These moments allowed us to become part of their daily lives and to create an initial relationship of trust. Once this relationship was established, we were able to plan and conduct the interviews. This approach was facilitated by the support of field professionals, who played a key role in helping us make contact with older adults. Finally, although the mental maps were initially planned for a separate time, they were ultimately carried out following the interviews, due to time constraints on the part of the actors involved.

Furthermore, our posture as designer-researchers evolved over the course of the investigation, depending on the situations and individuals encountered. Faced with often challenging contexts—whether professionals dealing with difficult working conditions, exhausted caregivers, or vulnerable older adults—our involvement sometimes went beyond traditional methodological frameworks. During observations with professionals, we chose to become deeply involved, in order to understand their daily lives as closely as possible and to acknowledge the physical and emotional burden of their work. Conversely, during formal or institutional exchanges, a more distanced posture was adopted, allowing for attentive listening without disrupting existing dynamics. This variability in posture also manifested itself during interviews and the creation of mental maps. These moments of exchange often led to a form of personal, emotional, and relational engagement, fully mobilizing our presence. This approach aligns with a form of participant observation as described by Jeanne Favret-Saada (2009), where the researcher no longer merely observes from the outside, but becomes personally affected. Finally, supporting the mental map exercise also required adaptation depending on the

profiles encountered. Some participants, particularly among the older adults, needed more active support: in such cases, it involved drawing together a visual representation of their relationship to space, based on the verbal exchanges we had. Here again, the adopted posture was one of attentive engagement, aiming not to impose a framework, but to co-construct a sensitive trace of their lived experience.

3. Contributions and limitations of the methodological approach

At the end of the presentation of our methodological approach, it is necessary to highlight the specific contributions of this work, as well as its limitations. We will pose the following question: To what extent does this interdisciplinary methodological approach renew perspectives on supporting ageing at home?

This approach gradually took shape as a form of methodological bricolage (Nova, 2015), characteristic of ethnographic practices in design (Hirt et al., 2015). It combines approaches from geography and ethnography, in a perspective nourished by care thinking (Tronto, 2009; Dautrey, 2018), in order to explore new ways of supporting older people at home, within a logic of "taking care" as described by Andrès (2017). This work was grounded in careful attention to the vulnerabilities of the individuals encountered, which became a decisive lever for transforming our relationship to the field, rethinking our investigative tools, and adjusting our research posture. This methodological positioning echoes the work of Marine Royer and Denis Pellerin (2022), who analyse how a care ethics integrated into design practices leads designers to adjust their presence in the field.

It is precisely in this ability to access the intimacy of lived situations—often made invisible (Avril et Schwartz, 2014)—to establish dialogue with a diversity of actors, and to make visible the dynamics at play in supporting ageing at home that the major contributions of this work lie.

A first contribution of this research lies in the way the articulation between approaches and postures enabled us to "settle into an environment" (Royer & Pellerin, 2022, p. 129), by gradually becoming embedded in the living contexts of the people we met.

This embeddedness was facilitated by the diversity of methods and tools mobilised, which multiplied entry points into the field. By relying on intermediary actors, especially home-based professionals, and by varying modes of contact (phone calls, emails, direct meetings…), we were gradually able to establish a relationship of trust, a key condition for continuing the investigation. This approach also made it possible to cross perspectives on the same situation, thereby revealing the singularities (Andrès, 2017) of each context. This work paves the way for developing responses adapted to local needs. However, within the time constraints of the doctoral project, this research currently focuses on identifying needs and highlighting points of tension. A follow-up study would be necessary to initiate a process of designing interventions and analysing their reception within the investigated contexts.

The involvement of stakeholders in the field was also made possible by a careful adaptation of the inquiry conditions. By allowing individuals to choose the location, timing, and presence or absence of their relatives, we were able to create a climate of trust, conducive to the expression of their feelings.

This atmosphere was also strengthened by the adaptation of our research posture. A posture grounded in understanding and reciprocity, as Bilger (2023) highlights in her fieldwork account, stressing the importance of finding the right tone and pace to welcome the emotions of participants, particularly when dealing with sensitive topics (Fresia et al., 2006). This availability allowed participants to express themselves freely, sometimes revealing their emotional burden. However, this posture is not without its challenges: as Elisa Wrembel (2023) reminds us, it requires navigating between empathetic listening and maintaining the structure of the interview, which can be delicate when participants feel the need to share personal experiences.

Furthermore, while this research relies on a diversity of methods and tools, as well as a flexible and evolving inquiry posture, these methodological choices also present certain limitations. The main issue concerns their replicability: although the situated nature of this work is one of its strengths, it may make it more difficult to transfer the approach to other research settings. Moreover, this approach, particularly time-consuming, requires significant on-site engagement, which is not always easy to sustain.

A second contribution of this research lies in the methodological approach itself, constructed through an interdisciplinary dialogue between geography and design. This articulation enabled a different perspective on existing investigative tools by integrating sensitive and creative methods capable of revealing dimensions that are not easily accessible through traditional approaches. Similar to the work of Marine Royer, who uses drawing as an observational tool in medical contexts from an anthropological perspective, design here has been used as a fully-fledged investigative practice. It enabled not only the collection of forms of knowledge but also the design of intermediary objects to facilitate participant engagement and the researcher's acceptance in the field (Mourat et al., 2015).

First, the use of visual and creative tools was a lever to encourage dialogue and foster participant expression, as shown in the work of Catoir-Brisson (2018). These tools, specific to design practice, open the door to new forms of innovation (Catoir-Brisson & Royer, 2017). The *Dixit* card game we used aligns with this logic. As a "creativity support" (Zaïdi, 2024, p.257), it helped initiate dialogue and explore the imaginaries of older people and their informal carers. In addition, maps of the local territory were used as a medium for expression, enabling participants to concretely represent their movements and habits. These tools, based on an accessible visual language, helped generate a more detailed understanding of their daily lives, echoing the observations of Bassereau et al. (2015) on the value of intermediary tools in fostering exchange.

However, these methods are not without limitations. Their unusual nature can sometimes unsettle participants or even provoke rejection. This was the case with the Dixit game, which some older participants criticised as infantilising. In such situations, far from encouraging dialogue, these tools may interrupt it. Moreover, the use of certain techniques, such as the mind map, also requires adjustments. It did not prove suitable for all audiences, with several older individuals expressing discomfort or refusing to take part in this exercise. It would be worthwhile, in future work, to explore the conditions for appropriating these formats in order to improve their reception.

More broadly, this is one of the limitations of this methodological approach: because it was built in an evolving manner, certain adjustments were made late in the process and could not be fully explored or tested.

A second key point lies in the richness of the interdisciplinary dialogue between

geography and design, which allowed for the articulation of complementary tools from both fields. This articulation opened new ways of sensibly apprehending the social and spatial realities of ageing at home (Coblence & Pallez, 2015). It contributed in particular to revealing often invisible elements or tensions within the organisation of support among the various actors involved. In this perspective, drawing and photography proved to be relevant media for documenting ordinary situations, capturing atmospheres, or conveying the intimacy of the home. This use of visual media to render complex experiences perceptible is in line with approaches already explored in other design studies, such as those of Loélia Rapin (2024), who proposes a sensitive and situated reading of lived experiences through these forms of expression.

Service Design and Local Welfare: boosting Coordination Strategies between PAs and Communities.

Rachele Graccia , Marco Tognetti*b

b ISIA Florence

rachele.gracci@uniroma1.it

ABSTRACT | Exploring the theme of improving access to local welfare services, this ongoing research aims to use service design practices as an innovative tool to help Public Administrations (PAs) offer new service design models that are more effective, distributed, and responsive to the needs of individual territories. By analyzing three relevant forms of engagement in service design – civic activism at the micro, advocacy in umbrella institutions at the meso, and knowledge circulation and capacity building in European multi-actor bodies at the macro – it explores whether multi-level coordination can empower citizens to effectively advocate for increased access to welfare services and become key interlocutors for territorial development and the redistribution of essential services. In practice, the research analyzes the dynamics present in internal areas, i.e. those territories characterized by the difficulty of access to services, and therefore ideal for highlighting systemic challenges and potential solutions, to activate new experimental approaches and detect new ways of intercepting resources in an autonomous but coordinated way. This research aims to establish a framework for how service design can guide, systematize, and replicate policies that effectively redistribute essential services by enhancing communities; at the same time, through multi-level coordination, it seeks to enhance PA to enact more impactful and targeted policies.

KEYWORDS | SERVICE DESIGN, PUBLIC ADMINISTRATION, MULTI-LEVEL GOVERNANCE, RURAL AREAS, POLICY DESIGN

1. Introduction

In the context of increasing disparities in the distribution of essential services, particularly in Italy's rural areas[1] (SNAI, 2013), this research aims to explore the potential of service design as a strategic framework for enhancing the capacity of Public Administrations (PAs) (Gieske, 2018) at regional and local level to implement effective and targeted policies. In line with the objectives outlined in the Territorial Agenda 2030, which seeks to create sustainable models that are replicable on a European scale for service delivery, the General Objective (GO) of this study is to identify best practices for integrating the role of the service designer in the public sector into public policies. This is to be achieved through the development of a multi-level coordination model that promotes community empowerment among stakeholders, ultimately supporting PAs in implementing more effective and targeted policies aimed at redistributing essential services. Furthermore, the research aims to derive actionable insights on how local needs can be better aligned with European policy objectives, thereby contributing to a more equitable distribution of essential services.

This research ongoing addresses several key Research Questions (RQs):
RQ1) How can service design principles be integrated into public policy formulation to improve service delivery in underserved areas?
RQ2) What are the service design's mechanisms through which multi-level coordination can be achieved between PAs, civic activism and European bodies?
RQ3) What outcomes can the implementation of a service design framework yield in terms of improving access to services?

2. Context

Situating this research within both national and international contexts, specifically in Italy and Europe more broadly, and analyzing the macro-trends outlined by the Organisation for Economic Co-operation and Development (OECD), we observe the erosion and uneven distribution of essential services and institutions across the territory (Eurostat, 2024). This research focuses on territories characterized by low population density and distance from essential services—referred to as "internal areas" in the Italian context (SNAI, 2013). These areas serve as case studies where significant challenges emerge, including limited job opportunities, inadequate infrastructure in energy, transport, and information and communication technology (ICT), and restricted access to essential public services, such as healthcare and education (Eurostat, 2024). As highlighted by Barbera et al. (2018), the situation in Italy, marked by the scarcity and uneven distribution of essential services, mirrors similar trends observed across the European landscape. To identify potential avenues for improvement within this scenario, this research aims to contribute to the rebalancing of territorial development, aligning with the common European goals articulated in the Territorial Agenda 2030 (2020).

Following the initiatives proposed in Italy for the development of policies for internal areas, the Barca Report (2009) is cited, which enabled the implementation of the National Strategy for Internal Areas (SNAI, 2013). Among the various trajectories for improving the

[1] In Italy, rural areas are referred to as 'internal areas': regions that are significantly distant from centers offering essential services such as education, healthcare, and transportation. These areas are rich in important environmental and cultural resources and are highly diverse, shaped by both natural features and centuries of human influence.

current situation, the adopted approach shifts away from top-down policy design, favouring instead co-design processes involving active local stakeholders and a place-based logic, with investments in infrastructure, services, and human capital in the most disadvantaged areas. In this framework, a set of pilot areas was selected to initiate problem-solving pathways. Despite these initiatives, the SNAI itself, designed to integrate funds and projects, has encountered several forms of failure (Cersosimo and Licursi, 2022). Among these, the persistence of sectoral constraints emerges, such as the use of competitive calls for proposals, which risk excluding municipalities with limited planning capacity (Zabatino and Carrosio, 2022), and the lack of truly shared planning actions, where participation is often driven merely by the opportunity to access funding (Zabatino and Carrosio, 2022; Cersosimo and Licursi, 2022). Furthermore, following the pandemic, substantial resources were allocated at the national level through instruments such as the National Recovery and Resilience Plan (NRRP), the Complementary Fund, and React-EU. As reported by Canesi (2023), particularly during this year, significant difficulties have emerged in responding promptly and effectively to the many national and European calls for new projects aligned with EU directives and objectives. Moreover, available data indicate that Italy is less competitive in accessing indirect EU funds due to the complexity of procedures, a limited culture of European project planning, a shortage of qualified personnel, and challenges in building international partnerships ("European Funds: What They Are and Why Italy Is Struggling to Access Them", n.d.). Finally, PAs have been observed to frequently lose sight of citizen-defined priorities throughout the complex processes involving multiple stages and levels of governance (Ianniello et al., 2018). In light of these challenges, it is becoming increasingly necessary to demonstrate how Service Design in the Public Sector (SDPS) can serve as a key field (Bason, 2017) for overcoming the structural and procedural obstacles that continue to hinder effective policy implementation.

3. Local Governance and Coordination in Marginalized Areas

Reflecting on the importance of the distribution of economic activities and the presence of public services and infrastructure for population concentration and national development (OECD, 2022), sparsely populated areas could be an opportunity to rewrite policies (Barbera et al., 2018, p. 11) not merely focusing on delivering more services, but completely rethinking the way public services are designed, managed, and delivered; where new forms of governance that take into account needs expressed from the grassroots can be identified; innovating more broadly in policy models by co-designing with local communities, experimenting with tailored solutions, and find models that can be replicated elsewhere.

The analysis of key systemic archetypes featured in the 'Systemic Design Toolkit' (Jones and Van Ael, 2022)—such as 'Success to the Successful', 'Shifting the Burden', and 'Eroding Goals' [see Figure 1]—reveals recurring patterns that characterize many of the critical issues within complex policy systems, such as those affecting internal areas. These archetypes illustrate how success tends to reinforce itself where capabilities and coordination are already present (Success to the Successful), while elsewhere, temporary solutions are adopted that fail to address underlying causes (Shifting the Burden), or goals are progressively lowered to match underperformance (Eroding Goals). In all cases, the same systemic matrix emerges: a lack of metagovernance—that is, an overarching level capable of effectively coordinating the various actors and instruments involved; the

absence of relational infrastructures that could facilitate collaboration across institutional levels; and insufficient investment in local capacity building, which further exacerbates operational inequalities between territories.

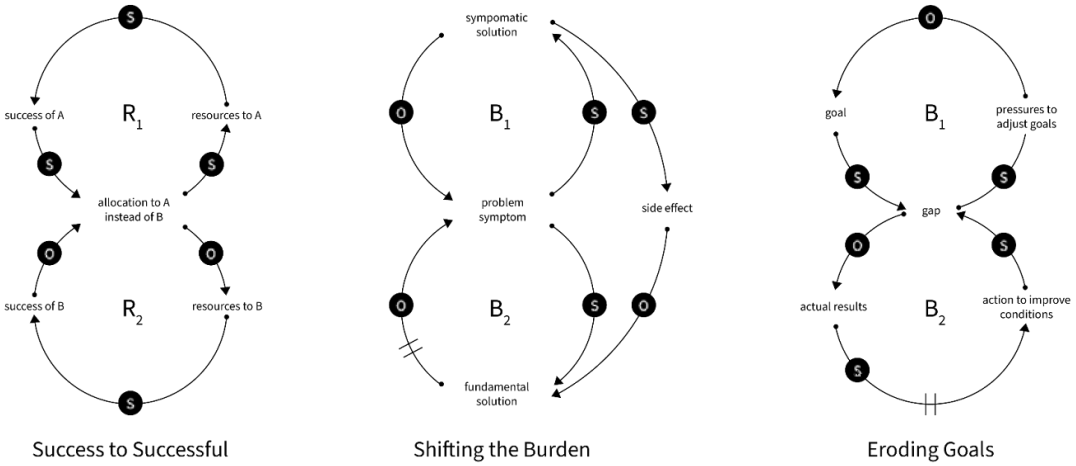

Figure 1. Systemic archetypes present in the Systemic Design Toolkit. [Resource: Jones and Van Ael, 2022]

Analyzing the closely observed case study of 'Montagna Fiorentina', which involves the neighboring municipalities of Londa and San Godenzo, it becomes evident that small territories — despite having limited economic and administrative resources, have succeeded in accessing European NRRP funds. This experience demonstrates that the successful mobilization of resources and engagement of civic activism at the local level depends on institutional vitality. At the same time, operational weaknesses and the complexity of top-down administrative procedures — as occurred with the management of SNAI funds — have led public administrations to adopt a middle-up approach. Within this framework, PAs have managed to: establish strategic collaborations with experts in the design and management of European funding; actively involve the local community in defining project priorities, thereby enhancing the relevance and effectiveness of the interventions; and include stakeholders from the local economy, introducing targeted measures to support businesses within territorial regeneration projects (Montagna Fiorentina, n.d.). Such redistributive approaches remain exceptional and tend to emerge within a fragile institutional system that is difficult to replicate.

Focusing the analysis on the adoption of a bottom-up driven approach, in territories such as internal areas, niches of social and civic innovation, such as those described by Geels and Schot (2007) in their socio-technical transition theory, rarely succeed in evolving into actual trajectories of change. Especially in the Italian context, these niches often encounter fragmented administrative environments which, in most cases, lack the systemic conditions necessary to pursue and channel civic demands. As a result, the trajectory is interrupted before the innovation can be institutionalized. The multi-level research framework proposed in the following chapter aims to develop findings that contribute to the construction of a regime capable of accommodating innovations, thereby fostering an institutional context that is receptive to transition.
Through the integration of the two approaches described above — on the one hand, fostering the systematization of the middle-up approach, and on the other, creating enabling environments for the recognition and affirmation of innovation niches — this research aims to strengthen the coordination strategy understood in terms of alliance. This notion of alliance refers to the combined capacity to allocate resources from above

and to interpret and articulate resources from below.

4. Research Positioning: Service Design to fill the Coordination gap in PAs

In recent years, the discipline of design has gained greater prominence within the context of public policy, integrating creative and experimental practices into governmental processes (Mintrom and Luetjens, 2016). Specifically, the discipline of SDPS recognizes the need to more actively account for multi-actor dynamics and interdependencies within complex service systems (Sangiorgi et al., 2017). This stands in contrast to traditional views of service design, which often overlook the institutional arrangements and interdependencies that influence the entire service system. Aligning with the heuristic outlined by Kimbell (Kimbell, 2023), this research delineates various ways in which design can influence the policy process and be utilized for diverse purposes in relation to policy formulation. Situating this research within the relationship between design and public policy, we position ourselves within the domain of design as a tool for policy-making, drawing inspiration from models defined within the service ecosystem design [see Figure 2].

RELATIONSHIP BETWEEN DESIGN AND POLICY-MAKING	Whose/what knowledge	Who are the designers?	Examples	Relationship to design research literatures
Design as a tool for policy-making	Narrow recognition of different forms of knowledge useful to the policy process	Policy-makers and professional designers	Design toolkits	First and second-generation design methods, service design
Design as a practice of improvising within policy-making	Inclusion of specific and explicit kinds of knowledge/co-construction of knowledge	Policy-makers and designers, plus users/those with lived experience of a given policy issues	Living labs	Partecipatory design, service design
Design regenerating policy-making	Hidden, unknown, occluded knowledges	Inclusive/wide recognition of different knowledges and perspectives	Creative futuring	Anticipatory/ speculative design, service ecosystem design, transition design

Figure 2. Description of the research's positioning within the relationship between design and policy-making. [Resource: Kimbell 2023]

Adopting a systemic view of the service ecosystem, this research takes as its starting point the study by Vink et al. (2021), which focuses on shaping institutional arrangements and their physical enactments by collectives of actors to facilitate the emergence of co-created forms of value. As a theoretical starting framework, we specifically examine the model referred to as the "Multi-level process model for service ecosystem design" [see Figure 3], which analyzes the dynamics of the actors involved in service processes at the micro, meso, and macro levels, taking into account institutional arrangements with a view to achieving long-term change. The study states that its objective is to lay the theoretical foundations for future empirical research based on the proposed model, while the future

research directions suggest the development of methodological tools to measure such impacts.

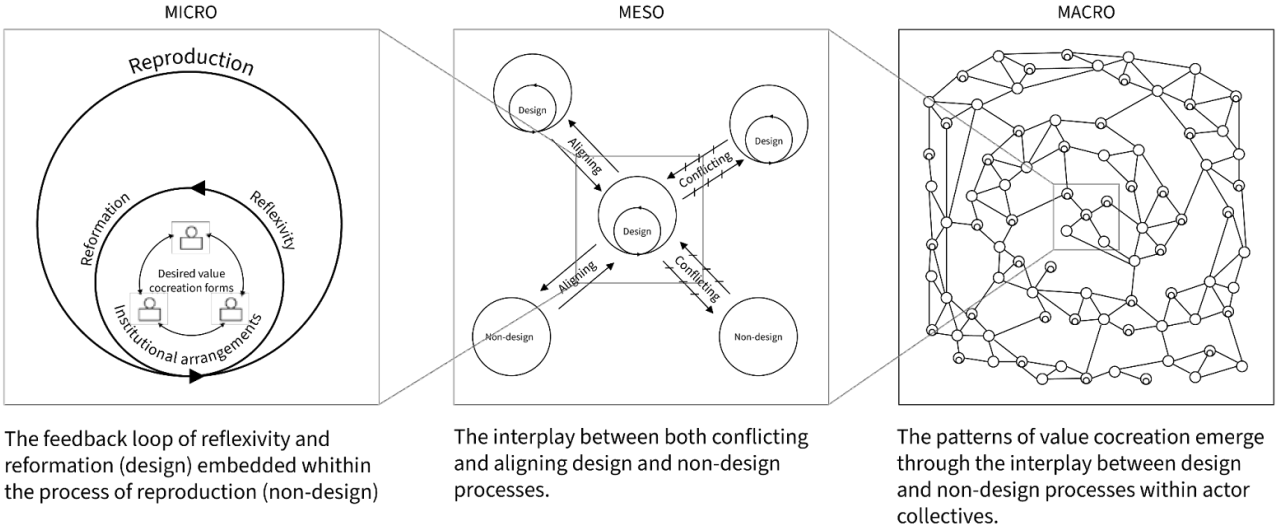

Figure 3. [Resource: Vink et al. (2021)]

To establish an initial systematization of the three levels of involvement in the definition of policies, programs, and projects that activate services within a territory, this research focuses on the meso level of the model. This level is identified as a key phase in which the designer, through the interaction between design processes and non-design processes—understood as the dynamics through which actors reproduce existing institutional arrangements without intentionally seeking to change them (p. 178)—can co-create broader value patterns, as defined at the macro level.

To represent the multidimensionality and complexity of the governance process, each level influences the activation of services within the PA system in a systemic logic, leveraging the potential of their respective tools and connected resources in an autonomous but coordinated manner [see Figure 4]. The following list is expressed in bullet points to emphasize its non-hierarchical, interconnected, and iterative nature:

- Micro level: Individual civic activism stimulates action at other levels and contributes to defining the needs and priorities of the territory.
- Meso level: Umbrella institutions serve as intermediary bodies bridging European policies and local needs. Through advocacy, they translate citizen needs and European best practices into concrete actions, promoting co-participation. Furthermore, they collaborate with PAs to adapt policies and programs to the specific needs of the territory.
- Macro level: European multi-actor bodies are responsible for disseminating best practices and capacity building. They contribute to defining general policies and strategies at the European level.

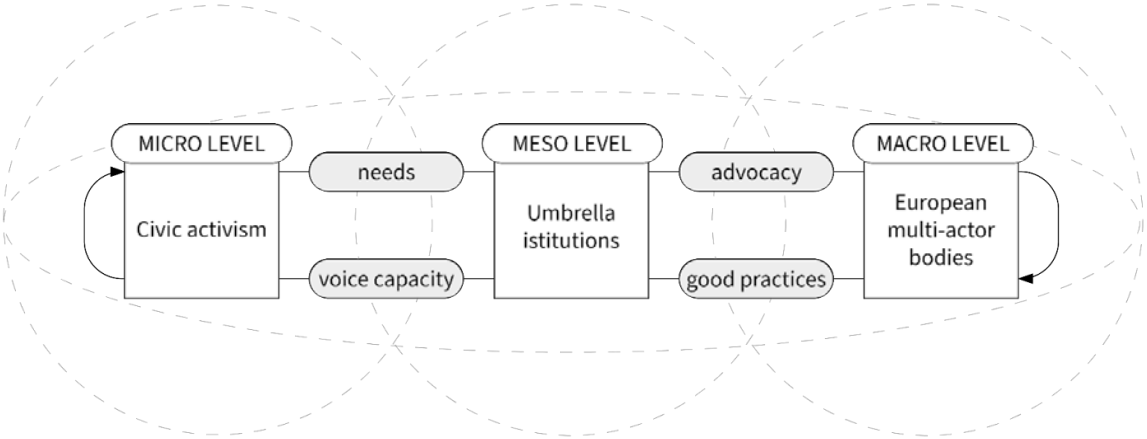

Figure 4. [Resource: Authors. The model was developed in collaboration with Economics Professor Marco Tognetti.]

5. Research Proposal: a Multilevel Coordination Strategy

This research proposal focuses on structuring a new model to redistribute agenda-setting power, leveraging already existing communities empowerment practices to design policies that are more effective and relevant for the communities themselves. In fact, if communities engagement is a well known design research field since years, the model aims at serving and improving the specific action of translating the indications of community engagement practices into effective policies, thus achieving more impactful and targeted policies through a better multi-level coordination [see Figure 5].

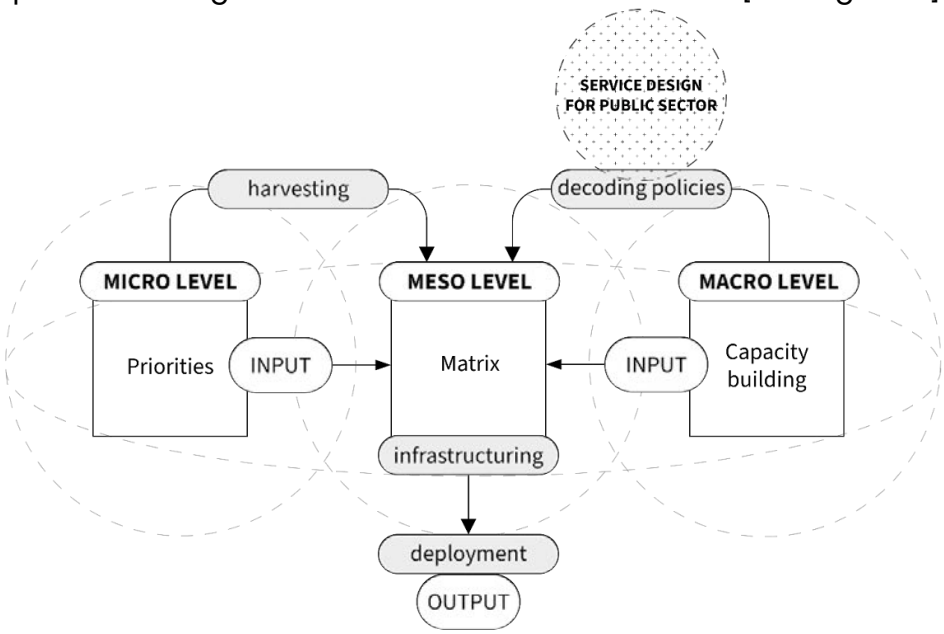

Figure 5. [Resource: Authors. The model was developed in collaboration with Economics Professor Marco Tognetti.]

The proposed design process, also referred to as the research framework, is divided into five phases:

1) Analyze, via desk research, the input provided by:

- Micro level - civic activism: acquire reports providing information on territorial needs and intervention priorities;

- Macro-level - European multi-actor bodies: calls for proposals outlining methods for resource acquisition.
  To grant meso-level access to resources, the completion of key issues is required to identify project objectives, activities, impact, and value;

N. Define a matrix to structure the impact and connections among the determining factors in the classification of policies. In order to improve the concept of coordination, through studies and collaborations with public administration practitioners, the objective is to identify a correlation coefficient between key issues defined at the micro level and priorities identified at the macro level. Correlation studies by Taherdoost (2022) are used to provide a graphical representation of the concept [see Figure 6].

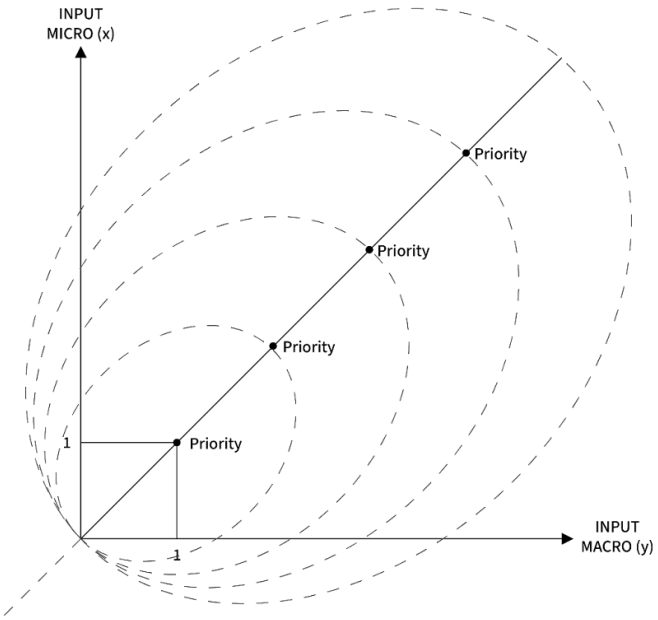

Figure 6. [Resource: Authors.]

3) Harvesting data from communities engagement practices (e.g. from focus groups, Open Space Technology workshops, stakeholders engagement initiatives, Town Meetings, etc.) to sort the information into the matrix model;

4) At the meso level, prioritize agenda items and decode the most relevant policies that emerged from the correlation between the micro-level and meso-level. This phase is crucial to bridge the coordination gap identified in the policy definition process;

5) The meso level can deploy policies with the aim of making them more place-based and targeted.

Within this process, the service designer for the public sector, emerges as a new figure who can facilitate the transition between the macro and meso levels, organizing the priorities expressed at the micro level and enhancing the efficiency of PAs in policy

determination.

6. Research Methodology

To pursue the proposed objective, this research will follow the following research method:

Phase 1: Investigation of Framework Integration in Policy Formulation (3 months)

Five to ten semi-structured interviews, each lasting approximately 20 minutes, will be conducted with policymakers in the public sector administration. The aim is to gather data on trends that either hinder or facilitate the operational implementation of projects, in order to understand how the model matrix can be validated within policy formulation and public service delivery. Thanks to the visiting opportunity at Aalborg University in Denmark, interviews will be conducted in Denmark with the aim of formulating a generic macro-flow of how a civic initiative operates, as well as to learn about new systemic structures and best practices.

Phase 2: Testing and Evaluating Framework Effectiveness (3 months)

In collaboration with a sample of two PAs located in internal areas (meso level) within the municipality of Florence, this phase will establish clear metrics for evaluating the framework and test its impact on public policy in the field. The methodological approach will be defined following the interviews.

Phase 3: Matrix model Development and Dissemination (1 year)

This phase will systematize the results obtained in Phase 2 and finalize the integration of the matrix model into the definition of policies and the design of public services. Multidisciplinary collaborations are envisaged wherever specific expertise is lacking.

7. Conclusions

This research has highlighted the profound challenges faced by Italy's internal areas, which are experiencing a progressive weakening of essential services and an unequal distribution of economic opportunities. Through an in-depth analysis of public policies and governance dynamics, it has become evident that current strategies exhibit significant deficiencies in policy coordination, particularly in harnessing the potential of active engagement with civic activism entities. While the SNAI represented a significant step towards rebalancing territorial development, its effectiveness has been hindered by constraints that reveal administrative fragilities. In this context, the role of the service designer within the public sector emerges as a key professional figure capable of navigating the inherent complexities of public policies. This research emphasizes how systemic approaches and existing multi-level models can foster greater integration between local needs and European policy frameworks. By analyzing the three levels of engagement—micro (civic activism), meso (intermediary bodies), and macro (European actors)—the study outlines a comprehensive framework that underscores the urgency of a paradigm shift in public policy design. This shift is encapsulated in the concept of coordination, interpreted as an alliance that combines top-down resource allocation with bottom-up resource mobilization, aiming to enhance the effectiveness of public policies

in delivering projects—and consequently, services—across territories.
The research process is currently defining a methodology aimed at validating and developing the proposed framework, with the intent of contributing to policy alignment. The anticipated findings and implications of this study offer a resource for other European countries facing similar challenges, while for the Italian system, it seeks to identify operational and cultural fracture points, guiding policies towards resolution. More broadly, the insights gathered in this paper aim to underscore the importance of integrating innovative design practices within PAs, with the goal of charting, through the discipline of SDPS, more responsive and equitably distributed public policies.

ABSTRACT | This paper explores how bottom-up, non-formal design education formats can contribute to improving governance and policy design, with a focus on municipal-level practices in Budapest, Hungary. The authors investigate how participatory design methods can be integrated into the training of municipal employees and civil activists to strengthen democratic values and governance processes (Mintrom et al, 2024). By examining an experimental education format consisting of after-hours training sessions organised with Közélet Iskolája (School of Public Life), the paper demonstrates how these design research methods (persona building, user journeys, stakeholder and problem mapping, action plan visualisation, community brainstorming, etc.) can promote collaboration between local governments and civil society. The training sessions target diverse groups of activists and municipal workers, focusing on the implementation of participatory design methods in everyday governance tasks. The study analyses how this bottom-up approach encourages active citizen participation, fosters inclusive decision-making, and enhances public service delivery, especially in more conservative or authoritative political climates (Málovics et al, 2024). The research suggests that participatory design education, especially when conducted informally and through personal motivation, can reshape municipal governance by encouraging collaboration in policy design, leading to more democratic and responsive governance systems.

KEYWORDS | PARTICIPATORY DESIGN RESEARCH; CO-CREATION; POLICY DESIGN; CIVIL ACTIVATION

1. Introduction

Even though several municipalities and inter-sectoral collaborations across Europe are using participatory design methods in civil engagement and decision-making, this approach is still far from still far from being well integrated in public administrations across Europe. While Barcelona involves citizens in urban planning (Ajuntament de Barcelona 2023), Bologna allows citizens and organisations to co-manage public spaces (Buemi 2021), and Berlin (Herzberg 2013) as well as Lisbon (Allegretti & Antunes 2014) applies participatory budgeting, cities like Budapest still lag behind despite the growing adoption of these inclusive methods in Western Europe. While some efforts have been made, large-scale participatory planning and direct citizen involvement in urban governance remain limited, leaving potential for future development in fostering civic engagement.

This study examines how bottom-up, non-formal design education formats can contribute to improving governance, policy design, and participatory urban planning with a particular focus on municipal-level practices. Specifically, it explores training civil sector workers and activists through the application of design tools. These stakeholder groups actively seek fresh perspectives on collaboration and participatory practices, and they both tend to be involved in equitable urban planning practices, although from contrasting sides. Often, civil sector workers engage in activism as volunteers connected to topics such as housing issues, gender equality or legal advovacy of vulnerable groups, and their time is invested in meanginful change- therefore some participants embody both experiences. The study is set against the backdrop of a public life in Hungary characterized by high societal tension, an overburdened and underfunded civil sector and a shrinking space for democratic and community-led decisionmaking. The authors are social designers and researchers with academic affiliations who also work independently as trainers, facilitators, and practitioners in social design. This study presents and analyzes a recent series of training workshops conducted with the School of Public Life (Közélet Iskolája, KIA).

KIA is a grassroots civic education center founded in 2014, dedicated to building a democratic and just Hungary. Based in Budapest, the organisation is and has a nationwide reach through their activities and trainings. The organization engages a wide variety of stakeholder groups, with a special focus on marginalized communities and those working on their behalf to organize, advocate for their rights, and protect their interests effectively. The organisation aims to provide accessible knowledge and skills for grassroot organizations and individuals, particularly in anti-oppression work. Additionally, it supports movements and civil society organizations striving for social justice, helping them operate

more effectively while fostering a diverse community where critical thinking, democratic participation, and solidarity are highly valued (https://kozeletiskolaja.hu/homepage/).

KIA's work is heavily influenced by participatory action research, which serves as the primary connection to its collaboration with the authors, who apply these methods through creative processes in their academic work. The specific focus of the conducted workshops were, therefore, to provide a variety of creative and design tools to the training participants (activists from NGOs and civil servants), which they can use through their professional and activist work. According to the authors' past experience on the field, creative tools can be highly effective in fostering community engagement and ownership (Málovics et al., 2024), especially when working with vulnerable or multi-stakeholder groups from diverse social backgrounds. Recognizing the need to incorporate training on engagement through design into KIA's portfolio, the collaboration sought to develop a framework that aligns with KIA's existing participatory research practices. This framework builds upon those practices through creative methodologies, offering practical knowledge to non-designers.

Both KIA's work and certain aspects of the authors' academic work can be understood as counter-hegemonic (Málovics et al, 2024). To fully grasp the ecosystem in which the training described below was developed, two contextual factors must be considered. First, the illiberal transformation of the Hungarian state has fostered a hostile environment for civil society organizations (CSOs), characterized by severe funding cuts for non-loyal groups, stigmatization as "foreign agents," and state interference to hinder their operations (Grzebalska and Pető, 2018). Second, since 2010, the government's "politics of revenge" has targeted vulnerable groups as perceived enemies of the nation—such as refugees, LGBTQ communities, and the Roma—creating widespread stigmatization and discrimination against potential stakeholders in, leading to a constricted access to funding and visibility (Udvarhelyi, 2014).

2. Context

2.1. The background- A troubled ecosystem of civil engagement

In an environment where so many contrasting forces are at play, good practices of civil engagement and encouraging activism on a policy-maker level are rare and highly valuable. Depending on the political agenda of individual Budapest municipalities, there are currently a wide variety of principles at work that either encourage or largely negate such initiatives, especially when it comes to citizen involvement in urban and policy design. The 8th district, Józsefváros, stands out as a positive example, particularly given its diverse social fabric, the wide variety of nationalities among its residents, and the high concentration of social challenges and organizations working to address them, such as homelessness, domestic violence, and racism. Since 2019, the district has maintained consistent leadership and implemented a range of socially innovative governance practices, including participatory budget planning, organizing civil forums, co-designing public spaces, and actively working toward a more sustainable housing policy—despite the increasing gentrification of the area. Most training programs organized by KIA, including the

one presented in this study, took place in this district, providing a rich context for both theoretical and practical aspects of the training.

2.2. NGOs and civil actors in urban design

Even though the discourse is still in its early stages, urbanism is one of the most developed fields for fostering fruitful cooperation between Hungarian municipalities, professionals, NGOs, and local communities. When it comes to local involvement and participation, the municipality of Budapest's 8th district (Józsefváros) is the most active. In 1997, it initiated the organization Rév8 to implement urban development projects, focusing on making the city more livable and appealing through local participation. Rév8 has worked on more than 20 urban projects, including design development, completed implementations, and reconstructions. Another successful collaboration between top-down and bottom-up initiatives is the Bartók Quarter in Budapest's 11th district. The Bartók Quarter serves as a living example of the 15-minute city concept, where essential services and institutions, restaurants and cafés, galleries and art studios, civic initiatives, and educational programs are all located within close proximity, transforming the neighborhood into a true meeting point for locals.

Alongside successful examples, there are also less effective projects. One early case from 2013 was among the first large-scale participatory landscape interventions in Budapest. During the redesign of Teleki Square in the 8th district, designers sought to bring together four different stakeholder groups—the local council, architects, a local association, and "critical intellectuals" (a term used by the author)—to find common ground. The project was widely regarded as a success by architectural professionals, the media, and the local council. However, as Balázs (2020) highlights, the fact that the marginalised population of the district (who are otherwise a high proportion of the inhabitants) was not represented in the design process. The result materialises the contrasting needs and objectives of the different stakeholders: the square today is a guarded green oasis, surrounded by a massive fence, lies in one of Budapest's most stigmatised areas, marked by crime, poverty, and discrimination (Czirfusz et al., 2015). The contrast is striking: inside, there are neat lawns, flowerbeds, park furniture, and families enjoying leisure, while outside, the scene shifts to dirty asphalt, migrants near a Lagos buffet, Roma youths on benches, and homeless people under sparse trees (Balázs, 2020).

We can see therefore, that even cooperations has been started between the municipalities and civil sector with the tools of design, plenty of place for improvement remain. The phenomenon can be understood from another perspective as well: if we consider the wider context, the design process can be understood as a systemic challenge instead of a solely design problem. It is apparent that the shortcomings of the design process of the Teleki square originate from a lack of communication between local stakeholders rather than the insufficient participation of local inhabitants. As described earlier, the complexity of social challenges, class struggle, homelessness, and substance abuse that characterized the area before the redesign process did not actually get addressed, and these practices were relocated instead of being eliminated. The usability, safety and aesthetic quality of the area

increased significantly without addressing some of the systemic issues, mirroring the gentrification process of the district. We can conclude by stressing the limitations of design in solving such complex challenges, and instead highlighting how design can be a powerful tool to understanding and addressing the complexity itself. The training program described below was specifically created to fulfil this need detected by KIA and their clients, who articulated a lack of practical knowledge in including effective participative inquiry tools in their daily work and civil activism.

3. Training method and analysis

The training method was built on a critical application of participatory action research methods (Juarez-Brown, 2008; Fine-Torre, 2021) and an intersectional approach rooted in gender equality, but also fit for understanding a variety of complex social contexts (Crenshaw, 1989; Erete et al, 2018). The theoretical frameworks were laid out in the preparatory phase in collaboration with KIA, where the organization placed an emphasis for the training material's translatability to practical application. The training structure was required to fit to KIA's already available participatory research and participatory action research trainings, integrating a creative angle in order to seamlessly approach target groups less used to the terminology of advocacy and activism. Therefore, the authors developed and conducted two pilot training sessions in 2024, one in early March, the second one in October. These sessions aimed to bring together municipal representatives, professionals, and civil activists through participatory design tools while exploring the potential of design research training for various professional fields. A total of 25 participants attended both sessions, representing a diverse range of professions and interests, including municipal representatives, creative industry professionals, and NGO leaders and activists advocating for various causes such as gender equality, child rights, disability rights, and environmentalism. The training was not meant to provide an all-encompassing framework for a variety of applications by participants, rather, it aimed at providing an introduction and an overview to those looking to explore new options for challenging conditions and widening their toolkit as practitioners.

3.1 Training structure

While both sessions followed a similar structure, the authors made modifications to the second session based on insights gained from the first. To create an engaging and collaborative experience, each session began not only with an introduction to the overall aims and structure but also with mutual introductions between the facilitators (the authors of this paper) and the participants. To give opportunity for the participants to explore key concepts, the introduction was followed by a short presentation about the fundamentals of social design (Tromp & Vial, 2022; Papanek, 1973), different levels of participation and empowerment (Cavalieri & Almeida 2020; Arnstein, 1969) as well as the design tools of participation (mapping, visual storytelling, community brainstorming, co creation, shared persona building etc.) illustrated through the timeline of the Double Diamond diagram (Design Council, 2006) as well as presenting widely used design thinking methods applicable in participatory research (persona building, user journeys, stakeholder and problem mapping, action plan visualisation, community brainstorming, etc.). The presentations also highlighted the importance and opportunities offered by intersectional

approaches in building impactful social change. Both in academic and in community-led research, actors and policymakers have increasingly involved diverse stakeholders—such as service users, citizens, and marginalized communities—in shared decision-making to ensure research is relevant and translational (Vaughn et al., 2018). Today, stakeholder engagement ideally exists on a continuum, from academic-driven research to equitable partnerships between academics, policymakers and communities, and the training developed by the authors aimed at bridging existing gaps in currently available support for activists.

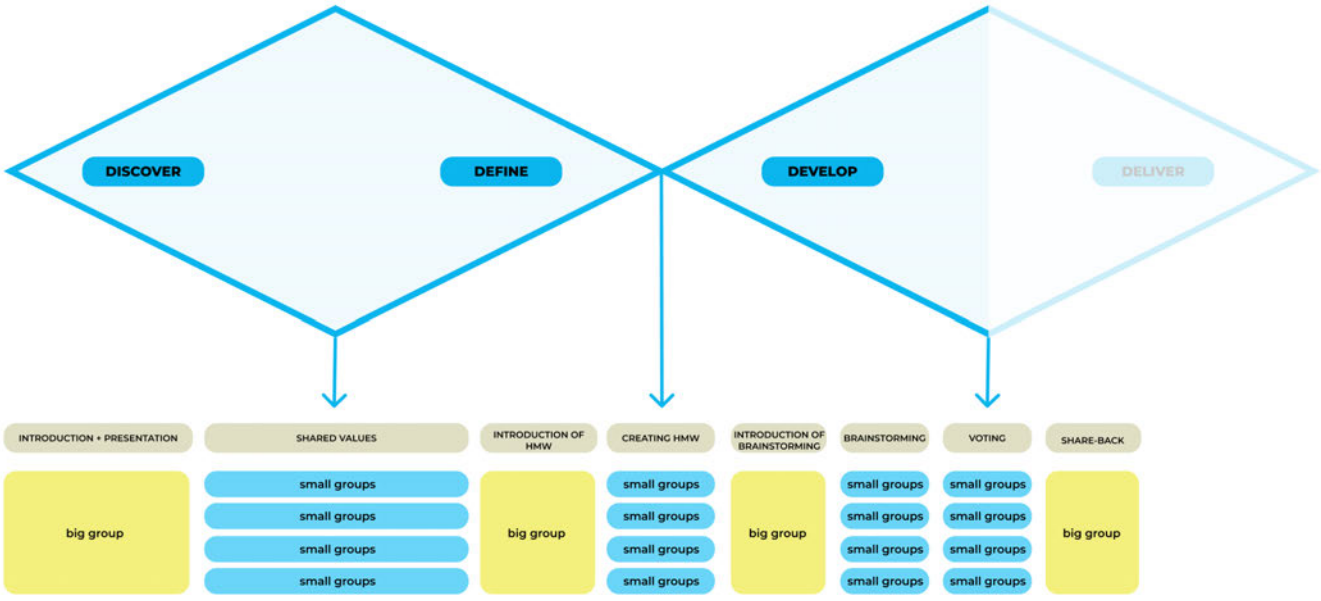

Figure 1. Training structure model in parallel to the Double Diamond diagram. Source: Authors.

Afterwards the participants were divided into smaller, professionally diverse groups of 4-6 people and until the end of the session they worked together as teams. The participant groups's first task was to share their primary interests within their group and reflect on the intersections of their personal backgrounds and areas of expertise. This exercise helped identify shared values and unique perspectives, strengthening team cohesion. Each group then presented its shared values, after which the facilitators introduced the structure and purpose of "How Might We..." (HMW) questions. Participants were encouraged to transform their identified intersections into an HMW question, guiding the next phase of the session. This was followed by a brainstorming session: after introducing the main principles of community brainstorming (Brown, 2009), participants assessed ideas to answer their own HMWs and in the second round they had to rank the ideas based on criteria such as ease of implementation, potential impact, and personal relevance, narrowing down their focus to actionable concepts. Finally, participants created a shared map of their competences and resources, pooling their skills, knowledge, and available resources. This step emphasised the power of collaboration and demonstrated how collective strengths can drive progress. Due to time limitations and group dynamics, the session did not fully adhere to its planned schedule. In the final step, participants were meant to materialize their concepts into a visual action plan, experimenting with visual communication tools and mapping out

resources to bring their ideas to life. However, this component could not be fully executed within the given timeframe.

The second session was conducted six months after the first and applied a few modifications according to the lessons of the first one. One important change was shortening the social design presentation: by introducing the above-mentioned topics in a more dense way, participants had more time to explore both the theoretical background and the practical applications of social design, design thinking and design research methods. Another major adjustment was the introduction of a more concrete and engaging task, in order to emphasize more clearly the direct impact of their inputs. Here, groupwork centered around various visualization-based tools which helped clarify and pinpoint group dynamics as well as individual positioning. These exercises were inspired by participatory research methods rooted in creative expression (Reinharz-Davidman, 1992) During the exercises, firstly, participants were first asked to individually connect their core values and skills to an animal or plant. Then, within their small groups, they collaboratively created a "magical creature" that embodied the collective attributes of their team members. Each team then introduced its magical creature to the larger group before brainstorming solutions for their HMW challenge, tailoring their ideas to the unique characteristics of their shared creature. This

3.2 Feedback

Data was collected using both non-formal (such as immediate oral feedback through closing shareback sessions) and traditional methods (such as interviews, anonymous surveys conducted by KIA). Immediately after each session, group conversations were conducted with all participants as part of the closing circle. Additionally, several months later, follow-up interviews were recorded with three former participants.

In the closing circle of the workshop, each participant had the chance to share some personal insights about their experiences and leave suggestions for the future. Based on this feedback we can conclude that the participants in general felt safe and supported during the process. Besides the general experience of a positive and supportive environment, some of them also highlighted the unexpected results of the 2 hours long sessions as it led a very diverse group of stakeholders to find common ground based on their interests and goals through the proposed design methods.

Participants of the second session also expressed their satisfactions about how easy it was to connect with each other and find shared values through the introduced design methods. More interviewees articulated the importance of the association game with the involvement of a magical creature: "By associating with animals, the whole process became very easy to understand. Maybe because it brought us back to our childhood, when we all loved animals. It was a really good experience to see that by this we could bridge the distances between us." Referring to animals and magical creatures during the second session led to several positive outcomes, particularly in terms of visual communication. Since many participants were not from creative fields, tasks involving visualization could have been challenging or even demotivating. However, as one participant shared: "Thinking about

magical creatures really helped with the graphic visualization. Also, through visualization, we were able to communicate more easily than with words—it helped us get to know each other and identify our shared values. I was surprised by how easy it was to do this in such a short time."

4. Results

Based on the experiences from the two training sessions, the authors identified several key results and insights through on-site observations and follow-up interviews with participants.

According to the on-site observations of authors and immediate feedback of participants, several opportunities as well as challenges were identified. In some cases these opportunities and challenges were connected and resulted from one another. The training sessions demonstrated that creative, participatory methods—such as visual metaphors and collaborative exercises—significantly enhance engagement, especially among participants coming from different fields. A key learning was to understand the challenges of time limitation: non-designer participants needed significantly more time to understand the general concept of design research as well as framing the HMW questions. To these challenges the authors responded with alternating between small and large group settings. By creating small groups, participants could support each other easier and during the share-backs of big groups they could hear more cases and discussion. In the case of HMW questions the *magical creature* served a significant support for the second group to emphatise with each other and their missions. The *magical creature* exercise helped simplify complex ideas, foster connection, and build shared understanding among diverse professionals. Another key learning was the importance of adapting content: shortening theoretical presentations in the second session created more room for practical exploration and group interaction. However, time constraints remained a challenge, particularly when attempting to implement more complex outputs like visual action plans. Additionally, managing group dynamics within limited time required flexible facilitation strategies to ensure equal participation and progress.

After the training sessions, participants also expressed the facilitated design process helped them understand and emphatise with different missions of their groupmates, even if they came from very different fields and contexts. This observation suggests that through a well-structured and longer training methodology, municipality workers could gain tools to map and understand actual cases more effectively. Reflections also suggested that practicing non-formal decision making has the potential to bring people from very different backgrounds to a common understanding, showing promising potential in case of further training method development. Furthermore, as an indirect result of these training sessions, several other, specialized short courses were developed in KIA's portfolio, reflecting on smaller aspects of the larger learning process described above.

Months after the sessions, three participants participated in interview sessions to help us understand their point of view about how design methods can be useful for their work. They articulated several aspects through their experiences. One interviewee used the entire

workshop method at an intercultural training she facilitated and others also stated that they would include the learnings in their training. Although all of them articulated that the real systemic development would be to use design methods not only for training but to design new project proposals (by involving their target group into the development phase) or to map organisational challenges in general. For these purposes they believe that each member of one organisation should experience a longer training about design methods in order to arrive at the same ground and after that even their yearly strategic meeting could be structured by design thinking: "It should become part of our working culture so we could face together any kind of challenges with this method." One of the interviewees also mentioned that these design methods could help their target group (youth living in state care) with self-representation, self-expression as well as developing problem-solving skills. By involving their groups into these kinds of design challenges, she believes that underprivileged youth could be integrated even into policy discussions.

5. Conclusion

As the authors have experienced throughout their practices, participatory design trainings, workshops or hackathons bear the capacity to equip multiple stakeholder groups (such as civil actors, policymakers, activists, etc.) with collaborative tools that foster mutual understanding, enabling stakeholders to engage in more inclusive decision-making (Simonsen & Robertson, 2012). By involving diverse perspectives in the design process, these trainings help bridge gaps between different groups, ensuring policies and initiatives reflect the needs of the communities they serve (Bjögvinsson, Ehn, & Hillgren, 2012). This approach strengthens democratic practices by promoting transparency, shared ownership, and long-term engagement in civic and policy-related work (Sanders & Stappers, 2008). Developing a clearer mutual understanding among such a wide range of stakeholders can prove beneficial to intersectoral collaborations through facilitating shared goal setting, as well as increasing the visibility on design's capacity to foster collaboration.

A similar understanding was gained from the training sessions described and analysed above, with the addendum of further aggravating circumstances characterised by centralised and top-down decision-making practices of current policymaking in Hungary. As designers, however, the real challenge is to find the right tools to address the given circumstances, therefore such a case inspires customizable approaches. As design scholars and social design practitioners, building and conducting such a training deepened the authors' understanding on how various (non-designer) groups can integrate these tools into their daily practice. Among the multiple ways of applying such new knowledge, three most important stand out: firstly, using counter-hegemonic (or non-hegemonic) decision-making approaches in diverse groups of activists and municipal employees enhances more democratic policymaking practices; secondly, both groups experiencing opposing perspectives helps empathize with other groups' understandings and goal-setting or even internalize other groups' values and goals quicker; and thirdly, using visualization tools to set a shared baseline proves very effective for diverse stakeholder groups to build a common understanding and language and quickly establish shared values.

Moreover, a small minority of participants did arrive from a design background either working outside the design field or as activists still working on their design degree, and their reflection shed light on how design education can incorporate the specificities of such ambiguous scenarios.

In conclusion, while participatory design tools offer valuable benefits for various stakeholder groups, their effectiveness is often constrained by environmental factors, limited time resources, and reluctance from management to fully integrate them into decision-making processes. Despite these challenges, findings described above suggest that such tools provide significant personal benefits by helping participants make sense of complex processes and reducing the risk of burnout- which is especially frequent in the under-resourced civil sector and activist scene- rather than immediately leading to systemic change. However, interviews conducted with participants highlight that fostering critical thinking and embracing more radical collaboration can contribute to bottom-up transformations, supporting more democratic and community-led approaches in topics such as urban development, policy design and citizen engagement.

Furthermore, the recurring concern of time constraints suggests a need for extended training programs lasting 7–10 days, allowing for a slower and more practical learning process, including tangible examples and case studies with different outcomes. Future research is needed to explore the design and implementation of such programs to maximize their long-term impact on democratic practices and stakeholder collaboration.

About the Authors:

Dr Janka Csernák is a social designer and research lead at MOME. Her research focuses on the topic of gender equity within social design, investigating the agency of disadvantaged female communities through design approaches. With a background in product and concept design and curatorship she has been working in social design since 2015. Her research focuses on social design in the context of disadvantaged groups, gender equity, participatory design, design ethics, and speculative design. She is a visiting teacher of multidisciplinary social design courses in ALU, KASK, and EKA.

Erzsébet Hosszu DLA is an architect, lecturer and researcher at MOME. Her research mainly focuses on vulnerable groups and the development of their physical environment using the combination of participatory design approach and environmental psychology, aiming to support mental health. She is also a civil activist as

cofounder and vice-president of a Hungarian NGO supporting refugees and immigrants.

Main challenges (BA level)

Individual Level

Lack of prior exposure to social contexts

Missing personal skills:

- Discomfort with Collaboration
- Uncertainty and Ambiguity Tolerance
- Ethical Sensitivity and Advocacy Balance
- Communication and Facilitation Skills

Motivation and Personal Relevance

Main challenges (BA level)

Program Level

Overemphasis on individual performance

Traditional categorisations of design disciplines

Limited project duration and scope

Insufficient support for real-world engagement and working with outer collaborators

Faculty expertise gaps

Who are we aiming for?

Novices in social design

BA level educators

BA level programs

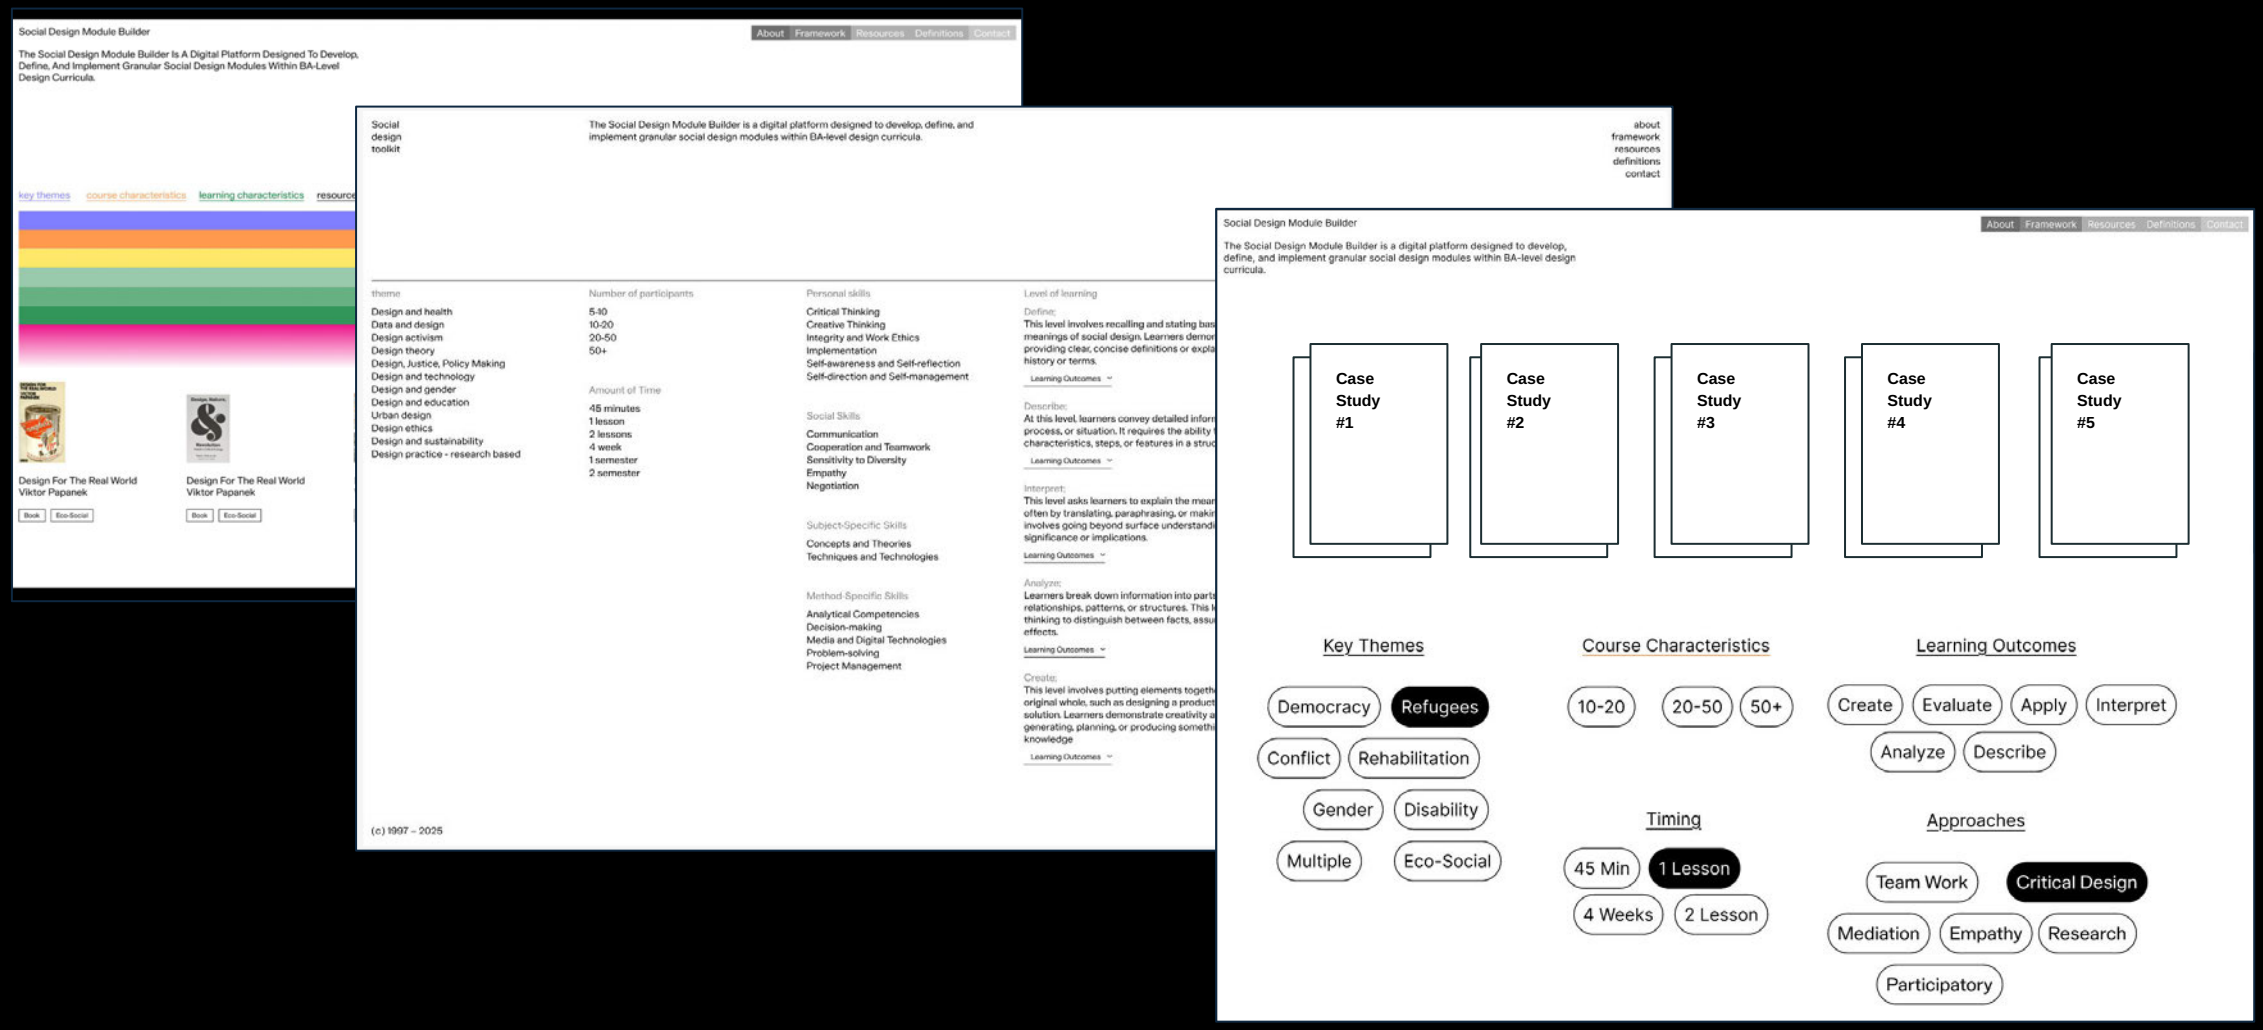
Interested in implementing social design into their courses and existing curricula

Pedagogies of Social Design

- ➔ What does the pedagogy of social design look like in practice?
- ➔ What methodologies emerge when educators engage with social design concepts?
- ➔ Where is social design taught?
- ➔ How does social design education vary across geographic and cultural contexts, and what are its key characteristics?
- ➔ How can these methodologies be adapted across different disciplines and temporalities within BA-level curricula?

Social Design Education Modules

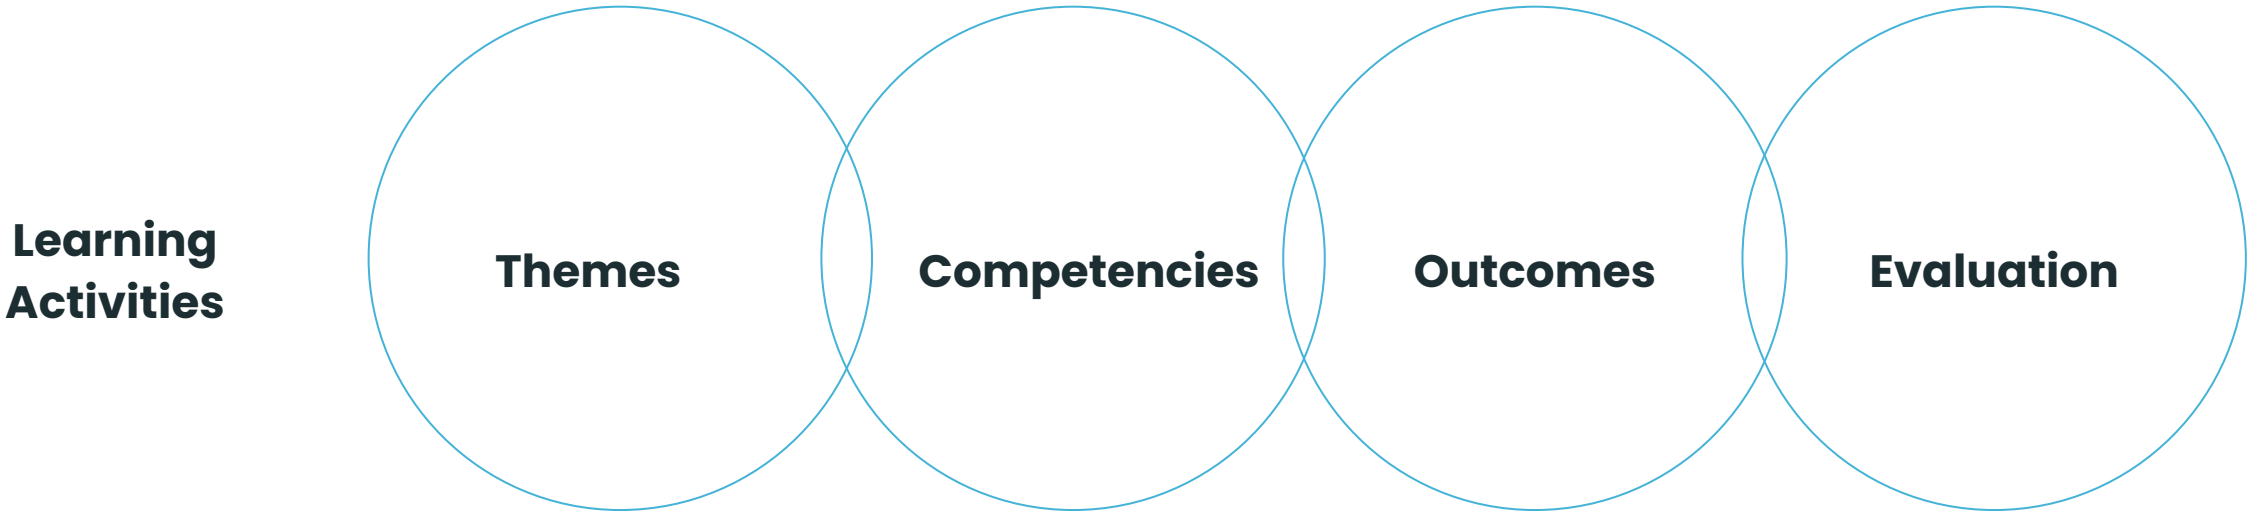
A new toolkit to integrate social design values in design curricula



Current iterations of the module builder, 2025

Possible outcomes

Activity and Discussion



Next Steps

- ➔ Collect and map case studies
- ➔ Further iteration of the module builder
- ➔ Opportunity to engage as a working group
- ➔ Pilot in Shenkar (October 2025)
- ➔ Possible comparative research
- ➔ future conferences and publications

Thank You!

ABSTRACT | This paper presents an analysis of 'live' student projects delivered by Manchester Metropolitan University (MMU) as part of *Stockport Creative Campus* (SCC), a project which links university activity with a public authority, partner organizations, and the citizens of Stockport, Greater Manchester (UK). Recent decades have seen a growth in the adoption of project-based learning within design education. Current literature focuses on the benefits of such approaches for students' learning and their future role as professional designers in society, however, there is a lack of critical discussion regarding the value these approaches have beyond the learning experience. As argued by DiSalvo, the pursuit of innovation and uncritical application of design methods to address societal issues risks reproducing and re-asserting structures of power over communities that we work with. Through an analysis of four student projects taking place across the departments of Design and Architecture at MMU, this paper questions the value of 'live' student projects for the communities they align with. We outline four pedagogic models and assess their contribution to the wider aims of *Stockport Creative Campus* and the potential risks they pose in perpetuating extractive practices.

KEYWORDS | SOCIAL DESIGN, PROJECT-BASED LEARNING, DESIGN, ARCHITECTURE, COMMUNITIES, EXTRACTIVE PEDAGOGIES

1. Introduction to Stockport Creative Campus

Project-based learning and the use of 'live' briefs has been widely adopted in design education and are "at times presented as best practices in design education" (Noel, 2021: 256). DiSalvo (2021) warns that in the pursuit of innovation and uncritical application of design methods to address societal issues we risk reproducing and re-asserting structures of power over communities that we work with. This paper proposes a critical discussion of project-based learning as a pedagogic model widely used in design education and questions its potential for extractive practices through an analysis of four student project models. In environmental terms extractivism refers to the fast removal of "large quantities of natural resources" (Acosta, 2013:62). While environmental forms of extraction remain an important global focus, in recent years "extractivist practices have been abstracted and applied to entirely new areas" (Chagnon et al., 2022:761). We will use the term pedagogical extractivism to refer to the practice of removing cultural/social resources for distant (institutional) benefit, relating to a context/community in a way that is short-term and non-reciprocal.

Design Factory Manchester is an innovation hub at Manchester Metropolitan University (MMU) that acts as a vehicle for researchers, and students to drive sustainable development in communities within and beyond the city. Stockport Creative Campus (SCC) is one of the first projects undertaken by the Design Factory Manchester initiative. As one of ten Metropolitan Boroughs in Greater Manchester, Stockport is located eight miles south-east of the city of Manchester, in the Northwest of England. Led by Stockport Metropolitan Borough Council (SMBC) SCC is a three-year town center reinvigoration program transforming Stockport's heritage rich center. The case studies presented here set out four models of student projects that have been delivered across Manchester School of Art's (MSoA) department of Design and Manchester School of Architecture (MSA) at MMU during the academic year 2023/24. Each of these projects involved student briefs linked to the town of Stockport either via the specification of a single or multiple sites; developed thematically with an external organization; or initiated by a community partner. The paper has been jointly written with lecturers who led each of the projects in collaboration with Potter and Micklethwaite from the Design Factory Manchester team. The primary goal of project-based learning in design education is clearly related to student experience, and all the case studies discussed here center around providing students with an opportunity to develop skills that are vital to designers working in contemporary contexts. This paper, however, does not seek to discuss the merits of these projects within this remit. Instead, we present them as case studies for critical reflection on the impact they have (or could have) upon the people who live and work in the communities in which they are located and question the potential (or risk) for extractivism.

2. Site-responsive Model

The site-responsive model represents a common approach in design education, in which students are given a 'live' location to respond to. Locations may be a vacant site or an existing building in 'need' of regeneration and are selected by course tutors for the opportunities they present for transformation.

During Year 2 of the BA(Hons) Architecture course at MSA students work on a series of interrelated projects that develop the context for architecture as a social and cultural act commencing with a 'Transforming Places' module. For 2023/24, a vacant and somewhat overgrown plot on Lower Hillgate in the center of Stockport was selected as the local site for students to respond to. They were tasked with researching and designing a small number of dwellings with associated creative workspaces for the site that drew upon the town's past and current entrepreneurial nature. Stockport was chosen as a study territory due to its industrial heritage and the opportunities presented for innovative projects through aspects of post-industrial decay and urban fabric 'gaps'. With Manchester's development reaching saturation, Stockport's strong connectivity, diverse demographics, and cultural resurgence - marked by its designation as a Greater Manchester Town of Culture for 2024 - made it an ideal site for exploring creative and sustainable architectural solutions for BA2 architecture students.

Prior to the 2023/24 launch, BA2 program co-leads met with representatives of Stockport Metropolitan Borough Council recognizing the course's project alignment with the broader SCC aims. Aside from this overlap, the project did not have any formal external partners, and the student project was linked with Stockport via the selected site alone. 186 students were introduced to the site location as part of their Studio 2.1 project briefing, visiting Stockport and the site in Lower Hillgate. Students worked in 10 Studio groups with two studio tutors and were encouraged to visit the site under different conditions with many engaging in conversations with local business owners and members of the public. An interim review for the project took place on campus.

Figures. 1 (left) and 2 (right). Pop-up exhibition of selected BA(Hons) Architecture student project outcomes at Miru Mill, a creative co-working space in Stockport.

Following the end of the project a pop-up exhibition of a selection of the students' work was organized at a co-working space near to the Lower Hillgate site in Stockport (see Figures 1 and 2). SCC stakeholders were invited as well as being open to the public, but, unfortunately, the event received little attendance except from some younger members of the surrounding community. This is perhaps indicative of the lack of formal external partners to the project. Students also took part in the annual Faculty Degree Show where they exhibited their BA2.1 project outcomes.

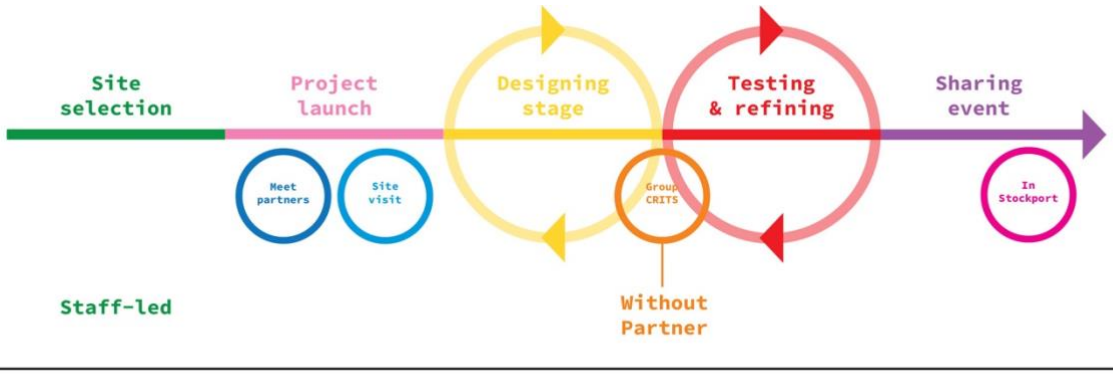

Figure 3. The Site-responsive model (as demonstrated BA2 Architecture project 'Slicing and Stitching Stockport') includes staff-led site selection, on campus project launch followed by group site visits, mid-point CRITS without no external partner and a final showcase of student work in Stockport.

The diagram above (Figure 3) shows the different stages of the site-responsive model demonstrated here by the BA2 Architecture 'Slicing and Stitching Stockport'. This (and related diagrams used for each model in this paper) has been adapted from diagrams developed by Daniel Charny and Maya Alvarado to illustrate 'Fixperts' student projects in *Fixperts*: *models, learning, and social contexts'* (Micklethwaite et al., 2020).

Key aspects of the site-responsive model include:

- Site selected by teaching staff due to relevance of local context and transformative possibilities offered for students to respond to.
- Project aligned with SCC aims but no formal external partner.
- Project launch on campus with site visit following.
- Mid-point CRITS held on campus with no external partner present.
- Project outcomes shared via pop-up exhibition in Stockport and included in the Faculty end of year Degree Show with SCC stakeholders invited.

3. Multi-site model

The multi-site model is an extension of the site-responsive model, with students given a selection of sites to choose from. External partner organizations may be involved but the site selection and project brief remain staff-led.

MA Interiors at Manchester School of Art is a one-year full-time (or two-year part-time) course in which students investigate and interpret interior space, inside and outside of the traditional architectural envelope. For 2023/24, 30 MA Interiors students undertook a Stockport-linked project as part of their final 'Synthesis' module. This module puts into practice methods and approaches for devising interior schemes in relation to site specific contexts in real-world settings. A briefing for the project was hosted in Stockport's St

Mary's Parish Church, providing a historic setting next to the town's market hall. Three sites were pre-selected for the students to focus their responses on: 18-19 Market Place, a mock-tudor building included in forthcoming regeneration plans as part of SCC's wider funding; The White Lion public house (including affordable residential spaces) recently refurbished through the SMBC's wider regeneration plans; and Albion House an empty plot set for re-development into flexible commercial and residential spaces by property developer Hall & Co. Students' were given a tour of each site by SMBC's Development and Regeneration Manager and Architect Construction Lead.

Figure 4. MA Interiors students and staff entering 18-19 Market Place during site visit and tour of Stockport town center following a project briefing.

An Interim Crit was held at MMU with students presenting their work-in-progress to the MA Interiors teaching team. Following completion of the module, four project proposals were identified as aligning with the wider aims of SCC and these students were invited to present to the SMBC team along with the Director of Hall & Co.

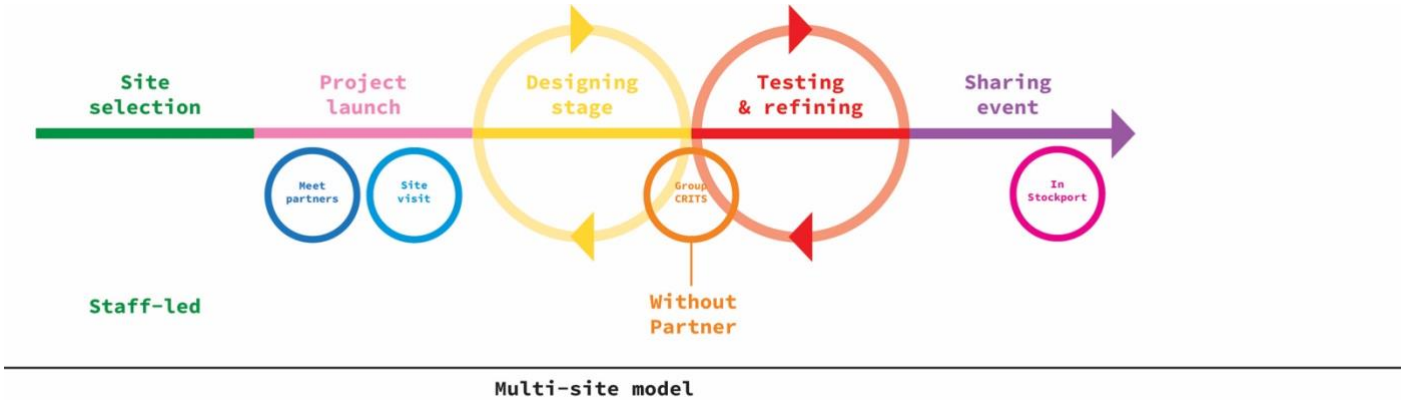

Fig.5: The Multi-site model (as demonstrated by the MA Interiors 'Synthesis' unit) includes MMU staff-led site selection, on campus project launch followed by group site visit led by external partner SMBC, mid-point CRITS without an external partner and a final presentation of student work to partners in Stockport.

Key aspects of the multi-site model include:

- Sites selected by teaching staff in relation to external partner relationships.
- Project aligned with SCC aims.
- Project launch took place on campus with site visit following led by external partner.
- Mid-point CRITS held on campus with no external partner present.
- Selected student project outcomes shared with external SCC partners via in-person oral presentations.

4. Partner model

In the partner model tutors develop relationships with external partners and co-develop a project brief before engaging students. The brief is linked to a particular locale but without a fixed site to respond to. This gives students' free choice over their creative responses allowing mixed disciplines of students to respond to a collective theme.

'Unit X' is a Design wide initiative that invites students from across the department to develop creative projects in association with partner organizations from Greater Manchester and beyond. For 2023/24 one (of seven) Unit X projects were linked with Stockport, developed in collaboration with external partners Zoetmulder - a design agency for architecture, interior, urbanism, and design, based in Delft, the Netherlands - and Future Everything – a Manchester-based digital arts organization and one of the partners of SCC. The project brief, titled 'Reframing Experience', tasked a mixed group of 61 2nd year students from six undergraduate disciplines in the department of Design to undertake a placemaking exercise centred on culturally activating Stockport town centre. Students worked in twelve mixed-discipline groups to develop proposals for permanent or temporary interventions for Stockport town centre. External partners were selected by the teaching team based on the potential they posed for students in relation to the sharing of professional methods and approaches. The project was launched with external partners present followed by a group visit to Stockport (see Figures 6 and 7).

Figure 6. ‘ReFraming Experience’ project briefing with Unit X students at St Mary’s Parish Church in Stockport.

Figure 7. Unit X students discussing their observations of Stockport town center with external partner Zoetmulder.

Student groups continued to revisit Stockport on a self-directed basis to carry out further research and observations, often discussing the project with members of the public. Mid-point CRITS provided students with the opportunity to present and receive feedback on their work-in-progress from the teaching team and both external partners. At the end of the project a showcase of the students’ work was held on campus with external partners invited to attend as part of a module wide ‘Open Studios’ event.

Figure 8. ‘ReFraming Stockport’ student project outputs on display as part of Unit X Open Studio event

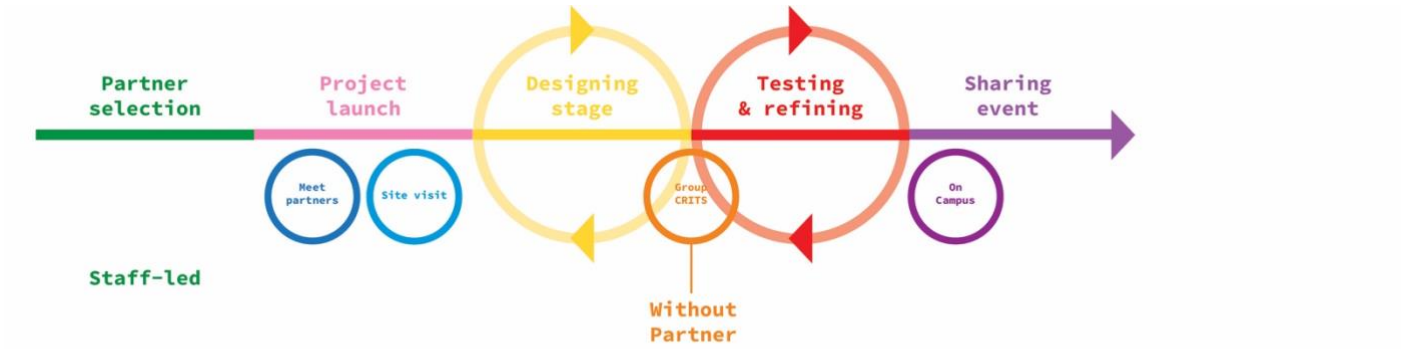

Figure 9. In the partner model (as demonstrated by Unit X project ‘ReFraming Experience‘) external partners are selected and invited into the project by staff teams and project briefs developed in relation to their practice and/or approaches to working in real-world contexts. Project launch on campus is followed by a group visit with external partners informing initial exploration of the local context. Mid-point CRITS include external partners who feedback directly to the students on their work and a final sharing event showcased student outputs with external partners invited.

Key aspects of the partner model:

- Project brief is co-developed with external partners in relation to their professional practice.

- Project broadly aligned with SCC aims, specifically in relation to cultural approaches.
- Project launch took place on campus with site visit following including external partners.
- Mid-point CRITS held on campus with external partners present.
- Project outcomes showcased as part of 'Open Studio' event on campus with external invited.

5. Community model

In the community model students work directly with a community partner to co-develop a brief aimed at creating social impact or being of community benefit. Project tutors facilitate initial pairings with students able to select their project preference to ensure buy-in.

Each year Manchester School of Architecture run 'MSA LIVE', a program that unites students from multiple programs in mixed-year teams to undertake live projects with community partners. A core group of between five and seven Masters students take the lead on brief development, delivery and co-ordination of the project with other cohorts of students joining for an two intensive 'action-weeks' at the end of the academic year. Each group produces a blog sharing the project's progress allowing community partners, tutors and wider publics to gain insight into the group's work as it develops.

In 2023/24 approximately 600 students from six cohorts in MSA worked on a total of 40 MSA LIVE projects, eight of which were connected to partners based in Stockport. These included: the transformation of vacant sites earmarked for future development through proposals for meanwhile uses (working with Stockport Mayoral Development Corporation (MDC)); the design of a customizable, modular pop-up workshop and exhibition space (working with Future Everything); the design of creative, low-budget interventions for Merseyway Shopping Centre (working with SMBC).

Figure 10. .Student created documentation of site visit from Group 21's project blog

Figure 11. Image from Group 34's blog documenting meeting with their collaborator, Future Everything.

Project aims are led by a core group of Masters students who work closely with representatives from the community partners to develop a brief that aligns with their desired outcomes. A preparation period is carried out where students consider the ethics, scheduling and budget for the two action weeks when the main design work takes place. Each group defines their own program for the action weeks, which usually includes site or community visits (see Figures 10 and 11) with students encouraged to activate engagement and participation practices as part of their work. Project outcomes are fed back to the community partners via student designed publications and presentation of outcomes shared at a collective celebration event. This event was well attended by project partners (see Figure 12).

Figure 12. .SCC stakeholders viewing students work at MSA Live 24 celebration event.

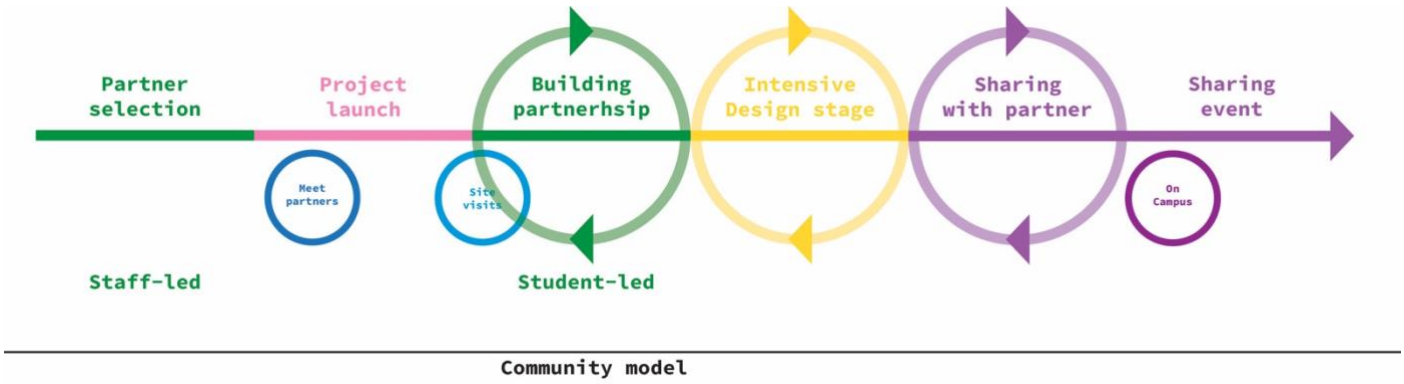

Figure 13. In the community model (as demonstrated by MSA Live 24 projects) project briefs are initiated by community partners with MMU staff making final selections and pairing partners with students for full brief development. Partnerships are built over a long lead time between core students in each group working directly with the community group or organization.

Projects remain in full consultation during project 'action weeks' with project outputs shared (and given to) the community partners at the end of the project and at a celebration event on campus.

Key aspects of the partner model include:

- Project brief is initiated by community partners and co-developed directly with students.
- Project broadly aligned with SCC aims.
- Students self-direct and co-ordinate meetings and site/community visits with community partners.
- Projects have a long lead-in time before wider student bodies join groups for intensive 'action weeks'.
- 16-page documents reporting and reflecting on the projects are produced *for* the collaborator.

6. Discussion

The student projects discussed here have been outlined in terms of how they connected with Stockport as a town, and where applicable, how they overlapped with the wider aims of Stockport Creative Campus.

The models described engaged with the communities of Stockport to varying degrees from the site-responsive model in which students responded to a 'live' site and its surrounding context to the multi-site, partner, and community models that worked with external partners in the form of cultural organisations, council representatives, and community groups. Each of the models used various methods for feedbacking back student outputs to Stockport's communities and linked external partners. External partners who fed directly into projects (feeding into project briefs and contributing to student feedback) and gave their time in doing so, were

The below table (Table 1) shows the partner types and feedback methods employed within each model.

Table 1. Summary of the four models and connected external partners for each case study student project presented in this paper.

Model	Partner	Partner type	Feedback method
Site-responsive model	None	N/A	Exhibition in Stockport
Multi-site model	SMBC	Council representatives	Presentation to partners
	Hall & Co	Stockport-based property developer	
Partner model	Zoetmulder	European design agency	Exhibition on campus (partner attending)
	Future Everything	Cultural organisation	

Community model	Heaton Mersey Village Conservation Group	Community group	Exhibition on campus (partners attending) with student reports gifted to each collaborator.
	SMBC	Council representatives	
	Marple Civic Society	Community group	
	Stockport Mayoral Development Corporation (SMDC)	Connected to the council	
	Future Everything	Cultural organisation	
	Merseyway car park (SMBC)	Connected to the council	
	SMBC	Council representatives	

In the site-responsive model project briefs were developed without external partners. Sites were selected by course tutors with the primary intention focused on opportunities posed for students' projects in relation to learning outcomes. The multi-site model is very similar but with students given a selection of sites to choose from. All sites were connected to ongoing regeneration plans in the town. In both the site-responsive and multi-site models, students undertook site visits and were encouraged to engage directly with local businesses and publics to gain a deeper understanding of the social contexts relating to each site. In seeking ways to share student work back with communities outcomes in the site-responsive model student project outcomes were showcased through a pop-up exhibition near to the original site. In the multi-site model a selection of student outcomes were shared with external partners and SCC stakeholders SMBC, and local property developer Hall & Co. These models could be considered 'light touch' operating primarily from the distant institution with minimal demands made on external partners time or resources.

In the partner model the project brief was developed in collaboration with the external partners drawing on their practices and approaches to working with communities. In the case of the 'ReFraming Experience' project only one of the partner organizations was connected with Stockport, the other was a design agency based outside of the UK. Future Everything are formally a cohort member of SCC and had spent the previous year consulting with communities in Stockport as part of an Artist commission in the town. Their position within the SCC cohort also gives them a vested interest in the student projects and their contribution to the wider SCC aims. Students were required to undertake their own research and many student groups sought opportunities to informally connect with local businesses and members of the public in the town. Final proposals were showcased through an on campus 'open studios' with external partner Future Everything attending. This event was not widely advertised and was not

particularly accessible to residents of Stockport with the University campus being approx. 7 miles from Stockport town centre.

In the community model the direct pairing of student groups and community partners implies a greater sensitivity to the desires of the people who live and work in Stockport. The longer lead-in time with lead students co-developing each project brief with the partner, allowed for greater care to be taken in considering the needs of the community partners and their linked communities. Partners are also kept in the loop during the program's 'action weeks'. Project 27 'ELEV8STOCKPORT', for example, undertook several visits in the preparation period, as well as a site visit with the group at the start of their action weeks and presentations giving at the end. The feedback given to the group from community partner Stockport MDC noted the alignment of the project outcomes with Stockport's future vision. There is an implicit trust upon the community partners in this process to fully represent the needs of their communities in co-developing project briefs. The desires of a council vs the desires of a community-led organization may vary greatly depending upon their motivations and organizational goals. The desired outcomes expressed by SMBC for Group 28's project 'MERSEYWAY FACELIFT' was to "attract a higher-class demographic" to the shopping center. This is an example of a goal that potentially doesn't reflect the needs and desires of Stockport residents living close to the shopping center. In these instances, there is an innate need for course tutors to guide students in bringing critical awareness to the brief and partner motivations.

7. Conclusion

In this working paper we have set out to question whether 'live' student projects risk perpetuating extractive practices. We have outlined four models of project-based learning using case studies of student projects delivered across MMU in the academic year 2023/24 connected to the wider project *Stockport Creative Campus* (SCC).

In the main the models discussed here engaged with either physical sites and/or external partners in the form of cultural organisations, council representatives, and community groups. As indicated in Table 1 many of the external partners in the case studies we have shared, were connected to the wider aims of SCC, either as cohort members and project leads, such as SMBC and other council linked bodies, and organisations such as Future Everything. Potter and fellow SCC team members based at the University who engaged and fed into the student projects also had an ongoing relationship with the town as a cohort member of the SCC project. Very few of the projects involved direct interaction with the communities of Stockport. Very little was 'extracted' from the communities of Stockport beyond the time given by external partner teams and some direct engagement with town centre residents and businesses by students. Connecting to organisations with no vested interest in Stockport itself could be deemed as at higher risk of extractivism.

In order to reduce the potential for extractive pedagogies, we propose the following considerations for project-based learning:

- Develop long-term relationships with external partners ensuring adequate lead-in times for brief development that reflects the needs and desires of the community.

- Include external partners and communities in as many stages of the project as appropriate acknowledging that staff from volunteer led organisations may have more limited time and resources to contribute than larger cultural and policy-led organisations.
- Ensure external partners are invited to participate in any showcases of project outcomes and if appropriate, seek to develop outputs that offer potential benefit to external partners and their communities.

All of the models described are being delivered again in 2024/25 with some of the above considerations implemented. For example, the site-responsive model (with 2nd year Architecture students) has become a multi-site model for this academic year with a second site in a different town centre location added for students to respond to. With low engagement with the exhibition of student outcomes for 2023/24 we are seeking to showcase student outcomes for 2024/25 in a more public space on the town centre high street. Since commencing the project again this academic year, physical development has commenced on the Lower Hillgate site which students have been responding to across both years. When sharing student designs with the public this could lead to some confusion, and we are conscious that members of the public may perceive the students' designs as being directly linked to the ongoing development. Expectations around this need to be managed and the speculative nature of student projects made explicit.

For 2024/25 the Partner model is being delivered with two cultural organisations based in Stockport (the 'Hat Works Museum' and a new cultural hub called 'Stockroom')with a revised project brief (co developed with these partners) inviting students to seek out and amplify seldom heard voices from Stockport's past, present, and future. In the Community Model external organisations from Stockport who proposed projects for the 24/25 academic year are all grassroots community organisations with no council or wider body involvement. This change has not been by design and simply reflects how MSA Live is a responsive model led by the desires of external partners. These projects will be reassessed at the end of the 2024/25 academic year.

About the Authors:

Gemma Potter is a Research Associate at Manchester Metropolitan University currently working on DCMS funded *Stockport Creative Campus* project as part of Design Factory Manchester. Her research explores the transformative potential of making through inclusive and participatory approaches.

Paul Micklethwaite's research explores the impact of sustainability agendas on how we think about and do design, particularly via modes of practice which are explicitly social and take design (and designers) into new territories. In short, socially-led design for sustainability.

Fabrizio Cocchiarella's research investigates new and alternative territories for design that shape how we understand the designed environment. Through a multi-specialist approach to develop new 'ways of seeing', design practice investigates relationships with the physical (and metaphysical) through 'para-design'.

Emily Crompton is an Architect and Senior Lecturer at Manchester School of Architecture where she leads the MSA LIVE programme as well as the Foundation year. Her research interest is in collaborative and participatory design, with a focus on engagement methodologies.

Pattilyn Crozier is Programme lead for international top-up programs across the Department of Design at Manchester School of Art. Pattilyn is committed to driving meaningful change inspiring students to create positive social, environmental, and cultural impact that transcends borders.

Dragana Opačić Wilkinson is an architect and lecturer whose research focuses on fragmented urban fabric and

heritage. She integrates these themes into design education, fostering critical engagement, cultural awareness, and socially responsible practice among emerging designers shaping the built environment.

John Wood is an architect and lecturer whose practice research engages with complex urban places, subject to plural and contradictory forces. Often operating on the margins of viability his work promotes equitable access to good quality architectural and urban space.

Acknowledgements: Stockport Creative Campus is funded by the Department for Digital, Culture, media and Sport via the Cultural Development Fund, managed by Arts Council England. We would like to thank all external partners who worked with us on the projects discussed here and thank our students for their contributions.

STREET LAB STRATEGIES FOR POP-UP PLACEMAKING: ENGAGING COMMUNITIES TOWARDS LASTING CHANGE

Hannah Berkin-Harper

New Jersey Institute of Technology, Hillier College of Architecture and Design and Street Lab
hannah.berkinharper@njit.edu

ABSTRACT | Pop-up urban placemaking is the short-term, event-based activation of public spaces. Street Lab is a nonprofit in New York City working with communities to create, activate, and improve public space. We pop up by invitation of community groups and city agencies for several hours at a time, bringing programs to streets, plazas, and other public spaces. While activations may last only hours, they provide support for neighborhood organizations, schools, and other nonprofits who often do not have the capacity to plan, document community input, create programming, store materials, or perform maintenance.

Street Lab uses design as a central strategy to deliver immediate and impactful experiences. Beautifully designed objects help create enjoyable spaces for people to gather. Designs include pop-up libraries and drawing studios, seating, tables, play activities, and more. Objects are designed for easy transport and assembly by anyone and support flexible use by partners.

Street Lab's activations are demonstrations, showing what is possible through good design and care in a cost-effective and community-led way. Our pop-ups inspire people to come together, share their visions for public space, and work together toward lasting urban transformation.

KEYWORDS | URBAN TRANSFORMATION, PUBLIC SPACE, DESIGN, COMMUNITY ENGAGMENT, PLACEMAKING

1. Introduction

In New York City, where private outdoor space is scarce, making vibrant and safe public spaces essential to community wellbeing, and the activation of those spaces central to their success. Street Lab is a nonprofit that pops-up in New York City, transforming public spaces for only a few hours on streets and plazas in partnership with local community groups. Street Lab envisions a city filled with public spaces that inspire, where people can gather in every neighborhood. To make this vision a reality, Street Lab relies on design to provide people with good experiences in public space, show care to communities, and to soften and transform the urban streetscape. Guided by a commitment to ethical leadership, Street Lab works by invitation, ensuring that its presence supports community-led goals and reflects a deep respect for local voices. Through this approach, organization creates demonstrations that catalyze change and help foster lasting transformations.

2. Street Lab Strategies

Founded in 2006 as a pop-up library in Boston, Street Lab moved to New York City in 2011. (Street Lab/about, n.d.). During the COVID-19 pandemic, it expanded alongside the city's Open Streets program when the city began issuing permits to community organizations to close certain streets to traffic. Some funding was distributed to organizers of those streets, but it was not sufficient to maintain upkeep and programming (Streetsblog, 2024). Street Lab is unique in that we create custom objects and program designs, and we are a service provider to New York City agencies. As Design Lead, I create custom designs that can be deployed in public spaces by invitation of community groups, NYC's Department of Transportation (DOT), and other agencies. We provide staff for our pop-ups that set up, clean up, and run programs.

This paper focuses on Street Lab post-2020, when New York City drastically changed its approach to public space in response to the COVID-19 pandemic. However, Street Lab has been using design to activate public space long before that, including one of the most iconic objects: the Uni carts and benches by architecture firm Höweler + Yoon (Street Lab/design, n.d.). Street Lab sells kits to others across the United States interested in fostering similar engagement in their communities.

2.1 Why Pop-Ups?

Pop-ups show the power of street transformation in an immediate way. Change in the urban environment can be slow, with many permits and permissions needed to approve more permanent plans. Pop-up is a "now" approach, reactive to the infrastructure and programming needs of a particular place. Many community organizations lack capacity to program spaces, store and replenish materials, or staff to maintain materials and infrastructure. Sometimes neighbors do not agree on community priorities (Transportation Alternatives, 2020), while pop-ups can engage communities and encourage consensus toward a shared vision, valuing experimentation to understand what works in a specific space. Street Lab works with a network of partners whom we connect to share resources and ideas to help inspire and strengthen one another. In most low-and middle-income areas, these pop-ups are free to the community, paid for with funding from the Department of Transportation (DOT, 2024).

Figure 1. Street Lab on Jennings Street in the Bronx, NY. Photo credit: Street Lab

2.2 The Role of Design

Street Lab uses design as a central strategy to demonstrate immediate and impactful transformation. We create beautifully designed objects and programs using premium materials including libraries, social seating, tables for dining and activities, objects for play, and community engagement kits. A set of principles guides the design process at every phase of development and serves as a rubric to continuously evaluate ideas. The rubric is first used to determine whether to pursue a new project. Design projects must stay true to the mission of the organization, as well as work within available capacity. Once the initial design is complete, we evaluate whether the concepts continue to meet these goals, and a third time once we have a prototype. Some items on this rubric include:

- Simple and emotional
- Walk-up, drop-in and open-ended
- Scalable and replicable
- Softens the urban landscape
- Makes an attraction
- Gives the community something
- Materially responsible (carbon footprint, repair, reuse, efficiency, end of life)

In addition to these criteria, we design according to the realities of moving and storing equipment in New York City. This creates a set of constraints that help guardrail the design process. They include:
Must be portable within our capacity (van or lift-gate truck if needed)

- Should fold, pack-flat, or stack (or similar)
- Assembled easily by 1-2 people
- Operable/programmable by staff and partners
- Ease of maintenance and repair

Street Lab employs a version of the “quicker lighter cheaper” approach, a term coined by Eric Reynolds, which describes a strategy harnessing the creative energy of the community to quickly and inexpensively transform spaces toward new uses and possibilities. (Project for Public Spaces, n.d.) We use this approach for materiality as well,

to specify designs that are lightweight, yet suitable for constant public use.

Birch plywood is a primary material because it is inexpensive, durable, and creates warmth in the urban landscape. Plastic is used sparingly for environmental reasons, but sometimes is the most practical choice where lightness and strength are most important. For example, Street Lab's stacking benches are fabricated using CNC-cut polypropylene, and are one of our most requested designs, and a best-seller to others, as they are easy to move and store. While converting these to wood or other materials has been discussed, a suitable design has yet been developed that can compete with plastic. Where possible some designs in plastic are being converted to recycled HDPE, though it is expensive and not easily available.

Materiality is central to our design strategy. Designs are meant to move and be used together in different combinations, inspiring community members to adapt designs for their own use, create new uses, or combinations that work for them. This helps partners consider how spaces should evolve without the pressure of a long planning process or great expense. Materials feel premium which creates a sense of excitement and shows care towards the community. There is a sense that something special is happening that is not experienced with generic folding tables and tents.

2.3 Program Design

In addition to physical design, Street Lab designs programs that activate these objects following similar principles to those used for physical designs. Street Lab offers 14 programs, each referenced by words like READ or PLAY. Generally, designs serve multiple programs: Carts can be libraries or art studios for READ and DRAW, respectively. Tables used for BUILD, our block construction program, are also used for EXPLORE, a nature program with microscopes and specimens. We use the same tables for WRITE, a program featuring typewriters. Each program uses materials constantly cared for and refreshed. READ is often curated along themes from our extensive library featuring books in a variety of languages that are tailored to different locations and populations. Objects also support the programs of partner organizations who pop-up alongside us, and adaptive reuse by community members.

2.4 Community Engagement

According to the American Planning Association, "pop-up designs and activations are successful when diverse community members are engaged in the process from beginning to end, including the implementation of the final design. Community engagement ensures that the pop-up designs and activations relate to local priorities and needs." (Pena, 2021)

At Street Lab, all designs are informed by the communities we work with, but it is not strictly a codesign process. Our equipment must work in multiple neighborhoods, be flexible for various uses, and be usable by anyone. Multiple communities are engaged in the development of designs and programs through unique feedback loops that come with long-lasting partnerships. Staff engages with the community at activations, listens to their thoughts and vision, learns how existing programs are operating in various places, and any pain points with equipment deployment or use. We have created a physical framework and program to formalize this process, called IMAGINE, which has been developed over several years in collaboration with our partners. This approach echoes urban writer and activist Jane Jacobs' belief in the importance of local knowledge and

the value of observing and responding to the "intricate sidewalk ballet" of neighborhood life—a philosophy that prioritizes organic, community-rooted development over top-down planning (Jacobs, 1961)

Figure 2. Street Lab engages with community using an IMAGINE prototype. Image credit: Street Lab.

2.5 New Public Spaces

In addition to design and programming, Street Lab works with local partners and the DOT on a New Public Spaces initiative (NPS). We work with a partner to secure permits, understand needs, and build consensus around the space through a mix of support, program, and design utilizing co-design methods. Partners include public schools, local government, community organizations, and neighborhood associations who reach out to us to participate. Street Lab's staff visits the site, helps with communication and outreach, and recommends and delivers programs and designs to pilot a space. Then we pop-up: Street Lab sends staff and equipment regularly over months to pilot the site. If the partner can store equipment, we lend objects and programs long-term. The goal is to transition the site so the partner and community can take ownership and continue with planning and management, while we continue to support programming and infrastructure as requested.

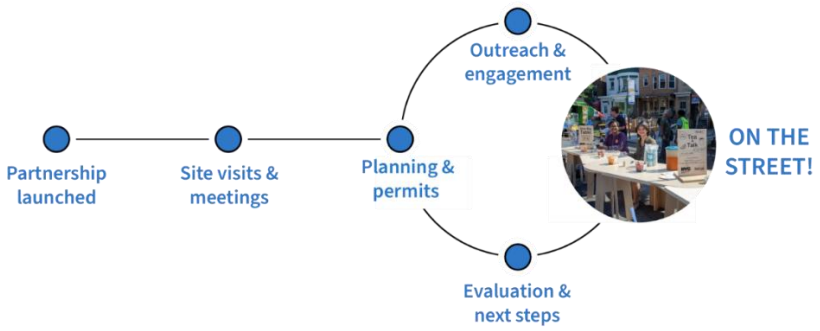

Figure 3: New Public Spaces process. Image: Street Lab

3.Examples

There are numerous examples where Street Lab's work with communities has helped create lasting change. The following examples show how Street Lab designs can help transform public spaces in meaningful ways. These examples share different types of partnerships and spaces, in different neighborhoods.

3.1 Beverly Triangle, Kensington, Brooklyn, New York

Beverly Road Triangle in Kensington, Brooklyn is an example of how pop-ups demonstrate possibility. This triangle became an Open Street in 2020, adjacent to an existing plaza. A local neighborhood association worked with New York City Councilmember Shahana Hanif to advocate for the transformation of this space into a permanent public plaza. Street Lab helped demonstrate what this transformation could look like by creating weekly activations during Summer 2022 using a variety of existing programs and designs. We piloted two new prototypes, including One Big Table (OBT), a modular and scalable approach to outdoor dining and gathering, and IMAGINE, our community engagement toolkit.

Beverly Road has several restaurants lacking outdoor spaces and a large market. We hosted a "tea and talk" using OBT with the Councilmember, featuring food from these local establishments. Community groups participated in pop-ups as well: the Bangladeshi Ladies' Sewing Club used the tables to meet and work on patterns, and cyclists returning from a ride stopped to enjoy a snack and chat with neighbors (figure 4).

Figure 4: One Big Table, PLAY on Beverly Road, Summer 2022. Image credit: Street Lab.

We brought an early prototype of the IMAGINE toolkit. Street Lab has long used Polaroid cameras and prompt cards to capture and share people's ideas and aspirations. Some prompts might include “Dear New York City, on this street I want to…” or “What does this street mean to you?” (Street Lab/imagine, n.d.). People affix cards to the outside of our carts to inspire others to do the same, creating an asynchronous collaborative experience. In Kensington, a simple three-panel board was assembled for displaying cards asking people to share their ideas for Beverly Road (figure 5). We used these cards to communicate support to the DOT. The answers were incredibly moving and celebratory of the diverse residents of the community, advocating for both active and cultural programming. Activating space with prototypes allows us to both test ideas and deliver new designs very quickly.

Street Lab was not solely responsible for community engagement at this site. The neighborhood association created surveys, and DOT created a survey for a quantitative understanding. Street Lab's engagement is generally qualitative, focused on sharing stories. Per the survey conducted, 82% of people surveyed (of a total number unknown) were in favor of the street becoming a public plaza, with some concerns about ongoing maintenance and programming (DOT, 2023). In Summer 2023 the site became an official plaza. We continued to program as requested, while maintenance and plantings were managed by the Horticulture Society, another DOT partner. It took many groups and people to help turn this Open Street into a plaza with Street Lab's work demonstrating potential when activated with people and gathering helped lead to its success.

Figure 5. A community member shares ideas using the IMAGINE prototype. Image Credit: Street Lab

3.2 34th Avenue Open Street, Jackson Heights, Queens, NY

34th Avenue in Jackson Heights is the longest Open Street in New York City at over a mile long. It began in 2020 and has been praised as the "gold standard" for Open Streets by the DOT and others (Bartolini, 2022). Since then, the street has been completely redesigned with some blocks entirely closed to traffic, speed calming measures, and new bike lanes. It has a huge volunteer force of community members, the 34th Avenue Open Streets Coalition (34AOSC), who help to program the street. In 2020, many volunteers worked from home and helped create programming, storing supplies in their apartments. Street Lab developed our PLAY kit in March 2020 in response to the pandemic. We partnered with DOT, who were planning to launch Open Streets in July 2020 when playgrounds were still closed. PLAY is an obstacle course that can be customized with chalk drawings on the asphalt, and can be reconfigured many ways. As social distancing measures eased, we brought additional programming. 34AOSC acquired storage, and they now own one of the original PLAY prototypes (Figure 4), as well as our tables which they use regularly. All of the objects are designed with flexibility to empower partners to use and adapt any way they like to be most impactful for their space.

Figure 6. PLAY kit prototype on 34th Avenue Open Street, Spring 2021. Image credit: Street Lab.

We refer to 34AOSC as a "pro" partner, one that can pop-up on their own with our equipment. 34AOSC were also partners for a special project created as a fellowship I completed at Pratt Institute, using a co-design process to work with seniors and families on 34th Avenue towards new active designs for a multigenerational community (Crespo, 2024). We learned that people needed places to rest in order to be active on the street. This project developed into One Big Bench (OBB), a modular and scalable kit of benches featuring supportive seating elements that has multiple configurations. 34AOSC kept the original OBB prototype which they use for social seating as well as audience seating for performances and events. In cases like 34th Avenue, adding objects that they can easily store, or that we can deliver when they have larger events helps them to provide amazing experiences and services to their community.

3.3 New Public Spaces at New York City Public Schools

Public School 32 (PS32) is in the public system serving children grades kindergarten through Fifth in the Bronx. PS32 has been partnered with Street Lab for 3 years and was among the first of our New Public Spaces sites, starting during the COVID-19 pandemic.

Jim Lammers, then one of Street Lab's program staff, partnered with PS32 and Street Lab for his master's thesis (Lammers, 2023), to develop an engagement framework for their Open Street. Lammers later joined Street Lab's office team as a project manager. We built on his thesis work to develop the IMAGINE program with activities and co-design workshops engaging students and staff. Taking some learnings from Beverly Road, IMAGINE panels were redesigned to be more lightweight and transportable to support workshops on the street in a more engaging way (figure 5). We developed a share-back strategy using the panels for display, and teachers started using them for outdoor lessons.

Figure 7. PS32 students share visions for their street using the IMAGINE toolkit. Image credit: Street Lab.

PS 32 also helped to inspire a new design. In one of Lammers' workshops, students built a consensus around creating a water park on the street. Lammers asked them to think about how they might create this, who might help, and what kinds of permissions they would need. To bring their vision to life, we helped PS32 pilot a waterpark for an year-end festival by bringing sprinklers, hoses, and other water activities. We began to think about water and cooling on the street and how to create a program incorporating water. There is a long history of communities opening fire hydrants to cool off in summer. Street Lab decided to pursue a more passive, less water-intensive system using a hose or hydrant, and created a modular misting river. We added a mobile landscape of native plants and named the program OASIS. We brought a prototype to field day at PS 32 in Spring 2024, and continue to use this program all over the city to cool people on the hottest days. (Street Lab, 2024)

After three years of partnership with PS 32, the school has taken over management of the site. What started with one teacher as leader of the Open Street has now grown to become a full support team of teachers and staff to handle permitting and organization

of the street. We also partner with Equity Design, who specialize in fitness programming. PS32 created an Open Streets Ambassador program made up of children in grades 2-5 who set up the street and plan programming (figure 8). This teacher is also creating a guide for schools Open Streets best practices and is working with Street Lab to develop and share it more broadly. We continue to bring our equipment and programs, but PS32 now handles the rest.

Figure 8. Children at PS32 often assemble One Big Table themselves. Image credit: Street Lab

4. Evaluation

Street Lab uses design and programming to create street transformation. It is important to note that most times, multiple programs are deployed together to create full street activations and options for everyone to enjoy. Measuring impact is complex, influenced by factors like weather and concurrent events. We assess impact based on feedback from our street staff, partners, and the public using head counts, surveys, and interviews to understand which programs "encourage community gathering, increase people's sense of safety and make places more welcoming and accessible to all" (Street Lab, 2024). We look for markers that indicate a positive experience, a sense of safety, and community cohesion. Our partners help assess our designs and programs and collaborate with us to iterate our offerings to deliver the most impactful work.
of lasting urban transformation within New York City. Together, these processes support lasting urban transformation in New York City by modeling community-led public space change and building local capacity so that each neighborhood can develop its own vision for its streets.

5. Conclusion

In 2024, Street Lab popped-up 535 times with 73 partners in 93 locations. Over 26,000 New Yorkers participated in these pop-ups (Street Lab, 2024). We will increase that number in

2025, continuing to respond to the needs of our partners and add to the catalog of designs and services on offer. Street Lab's work exemplifies the power of pop-ups as a strategy for meaningful public space transformation. These temporary interventions serve as demonstrations, sharing the potential of well-designed and inclusive spaces to have a positive impact on the communities that share them. Our model offers a replicable, community-driven approach that fosters social connection and equity, and leads to meaningful and long-lasting change where communities are empowered to have ownership of their public spaces. The success of these efforts reflects an ongoing commitment to ethical leadership that centers trust, collaboration, and respect for communities, and highlights the importance of design and community action in shaping the public realm.

Tacit Knowledge in Clothing Design: A Phenomenological Analysis of the Dressing Issues of Chinese Female Wheelchair Users

Wang Qidi[a], Wang Yue*[a], Jiang Shouxiang[b]
aAcademy of Arts & Design, Tsinghua Universiy, Beijing, China
bSchool of Fashion and Textiles The Hong Kong Polytechnic University Hong Kong, China
***daixingxing07@gmail.com**

Abstract: Clothing goes beyond body-covering. Psychologically, it enhances wearers' confidence and self-identity; socially, it significantly impacts interpersonal relationships and social cognition. However, the dressing difficulties of people with disabilities are often overlooked. This paper centers on the dressing problems of the specific group of female wheelchair users in China. Through in-depth interactions with seven female wheelchair users in the form of a focus group, and by using Colaizzi's phenomenological analysis method to conduct an in-depth analysis of the textual data, it reveals the unique challenges this group encounters during daily dressing and the coping strategies they employ. Ultimately, three core themes are distilled: "Physical Limitations and Movement Skills", "Clothing Modification and Tool Adaptation", and "Social Interaction and Psychological Adjustment". This research uncovers the tacit knowledge amassed by female wheelchair users in their dressing practices. Stemming from their real-life experiences, this knowledge is pivotal for comprehending the needs of this group. It helps designers better recognize these needs, promotes the development of clothing designs and assistive devices, and improves the public environment. Moreover, it positively contributes to social inclusivity and the enhancement of their quality of life and social integration.
(Keywords: Chinese Female Wheelchair Users; Clothing Design; Phenomenological Analysis; Tacit Knowledge; Dressing Issues)

1. Introduction

As societal attention to the disabled grows, the quality of life and rights protection of special groups have emerged as significant social issues. For female wheelchair users, clothing is not just for warmth and beauty; it is integral to self-identity and social interaction. Yet, physical and social barriers pose distinct dressing challenges. China's disabled-oriented clothing market is nascent, with slow progress in design and research. Existing garments often lack style, failing to meet their aesthetic desires, and are designed from able-bodied perspectives, mismatching actual needs. Previous research mainly focused on functional or inclusive design based on general physical requirements, neglecting the tacit knowledge female wheelchair users accumulate while dressing. This knowledge, rooted in their unique experiences, is crucial for understanding their clothing needs and living conditions. This study aims to systematically uncover this "tacit knowledge," presenting a vivid picture of their dressing experiences. It seeks to inspire innovation in disability-focused clothing design, enabling the creation of products that better fit their physical and aesthetic needs.

2. Theoretical Foundation of Phenomenological Analysis

Inspired by his teacher Franz Brentano, Edmund Husserl founded phenomenology in the late 19th century, defining it as the study of "the essence of conscious experience, especially intentional experience" with the core principle "returning to the things themselves". Unlike traditional empirical methods, it focuses on conscious appearances as a whole, rather than breaking them into parts. Key concepts in Husserl's system include natural attitude (unreflective daily interaction), intentionality (consciousness directed at an object), and phenomenological reduction (suspending judgment to reveal essence). Phenomenology posits that reality is constructed by inner conscious perception, balancing subjectivity and objectivity. Through phenomenological reduction, it can distill universal essences from diverse individual experiences. As a theoretically rich research approach, phenomenology offers a unique lens for studying the dressing experiences of female wheelchair users. By focusing on their lived experiences, setting aside biases, and exploring the subjective meanings of dressing, it enables a deeper understanding of their clothing needs, challenges, and the tacit knowledge embedded in daily dressing.

Phenomenological analysis examines lived experiences, suspends biases, and uncovers the essence of phenomena by leveraging diverse materials (e.g., pictures, videos, texts) collected through interviews, observations, or group discussions. There is no one-size-fits-all approach; rather, multiple descriptive methods exist, such as those by Giorgi and Giorgi, Moustakas, Colaizzi, and Sundler. Given its wide use in health-related research, this study will employ Colaizzi's 7-step analysis method (Table 1).

3. Research process

This study employed a focus-group method to investigate the dressing challenges faced by Chinese female wheelchair users. In collaboration with the Qingdao Barrier-free Environment Promotion Association, the research team organized the "Inclusive Fashion Co-creation Camp", recruiting 7 female wheelchair users interested in fashion design. Guided by a professional moderator, the 2-hour session centered on "daily dressing difficulties" and "coping strategies", enabling participants to share their experiences and insights. The discussions were recorded, transcribed by two assistants, and cross-checked by the principal researcher to ensure accuracy. Participant details are in Table 2.

Subsequently, data analysis followed Colaizzi's 7-step phenomenological method. To enhance authenticity, 2-3 representative original statements were inserted into each theme description. The core of Colaizzi's method, involving collecting, comparing, and extracting similar viewpoints to form concise themes, was crucial for achieving phenomenological reduction.

Finally, research findings were presented to participants via online video conferencing. The derived themes comprehensively reflected the participants' daily dressing realities, validating the study's effectiveness.

4. Conclusion

This study employed a phenomenological analysis method to explore the daily dressing experiences of female wheelchair users, identifying three key themes: "Physical Limitations and Movement Skills,""Clothing Modification and Tool Adaptation," and "Social Interaction and Psychological Adjustment."(Table 3)

4.1 Design Considerations Based on Physical Abilities and Behavioral Habits

Wheelchair users often experience limited limb mobility and prolonged sitting, resulting in impaired blood circulation and pressure-induced skin discomfort. Therefore, clothing design should prioritize soft, breathable, warm, lightweight, and highly elastic fabrics. Adequate space should be reserved in areas such as the armpits and knees to facilitate movement. Given their close interaction with wheelchairs, clothing design must avoid long or wide hemlines and loose decorations to prevent entanglement with wheels. Additionally, bottom wear should be designed for easy wear and removal while maintaining comfort and decency, addressing their toileting needs.

4.2 Design Ideas Drawn from Self-modification and the Use of Assistive Tools

The self-modification practices of female wheelchair users provide valuable insights for designers, highlighting the importance of adaptability and adjustability in size and structural design. Furthermore, the use of assistive dressing tools suggests that clothing design can incorporate structural elements compatible with such tools, enhancing usability and independence.

4.3 Design Principles Aligned with the Need for Social Integration

For female wheelchair users, clothing serves not only as a functional necessity but also as a medium for social integration and self-image expression. Designers should align clothing with current fashion trends, avoiding over-design or styles reminiscent of nursing-type clothing. Excessive design complexity may hinder ease of wear and usability, while stereotypical nursing-style clothing can exacerbate feelings of social exclusion. Therefore, designs should balance functionality with public aesthetics, promoting confidence and social participation.

4.4 Significance and Limitations

These themes vividly represent the real-life dressing situations of female wheelchair users, revealing the tacit knowledge within their dressing practices. This knowledge is crucial for clothing design, helping designers understand users' experiences and needs, thus making designs more practical. Phenomenological analysis allows researchers and designers to explore deeper-level user needs, facilitating the identification of design requirements and innovation.

However, the study has limitations. With only seven participants from Qingdao, despite meeting the minimum sample-size requirement for phenomenological analysis, the findings' generalizability is limited. Future research should expand the sample size, including participants from various regions, cultures, and socioeconomic backgrounds. This will improve the conclusions' representativeness and offer more comprehensive guidance for designing clothing for this group.

5. Conceptual design: Modular Clothing for Wheelchair Users

Based on the previous theoretical research and user research, the author has carried out a design exploration of modular clothing for wheelchair users (as shown in Figure 1). This design demonstrates remarkable flexibility and operability in terms of meeting the needs of easy wearing and taking off, adapting to different scenarios, and functional compatibility.

The modular design consists of fixed modules and variable modules. The fixed modules mainly address the issues of easy wearing and taking off as well as convenient toilet use, forming the main part of the clothing. The design of the combination mechanism aims to be as streamlined as possible. A series of modular clothing usually includes 3 to 4 variable modules. Excessive connection interfaces will reduce comfort and increase the complexity of use. The design of variable modules can start from aspects such as style, color, texture, and function, and carry out serialized design. The materials of the clothing for wheelchair users should be soft and lightweight. In terms of the connection method, considering the behavioral characteristics of long-term sitting and lying down, the connection interfaces should be avoided on the contact surface between the body and the wheelchair to prevent pressure marks and pressure sores. Users can match and use the corresponding module combination schemes according to different needs in daily life

This design has three major advantages: easy wearing and taking off, easy washing and changing, and personalized matching. The modular structure allows for the disassembly of specific parts, achieving easy wearing and taking off and convenient local washing and changing, which improves the practicality and hygiene of the clothing. At the same time, the modular design can combine functional modules according to the specific needs of users, realizing personalized matching of styles and functions.

Table 1. Colaizzi's 7-step phenomenological analysis method

1. Familiarization	The researcher thoroughly familiarizes with and understands all the content provided by the research participants through repeated and careful reading of the collected data.
2. Identifying significant statements	Analyze the data word by word, identify and extract important and meaningful statements related to the research questions.
3. Formulating meanings	The researcher constructs/codes the meanings of the recurring viewpoints, but tries to "bracket" as much as possible the pre-assumptions they already have related to the phenomenon.
4. Clustering themes	Gather the coded viewpoints, search for meaningful common concepts, and form the embryonic form of themes. At this time, it is still necessary to "bracket" one's own existing ideas or experiences, especially the theoretical knowledge from the literature.
5. Developing an exhaustive description	The researcher needs to provide a detailed description of each theme generated in Step 4 and can extract and include typical original statements from the participants.
6. Producing the fundamental structure	Put similar themes and their descriptions together for repeated comparison, distinguish and extract similar viewpoints, and then construct a short and meaning-dense phrase, that is, a theme.
7. Seeking verification of the fundamental structure	Return the generated theme structure to the research participants for verification, asking whether their true experiences have been captured to ensure the accuracy of the results. If there are deviations, the researcher must start from the first step and re-analyze step by step.

Table 2. Sample demographics

Name	Age	Occupation	Disability
Bing Si	46	Administrator	Motor dysfunction, scoliosis
Xiao Zhao	28	Administrator	Muscle atrophy, Hand deformity
Mei Hua	27	Student	Amputation below the knee
Jing Jie	38	Teacher	Progressive muscular dystrophy
Si Si	21	Illustrator	Dermatomyositis
Chen Xi	40	Freelancer	High paraplegia
Qi Tian	53	Freelancer	Paralysis of the lower limbs

Note: Pseudonyms were assigned to participants to ensure confidentiality.

Table 3. Merge the preliminary theme versions into one theme

Proposed Thematic Clusters	Topic	Explanation
The perception of female wheelchair users regarding the limitations of their physical functions during the long-term process of dressing.	Theme 1: Physical Limitations and Movement Skills	The theme reveals that female wheelchair users face numerous challenges when dressing due to their limited physical functions. However, they have explored dressing techniques and behavioral habits suitable for themselves to adapt to their limited limb strength and range of motion. This not only reflects their positive response in the face of physical limitations but also demonstrates the strong ability of humans to adapt to the environment. Such profound understanding and ingenious response to physical limitations provide an important perspective for understanding the lifestyle of this special group.
In order to overcome physical limitations, they have explored dressing movement patterns suitable for themselves.		
Based on the actual difficulties in daily dressing, they have a profound understanding of the functional requirements of clothing.	Theme 2: Clothing Modification and Tool Adaptation	The theme reveals that female wheelchair users, based on their actual physical needs, independently modify their clothing or use auxiliary dressing tools to overcome the lack of hand flexibility. These seemingly minor changes have actually greatly enhanced their dressing autonomy and quality of life. This theme highlights the creativity of this group when facing life difficulties. At the same time, it provides valuable practical evidence for the research and development of related clothing designs and assistive devices.
They can select and modify clothing according to their own special physical needs, and use auxiliary dressing tools as well.		
They use clothing as a means of self-expression to shape a positive and healthy personal image.	Theme 3: Social Interaction and Psychological Adjustment	The theme delves into the inner world of female wheelchair users as they use clothing to shape images and integrate into society. They see dressing as more than a basic need; it's a social medium. Proper clothing helps them break prejudices, regain confidence, and achieve self-acceptance. This indicates that clothing plays a crucial role in the social integration process of special groups. It also reminds us that while paying attention to functional needs, we should not overlook their psychological and social needs.
They will choose appropriate clothing according to different situations to make themselves feel comfortable and confident.

THE TATTAS PROJECT: PROMOTING EARLY BREAST CANCER DETECTION THROUGH POSITIVE DESIGN.

Margarita Cepeda Erazo[a], Alexandra Huertas Caycedo[a],

Angie Henríquez Martínez[a], Santiago de Francisco Vela[a]

a Departamento de Diseño, Facultad de Arquitectura y Diseño, Universidad de los Andes, Cra. 1 Este No. 18A – 70

Bogotá, Colombia

m.cepedae@uniandes.edu.co

ABSTRACT | The Health Ministry of Colombia states that 57,5% of the annual cases of breast cancer in Colombia are noted late, highlighting the need to work more on early detection (Castilla, 2021). The main reason that increases hesitation to perform the self-exam is self-imposed barriers. Therefore, the *Tattas* project applies a Positive Design framework to address these barriers through a design that fulfils the needs of autonomy, beauty, security, and community. It strengthens the four dimensions of self-care agency: self-awareness, initiative, knowledge-seeking, and passivity. With the *Tattas* methodology, we achieved self-awareness, increased self-exam knowledge by 60%, provided guidance, reduced anxiety through self-touch, and fostered a supportive environment encouraging women to invite others to perform the self-exam. Therefore, *Tattas* introduces a replicable methodology for health education models that can improve accessibility to breast self-examination and empower women to take proactive control of their health.

KEYWORDS | SELF-CARE AGENCY, POSITIVE DESIGN, AUTONOMY, SELF-EXAMINATION, SELF-IMPOSED BARRIERS

1. Introduction

Self-imposed barriers related to conscious or unconscious obstacles are one of the main limitations for women performing breast self-examinations (Ceballos & Giraldo, 2011). These barriers are associated with beliefs, attitudes, behaviours, or social circumstances. Have you ever performed breast self-examination? Do you know how to do it? Usually, the answer to these questions is "NO". Fear, taboos, and misinformation are common concepts around breast self-examination, making self-exploration an uncommon practice (Castilla, 2021).

In 2022, there were 2.3 million women diagnosed with breast cancer and 670.000 deaths globally (WHO, 2024). Only in Colombia by 2020, 15.509 new cases of breast cancer and 4.411 deaths were registered (Escallón, 2023). In addition, the Health Ministry of Colombia stated that in 2021, 57,5% of these cases were noted late, highlighting the urgent need to work more on early detection (Castilla, 2021). Despite the existence of breast cancer awareness campaigns, their impact remains limited. These initiatives are often confined to specific dates, such as October 19, and rely on generic impersonal formats emphasising medical terminology. As a result, these initiatives have low effectiveness, and early detection rates remain insufficient. The *Tattas* project, with its focus on early detection, is a crucial step in addressing this issue.

Fear is the main barrier to self-examination. Medical language, limited information, and cancer-related stereotypes reinforce negative narratives, increasing hesitation, guilt, and insecurities. Similarly, Radhakrishnan (2024) found that some participants in India avoided the procedure due to embarrassment, forgetfulness, or lack of privacy. Our research explores how to inform people about breast self-exams to promote body awareness and early detection. This project connects emotional and physical well-being to inspire preventive health practices, transforming self-exams into a meaningful self-care routine with a clear message: raise awareness, not fear.

According to Pang (2022), fear can be managed by introducing self-touch as a self-calming technique that reduces the emotional load. However, as this fear is strongly related to self-imposed barriers, it is necessary to cultivate self-care agency. To address that need, we adopt a four-dimensional view of self-care agency (Kearney & Flesicher, 1979) and the Positive Design Framework (Desmet & Pohlmeyer, 2013). The self-care agency dimensions are (a) achieving self-awareness, (b) developing an initiative and self-responsibility, (c) having knowledge and a sense of information-seeking and curiosity, (d) achieving passivity, an inertia behaviour where the self-exam becomes a habit. By learning and appropriating these stages, women will create self-care behaviours and gradually build confidence and familiarity with self-touch.

Positive Design aims to enhance human flourishing by addressing pleasure, personal significance, and virtue. These approaches highlight the role of design in promoting well-being and ethical leadership and facilitate the evaluation of social, economic, and political impacts, ensuring that innovative strategies prioritise care and public well-being. One of the 13 fundamental needs used to understand self-examination is autonomy. Autonomy is the cause of one's actions and feeling that one can do things in one's way (Desmet & Fokkinga, 2020). This need plays a leading role in fostering self-care agency, empowering individuals to take ownership of their health and well-being.

This article describes the *Tattas* project. A project in which women are encouraged to approach breast self-examination as an act of autonomous self-care while also addressing other fundamental needs: (1) beauty by offering a product that brings unity and order to the practice through its thoughtful and attractive design; (2) A sense of security, by empowering women to take an active role in their health through consistent self-exams; and (3) community, by creating a safe space where fears and doubts rooted in taboos can be openly shared and addressed, all of which contribute to enhancing self-care agency and well-being.

2. The beginning of our research

The question that initiated our research was why women in Colombia often do not perform breast self-examinations. To explore this, we surveyed 58 women aged 17 to 60, with the majority (53%) between 18 and 30. The results are presented in Figure 1.

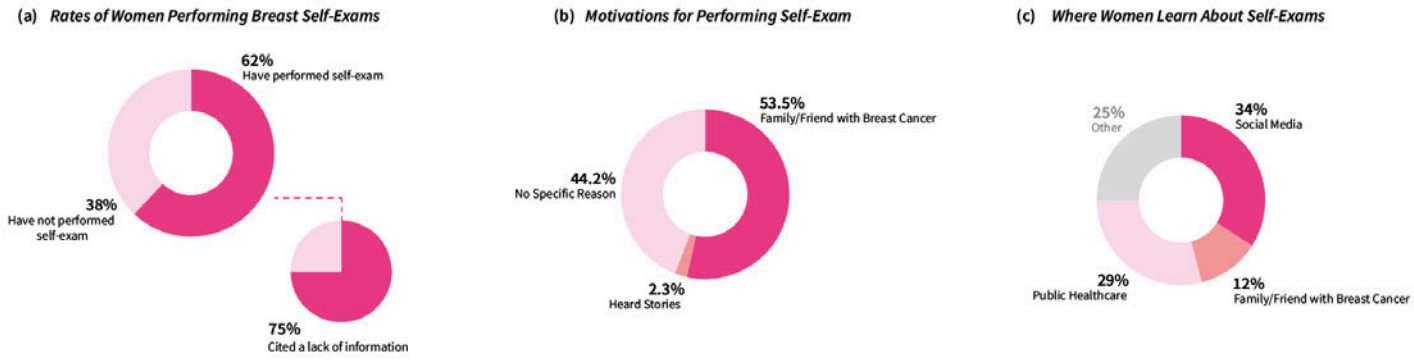

Figure 1. Results from an initial survey involving 58 women aged 17–50 exploring: (a) frequency of self-examination practices and availability of reliable information; (b) primary motivations behind performing the self-exam; and (c) main channels used to acquire self-exam knowledge. Responses highlight significant gaps in the regularity of practice, limited information on self-examination, and indicate that 44.2% of women do not perform self-exams due to a lack of personal connection to breast cancer.

While the survey gave us an initial understanding of the context, it also raised additional questions. We wondered why women continued to experience uncertainty despite the available information, their emotional state during the self-exam, and whether fear played a role. To explore these questions, we conducted interviews using a tool we developed called the Body Emotion Cartography (BEC) tool, which was key to understand how the relationship with the body influences self-care and self-exploration.

The BEC tool was designed to map emotions within the body. It enables participants to identify where and how they feel specific emotions while fostering personal reflections on the underlying reasons for these feelings.

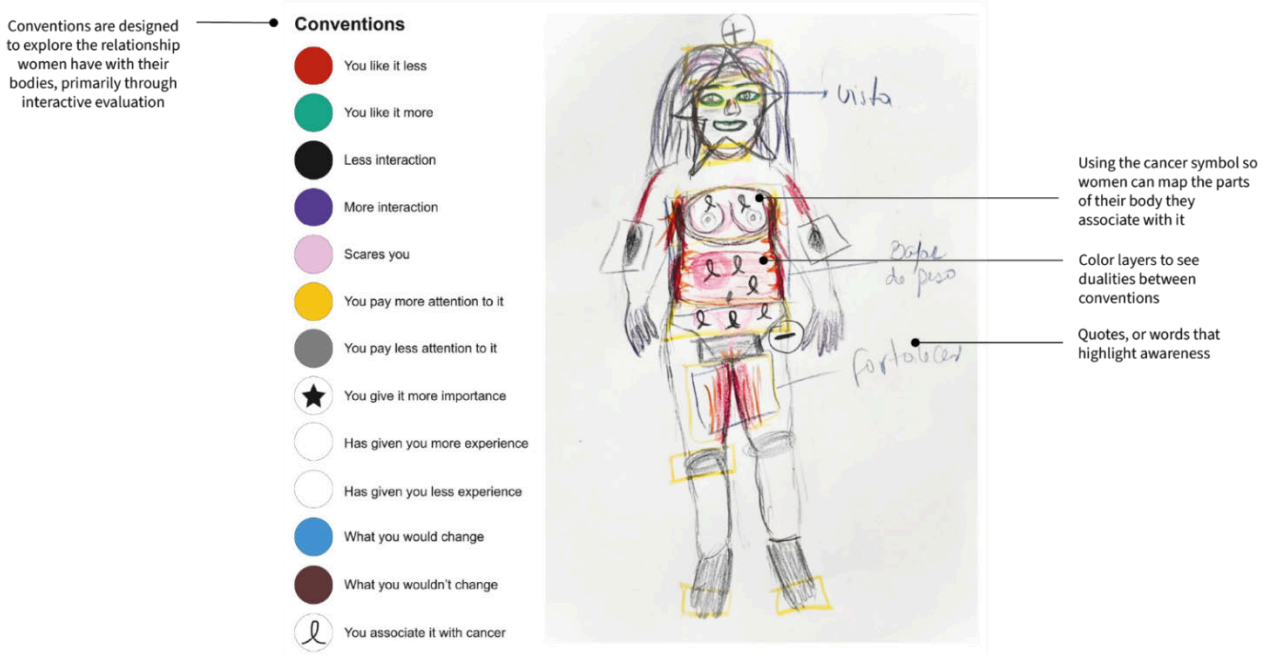

Figure 2. First iteration of the Body Emotion Cartography (BEC) tool showing visual conventions participants used to map emotional perceptions about their bodies and breast cancer during initial interviews. This tool enables participants to explore emotional dualities within their bodies, thus encouraging self-awareness.

The interviewer instructed the participants to draw their silhouettes first. Next, they used a set of conventions, as shown in Figure 2, and had approximately 15 minutes to map their emotions on the silhouette. The interview concluded with a question about how their relationship with their bodies influenced their engagement in breast self-examination.

This approach allowed women to speak more deeply about why self-exploration was limiting and generating uncertainty. They mentioned taboos surrounding the topic and how this lack of dialogue left them unsure about whom to approach for advice or information. These conversations provided a clearer understanding of the self-imposed barriers women face when self-examining.

Overall, this initial research led us to three key insights. First, self-awareness is essential for self-care, as there can be no effective self-care without a deep understanding and knowledge of one's body. Secondly, barriers to open dialogue persist, as self-exam remains tied to taboos despite being a health-related topic, limiting conversations and making it a rarely shared subject. Finally, the word "cancer" carries significant emotional weight, causing fear and uncertainty. These insights highlight the need for education on the topic, focusing on addressing fear without resorting to scolding or judgment.

3. The *Tattas* Project

The *Tattas* Project empowers women to take the first step in practicing breast self-examination with confidence. The project combines a practical kit and workshops to encourage consistent self-examination and early detection habits. The kit was designed with the essential factors for designing health products defined by Henriquez and De Francisco (2020). We use the analogy of "the maze" to facilitate women's involvement towards the awareness of the universal movements for breast self-examination. We use the materiality of the temporary tattoos to reduce the self-imposed barriers around touching one's body.

Figure 3. The *Tattas* kit. A self-exam guiding product with three temporary tattoos, each with a universal movement pattern of self-examination, accompanied by two sets of guiding cards, one on how to perform the self-examination and another on how to identify physical and visual signals of breast cancer.

The kit

The *Tattas* Kit includes three temporary tattoos and a set of guiding and caution cards designed to be visually engaging and intuitive.

- **Tattoos**

Figure 4. The tattoos, each illustrating a universal breast self-examination pattern. From left to right: vertical and horizontal strips, concentric circles, and radial spokes.

There are three universal movements for breast self-examination: concentric circles from the breast's outermost point to the nipple, radial spokes from the perimeter toward the nipple, and vertical strips covering the entire breast, including the axilla area (Saunders, K. J. et al., 1986). *Tattas* provides three temporary tattoos to help women effectively learn these movements, each featuring one of the patterns and indicating the necessary pressure points.

- **Cards**

With support from mastologist Ignacio Castilla, we developed a set of cards using accessible and familiar language to make the information relatable and less intimidating regarding the self-exam process.

Figure 5. Visual overview of five guiding cards, offering (a) step-by-step visual instructions for temporary tattoo application, (b) graphic illustrations showing each examination pattern on the breast, and (c) detailed textual instructions on how to perform each pattern.

The guiding cards provide clear visual instructions for conducting a self-exam. They introduce the three universal patterns and outline five steps for applying tattoos.

Figure 6. Set of seven caution cards highlighting (a) key reminders when practicing the self-exam, such as monthly consistency and when to perform it; (b) a visual summary of general breast cancer indicators; and (c) detailed illustrations with descriptions of specific symptoms.

The caution cards explain ten warning signs of breast cancer, emphasising the importance of medical evaluation if symptoms persist. The cards clarify that experiencing these signs does not necessarily indicate breast cancer.

4.1. The workshops

The kit is the project's foundation, serving as a guide that empowers women's autonomy while workshops foster community. These spaces allowed us to prototype the kit and provide self-exam education, encouraging self-awareness and creating a safe space for discussion. The kit aims to open a moment for women to share their concerns, encourage collective knowledge-sharing, and let them know that they are not alone in their uncertainties about breast self-examination.

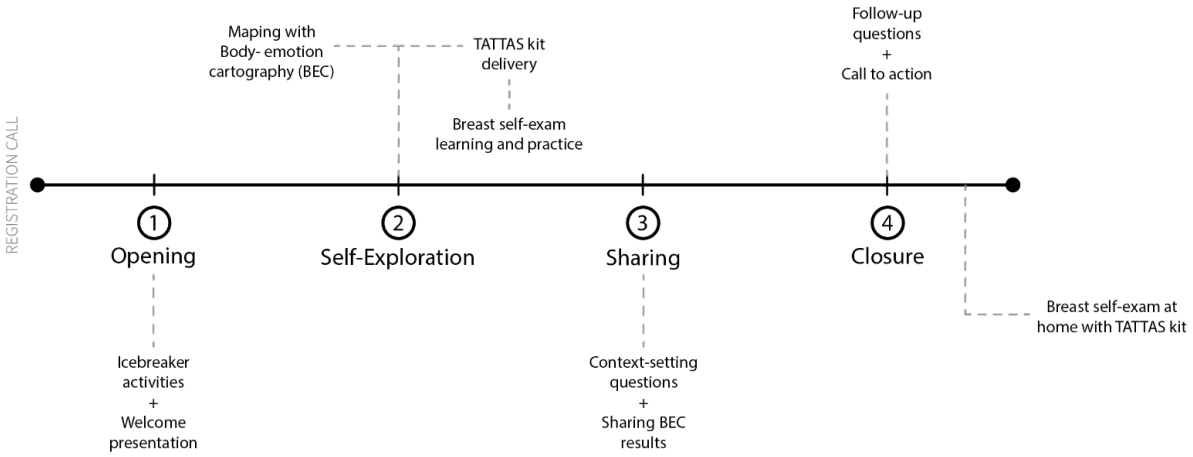

Figure 7. Diagram illustrating the structured methodology of the Tattas workshops, outlining the four key phases: (1) Opening, (2) Self-Exploration, (3) Sharing, and (4) Closure.

The workshop's methodology has four stages: Opening, Self-Exploration, Sharing, and Closure.

The **Opening stage** connects participants through discussions of self-care, health experiences, and breast self-examination. To encourage engagement, we apply icebreaker exercises such as rating their familiarity with self-examination on a 1-10 scale (Figure 8). Afterwards, we introduce the *Tattas* Project mission and the workshop expectations. By promoting trust from the first moment, we encourage active engagement among women.

The **Self-exploration stage** has two parts. The first part uses the BEC tool, encouraging participants to explore their bodies through emotions. It specifically focuses on participants' relationship with their bodies and how this connection influences the practice of breast self-examination. The second part uses the *Tattas* Kit to facilitate self-exploration of their bodies through self-examination. Some participants used the *Tattas* tattoos, while others focused on the information in the kit. During this phase, we review each kit component, ensuring that all elements are explained clearly.

The BEC tool consisted of three structured steps:

1. **Body Silhouette Drawing:**
   Participants are given a worksheet with an incomplete body sketch, where the head, arms, and feet are separated. This body allowed them to draw their silhouette freely, connecting the body parts and recognising the uniqueness of their bodies.

2. **Contextualization:**

Once the silhouette is defined, a scenario or question is introduced to contextualise the moment the person was mapping within their body.

3. **Mapping:**
   Depending on the session, participants follow predefined conventions or freely map emotions using colours, symbols, writing, or drawing.

The purpose of the **Sharing stage** is to create a space where participants take the lead, using their individual experiences to foster empathy. We ask context-setting questions about their self-exam practices, experiences, knowledge, and doubts. Participants also reflect on what they have learned through the BEC tool, recognising how their emotions and experiences are alike.

In the **Closure stage**, through follow-up questions, we aim to assess the project's strengths and areas for improvement. We asked the participants again, "On a scale from 1 to 10, how much do you know about self-exam?" to compare with their responses from the first stage. Each participant takes their *Tattas* kit home, and we end with a call to action, encouraging them to continue practising and applying what they have learned.

Cases

The *Tattas* Project was prototyped in two cases: Women in Business (WIB) and Medtronic. These prototypes aimed to gather feedback on the kit and workshop, understand their impact and innovatively raise awareness about breast self-examination.

Figure 8. Photographs documenting the implementation of the Tattas workshops in two different contexts: (Left) with Women in Business (WIB) community at Universidad de los Andes; and (Right) among women employees at Medtronic Colombia, highlighting engagement and practical application of the kit.

WIB is a student leadership community at Universidad de los Andes. The *Tattas* Kit and BEC tool were tested during Breast Cancer Awareness Day with 10 women between 18 and 23. The session began with context-setting questions on breast self-exams. Since the BEC tool was designed to be used in two stages, participants first created a map during the session and later a second one at home while practising with the *Tattas* Kit. The workshop ended with follow-up

questions and encouragement to integrate self-exams into their routine.

Medtronic is a medical device company with an office in Colombia. Two workshops were conducted with 15 female employees, split into two groups. A Kahoot quiz on self-exam myths and facts served as an icebreaker, assessing knowledge and addressing doubts. In the self-exploration phase, private cubicles allowed participants to practice the self-exam using the *Tattas* Kit tattoos. They then mapped their feelings with the BEC. The session concluded with discussions and follow-up questions on learnings, gaps in information, and participants' overall experience.

4. Results

This section presents the findings from the WIB and Medtronic workshops, with 25 participants (10 from WIB, 15 from Medtronic). Analysis of key patterns led to four main categories, summarised in Table 1, organised by BEC tool number, case, image, and category. Below, we present four representative examples illustrating these results.

Table 1. Body-emotion cartography results

BEC #	Case	Image	Category	Quote/Words
1	WIB		Cultivating self-awareness.	"I have to learn to appreciate also my insecurities" **Conventions:** Dislike the most, like the most, less interaction, more interaction; you feel fear, you give it more importance, and you relate it to cancer.
2	MEDTRONIC		Loving makes me fear.	"What symptoms should worry me? At what moment at the beginning is it still possible to start a treatment?" **Conventions:** Impact, self-love, worrying.

3	WIB		From self-exploration to self-touch.	"I was not aware of my interaction with my legs; I seek to massage them; it is an area of my body that I feel comfortable touching. It would be interesting to work that comfort in other parts of my body." **Conventions:** Dislike the most, like the most, less interaction, more interaction, you feel fear, you give more importance to it, you relate it to cancer.
4	MEDTRONIC		Taking the leadership to make a call to action.	"I must be conscious of my health. Give priority and follow-up. It is simple and fast. Schedule it and do it!" **Conventions:** Curiosity, attention, emotion, novelty.

The findings from the BEC tool highlight key aspects of self-care agency:

- BEC 1 demonstrates how the tool cultivates self-awareness by helping participants recognise their insecurities and interactions with their bodies.
- BEC 2 reveals how the tool facilitates the expression of self-love and its connection to fear, allowing participants to reflect on what they are caring for and why.
- BEC 3 highlights that self-exploration is easier through self-touch, yet emphasises that touching the breasts is more challenging than other body parts due to the discomfort it may cause.
- BEC 4 shows how the tool helps to map learnings after performing the self-exam, empowering women to take leadership and issue a call to action for themselves and others.

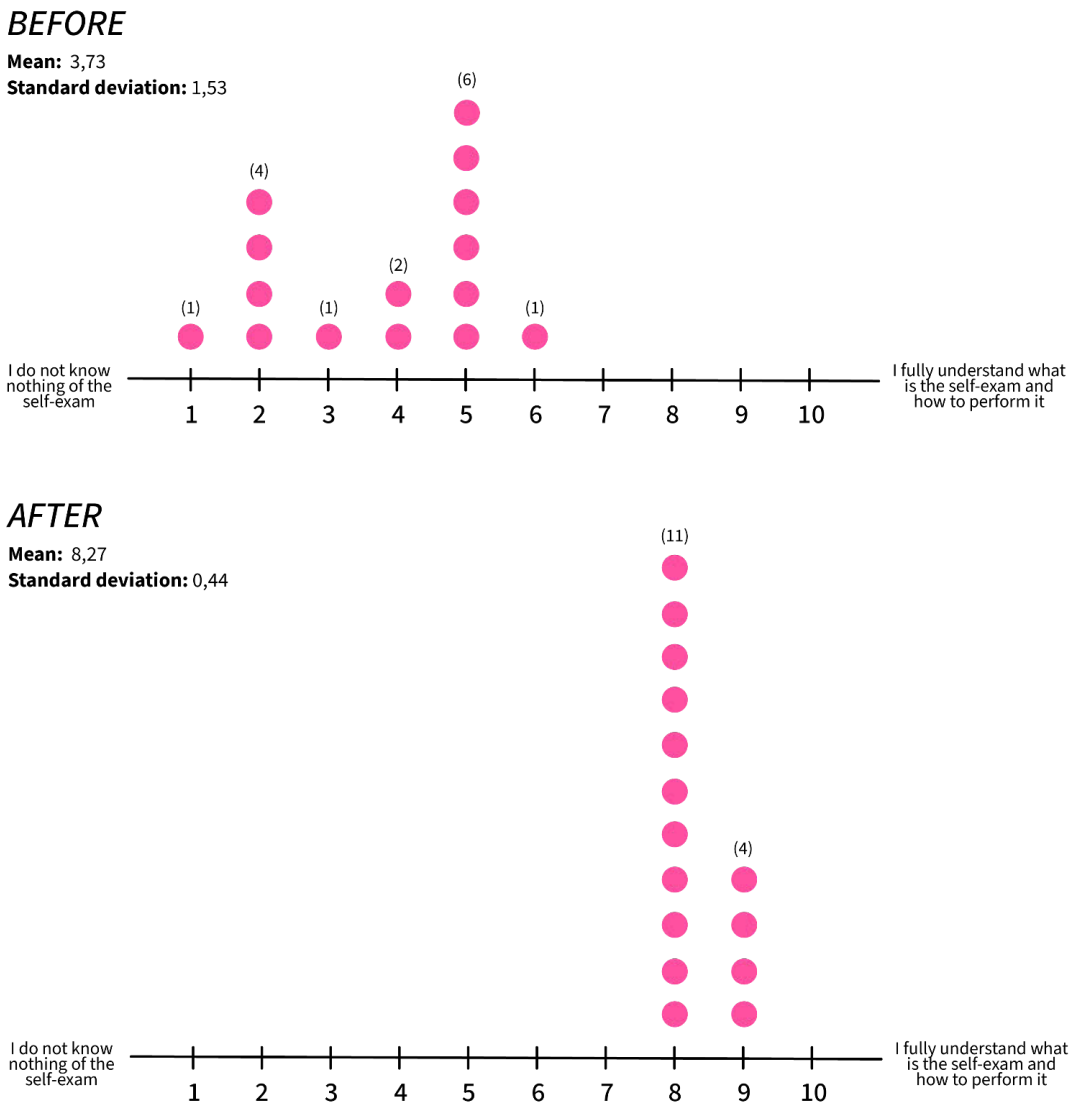

Figure 9. Comparison chart showing Medtronic participants' knowledge of breast self-examination before and after the Tattas workshop, illustrating a substantial increase in understanding

Figure 9 illustrates the knowledge levels of breast self-examination before and after participating in the workshop. Initially, the mean knowledge score was 3.73, with no participant scoring above 6. However, there was a noticeable shift after the workshop, with the mean rising to 8.27, with several participants reaching level 9, reflecting a substantial increase in understanding of breast self-examination.

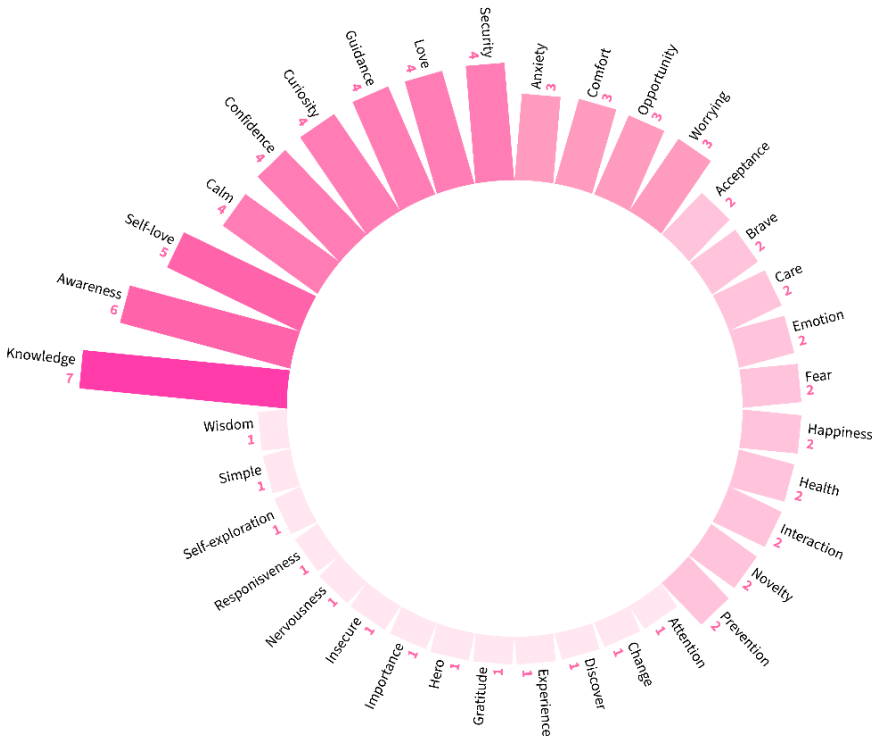

Figure 10. Frequency chart showing prominent words and emotions expressed by workshop participants, emphasizing key themes such as knowledge, awareness, and self-love.

Figure 10 illustrates the most frequent emotions and expressions that emerged during the application of the BEC tool and from responses to three collective survey questions: "In one word, how do you feel with the tattoo on?", "What did you learn today?" and "What additional topics would you like to learn about self-exam?". A qualitative analysis was conducted to examine these responses, drawing on 14 body-emotional cartographies and written survey answers collected during both workshops. As a result, this data identified and grouped the most prominent emotions and concepts based on their frequency and thematic connection, which are visually represented in this figure. Among the standout terms are "Knowledge" (7), "Awareness" (6), and "Self-love" (5), reflecting a strong emphasis on self-awareness and understanding. Additionally, other recurring themes include "Confidence," "Calm," "Guidance," "Love," and "Curiosity" (4).

Figure 11. Venn diagram illustrating the intersections between emotional outcomes and fundamental psychological needs (autonomy, beauty, security, and community) as addressed in the Tattas workshops, with knowledge positioned centrally as the core element.

The Venn diagram in Figure 11 maps the interplay between emotions, expressions, and the fundamental needs of autonomy, beauty, security, and community (Desmet & Fokkinga, 2020). These needs serve as lenses to understand how emotions connect with deeper motivational drives. Knowledge is at the centre of the diagram, acting as a catalyst that activates and interlinks all four needs.

In the quadrant of autonomy, words like change, curiosity, bravery, confidence, and self-exploration reflect how participants embraced the self-exam as an act of agency. The Tattas kit supports this by guiding the practice through clear, body-centred instructions that help transform initial fear into empowerment and self-awareness.

In the space of beauty, terms such as simplicity, coherence, and gratitude highlight how the novel aesthetics of the kit, particularly its unified design (a set of guiding and caution cards with a tattoo-based visual aid), promoted comfort and calm. This design helped women embrace both their natural beauty and the self-exam process. Beyond its functional role, the tattoo became a symbol of care and attentiveness toward one's body, reinforcing a positive and harmonious self-perception.

Within security, emotions like anxiety, fear, and nervousness reflect the uncertainty that often accompanies self-exams. However, their proximity to words like prevention and guidance reveals how structured knowledge can transform that uncertainty into reassurance. Understanding how to perform the self-exam empowers women, making prevention a proactive step rather than a source of worry. This approach is further reinforced through the workshops designed with a community-centred approach (safe, guided, and emotionally responsive spaces) where women receive support, ask questions, and build confidence through shared knowledge and experience.

5. Discussion and future directions

The results support the four dimensions of self-care agency (Kearney & Flesicher, 1979). As shown in Figure 12, these dimensions align with the *Tattas* methodology and objectives, empowering women to adopt breast self-exams and strengthen self-care agency. Below, we analyse their reflection on the project's outcomes.

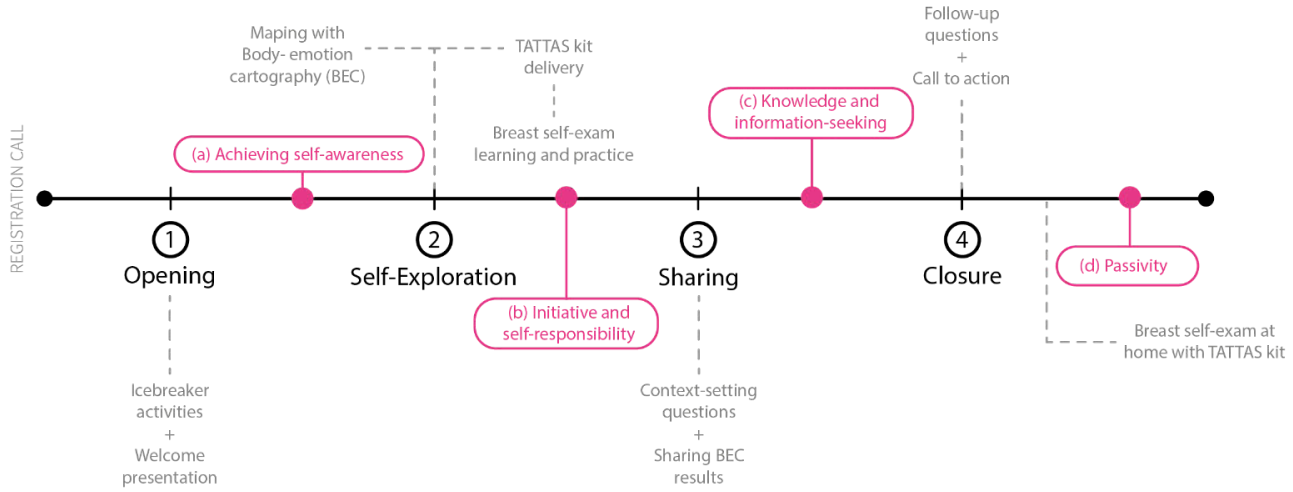

Figure 12. Diagram representing the four stages of self-care agency (self-awareness, initiative, knowledge-seeking, and passivity) integrated with the Tattas methodology.

Achieving self-awareness is the first step in developing the concept of self-care agency. This step is evident in the opening and self-exploration phases of the *Tattas* methodology, mainly through the BEC tool used in workshops. The BEC tool prompts reflection with questions like, "What do I like or dislike?" or "Which body parts do I interact with most?" Mapping these reflections fosters self-exploration beyond touch, strengthening emotional awareness of the body.

As shown in the results, participants shared insights such as, "I had never considered whether I interacted more or less with different body parts." These insights highlight how *Tattas* creates a space for self-awareness, helping participants recognise what they care for and why. Additionally, findings show that self-awareness reinforces emotional connections to the body and strengthens the sense of autonomy.

The second dimension, initiative and self-responsibility, emerges in the *Tattas* self-exploration phase, facilitated by the *Tattas* Kit. The kit's tattoos serve as visual guides, boosting confidence and comfort with practice. As shown in Figure 10, participants described their experience as one of "knowledge, awareness, and self-love", the key to taking responsibility for self-care. The project recognises the

duality of emotions: calm vs anxiety, confidence vs insecurity, comfort vs nervousness, and love vs fear, encouraging participants to embrace them as motivators rather than barriers. This paradox emphasises the importance of providing tools that empower participants to take the first step in self-care while navigating emotional challenges. Knowledge sustains self-care agency. Participants ask questions and express fears in the sharing phase, fostering trust and collective growth. Their curiosity about self-exams, prevention, and healthy habits reflects engagement.

Passivity, in the context of our research, refers to an inertial behaviour where the self-exam transitions from being perceived as an obligation to becoming a natural habit embedded in the participant's routine. This dimension of self-care agency aligns with the closure phase in the *Tattas* methodology, aiming to create a sustainable self-care practice. The *Tattas* project addresses this by providing a portable kit that participants can take home, enabling them to integrate the self-exam into their monthly routine. Workshops encourage participants to stay motivated and use the kit as a support tool. However, the project lacks a follow-up system to determine if self-exams become a lasting habit. This situation presents an opportunity to strengthen long-term engagement through community support.

While the early stages of self-exam adoption can be challenging, a supportive network could provide encouragement and continuity. If implemented in future project versions, women who establish self-exams as part of their routine could guide those just beginning, ensuring sustained knowledge and motivation. This potential evolution could help transform passivity into an ongoing self-care habit, reinforcing the *Tattas* project's long-term impact.

6. Conclusion

The *Tattas* project demonstrates that promoting breast self-examination as a self-care habit requires more than just sharing medical knowledge. It requires an approach that fosters self-care agency through self-awareness, initiative, knowledge-seeking, and habit formation. Our findings underscore the importance of empowering individuals to take an active role in their health while recognising that medical professionals remain essential in guiding and validating health practices. Designers do not replace the role of healthcare professionals. However, they offer alternative perspectives that enhance healthcare experiences, facilitate access to information, and transform self-care into a proactive and community-driven practice.

The *Tattas* project has the potential to become a leading example in health education by promoting autonomy and strengthening community engagement. By integrating design methodologies into healthcare, we can create solutions prioritising accessibility, inclusivity, and personal empowerment. *Tattas* exemplifies how self-care agency can be cultivated and encourages individuals to take responsibility for their well-being. This approach balances medical expertise with the understanding that self-care extends beyond doctor visits.

Tattas stresses that information is a powerful tool in challenging cultural taboos surrounding self-exploration. However, knowledge is not only acquired through information; it also needs a call to action through curiosity, questioning, and reflection to foster a deeper connection with one's body. While the initial stages of self-exploration may evoke discomfort, we identify that these emotions are

part of the learning process. The project does not aim to eliminate discomfort but to transform it into shared experiences that build resilience and collective knowledge. Community-based learning, where individuals share experiences and insights, reinforces the idea that no one navigates this journey alone. Looking ahead, we aim to create a supportive network that strengthens knowledge transmission and encourages sustained engagement with self-care practices. While community formation occurs during workshops, we seek to ensure it is long-term.

Furthermore, cultural and socioeconomic contexts play a significant role in shaping self-care behaviours. Moving forward, we plan to expand the project's reach to address geographical and economic barriers while understanding how access to healthcare creates new challenges for adopting self-examination practices, ensuring that self-care agency is accessible to all. By embracing a holistic approach, we envision *Tattas* as an ongoing movement that inspires self-care agency, curiosity, and collective well-being.

About the Authors:

Margarita Cepeda Erazo is a design student of the School of Design at the University of Los Andes in Bogotá, Colombia. Her work integrates positive design, social innovation, and service design.

Alexandra Huertas Caycedo is a design student from the School of Design of the University of Los Andes in Bogotá, Colombia, with a minor in Organizational Management. Her work spans interdisciplinary projects that integrate strategic thinking, research, and biodesign.

Angie Henríquez Martínez is a designer and biomedical engineer and an assistant professor in the School of Design at the University of Los Andes in Bogotá, Colombia. She has worked in wellbeing and healthcare innovation applying positive design methodologies.

Santiago de Francisco Vela is a designer and an associate professor in the School of Design at the University of Los Andes in Bogotá, Colombia. He has worked in emotions and positive design, fostering emotional experiences and positive behaviors through product design.

Acknowledgements: We sincerely thank everyone who has supported the Tattas project. Special thanks to the organizations and participants who welcomed and facilitated our workshops. We are especially grateful to María Mercedes Erazo for inspiring this project, and to María Camila Jaramillo, Nicole Peñarete, and Mariana Álvarez for contributing to its development. We also thank David Bigio for his support from the Department of Biomedical Engineering at the University of Los Andes. Our appreciation extends to the Disemociones Research Group for their ongoing support, and finally, to Dr. Ignacio Castilla and Dr. Eder Lancheros for their valuable medical guidance.

PAPER SESSIONS WORKING

CARE AND PUBLIC INNOVATIVE ACTION ISSUES
Managing new ethics of public design

THE WORLD AS SEEN FROM THE WORKSHOP PERSPECTIVE. ON THE DILEMMAS OF TEACHING ETHICAL DESIGN.

AUTHORS

Jakub Karpoluk
Sabina Twardowska
Anna Eichler

JUNE 3-7, 2025

ABSTRACT | Graphic design and media carry social responsibility and can and should improve the world and global society. Therefore, graphic designers can play pivotal role with their ethical choices and finding solutions in complex transdisciplinary areas. Teaching designer's ethical attitude is crucial. This paper presents PJAIT strategies of teaching at the very early stages of students' education in their relationship to the ethical dimension of public design. The main subject of our analysis is the workshop program established at PJAIT. The Social Design Course, which started at PJAIT New Media Art Department in 2014, focuses on current critical social issues and emphasises the importance of first-hand and secondary research in creating wise and insightful content. Over the past 10 years, different issues have been the focus. The titles of the workshops explain the problems quite well: Refugees Crisis in Europe (2015), State of Democracy (2016), 100xIndependence (2017), Who is working? (2018), Fashion is my -ism (2019), If – Social Design for Sustainable Cities (2020), Truth Hurts – Lies Kill (2021), Belonging (2022), Identity in Crisis (2023) and Young Forever? (2024).

On the one hand, the workshops for BA and MA students teach the design process and skills, and touch upon an ethical approach to matters, f. ex. on the border of the digital and the physical world like *Truth Hurts, Lies Kill,* which focused on raising awareness of digital dangers. Other workshops PJAIT offers, go further into the world, like *U(A)rban Topologies* which was dedicated to the design of augmented reality applications in an urban environment. During the workshops that have taken place so far in several European cities - Warsaw, St. Pölten, Setúbal and Athens - priority was given to informative content taking into account the interests of local communities. Digital technologies, including AR, can be used to enhance the transmission of local cultures and can be characterised by an ethical approach to both the material cultural heritage and the current situation of a given local community. They can also engage audiences, enhancing educational processes and reinforcing contextual understanding as presented in the results of PJAIT workshop in collaboration with Manggha Museum of Japanese Art and Technology in Cracow – a project focusing on museum narratives.

These workshops strengthen students' awareness of their surroundings and disparity between the real and digital world, building their capacity for reflective and critical

approach in design. However, the workshops mentioned above address only a part of current social issues. This raises the question of whether academic programs can genuinely prepare students to solve social problems and instil an ethical design approach. Therefore, the relevant topic of the presentation is the ethical dimension of academic curricula in the design field.

KEYWORDS | SOCIAL DESIGN, SOCIAL ISSUES, WORKSHOPS, ETHICAL DESIGN, URBAN TOPOLOGIES

In our understanding, graphic design and various media carry social responsibility and can and should improve the world and global society. The human factor is crucial – an educated designer plays a pivotal role in identifying and responding to social and environmental needs. This designer is aware of their power to make a difference through their choices, strives to make ethical decisions, and can find solutions in complex transdisciplinary areas. Teaching this designer's attitude is not just crucial, it's empowering. With the proliferation of digital tools, students of design departments may quickly skim the surface of knowledge, but the critical approaches they learn genuinely empower them to act ethically. BA students at PJAIT come from different backgrounds, nationalities, and education systems. Some of them are as young as 17 years old. In order to guide BA students to the point of taking the designers' role in participatory projects, one must pave the way that will equip them with necessary knowledge, competences, and social skills. This is a process that takes time; therefore, it is paramount to start it early during studies.

The Social Design Course (SDC) at PJAIT Graphic Design and Multimedia Art is the first thing students experience when their first year of education begins, and every year they partake in a more advanced level of these 2-week workshops. Every year the socially urgent topic selected by SDC's initiator and main curator, Prof. Emerita Marjatta Itkonen (Aalto University), changes, but the structure of SDC eventually crystalized into the following form: all students receive a set (10-15) of articles before the workshop starts, all students attend lectures presenting broad view of given social issue during the first week of the workshop, then during the workshop the 1st year students learn the ropes of first-hand and secondary research and the design process based on editorial illustration and animation to aforementioned articles, whereas 2nd and 3rd year students elect workshops based on their design interests (they choose from approximately 10 options), and finally, MA students and selected 3BA students, led by Prof. Itkonen, participate in the most advanced projects. SDC concludes in presentations of the results of all workshops to everyone.

SDC started in 2014 and over the past 10 years have been curated by Prof. Marjatta Itkonen, Prof. Ewa Satalecka – Dean of PJAIT New Media Art, Prof. Jan Piechota with different issues in focus: *Refugees Crisis in Europe* (2015), *State of Democracy* (2016), *100xIndependence* (2017) – investigating the concept of 'independence' and connected to the celebration of Poland's 100 years of independence in 2018, *Who is working?* (2018) – on present and future jobs – a workshop with significant field research component including for the 1st year students, *Fashion is my -ism* (2019) – on fashion industry, fashion habits and circular economy, *If – Social Design for Sustainable Cities* (2020) – the international workshops and conference organized by EUNIC Warsaw and PJAIT with 30 partner schools from all continents, *Truth Hurts – Lies Kill* (2021) – on fake news and dangers of misinformation, *Belonging* (2022) – analysing the concept of 'belonging' in personal and planetary context, *Identity Crisis* (2023) – identity and identity politics in digital revolution, and *Young Forever?* (2024) – aging society. The topic in 2025 will be *Consumer Trap*. The programme for 1BA students based on Yadzia Williams' (Wrexham University) illustration programme is curated at PJAIT by Anna Eichler.

That strong introduction to the process of studies and to every academic year sets the tone to the students' learning process, raises their awareness and influences their way of thinking also in regular classes, as shown for example during other workshops like *U(A)rban Topologies* (dedicated to the design of augmented reality applications in an urban environment) or in the approach to a diploma theme. The fact that students of all years participate in the workshops and present various results on the same topic, and that a single workshop may include students on different level (2BA-2MA), creates a powerful peer-learning situation.

1BA students learn the design process with special emphasis on first-hand and secondary research, as well as the ethical concerns of using references or building mood boards. Following Lucy Alexander and Timothy Meara, the design process is presented as nonlinear and open for modifications.

We have chosen the following 1BA SDC workshops as case studies:

BELONGING

In 2022, the leading theme of the social design workshops was ecological issues and belonging to each other and to the planet with a motto from John Donne 'No Man is an Island'.

In October, 1BA students were divided in teams and chose articles:

- *Missing Your People: Why Belonging Is So Important and How To Create It* by Tracy Brower, Forbes
- *Pesticide widely used in US particularly harmful to bees, study finds* by Lauren Aratani, The Guardian
- *The Importance of Developing a Sense of Belonging* by Sally Boardman, Lifeskills Group
- *We Were Born to Be Wild* by Margaret Renkl, New York Times

They attended the lectures of Minna Pyykkö (environmental journalist and artist, Finland), Karolina Rychter (philosopher and journalist, PhD), Kenji Kondo (Design and Creative Center Kobe, Japan), Krzysztof Cibor (Greenpeace Polska), Jason Grant (Inkahoots Design, Australia) and Maja Kleczewska (theatre director, Poland). Special guest speakers in the 2nd week were Bartłomiej Sabela (journalist reporting on Great Green Wall in Sahel) and Constance Guisset (designer). Under the supervision of visual storytellers Yadzia Williams, Sabina Twardowska, Anna Eichler and Sebastian Trzoska, they created an editorial illustration on a spread in given layout. The workshops continued in November, when the storytellers were joined by professional animators - Babis Alexiadis and Alicja Adamska, who guided the students to adapt their illustrations into short animations.

STANDOUT WORKS

WE WERE BORN TO BE
WILD
For we belong to one another — to the house finches and the climbing raccoons and the door-knocking turtles and the bathing bears. Recognizing that kinship will do more than keep our fellow creatures safer.

MISSING
YOUR PEOPLE
WHY BELONGING IS SO IMPORTANT
AND HOW TO CREATE IT
The pandemic has played havoc with our mental health, and a significant factor in our malaise is that we're missing our people—terribly. We long for friends, family and colleagues.

Illustrations 4-8. Examples of editorial illustrations made during BELONGING workshop in 2022.

IDENTITY CRISIS

Within the 2023 topic, the students looked at the following questions:

- Why is the younger generation so involved in this issue?
- Identity politics – is it detrimental to democracy?
- Identity politics and minority rights (immigration, sexual orientation, skin colour, religion) in the context of the politics and visual languages of Western and Eastern EU countries.
- National identity and propaganda.

They chose the following articles:

- *National identity is fake. We should focus on the wider common good* by Carlo Rovelli, The Guardian
- *Am I rootless, or am I free? 'Third culture kids' like me make it up as we go along* by Ndéla Faye, The Guardian
- *What's the Matter with Men?* by Idrees Kahloon, New Yorker
- *Online identity*: *Can we really be whoever we want to be?* by Aleks Krotoski, The Guardian

The students attended lectures by: Naomi Bueno de Mesquita (Design for Inclusion), Zuzanna Popławska (Centre for Migration Research), Kasper Strömman (Finnish graphic designer and influencer), Damian Flisak (lawyer and expert in law regulations concerning latest technologies, PhD), Beata Czajkowska (expert in governance and politics, PhD), Ingrid Van der Wacht (Factor-I, facilitator and communication specialist), Karolina Rychter (philosopher and journalist, PhD), Prof. Rebecca Duclos (Concordia University, Canada) & David Ross (ELIA UAx – report from visit in Ukraine), Piotr Niedziałkowski (medicine and allergology, MD), Paweł Pokutycki & Sonia Górecka (interaction designer and multimedia artist focusing on identity of digital). This time the voice was also given to graduates Ngoc Tran, Alesia Kuzmenkova, Aleksandra Mosina, Elina Pyrohova, Anastasiia Babii and Dieu Nguyen, whose diploma projects related to their own experiences of ethnical or national identity, the feeling of exclusion, longing for the homeland or the experience of war.
The illustration workshops for first-year students were led by Yadzia Williams, Ann Bessemans & Johan Vandebosch, KaMochi, Anna Eichler, Sabina Twardowska and Sebastian Trzoska. November animation process was supervised by Babis Alexiadis, Edyta Adamczak, Alicja Adamska, Ala Nunu and Magdalena Bryll.

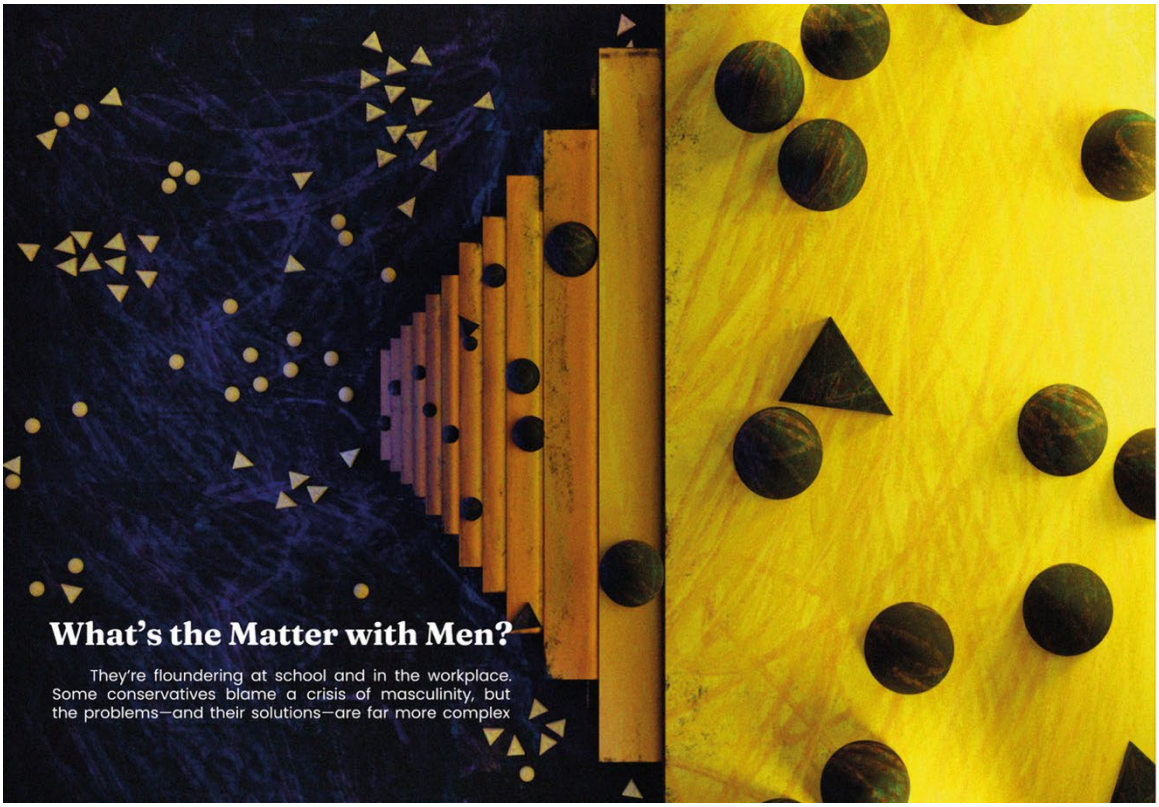
Online identity: Can we really be whoever we want to be?
One of the net's original evangelists says that our experience of the web is changing our identity both on and offline



Illustrations 9-12. Examples of editorial illustrations made during IDENTITY CRISIS workshop in 2023.

The latest workshop (2024) touched on the issue of the ageing European society and was titled **YOUNG FOREVER?** The starting point was the encounter with statistical data, which says that by the year of 2100, one in three Europeans will be over the age of 65.

Students tried to answer the questions below:

- What about well-being, social networks, employment, and economic situation of the ageing population in Europe?
- Do elderly people have family and friends, or do they feel lonely?
- Does age racism exist?

They chose the following articles:

- *I've spent a decade studying gender and I can tell you: as a woman, ageing sets you free* by Angela Saini, The Guardian
- *Making Ageing Positive* by Linda P. Fried, The Atlantic
- *The Way You Think About Aging Affects Your Well-Being, Self-Esteem and How Long You Live* by Bonnie Marcus, Forbes
- *Old and Young, Talking Again* by Paula Span, New York Times
- *How to Be Happy Growing Older* by Artur C. Brooks, The Atlantic

The following speakers discussed the issues of an ageing society from different perspectives: Gregor Strutz (designer - inkl.Design, Berlin), Zofia Szweda (Doctor of Economics, Poland), Marta Wierusz (architect, Poland), Aleksandra Warecka (reporter specialising in social issues, Poland), Kristel Auero (Population Research Institute, Väestöliitto, Finland), Kuba Szczęsny (architect, Poland), Kajetan Gołębiewski (expert in cultural studies, Dom w Alejach, Poland), Beata Czajkowska (expert in governance and politics, PhD), Mateusz Szewczyk (designer, DFA) and Radosław Siedliński (philosopher, PhD).
The students were supported by illustrators (Ka Mochi, Sabina Twardowska, Anna Eichler, Marta Marszałek, Yadzia Williams and Susanna Cerri), as well as animators (Babis Alexiadis, Ala Nunu, Weronika Szyma, Magdalena Bryll and Edyta Adamczak).

The Social Design Course for 1BA broadens students' horizons and equips them with basic designer tools, it serves as an introduction to more complex workshops with socially engaged topics like the following example of *U(A)rban Topologies*.
Each passing year proves that the encounter with a socially and ethically engaged design of students – future designers of different fields –should occur as early as possible in their learning process. Starting with a program that allows 1BA students much freedom in the aesthetical approach, which introduces the basic tools to explore critical issues, leads to their future projects or diplomas that are not only visually attractive but, above all, deep, important for the world, based on real, reliably collected data - projects that have the potential to initiate a change for the better.

TOWARDS ANTHROPOLOGY OF AR

Augmented Reality (AR) is an enhanced interactive version of the real environment created using digital visual elements, sounds and other sensory stimuli via holographic technology. Still a good definition of the nature of mixed reality of which a variation is augmented reality is that proposed by Paul Milgram and Fumio Kishino. Scientists defined MR, AR and VR as "related technologies that involve merging real and virtual worlds somewhere along the 'virtuality continuum' which connects authentic environments to completely virtual ones." [1] There is a mutual influence between information technologies, the design industry and the cyborgization social process. The latter stands behind, the development of, among others, AR technology, which can expand the user's field of information within everyday life and has artistic applications. Most popular contemporary human extension, enabling AR applications, is no doubt a smartphone or a tablet. Designers and social scientists can positively influence the development of the mixed reality phenomenon by, among other things, orienting the associated technologies and the content presented to present the cultural heritage of different societies in a spirit of cultural relativism.

All the places inhabited by humans are meaningful. Yi-Fu Tuan suggests that a place is distinct from other spaces, existing as an anchor of personal emotional attachment and involvement, where humans "pause" in an otherwise highly mobile existence.[2] A place is what brings meaning to human lives. A place is intimate and AR design benefits from recognising the multiplicity of that meaning. Using this lens of place requires prioritising lived experiences, working in what spatial theorist Edward Soja called the register of "lived space".[3] Different places have their meanings, they are intimate for some of the inhabitants, AR designer is to some extant able to make these meanings (culturally defined) visible, to as many of social actors as possible.

PJATK has some experience in the creation of MR applications including augmented reality. Currently, the university is co-creating an educational programme, based on Erasmus BIP funds, *Roots of Digital Future*, in collaboration with the Polytechnic Institute of Setúbal (Setúbal, Portugal), the University of West Attica (Athens, Greece) and St. Pölten University of Applied Sciences (St. Pölten, Austria). As part of the programme, educators have realised the *U(A)rban Topologies* AR project of an informative nature in urban environments (St. Pölten, Warsaw, Setúbal and Athens).

Regarding Yi-Fu Tuan's and Edward Soja's postulates of meaningful places and considering that these places have both past and future in April 2024, we have proposed a new AR content to the citizens of Setúbal city in Portugal. We were not exactly adding meaning to public places and monuments of Setúbal, using AR, but rather enhancing the local voices, making the socially negotiated meaning visible to all kinds of users, these who were members of local community and these who just happened to visit Setúbal for a limited period,

like we and our students have. One of the applications titled *Fish m(AR)ket*, told the story of the Marcado do Livramento, important food market, inaugurated in 1876 and decorated with some 5700 *azulejos* tiles.

When AR developers digitally augment a location, they automatically connect with the communities inhabiting that space. However, that relationship is often unrecognised or underdeveloped. How people use a certain area should be important for the AR designer. We believe AR practices called 'tethering' and 'rooting' are more anthropologically sustainable practice of AR design.[4] Many AR experiences are limited in geographic scope, which sounds like a limitation but these applications enable meaning into places. They are tethered - tied to points in space. Tethered AR opens possibilities for site-specific experiences, for augmentations that build on where a user is and what they are seeing in a less definite way. Here the designer is augmenting a curated locations rather than the world as a whole. Not only local communities but also museums around the world are using augmented reality to enhance exhibits by overlaying digital content on top of physical artefacts. Recognising the museum potential of AR applications, in December 2024, we realised the AR Museum project in collaboration with the Manggha Museum of Japanese Art and Technology in Krakow. AR offers an interactive, educational experience, allowing visitors to see additional information, reconstructions, animations, etc. The technology engages audiences, enhancing educational processes and museum narratives and reinforcing contextual understanding of exhibits. The Ministry of Culture of the Republic of Poland fully funded the AR Museum project. Five applications or, in other words, five different AR 'experiences' have been created for the usable spaces and collections of the Manggha Museum. All work was carried out in a workshop system, between 9 and 13 December 2024. Here is the description of two of the resulting AR experiences.

The first of the applications, informative in nature, was titled *Wave* and deals with the already iconic buildings that make up the Manggha Museum. Most attention has been paid to the main building, designed by Japanese architect Arata Isozaki (1931-2022), shaped like a river wave. The user, using their smartphone, can recognise the museum's individual buildings from the text that appears next to the image. The user thus learns about the functions of the museum buildings and any contexts, including the history of how the museum came into being or the architectural concepts underpinning its form. The user is also provided with a film showing the building from a bird's eye view, which allows them to understand the Manggha Museum's place in Cracow's urban structure. The application can be used regardless of whether the museum is open or closed, and two language versions are available - Polish and English, which increases the number of potential users. Information about the museum is based on text and images, including architectural sketches.

The second application was entitled *In the Collector's Room*. It concerns the person of Feliks 'Manggha' Jasieński (1861-1929), an art critic and collector whose collection comprises almost 15,000 objects, the best known of which are the works of Japanese art that have been on display at the Manggha Museum for 30 years. To launch the application, the user must

[4] Fisher, J.A. (2021). Augmented and Mixed Reality for Communities. Abingdon: CRC Press. 2021. p. 90-92.

point the tablet's camera at the bust of Feliks Jasieński, located in the central part of the museum's hall. The user is shown screens presenting the collector's biography and information on the various categories of objects comprising the collection, including *ukiyo-e* woodblock prints and Buddhist sculptures. Scans of the objects appear before the viewer's eyes. The application is informative and based on text and three-dimensional images.

Given our experience of implementing AR applications in urban spaces and the museum, we believe this technology has a significant, positive dimension in a social sense. Of course, only if we as designers have social and educational interests at the centre of our activities and if we draw largely on the achievements of contemporary anthropological thought. AR even has anthropological research potential, and we intend to devote our next planned workshop to this idea.

TOWARDS COMMUNITY-LED GOVERNANCE: DESIGNING EQUITABLE POLICIES FOR SOCIALLY RESPONSIBLE COMMUNITY EMPOWERMENT.

Mariana Fonseca Braga*[a]

a University of Salford

*m.fonsecabraga@salford.ac.uk

ABSTRACT | This paper discusses the transition towards community-led governance supported by design approaches in new public governance, helping to define an agenda on designing equitable policies for socially responsible community empowerment. It highlights the critical importance of identifying and addressing community capabilities and their limitations to deploy socially responsible design processes aiming at equitable policies and community leadership. Neglecting the limitations of communities' capabilities can lead to reckless community empowerment, which does not prevent precarious and risky situations for communities.
Despite the growing interest in design approaches to community engagement and empowerment in the context of policymaking and democracy (Bason, 2014; DiSalvo, 2022; Huybrechts et al., 2018; Sanoff, 2007), a socially responsible design approach to community empowerment in the new public governance still needs to be explored and defined further. This manuscript explores this by drawing on collaborative design research with Brazilian communities living in informal settlements during the COVID-19 pandemic. This research included multiple data sources. Primary data were collected at the beginning of the pandemic in Brazil through 3 online roundtables with community members and not-for-profit organisations' representatives who helped the communities mitigate the impacts of the disease. Mapping methods were utilised to make the lived experiences of communities visible, enabling to identify and analyse interrelated problems, challenges for communities, and adaptive strategies or solutions (mostly by communities).

Creative and collaborative design approaches could contribute meaningfully to anticipating and responding to complex 21st-century challenges (Junginger, 2014; Mortati et al., 2016), which cannot be solved by a single knowledge area and without effective engagement of citizens and key stakeholder groups. In policymaking, these design approaches and methods often aim at effective community and stakeholder groups' engagement and empowerment throughout new public management processes that share with or transfer to the public (e.g., citizens, non-governmental organisations, etc.) roles and responsibilities that were traditionally taken by the public sector, potentially moving towards community-led governance.
These design approaches have been gaining momentum in policymaking and implementation by supporting new public governance and responding to the austerity period's plummet in public budget spending (Julier, 2017). In this context, design plays a transformative role in conventional policymaking by helping to bridge the gap between policy development and implementation (Junginger, 2014) and supporting multidirectional learning between designers, various stakeholder groups and citizens across the span of design processes (Huybrechts et al., 2018). Community empowerment in these processes has been related to citizens' design literacy or skills (Dong, 2008; Manzini, 2015a, 2025b, 2019) also as a form of resistance (Viana & Loschavio dos Santos, 2020; Seldin, 2024).
However, design approaches to community engagement and empowerment in new public governance have not often considered their limitations, drawbacks and effects on communities. Furthermore, they are grounded in Global North studies, missing contributions from the Global South that could have a transformative and political role in addressing these public challenges (e.g., Freire, 1970, 1976). Insights into community leadership and its limitations are still necessary to develop socially responsible design approaches to equitable policy development in the transition towards community-led governance.

KEYWORDS | EQUITABLE POLICIES, SOCIALLY RESPONSIBLE DESIGN, COMMUNITY-LED GOVERNANCE, COMMUNITY LEADERSHIP

1. Introduction

This paper draws on a collaborative pilot study conducted with communities living in informal settlements in Brazil when the COVID-19 pandemic was starting to reach the country in 2020. On the one hand, it addresses the need to consider their lived experiences, livelihood diversity and socioeconomic determinants to co-design public systems, policies and services that could help them protect their health. On the other hand, it identifies and analyses powerful community leadership that is emerging in these communities and could lead to a future of governance that is community-led. In this paper, I am particularly interested in defining a research agenda that is concerned with the socially responsible development of this future community-led governance supported by design research and practices.

In this research context, socially responsible design and designers' role could be key enablers of ethical leadership by helping to ensure responsible community empowerment in health and well-being and by communicating community lived experiences and needs in respectful, clear and accessible ways to different stakeholder groups that communities might not be able to access and affect their capabilities to protect their health and well-being as well as to cultivate their own ways of living a healthier life.

In this process towards ethical leadership, socially responsible design and designers could contribute to socially just decision-making by deploying collaborative, creative and analytical design skills for equitable public service and policy development that prioritises communities' needs, respects and addresses their livelihood and sociocultural diversity, considers their socioeconomic determinants, their capacity and its limitations.

Community is a term utilised to describe a group of people "living in one particular area or people who are considered as a unit because of their common interests, social group, or nationality" (Cambridge, n.d.). In this paper, a community refers to the people who live in the territories (informal settlements) which were the focus areas of the study. They share sociocultural practices and are affected by similar socioeconomic determinants. They also deal with the challenges of living in territories where often there is no proper and formal urban infrastructure. They have been using their social organisation and cohesion capacity to address deficiencies in public infrastructure, policies and services.

1.1. New public governance and design

The origin of participatory design methods is typically traced back to the 1960s regarding public decision-making processes in the USA, and systems development during the 1970s in Scandinavia (Sanders & Stappers, 2008; Sanoff, 2007). Participatory design and co-design capabilities relate to designers' traditional skill set that enables tools development (Sanders & Stappers, 2008), and to management methods utilised to facilitate visioning and strategic planning along with communities (Sanoff, 2007). Codesign is seen as the "collective creativity as it is applied across the whole span of a design process", is a specific instance of co-creation and refers to "the creativity of designers and people not trained in design working together in the development process" (Sanders & Stappers, 2008, p.6).

Julier (2017) explains that the trend towards different stakeholder groups and citizen engagement to solve public problems started in the 2000s and was particularly triggered by the austerity crisis. This networked or new public governance concept is based on the idea that citizens, public servants, and organisations could form networks or communities and the state would manage those networks, reinforcing interdependence of actors and

their shared goals. In this context, creative and collaborative design approaches and methods have been attracting attention in policymaking and the design capabilities of the public are stressed (Manzini, 2015b, 2019; Dong, 2008). Manzini (2015a, 2025b) classifies citizens' design capabilities as diffuse design capabilities, meaning the natural human ability to design based on creativity, critical and practical sense. The author suggests that these will be elementary capabilities of citizens in the future of public governance (Manzini, 2019). Similarly, Dong (2008) argues for the need to develop citizens' design capabilities to enable meaningful participation in public urban design and public work during recovery. In international development, Sen (1999) emphasises the critical role of "the effective use of participatory capabilities by the public" (p. 18) as well as the need for appropriate public policies to enable people "to live the kind of lives they value - and have reason to value" (p. 18). The latter is central to Sen's capability approach.

Another aspect that makes design approaches and methods relevant in policymaking innovation is that policy cycles are traditionally drawn from a problem-solving approach that separates policymaking from policy implementation, generating a mismatch between policy planning and implementation once policymakers are usually not familiar with citizens' problems (Junginger, 2014). Hence, a human-centred design approach helps to identify the causes of a public problem and could go beyond, contributing to building desirable futures, being future-oriented rather than reactive and responsive to existing problems (Junginger, 2014). Moreover, our 21st-century challenges are complex, systemic and interconnected, therefore they require design skills and experimentation typical of design approaches as public challenges faced by governments cannot be solved anymore through pre-set answers (Mortati et al., 2016).

Finally, design approaches in the public sector could help to protect and strengthen democracy through their participatory principles and methods. Huybrechts et al. (2018) highlight design processes as multidirectional learning processes. Throughout these processes, designers, diverse stakeholder groups and citizens learn together. They identify three clusters of capabilities in participatory design promoting the capacity to collectively visualize the different views on the matters of concern, to reflect together and to take collaborative action. DiSalvo (2022) recognises that design tends to be oriented towards the commitments of free-market capitalism that also have been influencing government and civil society, proposing design as "a mode of democratic inquiry into diverse civics" (p. 1) that could be a means of caring together for our collective futures.

The drawbacks of design approaches in the spaces of policymaking and of the public sector are related to conflict of interests, privileges of specific networks over others, their criteria for inclusion or exclusion of individuals, or, if the represented citizens can be considered representative of all citizens and public interest (Julier, 2017). Additionally, an emphasis on a vision that lacks implementation concerns and consideration of feasible and politically desirable outcomes and impacts makes these approaches questionable (Julier, 2017). Furthermore, this can be seen as "the relinquishment" of the state's responsibility for the welfare and other public services (Julier, 2017, p. 155).

1.2. Critical pedagogy and democracy in Brazil

Another criticism is that the literature concerning this topic is grounded in the Global North scholars' work and contexts. Although meaningful views and perspectives from the Global South were discussed and applied before towards equitable futures and contributing to democracy (see, for example Freire, 1970, 1976), they are still missing and underrepresented. In response to this issue, I have been collaboratively exploring and

defining the potential contribution of Freire's work (Freire, 1976) to the further development of socially responsible design approaches in an effort to integrate and apply this meaningful perspective and practice to socially responsible design research and practices that share their interest in the public good (see Fonseca Braga, M. C. van Amstel, & Perez, 2024).

Freire's critical pedagogy methods introduced the principle of mutual learning in the literacy context influencing democracy in Brazil. He changed people's lives through new ways of bringing literacy to illiterate adults in these communities, generating a massive impact on their capacity to read 'not only the words but the world'. His approach is recognised to be radical in breaking the hierarchies of learning practices and introducing equitable, bottom-up ways of 'teaching' that started to be understood as 'mutual learning', putting students as the most knowledgeable of their own lives in an equitable position in the learning process and immersing 'teachers' in the world of students, which was the starting point for their literacy learning processes. The mutual learning process is liberatory and grounded in reciprocity, transforming the educator and the educatee. This also influenced democracy in Brazil. In the 1960s, there was a law that prevented illiterate people from voting, and 40 per cent of the Brazilian population was illiterate. They must achieve a minimum literacy requirement to allow them to vote.

1.3. Research context

This paper's discussion is based on a prior pilot study conducted with Brazilian communities who live in informal settlements. This design research identified the needs, challenges for and strategies of these communities to protect their health during the beginning of the COVID-19 pandemic in 2020. Informal settlements are overcrowded territories characterised by inadequate housing, and people living in these areas are often unemployed or informal workers (United Nations, 2020).

1 billion people live in informal settlements worldwide (United Nations, 2020), and there is an upward trend in informal settlement populations (Samper, Shelby, & Behary, 2020). 8 per cent of the Brazilian population (16,6 million people) lives in informal settlements and favelas according to the preliminary data collection for the census 2022 (Confederação Nacional de Municípios, 2025). Above the Brazilian average, the focus areas of this research, Rio de Janeiro and Belo Horizonte (Brazilian cities), were estimated to have respectively over 19 per cent and over 11 per cent of households living in informal settlements (Instituto Brasileiro de Geografia e Estatística [IBGE], 2019).

Figure 1. Focus areas of the pilot study. Figure adapted by the author and based on data from the Brazilian Institute of Geography and Statistics (Instituto Brasileiro de Geografia e Estatística [IBGE], 2019).

Although informal settlements vary across Brazil, they share some characteristics. Their emergence is related to historical migration from the countryside to cities, particularly in the 1940s in the case of favelas. Their infrastructure is precarious. For instance, often there are no water, sanitation, and energy grids, and elementary urban services (e.g., waste collection, sewage treatment, Internet, water and energy supply). Communities are mostly made up of minority groups (Black and Brown) and of informal and low-income workers, who do jobs such as construction work, cleaning, waste picking and collection (Musumeci, 2016).

There is growing research on the role of design and designers in supporting underrepresented Brazilian communities and aiming at societal change. These studies adopt different design philosophies and approaches as follows:

1. Design as an economic activity that can contribute to situated product-service solutions as well as to local businesses' innovation, development and growth (e.g., start-ups) (Khara & Fudarba Curcio, 2024);
2. design as an enabler of participation and collaboration for inclusive urban planning and social justice (Viana & Loschavio dos Santos, 2020; Lima, 2019; Wilson, Thoma, & Loschavio dos Santos, 2024);
3. design and diffuse design (or the natural ability to design based on everyday practice by lay people, see Manzini [2015a]) as ways of challenging oppression and power relations (Viana & Loschavio dos Santos, 2020; Lima, 2019; Oliveira Serpa & Batista Silva, 2021; Seldin, 2024).

The first uses design as an instrument to capitalise on the economic potential within a neoliberal perspective, where community members are seen as recipients of design processes. The latter two advocate for community empowerment, social and political transformation, where community members' agency is central in design processes.

2. Methodology

This qualitative and exploratory design research, or research through design, had its primary data collection based on online roundtables conducted with community members living in informal settlements in two Brazilian cities, Rio de Janeiro and Belo Horizonte. The research activities needed to be conducted online due to travel and other restrictions and health advice during the pandemic. The roundtables enabled conversations about the COVID-19 pandemic circumstances and impacts in the communities. Also, they helped to foster connections and collaborations on preventative measures and the sharing of resources between the different communities which joined the study. These roundtables had the participation of not-for-profit (or non-governmental) organisations' representatives who actively helped these communities mitigate the effects of the pandemic. Secondary data collection included public data (from NGOs' and community members' social media posts, websites, and press news).

The online roundtables were conducted during the very beginning of the COVID-19 pandemic in Brazil in 2020 with community members representing two informal settlements in Belo Horizonte and three informal settlements in Rio de Janeiro (please see Tables 1 and 2 for further details). These were audio and video recorded. Each roundtable had a mediator and a time moderator to facilitate equal participation among participants. Notes were also taken by observers during the conversations, besides the transcriptions. This research was only possible at that time due to the successful international collaboration between the research teams in the UK and Brazil. The Brazilian research team had already been building a good relationship through their continuous work with the communities we could invite to participate in this research.

Table 1. Belo Horizonte online roundtable.

Roundtable role	Role	Related community	Gender
Participant 1	NGO representative, community member	Community A	Male
Participant 2	NGO representative	Community A	Male
Participant 3	Kindergarten teacher, community member and volunteer	Community B	Female
Participant 4	NGO representative and community member	Community B	Male
Mediator	Researcher	University (UK)	Female
Time moderator	Master student	University (Brazil)	Male
Observer 1	Professor	University (Brazil)	Male
Observer 2	Professor	University (Brazil)	Female
Observer 3	PhD student	University (Brazil)	Female

Table 2. Rio de Janeiro online roundtable.

Roundtable role	Role	Related community	Gender
Participant 5	Nurse, doula and community member	Community C	Female
Participant 6	Journalist and community member	Community D	Female
Participant 7	NGO representative and community member	Community D	Male
Participant 8	Educational project founder and community member	Community D	Female
Mediator	Researcher	University (UK)	Female
Time moderator	Master student	University (Brazil)	Male
Observer 2	Professor	University (Brazil)	Female
Observer 3	PhD student	University (Brazil)	Female

Three online roundtables' conversations were run in Portuguese, the first language of the communities. One was conducted with community members living in Belo Horizonte. Another one took place with people living in Rio de Janeiro. After these two roundtables, the conversations were transcribed. The conversations helped the research team draft maps that made visible the problems, adaptive strategies and actions as well as challenges for communities regarding the first warnings about the COVID-19 pandemic when it was reaching the country, prevention, diagnosis, treatment, and support available for communities and created by communities. These first maps were shared with

community members from both cities in a third roundtable. Amendments were made according to their comments on each map. These mapping processes clarified the factors affecting the ability of community members to protect their health, and their interrelation, making visible community knowledge and actions that mitigated the impact of the COVID-19 pandemic on communities based on their lived experiences. These were also useful to identify challenge areas for communities and their needs (please see Fonseca Braga et al., 2020 for a further and detailed explanation of this research phase). All the data generated during the collection and analysis were translated into English.

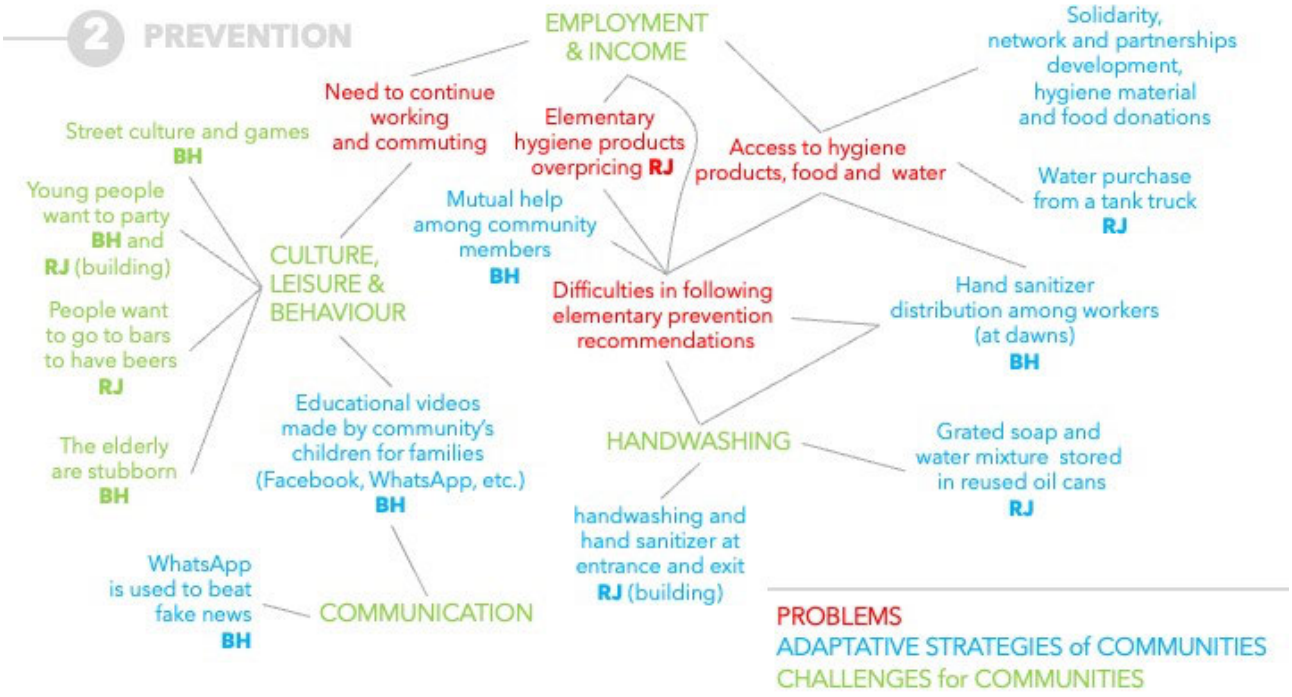

Figure 2: Example of a map made with communities (Fonseca Braga et al., 2020).

After that, the research team further analysed the transcriptions and the first maps generated, which gave a holistic view on the factors affecting the capacity of communities to prevent and mitigate the impacts of the COVID-19 pandemic. This further analysis enabled us to identify barriers, challenges, communities' strategies and their relations to 5 key areas affecting those: infrastructure, politics, public policy and service, behaviour and culture, and socioeconomic determinants (Figure 3).

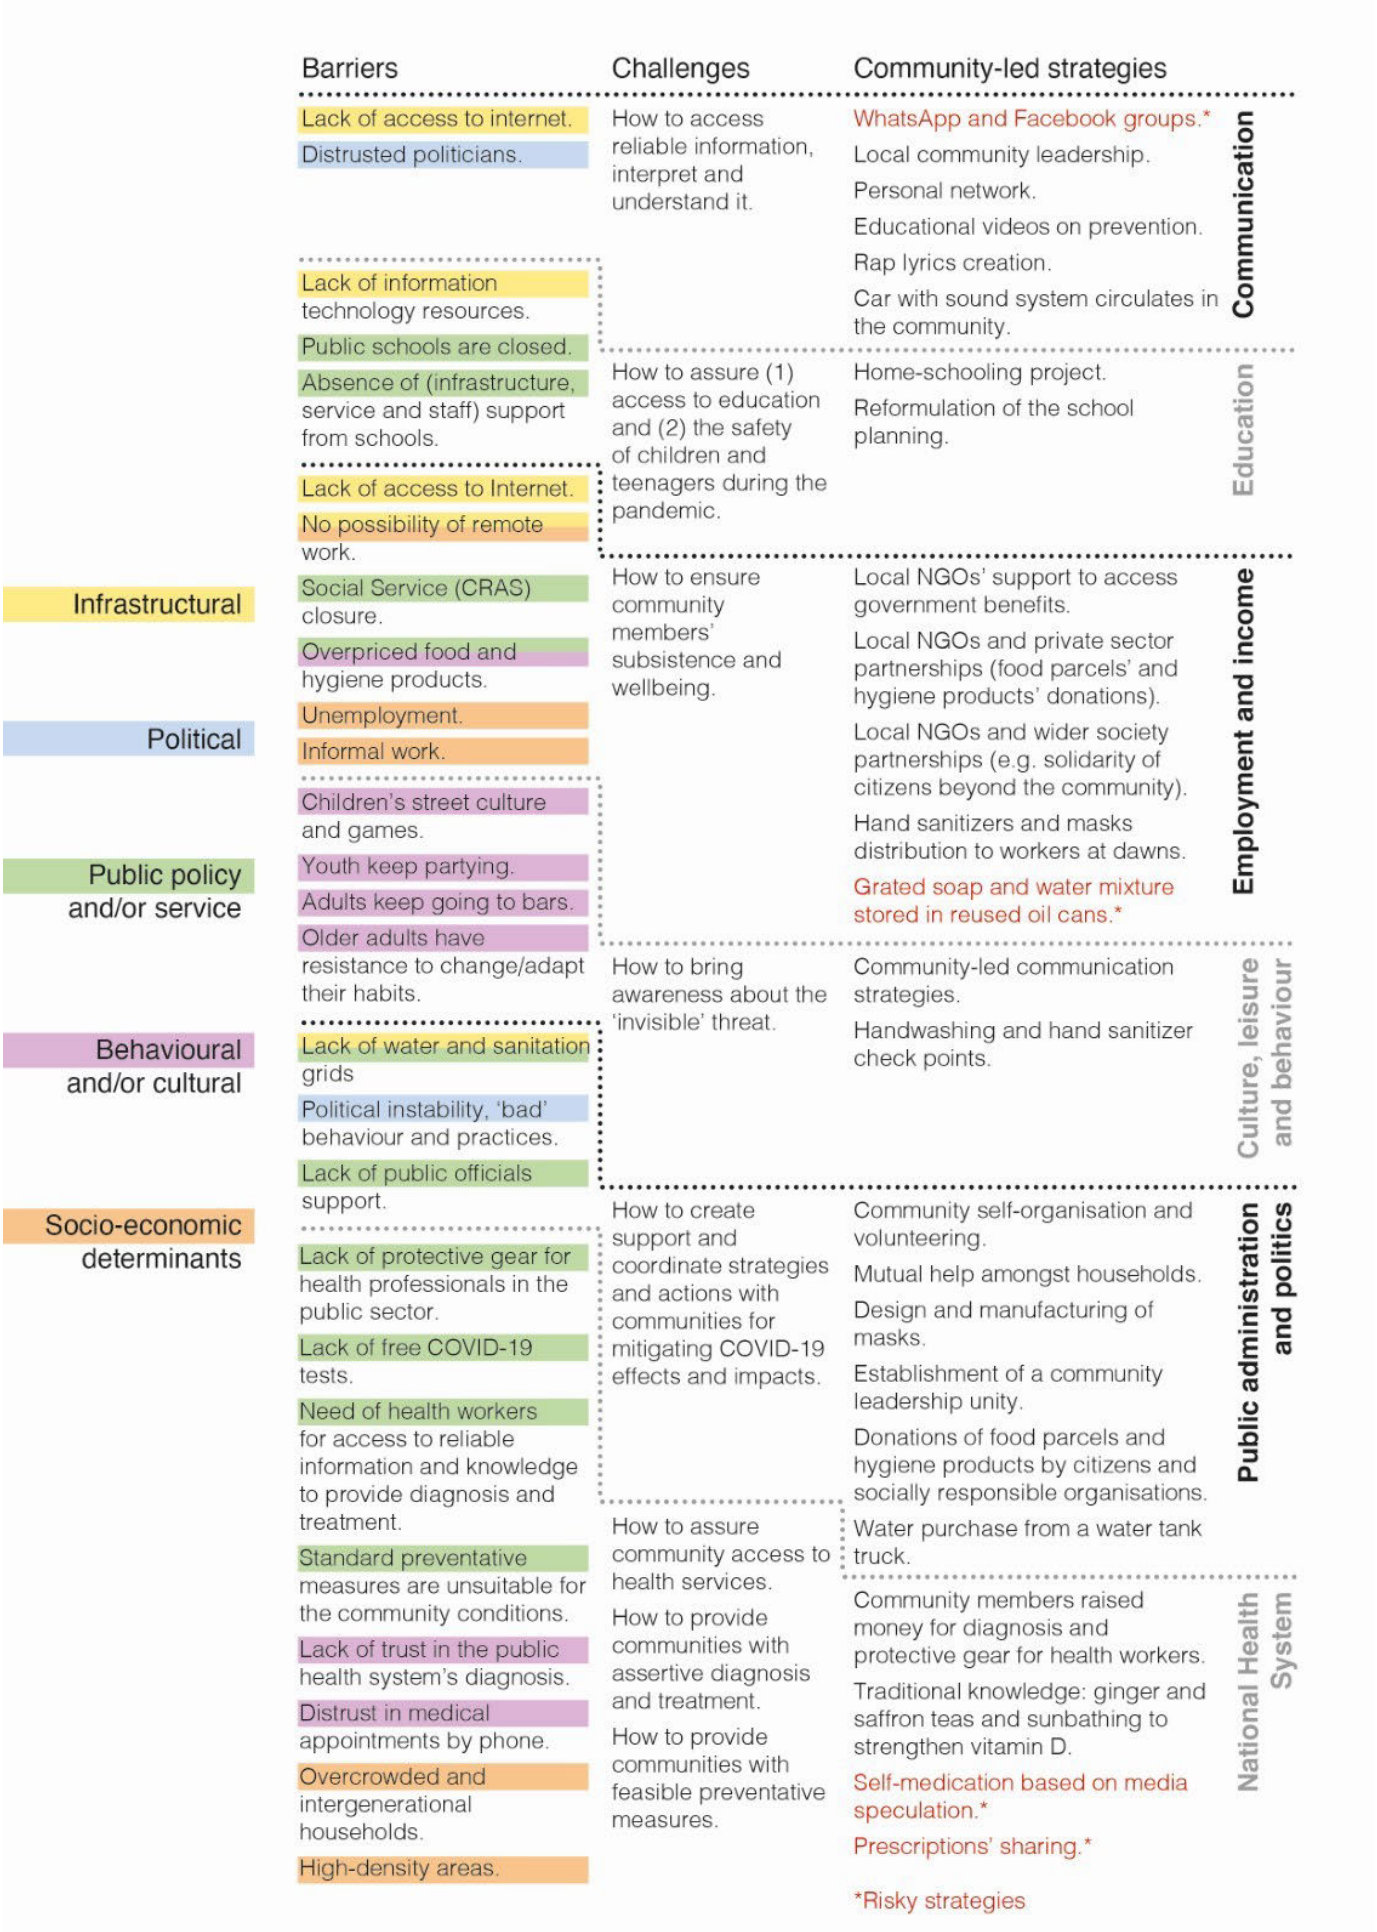

Figure 3. Map of the barriers, challenges, and community-led strategies for tackling the COVID-19 pandemic (Fonseca Braga et

al., 2021).

A third research stage explored and defined the designers' capabilities that could support community resilience (Figure 3).

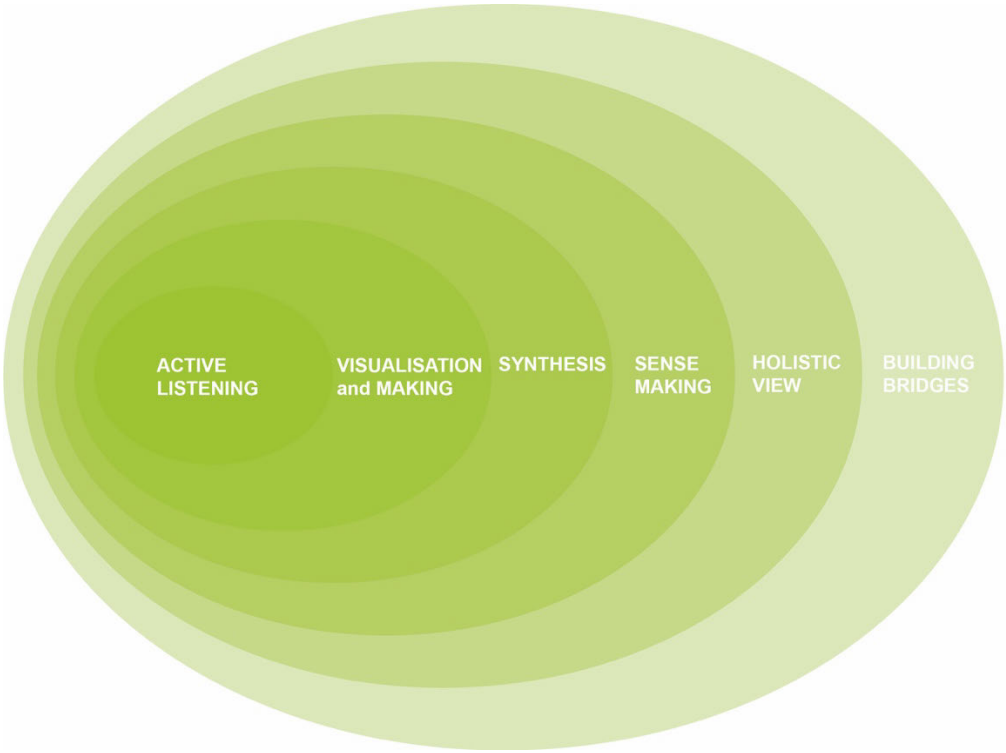

Figure 4. Design capabilities for community resilience (Fonseca Braga et al., 2022).

This paper expands on this third research stage, highlighting the critical need for socially responsible community empowerment in the new public governance in which community resources and capabilities are key assets, especially with under-resourced health systems and the plummet in public budget spending. It analyses particularly the transition towards community-led governance based on emerging community leadership observed in the communities that joined this pilot study. It focuses on the aspects that this transition should entail, supported by design approaches and processes, to contribute to socially responsible community empowerment.

3. Communities' capabilities and limitations

Preventative measures and advice proposed through global health policies, such as handwashing with water and soap, social distancing, self-isolation and remote work, were often not possible to be followed by communities living in informal settlements. These measures were unfeasible for communities because of several interrelated factors including the infrastructure of these territories, socioeconomic determinants, public policies and services that did not meet the specific circumstances and needs of communities alongside cultural, behavioural aspects and political climate.

Many factors made prevention even more challenging for communities. Hygiene products were overpriced during the pandemic which made these unviable for them. Additionally, the lack of appropriate infrastructure, such as water and sanitation grids; and the absence of Internet services combined with the kinds of jobs often done, that require commuting and being present at the work venue (e.g., cleaners, construction and informal workers), did not enable remote work.

"... this issue of prevention is very complex. [...] we had guidance like 'keep socially

> isolated', 'use hand sanitiser', and 'wash your hands frequently'. Mate, none of this applies to our reality. Maintaining social distancing, there's no way… We live in packed houses, sometimes with more than 10 people. […] Wash hands frequently, also no. We have a problem with the lack of water. This is recurring. It's something that is part of our reality. So, it becomes one more problem. And another one was hand sanitiser. We are talking about informal workers, who don't have savings for emergencies like this COVID one. So, they couldn't include this additional survival cost well into their budgets." Community member, NGO representative.

Other frustrations of community members came from the measures regarding a possible diagnosis, which was not accurate due to the lack of tests. COVID-19 symptoms could be confused with several tropical diseases' symptoms, which led to inaccurate diagnoses. When people were possibly diagnosed, they were requested to self-isolate. Self-isolation was not feasible in their circumstances of crowding and intergenerational households.

Public support available was mostly provided through online systems. This worsened access to those benefits. Moreover, some people were 'not found' on these public online records used on these public online platforms.

Furthermore, the political climate and the distrust of communities in politicians also worsened the belief that the COVID-19 virus was real, as it could not be seen by the naked eye even when they were working in health areas. A community member, who is a nurse and doula, shared their lack of belief in it during one of our conversations: "Does it [the COVID-19 virus] really exist? Might it not just be a manipulation? Could there be a hidden political interest in all this?".

A political factor that contributed to that was the continuous dispute between opposing parties. This led people to think the virus could be an 'invention' created with hidden political intentions. Additionally, politicians who say they will improve community territories and circumstances during elections but do not commit to their pledges made after being elected. This contributed to community distrust.

On the other hand, it was clear that emergent community leadership was critical to making a difference in their communities. Community members interested in enhancing the future of their communities have been founding their own not-for-profit (or non-governmental) organisations supporting education, participation in sports, creative arts and music. These NGOs covered public policies' and services' gaps and deficiencies during the COVID-19 pandemic, promoting social cohesion and organisation to tackle the pandemic challenges and making partnerships with charities and private sector companies. Their initiatives helped to provide communities with hygiene products, masks, food parcels, as well as access to Internet services. They also coordinated several social solutions in order to communicate information about the COVID-19 pandemic in accessible ways. For example, co-creating short videos and using sound cars to disseminate information in the communities. Other initiatives included coordinating collaboration with healthcare professionals in their communities, mask production and distribution in their communities, and generating "self-isolation" alternatives among households in the communities. Additionally, protective gear was lacking in the local public health system and was also provided through the support of communities.

However, these community-based resources or capabilities also had their limitations. This was noticed particularly when people needed to take risks aiming to protect their health. For instance, when a health expert, professional advice and diagnosis were needed but could not be reached or accessed. This led community members to risky alternatives

such as prescription sharing and self-medication based on media speculation.

4. Socially responsible community empowerment

Citizens' capabilities were identified and classified in prior literature (Manzini, 2015a, 2015b). These are considered critical to public work (Dong, 2008) and to the new public governance (Julier, 2017) and the future of governance (Manzini, 2019) in a rationale grounded in community engagement, empowerment and ownership. There is growing research on the diffuse design capabilities of underrepresented and underserved Brazilian communities (e.g., Viana & Loschavio dos Santos, 2020; Seldin, 2024). However, these diffuse design capabilities are still mostly unknown or poorly documented in health and well-being. Understanding communities' or citizens' capabilities and their limitations is fundamental, particularly in areas of public health. Diffuse design and collective community-based solutions are seen as a form of political resistance that can lead to social transformation, challenging power relations and responding to neglect (Viana & Loschavio dos Santos, 2020; Seldin, 2024). Nevertheless, precarious diffuse design practices which can put communities at risk rather than benefit their lives should not be ignored. Therefore, we need to help build spaces for communicating and escalating communities' voices, values and needs, besides their capability to resist. We need to be able to influence decision-making processes that affect communities' lives, making neglect unacceptable in the public sector.

Furthermore, most literature draws on the benefits of design approaches in the public space, but they do not clarify the limitations in sharing or transferring these functions to different stakeholder groups and communities. This is a key point as these roles were originally taken by the public sector, for example, being carried out by civil servants, policymakers, government agency members, and people specialised in implementing policies for the public sector (for instance, through tenders). This can lead to important implications for citizens who take or share these roles and their related responsibilities, especially in health and well-being.

In this context, designers could play a meaningful role in supporting community-led governance and empowerment over their lives, over their health. Different contexts and communities require situated initiatives. On the one hand, the learnings from this pilot research showed the importance of addressing community capacity, resources or capabilities and their limitations as a necessary step for informing socially just or equitable public policies and services that should meet communities' needs and are particularly critical to them during emergencies like the COVID-19 pandemic. On the other hand, designers can also support a vision of and from communities about what they aspire to from the medium to the long term.

4.1. Designing equitable policies

It would be naive to assume that this collaborative work is defined only by the community's will. The active engagement and will from different stakeholder groups, including (but not limited to) civil servants, policymakers and politicians are still crucial to enabling and facilitating communities' safety, security, health, vision and aspirations.

In this context, socially responsible design jobs include navigating different political climates and identifying potential community supporters and advocates in the public sector that can influence decision-making. Designers should consciously advocate and raise the communities' voices and needs in a socially responsible way in these design processes. This includes identifying what puts communities at risk and helping to promote and co-design more equitable solutions that help to tackle the challenges that

lead to communities' risk-taking actions. People do not take these risks for free; they do not see other ways they could deal with a challenge when the solutions available to them are not feasible in the circumstances they find themselves in. Therefore, identifying and making visible the challenges and their triggers in the lived experiences of communities is critical. This enables better informed development of socially just or equitable public systems, policies and services.

For example, if communities do not have access to Internet services and these cannot be fairly provided to communities, other alternatives could be created considering their resources and capabilities. By fairly provided, I mean provided in a way that people can make a well-informed use of a service or can make informed decisions and take well-informed actions. Hence, knowing communities' capabilities and resources in protecting their health could enable us to identify focus areas for public budget spending or the areas and needs that communities require public and expert support to deal with a challenge.

It is our social design job to help clarify these challenges based on the lived experiences of communities and contribute to influencing change in the way these public systems, services and policies are designed and implemented, developing further socially responsible design research and practices for equitable policymaking. In this sense, these design processes could be inspired and learnt from Freire's work, in a diversity of design aspects, from co-designing communication that is accessible to communities, understanding their day-to-day language(s), to bringing people's lived experiences of not only going through challenges but also of creating solutions to their problems in a mutual learning approach. However, precarious community-led solutions that put community members' lives at risk should not be acceptable. Hence, designing equitable policies also involves acknowledging the need to identify and understand risky strategies and actions during co-design processes and address the factors triggering those.

4.2. Towards community-led governance

Community leadership was critical to promoting social cohesion and organisation or collaborative strategies and actions to mitigate the COVID-19 pandemic impacts and protect their health when public services and policies did not suit them in this pilot research. This shows that there are communities capable of fostering and developing community-led governance that could be key to defining the futures of governance, democracy and policymaking. In this scenario, socially responsible design is needed to support this leadership in thriving as well as to explore and define innovative policymaking systems and public policies that are effective for communities to protect their health.

However, the limitations of communities' capabilities and their impacts make a socially responsible design approach to community empowerment necessary. This socially responsible design approach should be committed to raising and making visible the lived experiences, voices and needs of communities. In these terms, there is still much to be understood about how (social) designers and (social) design could support community leadership to thrive. I draw on starting points to define an agenda on that.

At the strategic level, we need to be able to navigate and negotiate in different political climates and public sector systems, supporting communities' needs and relationship building with different stakeholder groups that are necessary to be involved for the improvement of their capability "to live the kind of lives they value - and have reason to value" (Sen, 1999). Questions such as 'Who should be involved and can contribute to

enhancing or enabling responsible community capability development?', 'How can we meaningfully engage them and foster a commitment to communities' needs and visions?' could be ways of exploring, reflecting and defining ways of achieving this with communities.

At the operational socially responsible design level, we still need to explore and define further how communities' capabilities can be mapped and understood quickly. Although this could ideally be a continuous design work with communities, during an emergency like the COVID-19 pandemic, this should be a job done safely for all the people involved and in time to inform the development of suitable, viable and feasible public support, services and policies. These should be effective for communities respecting and addressing their lived experiences, livelihood diversity and socioeconomic determinants. Questions such as 'How can (social) design and designers' skills and methods develop further and contribute to this deep understanding?', 'How can this deep understanding of communities' capabilities and their limitations effectively inform policymaking, public systems and services development and innovation?' could be starting points to explore and define community-led governance in which community empowerment is socially responsible and concerned with designing equitable policies.

About the Author:

Mariana Fonseca Braga is a design researcher and educator interested in socially responsible design research, education and practices. Her work aims to inform socially just solutions (e.g., public policies, services, systems, technologies) and equitable innovation in community health and well-being.

Acknowledgements: This research was conducted thanks to Lancaster University seed corn funding support and the collaboration with the research team in Brazil. I am grateful for all their contributions and especially thankful to all the community members and NGO representatives who provided us with meaningful insights into their realities during difficult and uncertain times. I also thank the University of Salford for the support and opportunity to continue doing design research towards responsible community empowerment.

ABSTRACT | This study investigates the pivotal role of visual design in enhancing community cultural construction in Beijing, China, while examining the intricate mechanisms of social force engagement in this endeavour. Drawing extensively from domestic and international literature, it underscores the escalating significance of visual design within the realm of social culture, particularly highlighting comparative case studies on community image revitalization and cultural heritage preservation in East Asia and Northern Europe. Despite Beijing's abundant research on community cultural construction, a notable gap persists in exploring specific mechanisms and implementation strategies, particularly when juxtaposed with Shanghai, Guangzhou, and Hong Kong. This project bridges this gap through meticulous surveys of emblematic Beijing communities, employing a blend of case studies, questionnaires, and in-depth interviews. Our findings elucidate the distinctive function of visual design in fostering community cultural development, revealing its efficacy as a medium for cultural expression and communication. We dissect how visual elements—such as colour, graphics, and typography—meld residents' cultural perceptions, evoke emotional resonance, and shape behavioural patterns. Furthermore, we scrutinize the roles and participation modes of diverse social forces, including governments, NGOs, residents' groups, and enterprises. The study acknowledges the intricacies of data collection and processing, the challenge of case selection, and the necessity for actionable policy recommendations. A key case study, the transformation of Beijing's Hepingli (和平里) community, is analysed to illustrate the practical application of visual design in fostering social development and cultural

preservation.

KEYWORDS | Visual Design, Social Development, Social Participation Mechanisms, Cultural Heritage Preservation, Hepingli Community

1. Introduction

Visual design has emerged as a critical tool in cultural expression and social development, bridging tradition and modernity while fostering community identity and cohesion (Li & Choe, 2023). In Beijing, a city with a rich cultural heritage and diverse social fabric, visual design plays a pivotal role in community cultural construction, offering unique opportunities to explore its impact on social participation and cultural preservation (Jiansheng, 2019; Wang et al., 2021). This study situates Beijing as a compelling case study to examine the interplay between visual design and social development.

Despite Beijing's extensive research on community cultural construction, there remains a significant gap in understanding the specific mechanisms and implementation strategies driving these efforts, particularly when compared to other major Chinese cities like Shanghai, Guangzhou, and Hong Kong (Beijing, 2022). This study seeks to address this gap by investigating how visual design and social forces collaboratively shape community development in Beijing, with a focus on the Hepingli community as a case study.

This study aims to achieve two primary objectives: first, to explore the role of visual design in fostering community cultural development, focusing on its ability to convey cultural identity and evoke emotional resonance; and second, to examine the engagement mechanisms of diverse social forces, including government agencies, NGOs, residents, and enterprises in this process.

This research contributes to the growing discourse on visual design as a catalyst for social development, offering theoretical and practical insights for policymakers, designers, and community leaders. By providing actionable recommendations, the study aims to enhance the effectiveness of visual design initiatives in promoting cultural preservation and social participation in urban communities.

2. Literature Review

2.1. The Role of Visual Design in Social Development

Visual design has historically served as a powerful medium for cultural expression, from ancient cave paintings to modern digital interfaces, reflecting societal values and aspirations (Clottes, 2020; Meggs & Purvis, 2011). In contemporary contexts, visual design is increasingly recognized for its ability to foster social cohesion, shape cultural identity, and influence behavioral patterns. Theoretical frameworks, such as semiotics and visual

communication theory, highlight how visual elements like color, typography, and imagery can evoke emotional resonance and convey complex cultural narratives (Hall et al., 2024; Kress & Van Leeuwen, 2020; Lupton & Phillips, 2015). Successful initiatives, such as the use of murals in Bogotá, Colombia, to promote social inclusion and the revitalization of public spaces through graphic design in Barcelona, Spain, demonstrate the transformative potential of visual design in community development (García, 2010; Sasser, 2017). These examples underscore its capacity to bridge cultural divides, enhance civic engagement, and promote sustainable urban growth.

2.2 Community Cultural Construction in Beijing

Beijing, as China's cultural and political center, boasts a rich heritage and a diverse community landscape, making it an ideal setting for exploring the intersection of visual design and social development. Existing research on Beijing's community cultural initiatives highlights efforts to preserve traditional neighborhoods (hutongs) and promote public art, yet it often lacks a detailed analysis of implementation strategies and stakeholder engagement (Wang, 2016; Wang, 2023). Compared to Shanghai, Guangzhou, and Hong Kong, where community cultural construction is often driven by innovative design policies and strong public-private partnerships, Beijing's approach remains understudied, particularly in terms of visual design's role (Wu, 2007; Zhang et al., 2020). This gap underscores the need for a deeper exploration of Beijing's unique mechanisms and challenges.

2.2. Comparative Case Studies: East Asia and Northern Europe

Lessons from Japan's "Machizukuri" (town-making) movement and Sweden's "Folkhemmet" (people's home) concept provide valuable insights into the role of visual design in cultural preservation and community revitalization (Evans, 2002; Grundström & Molina, 2016; Watanabe, 2006). In Japan, community-driven design initiatives have successfully integrated traditional aesthetics with modern functionality, fostering a sense of belonging and cultural continuity. Similarly, Sweden's emphasis on inclusive design and public participation has strengthened social cohesion and urban resilience. These case studies highlight the importance of collaborative approaches and culturally sensitive design strategies, offering a framework for Beijing to enhance its community cultural construction efforts (Duxbury & Jeannotte, 2011).

3. Methodlogy

3.1. Research Design

This study employs a mixed-methods approach, integrating qualitative and quantitative techniques to provide a comprehensive understanding of the role of visual design in Beijing's community cultural construction. The qualitative component includes case studies and in-depth interviews, offering rich insights into stakeholder perspectives, while the quantitative component involves surveys to gather measurable data on community

perceptions and engagement (Koskinen, 2012; Patton, 1990) . This approach is justified by its ability to triangulate findings, ensuring a robust and nuanced analysis of complex social phenomena.

3.2. Case Selection

Emblematic communities in Beijing were selected based on their cultural significance, diversity, and active engagement in cultural construction initiatives. The chosen communities include traditional hutong neighborhoods, modern residential complexes, and mixed-use urban areas, representing a spectrum of cultural and social contexts. These communities were selected to ensure a holistic understanding of how visual design operates across different urban landscapes, from historic preservation sites to rapidly developing districts. The Hepingli community, a historically significant area undergoing transformation, serves as a key case study to illustrate the practical application of visual design in fostering social development.

3.3. Data Collection

Data was collected through three primary methods: surveys, interviews, and visual material analysis. Surveys were distributed to residents, visual designers, and community leaders to gather quantitative data on perceptions of visual design and its impact on cultural identity. In-depth interviews were conducted with government officials, NGO representatives, and local business owners to explore the roles and challenges of various social forces in community cultural construction. Additionally, visual materials such as posters, signage, and public art installations were analyzed to assess their cultural and communicative functions.

3.4. Data Analysis

Qualitative data from interviews and visual materials were analysed using thematic analysis to identify recurring patterns and themes related to visual design's role in community development (Dexter, 1970). Survey responses were subjected to statistical analysis to determine correlations and trends in community perceptions and engagement levels. The findings from both qualitative and quantitative analyses were synthesized to provide a comprehensive understanding of the mechanisms through which visual design fosters social development, offering actionable insights for policymakers and practitioners.

4. Findings

4.1. The Role of Visual Design in Community Cultural Construction

Visual design plays a pivotal role in shaping cultural perception and fostering emotional

resonance within Beijing's communities. The strategic use of visual elements such as color, graphics, and typography has been shown to influence how residents perceive and engage with their cultural environment. For instance, the use of vibrant colors in public art installations in the Dashilar hutong district has revitalized the area, created a sense of pride and belonged among residents (Zhang, 2020; Zhang & Xin, 2023). Similarly, the integration of traditional Chinese calligraphy and modern typography in community signage has bridged the gap between historical heritage and contemporary urban life, enhancing cultural continuity and identity (Tversky, 2013; Zhang et al., 2008).

In the Hepingli community, visual design has been instrumental in transforming the area into a vibrant cultural hub. The community's redesign incorporated traditional Chinese motifs into modern urban infrastructure, creating a seamless blend of old and new. For example, the use of traditional lattice patterns in street furniture and public art installations has reinforced the area's cultural identity while meeting the needs of a modern urban population. This approach has not only preserved the community's historical character but also fostered a sense of pride and ownership among residents.

4.2. Mechanisms of Social Force Engagement

The engagement of diverse social forces is critical to the success of community cultural construction in Beijing. Government initiatives play a central role in providing the necessary policies, funding, and regulatory frameworks to support these efforts. For instance, the Beijing Municipal Government has implemented policies that promote the integration of visual design into urban planning, such as the "Beautiful Beijing" initiative, which focuses on enhancing the city's aesthetic appeal and cultural vibrancy (Rocha, 2017). These policies provide a foundation for community cultural projects, ensuring their alignment with broader urban development goals.

In the Hepingli community, the local government collaborated with NGOs, residents, and businesses to implement a comprehensive visual design strategy. As illustrated in Figure 1, a stark contrast exists between the unrenovated community corridor and its post-intervention state. In-depth interviews with residents revealed that the visual redesign contributed to enhanced social cohesion and strengthened cultural identity within the neighbourhood. NGOs such as the Beijing Cultural Heritage Protection Centre played a key role in advocating for the preservation of traditional architectural elements, while residents' groups contributed local knowledge and cultural insights. Businesses, through corporate social responsibility (CSR) initiatives, provided funding and creative expertise, resulting in a cohesive and culturally resonant urban environment.

Figure 1 Visual reconstruction of Hepingli Community corridor before and after

4.3. Challenges and Opportunities

Despite the positive impact of visual design on community cultural construction, several challenges persist. Data collection and processing present significant hurdles, particularly in gathering comprehensive and accurate information from diverse sources. Ensuring the reliability and validity of data requires meticulous planning and execution, which can be resource-intensive. Case selection is another challenge, as the diversity of Beijing's urban landscape necessitates careful consideration to ensure that chosen communities are representative and provide meaningful insights. Additionally, translating policy recommendations into practice often encounters institutional and operational constraints, underscoring the need for persistent coordination among stakeholders.

However, these challenges also present opportunities for leveraging visual design to address community-specific needs. By adopting a participatory approach that involves residents, designers, and policymakers, communities can develop tailored solutions that reflect their unique cultural and social contexts. For example, the use of co-design workshops in the Hepingli community enabled residents to actively contribute to the design of public spaces, ensuring that these spaces meet their needs and preferences (Federation, 2024). Furthermore, advancements in digital technology offer new

possibilities for visual design, such as augmented reality (AR) and virtual reality (VR), which can enhance cultural experiences and engagement. By embracing these opportunities, Beijing's communities can continue to harness the power of visual design to foster cultural identity, social cohesion, and sustainable development.

5. Discussion

5.1. Visual Design as a Medium for Cultural Expression

Visual design serves as a powerful medium for articulating cultural identity and fostering social cohesion within communities. By leveraging elements such as color, typography, and imagery, visual design communicates cultural narratives that resonate with residents and visitors alike. In Beijing, the integration of traditional motifs with modern aesthetics has proven particularly effective in bridging the gap between historical heritage and contemporary urban life. For example, the use of traditional Chinese patterns in public art installations in the Qianmen district not only preserves cultural heritage but also creates a sense of continuity and pride among residents (Wang, 2017). This interplay between tradition and modernity ensures that cultural identity remains relevant in a rapidly urbanizing context, fostering a shared sense of belonging and community.

5.2. The Interplay of Social Forces

The success of community cultural construction in Beijing relies heavily on the collaborative dynamics between government, NGOs, residents, and businesses. Government initiatives provide the necessary policies, funding, and regulatory frameworks to support cultural projects, ensuring their alignment with broader urban development goals. For instance, the "Beautiful Beijing" initiative has been instrumental in promoting the integration of visual design into urban planning, creating a foundation for community cultural projects (Rocha, 2017). However, the role of NGOs and residents' groups is equally critical, as they bring localized perspectives and grassroots efforts to the table. Organizations like the Beijing Cultural Heritage Protection Center have been pivotal in preserving traditional neighborhoods and fostering community engagement through visual design.

Inclusive and participatory approaches are essential for ensuring that community cultural projects reflect the needs and aspirations of residents. Co-design workshops, such as those conducted in the Hepingli community, enable residents to actively contribute to the design of public spaces, ensuring that these spaces are both functional and culturally meaningful. Similarly, enterprise participation through CSR initiatives and public-private partnerships brings creative expertise and financial resources to community projects. A notable example is the collaboration between a major real estate developer and Beijing Design Week, which transformed an abandoned industrial factory into the event's permanent venue under the principle of low-carbon sustainability. Through dynamic visual interventions, the revitalized space exemplifies an innovative integration of visual design and sustainable urban practice. As depicted in Figure 2, the

adaptive reuse strategy not only preserved the factory's architectural heritage but also activated the surrounding neighbourhood through strategically implemented visual elements.

http://xhslink.com/a/HyQbZoR0urWcb)

5.3. Challenges and Opportunities

To fully harness the potential of visual design in community cultural construction, it is essential to integrate it into urban planning and cultural policies. Policymakers should prioritize the development of frameworks that support the use of visual design in public spaces, ensuring that it is both accessible and culturally relevant. For example, guidelines for incorporating traditional motifs into modern designs can help preserve cultural heritage while promoting innovation. Additionally, funding mechanisms should be established to support community-led visual design projects, ensuring that resources are allocated equitably and effectively.

Enhancing stakeholder collaboration and resource allocation is another critical strategy for addressing the challenges of community cultural construction. Establishing platforms for dialogue and collaboration between government agencies, NGOs, residents, and businesses can facilitate the sharing of resources and expertise. For instance, the creation of a "Community Design Council" in Beijing could provide a forum for stakeholders to coordinate efforts and develop integrated solutions. Furthermore, leveraging digital technologies such as augmented reality (AR) and virtual reality (VR) can enhance the impact of visual design by creating immersive cultural experiences that engage a wider audience. By adopting these strategies, Beijing's communities can continue to leverage visual design as a catalyst for social development, fostering cultural identity, social cohesion, and sustainable urban growth.

6. Conclusion

This study highlights the distinctive role of visual design in Beijing's community cultural construction, demonstrating its capacity to articulate cultural identity, foster social cohesion, and shape behavioral patterns. Through the strategic use of visual elements such as color, typography, and imagery, communities can preserve their heritage while adapting to modern urban contexts. The research also reveals the critical mechanisms through which social forces—government agencies, NGOs, residents, and businesses—engage in cultural initiatives. Collaborative efforts, such as public-private partnerships and grassroots projects, underscore the importance of inclusive and participatory approaches in achieving sustainable community development.

This study bridges the gap between theory and practice by providing a comprehensive framework for understanding the role of visual design in social development. By analysing successful initiatives and stakeholder dynamics, the research offers actionable insights for policymakers, designers, and community leaders. These insights can inform the development of culturally sensitive design policies and collaborative strategies that enhance community engagement and resource allocation. The findings contribute to the growing discourse on visual design as a tool for fostering cultural preservation and social cohesion in urban contexts.

Visual design holds immense potential as a catalyst for sustainable social development. By integrating traditional and modern aesthetics, fostering stakeholder collaboration, and leveraging innovative technologies, communities can create culturally vibrant and socially inclusive spaces. As Beijing continues to evolve, the strategic use of visual design will remain essential for preserving cultural heritage, promoting social cohesion, and enhancing the quality of urban life.

7. Future Research

7.1. Long-Term Impact of Visual Design

Future research should explore the long-term impact of visual design initiatives in rapidly urbanizing contexts, particularly in cities like Beijing. Investigating how these initiatives sustain cultural identity and social cohesion over time will provide valuable insights into their effectiveness and adaptability. This research could also examine the role of digital technologies, such as augmented reality (AR) and virtual reality (VR), in enhancing the longevity and accessibility of visual design projects.

7.2.Comparative Studies

Expanding the research to other cities in China, such as Shanghai, Guangzhou, and Shenzhen, as well as internationally, would offer a broader perspective on the role of visual design in community cultural construction. Comparative studies could identify best

practices and innovative approaches that can be adapted to different cultural and urban contexts, enriching the global discourse on visual design and social development.

7.3. Framework Development

Developing a comprehensive framework for evaluating the effectiveness of visual design in community cultural construction is essential for guiding future initiatives. This framework should include metrics for assessing cultural preservation, social cohesion, and community engagement, as well as guidelines for stakeholder collaboration and resource allocation. Such a tool would provide policymakers and practitioners with a standardized approach to designing and implementing impactful visual design projects.

VISUALISING ORGANISATIONAL SYSTEMS: A RELATIONAL GRAPH APPROACH

Attila Bujdosó*[a], Bálint Ferenczi[ba]

a Moholy-Nagy University of Art and Design Budapest
b MITO Group

*attila.bujdoso@mome.hu

ABSTRACT | This interactive 30-minute X-session invites participants to experiment with a new visualisation methodology currently in development.

KEYWORDS | ORGANISATIONAL DESIGN, HUMAN SYSTEMS DESIGN, ETHICAL DESIGN VISUALISATION, SYSTEMS THINKING

1. Overview

This interactive 30-minute X-session invites participants to experiment with a new visualisation methodology currently in development.

2. Rethinking Organisational Design

Social structures shape individual behaviour by influencing habits, preferences, and opportunities (Bourdieu, 1977). Traditionally, organisational models (Mintzberg, 1979) have been the domain of management, yet structuring multi-actor social systems is also a design challenge—part of fourth-order design (Buchanan, 1992; Margolin, 2015).

Management and leadership disciplines have developed numerous ways to visualise organisations, including organisational charts, process diagrams, financial flows, communication streams and employee networks, and value chains, OKR systems. Conventional models, however, typically prioritise financial performance over social value creation.

How can we design organisational models that prioritise value creation over financial performance? How can we reinvent organisations, so that they, and the actors within them, behave more responsibly? What do we need to visualise in organisations so that new organisational models can be designed?

3. A New Visualisation Methodology

Previous research on replicable formats of social cooperation identified six key components: contributors, contributions, motivations, enablers, rules, and tools (Bujdosó, 2019b). To map these systematically, the Social Design Canvas was developed, helping users think strategically about social cooperation (Bujdosó, 2019a).

An ongoing study explores the use cases and effectiveness of the Social Design Canvas. This study demonstrates that the Contributors–Contributions–Motivations–Enablers part of the canvas resonates strongly with users of the tool, and helps them think strategically and systematically on various contributors in social cooperative projects. However, while the canvas effectively categorises elements, it does not illustrate their interconnections.

A new graph-based visualisation method is being developed to map relationships between contributors, contributions, motivations, and enablers. Inspired by the Connected Content framework (Atherton & Hane, 2018) and the Jobs to Be Done framework (Kalbach, 2020), this method adopts a relational graph structure, where contributors are nodes, and contributions, motivations, and enablers function as edges.

This approach could uncover feedback loops and leverage points in social systems (Meadows & Wright, 2008), supporting the creation of ethically sustainable organisational models.

4. The Session X

This session introduces and tests the new relational, graph-based visualisation methodology. Participants will explore how mapping social systems in this way can reveal underlying dynamics and inform ethical, responsive organisational design.

Researchers and practitioners from academia, civil society, public administration, and business are invited to engage in this collaborative experiment—contributing to the foundation of more ethically aligned, sustainable human systems.

5. Session Outline

WHAT IF DESIGN COULD TRANSFORM THE WAY WE THINK AND MAKE PUBLIC POLICIES ? PROPOSING A NEW MODEL : THE POLICY DESIGN JOURNEY

ABSTRACT | For about 15-20 years, a rather small – yet growing – community of designers started getting involved in public policy innovation and public problem solving activities. Those design activists (willing to work for the common good, public welfare and social justice) have decided to apply their design skills, tools and methods in order to help public authorities of all levels (from village, to city, metropolis, national governments, or EU commission, etc.) reset & solve public problems and/or fix public policies and public services. « Designing better policies for people, by people » could be their motto. In parallel to working on solving public problems, designers have also spend energy on training civil servants and sometimes elected officials about their design approach so as to empower them in replicating, once the designers are gone, some design-inspired techniques and tools such as co-design with users, involving citizens in policy ideation, prototyping and experimenting before implementing, etc. By doing so, designers slowly spread their know-how to equip public authorities with design skills and progressively transform them. At the same time, we started seeing the first public authorities which would offer to designers real official design positions within their own administrations. Designers would not be only consulting for public authorities but transforming public authorities from within (often linked with the creation of public policy innovation labs). If it's still too early to discuss the success and impact of this strategy on the long term, we can already observe that by applying design methods to policy making, a new way of creating policies is emerging, one inspired by design. In this paper, we'll propose to draw a new guiding approach to policymaking inspired by design. To do so, we will build upon the initial critics of the policy cycle model such as the one of Lasswell drawn in 1957 (still in use today as a reference model) which, despite its clarity and simplicity, is purely theoretical (too linear, too static and too rational) and never takes place in the « real world »

and question the actionability of policy threads or streams model as proposed by Howlett in 2015. Then, we'll look into how, in practice, designers have, through practice, « tinted » policy making with their own methods to finally, extract and draw a new model for policy making, one which would build upon the design thinking & doing methodology (questioning the double diamond of the UK Design Council) but also the design « spirit » (capacity to improvise, to detour, to navigate at ease through uncertainty, etc.). Considering public policymaking from the angle of a "journey" could enable designers but also public authorities to embrace the fact that true policy design is an unwritten voyage, made of choices, options, creative detours, opportunities, trips to the unknown, etc.

KEYWORDS | POLICY DESIGN, POLICY INNOVATION, SOCIAL DESIGN

Introduction

This paper examines the possible contributions of design approach to reshaping public policy making. Chapter 1 describes the evolution from ecodesign to service design and finally to social and public design, showing how designers have progressively expanded their focus from sustainability concerns to addressing public sector challenges. Chapter 2 examines the proliferation of Public-Sector Innovation labs (PSI labs) as institutional spaces where design practices are applied to policy making, highlighting both their potential and the resistance they face within traditional administrative structures. Chapter 3 explores how designers' distinctive postures and attitudes—including curiosity, attention to detail, empathy, and comfort with uncertainty—are gradually influencing civil servants' approaches to policy making through collaboration and training. Chapter 4 discusses the tentative visual representations of policy making processes as well as of design approach. Chapter 5 finally proposes a novel "Policy Design Journey" framework that reimagines policymaking as an organic, non-linear process where design methodologies can be meaningfully integrated at various crucial moments.

1. From ecodesign to service design and social & public design: the consolidation of an emerging practice

Since the early 2000s, a rather small – yet steadily growing – community of designers started getting involved in public policy innovation and public problem solving activities (Kimbell, 2009). Moving away from the private sector, those design activists decided to work for the common good, the general interest, by working directly with the public sector. If the industry knows how to use design for

its products and services, why not apply design also to the public sector for its public services and policies?

This does not come out of nowhere, it is in part the result of half a century of questioning on the role and impact of design on society: in terms of sustainability of course, but also economics and social impact. In 1971, Victor Papanek [1] wrote: 'There are professions more harmful than industrial design, but only a very few of them.' Yes, in a polluted planet and a society suffering an over-consumption illness (and a 'Kleenex culture' – meaning a use-and-throw culture), designers are part of the problem. They have a responsibility. As Alain Findeli (2010) reminds us: 'the end or purpose of design is [or should be] to improve or at least maintain the habitability of the world in all its dimensions."

The responsibility of design in some of the worlds' problems led to change of design practices (and design teaching) with green design appearing in the years 1980s, then ecodesign in the years 1990-2000, and sustainable design in the years 2005-2010 (Ceschin et al, 2020). 'This shows that the role of design has evolved and has integrated new concerns, thus making it a more responsible design that has oscillated between large focuses on environmental concerns and encompassing social and ethical concerns' (Vicente, Frazão, and Moreira da Silva, 2012).

In parallel, to integrating the concepts of ecodesign and sustainable design quite early on, design schools also started, in the years 2005-10, to develop the logic of product-service-system design (PSS) (such as the PSS master degree in the Politecnico di Milano). The idea? Products can be produced in better ways, more responsible ones, but they don't stand alone no more. In a service-based economy, products are part of a larger system that include services and in which interactions between actors play a key role, and all that could be designed. Not just the product alone.

Slowly, service design started to appear as a new discipline of design (Meroni, Sangiorgi, 2011) in design schools but also in design consultancies. Even though service design was, at first, largely private-oriented (and often focusing on digital user interface services), projects that would include (or be directly with) the public sector got more and more common. For example, design schools would not only work with private business anymore but also propose to their students to work on projects in direct collaboration with public authorities, in particular local governments (on cultural projects, public space and/or urban challenges, social services, etc.). But besides some occasional cooperation on projects, it took quite some time for design schools, to realize that a possibly new discipline of design (and market) was emerging, one purposely social and directly public-sector oriented. 'The primary purpose of design for the market is creating products for sale. Conversely, the foremost intent of social design is the satisfaction of human needs' (Margolin, 2002). This discipline or practice has a name: social design, or even public design (in dutch speaking countries in particular), and finally policy

[1] Victor Josef Papanek was an Austrian-born American designer and educator, who became a strong advocate of the socially and ecologically responsible design as early as the 1970s.

design (or design for policy) which could be seen as a sub-category within social & public design.

Despite variations, for Nynke Tromp & Stéphane Vial (2022), there are five components of social design:
1. Care-driven design activities for the wellbeing of underprivileged people,
2. Responsiveness-driven design activities for good governance,
3. Political progress-driven design activities for empowered citizens,
4. Social capital-driven design activities for beneficial communities, and,
5. Resilience-driven design activities for sustainable future systems

Social designers are now, in many countries, applying their design skills, tools and user-centered methods in order to help public authorities and institutions of all levels (from village, to city, metropolis, national governments, EU commission or international institutions such as OECD, 2022) reset and solve public problems and/or fix public policies and public services (Bason, 2014). 'Designing better policies for people, by people' could be their motto.

2. The integration of [social] design in public institutions: the Public-Sector Innovation labs (PSI labs)

'The public sector is now established in theory and practice as a major site for design activity' (Buchanan, 2020).

Two proofs of this phenomenon: the multiplication of design studios who have specialized in public design (it's important to mention that many of those design consultancies have played a pioneer role in the development of design for policy (Buchanan, 2020)) and the multiplication of public innovation labs (within public authorities). And we could possibly even add a third proof: the emergence of 'social design' courses (Tromp & Vial, 2022) or 'design for policy' masters degree specialization in design schools, but also the emergence of 'public design' courses in political science schools (such as Sciences Po in France for example). For this article, we'll mainly focus on this second proof or phenomenon: the rise of public innovation labs.

Indeed, 'innovation labs (i-labs) are becoming increasingly popular in the public sector' (Tõnurist et al., 2007, McGann, Blomkamp & Lewis, 2018). Mindlab (Copenhagen), Helsinki Design Lab (Finland), Nesta Innovation Lab (London), Kennisland (Amsterdam), Social Innovation Lab Kent – SILK (Kent), La 27e Région (Paris), the Australian Centre for Social Innovation - TACSI (Adelaide), MaRS solution Lab (Toronto), Public Policy Lab (New York), EU Policy lab of the Joint Research Center - JRC (EU Commission), are just a few of the – probably – most well-known public-sector innovation (PSI) labs (which integrate, at least in part, design activity) that exist worldwide (or have existed as some have gone extinct). But there are hundreds of similar labs throughout the world and keeping track of all of them is no easy task.

First, because they often operate at very various levels of governance. Indeed, PSI labs can be found at national levels, but also regional and local levels, and the latter ones can sometimes be harder to spot as their publicity is not necessarily very high and the publication of their work not systematic.

Second, because they, sometimes, carry very different names and present themselves (or are referred to) as: innovation units/departments, i-team or i-lab, public policy lab, change lab, design lab, social innovation lab (McGann, Blomkamp, Lewis, 2018) or creativity lab or public transformation lab. And the list can go on. But despite how they define or present themselves, they all try – more or less – to: improve, fix or create new public policies and/or services (policy result, outcomes, better services), instill a culture and posture of innovation within – and around – the institution (agility, flexibility, creativity), transforming ways of working (policymaking process, user-centered approach, co-creation, learning by doing, prototyping and experimenting), and finally promoting collective intelligence (in particular involving users and stakeholders). Often, labs also work in the future, or rather explore and invent desired futures (vision and scenario building), by using creative participatory foresight and design fiction methods (Pólvora and Nascimento, 2021) to pave future policies.

'Public authorities attempting to innovate face a delicate trade-off between "safe" procedures and "risky" innovations [...] The idea that tax revenues could be "wasted" on risky, doomed-to-fail experiments makes the public sector a place that doesn't naturally lend itself to innovation'. (Lewis, 2020). Public sector innovation labs are therefore seen as a good way to bypass this risk aversion by giving innovation an open and dedicated 'safe' space to experiment in and opportunities for collaboration on innovation across units, departments and sectors (Carstensen & Bason, 2012). In other words a dedicated sandbox or playground in which things that would not be allowed outside are exceptionally authorized inside. And by doing so, installing inside (or together with) public authorities, a certain practice and experience of innovation, so that in the end, 'Public-Sector Innovation (PSI) labs are helping to create a new era of experimental government and rapid experimentation in policy design' (McGann, Blomkamp, Lewis, 2018).

But one should not rejoice so quickly. Yes, labs multiply, but some also die (sometimes almost without notice), and most importantly, even though they mutltiply, they still vastly remain scarce in regard to the (potential) need. And it appears clearly that despite all the calls and various public announcements for more innovative, modern, agile, creative, efficient administrations, 'there are strong pressures to maintain the status quo, and fewer incentives to innovate than to not' (Hallsworth, 2011).

Even within public authorities that are 'equipped' with innovation labs, changing things are not easy. Indeed, public authorities who do host a lab don't necessarily do things differently or apply, at all levels of its institution the principles, approach, tools, postures promoted by the lab. Far from it. But we won't enter much in this specific question as this would require a deeper dive into the recent attempts to

evaluate and measure the impact of design interventions such as the one conducted by Jeanne Liedtka (2018) or the evaluation of the impact of innovation labs such as the ongoing work of Amy Zidulka et al (2024). We need much more research and evaluation on co-design for policy (Blomkamp, 2018) if we wish to have proofs of its transformative effects and added value on policies, institutions and people. What we know at least for the moment is that 'without the support of political leaders and top managers who lobby on their behalf, these laboratories could not continue' (Lewis, 2020).

People enjoy routines much more than they enjoy disruptions. This means that innovation labs are, at best, seen as object of curiosity (provoking a bit of interest) but most often as a rather 'possibly dangerous and disruptive new thing'. If not, sometimes, 'a new toy' of the managing directors. In his *Transformation Manifesto*, John Kao (2004) reminds us that 'every effort to change is accompanied by resistance, fear of the unknown, nostalgia for the status quo and concerns about the loss of efficiency and control that result from trying something new'. And any designer working for, with or within a public authority knows how well this resonates and how, despite giving design lectures, training workshops or design handbooks so as to re-assure about the process, the approach, etc., embarking civil servants (as well as elected officials) can be a tiring and tedious chore with uncertain results.

Are the public authorities who host a lab more innovative and deeply changed? We are in desperate need of proofs. Jean-Marc Weller and Frédérique Palle (2017) wondered: Is public innovation by design an 'underlying trend, revealing lasting changes in the forms of innovation in government, or is it a temporary phenomenon, the product of what some will call a 'fad'?'

3. Instilling designers' posture and attitudes within public authorities

While I share the warning that design thinking should not present itself as 'a wholesale saving grace' (Clarke & Craft, 2018) for today's policymakers to avoid the risk of overpromising and underdelivering, and while I also share the concern that innovation labs may disappear if it's unable to prove itself useful and necessary – despite satisfying the political strategy: 'Look! We innovate, we have a lab' –, I still believe that design has a lot to offer to modify, enrich, improve the way we make policies on an everyday basis.

Despite the reluctance of people, and institutions, towards what's new and disruptive, the more designers, civil servants and politicians collaborate, either through the PSI labs or design consultancy, the more they get familiar with each other's ways of working. In particular, since designers often intervene but also train civil servants along the way – usually through 'learning by doing'–, we observe that civil servants become more and more comfortable with understanding design concepts (and process) such as user-centered approach, field investigation, co-

creation with users, ideation, modeling and prototyping, experimenting and crash-testing, etc. We also see that civil servants are becoming more and more familiar with design tools. Indeed, they start manipulating – or at least knowing about – design tools such as personas, user journeys, system maps, story-telling and scenarios, etc.

This is not only the result of more and more design-based innovation projects but also the growing number of trainings, keynotes, lectures, courses about design thinking applied to the public sector. Again, conducting an analysis of trainings or ex-post evaluation of design thinking trainings would provide us rich and more qualitative insights on this aspect. As a result of this greater acquaintance and cooperation between designers and public authorities, we also see, regularly call for tenders from public institutions demanding explicitly for design support in installing co-creation processes, designing and conducting policy experimentations or participatory user-based diagnosis of a policy or service. 10 or 15 years ago, public call for tenders asking for design were quite rare. Conducting a review of the call for tenders (at leat at EU level) calling for design in the last two decades would be interesting in this regard to provide supporting evidence of this phenomenon.

What we see, from the practice, is that public institutions are, generally speaking, more and more familiar with design thinking or design-originated concepts. 10 years ago, in France, when I was asking civil servants I was training if they were familiar with public design, the vast majority of participants were answering 'no'. Today, at least half of them tell me they have a pretty good idea of what it is, even though they didn't use it or had experience yet working with designers. And a quarter of them tell us they already had trainings or lectures, or courses about it. Finally and obviously, a couple of them even have some experience working with design(ers) or using some design tools.

For those civil servants (but also eventually elected representatives), who had the opportunity to take an active part to design-led projects (whether the re-design of a policy or the design of a new public service for example), we realize that not only they are familiar with design process (or method), or even design tools, but they also became familiar with the design posture, or design attitude.

Of course, designers are not all alike but they all, (besides method and tools), adopt the following attitude or posture when given a problem:

- A high degree of curiosity, showing interest for everything, a certain willingness to learn, in particular topics or subjects they know nothing about yet ;
- An attention to details, showing high care for things that may sometimes, to others, seem anecdotical or useless. They pay attention to how things work, how they are built, how they stand, how they look.
- A care for esthetics, beauty matters for designers. It makes products, services, or policies more pleasant, more attractive, more appreciable.
- Empathy with users. Designers are focussing on answering to users needs by taking into consideration their struggles, their constraints and their diversity.

They don't design for an 'average lambda user' who does not exist, they design for real users who come with all sorts of feelings, emotions, worries, needs.

- A skill for bricolage. The 'Doing before thinking' (Jégou, Thévenet, Vincent, 2014) hands-on activity. Designers, obviously know how to draw and build things. But they also know how to build things out of the available bits and pieces around them. Make, then stepback, see, adjust, try and fix.
- At ease with uncertainty and improvisation. Designers are rather fine with blurriness and they tend to adapt quickly to changing situations or unexpected events or emerging opportunities. They're fine with modifying their original plans if need be.
- Friendly-hacking (Jégou, Thévenet, Vincent, 2014). 'An innovation is a successful disobedience, and local public authorities are embarrassed because they don't how to deal with that' said Jean-François Caron (ex-mayor of Loos-en-Gohelle and former regional councillor in Nord Pas de Calais). In this logic, designers often go towards things that are not explicitly and openly authorized (yet not illegal) so as to push boundaries and play with practices (in a friendly way – and for the common good) otherwise, it's difficult to really innovate within an overly-constrained and rigid system.

These attitudes or postures are not strictly limited to designers alone, but they remain unusual within public authorities. At least, they are not written anywhere as key values of public institutions or cited as key postures for civil servants by the top management. On the contrary. Planning, organizing, managing, executing, performing and supervising are more commonly met concepts within public authorities.

What is interesting to observe is that designers tend to bring those attitudes along with them in the public sector and it slowly, seamlessly, instills a certain "spirit" or "way of doing" things (Deserti & Rizzo, 2015, Kimbell & Bailey, 2017)). Couple of years ago, after having worked with a french public authority, we heard the civil servants say "we're going to do this project *à la manière de* (in the style of) the 27th Region[2]". This meant that, despite the tools or design process itself, the civil servants captured and appreciated the 'spirit' or rather, here, the 'style' of working of designers (which, besides the technical tools or methods, include informal, convivial, participatory, collaborative, friendly creative work) and that they were planning on trying to replicate it, 'à la manière de' designers. 'Anchoring this logic and these new practices within the administration requires a real change of culture and a significant increase in capacities' (Christiansen, 2016).

And it needs to work both ways. Indeed, 'we argue that if policymaking learns how to incorporate the insights from design thinking into policy, and design learns how to deal with the politics of the policy process, there could well be significant benefits for policy design and for everyone who is involved in making it and everyone who is affected by it.' (Christiansen, 2016). Building upon this logic, we can congratulate the Ecole de Design Nantes Atlantique (France) and the political

[2] The 27th Region is a french public innovation lab which, starting in 2007, were sending teams of designers together with sociologists and others professionals to public authorities for a limited period of time to carry on experimental and innovative public policy or service re-design.

science institute of Sciences Po Rennes (France) for launching, in September 2024, the very first (as I know of) experimental and joint Master Degree between a design school and political science school to create a 'Design for Policy' Master.

Echoeing Jesper Christiansen's call for closer acquaintance between designers and policymakers, I decided, in an autoethnography logic, nourished by our field experience, to give it a try, and draw what designing policies could look like if we were to take into consideration the two dimensions (policymaking by institutions and designers' way of doing things). Of course, it is highly risky and this is to be regarded as an experimental artefact build to be criticized and for the sake of advancing knowledge and kickstart conversation amongst designers, policymakers, political scientists and whoever is involved or interested by public innovation in general.

4. So, what if policymaking were done a designer's way?

Of course, we're not arguing that designers should replace civil servants to make policies but rather try to draw, to explore, to imagine what it would mean to design policies that would integrate some of the designers' way of solving problems (some even say 'designerly' so as to express the designers' way of thinking and doing). Or in other words, if design thinking gets more and more used for policymaking, how would it fit into the policymaking process? Where would it enter in the process? To what would it contribute?

Before imagining how we could design policies a designers' way, let's have a look at how policies are made today, in theory first, then in practice. Indeed, we will see that there is quite a gap between the two.

So how are policies made? Many researchers, and in particular political scientists, have tried to describe or even picture how policies are or should be made. The most famous policymaking model is undoubtedly the policy cycle of Harold Lasswell dating back in 1956. At that time, he described policymaking through 7 stages (1. Intelligence, 2. Promotion, 3. Prescription, 4. Invocation, 5. Application, 6. Termination, and 7. Appraisal), but this got, later on, reduced and re-organized into 5 key stages which have been regularly reshaped, adjusted, rephrased, etc. But, in general, here are the five main stages of the policy cycle:

1. Setting up the agenda,
2. Policy Formulation,
3. Decision-making,
4. Policy Implementation
5. Policy evaluation.

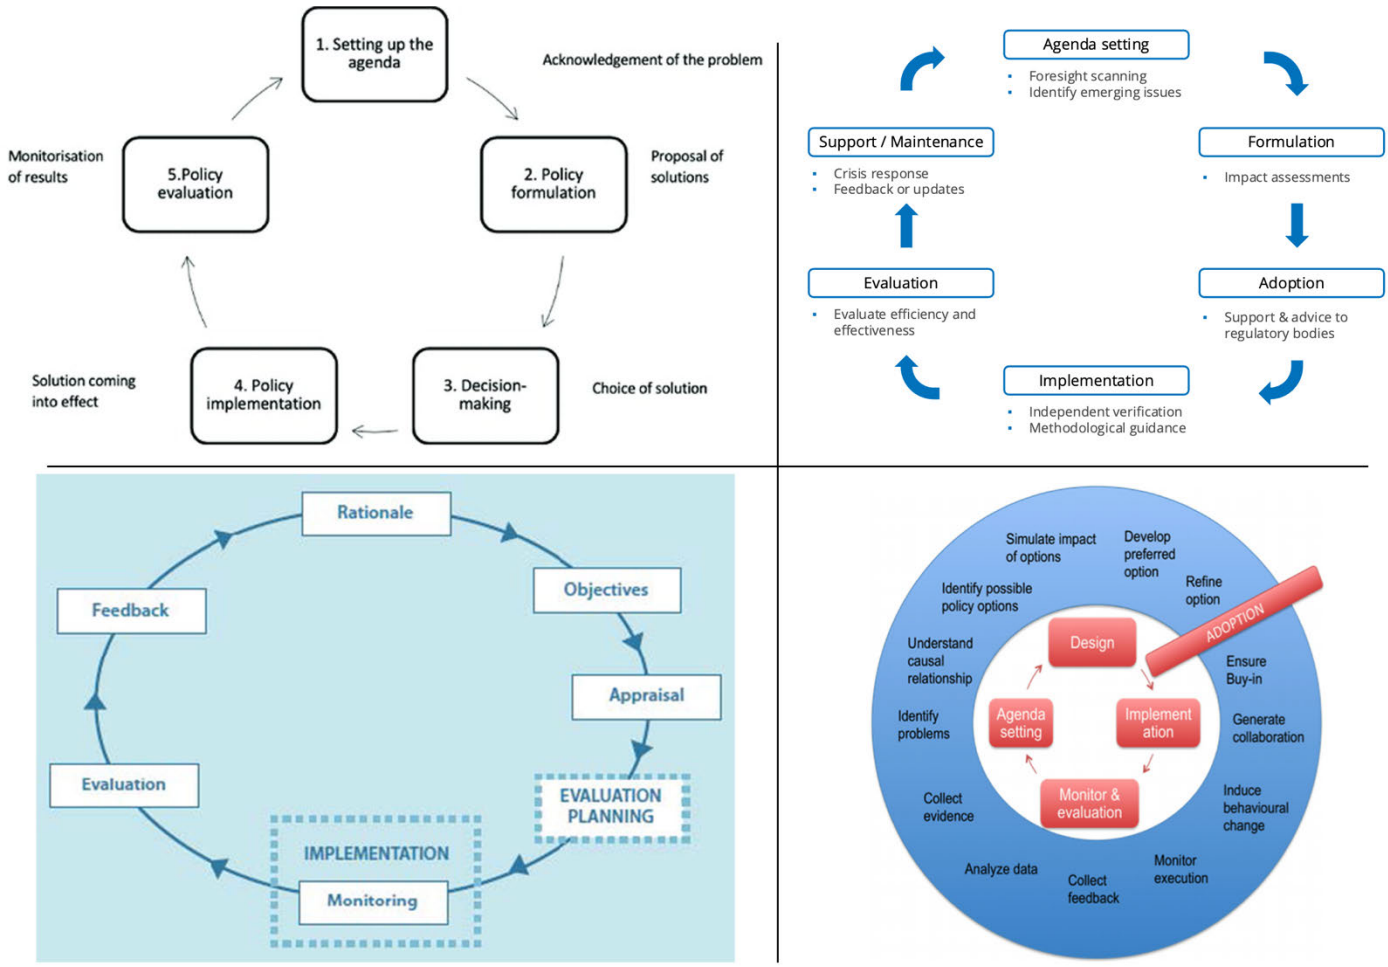

Figure 1-2-3-4. Different variations of the policy making cycle models: Public policy cycle (Lasswell, 1957) (top-left), Policy cycle as found on egu.eu European Geosciences Union (top-right), The ROAMEF cycle of the British Government, adapted from HM Treasury Green Book (2013) (bottom-left), Model elaborated by Stefano Armenia based on Howard (2005) and EC (2009) (bottom-right)

Some variations come up with 6 stages instead of 5, such as the ROAMEF model from the British government in 2022 (bottom left). But regardless of its variations and subtleties, the policymaking process is pictured as a cycle made of sequential stages which end up forming a loop.

This cycle model is clear, straight forward and easy to understand. It's a great tool for pedagogy. However, to some, the policy cycle is missing important dimensions of policymaking as it happens in real life. Indeed, according to John W. Kingdon (1984) policymaking is not integrated, and decision making is also not rational. Several dimensions co-exist together, yet in parallel: problems, policies and politics. For Kingdon, each of these dimensions have a life of their own. Policies are not made in an enclosed pipe, they are subject to interferences, politics on one side, and problems on the other. Problems are not nicely standing static on the side of the road, waiting to be picked up. They are alive (energy poverty, for example, is real, it's tangible and it does not 'wait' for policies), and not only they are impacting people's lives (or ecosystems in the case of pollution for example), they are evolving, even sometimes getting worse. Those 3 dimensions (problems, policies and politics) constitute what Kingdon calls 'streams', which led to the development of an extra approach to policymaking, the one of Muliple Streams Framework

(known as MSF). MSF got very popular in political science since its creation (see figures below) as it highlights the complexity of policymaking.

John Kingdon's Multiple Streams Framework explains that policy changes occur when these three independent streams converge and form a 'policy window' (often due to a focusing event such as the alignment of a standing-by solution with an emerging problem, but also a political change (new government)). Inside these policy windows, streams align, allowing policy entrepreneurs to push their solutions onto the agenda.

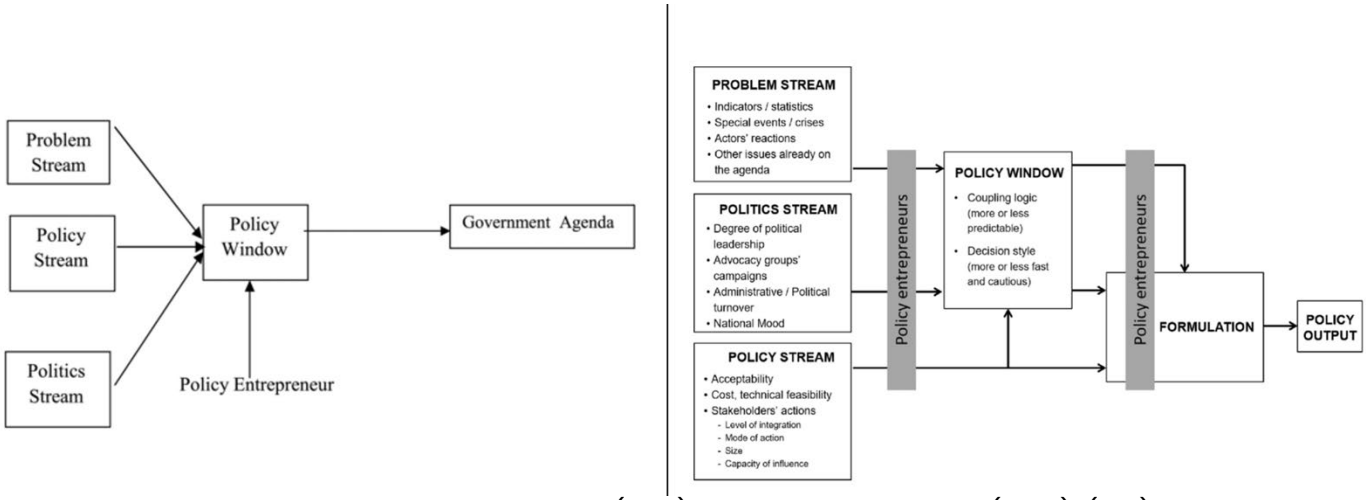

Figure 5-6. The Multiple Stream Framework (MSF) of John W. Kingdon (1955) (left) and Graphical representation of Kingdon's Multiple Streams Theory. Sources: Adapted with permission of Taylor and Francis Group, from Zahariadis (2007) (right)

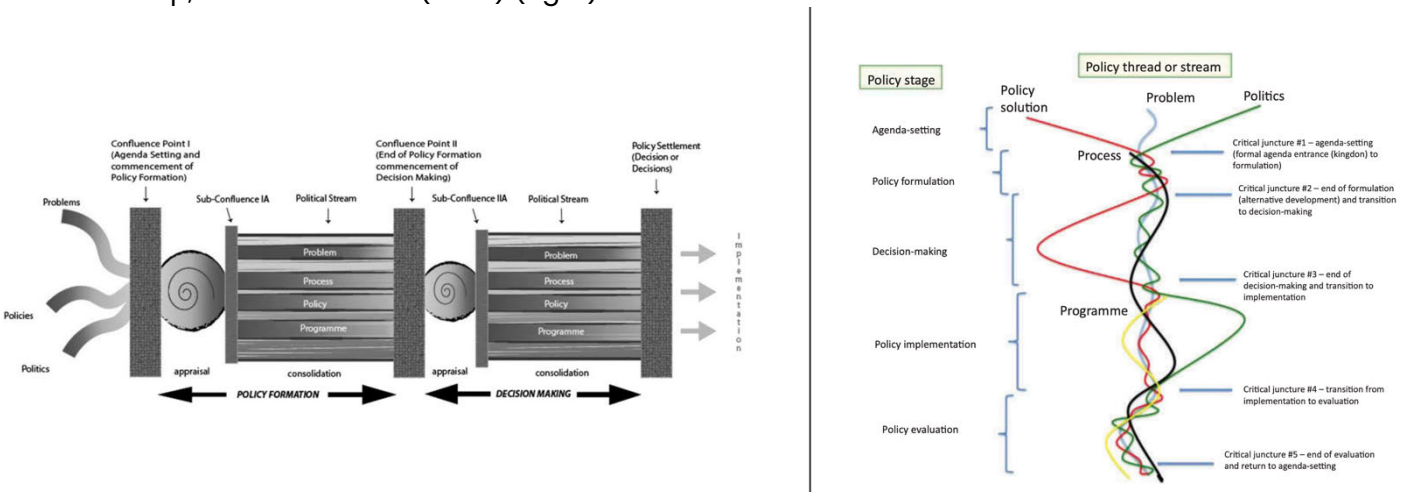

Figure 7-8. The Five Stream confluence model of Howlett, Mcconnell & Perl (2014) (left) and Five-thread (Stream) model of policy process Howlett, Mcconnell & Perl (2015) (right)

In my view, what is interesting in Kingdon's streams model is that it tries to picture policymaking not in an idealistic and theoretical way (like the policy cycle) but rather a more down-to-earth approach taking into consideration how things happen in reality. Since then many political scientists have (seriously) played around with the models and proposed enriched, revised versions (such as the Five stream confluence model of Howlett, Mcconnell & Perl (2014), which brought together Kingdon's multiple stream framework together with the Advocacy Coalition Framework of Paul Sabatier (1998)) and in particular their weaving metaphor (which highlights the fact that the stream (or threads) are not linear but

pulled in different directions based on the multiple (variable and inconsistent) forces at play (government, lobbies, citizens, etc.). But we will not enter further, in this paper, in a tentative review – which I would not be capable to conduct anyway – of all the existing models. What I find interesting is that policy science has tried to draw and describe 'how things work' and designers have also tried to model 'how design works'.

Indeed, whether we look at the 5 steps of design thinking of IDEO or Stanford or the double diamond of the British Design Council, designers have tried to model their process, their way of working. And, just like the policy cycle or policy streams models, the 5 steps model of design thinking or the double diamond model are vastly used in design schools and even more widely in trainings, courses, conferences, etc.

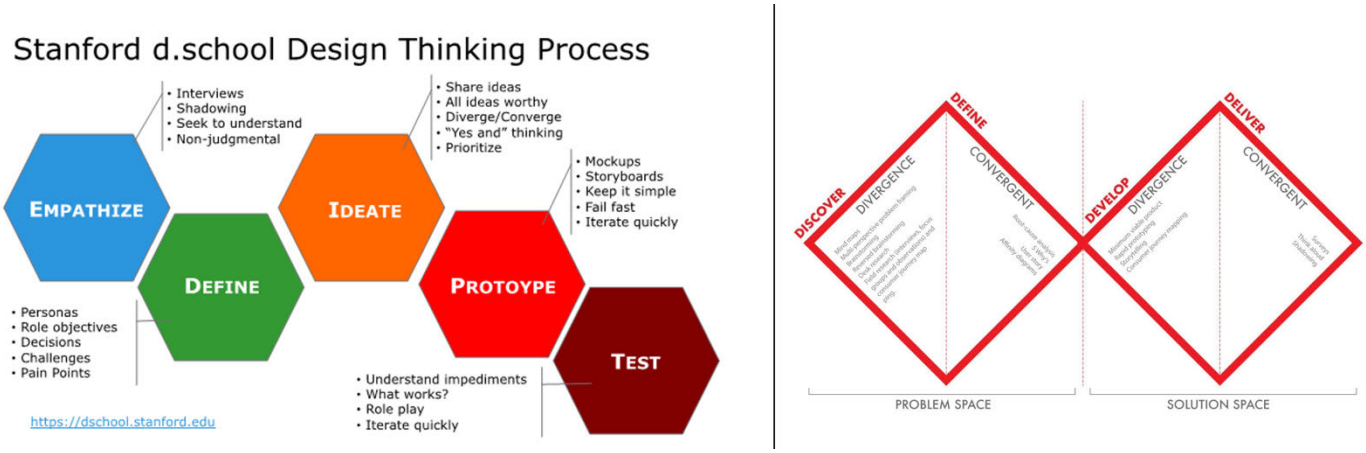

Figure 9-10. The Five step model of design thinking by Stanford d. (left) and the double-diamond model of the Bristish Design Council (right)

While there is certainly some research analyzing the powers of models, what I am most interested in, is the fact that despite their popular use, they all tend to be – to some degree – wrong.

Indeed, policy models, in general, are unrealistic (Hallsworth, 2011). They are not intellectually incorrect but lacking political realism (Howlett, Mcconnell & Perl, 2014). Indeed, none of the models happen in real life (even though I want to point out that the weaving model of Howlett, Mcconnel & Perl is probably the best one to visually depict the 'fluid' or organic nature of policymaking). As Michael Hallsworth highlights it, policymaking does not take place in clear and distinct sequential stages as the models of policy cycles try to reduce it. Policymaking is always made of a mix of existing bits and pieces of programmes and policies, new emerging priorities, windows of opportunities, that are combined and/or at least need to be considered altogether (Delahais, 2024). For instance, policy problems and solutions (when they are not Kingdons' 'pet solutions') tend to emerge at the same time, not nicely one after the other. Governments' decisions, priorities and agendas also do not 'take place in a vacuum' (Hallsworth, 2011), they are subject to all sorts of unexpected events (which sometimes come together and form confluence moments: depicted as the whirlpools in Howlett et al's 5 stream confluence model) including external ones (Sabatier's external events such as changes of socio

economic conditions, changes in subsystem actors). In other words we could say that things are definitely always messier in reality than depicted in policy models. In this regard, Paul Carney's policy 'spirograph' is probably a rather good illustration of the reality of policymaking, yet difficult to use.

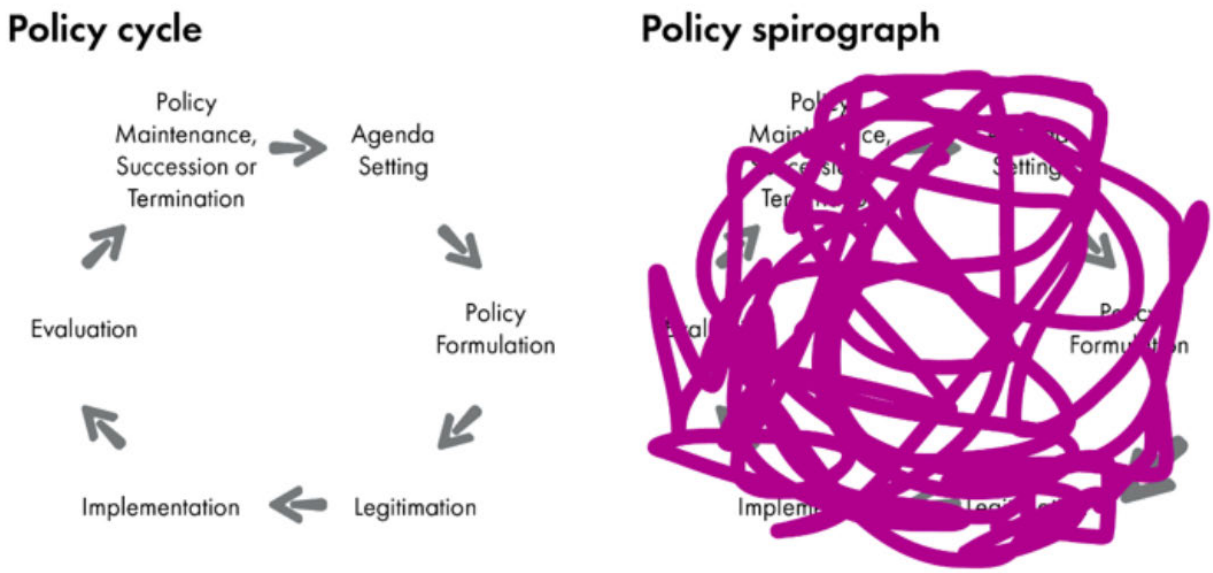

Figure 11. The policy spirograph by Paul Carney (2015)

Policymaking has clearly more to do with bricolage than perfectly well planned engineered manufacturing. And anyone who has worked as a policy practitioner, knows too well that policymaking is definitely more organic (or fluid) than mechanical. And it's not only the case for policymaking but also for design thinking.

My colleague François Jégou (senior designer) and I teach together (in design schools but also in political science schools) and train senior civil servants (at the French National Institute for Territorial Studies) about design and how to apply design in the public sector, and each time we present the 5 steps of the design thinking process, François Jégou keeps telling me: 'what we are showing is wrong, and not only it's wrong but it's also a bit misleading. A designer does not start to have ideas at stage 3 when it's finally time for ideation, he gets ideas when he goes out in the field, when he discusses with users, when he is under the shower'. And it's not only true for ideation. Prototyping usually happens sooner in the process, or at least at the same time as ideation, because designers 'think with their hands', François Jégou says. The design thinking models, just like the policy ones, are misleading as they tend to present things as sequential, and not only it's wrong but it's problematic. Why? Because part of the problem we see with public institution (and their difficulty to make good policymaking) is their rigidity, the fact they tend to 'stick to the plan', to follow an imaginary linear process. And it's difficult, for a (rational-wannabe) policymaker, to accept that while in Phase 3 we might need to go back to Phase 1, or that Phase 4 will take place at the same time as Phase 2 because they feed one another and should advance hand in hand.

So, whether we look at policymaking or at design thinking, in practice (in the real world), we see that they have more to do with a journey than a cycle, or sequence or even steps. It's a journey that sometimes may look straight, but also cyclical,

regularly chaotic, but always evolving, living, changing. It's organic. Considering public policy from the angle of a journey could also enable us to envisage that it is made up of obstacles, options and choices, but also of bifurcations and detours, sometimes deliberate, sometimes not. Improvisation is therefore a key aspect to take into consideration. Using the metaphor of a "journey" would also illustrate the fact that no policy is laid down in advance (despite a vague idea of direction), that no solution is defined in advance, but that they will emerge "along the way". This way of looking at policies may appear a bit radical or disturbing as it proposes to move from a clear paved process, easy to follow and grasp, to a sort of journey, with unclear pathways, and unknown ends…

But this metaphor would actually enable us to draw policymaking in a more realistic and authentic way, but also allow us to incorporate the design approach (as a 'methodology or process') in one hand, and the design posture in the other. Designers are often said to be quite at ease with uncertainty, blurriness, fuzziness. They are not stressed by not knowing where they're going. In fact, they rarely know where they are going, they enjoy wandering and visiting unknown shores. They are also quite fine with following their intuition (building upon what they've seen, the users they've listen to, the impressions they got from spending time on the field). Just like a navigator who would go around and ask questions to both fishermen, but also merchants, travelers, locals before taking the sea but also a sailor watching the clouds, the seagulls and looking for whatever sign he feels might be interesting to catch. Designers easily take creative detours, and remain open to (or even provoke) creative accidents or serendipity. Regularly, the solutions they come up with may seem to be 'coming out of nowhere' or from paths that were not foreseen. Also, they are fine with going backwards, to check on things they might have missed on the field. Combined with their skills to draw, build, model and prototype, they may be a useful add-on crew to have onboard of a wandering policy ship (to echo the sea and ship metaphor of Howlett, Mcconnell and Perl, 2014). Of course, if design can be a useful add-on to equip public authorities with, other disciplines could also help us make better policies such as foresight, human sciences (sociology, behavioural insights, etc.), and evaluation.

5. The Policy Design Journey

As announced, I decided to give it a try and come up with a proposal that would depict the policymaking process as what it is, in my view, meaning a journey, and enrich it with design inputs. In other words identifiy at which moment, of the policy journey, design could contribute, hopefully, in a meaningfull and usefull way. Again, it does not mean that design is the new panacea to policymaking but possibly one of the many useful contributor (or add-on) to new ways of making policies along with its friend-disciplines of foresight, evaluation and behavioral science.

To me, policymaking is an adventurous journey within a vast sea of optional routes and hazards. Therefore, I decided to visualize the journey as a nautical-like chart or navigation map, of course not in a geographical sense but a metaphorical one. And it's important to warn everyone that this Policy Design Journey map is not

meant to reflect how things work right now, in real life, but rather how things could work if we were to better integrate design within policymaking at the same time as to revise the policymaking process itself. So it is not a depiction of the current state of affairs but a wishful view, yet pragmatic – and hopefully credible –, of how policies could be designed. Now that this is made clear, let's dive into the Policy Design Journey in details.

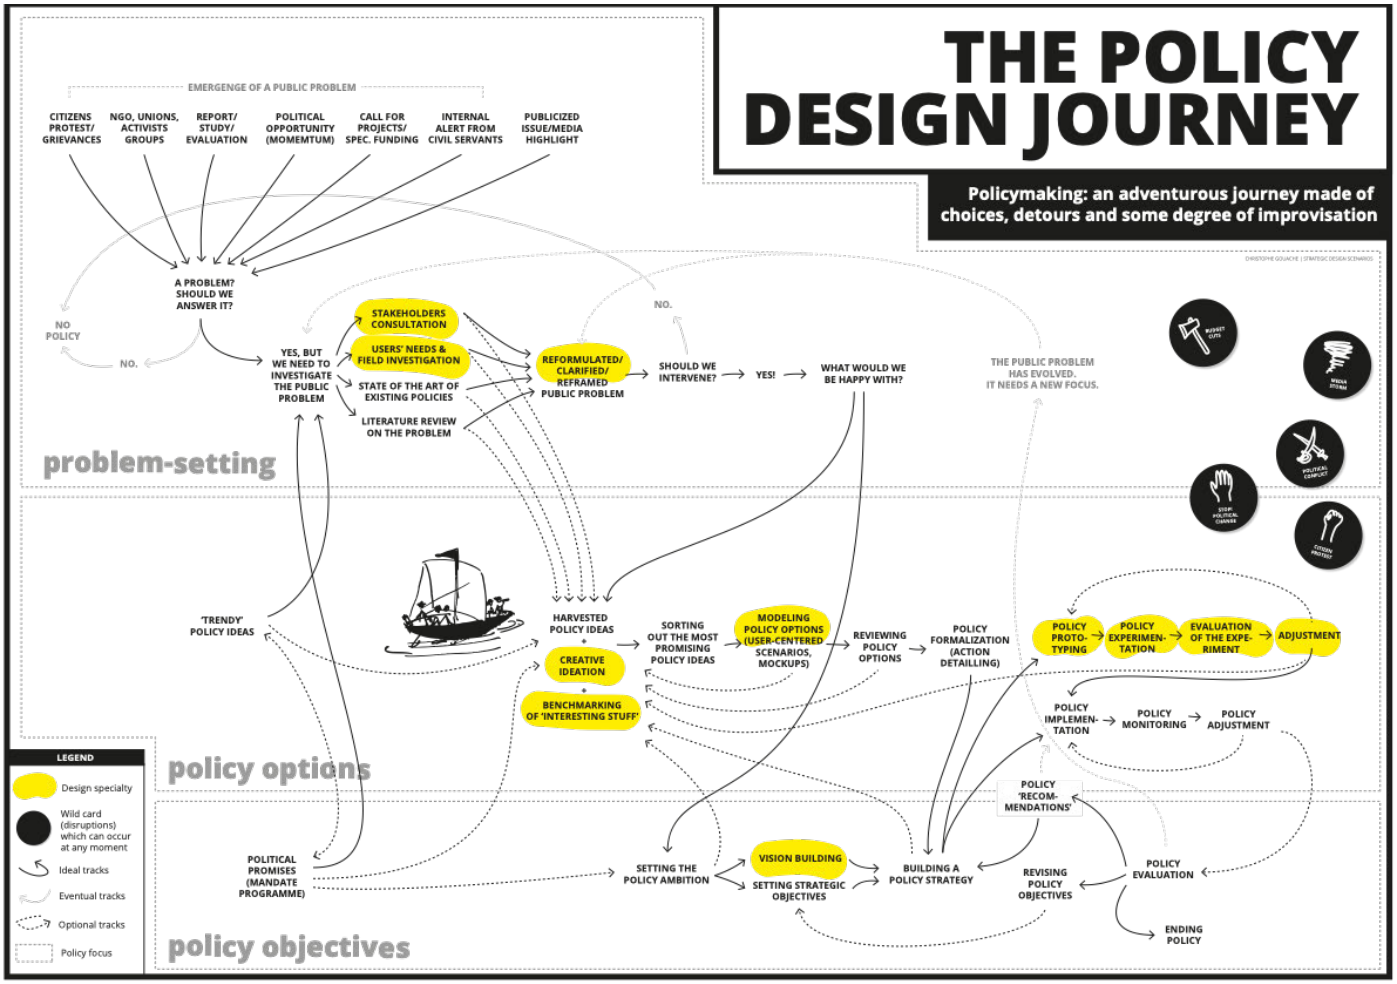

Figure 12. The policy design journey by Christophe Gouache

First, I would like to highlight the underlying layer of the map. Indeed, it has been structured (or arranged) with 3 distinctive zones or areas: the problem-setting, the policy solutions and the policy objectives.

The first one refers to the public problem. Here we build upon two main ideas: the first one being that all policies try to solve a public problem (Knoepfel et al, 2015), the second one that the public actor want and have the possibility to tackle effectively the problem or at least part of it, in other words that practical solutions exist and can be put in place by the public actor – policy solutions – (Neveu, 2017). As Erik Neveu argues, the public problems (which are virtually unlimited) may be popularized by all sorts of actors and claim-makers, therefore the problems that could or should be answered, possibly, by public actors are numerous (and complex) but also in competition with one another.

A public problem might be brought to the political attention in different ways: citizens' protests & grievances (for example an increase of the price of gas), NGOs or activist groups may publicize or reveal a problem that was either overlooked or unknown by the mass (for example chick culling - killing unwanted male chicks which led to new regulation or ban policies in a dozen of countries), report/studies or evaluation (for example the Report of the The Intergovernmental Panel on Climate Change), political opportunity/momentum because of the maturity/favorable context to highlight a particular public problem (for example policies to prevent violence against women), sometimes problem may also be brought by a funding opportunity or call for projects (for example topics such as the 'integration of marginalised communities' pushed under European Regional Development Fund (ERDF)), civil servants may also play a key role by alerting, based on internal technical evidence, their elected officials about ongoing public problems (for example the decreasing quality of local water), and the media (includ. social media) may publicize or highlight real social problems (for example food price inflation) but also, sometimes, highlight anecdotical events or phenomenons which take huge proportions and may lead to the making of specific policy response and regulations (for example the controversy that took place in France in 2016 with the banning of burkinis by a couple of local municipalities, which then sparked international debate and led, in some countries or municipalities, to dedicated policies on the 'burkini problem'). I will not enter further, within the scope of this paper, on the fascinating question of how public problems are formed (or not), considered or ignored, etc. but felt this was important enough to be appearing in our policy design journey as public problems and the way they are proposed to the political agenda is key for our Policy Design Journey.

Regardless of who points out the problem, once it is under the spotlight, a fundamental question needs answering from the public authority: A problem? Ok, we see. But should we answer it? No? Ok, we won't make any policy (as we may consider, for example, that this problem might be someone's else's job to take care of – because of competence, mission or else – or because it's 'not a real problem' or 'not a priority'). If the answer is 'yes, we should do something about this problem' – even though we don't know what yet, the policy journey is initiated. And in our 'ideal' Policy Design Journey (PDJ), this should lead to the investigation of the problem (indeed, in reality and unfortunately, many elected officials skip this step because they claim 'they know the problem' and they might even have the answer to it, 'it's simple all we need to do is to build a wall' (to prevent illegal immigration for example). Yet, it is very unlikely that a public actor can respond to a complex problem if it skips a proper problem-investigation. Why? Because 'to every complex problem, there is an answer that is clear, simple and wrong' reminds us Henry Louis Mencken (American journalist & essayist). Wicked problems cannot be tackled by a simple unique solution. Otherwise they would not be wicked, they would be simple problems.

At this problem analysis moment, design may come at hand by suggesting an immersive investigation on the field, careful listening of its users and a tour of stakeholders, but also, a 'good old state of the art' or evaluation of existing policies on the subject (or close related problem) may prove useful as well as a literature

review of the problem. Indeed, it is very unlikely that a public actor is facing a public problem that no one ever met before (in one way or another). While all of those investigation methods should allow us to better grasp and understand the problem as well as its multiple causes and its effects on people, they may also, at the same time, provide us with policy ideas. Indeed, this goes back to François Jégou's earlier remark: 'when we (designers) go on the field, spend time with the users, listen to the stakeholders, discuss with the workers, ideas come up, on the spot'. This is the same for literature review which can prove to be mines of ideas (yet are often overlooked).

All of this should allow the public actor to get a better grasp of the issue, at the same time as a better understanding of how it should (could) approach the problem (or its sub-factors or causes): that is problem (re)framing or problem (re)formulation. Regularly, policies fail at tackling a problem, not because they are bad policies or wrong actions, but because the problem they try to tackle is not the right one. Or not from the right angle. Setting the angle (or the 'Define' stage of design thinking) of the problem is also something design can help with.

While the public actor investigates about the problem, it may also, at the same time, wonder about its political ambition (or policy objectives) about it: what do we wish? What can we reasonably hope for? Or eventually promise? Potentially, the public problem was even already cited in the political programme for the mandate and this is how it's been brought onto the agenda. The policy objectives background layer (or stream) highlights where political strategic decisions take place. And sometimes, a policy journey does not 'start' from a public problem but the political programme, that's often the case when, for example, a new government takes office. Not all policy journeys start with a problem. Sometimes they start by a political promise or statement during elections.

The policy objectives area (bottom part of the PDJ) is the area in which strategies and visions are built, as well as 'big decisions' regarding the continuing, stopping or revising of a policy or strategy. It's also, mainly, where politics happen (to refer to Kingdon's politics stream).

In a Policy Design Journey, sometimes ideas may come first, meaning aside (or before) problems and politics. Indeed, 'trendy' policy ideas may be politically popular at the moment, either because it's been publicized as a good practice, or maybe because a neighboring government had success implementing such a policy (for example the banning (or restricting) of short-term rental like Airbnb in touristic cities, first publicized by the City of Barcelona then soon copied in other highly touristic cities). In this case, 'trendy' policy ideas may have enough political attention that they mark the beginning of a policy journey. But in this case, ideally again, it should lead back to the problem-setting area for problem clarification and eventual (re)framing, rather than a basic 'copy-pasting' of the policy idea (as context and social realities are necessarily different). An other example of a Policy Design Journey that starts with a 'trendy' policy idea are URBACT Transfer Networks. URBACT Transfer networks are problem-based networks of European cities who come together (for example to work on sustainable food) and work in a close collaborative way for about 2-3 years to transfer the 'good practice' of one city to

all the others. Of course, each EU city, rather than copy-pasting the policy solution of the 'Model City' needs to investigate its own local challenge/problem in order to, later on, come up with its own version of the policy solution.

If we look closely at the policy options area (or stream), we'll also see that design can support the policy process by bringing in, not only its creativity and ideation tools, but also its culture of modeling, mocking up and later on prototyping (Kimbell & Bailey, 2017) and experimenting (in order to crash test a policy before implementing it).

In particular, we can see that the 3 areas (or streams) are not impermeable pipes or isolated canals, but rather areas of a vast sea, meaning that we seamlessly pass from one to another, that we may go back to a previous waypoint, navigate back and forth but also take long detours and new routes, based on windows of opportunities, but also on needs, capacities, time, competencies, and so on.

Finally, the Policy Design Journey is subject to disruptions which may occur at any given moment, which may include: budget cut, political change, political conflict, media storm, citizens protest (and possibly some others). There are no need for examples as we all know, from experience, how a political change of government can stop a policy right away or how a massive citizen demonstration can make a government cancel or stop or modify a policy idea... These disruptions are not only unpredictable but their impact on the Policy Design Journey is also uncertain. Just like a storm, high waves or dangerous wind, the 'captain of the ship' (to cite Howlet's metaphor) may have, whether he/she likes it or not, to change route and adapt.

The Policy Design Journey (PDJ) is not meant to be a handbook or manual for policymaking but rather a tool that could help reflect, organize, plan, consider the multiple options, routes, choices that a team in charge of making a policy may encounter or experience. It could also be useful – eventually – to PSI labs who may, using it, try to draw their desired journey, or consider possible activities that were not planned at first, when working on a new project or topic or public problem. It may also be handy to explain and/or discuss policymaking (that would include a bit of design, but also evaluation) with design and/or political science students.

Finally, I would like to invite practitioners (designers, policymakers, etc.) as well as researchers to 'tear apart' this Policy Design Journey in order to eventually come up with enriched versions of it.

A Moss-Supported Emotional Regeneration Kit: Posthumanism Speculative Design for More-than-human Sociality and Communities

Herun Chen, Francesca Valsecchi
Tongji University
francesca@tongji.edu.cn

RESEARCH BACKGROUND

- The Anthropocene and the value turn in Design.
- Speculative design and multispecies ethnography as a pioneer in reflection.
- Moss as a proxy for natural observation and interaction.

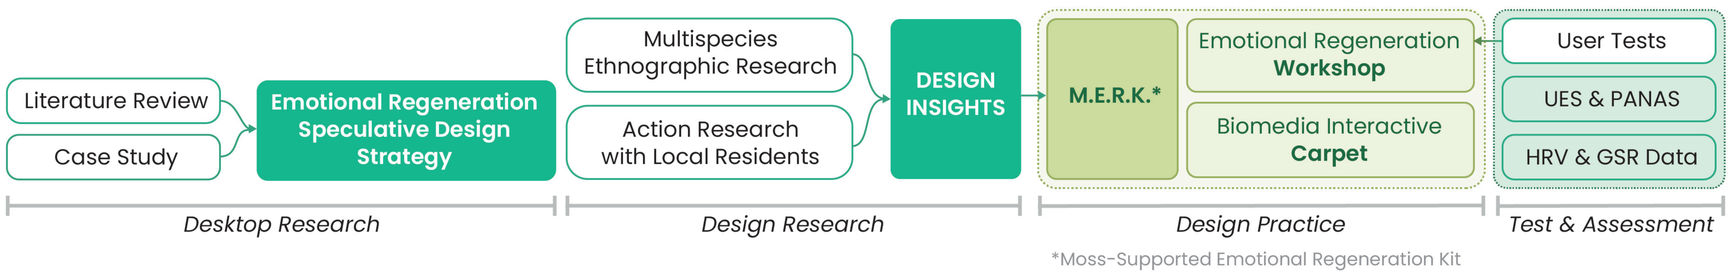
ABSTRACT

Mosses are tiny, non-flowering and rootless plants that are often neglected but crucial to the global and local ecology. They are sometimes defined as the lifeblood of plant ecosystems, not only for their ecological characteristic but also for their contribution: other plants actually benefit from having moss as pioneers and neighbours. The observation of and interaction with these microscopic entities offers a proxy to the nature domains that challenges holistically the perspectives of human-nature interaction (Kimmerer R. W.). The overlook of such a community of nature entities can be seen metaphorically in light of the decayed relationship between humans and nature in the framework of the Anthropocene. On these premises, and leveraging on microscopic community role of these plants, the paper presents an action research that introduces mosses as the agency characters to explore emotional regeneration in the context of community life from a micro and systemic perspective. By presenting a speculative design project, this paper discusses **1) what is the trans-media approach to foster emotional regeneration at the level of urban community and 2) how to integrate speculative design and more-than-human design for inspiring and constructing forms of a cross-species social fabric.** This project involves multispecies ethnography research with the moss and action research with local citizens. At the practice stage, it employs data-driven design and participatory design methods and creates a multi-sensory media experience. Such deep connections between more-than-human agents, designers, and citizens weave a flourishing web of kinship, picturing a clear preferable future of coexistence.

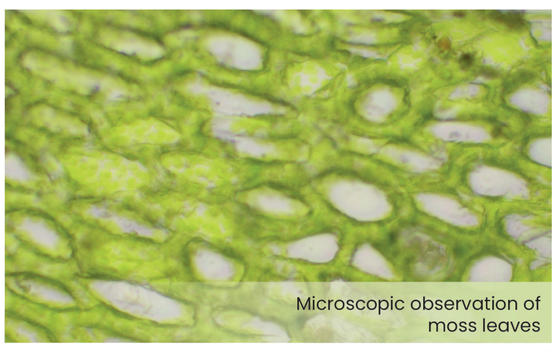
RESEARCH FOCUS

Mosses, as microscopic yet ecologically foundational more-than-human agents, embody a dual significance: their neglect not only mirrors the Anthropocene's imbalanced human-nature dynamics but also metaphorically reflects the marginalized status of individual emotions within societal macro-narratives.

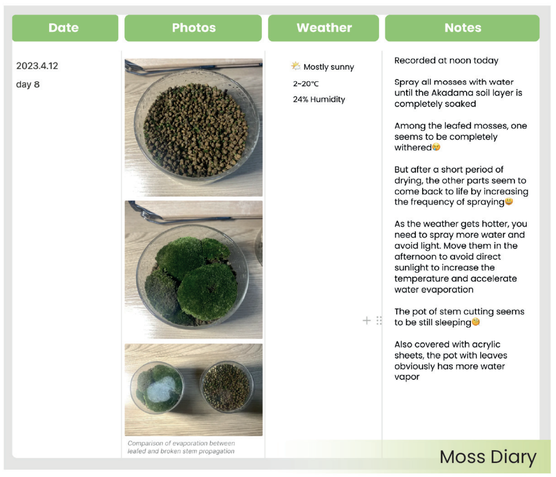
RESEARCH PROCESS



Multispecies Ethnographic Research Outcomes



Microscopic observation of moss leaves



Moss Diary

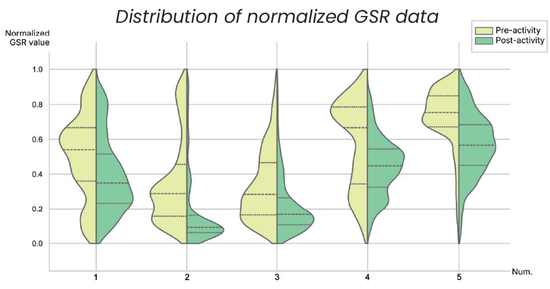
The multispecies ethnographic research includes literature reading, recording moss diary and microscopic observation, providing botanical knowledge and embodied insights.

Action Research Outcomes

The action research arranged an open activity in the target community on Earth Day, and conducted interviews and qualitative analysis.

User Test Result

Distribution of normalized GSR data

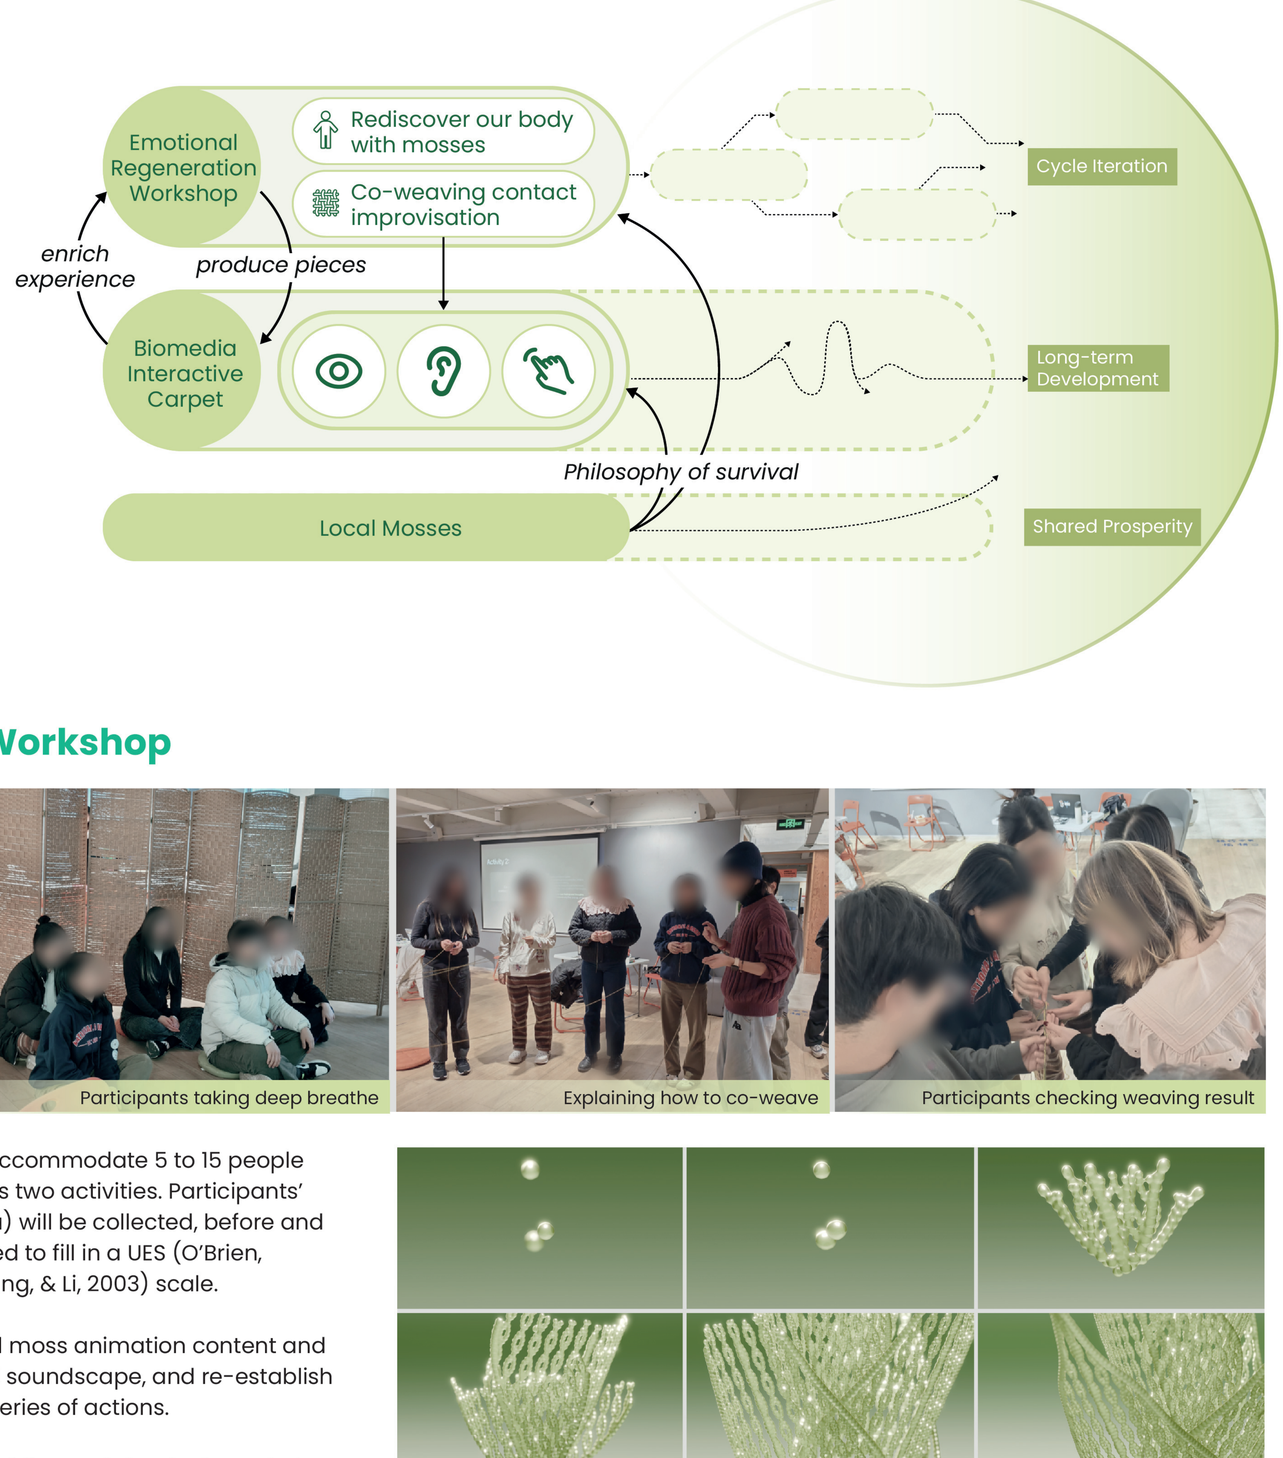


The results showed that the regeneration effect was generally good. Specifically, the scales showed that the activities could promote positive emotions and alleviate negative ones to a certain extent; the physiological data showed a trend of calm recovery, stress relief, and improved physical and mental regulation. **For example, higher GSR levels indicate higher emotional arousal** (Bakker, Pechenizkiy, & Sidorova, 2011). The diagram above shows that participants' normalized GSR values significantly decreased and concentrated, indicating relief and calming.

The Structure of the Moss-Supported Emotional Regeneration Kit

The project is both functional and speculative. In **the workshop**, participants work with their own body, virtual mosses, their teammates and fibers, **fostering emotional regeneration on psychological, ecological, and social levels** (Fredrickson, 2009, Frumkin, 2001, Yang & Li, 2023). **The carpet** combines sounds generated by moss with data-informed fabric design, offering an **empathetic multisensory experience**.

Periodic workshops are participatory, allowing feedback to form **cycle iterations** that better align with the local social fabric. The carpet, **long-term**, is shaped by local moss, offering residents continuous interaction and emotional regeneration, while providing space for future complements, making it a **co-constructed infrastructure**.



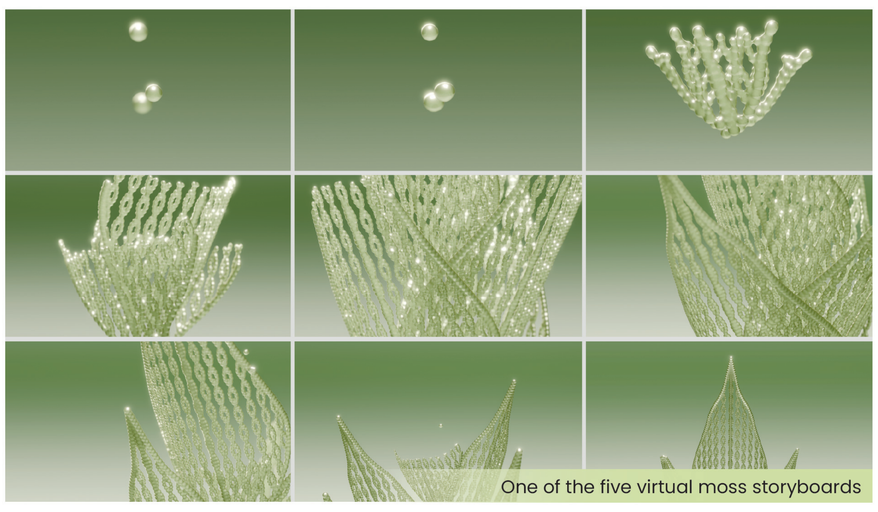
Emotional Regeneration Workshop

Collecting HRV & GSR data
Participants taking deep breathe
Explaining how to co-weave
Participants checking weaving result

An Emotional Regeneration Workshop can accommodate 5 to 15 people and lasts 40 to 60 minutes. It mainly includes two activities. Participants' physiological data (heartbeat and GSR data) will be collected, before and after the activities, and they will also be asked to fill in a UES (O'Brien, Cairns, & Hall, 2018) and a PANAS (Huang, Yang, & Li, 2003) scale.

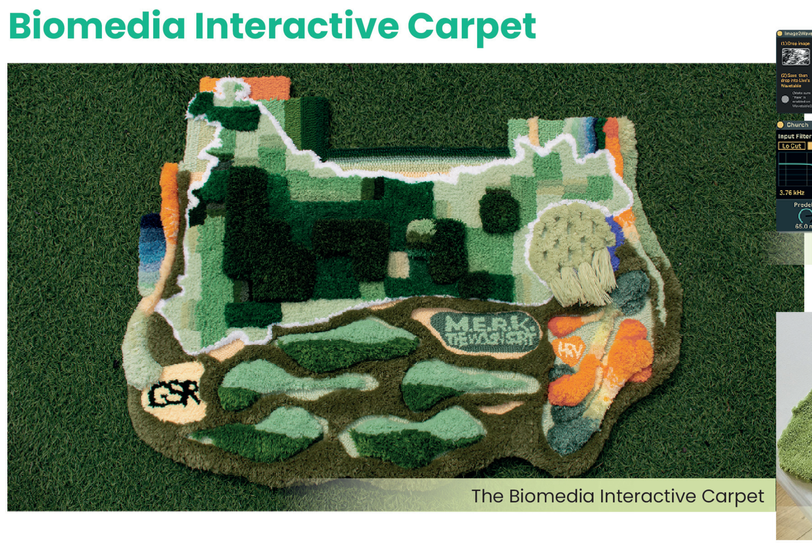
In Activity 1, participants will follow the virtual moss animation content and text prompts, relax their minds in the natural soundscape, and re-establish the connection with their bodies through a series of actions.

In Activity 2, participants will work in groups of five and shuttle through the moss-colored wool about 2 meters long, weaving invisible relationships and complexities into tangible fabrics. It is also possible to do this contact improvisation on the Carpet, making sonic media generated by mosses according to their footsteps.



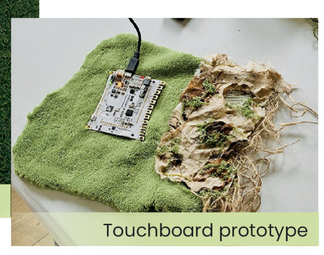
One of the five virtual moss storyboards

Biomedia Interactive Carpet



The Biomedia Interactive Carpet

Ableton Live plug-ins used



Touchboard prototype

The carpet is an interactive data object composed of an abstract NDVI map of the Changning District in Shanghai, as well as data on local mosses and physiological data from community residents, which are then woven together to encompass body, emotion, space, and relationship.

Different blocks are connected to a Touchboard with conductive yarn, which is mapped as a MIDI keyboard in Ableton Live, so that pressing can make sounds. The sound media is converted from image media to sound media by Ableton Live's plug-in, and has been processed by a series of tuning plug-ins.

ABSTRACT |

Many actions are being carried out in France to amplify the ecological transition in and with the territories. Some programs help local actors, who often have weak engineering skills, to propose projects to increase the productive nature of their territory. They are supported by urban planning agencies, landscapers, or geographers, and challenged by researchers in transition, innovation, or knowledge management. However, "planning thinking" is sometimes an obstacle to the natural articulation between production (economy), territory (planning) and sustainability (environment). How can we combine territorial planning, ecology, and economy? Designers can be essential to answer this question as they can characterize, mobilize, and federate the actors of a territory to resolve local problems, co-design and test a vision and an action plan, thanks to a systemic and sustainable design approach.

Among the tools used by designers to manipulate the economic variable of a project, we analyzed the Business Model Canvas (BMC) created by Osterwalder in 2004. This tool is widely used in companies to create or challenge an economic model. Initially anchored in a model based on growth, cost optimization and revenue maximization, it has evolved in recent years to integrate social and environmental dimensions, particularly under the impetus of circular design. However, even these evolutions (eg. Sustainable Business Model Canvas) still present several major pitfalls if we wish to resolve a territorial problem:

- Their micro-economic logic, they remain centered on the company rather than on collectives (communities, collectives, networks, etc.).
- The absence of territorialization, for the benefit of an abstract valorization space predisposed to globalization.
- The association of empirical categories (or "building blocks") which do not reflect the advances of practitioners and researchers on the circular economy and associated main schools of thought.

Moreover, Osterwalder's thesis (2004) is marked by the preeminence of a substantialist and ontological perspective, to the detriment of a more adequate representation with flows and processes which would be better suited to the circular economy.

We are experimenting the creation of a more territorialized, dynamic, and resilient canvas as part of a national program to support territories in the ecological transition. This tool would allow the teams in charge of these projects (public authorities, citizens, designers, urban planners, landscapers, architects, developers, etc.) to work on a common systemic and sustainability-oriented object at various scales. This paper will introduce the existing models, share a new canvas and its first tests to articulate ecology, economy and territorial planning for cities and territories transformation.

KEYWORDS | design, territories, ecology, economy, sustainability, territorial planning, regional planning, territorial development, transition, systemic design, circular design, regenerative design, dynamic modeling, business model canvas, bmc, sustainable business model canvas, SBMC, territorialized business model canvas, resilient canvas, systemic sustainable territorial dynamic canvas

1. Introduction.

Territories have always faced planning and attractiveness issues. But climate and biodiversity issues add a new logic that they sometimes struggle to integrate into their vision and action plans. Some national programs support them in defining a strategy or developing projects in favor of the ecological transition. These programs help them in identifying assets, local actants and resources, intraterritorial and interterritorial dynamics and cooperation... and analyzing risks and opportunities. They involve communities, elected representatives, project leaders, residents and supporting structures such as urban planners' agencies, geographers, or designers...

Through the analysis of such territorial planning projects in France, we have identified several key issues. The first one is linked to a major imbalance between planning, economy and sustainability in the analysis and implementation of these projects and their governance. Involved urban planners' agencies or even geographers share a planning vision of the territory. While businesses have above all an economic vision and local communities have expectations linked to territorial development. It gives rise to another major imbalance that disrupts these territorial development projects: a public-private imbalance. It is also difficult for all these actors to think about the entire system and not stay on a microeconomic and local vision of things. They thus have difficulties to understand and align the territory metabolism with the ecologic and economic dimensions.

National programs seek to ensure that the development projects a territory implement

will create (and not destroy) value (economic, social, ecological, etc.). They engage them towards a more productive and sober territory. Thus production, value creation and sobriety are at the heart of territorial issues. However, these territorial planning projects' stakeholders do not necessarily share the same definitions of these concepts which are complex. Moreover, despite their importance in our society and our economy (in France, they represent nearly 80% of economic activities), services remain an unthought in many projects. However, they are complex and multidimensional systems which can give rise to many significant sociological, economic, and environmental impacts.

To ensure that development projects for a territory or more specific area (such as wasteland) consider the aforementioned issues, it is important to help local actors to share a common language and to evaluate the relevance of the proposals with regard to these multiple dimensions. By challenging and realigning projects to increase the productive and sober nature of the territory, they will bring out innovative strategies and action plans based on the potential and limits of the territory and its environment. However, there are no tools completely adapted to these interconnected questions and dimensions. Business modeling tools such as the BMC are limited given their micro-economic, non-territorialized and static nature.

We carried out an exploratory approach to:

- Redefine an updated typology of productive activities that can create value within territories,
- Support and equip public stakeholders in the characterization and self-diagnosis of development projects.

We have worked on a tool for local authorities at the scale of a territorial planning project. This canvas has been inspired by the BMC, but it is based on a more transitional, territorial, and processual matrix.

This work has been experimented as part of the French program "Atelier des Territoires" which is proposed by the General Directorate of Planning, Housing and Nature of the French Ministry of Transition. We have conduced some exploratory interviews and a collaborative workshop. New interviews are planned to improve the model and go further in its transformation towards useful narratives and concrete territorial roadmaps. We therefore present a first version of the territorial and dynamic canvas and its application to one case study. Further testing will be carried out and improvements will be made in the coming months.

This article is organized around 3 parts:

- The first part describes in more details to the context of this explanatory work and the issues we seek to resolve.
- The second part analyzes the notions of production, value creation and sobriety and proposes a typology for "productive activities".
- The third part presents the territorial and dynamic canvas we built and a first application to a French territorial planning project.

In conclusion, we will discuss the learnings of this proposal and we will present the perspectives of our work.

2. Major difficulties in regional planning projects.

A French annual program subsidizes and supports many territories in the definition and

the construction of planning/development projects in favor of the ecological transition. It is organized through participatory workshops to enrich reflection, identify blocking points, and build responses adapted to these territories' real contexts, needs and constraints. Researchers also contribute through food for thought and exploratory research such as the one presented in this article. Among the 6 projects underway this year, let us note for example:

- The redevelopment of an industrial wasteland representing the largest land reserve (and a largely artificialized space) in one of the conurbations of the Nouvelle-Aquitaine region.
- The creation of a new district around a railway station and the creation of a new economic area which should foreshadow the new economic geography of one sub-territory of the Pays de la Loire.
- The development of economic areas radiating beyond the scale a French river, including an industrial-port zone...

In this first part, we detail three key issues we introduced previously: major imbalances within territories, non-consensual concepts with which stakeholders must agree, inadequacy of tools such as the BMC (and the models that inherit from it).

2.1. Major imbalances within territories.

National and local development programs, such as the French program we work with, bring to light fundamental imbalances within territories.

The first one is a significant imbalance between planning, economy, and ecology. This imbalance can be partly explained by the roles, focus, constraints, and levels of maturity of the different stakeholders in these projects:

- Local authorities are focusing on specific issues such of attractiveness, employment, and infrastructure.
- Companies are focusing on business. They seek to maximize their competitiveness and meet the demands of their value chain.
- Planning agencies, urban planners, or design offices are focusing on their operational role with a strong spatial component.

Although the last ones are rooted in economic and social developments questions, they struggle to support cities or agglomerations in their strategic thinking, urban planning approaches and land use planning projects. Taking urban and natural context, regulations, business, and ecological issues into account is difficult. All this leads to a certain misalignment within the triptych planning-economy-ecology.

Another fundamental tension in territorial projects is the imbalance between public and private decisions. It is strongly linked to the distribution of competences usually assigned to the different actors in such a project:

- Local authorities do not have the power or legitimacy to influence business strategies directly.
- Companies base their decisions on specific industrial logics (access to resources, proximity to markets, logistics efficiency) that are often independent of territorial concerns. They face more macroscopic and purely economic considerations which sometimes makes them less receptive to local development priorities.

This imbalance is also amplified by the recurring absence of some stakeholders such as

companies in collective meetings, the possible difficulty to involve some elected officials, the lack of skills in economic development of services or the absence or lack of formalization of a clear vision for sobriety and production on the territory.

There are therefore limits and obstacles to a more strategic coordination to support the redevelopment of territories:

- Influence the location of businesses (e.g. ecopark industrial) through infrastructure, subsidies, or tax benefits ➔ but local authorities lack regulatory instruments.
- The separation of (public) planning decisions from (private) industrial strategies often creates phase shifts ➔ including with environmental objectives or residents' expectations.

To answer these major imbalances, our objective is to identify concepts and models that directly propose theoretical frameworks for integrating economic, territorial, and environmental dimensions into a common vision for both communities and companies. The territorial circular dynamic could provide an interesting framework for co-governance of resources. Such new governance models could, for example, provide a better understanding of the role of different stakeholders in aligning different objectives.

2.2. Non-consensual concepts.

Production, value creation and sobriety are three of the key concepts inherent in this type of projects. However, these concepts are quite vague, sometimes overused and not consensual. This results in a misalignment of stakeholders who struggle not only to agree on the projects objectives but also to assess and challenge their relevance with respect to initial expectations. How can we ensure that a project is suitable for the territory if the evaluation criteria themselves are not shared or poorly understood? Here are some key definitions:

Production:

- According to the French National Institute of Statistics and Economic Studies (INSEE), production is an activity carried out under the control, responsibility and management of an institutional unit that combines labour resources, capital, goods, and services to manufacture goods or provide services. Purely natural processes without human intervention or control are not part of production. According to Mariana Mazzucato, production encompasses the economic and social processes that transform resources into goods and services (Mazzucato, 2013, 2018). She highlights the boundary between what is considered productive and non-productive, pointing out that this distinction is often influenced by economic conventions and political choices.

Value creation:

- In design, the notion of value creation is strongly linked to that of value proposition through a set of products and services creating value for a particular segment of customers (Osterwalder and al., 2014). Value creation is therefore based on the identification and resolution of customer needs or pain, within a viable framework for the provider.
- Value creation, from the perspective of Mariana Mazzucato, is distinct from value exploitation. Value creation involves activities that contribute to the collective well-being and resilience of economic systems, integrating social and environmental dimensions (Mazzucato, 2013, 2018). On the other hand, value

exploitation focuses primarily on financial profit extraction without regard to social or environmental impacts. She calls for a reassessment of value indicators to promote a more inclusive and sustainable economy.

Sobriety:

- A study of the French agency for ecological transition (ADEME) highlights the lack of a single, shared, and precise definition of sobriety (Cezard and Mourad, 2019). According to them, sobriety refers to an approach that aimed at reducing consumption of natural resources and energy while maintaining or improving quality of life. It involves a reflection on the real needs and how to meet them in a sustainable way, with emphasis on efficiency and moderation in the use of resources. Sobriety encourages more environmentally friendly lifestyles and production, integrating practices such as recycling, reuse, and waste reduction.
- Valentin Baudouin explains that sobriety is an old concept (already in use in ancient times) experiencing a renewal (Baudouin, 2019). He opposes it to 'sustainability' understood as green growth. But he also notes that sobriety does not only concern the harvesting and consumption of natural resources. Service activities may indeed also cause harmful effects and pollution.

It therefore seems necessary to redefine the key concepts determining the expectations and evaluation criteria of territorial development projects to support the French program actions. It also appears necessary to re-categorize the so-called "productive activities" to allow a better appropriation of this term and a useful basis to build our tool. Our objective was to obtain a more current and complete compass of these productive activities in relation to the most recent economic theories (circular, functionality…) (see part 3).

2.3. Unsuitable tools: BMC and associated models.

The BMC is a pragmatic tool allowing to question the (current or future) business model of a product or a service offer (Osterwalder, 2004) (Osterwalder and Pigneur, 2010). It is used by large groups or SMEs to redesign an offer or create new offers. It is also used by start-ups or small businesses to assess the economic viability of an idea/an innovation.

It is also regularly used in territorial contexts such as the one we described in this article. Territorial stakeholders describe their project (for example, the creation of a coworking space in the city, the redevelopment of an old wasteland, the relocation of an industry in a deserted area…) and try to analyze the underlying economic model.

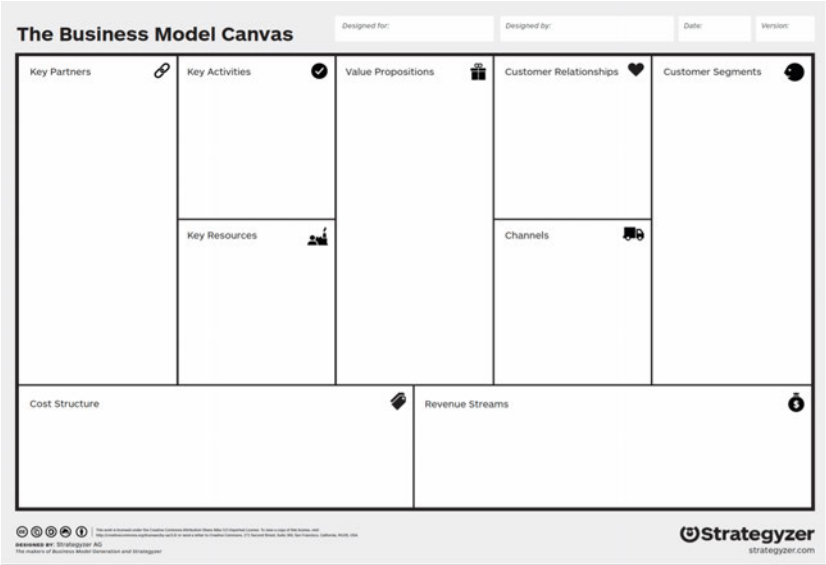

Figure 1. The Business Model Canvas (BMC) proposed by Osterwalder and Pigneur (2010)

The BMC is based on 9 key “building blocks”. The result is a synthetic table that can be manipulated and is easy to disseminate in order to present the offer and to get decision-makers or investors on board. To obtain a favorable decision, it is therefore necessary to present a BMC that is as cost-effective as possible. To do this, questionable design and implementation choices may be necessary to maximize economic performance. Thus, the use of BMC in companies without a systemic and holistic perspective has given rise to many products and services that are not concerned about their negative impacts on society and/or the environment (Bugeaud-Remond, 2023).

But in recent years, this model has inspired the creation of other tools offering more grounded reflections in a socio-environmental logic. Among them:

1. The **Sustainable Business Model Canvas** (available on case-ka’s website) contains two additional building blocks: environmental and social "costs" and "benefits". Such a model may bring out for example energy-intensive or resources-intensive activities, partners using low-paid labor, international logistics with high CO2 emissions... It may also bring out benefits such as employment of people in reintegration, use of renewable energies... Their description requires an adapted decision-making process.

2. The **Sustainable Business Canvas** (proposed by Loïc Bar, founder of Opinum and CoophubEU) is based on the Sustainable Development Goals as described by the UN. It describes the externalities of a product supply or service offer. It also describes what could destroy value, social benefits or even the degree of possible regeneration of the environment. This model supports collective decisions to meet and comply with the SDGs.

3. The **Circular Canvas** (proposed by Circulab) promotes and encourages a systemic perspective. It requires the identification and analysis of all elements of the system under study. It adds to the classic questions of the BMC a reflection about resources that are involved throughout the product or service life cycle (natural, technological, energy), product/service valorization or following use, and (positive or negative) externalities linked to each column of the tool.

Figure 2. Sustainable Business Model Canvas (on the left), Sustainable Model Canvas (in the middle) and Circular Canvas (on the right)

These new models have led to a new and challenging reflection that remains limited in the context of territories planning projects. Indeed, these tools are always very substantialist, ontological and relatively abstract. These projects stakeholders, in particular public actors, need tools for diagnosis, positioning and ideation that are anchored in their territory (its context, vision, heritage...), reflecting and promoting circular dynamics and capable of "playing" between the macro and micro levels of a system at the level of a territory or its sub-territories. Current models are therefore poorly suited to the analysis of a planning/development project in relation to a specific territory from a systemic, holistic, dynamic, and responsible perspective.

3. Exploration of key concepts within territories.

Many stakeholders of the French program have expressed their need to have a 'compass' to better orient and select community-supported economic projects from a productive and sobriety perspective. In this part, we explore the different definitions of production, value creation and sobriety and reposition the notion of 'productive activity'.

2.4. Production and value creation.

The contemporary concept of "production" has now gone beyond the single act of manufacturing material goods to encompass larger and more complex processes. These processes incorporate intangible, social, and environmental aspects. In the face of ecological and social challenges, concepts such as servitization (Baines and al., 2009) (Peillon, 2016), economy of functionality (Buclet, 2005) (Gadrey, 2010) (Du Tertre, 2009), commons, proximity economy, or industrial and territorial ecology reshape the way we understand production from a territorialized perspective.

The concept of value is very regularly lost in favor of the price. Thinking about value-creating activities also disappears and, from there, the question of who creates value and how wealth is distributed. Thus, the value no longer determines the price. But the price determines the "value" of things. This kind of illusion obscures the question of what kind of activities the society might consider important and really productive (e.g. health, education, environment, essential products, security, etc.).

Moreover, the distinction between productive and unproductive activities gradually disappeared to adopt a subjective conception of value determined by the marginal utility of a good or service to a consumer. Therefore, any activity or property for which an individual is willing to pay is considered "value-creating". The consequences are, for example, that services previously considered unproductive are now considered as creating value, once they meet a demand.

Based on the work of Mazzucato (2013, 2018), we have created a summary table illustrating the reclassification of activities according to the new production frontier. It distinguishes productive activities (creating real value for society) and non-productive activities (creating value extraction or destruction, or just surperficial activities).

Table 1. Reclassification of activities according to the new production boundary

PRODUCTIVE ACTIVITIES	NON-PRODUCTIVE ACTIVITIES
Health and education: hospitals, public schools, medical research...	**Financial speculation**: high frequency transactions, speculative "trading"...
Infrastructure: road construction, renewable energy networks, social housing...	**Patent trolling**: accumulation of patents without real innovation to prevent competition...
Useful technological innovation: development of renewable energies, medical technologies...	**False innovation**: gadgets or superficial product updates...
Sustainable industrial production: manufacturing of equipment for the ecological transition, electric vehicles...	**Tax evasion**: transfers of profits to tax havens to avoid contributing to the real economy...
Social and environmental services: forest management, reintegration programs...	**Excessive marketing**: manipulative or superficial advertising...
Basic research: public investments in science...	**Rents**: pharmaceutical monopolies imposing excessive prices...
Circular economy: repair, recycling, sustainable waste management...	**Cost outsourcing**: polluting activities such as extractive industries)...
Commons economy: open-source projects, collaborative production...	**Unnecessary or superfluous services**: excessive luxury or services without social utility (e.g. speculative NFT art sales)...
Cultural and creative industries: significant artistic creation, independent media of public interest...	**Real estate rents**: speculative accumulation of real estate without contribution to the supply of housing...

This table can be used to rethink public policies, to evaluate private investments and finally to reform economic indicators. In France, the INSEE definition of “production” (see part 2.2) hardly considers:

- New and complex forms of governance based on massive cooperation (ecosystems, networks, platforms, communities...) between heterogeneous stakeholders (companies, public actors, associations, citizens, researchers...),
- New forms of value (common property, experience, residential economy, social and solidarity economy...),
- New forms of ”actants” (autonomous technological agents and intelligent systems, collective agents for ecological transition, new entities of the «living»,

etc.) mentioned in the literature by Latour, Descola, Garcia.

To link planning, economy and environment in territorial projects study and implementation, it seems essential to redefine and share the notion of "productive activities". This concept and the resulting reference/questioning tool should also make it possible to improve the transition from project actions to an implementation roadmap involving all the stakeholders in a productive and sober territory logic.

2.5. « Productive activities ».

What we propose to call the "new production models" are very heterogeneous in terms of maturity and origin levels. They are driven by economic theories, territorial and transition concepts such as (non-exhaustive list): circular economy (Stahel, 2019) (McDonough and Braungart, 2002), economy of functionality (Gadrey, 2000, 2010) (Du Tertre, 2009), servitization (Baines and al., 2009)(Peillon, 2016), frugal innovation (Radjou, 2025) economy of the commons (Ostrom, 1990, 2010), industrial and territorial ecology (Buclet, 2021) (Chertow, 2007), industrial symbiosis (e.g. Kalundborj), local economy, ecological transition (Hopkins, 2008), regenerative economy (Raworth, 2017)…

We therefore start from the notion of "productive activity", focusing on new types of productive activities that appear in these theories or models. We have integrated contemporary territorial and spatial theories to enrich our typology by anchoring more production concepts in local, global and landscape dynamics. These complex dynamics need to be integrated and balanced, combining global influences with local specificities and needs, and promoting a harmonious coexistence between economic activities, the environment, and local communities.

This typology includes categories that go beyond traditional production and integrates activities focused on use, experience, commons, and ecological transition. The following is a revised proposal, organized by major axes:

1. **Activities from functional economy and use**: Services "as-a-service" and resource pooling, Energy "as-a-Service" and on-demand distribution.

2. **Activities from experience economy**: experiential and farm tourism, immersive recreation, and culture spaces such as interactive ecological parks…

3. **Activities from circular economy and industrial symbiosis**: recycling and recovery of waste, industrial symbiosis which includes eco-industrial parks, repair and reconditioning of electronic equipment and products to extend their life and reduce waste…

4. **Activities from commons and reciprocity economy**: shared management of natural resources (e.g. community forests and biosphere reserves), local collaborative platforms facilitating the sharing of resources between citizens (eg. object libraries or carpooling tools), green energy cooperatives…

5. **Activities from knowledge economy and high added value services**: innovation and research in sustainable transition (bio-sourced materials, energy storage technologies…), consulting on sustainability and resilience, training, and education in green trades (e.g. permaculture training, waste management…).

6. **Activities from residential and proximity economy**: local shops and basic services (grocery stores, farmers' markets, health, and education services…), social and solidarity economy (home help, care, support for vulnerable people…), short food circuits…

7. **Activities from green production and ecological transition**: production of renewable energies (wind farms, solar farms and biomass), ecological renovation and construction and building renovation to improve energy efficiency, regenerative agriculture and permaculture…

These new types of productive activities are distinguished by their integrative approach, which includes:

- Strong focus on sustainability: activities are designed to minimize environmental impact, often by enhancing local resources and integrating circular practices.
- Use and experience logic: rather than producing to own, the new models value shared use and experience, thus enhancing quality of life and local participation.
- Collaborative and territorialized governance: shared resource management activities and co-operatives promote local governance and community involvement.

This typology could be applied to structure and analyze planning/development projects, allowing to select and evaluate activities (new, strengthened, reduced…) according to their contribution to territories' ecological, economic, and social objectives. They thus will be able to reorient or abandon certain projects in favor of more positive and fair alternatives.

2.6. The territorial metabolism.

To conceptualize these different concepts and discuss their own dynamics, we developed the following diagram:

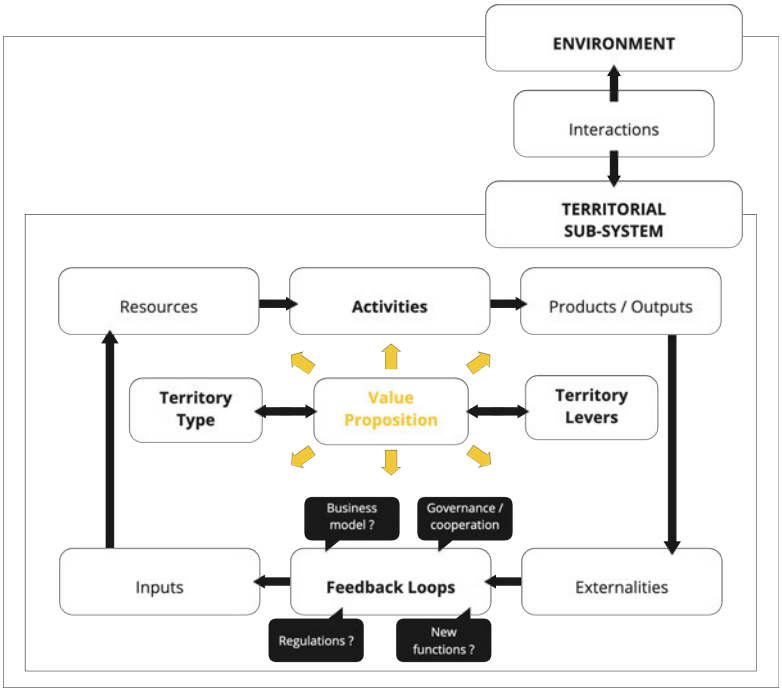

Figure 3. Territorial metabolism diagram

This diagram shows a circular territorial metabolism model in which we can find:

- Significant **activities** (at the heart of the model) or main sectors in the territory (e.g. textile industry, presence of activities related to technological innovation…).
- **Resources** or territorial capabilities that are linked to the territory's heritage (e.g. natural resources, competencies, financial resources, infrastructures…).
- **Inputs** that are necessary for these activities (material, fertilizer, external skills…).
- Products or **outputs** that these activities generate for the territory or not, it could be tangible goods or any other contributions.
- **Externalities** caused by these activities and their outputs. They can be positive or negative for the territory and at more macro scales.
- **Interactions**/exchanges/flow with other territories but also with other activities.
- **Feedback loops** to improve the circularity of the overall system, its productivity and sobriety (new business models, governance and cooperation, regulations, new functions or new uses, new KPIs…).

Once this current territorial metabolism is exposed, the definition of the on-going project **productive and sober value proposition** must be added and tested. It must participate in improving the global system and its internal and external circularity. In addition, it is necessary to analyze:

- The existing or under development **territorial levers** of attractiveness and location such as proximity to a logistics hub, cutting-edge expertise, quality of life…
- The **type of territory** and the coherence between the territory chosen to conduct the feedback and the type of economic model integrating sustainability.

We can then re-loop the analysis by looking at the activities that are concerned by the project value proposition but also the resources, inputs, outputs, externalities, feedback to be implemented… So, we highlight on the model (the first loop result) the elements concerned by the value proposition and its effects on the current system. This dynamic could lead to a kind of strategic causal map to explain the choices made by public and private actors in terms of spatial planning.

4. A systemic canvas to diagnose and realign projects.

This last part presents a first sketch of the Systemic, Sustainable and Territorial Dynamic Canvas (SSTDC) and a case study from the French supporting program. Its contributions and limits have given rise to a collaborative workshop to refine the tool.

4.1. Description of the canvas.

The first draft of the SSTDC is based on the previous territorial metabolism diagram and

on the discussion we had with stakeholders during our recent interviews and workshop. We have presented our research object to the participants of the French program, and we have started a series of 6 interviews to test and refine this model. We then have organized a collaborative workshop during which the projects stakeholders were able to comment and develop together the first draft we made.

This canvas is organized around two main zones, nine blocks, interactions between blocks, interactions between zones, and a global dynamic of the model favoring circularity and questioning. This circularity is expressed in all areas: resources and inputs (local or imported), transformation actions (whatever they may be), output/products causing positive and negative externalities, requiring feedback loops... all being improved or disrupted by the introduction of a new value proposition. In addition, each block is proposed as a set of questions to invite the users to question the block's content but also the circular dynamics of the territorial system in place.

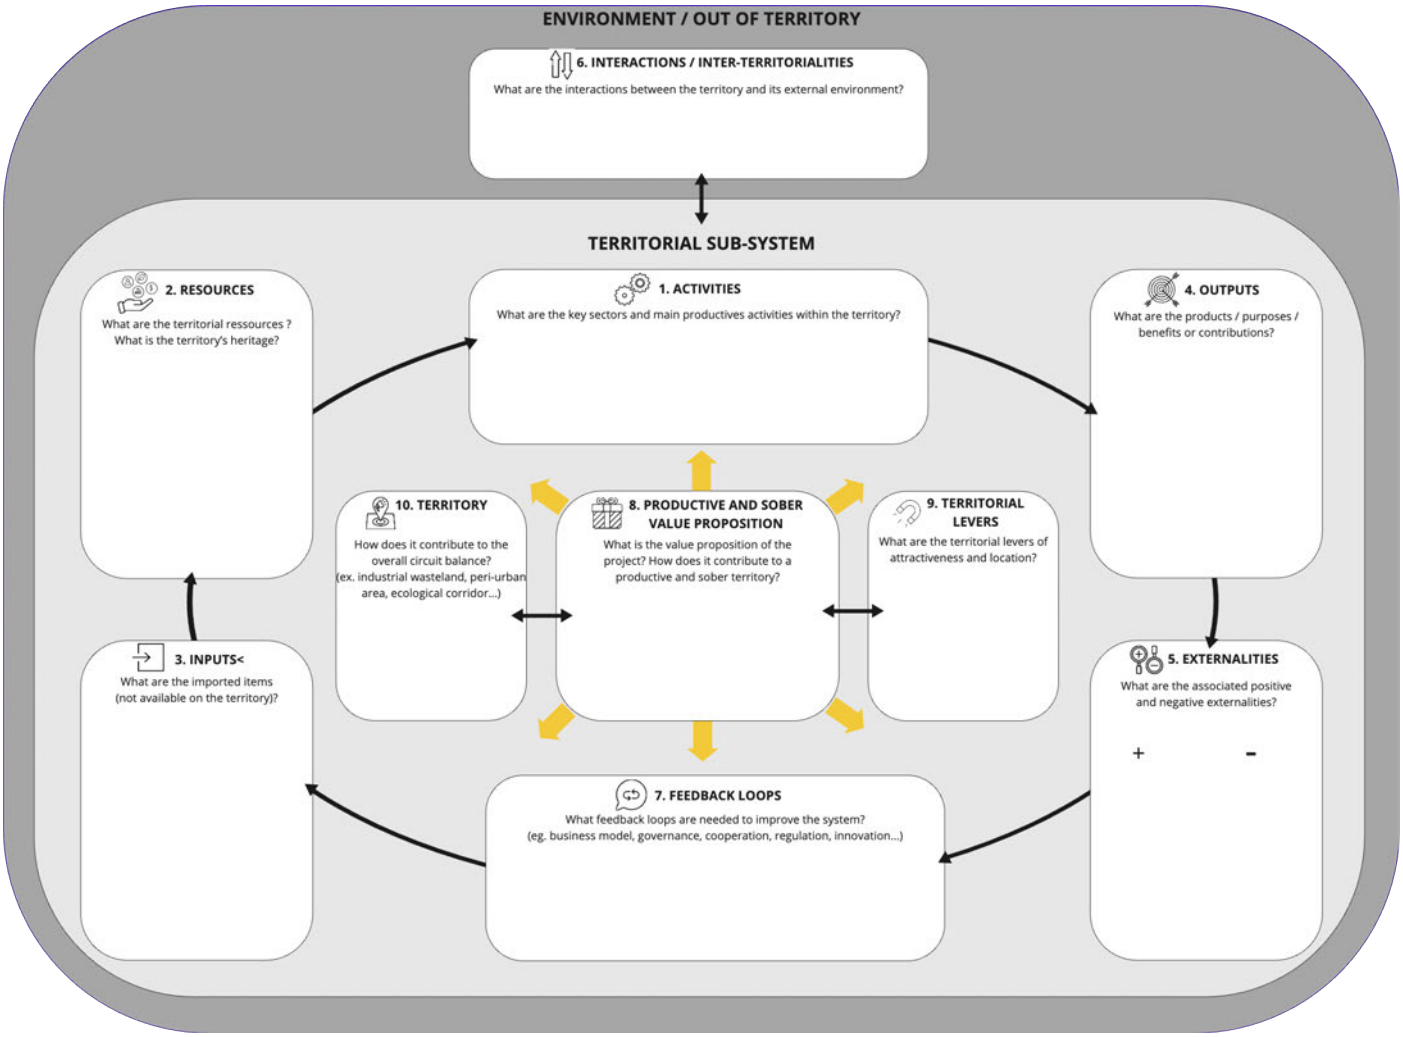

Figure 4. First sketch of a Systemic, Sustainable and Territorial Dynamic Canvas (SSTDC)

Three steps and two loops are required to fill the SSTDC and analyze the interest and impact of a new development/planning project:

Step 1: Describe the current territorial metabolism.

The fist loop is to provide information on the current system:

1. What are the territory or sub-territory key sectors and productive activities?

2. What is the territory heritage and main resources / capabilities (e.g. natural resources, competencies, financial resources, infrastructures…)?
3. What are the required inputs to perform these activities (e.g. material, fertilizer, external skills…)?
4. What are the activities outputs/contributions/benefits?
5. What are the positive or negative externalities caused by these activities and their outputs (political, social, societal, environmental)?
6. What are the main interactions/exchanges with other territories and with other activities?
7. What kinds of feedback loops have been (or are going to be) implemented to improve the circularity of the overall system?

Step 2: Define the development/planning project value proposition and context.

We now have a complete view of the territorial metabolism in place, its opportunities, and limitations. It is then necessary to define:

8. The development project value proposition, paying attention to its productive and sober character: how does the project will contribute to a productive and sober territory?
9. The territorial levers of attractiveness and location: what are the elements (such as proximity to a logistics hub, cutting-edge expertise, quality of life, housing options, key resources access, available services…) that can attract/make businesses and individuals want to come and settle in the area?
10. The current type of territory but also the way it must transform itself to bring coherence between its ambitions, the current or future feedback, and a more sustainable economic model. How does it contribute to the overall system and circuit balance?

Step 3: Test the closure of the project within the territory.

We can start the second loop analysis. We go through all the blocks and their interrelationships to check what the value proposition would improve, add, or disrupt. For examples:

- Creation of a new productive activity? Strengthening or reducing an existing activity?
- Use of additional resources? Regeneration of existing resources?
- Renewal or creation of new outputs?
- Reduction of existing negative externalities or addition of new ones?
- …

Once the key elements have been highlighted, project stakeholders may wonder: is it really useful and productive? does it really improves the existing situation?… They can also modify certain parameters to "play" with the model and refine the project.

4.2. Application to a French rural sub-territory.

We have tested this reference model on five «case studies» from the 6 winners of this year French supporting program “Atelier des Territoires”. One of these case studies is presented below and further tests will be conducted in the coming weeks and months.

This case study concerns a rural sub-territory in the northwest of France. It is particularly characterized by a quality amenity but a decline in the industry and tertiary sectors. The

initial request of the public authorities was about the "land sobriety as an economic opportunity". They specified two main objectives:

- To obtain a shared vision of the future of the sub-territory,
- To reconcile economy and quality of living by taking advantage of local identity and culture.

Two "territorial objects" are concerned:

- The station area for which a tertiary space and mutualizable training offer is envisaged.
- An economic activities zone for which a new, more sober, collaborative, and qualitative format is to emerge.

We have filled the SSTDC with the project management according to the 3 steps and 2 loops presented above:

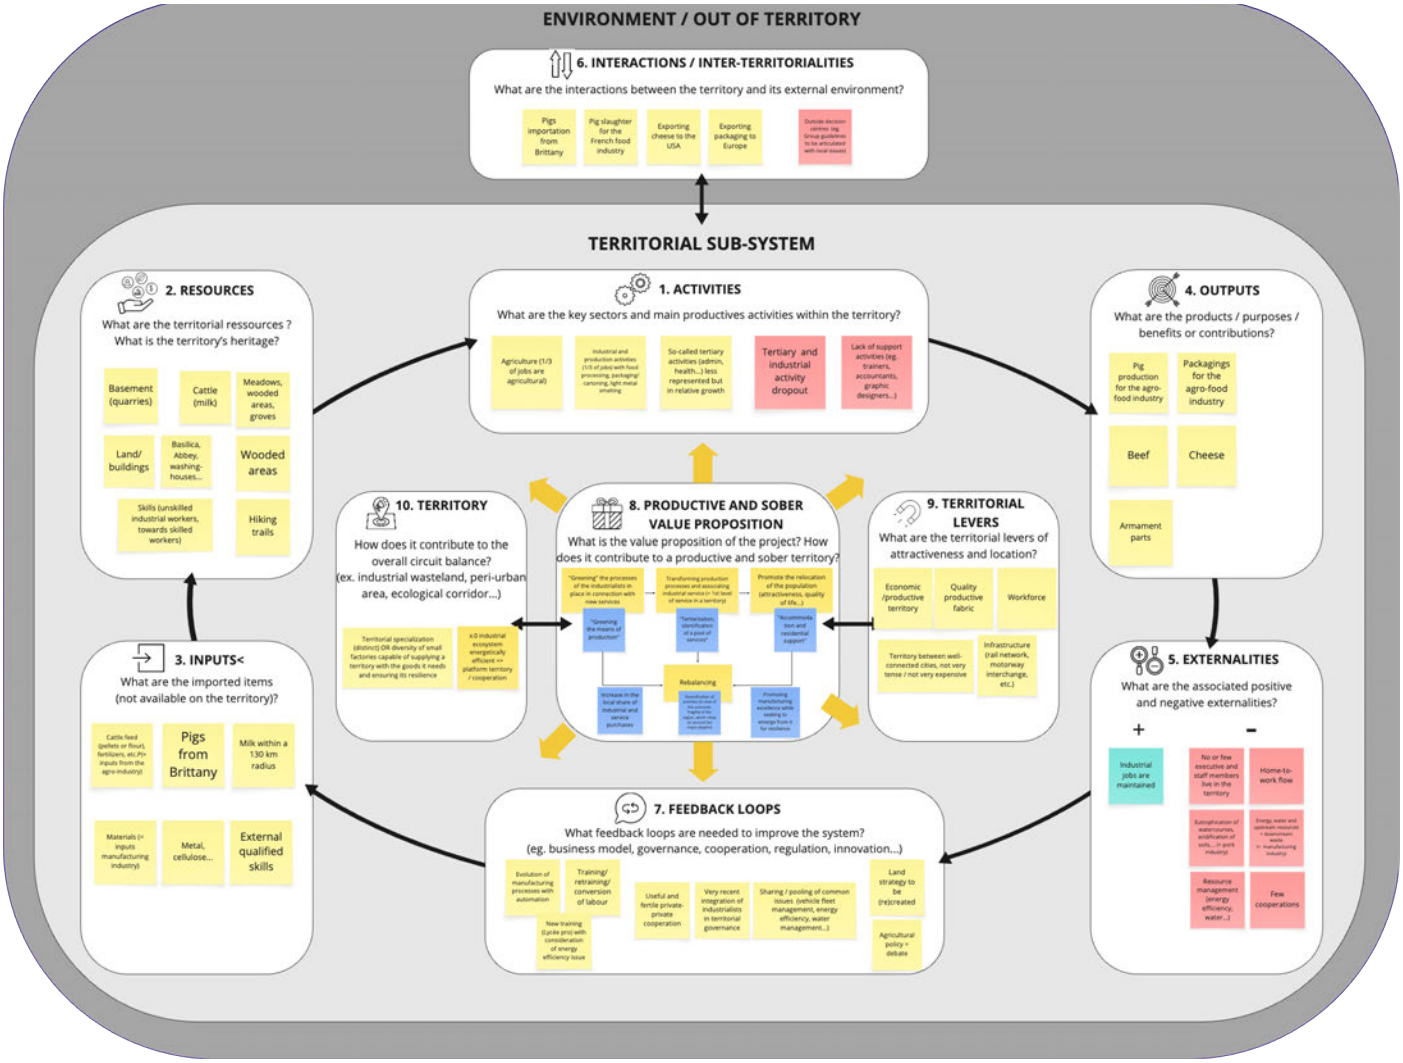

Figure 5. The SSTDC applied to a French rural territory and its green industrialization + services development project.

1. The main **productive activities** of this sub-territory are related to agriculture, industry (food industry, packaging, light metal smelting) and tertiary activities (administration, health) ➔ Two warnings have been noted here: there is a lack of support activities (e.g. training, accounting, graphic design...) and industrial activities are declining.
2. The sub-territory **heritage and resources** are related to basements historic buildings (abbey, basilica...), land, wooded spaces, cattle (for milk) and valuable

skills (mainly unskilled industrial workers).

3. The sub-territory activities require various **inputs** such as pig, cattle feed (inputs from agro-industry) and milk for industrial cheese factories, materials (for manufacturing industry: metal, cellulose…) and qualified skills that are not available locally.
4. These activities produce various **outputs** including cheese, beef and pig production but also packaging for the agro-food industry.
5. These outputs generate several **externalities**:
    - On the positive side - They maintain industrial jobs on the sub-territory.
    - On the negative side - Pork and beef industry contribute to watercourses' eutrophication and soils' acidification. Manufacturing industries consume energy, water, and resources. They also generate downstream waste. Moreover, they require executive and staff members that do not live on site and thus generate commuting.

    ➔ Two warnings were noted here: the lack of resource management (energy efficiency, water…) and the lack of cooperation.
6. Few **interactions** with other activities or other territories have been identified: packaging export to USA and rest of the world, pig slaughter for the food industry, cheese exportation… ➔ Another interesting point concerns the interactions between outside decision centers (administrative headquarters are not here) and local issues.
7. **Feedback loops** are already in operation to compensate for or improve the existing situation: evolution of manufacturing processes with automation, training/conversion of workforce, schools new training with consideration of energy efficiency issue, very recent integration of industrialists in territorial governance, pooling of common issues (vehicle fleet management, energy efficiency, water management…), and land strategy to be (re)created.

Once this current "panorama of the territory" was drawn up, we discussed the development project in progress. The statement of a clear **value proposition** was relatively difficult to achieve considering ongoing discussions within the national program but also the complex governance of the project with a heterogeneous project ownership. The integration of sustainability issues seemed particularly difficult to achieve in favour of a spatial closure of the project. However, space does not always prove to be at the service of a real economic articulation and ecological issues. This is an interesting case study because the canvas allowed them to question the project by performing the 2nd loop to master the overall system and have alignment elements.

Despite the large scale of the program and the still cautious positioning, an interesting value proposition could be built around the following ideas:

- "Greening" the industrial processes and means in connection with new services,
- Transforming production processes and associating industrial service thanks to a tertiarization approach,
- Promote the relocation of the population (attractiveness, quality of life…).

These ideas require a kind of activities rebalancing and diversification. Services could therefore be at the heart of this sub-territory transformation, both to strengthen the performance and competitiveness of existing or future industries (automation, networking, innovative and sustainable design…), but also to support these manufacturers (graphic design, accounting, CSR consultancy…) and accompany their product offers (service innovation). Such an introduction of services is often the starting point for more important transformations (Bugeaud-Remond, 2023), especially through the economy of functionality (Du Tertre, 2009). The combination of

products and services is one of the first levels of maturity in the field of services (figure 6). In addition, the emergence of a servicial logic very often gives rise to new cooperation such as experience sharing or peers coaching, training mutualization or co-management of certain assets...

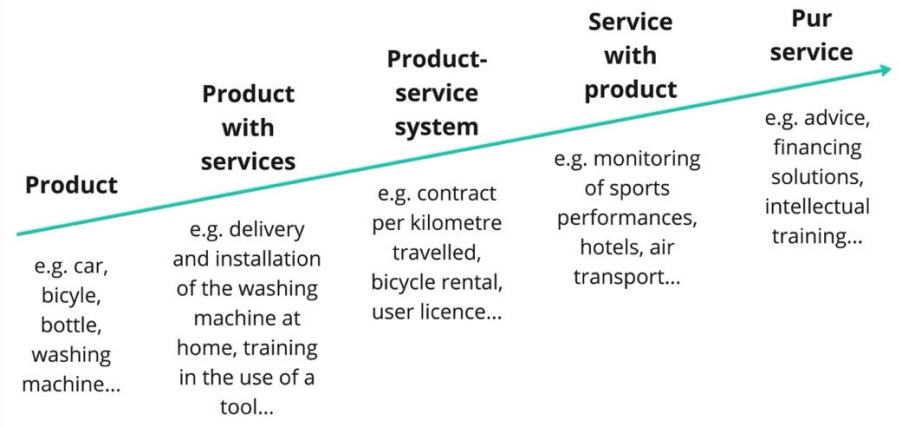

Figure 6. The product-service continuum (Bugeaud-Remond, 2023)

Moreover, we added the **territorial levers** for attractiveness and location as a key building block of the canvas during the workshop with the project stakeholders. This project team put forward the quality of the local productive fabric, the cutting-edge skills and know-how, and the existing and under development infrastructure as key factors to attract new businesses. They also noted the quality of life, good interconnection between areas and the cheapness of housing as interesting levers to attract new skilled workers and their families.

Finally, discussions around such a “servicial” value proposition have brought out a key point about the **type of territory**. The project stakeholders did not characterize the current type of territory but rather they brought out the idea of a networked territory with the question of energy and resource optimization at its center. Territorial specialization or diversification were also discussed during the workshop with this team. They put forward the idea of new activities capable of supplying the territory with the goods it needs and ensuring its resilience. As current production in the sub-territory is not sustainable, it will be important to bring coherence between this sub-territory type, the feedback loops and an economic model that will be both viable and sustainable. The role of “ecosystem” or “territorial platform” will therefore be a central point in the further workshops of this case study.

The case study is still in its infancy and the value proposition, economic model and governance associated with the project and its implementation need to be refined. A new loop will be carried out on the canvas in the coming weeks to verify the adequacy of the refined proposal with its territory. But the SSTDC has allowed them to identify the dynamics, opportunities, and externalities in place and to think constantly "productivity" and "sobriety" whereas this initial request is often set aside in the operational flow of this type of project. They validated the interest of such a shared diagnostic tool to cooperatively challenge projects but also to move towards the famous operational roadmap that they struggle to create so far.

We have more recently worked with them on transforming these models into storytelling, allowing them not only to share their work and the interest of their value proposition for the territory, but also to facilitate the creation of a concrete roadmap. One idea for the future concerns the creation of a complementary tool, such as radar, which would allow a

more quantitative analysis (measurement) to be added to this relatively qualitative analysis (narrative). This tool would help to position the project in relation to major issues and thus analyze its productive and sober character in relation to the concerned territory or sub-territory.

5. Conclusion and perspectives

In conclusion, territorial actors struggle not only to restore a balance between public and private decisions but also to align the economic, ecological, and spatial planning dimensions of these project. People we met have validated the value of the SSTDC to meet these challenges. The teams involved in this type of spatial planning project usually include urban planners or architects. But they also increasingly integrate designers (space, experience, service…) to help them understand the current system and project into a productive and sober future from a systemic and dynamic perspective. Designers use many tools to manipulate the economic dimension of a project and increasingly also its ecological dimension. However, these tools remain limited, little, or no territorialized and dynamic.

Our initial objective was to propose a simple and educational tool for self-diagnosis, contribution and realignment between projects and a territory in a perspective of sobriety and useful, responsible, and sustainable value creation. Drawing inspiration from the BMC, we created and tested a first draft of the SSTDC through two case studies including the one of the rural community discussed in this article.

The planning of the French program in which we conduct our research will allow us to continue the tests. This systemic and sustainable framework will therefore evolve in the coming months towards a more advanced, more pedagogical and even more dynamic model. In addition, this canvas allows a narrative of the territory and the project, promoting documentation and sharing within the territory but also between the territories winners of the French “Atelier des Territoires” program. We will continue our work for the transformation into useful narratives/storytellings and concrete roadmaps. One example can be shared during the CUMULUS conference. However, we think that a complementary and more quantitative tool would allow these actors to move from a project to an actionable roadmap on the 3 dimensions interwoven of the triptych planning-economy-ecology. That is why our next actions will be to organize and animate new workshops with the other 4 winners of the year in the coming months.

About the Authors:

Florie Bugeaud-Remond defended the first thesis dedicated to Service Sciences in France in 2011 (University of Technology of Troyes). After many years dedicated to Service Design in various contexts, she founded beewö to raise awareness of the impacts of services and help entrepreneurs, businesses and communities to rethink their strategy and eco-design their service offering in the face of environmental and societal challenges. She is also the author of the book “Green Service Design, pour une conception de services éco-responsables” (2023, ed. Pôle Eco-Conception).

Eddie Soulier is professor (emeritus) of artificial intelligence at the University of Technology of Troyes (UTT). His work focuses on complex graph modeling, data science and artificial intelligence, in application areas such as ecological transition, energy, innovation ecosystems, communities or knowledge management.

Acknowledgements: we would like to acknowledge the French Ministry of Regional Planning and Decentralization, and the French Ministry of Ecological Transition, in particular the members of the General Directorate for Planning, Housing and Nature (“Direction Générale de l'Aménagement, du Logement et de la Nature” – DGALN) for their support and their trust. We would also warmly thank all the territorial teams who participated in our interviews and our workshop for their major contribution and their feedback.

AGONISM/ANTAGONISM. SPORT AND TERRITORIAL REGENERATION THROUGH EXAMPLES OF TOURISM, SOCIABILITY AND MARKETING

Elisa Poli

NABA, Nuova Accademia di Belle Arti – Milano
elisa.poli@naba.it

ABSTRACT | Is it still appropriate, in 2025, to talk about regeneration as a possible solution to the pathologies of our metropolises and megalopolis and to focus on the sole dimension of the cities? Are we devoting sufficient attention to the delicate relationship between urban/rural, town/countryside nexus in the search for positive solutions for human life in the post-Anthropocene context? As a partial attempt to respond to these complex questions this paper intends to analyse the spatial and social relationship of sporting activities, with a specific focus on cycling, through key examples of its possible cultural, touristic, economic and communicative ramifications. Focusing on the relationship between the disciplinary sphere of territorial transformation through tourism (Frausto, Ockman, 2005) and sports (Nandasena et al., 2002), the main objectives of this research concern the sociality produced by organised forms of collective interests, the unconventional discovery of places related to sports tourism, and the sustainability of outdoor sports activities. For reasons of space and time, only the specific case study of cycling is presented here, with the awareness that other sports, especially endurance disciplines will subsequently need to be compared for a comprehensive analysis. The paper is structured into four sections: a general introduction, followed by a theoretical framework on the concept of sustainable tourism (Mallen, Adams, 2024), an in-depth analysis of the recent phenomenon of cycling tourism, a factual comparison between the sustainability of Tour de France and the Olympic Games in France in 2024 (Fife, 2008; Faure, 2024), and final conclusions. This paper adopts a qualitative, comparative approach centered on three strategies: (1) interpretive review of literature on tourism and territorial regeneration, with focus on rural contexts; (2) comparative analysis of public data on the 2024 Tour de France and Paris Olympics, emphasizing spatial and symbolic impacts; (3) discursive reflection on sport tourism practices, including cases like "L'Eroica." This methodology supports a place-based reading of territorial change, privileging landscape, temporality, and cultural capital.

It positions the study at the intersection of cultural geography and sport tourism, highlighting spectacle's ephemerality and uneven regenerative outcomes.
The paper critically evaluates two of the most prominent global sporting spectacles held in France in 2024 – the Tour de France and the Paris Olympic Games – probing whether their rhetoric of regeneration effectively translates into durable territorial benefits or remains bound to fleeting accumulations of economic and symbolic capital. These events, despite their contrasting formats and territorial footprints—one dispersed across rural and mountainous regions, the other concentrated in urban infrastructure—offer a unique opportunity to assess the regenerative potential of sport-led tourism and development... Furthermore, by drawing upon analyses from rural theory (Koolhaas, 2020), tourism studies (Aime & Papotti, 2012), and mega-event research (Maennig et al., 2024), it interrogates the role of sport in shaping contemporary landscapes, exposing the limitations of an economy predicated on ephemerality and spectacle.

KEYWORDS | Sport Tourism, Cycling, Tour de France, Olympic Games, Territorial Regeneration

1. Introduction

In the late 19th century, cycling significantly contributed to the discovery of the territories of many European countries, serving as an efficient mode of transportation for covering long distances (Herlihy, 1988). The Bicycle Touring Clubs provided valuable examples of how territorial stewardship intersected with a growing desire for discovery and adventure during leisure time (Horton et al., 2007; Pivato, 2019). Tourism and cycling have grown, fuelled by the same dual romantic and modernist imagination. Far from being a mere background landscape, the territory, especially through the lens of competitive cycling, becomes the embodiment of a modern Homeric mythology (Barthes, 1957), a Cartesian antithesis of the known universe, revealed through the toil of the technological hero.
Cities are not excluded from this popular narrative; however, they serve merely as "stages" in the journey of prestigious races like the Grande Boucle. Instead, the sporting event that most profoundly reinforces and accentuates the perception of the host city is the Olympic Games. Reintroduced as a quadrennial event in the same years in which the Tour was conceived, it transcends mere athletic competition, functioning as a vast socio-political, economic, and cultural enterprise (Richelieu, 2024). This paper, therefore, explores the relationship between urban and rural using amateur cycling and the sports spectacles of the 2024 Paris Olympics and the Tour de France as key case studies. Both events took place within the same country, merely a few weeks apart, thus enabling a comparative analysis of urban and rural tourism investment. The growth of amateur cycling as well as the comparison between two of the three largest sporting events in the world (in terms of media coverage, only the FIFA World Cup surpasses them) fosters a critical reflection on the concrete possibilities of initiating regenerative processes. The study builds on existing analyses (Hammond, 2024) to explore whether the Olympics and Tour serve as a regenerative force or an ephemeral spectacle leaving uncertain legacies.
The available data concerning the two events are partial at the time of writing; however, this very aspect underscores issues of transparency and public interest, which are intrinsically linked to the broader and more critical discourse on new territorial ecologies.

2. Theoretical Frameworks: Tourism and Territorial Regeneration

2.1 Rural tourism as a sustainable resource

Tourism plays a complex and ambivalent role in advancing the United Nations' Sustainable Development Goals (SDGs), acting both as a catalyst for economic growth and a potential threat to environmental and socio-cultural sustainability (Saarinen, 2021). A comprehensive assessment of tourism's contribution to sustainable development requires a place-based approach that considers spatial and contextual specificities (Dewailly, 2011). This perspective is particularly relevant to rural and heritage tourism, where the enhancement of local resources can simultaneously strengthen economic resilience and support environmental conservation (Paniccia, Leoni & Baiocco, 2017). However, the tourism sector often privileges short-term economic returns over long-term sustainability, necessitating a critical evaluation of its impact on local communities and ecosystems (EU Tourism Platform, 2024). Many rural tourism initiatives, therefore, struggle with scalability and adaptability. While certain case studies demonstrate localized success, their high context-dependency limits broader replication.
The "Albergo Diffuso" (scattered hotel) model in Italy, for instance, has proven effective in revitalizing small villages through the adaptive reuse of existing buildings for tourism accommodations. However, its applicability remains constrained by specific local conditions, including historical architectural stock and active community participation, making it difficult to implement in regions lacking these attributes (Di Bernardo, 2014). Moreover, the expansion of tourism, especially in destinations designated as UNESCO World Heritage Sites, poses significant challenges in balancing visitor numbers with the preservation of local communities and cultural authenticity. While UNESCO recognition tends to increase international tourism appeal, it often leads to unintended consequences such as overcrowding, gentrification, and the gradual commodification of cultural heritage (De Simone et al., 2019).
The case of the "Sassi di Matera" (ancient cave dwellings of Matera) exemplifies these issues, as it demonstrates the complexities of maintaining an equilibrium between tourism development and the daily lives of residents. Excessive touristification may result in a loss of historical authenticity, with urban environments becoming artificially tailored to meet visitor expectations rather than preserving their original character (Pedersen, 2002). Sustainable rural tourism has emerged as a response to evolving consumer preferences, particularly among new generations of tourists who seek personalized, high-quality experiences rooted in local cultures. Within this framework, territory regains central importance, with its cultural distinctiveness being recognized as a unique economic resource. However, realizing its full potential requires sustained commitment to territorial regeneration and enhancement (Primi, 2011).

2.2 Travel transformation and local identity

Tourism is shifting from a standardised, mass-market model to a personalised, experience driven approach that emphasizes individual needs and the exploration of lesser-known destinations (Zeqiri, 2024). However, tourism remains an inherently transient activity, often failing to become embedded in the daily life of local communities.
A notable example is the Maui Cultural Lands initiative in Hawaii, where visitors engage in reforestation and archaeological site restoration following the 2023 wildfires, thereby assuming an active role in ecological and cultural regeneration rather than remaining passive tourists (Time, 2023).

Similarly, in Costa Rica, Nayara Tented Camp demonstrates how eco-conscious tourism can contribute to biodiversity conservation. Guests participate in habitat restoration projects, such as tree planting to rehabilitate the sloth population's natural environment, integrating scientific conservation with immersive guest experiences (Condé Nast Traveler, 2024). In Chile, Explora Patagonia National Park adopts regenerative tourism principles, inviting visitors to reforestation programs and ecological education initiatives, ensuring that economic benefits extend beyond luxury tourism into long-term environmental sustainability (Condé Nast Traveler, 2024).

Tourism also functions as a mechanism for understanding the urban-rural dynamic, shaping travel experiences through evolving digital engagement. Initially a written narrative, tourism has transitioned into visual storytelling and digital interactivity, where destinations are curated through images, videos, and user-generated content.

This shift repositions travel, no longer defining the place itself, but rather serving as a backdrop for individual identity and existential positioning (Budiawan & Fedrina, 2024). The place-specific nature of successful projects often prevents the formation of sustainable tourism networks (Richards et al., 2024). By contrast, cycle tourism offers travel experiences that promote minimal environmental impact and a deep connection with the surrounding landscape. It can generate increased local revenues through cyclists' expenditure on accommodation, restaurants, and services, thereby fostering the development of businesses that cater to cycling tourists. It also enhances community engagement and reinforces local identity, as residents take pride in showcasing their region's natural and cultural heritage. Furthermore, it promotes sustainable mobility and reduces dependence on motorised transport, leading to a lower ecological footprint in sensitive areas (Gazzola et al., 2018).

3. The Economic and Cultural Paradoxes of Cycling Tourism

3.1 Mythology and Toponymy significance

The metaphorical and cultural significance of cycling lies in its dual role as both a personal challenge and a collective experience. As a sport, it transcends physical boundaries, transforming landscapes into arenas of endurance and conquest (Vigarello, 2002). Unlike other sports confined to specific playing fields or tracks, cycling ventures into uncharted territory, where the athlete competes not only against rivals but also against the natural and geographical elements. Events such as the Tour de France and Giro d'Italia embody this relationship between sport and territorial identity, turning cyclists into narrative agents of regional pride (Gallagher, 2017). Unlike ticketed sporting events, cycling competitions are freely accessible, allowing spectators to choose their vantage points, effectively inscribing their presence onto the landscape. The fleeting yet profound impact of the race transforms ordinary towns and villages into ephemeral theatres of spectacle, where time momentarily expands, filled with celebrations, anticipation, and ritualistic observation. The symbolic nature of this passage renders certain locations, such as Galibier and Tourmalet, legendary, anchoring them within the collective cycling memory. Even in recent times, professional cycling can reshape the perception of a territory, driven by the ongoing search for new landscapes to explore. In 2025, Rwanda will host the UCI Road World Championships for the first time, marking a historic milestone both for the country and the African continent. Rwanda has positioned itself as a hub for African cycling.
The nation has invested substantially in cycling infrastructure and development programs, with the Tour du Rwanda becoming a prominent race on the UCI calendar.

This event has not only provided local riders with exposure to international competition, but has also attracted global sponsors and teams, further integrating Africa into the broader cycling economy. Rwanda's success in cycling development is closely linked to government initiatives aimed at fostering sports as a tool for economic and social regeneration (Gassmann, 2021). Beyond competition, cycling fosters an immersive relationship between individuals and terrain, influencing consumer trends and brand aspirations. Manufacturers such as Colnago, Cervélo, Specialized, and Bianchi not only equip professionals but also shape the desires of amateur cyclists, reinforcing a culture of emulation. The global market for sports bicycles reached USD 7.0 billion in 2024, with a projected CAGR of 3.2% (2025–2034) (Global Market Insights). Cycling's direct engagement with the environment distinguishes it from other sports, embedding it within local traditions and landscapes, while simultaneously serving as a vehicle for mobility, identity, and tourism (Horton, 2007).

3.2 Economic implications and challenges

Cycling tourism has emerged as a sustainable model for rural economic revitalisation, praised for its low environmental impact, ability to disperse tourists beyond urban hubs, and integration with local heritage economies (Šimková, 2024). Unlike mass tourism, which centralizes economic benefits in urban centres, cycling tourism distributes its impact across broader territorial networks, connecting small towns, cultural landmarks, and rural landscapes (Aragon et al., 2024). However, despite its ecological and economic advantages, its long-term benefits remain inconsistent, exposing challenges in sport-driven territorial regeneration. The economic potential of cycling tourism is evident in several regional initiatives. In Catalonia, Spain, bicycle-friendly policies have contributed to a 17% increase in local commerce since 2022, particularly in protected natural areas (Farías-Torbidoni & Monserrat-Revillo, 2025). In Greece, the Evros region has developed sustainable cycling corridors, integrating trail networks with rural heritage tourism, fostering both environmental conservation and economic viability (Kolkas et.al., 2024). Similarly, in Bali, Indonesia, the Sambangan Eco-Trail has facilitated rural tourism diversification, generating revenue through mountain biking trails while preserving traditional agricultural practices (Sudiana & Rahmawati, 2024). Despite these successes, cycling tourism faces structural limitations. Its episodic and seasonal nature makes consistent revenue generation challenging, while insufficient infrastructure and investment hinder its long-term sustainability (Nguyen, 2024). A recent attempt to address these challenges is the "Il Ciclismo e le Ville Medicee in Toscana" project, a collaboration between the Italian Cycling Federation and academic institutions. This initiative seeks to promote sustainable tourism by developing digital itineraries that showcase the architectural and cultural heritage of the UNESCO-listed Medici Villas, demonstrating cycling tourism's potential in enhancing heritage conservation and economic resilience. Tuscany already had a best practice with "L'Eroica" cycling event in the iconic white gravel roads of the Sienese province. Conceived to celebrate the "heroic" era of cycling, it not only rekindled interest in vintage cycling but also underscored the cultural and historical significance of these unpaved routes. The event's success spurred a renaissance in cycling tourism, attracting enthusiasts worldwide to traverse these historic paths. Building upon this momentum, the professional race "Strade Bianche" was introduced in 2007, further elevating the global profile of the typically Sienese strade bianche (white roads). Collectively, these events have been instrumental in safeguarding these roads from modernization pressures, ensuring their maintenance and integration into the region's tourism infrastructure. As a result, the white gravel roads have transitioned from symbols of rural poverty to celebrated assets of cultural heritage, exemplifying the profound impact of sport in heritage conservation (Salvi, 2025).

4. Sports and the Illusion of Regeneration: Tour de France VS Olympic Games

4.1 The Tour de France: a transient economic engine for rural territories

The Tour de France is not merely a sporting event; it is a national liturgy, a celebration in which France watches itself unfold across its own landscape, recognizing its villages, its roads, its past. The Tour serves as a metaphor for the traveller, who, driven by the spirit of exploration, navigates the unfamiliar while finding reassurance in familiar elements. The race transforms the nation into both stage and spectator, an ever-shifting panorama in which movement and place momentarily converge. As the peloton advances, towns and villages—typically quiet and unremarkable—are briefly elevated to sites of national significance, only to fade back into obscurity once the race moves forward. This transformation is ephemeral; the momentary spectacle vanishes as quickly as it arrives, leaving behind echoes of excitement without lasting change. Meanwhile, spectators remain both stationary and in motion, following the unfolding narrative from afar. Through their gaze, they traverse landscapes that shift between proximity and distance, recognition and elusiveness. If tourism is more than a practice of mobility but an act of territorial transformation (Aime & Papotti, 2012), then competitive cycling exemplifies this dynamic (O'Brien, 2018).

Economic and Infrastructural Investment
The Tour de France generates direct economic benefits, particularly in hospitality, retail, and tourism sectors. In 2023, it generated €4.35 million in economic impacts related to tourism for the Finistère region. The costs for local administrations include the entry fee (up to €3.6 million for the Grand Départ), along with investments in infrastructure, tourism promotion, and logistics, amounting to approximately €3.3 million, of which €2.8 million was covered by local authorities (Adeupa-Synthese-impact-TDF, 2023). However, while Alpine and Pyrenean stages benefit from sustained cycling tourism, smaller towns struggle to capitalise on the event's momentum (Gallagher, 2017). The Grand Départ 2024 of the Tour de France, hosted in Italy, highlighted the significant economic impact of the event. The Italian stages, passing through cities such as Florence and Bologna generated a total economic impact of approximately €17.26 million for the Piedmont region. The Tour brought direct and indirect economic benefits to the region, with visitors spending estimated at over €8.97 million. The influx of spectators was estimated at 75,000 leading to a significant increase in tourism demand and hotel bookings across the region (Rizzi & Sorano, 2025). Cities hosting the Grand Départ experience long-term tourism benefits: in 2019, Brussels welcomed approximately one million visitors during the event, further strengthening its position as an international tourist destination.
According to the Visit Brussels Annual Report, the hospitality sector recorded an increase in occupancy rates, while tourist attractions surpassed five million visitors over the year.

Challenges of Long-Term Tourism Growth
Despite these financial gains, rural municipalities frequently struggle to sustain tourism activity after the race. Many lack the necessary infrastructure and marketing strategies to maintain visitor interest, resulting in short-lived economic gains (Richards, James & Halkier, 2024). While iconic climbs like Mont Ventoux maintain year-round cycling tourism, smaller host towns experience declining visitor numbers once the Tour concludes (Faure, 2024).

Although the Tour does not require stadium construction, it entails significant infrastructure investments. In 2024, €30 million was allocated to road resurfacing and cycling infrastructure improvements, alongside public transport upgrades to accommodate spectators (Ricordel, 2023). However, these investments present financial risks for smaller municipalities, as maintenance costs often outweigh long-term benefits (Chaboche & Faure, 2024).

5. The Paris 2024 Olympics: Infrastructure, Economic Speculation, and Urban Transformation

Unlike the Tour de France, which spreads its impact across multiple regions, the Olympic Games concentrate investments within a single host city, leading to significant transformations in urban infrastructure and governance. The Paris 2024 Olympics have been promoted as a model for urban sustainability, with 95% of the infrastructure being existing or temporary, 100% renewable energy usage, and strategies aimed at reducing carbon emissions by 54.6% compared to previous editions (Paris 2024 Sustainability & Legacy Report Summary, 2024). However, past Olympic experiences suggest that such projects frequently fail to provide long-term value, leaving behind underutilized infrastructure and financial burdens (Maennig et al., 2024). Seine-Saint-Denis, a historically marginalized district, was presented as the primary beneficiary of Olympic-related investments. The Olympic Village, designed to house 14,250 athletes, is set to be converted into 2,800 apartments for approximately 6,000 residents post-Games. Additionally, €1.4 billion was invested in decontaminating the Seine to allow open-water events, an initiative expected to transform the river's environmental status (Doustaly & Zembri-Mary, 2024). Despite these initiatives, several economic concerns persist. Hotel occupancy during the Games reached 80%, lower than previous editions such as London 2012 (90%) and Rio 2016 (94%) (INSEE, 2024). While the Games were expected to attract 15 million visitors, actual numbers were significantly lower, with international tourists making up just 10% of total attendees (Delaplace & Schaffar, 2022). Airbnb rentals surged by 400%, exacerbating an already volatile housing market and driving up rental prices by 40% compared to pre-Olympic levels (Gignon & Delaplace, 2022). The Olympic urbanism model has historically been associated with urban displacement. Beijing 2008 displaced 1.5 million residents, while Rio 2016 forcibly removed over 60,000 people (Wang, 2024). In Paris, Olympic developments accelerated gentrification, particularly in Seine-Saint-Denis, where real estate speculation has already begun affecting long-term housing affordability (INSEE, 2024).

6. Conclusion: The Fragility of Sports Tourism as a Regenerative Force

The broader role of sports tourism – from amateur cycling initiatives to large-scale spectacles – illustrates its potential to foster economic revitalization, cultural engagement, and sustainability. Yet, these outcomes depend on structural planning, local investment, and the integration of sports-driven tourism into broader strategies for sustainable development. Without these elements, sports events risk reinforcing ephemeral economic cycles rather than fostering lasting transformation.

To move beyond short-term economic gains, sports tourism must be reimagined as a long-term regenerative force. This requires policies that balance economic impact, social inclusivity, and environmental sustainability, ensuring that tourism-driven territorial transformation benefits both urban and rural communities in meaningful and enduring ways. Recent industry data reveal a dichotomy between global market instability and local opportunities in cycling tourism.

While brands like Giant report a 20% sales drop and price increases by Trek and Specialized raise concerns, regional contexts suggest resilience. Halfords recorded double-digit sales growth in the UK, and Italy's 2025 Cycle Tourism Forum in Bologna highlighted rising institutional and entrepreneurial interest. These findings suggest that despite systemic tensions, cycling tourism retains strong regenerative potential, especially when grounded in place-based strategies, networked governance, and sustainable practices, rather than dependent on the volatile logics of globalized manufacturing.

In 1957, Roland Barthes was already warning us about the complexity of major sporting events:

> "What is flawed in the Tour is the base, the economic motives, the ultimate profit of the event, generator of ideological alibis. This does not prevent the Tour from being a fascinating national fact, insofar as the epic expresses this fragile moment of History where man, even clumsy, duped, through impure fables, nevertheless foresees in his own way a perfect adequacy between himself, the community and the universe". (Barthes, 1957, p.111)

Figure 1. The 2024 Tour de France route was exceptional, featuring the Grand Départ in Italy for the first time, in the city of Florence, and an unprecedented finish in Nice instead of Paris, as per tradition. This decision stemmed from the impossibility of overlapping the two major sporting events of the year: Paris was already fully prepared for the imminent start of the Olympic Games. © NABA - DRAFT Department of Research and Faculty Training

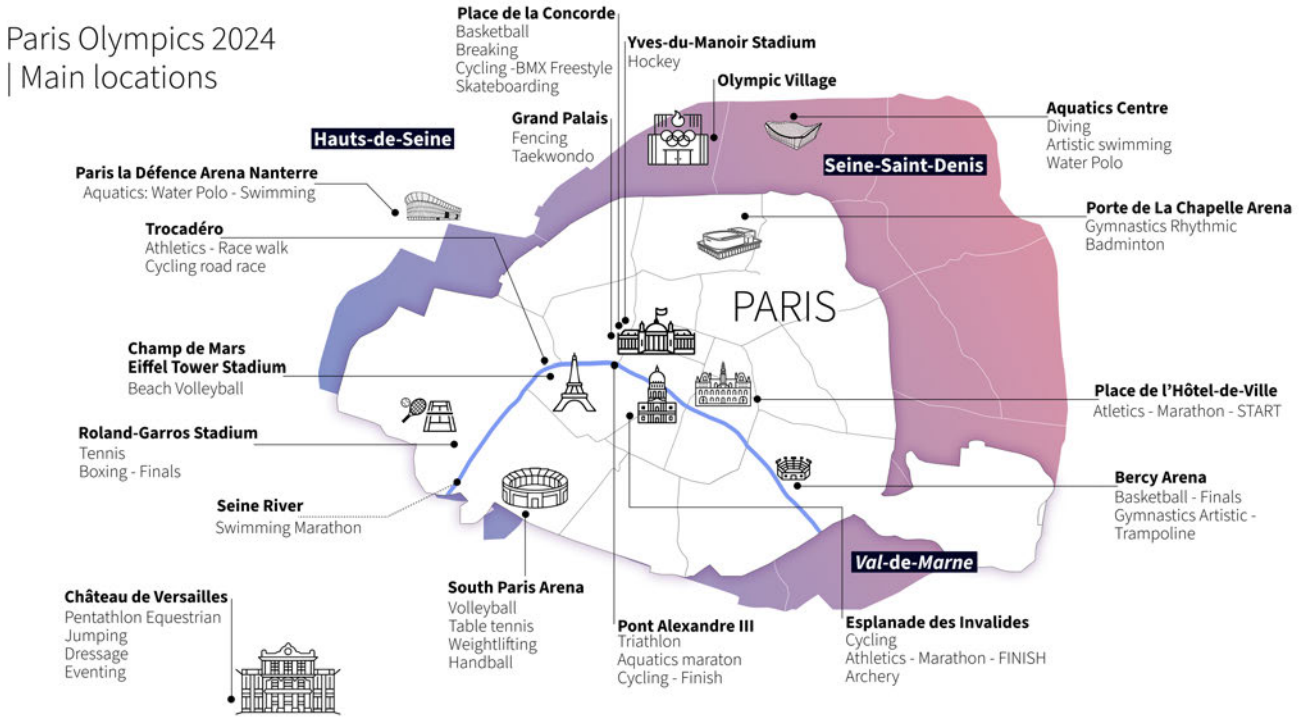

Figure 2. Distribution of the main Olympic venues within the city of Paris and its surrounding areas. The iconic status of the Ville Lumière is enhanced by the decision to transform the city's landmark buildings into temporary venues for the Games. The most exceptional and debated effort is not visible on the map but concerns the city's river infrastructure: the Seine. The water purification process came at an extremely high cost and was not fully completed by the start of the Games, as evidenced by the respiratory difficulties experienced by triathletes who swam in its waters. © NABA - DRAFT Department of Research and Faculty Training

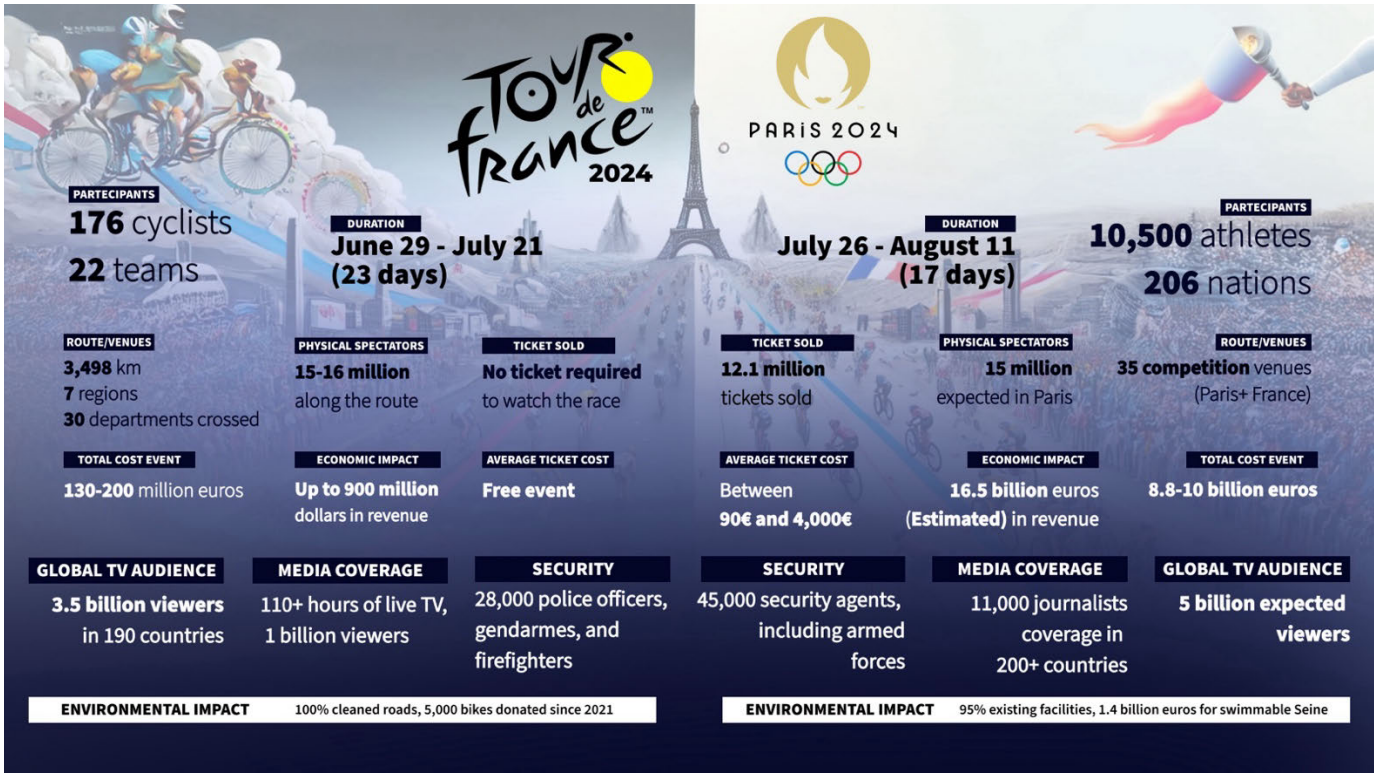

Figure 3. The comparison of data between the two events in question—the 2024 Tour de France and the Olympic Games—is clearly partial and incomplete. This is not due to a lack of time or willingness on the part of the author(s) to complete the research, but rather to a lack of transparency in the available information. Particularly regarding the Tour, the organising company A.S.O. does not make many relevant data publicly accessible for a specialised study on territory and regeneration. © NABA - DRAFT Department of Research and Faculty Training

BIO-DESIGN AND INNOVATION INSPIRED BY NATURE. REGENERATING TERRITORIES AND ECOSYSTEMS THROUGH DESIGN

Úrsula Bravo

Universidad del Desarrollo
ubravo@udd.cl

ABSTRACT | Recently, creative industry professionals, especially designers, have launched initiatives to develop bio-inspired innovations to reduce the environmental impact of current production and consumption models. Central to these efforts is the research and advancement of bio-based and bio-manufactured materials, providing a sustainable alternative to traditional extractivist economies while promoting local productive autonomy. Acknowledging the growing interest of designers in spearheading and engaging in such initiatives, we compiled a special edition of *Base, Diseño e Innovación* magazine to highlight a range of bio-design projects. This effort aims to increase visibility, foster collaboration on both national and international scales, and strengthen ties with academia, industry, and innovation ecosystems. This submission will address the project's background, outline the editorial proposal, and present the publication in print format.

KEYWORDS | BIODESIGN, BIOMIMICRY, REGENERATIVE INNOVATION, EDITORIAL PROPOSAL

1. Project Background

Over the past decade, designers and creative professionals have developed bio-inspired innovations to minimize the environmental impact of production and consumption. These initiatives apply biological principles to create sustainable materials, products, and services, promoting regenerative design.

Biomimicry, bioinspired design, and biobased design are approaches that take nature as a model, mentor, or measure to solve human problems. Biomimicry imitates biological processes and structures to create sustainable solutions. Bioinspired design draws aesthetic or functional inspiration from natural forms, without necessarily replicating their principles. Biobased design directly uses biological materials or systems. Key figures include Janine Benyus, who popularized biomimicry; the Biomimicry Institute; Neri Oxman, a pioneer in biological design; and studios like Festo and Michael Pawlyn, who apply these principles in architecture and technology.

A key focus has been the development of bio-based and bio-manufactured materials as alternatives to extractivist economies, fostering local autonomy and circular production. Regenerative design is an approach that goes beyond sustainability: it not only seeks to minimize negative impact, but to restore, renew, and revitalize natural and social systems. It is based on the idea that humans can be a positive force in the environment, creating solutions that regenerate ecosystems, strengthen communities, and improve the health of the planet.

Recognizing the growing interest in bio-design approaches, *Base, Diseño e Innovación* magazine published a special edition showcasing various global experiences. The project aimed to increase the visibility of designer-led bio-design initiatives, fostering national and international collaboration with academia, industry, and innovation ecosystems. Aligned with Chile's Policy for the Promotion of Design, this effort also supports cross-sector collaboration and the internationalization of Chilean design.

Base Diseño e Innovación is the academic magazine of the School of Design at Universidad del Desarrollo. Its mission is to highlight the role of design as a catalyst for innovation, driving processes that enhance quality of life and create social, economic, and cultural value. It fosters interdisciplinary academic dialogue, engaging key stakeholders from academia, industry, government, and civil organizations, as well as professionals and scholars from all areas of design. The magazine includes sections such as Perspectives, Cartography, Interviews, Opinion, Showcase, and Degree Projects. Besides, it features a refereed research section accessible through an open OJS platform.

2. Editorial proposal

Andrés Couve—the Chilean first Minister of Science, Technology, Knowledge and Innovation (2018-2022)—claims that when addressing the production and application of knowledge for tackling complex problems an interdisciplinary approach is essential. He

recognises that designers and scientists have different mindsets, methodologies, and disciplinary cultures, which often complicate convergence.

Alejandro Weiss and María José Besoain review the trajectory of the Valdivia Biomaterials Laboratory (Labva), which began in 2017 in an abandoned kitchen. Using a trial-and-error approach that blends curiosity with basic scientific methods, the lab promoted collective learning and collaboration with DIY and Open Hardware biomaterials communities. Later, it embraced virtual communication, strengthening connections across Latin America (Figure 1).

Figure 1. Nurturing a biomaterial movement. Perspectives on biomaterial practice in Latin America based on the experience of Laboratorio de Biomateriales de Valdivia (Labva).

Pilar Bolumburu and Alysia Garmulewicz, from Materiom, argue that advancing biomaterials requires more than technical development; it demands transformation across all stages of production. Hence, a broader network of specialists in different areas is needed to collaborate across the entire chain (Figure 2).

Figure 2. Materiom. Technology, nature, and community for a resilient future

Sofia Duarte and Valentina Rognoli explain that MaDe/Trans promotes a materials design approach to catalyze positive impact, encouraging experimentation with alternative resources, emerging materials, processes, and traditional or enhanced techniques. Their researchers aim to understand natural processes and materials to inspire new processes and applications (Figure 3).

Figure 3. Material design for transition. Practices and materialities for ecological balance and regeneration.

Jimena Alarcón interviews Carmelo di Bartolo, who explains that in bionics, designers use reverse engineering to understand natural systems and identify functional mechanisms for their objects (Figure 4).

Figure 4. Interview with Carmelo Di Bartolo. Bionics and Advanced Design.

In the Showcase section, the architect and visual artist Laura Messing presents Moebio, an initiative developing bio-leathers from organic waste and plant by-products (Figure 5).

Figure 5. Art and nature through Biodesign.

About the Author:

Úrsula Bravo is an Associate Professor at Universidad del Desarrollo School of Design (Chile) and the Editor-in-Chief of the magazine and open-access journal Base Diseño e Innovación. She holds a Bachelor's in Design and two Master's degrees in Education and Humanities. She is a PhD candidate in Education at Universidad Católica de Chile. Co-founder of Design Literacy International Network and member of the Design Research Society. For two decades, she has been interested in exploring the relations between design and education.

Care in Urban Design: Reclaiming Identity and Embracing Idleness through the Third Landscape

Niloofar Amini

Institution of Creativity and Innovation Xiamen University
Niloofar.amini@uca.ac.uk

ABSTRACT | In contemporary cities, the challenge lies in the diminishing human scale amidst rapid urban development, creating a tension between extensive development and intimate human experiences. This challenge motivated our design studio to focus on the key themes of Environment, Market, and Reuse. Our project took place in neglected spaces beneath the Yanwu Bridge and Bashi area, where a tourist hub, and the local neighborhood intersect in Xiamen, southeastern Fujian province, China. The local neighborhood, affected by recent tourist-driven redevelopment, struggled with a loss of heritage and identity, transitioning from a fishing community to landlords. To reclaim their sense of identity, they repurposed the idle spaces into a unique public realm, distancing themselves from the consumerist spatial character of the two districts. Our studio, employed a methodology that foregrounds film, mapping, and poetic design gestures to reclaim neglected zones. Drawing from theories of placemaking, landscape urbanism, and decolonial spatial practice, the paper offers a critical reflection on how design pedagogy can resist commodified urban development through idleness, unflow, and situated vision.

KEYWORDS | Third landscape, Idle space, Posthumanism, Decolonizing design, Landscape Urbanism

1. Introduction

In 'Materializing Vision: Performing a High-Rise View,' Jacobs et al. (2012) interrogate the modernist legacy of the high-rise as a window technology. Challenging the passive notion of vision, they introduce the concept of view events—a mode of "active seeing" that resists the architectural tradition of privileging distant landmarks over every day urban experience (Göbel, 2015). This redefinition of view finds resonance in the urban sketches of Leon Krier, who championed a city rooted in historical continuity and human-scale complexity as a response to the fragmentation caused by zoning and functionalist planning (Polis, 2012).

This integrated approach is critical at a time when urban design is increasingly reduced to cycles of production and consumption. Our studio situated design inquiry in Xiamen, Fujian province, focusing on idle or underutilized spaces. Drawing from Aelbrecht and Stevens (2019), we examined how these everyday views can become sites for alternative spatial practices.

We explored themes of Environment, Market, and Reuse, focusing on two districts of Shapowei and Bashi with 150 students of Level 4 and 5 at Environmental Design department. Located beneath the Yanwu Bridge and adjacent to a tourist-oriented fish market, these sites mark a stark threshold between local life and commodified development (Franck & Stevens, 2007). Here, tourism-driven planning reinforces economic disparity while marginalizing local fishing communities and their economy.

2. Literature review

This work builds on the theoretical frameworks of view events (Jacobs et al., 2012), everyday urbanism, decolonial design practices (Huybrechts et al., 2022), and landscape theory (Waldheim, 2016). It also references Michael Thompson's *Rubbish Theory* (1979), and Clément's (2004) concept of the *Third Landscape*. These ideas together form the backbone for our critical rethinking of design pedagogy and urban space.

3. Methodology: from view events to situated vision

This research studio employed an integrated methodology that combined mapping, documentary filmmaking, and landscape-based design thinking to critically investigate idle urban spaces and their overlooked narratives. By shifting the focus from iconic landmarks to everyday lived experiences, the studio encouraged students to challenge dominant visual and spatial regimes, particularly those shaped by consumerism and linear urban development.

3.1 View Events as Critical Provocation

We began by introducing the concept of view events (Jacobs et al., 2012), which we integrated into documentary filmmaking (Gedera and Zalipour, 2021) and then controversy mapping (Silberberger, 2021) to prompt our students to re-examine the urbanity of Xiamen, a coastal city in southeastern Fujian Province, China. Rather than privileging static or spectacular imagery, students were tasked with capturing fleeting, embodied, and everyday views—moments of visual tension between the dominant cityscape and the rhythms of daily life. This approach aimed to cultivate a reflexive visual literacy, empowering students to question the urban space (Haas, 2024).

Examining Xiamen from high-rise vantage points revealed a striking contrast between the scale of vertical development and the intimate, human experiences on the ground. Navigating between its tall towers and modest low-rise dwellings exposed the spatial and socio-economic contradictions of the city. These contradictions were not treated as design problems to be solved but as narratives to be unraveled, forming the conceptual basis for reimagining the city through the lens of unflow and

idleness.

The project sites themselves reinforced these contradictions. Located underneath of the Yanwu Bridge, and adjacent to the bustling touristic shopping district of Bashi, these sites are leftover and partially concealed spaces informally used by the local community for recreation. They stand in stark opposition to the hyper-visible, commercialized space of the city, embodying the economic divide between a flourishing tourist economy and the fragile every day and informal economy. The sites ambiguity—simultaneously marginal and meaningful—became fertile ground for design speculation.

3.2 Video Documentary as Design Pedagogy

To help students unlearn inherited modes of seeing, we adopted a video documentary pedagogy (Gedera and Zalipour, 2021), where the camera functioned not as a passive recorder but as an active agent of inquiry. Following Wim Wenders' idea that film can "move people," (Cited in Haas, 2024) students created 3-minute short documentaries to reveal, and narrate lived realities of the site. These films captured the informal uses, temporal rhythms, and affective dimensions of the site, often revealing insights that escaped traditional analysis. The moving image was thus mobilized to situate vision—to see not from above, but from within.

3.3 Mapping as Situated Knowledge

Following the video phase, students conducted a series of mapping workshops, including video mapping, controversy mapping, and psychogeographic drift exercises. Influenced by Donald Schön's (2017) concept of the reflective practitioner and Silberberger's (2021) framework of controversy mapping, these mappings allowed students to visualize complex, entangled layers of urban life—material, emotional, historical, and ecological. Mapping was not used to clarify or categorize, but to expose and complicate, making visible the hidden logics and affective landscapes of the site.

3.4 Landscape as Counter-Narrative

Finally, the studio reframed landscape not as scenery or surface, but as an active, ontological agent. The landscape urbanism acted as a counter-narrative to the spatial governmentality of modernist design, challenging its top-down way of looking at the city and its neglect of the rhythm and complexity of everyday informal life. Drawing from landscape urbanism (Waldheim, 2016), indigenous cosmologies (Grossman & Miguel, 2019; Jon, 2020), and Deleuze and Guattari's (2005) flat ontologies, we encouraged students to explore design as a collaborative process with non-human actors—soil, shadows, water, wind, and architectural decay.

4. The main argument and its application within the design studio context

In *Materializing Vision: Performing a High-Rise View*, Jacobs et al. (2012) interrogate the modernist legacy of the high-rise as a window technology. Challenging the passive notion of vision, they introduce the concept of *view events*—a mode of "active seeing" that resists the architectural tradition of privileging distant landmarks over everyday urban experience (Göbel, 2015, 119). This redefinition of view finds resonance in the urban sketches of Leon Krier, who championed a city rooted in historical continuity, form, and human-scale complexity as a response to the fragmentation caused by zoning and functionalist planning (Polis, 2012). Unlike nostalgic critiques of industrial modernity, these perspectives offer a constructive alternative: a design ethos rooted in the social, spatial, and material continuity of cities.

This integrated approach is critical at a time when urban design is increasingly reduced to cycles of production and consumption, fragmenting the socio-material experience of place. Instead, architecture, urbanism, and landscape must be understood as co-constitutive elements in shaping everyday life. Our studio engaged with these concerns by situating design inquiry in Xiamen, in the southeastern Fujian province of China, where we focused on everyday urban environments, and particularly on idle or underutilized spaces. Drawing from Aelbrecht and Stevens (2019), we examined how these everyday views can become sites for alternative spatial practices—forms of *communing* with land, resources, and the ordinary.

Guided by the themes of *Environment*, *Market*, and *Reuse*, we critically explored the spatio-economic aspect of the Shapowei and Bashi districts and their surroundings. Our sites, located underneath the Yanwu Bridge and adjacent to the tourist-oriented commercial zone of these two districts, mark a stark threshold between local community life and commodified urban development (Franck & Stevens, 2007). Here, urban planning driven by tourism imposes a model of the "common good" that reinforces economic disparity while marginalizing local fishing communities (Franck & Stevens, 2007, 20).

4.1 Methodological Reorientation: From View Events to Situated Vision

Jacobs et al.'s (2012) "view event" posits a bird's-eye, disembodied perspective of the city—abstract and distanced from the social, economic, and emotional realities on the ground. In our studio, we challenged this detachment by introducing a methodology rooted in *placemaking* (Verschaffel, 2021), emphasizing lived experience, human interaction, and local productivity. Working with 150 environmental design students across levels 4 and 5, we employed a pedagogical framework that began with video documentary as a method of situated seeing. The aim was to unlearn inherited visual regimes and replace them with grounded, empathetic engagements with space.

This "video pedagogy" (Gedera and Zalipour, 2021) positioned film not as a representational tool but as an instrument of critical inquiry. Following Wim Wenders' assertion that film can "move people" (Cited in Haas, 2024), the camera served not simply to document but to *participate*, to *listen*, and to *reveal*. As Foucault (1984) might argue, the students' documentaries disrupted the disciplinary order of urban space, unveiling the tensions between built form and lived reality. These videos did not just reflect; they provoked—a counter-narrative to the dominant urban image and a way to access the emotional, and affective layers of placemaking (Verschaffel, 2021).

4.2 Mapping as Situated Knowledge

Following the video phase, students participated in a series of mapping workshops, where the maps were created based on the videos they produced, rather than directly reflecting the city itself. These were not cartographic exercises in the conventional sense but conceptual mappings that synthesized insights from their film work. Techniques such as video mapping, controversy mapping, and psychogeographical mapping were used to make visible the hidden structures, affective intensities, and socio-economic undercurrents of the site.

Drawing from Schön's (2017) anthropology of design education and Siberberger's *Against and For Method* (2021), we understood mapping not as a neutral tool but as a situated, critical practice. *Mapping controversies* became a way to foreground the agency of the site itself—not only as a geographic location but as a co-author of the design process. It invited interdisciplinary analysis of the links between economy, environment, and culture. Rejecting Bruno Latour's emphasis on media debate (2005), our use of mapping focused on local urban dynamics and residents' embodied concerns in the videos.

What emerged was a nuanced understanding of marginalization of the non-human actors amid modern urban development. The site's proximity to the sea and its historical ties to the fishing economy illustrated how local identity was being eroded not through spatial displacement but through the loss of ecological agency (Franck & Stevens, 2007). This was reinforced in mapping exercises that foregrounded marine life, discarded fishing infrastructure, and informal uses of public space.

4.3 Landscape as Counter-Narrative

Our design strategy responded to the failure of architecture and urbanism to adapt to such fragile, complex conditions. Drawing on decolonial perspectives (Huybrechts et al., 2022), we sought to deconstruct the formalist design language imposed by the globalized, tourist-driven urban economy. Inspired by Grossman and Miguel (2019), we considered indigenous cosmologies that prioritize *being with* rather than *acting on* environments. In this cosmology, nature is not an inert backdrop but an active subject deserving spatial and ethical consideration (Jon, 2020).

This reframing allowed us to treat the landscape not as passive surface or visual amenity but as an agent in its own right. Landscape urbanism, in this context, becomes a tool for resisting cultural homogenization and reclaiming site-specific meanings. Waldheim (2016) argues for the potential of landscape to counter the objectivity of modern urban form and instead embrace processes, idleness, and relationality. In aligning with this view, our design proposals moved away from functionality toward a redefinition of productivity—one rooted in care, repair, and co-existence.

4.4 The Poetics of Idleness: Reclaiming Local Identity Through the Design of Unflow

A pressing question around our two districts—shaped by high land value and commercial ambition—is how to meaningfully intervene in a space and resist commodification. The idle areas in these two districts, seemingly unattractive and without function, became central to our design inquiry. It's very lack of flow, productivity, or visibility is what made it powerful.

Idle spaces are commonly dismissed as "ruins" or "fake real estate" (Mariani & Barron, 2014; Socks, 2014), their existence reduced to failure. Yet, from a design pedagogical perspective, these residual sites possess untapped value. They resist utility, elude beautification, and offer a platform to rethink the spatial narratives of cities. We propose that idleness is not emptiness, but a form of resistance—an invitation to design differently.

The next phase of our studio began by framing these spaces through *The Poetics of Idleness: Visualizing Unflow*, positioning it as a lens for reimagining landscape design. This concept shifts the student's attention from solving or activating space to witnessing and representing its absence of flow—its stillness, delay, and drift. Students were asked to see the idle site not as empty but as full of alternate rhythms, micro-residues, overlooked ecologies, and informal inhabitation. This became the foundation of our design pedagogy.

Students first chose a nearby idle or residual space—beneath bridges, beside walls, or between infrastructural gaps. They conducted non-intrusive mappings: recording soundscapes, plant life, wind shifts, micro-trash patterns, and shadow rhythms. These observations were not measured in traditional metrics, but instead formed a multisensory cartography of neglect. Each student produced a layered mapping titled *More Than Empty*, revealing the idle site's latent vitality and informal order.

In alignment with these workshops, we brought in the concept of the Third Landscape (Clément, 2004) as both ecological theory and design method. It challenges the dominance of programmed landscapes by valuing margins, leftovers, and transitional ecologies. our goal was to transform our space into the loosen space, which aligned with the distinctive characteristics of the local neighborhood. This approach challenges rigid economic categories like those imposed by the market.

The Third Landscape does not refer to traditionally designed spaces such as formal gardens, nor to untouched wilderness or protected natural areas. Instead, it occupies the in-between and often-overlooked fragments of the urban environment—those residual, uncultivated spaces that escape rigid control yet are rich in ecological potential. Characterized by spontaneous biodiversity and ecological adaptability, these spaces resist easy categorization. The concept of the Third Landscape invites a radical shift in perception: it calls for the recognition and integration of neglected or residual spaces as essential components of urban planning and design. By allowing non-human actors to flourish without predetermined function or aesthetic, the Third Landscape challenges normative ideals of beauty, utility, and value in design discourse (Clément, n.d.; Luogo, n.d.).

In our design studio, we employed the Third Landscape metaphor not only ecologically but also

poetically—as a conceptual realm where latent events gather and emerge unpredictably, echoing the unconscious layers of our shared spatial experience (Clément, 2004; Luogo, n.d.). Through this lens, the Third Landscape became both the subject and the method of inquiry, enabling students to challenge dominant narratives and contribute to more inclusive and responsive urban imaginaries.

5. An Examples of Visualizing Unflow: The Dry Stream as Design Gesture

Each student's proposal led to a distinct prototype and case study for the final design. For example, one prototype draws from Chinese and Japanese garden traditions—a dry stream, not as a literal watercourse, but as a spatial metaphor. A dry stream traces the absence of water: a composed void, a silent movement, a memory of flow. This idea resonated with our central theme of unflow—movement without velocity, presence through absence.

The final design challenge centered on composing a Third Landscape Garden—not a garden in the conventional sense, but an assemblage that embraces neglect, informality, slowness, and temporality. The idle site, long overlooked and misused, was transformed not through construction, but through sensitivity. Guided by cultural theory and speculative spatial practice, the student reimagined this residual space as a living composition, rooted in attentiveness and open-endedness.

In response to studio discussions around Bruno Latour's Actor-Network Theory (2005), Michael Thompson's Rubbish Theory(1979), and Georg Simmel's (1998) reflections on the autonomy of ruins, the student sought to reinterpret the site's cultural traditions through the lens of Gilles Clément's Third Landscape strategy (2004). Her controversy mapping process led her to conceptualize a bamboo installation—tree trunks placed beside the site—creating an informal public node for lingering, disconnected from consumption. This gesture linked the street level with the site, where a quiet redesign proposed an *event landscape*, rooted in poetic ecology rather than formal urbanism.

The transformation relied on three key spatial strategies:

- A dry stream gesture, drawn from Chinese and Japanese garden traditions, signifying unflow, pause, or gentle division—not a literal stream, but a spatial metaphor;
- The use of found fragments—bamboo, trash, weeds, broken objects, and shadows—collected from the site and re-situated within the landscape as material memory;
- A single invitational element, such as a perch, a glimmer, or a subtle acoustic signal, offering a moment of shelter or encounter for human and non-human life alike.

This design approach reframed the underneath as a Third Landscape—a space co-produced by human and non-human actors, resistant to fixity, and alive with ecological agency. The dry stream bed, for instance, was designed to receive seasonal rainwater and seeds carried by sea winds, allowing spontaneous vegetation to grow and morph the form of the space over time. In doing so, the student echoed Massey's notion of place as "thrown-together" (2005, as cited in Stevens & Dovey, 2023), emphasizing that places are shaped by multiple temporalities, actors, and trajectories—not only by human intention.

Importantly, the student's intervention restored cultural memory, referencing the lost traditions of local fishermen, while also drawing from the spatial language of classical Chinese gardens. Yet, the design intentionally avoided nostalgia or monumentality. Instead, it proposed a garden of refusal (Jon, 2020)—a counter-practice of waiting, watching, and lightly intervening, where time is allowed to move differently and meaning arises not through planning, but through openness.

Through this strategy, the role of the designer shifted from that of maker to enabler, facilitating rather than dictating spatial outcomes. Designs were expected to remain flexible, shaped by weather, occupation, decay, and growth. This aligns with recent shifts in spatial theory and practice, which suggest that innovation in public space does not emerge from new formal typologies alone, but through new actors, temporalities, and cultural recognitions. The looseness beneath the bridge thus became a

site of possibility—a poetic ecology where incompleteness, informality, and unflow are not problems to be solved, but values to be cultivated.

6. Conclusion

This studio offers a compelling case for how architectural pedagogy can challenge dominant paradigms of productivity, instrumentality, and intervention by embracing idleness, unflow, and situated vision. Rather than seeing idle spaces as failures, students reimagined them as latent territories of possibility—zones where other ways of living, sensing, and designing could emerge. Working within two shopping districts in Xiamen, they learned to resist the urge to fill, fix, or finalize. Instead, they developed strategies of attention, slowness, and co-existence that positioned the site not as a blank slate, but as a complex, living system—full of memory, material fragments, and untapped ecological potential.

This reorientation was not purely spatial; it was also ontological. Drawing on Deleuze and Guattari's (2005) notion of becoming, and inspired by Gilles Clément's Third Landscape (2004), the students explored how idle spaces could give rise to forms of subjectivity beyond the human. In this reframing, agency was extended to non-human actors—plants, shadows, trash, weather, decay—and the act of design became less about authorship and more about hosting emergence. The idle site thus became a stage for multiplicity, transformation, and becoming-other (Deleuze and Guattari, 2005). Through gestures like dry stream installations and ephemeral garden compositions, students engaged in a form of ontological design that challenged established values of order, function, and aesthetic cleanliness.

Theory in this studio was never a prerequisite or a distant lens. It was born of necessity. Each phase of student work demanded a theoretical anchor—one that could amplify what they had intuitively uncovered through drawing, building, and mapping. Whether through notion of "leaving blank" (Zhang, 2022, 35), O'Connor (2018, 15), "liberal carelessness," or De Sola-Morales (1995), advocacy for the weak and residual, theory became a stepping stone from one phase of design to the next. Rather than dictating design, it followed and deepened it. This reciprocal relationship between theory and making is emblematic of research by design: knowledge generated not before action, but through and because of it.

In embracing dry streams from historical Chinese and Japanese gardens, students designed with seasonal openness—creating porous, shapeless morphologies that welcomed seeds, water, animals, and local rituals. These interventions were neither prescriptive nor ornamental. Bamboo poles, repurposed from the seafood-drying tradition, were used not for their functionality but for their ability to evoke site-specific memory. Such gestures resisted commodification, instead proposing a scenographic, ethical, and cultural contribution to the neighborhood. The goal was not beautification, but attunement—a slow and careful noticing of what already exists, what is emerging, and what could be nurtured in time.

This pedagogical approach also challenged hierarchies within the classroom. As the design process unfolded, teaching itself became more responsive, improvisational, and dialogical (Freire, 1970). The studio's emphasis on experimentation and informal exploration meant that instructors were not simply delivering content but co-producing knowledge with students. Each design was treated as a small research experiment, calling forth tailored theoretical tools, critical discussion, and peer reflection. Students were not only designing spaces; they were actively testing pedagogical frameworks and developing their own design philosophies—an exemplary model of student-led, research-informed education.

Ultimately, this studio foregrounds a different kind of design knowledge—one rooted in care, attentiveness, and poetic resistance. It does not aspire to fix the city, but to reinhabit it differently. It does not romanticize idleness, but situates it as a condition for ethical engagement, ecological resonance, and cultural renewal. It reframes landscape urbanism as a discipline that does not just build things, but makes sense of the world, and in doing so, opens new pathways for coexistence, memory, and imagination.

In a time when urban development is increasingly driven by metrics, spectacle, and erasure, the reclaiming of idle spaces through the poetics of unflow offers a quiet, radical alternative—one that honors the fragments, the weeds, the shadows, and the people who linger. It is through these acts of spatial and conceptual care that a truly inclusive, grounded, and generative design can begin.

Communicating Urban Perception: Digital Tools to Inform Urban Regeneration Initiatives

Sabrina Scuri, Marco Quaggiotto
Politecnico di Milano, Department of Design
sabrina.scuri@polimi.it

ABSTRACT

Despite much research on mapping urban perception, such data is rarely used to inform urban regeneration initiatives. Moreover, literature on the subject is mostly focused on data gathering and analysis, with few studies on how to communicate this data to relevant stakeholders. By developing tools to understand people's perception of the urban environment, Design can play a major role in promoting cities' shaping and transformation, thereby linking public authorities and urban planners with citizens.

Research objective: the poster presents an ongoing research work in Communication Design. As part of a multidisciplinary funded project on urban regeneration, this work aims at developing an interactive, digital tool directed to multiple stakeholders (from real estate developers to public authorities) for visualizing, exploring and analyzing multivariate urban perception data (e.g. visual, emotional, cognitive & physiological) to inform urban regeneration initiatives.

THE MUSA PROJECT

Project aim: the Multilayered Urban Sustainability Action (MUSA) project aims at fostering the collaboration between citizens, public authorities and private sector in shaping sustainable urban regenerations policies and interventions.

To achieve this goal, it will develop a set of digital solutions to enable the collection, analysis and dissemination of objective environmental data (gathered from sensors and databases) and subjective personal measures (both psychological - obtained through on-site surveys - and physiological - collected from sensors and wearable technologies) to provide a comprehensive understanding of the human-environment relationship and support decision-making processes at different scales of intervention.

Main data gathered:

ENVIRONMENTAL
- Temperature
- Humidity

PSYCHOLOGICAL
- Emotion (likert-scale)
- Senso of restoration (likert-scale)
- Ease of understanding (likert-scale)
- Nudging exploration (likert-scale)
- Identification of landmarks
- Identification of activities associated with the site (e.g. “social”, “mobility”, “work”, ...)

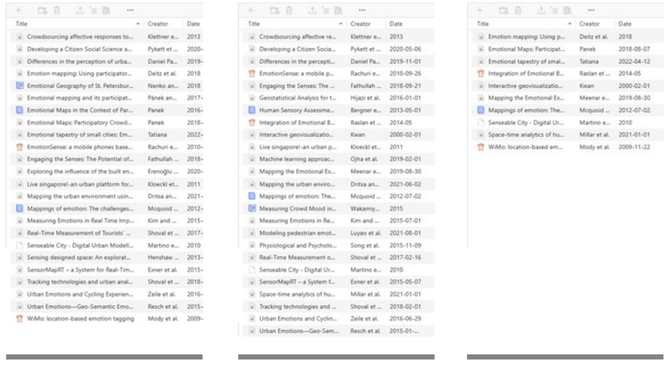
PHYSIOLOGICAL
- Heart Rate Variability (HRV)
- Electrodermal Activity (EDA)
- Eye Tracking

OTHER
- Demographics (age, gender, nationality, education)
- Position (via GPS)
- Picture of the site (taken by participants)

RESEARCH PROCESS AND OUTCOMES

DESK RESEARCH

Literature review on Urban Perception



Focus on Data Gathering: 24 items

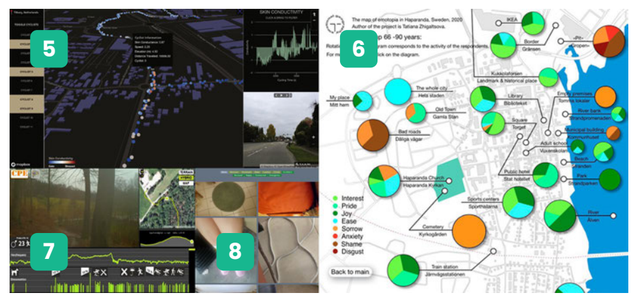
Focus on Data Analysis: 25 items

Focus on Data Presentation: 10 items

Current research mostly focuses on data gathering and analysis, overlooking data presentation.

Case study analysis: visualizing urban perception data

Existing works use few data types and limited typologies of visualization.



Few studies result into interactive tools that allow for data analysis & exploration.

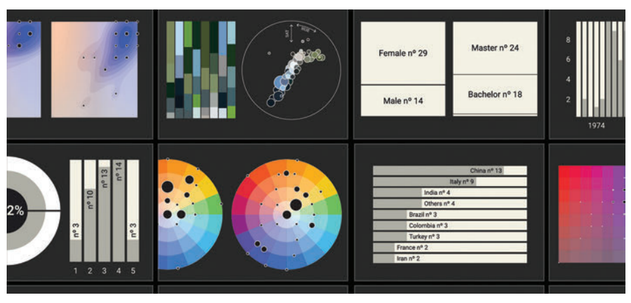
RQ 1: ***How do we represent a rich set of multivariate data through user-friendly visualizations?***

RQ 2: ***How do we design a digital tool allowing data exploration & analysis to diverse stakeholders?***

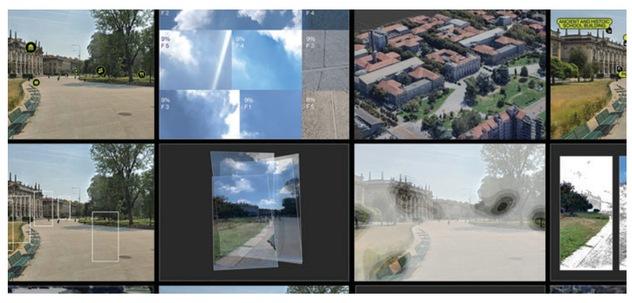
RESEARCH THROUGH DESIGN

Addressing RQ 1: Identification of models for the multimodal representation of the urban environment characteristics and its perception by citizens - objective environmental data and subjective personal measures (both psychological and physiological). Models have been selected considering the different data collection scales.

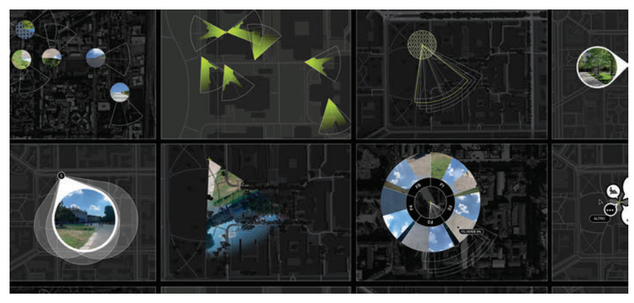
Abstract



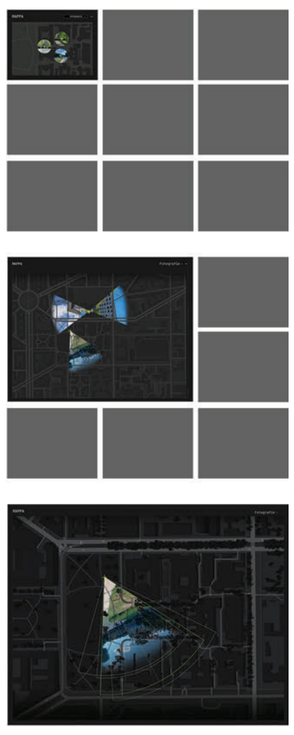
Figurative



Map-based



Addressing RQ 2: design of an interactive, digital tool for allowing multiple users (with different information needs and literacy skills on urban planning) to visualize, explore and discuss urban peception data.



Adaptive modules.

To adapt to different use contexts & information needs:
- Visualizations can scale to include additional data.
- Visualization boxes can be set to different modes depending on the user or the purpose (from "view only" to "interactive exploration" mode).

Flexible layout.
- Users can scale and move modules.
- Users can add comments and notes.
- Users can add sections, building a report-like dashboard that can be saved as a pdf and shared.

What’s next? Data from a pilot study is informing an early dashboard prototype, currently being developed. Effectiveness and usability of the resulting visualizations will be tested using both quantitative (error rate and time on task) and qualitative (interviews, and observations with think-aloud protocol) methods.

Acknowledgments:

This research was realized within the MUSA – Multilayered Urban Sustainability Action – project, funded by the European Union – NextGenerationEU, under the National Recovery and Resilience Plan (NRRP) Mission 4 Component 2 Investment Line 1.5: Strengthening of research structures and creation of R&D "innovation ecosystems", set up of "territorial leaders in R&D".

ABSTRACT |

This paper explores the contribution of design in identifying an accessible, open, and expandable tool capable of communicating and promoting local territories through the enhancement of tangible and intangible heritage, while actively involving communities in the support of design processes. Participatory and co-design approaches are highlighted as effective practices to engage local actors in the development of place-based strategies for heritage enhancement. Within this perspective, design assumes a restorative role (Antonelli, 2019), reinforcing the relationship between people and place, fostering awareness of their interdependence, and enabling synergies between local knowledge and established design methodologies for collaboration and social cooperation toward territorial enhancement (Bujdosó, 2019; Villari, 2012). The investigation into communicative tools and scalable processes for the enhancement of heritage across different types of territories is grounded in a pilot study conducted in a rural inner area of Italy. This area, characterised by natural landscapes, productive agricultural activity, and low population density, serves both as a field of inquiry and a complex design context. Initial desk research and fieldwork led to only partial identification of natural, architectural, and community-based heritage. It was through the identification of "entry keys"—places and people that offer access to primary or secondary sources, understood as "narrative carriers" (Studio Azzurro et al., 2011)—that a deeper understanding of implicit and explicit heritage narratives and traces emerged (Fagnoni, 2018, p. 17). Among the tools promoted by design for territorial contexts, the community map (Filippi et al., 2022; Menzardi, 2021) stands out as a device for translating collective knowledge and local specificities into visual and descriptive representations. These maps act as dynamic archives that document local identity and memory while prompting reflection on past, present, and

future transformations.
The research team identified the interactive digital community map as an enabling infrastructure for surfacing and preserving a plurality of traces—those perceptible signs of what remains over time [...] the core of cultural heritage, layered and identity-bearing for a community and its territory (Fagnoni, 2018). As an open tool, the digital community map supports multimodal communication systems and fosters shared storytelling practices that overcome the limitations of static paper-based mapping. It is specifically designed to engage non-expert audiences through the collaborative sharing of multimedia content.

KEYWORDS | COMMUNITY MAP, PARTICIPATORY DESIGN, CO-DESIGN, RESTORATIVE DESIGN, LOCAL HERITAGE

1. Introduction

The paper explores the contribution of design to territorial enhancement processes, investigating design practices capable of fostering the rediscovery and reactivation of local tangible and intangible heritage, as well as the participatory engagement of communities within a multidisciplinary requalification research project focused on the enhancement of inland areas and involving, in addition to design, urban planning and architectural design.
Participatory and co-design processes can promote the direct involvement of local actors—institutions, associations, cooperatives, residents—and guide the development of enhancement strategies grounded in the specific characteristics of place. Within this perspective, design takes on a "restorative" role (Antonelli, 2019, p. 16), capable of strengthening the relationship between people and places, fostering awareness of their interdependence, and contributing to the regeneration of compromised environmental, social, or cultural balances.
By supporting the creation of meaningful connections between people and place, design promotes the collective well-being and resilience of communities. In this sense, the designer operates as a facilitator and mediator (Cristallo, 2017, p. 16; Manzini, 2015; Sanders & Stappers, 2012; Siani, 2011) of synergistic relationships between lived experience, place knowledge, local narratives, and the integration of situated design methodologies (Franzato, 2009; Morozzo et al., 2023; Parente & Sedini, 2018; Villari, 2012). These interventions generate relational artefacts, systemic services, and collaborative environments (Meroni & Sangiorgi, 2011) capable of initiating and sustaining enhancement processes grounded in the rediscovery and reactivation of local heritage through community participation. These include analogue or digital devices that enable access to structured narratives; infographics, online platforms, site-specific installations and exhibitions that foster direct engagement with the subject; and events or performances that build collective momentum around specific themes, generating social and cultural value and helping shape the identity and potential of places.

2. The research project "STAI Veneto – Slow Tourism for Agrifood Integration"

The research project STAI Veneto – Slow Tourism for Agrifood Integration, conducted between January 2024 and February 2025, investigates strategies for enhancing a rural area in eastern Veneto (Italy) through the design of a ring-shaped cycling itinerary. The

route, located east of the Munich–Venice cycle path (link), interconnects the municipalities of Conegliano, Cordignano, Codogné, and Gaiarine. It aims to promote slow tourism while highlighting the cultural and productive value of local agri-food systems. The area is classified as an inland region and is characterised by natural landscapes, an active agricultural fabric, and low population density.
The research follows an interdisciplinary design approach, articulated through specific disciplinary focuses.
From the perspective of architectural and urban design, spatial scenarios are developed to enhance existing built heritage and regenerate marginal areas, with attention to ecological integration and social activation. From an urban planning standpoint, the project proposes strategies that link cycle infrastructure to territorial enhancement and local development, in synergy with the agri-food landscape.
The design dimension is structured around two core focuses. The first involves the development of a territorial visual identity system, intended to define a scalable and multimodal model that supports both local communities and extraterritorial networks, aligning with existing cultural assets, routes, and products. The second focus—carried out by the authors of this contribution—explores the enhancement of local heritage through the implementation of a collaborative narrative infrastructure, mediated by a digital platform. This tool is conceived to give voice to the plurality of territorial memories, enabling a shared narrative ecosystem through an open, multimodal communication system that encourages community participation and supports continuous content co-creation and updating.
Narratives—translated into situated experiences—trigger mnestic and identity-building processes, both individual and collective, that promote learning and the social valorisation of local heritage as a strategic resource (Bosco et al., 2024).
Following an exploratory phase aimed at identifying tangible and intangible assets through site investigations and community engagement, the design research group identified the community map as a strategic narrative device to convey and reflect the outcomes of the first phase back to both the interdisciplinary team and the local stakeholders.
The analysis of existing community mapping projects—selected based on their affinity with the strategic goals and contextual features of the area—informs the conceptualisation of a digital community map. This tool is intended as an online, scalable platform, characterised by a responsive interface adaptable to different modes and contexts of use (desktop and mobile), and designed to foster accessibility, collective authorship, and the long-term enhancement of territorial knowledge.

3. Community map as a resource for design for territory

Among the tools that have been considered by design for the territory, the community map is a device that enables participatory mapping experiences implemented by local communities with the aim of consolidating their own values, preserving their traditions and fostering development (Cristallo, 2023, pp. 40-41; Filippi et al., 2022; Menzardi, 2021). Since community maps enable the collection and representation of information, knowledge, impressions and details of place, they are particularly valuable for enhancing, recovering, enhancing, preserving, and transmitting local memories, know-how, and lived experiences—fundamental components that shape the identity of a territory and its inhabitants.
Participatory design and co-design practices are frequently employed in the creation and use of community maps (Cerutti et al., 2022), following both systemic (Bistagnino, 2011; Tamborrini, 2012) and strategic (Lupo, 2021) design approaches to address

contemporary challenges related to territorial development and enhancement.
The community map—an adaptable and scalable tool suitable for a wide range of contexts, from densely populated urban areas to remote rural regions, including territories affected by environmental or social emergencies—aims to highlight both the physical features of a place (such as buildings, roads, or natural areas) and its intangible assets, including histories, traditions, local know-how, and social dynamics. These maps diverge from the objective representation provided by analytical geographic maps, which rely on technical language and are often detached from the lived experiences of local communities. Instead, they embrace a participatory approach that activates a system for gathering and preserving cultural heritage that might otherwise be fragmented or lost (Filippi et al., 2022, p. 473).
The representation of territorial heritage developed in collaboration with local stakeholders strengthens the community's sense of belonging and anchors existing traces of the territory onto the map, transforming them into authentic narrative media that are shared and accessible to both local and extraterritorial online communities. As Raffaella Fagnoni (2018) observes,

> "traces are perceptible signs of what remains over time: objects, works of art and craftsmanship, traditions, foods, places, and memories. [...] They represent the heart of a community's stratified and identity-based cultural heritage. They are not simply history, but the living matter of a historical process that prompts questions about their meaning, breathing new life into them. Traces generate reflection and open up possibilities, becoming essential elements of a territory understood as a reservoir of experiences and meanings" (p. 17).

Caterina Madau (2015) approaches the topic of community maps from an economic-political perspective, highlighting their potential as dynamic archives of local knowledge. These maps capture the identity of a place while fostering connections between inhabitants and their territory, thereby reinforcing a sense of belonging. Thanks to their participatory nature, community maps emerge as strategic tools through which diverse fields—such as architecture, anthropology, spatial design, and territorial planning—can uncover hidden resources, activate new relationships among local actors, and support processes of cohesion and resilience. Paola Menzardi (2021) describes community maps as bridges between past, present, and future: while they document collective memory and local heritage, they also encourage critical reflection on ongoing transformations and untapped potential.

4. Towards the STAI Veneto community map

The initial phase of the research, focused on the analysis of the geographical area under study, was aimed at mapping local heritages. This activity led to the exploration and classification of existing resources, as well as the identification of the relevant spheres of reference through which they could be explored.
The categories identified include: the architectural and natural heritage, elements that define and characterise the landscape; the historical and artistic heritage, which can be investigated through documentary and iconographic sources; the social and community heritage, which restores the identity traits of the community through direct evidence and ritual practices of aggregation; and finally, the specific food, wine and craftsmanship features of the area, which can be traced through direct comparison with the local production fabric.
The second phase of the research focused on identifying potential "entry keys" (Castelli et

al., 2005, p. 3)—places and individuals capable of facilitating access to primary and secondary sources that carry explicit or implicit narratives related to local heritage (Studio Azzurro et al., 2011)—as well as on recognising the corresponding tangible and intangible traces (Fagnoni, 2018, p. 17). The entry keys that emerged from the territorial analysis include farms, museums, libraries, local festivals and commemorative events, along with institutions engaged in the promotion of the area's cultural, economic, and environmental resources. The identification of 40 local actors subsequently guided and structured the planning of on-site visits.

4.1 On-site visits to identify sources and resources

The on-site visits (**Table 1**) were conducted to validate the reliability of preliminary findings and to establish direct contact with places and individuals previously identified as potential entry points for tracing specific and original narratives related to local heritage. During the initial three visits, exploratory tours were undertaken to museums preserving elements of local culture, as well as to significant landmarks and community gathering spaces. However, these field trips did not lead to the identification of individuals capable of providing substantial testimonies and information necessary for the development of a comprehensive body of content associated with the heritage sites. Consequently, three additional field trips were organized with the objective of further investigating the identified content and documenting it through video and photographic reportage.

The findings emerging from the in-depth site visits revealed a fragmented and somewhat inconsistent knowledge base. This prompted the need to initiate a dedicated event aimed at eliciting local narratives by engaging key stakeholders actively involved in the area—such as representatives from cooperatives, associations, libraries, museums, and cultural event organizers. The objective was to enrich the understanding of local heritage through the collection of memories, knowledge, and testimonies capable of giving voice to the cultural landscape. As a response, a co-design workshop was convened (Bujdosó, 2019, pp. 42–63; Muratovsky, 2022; Rizzo & Sangiorgi, 2009). The invitation to take part in the workshop was circulated among the representatives of the "entry keys," who subsequently disseminated the initiative within their respective communities of interest.

Table 1. On-site visits plan and objectives.

	Entry keys [places and people that can lead to primary or secondary sources, to "bearers of implicit and explicit narratives"]		**Research areas where identifying traces** [signs of time, potential mediums of narratives]				
	Museums / Libraries	**Institutions**	**Festivals / Local celebration**	**Historical-artistic culture**	**Geography**	**Community**	**Local productive system**
Objectives	Accessing sources related to local heritage.	Deepen the knowledge of local heritages through the perspective of actors actively engaged in the cultural, economic or natural territory.	Participate in community gathering events related to the promotion of local products and traditions. Meet the community and identify contexts in which to promote participatory activities.	Historical Heritage [Historical events, commemoration, historical buildings, archaeological sites] Artistic Heritage [Paintings, films/ videos, sculptures, photographs]	Architectural Heritage [Squares, streets, urban spaces, monuments, civic buildings, religious architecture] Natural Heritage [Landscapes, waterways, parks, geomorphological formations]	Community Heritage [Popular traditions and festivals, social gathering places] Social Heritage [Community associations and networks, people, shared traditions and knowledge]	Enogastronomic Heritage [Local products, traditional crops, markets, food festivals] Craftsmanship Heritage [Traditional craftsmanship, local materials, artisan workshops]

4.2 Co-design for the Enabling of Cultural Spatial Synergies

The workshop was structured in two phases. The first phase, conducted remotely, initiated a process of individual reflection through the completion of a questionnaire by each participant. The second phase, held in person, facilitated group dialogue and exchange, with the aim of enabling the recognition of elements to be acknowledged as shared cultural heritage. The questionnaire consisted of ten open-ended questions. Participants were invited to identify, across various forms of heritage—architectural, natural, historical, artistic, community-based, agri-food, culinary and oenological, and artisanal—the following: distinctive elements shaping the identity of the place; potential carriers of narratives associated with these elements; personal testimonies related to these heritage dimensions.

The first phase involved the participation of four representatives from cultural associations, one representative from a civic library, and three representatives from local museums.

The second phase of the workshop, held in person at the Museo degli Alpini in Conegliano (TV), comprised four group-based activities (Table 2). Given the limited number of participants who had completed the initial questionnaire, this phase was opened to all those who had responded. The first activity involved a personal introduction through a narrative object—an item capable of symbolizing both an emotional and symbolic connection between the participant, their role or affiliation, and the local territory. This exercise helped initiate and guide the ensuing dialogue by framing the participants' identities and clarifying their role within their respective communities.

The second phase of the activity began with the collective presentation and discussion of insights emerging from the questionnaire. This material served as a shared reflective foundation to orient the participatory dialogue. The session was primarily dedicated to the selection of local heritage assets to be featured in the co-designed communication tool for the territory.

This phase also involved a collaborative validation of the associated narratives and a critical reflection on the most suitable media formats for communicating these heritage

elements to audiences beyond the local context. To support this process, participants were invited to visually map and situate the selected heritage assets on a blank geographic map of the area, thus enabling a spatialized representation of collective cultural memory.

Table 2. Workshop: phases, activities and objectives.

	Questionnaire Data collection and synthesis [remotely]	**Co-design sessions** [in person]			
Participatory design : phases and activities	Data collection aimed at contributing to the preparation of the in presence activity and to the bottom-up definition of the territorial knowledge.	Activity 1 Presentation of the participants and their personal connection with the territory through a 'narrative object'.	Activity 2 Graphic representation of heritage elements on a blank map of the area of interest.	Activity 3 Identification of f unvalued heritage and other points of interest.	Activity 4 Anticipating the potential impact
Objectives	Mapping of local heritages identified through an internal and bottom-up perspective.		Selection of local heritage assets to be featured in the co-designed communication tool for the territory.		Interpretation of what value the project can generate for the area. Identification of what actions are needed to activate this value. Collective reflection on how the project can have a concrete impact on the community.
Design	**Design of the process** Design of a participatory design tool for the awareness and enhancement of territorial heritage.		**Design of the system** Definition of strategies to ensure that the participatory design tool maintains its effectiveness over time after its creation, facilitating the emergence of self-sustaining processes and can ensuring the long-term continuity and effectiveness.		

The third activity sought to explore participants' awareness of currently overlooked or underutilized heritage assets deemed worthy of recognition. Using thematic post-its, participants identified a range of points of interest—including agricultural landscapes, rural and former industrial buildings, and sites of religious architecture.
Beyond the spatial mapping of these neglected heritage elements, the ensuing collective discussion also revealed participants' openness and willingness to engage in future initiatives aimed at valorising the local territory through collaborative design processes.
The fourth activity focused on anticipating the potential impact of implementing and promoting the community map. The design intention was to articulate strategies that would support the long-term continuity and effectiveness of this collaborative mapping tool. The aim was, in particular, to stimulate the emergence of self-sustaining processes—capable of fostering durable, positive transformations within the territory and across its communities. Participants were invited to reflect on the anticipated benefits of the project in both the short term (within one year) and the medium term (within five years), with reference to key target groups: residents, institutions, tourists, and the territory itself.
In the short term, the expected benefits included increased awareness of local specificities, the strengthening of networks among residents and associations across the involved municipalities, and the promotion of responsible tourism—though some concerns were raised about the potential risk of fostering superficial 'touch-and-go' tourism dynamics. Looking ahead to the medium term, participants envisioned a more sustainable use of local resources, alongside the development of a community archive of

traditions aimed at safeguarding and transmitting intangible cultural heritage over time.

Figure 1. Participants engaged in the mapping of local heritage during the co-design workshop at the Museo degli Alpini, Conegliano (Italy), October 2024. Photograph by Claretta Mazzonetto.

5. Open Systems for the Knowledge and Enhancement of Local Heritage

Upon concluding the main phase of research—focused on identifying heritage assets, "entry keys," and situated narratives capable of supporting the enhancement of the study area—the research team recognised the development of a community map as a meaningful outcome. This map was conceived as a way to integrate and give value to the plurality of traces collected through diverse narrative media, to support their long-term preservation, and to enable future expansion of the archive as a shared data source for territorial-scale planning. Rooted at the intersection of design, digital humanities, and information visualization for cultural heritage (Formia & Zannoni, 2018; Trocchianesi & Bollini, 2023), the community map is understood as an open tool: one that supports multimodal communication systems and fosters shared storytelling practices. The accessibility (Orletti, 2021), openness, and interactivity enabled by digital artefacts led to the identification of an interactive digital community map as the key outcome of the heritage and narrative mapping process. Thanks to its inherent flexibility, this format overcomes the updateability constraints of static community maps and is specifically designed to engage non-expert audiences by both offering and receiving multimodal content—such as videos, photographs, voice recordings, and digitised documents. In pursuit of an open, widely accessible, and user-friendly system, the research was oriented towards the integration of existing digital and interactive Geographic Information Systems (GIS) with embedded geolocation capabilities.

Table 3. Analytical framework to systematise and process the data collected through the workshop.

Areas of Inquiry and	**Historical and artistic culture**	**Geography**	**Collectivity**	**Productive system**
Place				
Heritage	Historical Artistic	Natural Architectural	Community based Social	Enogastronomical Craft
Traces	Material and immaterial signs of lived time and space, recognized as indicators of memory, identity, and transformation: architectures, artefacts, natural elements, toponyms, practices.			
Media for Trace Narration	Texts; Reproductions; Drawings; Photographs; Images; Video interviews; Video animations; Audio narratives; Geolocated podcasts; Storymaps; Site-specific installations; Interactive infographics.			
Narratives	Situated narratives; Recomposition of dispersed memories; Editing of multivocal content.			
Actions for Enhancement	Participatory workshops and gatherings to collect oral histories and local testimonies; Production of multimedia content; Public events; Educational activities; Development of thematic tourism itineraries; Narrative mapping labs; Co-documentation workshops; Construction of participatory multimedia archives; Public restitution events; Co-design of geolocated narrative itineraries; Interactive environments for enhanced place-based engagement.			
Local actors	Carriers of situated knowledge; Territorial facilitators; Cultural actors; Local mediation agencies such as residents, cooperatives, associations, libraries, museums, event promoters.			
Beneficiaries	Local inhabitants; Tourists and visitors; Scientific community; Online audience.			
Expected Impact	Activation of mnestic and identity processes; Emergence and sharing of situated narratives; Growth of awareness within resident communities; Dissemination of knowledge; Promotion of the territory and local heritage; Enhancement of territorial identity traits; Strengthening of community agency.			
Enhancement	Historical; Tangible; Social; Situated cultural; Landscape-based; Environmental; Artistic.

5.1 Framing and Selection Criteria for Case Studies

To inform the design of a digital, collaborative community map for the inner area of Eastern Veneto, a review of relevant case studies was conducted. These were selected based on shared objectives and the typology of territorial contexts involved. The projects examined relate to marginal areas characteristic of the Italian landscape—contexts in which the researchers had direct experience—where tangible and intangible heritage is at risk of being neglected and relegated to a peripheral or inactive status.

A unifying feature across these cases is the emphasis on participation, regarded both as a goal in itself and as a means through which the potential of territorial representation tools can be revealed and activated.

The selected case studies serve as examples of how to calibrate user interaction within the geographic context—positioned between the production of information for primarily commercial purposes and the creation of cultural content related to places, lived experiences, and local memory. These interventions are aimed at enhancing the communicability of the collected informational heritage, establishing a foundation upon which to build strategies for heritage enhancement at the territorial scale.

At the same time, they illustrate approaches to organising and shaping information in ways that facilitate the rediscovery of shared knowledge, values, and resources—essential for conveying and narrating the territory to a diverse audience.

The selected research projects meet the following criteria: they were initiated in Italy

between 2014 and 2020; they aim to facilitate access to knowledge related to both tangible and intangible heritage; they focus on marginal or marginalised areas; and they involve the development of web-based platforms featuring digital interfaces for the spatial representation of places—such as maps, illustrations, and infographics—that enable access to multimedia content connected to the territory.
The case studies were analysed and compared according to a set of core assets: the geographic areas and types of heritage addressed; the funding bodies and project teams involved; the objectives pursued; the range of actors engaged, including promoters, beneficiaries, and stakeholders; and the outcomes achieved. These outcomes include mapping processes, tools developed to support access and engagement with heritage content, and the participatory strategies adopted. Further dimensions of analysis included the anticipated impact and the feedback gathered over time.
Given that the broader aim of community maps—extendable to other participatory territorial design practices—lies in promoting a mode of use that goes beyond isolated and one-off interventions, this tool is positioned within a systemic and integrated perspective. It is intended to coordinate activities, initiatives, and programs within a more structured and impactful framework, capable of generating a collective impact greater than the sum of individual actions (Menzardi, 2020, p. 5).
Accordingly, one of the key objectives of the analysis was to examine the relationship between the map and the communicative system through which it is disseminated, with the aim of assessing the capacity of the digital mapping and heritage-sharing tool to activate networks of relationships and knowledge exchange.
Within this framework, the study also investigated the role attributed to participation across the selected projects, with particular focus on the methods of engaging local communities and the extent to which bottom-up content production was encouraged as a foundational element of participatory processes.

5.2 Case Study Analysis

Among the case studies analysed, four were examined in depth as they illustrate how the introduction of digital technologies into the experience of place has enabled the experimentation with participatory territorial storytelling and the creation of exploratory itineraries for engaging with specific geographic areas. In these projects, users assume an active role in the narrative construction of place, both creating and interacting with content through processes of rediscovery and enhancement of local heritage.
The selected cases include the Tracciaminima initiative, a participatory project resulting in a hiking itinerary around Lake Maggiore; the Monte Rolla community map, where sampling and experiencing the local soundscape brought renewed attention to the area's historical trail network; the Comuniterràe project, a participatory cultural mapping initiative that reflects the shared identity of localities adjacent to the Val Grande National Park and supports the development of a community-based ecomuseum; and the Metagoon digital platform, which documents and promotes exploratory routes through the intangible heritage of the Venetian lagoon ecosystem.
In all these examples, the map is conceived not as a final output, but as an intermediate result within an ongoing process. It functions as an enabling infrastructure—activating latent resources embedded in place and sustaining longer-term processes nourished by the energy generated through participatory engagement.

5.3 Tracciaminima: A Participatory Walking Project Around Lake Maggiore

Tracciaminima: A Participatory Walking Project Around Lake Maggiore
Launched in 2020 by a multidisciplinary team of young professionals, Tracciaminima is a

participatory mapping initiative aimed at enhancing the transregional landscape surrounding Lake Maggiore through a 230-km walking route. The project fosters slow, responsible tourism and encourages a reflective engagement with the territory through the practice of walking.
The digital map is co-created with local communities, who contribute to identifying and geolocating both tangible heritage (trails, historical sites, landscapes) and intangible elements (knowledge, stories, collective memory). Residents actively participate in territorial narration by submitting photographs, testimonials, and annotations.
The platform functions as an enabling infrastructure, open and expandable, aggregating user-generated content and supporting a multimodal and shared experience of the territory. Supported by the European Solidarity Corps, the initiative formalised in 2023 as a social promotion association, broadening its local presence.
Tracciaminima has fostered collaborative networks among institutions, citizens, and associations, activating place-based engagement and promoting the regeneration of marginalised areas. The official inauguration of the route in April 2025 marked a symbolic moment of public restitution and consolidation of the community ties formed through the project.

Table 5. Case study analysis Tracciaminima.

Tracciaminima	**Motivations/objectives**	**Actors involved**	**Output/Tool**	**Impact**
Year 2020-ongoing	To frame walking as a tool for place-based observation and informal learning, with the goal of enabling local communities to take an active and autonomous role in the co-design and management of cultural and territorial heritage.	**Promoters** **Social promotion association** **Beneficiaries** Hikers Local residents **Stakeholders** Local residents	A circular hiking route mapped as an interactive digital interface, co-produced with the community and enriched with geolocated multimedia content..	**Anticipated Impact** Promotion of slow and sustainable tourism, capable of triggering a change in both travellers/ tourists and local resiudents, favouring the creation of renewed connections between the parties.
Geographical area Lago Maggiore Provincia di Varese Italia				**Feedback** The project facilitated the formalisation and consolidation of social ties activated throughout the process. The route was officially inaugurated in April 2025.

5.4 Community Map of Monte Rolla

Monte Rolla Community Map: From Independent Research to Community Empowerment
The Monte Rolla Community Map project focuses on a mountainous area in the Province of Sondrio, characterised by significant natural, landscape, and cultural values embedded in local stories, agricultural practices, and mountain-based knowledge. Initiated between 2016 and 2017 by an interdisciplinary group of researchers, participatory geography experts, environmental educators, and community representatives, the project employed soundscapes as a medium for interpreting inhabited spaces and identifying heritage elements worthy of recognition and enhancement.
Funded by local administrations and private foundations (such as Fondazione ProValtellina and Consorzio BIM Adda), the initiative resulted in a digital illustrated map, designed as an interactive online tool through which users could access audio recordings and sound-based narratives. These sound traces conveyed tangible and intangible aspects of local heritage and supported new connections among residents, researchers, and visitors.
Participation was framed as a process of community empowerment, strengthening people's relationship with their environment and enabling the aggregation of heritage elements into a shared, transgenerational understanding of place. In 2019, the community map—now no longer accessible online—served as a strategic reference in the revision of the local zoning plan (Menzardi, 2021, p. 207). It also contributed to the restoration of a historic trail network connecting hamlets to the valley floor, leading to new sport and tourism initiatives aimed at fostering broader public engagement with local knowledge.

Table 6. Case study analysis Community Map of Monte Rolla.

Community map of Monte Rolla	**Motivations/objectives**	**Actors involved**	**Output/Tool**	**Impact**
Year 2016–2017	To explore soundscapes as a method for interpreting inhabited spaces and identifying place-based assets for heritage enhancement and territorial understanding.	**Promoters** Local ecomuseum Social promotion association Independent research centre **Beneficiaries** Local residents Visitors **Stakeholders** Local residents Schools cultural Associations Municipal administrations	An illustrated interactive map published online, allowing access to geo-referenced audio recordings and curated soundscapes connected to the territory.	**Anticipated Impact** Integration of multiple heritage layers into a shared narrative that connects the area's cultural memory across time.
Geographical area Province of Sondrio Italy				**Feedback** Restoration of the historical trail network connecting villages and the valley floor, alongside new sport and tourism programs promoting its use across multiple audiences and scales.

5.5 Comuniterràe: Participatory Mapping for a Shared Territorial Identity

Comuniterràe is a community-based cultural project initiated in 2017 by Ars.Uni.VCO – E.T.S. and the Val Grande National Park, supported by the Piedmont Region and the VCO Community Foundation. As part of the European Charter for Sustainable Tourism, the project aims to establish an ecomuseum as a platform for territorial enhancement (Bollati et al., 2023). Engaging around 250 residents across 10 municipalities, the project activated participatory processes to identify material and immaterial heritage elements —festivals, oral traditions, crafts, dialects, and everyday cultural practices (Perlo, 2018). Its core outcome is a set of digital community maps, one per municipality and one collective, accessible via an online platform and organised around selected place-based identity markers (Bollati et al., 2023). Working through thematic groups led by a professional facilitator, the initiative generated an open digital archive composed of historical photographs, local stories, personal documents, and oral histories contributed by residents. These contents are indexed by theme and location, and made accessible both online and via QR codes placed throughout the territory, often linked to community walks guided by local inhabitants (Cerutti et al., 2021).

Public restitution events further reinforced local engagement. Since 2018, Comuniterràe has produced significant impacts: civic activation, uncovering of underrepresented heritage, development of new educational and cultural tourism practices (Bagnati & Perlo, 2018), and the strengthening of networks between municipalities, schools, cultural associations, and citizens.

Table 7. Case study analysis Comuniterràe.

Comuniterràe	Motivations/objectives	Actors involved	Output/Tool	Impact
Year 2017–ongoing	To establish an ecomuseum for sustainable territorial development and heritage safeguarding; to connect municipalities through a shared cultural identity	**Promoters** University research centre (initial) Comuniterràe APS association (since 2023) **Beneficiaries** Local communities (10 municipalities) Online communities **Stakeholders** Local residents Schools Cultural associations Municipal administrations	Digital archive of local heritage; digital community maps; guided walks led by residents; cultural events.	**Anticipated Impact** Sustainable development; territorial cohesion; establishment of a community-led ecomuseum.

5.6 Metagoon: Participatory Mapping for the Cultural and Environmental Safeguarding of the Venetian Lagoon

Launched in 2015, Metagoon is a collaborative mapping project aimed at exploring, documenting, and enhancing the Venetian lagoon—a fragile ecological system and a culturally layered landscape. The project seeks to represent the complexity of lagoon heritage by intertwining material practices—such as fishing, navigation, and land transformation—with intangible dimensions including oral histories, local knowledge, and intergenerational relations.

At its core lies a multimedia digital platform, conceived both as a dynamic archive and a narrative interface. The interactive map enables the geolocation of audiovisual content, interviews, infographics, and downloadable texts. Users can explore thematic paths—ranging from environmental sustainability and industrial development to traditional fishing techniques—positioning the archive as a tool for research, knowledge dissemination, and ecological education (Marcon, 2021).

The project is grounded in a participatory design framework, in which local communities act as co-producers of content. Through interviews, workshops, night walks, and guided explorations, participants contribute to the co-construction of a shared memory infrastructure, strengthening their territorial agency and sense of stewardship.

Metagoon is distinguished by its interdisciplinary methodology and its ability to mediate between local knowledge systems and global environmental discourse. Supported by the TBA21–Ocean Space Foundation and developed in collaboration with civic and scientific institutions (CNR-ISMAR, Here We Are Venice, Laguna B), the project activates a collaborative infrastructure for situated knowledge production and epistemic pluralism (Meschini, 2023).

Over time, Metagoon has become a space for ecological memory and collective territorial imagination, contributing to public awareness of lagoon transformations. Events such as "Water Communities across the Adriatic and Pacific" have reinforced this dimension, fostering dialogue between local and international practices and establishing a transferable model for coastal and insular territories.

Table 8. Case study analysis Metagoon.

6. Conclusions

This study highlights the contribution of design in supporting territorial development processes, with a specific focus on the integration of an open, digital, and accessible ecosystem for the valorisation of local specificities. The analysis demonstrates how design can activate place-based development models by fostering deep synergies between communities and their territories through the promotion of co-design practices. Within this framework, interactive digital community maps have emerged as enabling devices—inclusive, accessible tools that facilitate the articulation of local heritage and narratives, especially in marginal contexts marked by social, environmental, or cultural fragilities.

By activating new collaborative dynamics and surfacing latent territorial resources, community maps stimulate both individual and collective memory processes. They contribute to shared learning around the richness of local heritage and reinforce the relational bond between residents and place.

In the specific context of the "STAI Veneto" research project, participatory and co-design methodologies have been used to explore the potential of local communities as primary agents of territorial activation. Through the mapping of traces and the integration of digital tools in documentation, communication, and dissemination processes, the project has laid the groundwork for design infrastructures that mediate between local narratives and scientific dissemination.

The next stages of the research envision the systematisation of the collected data within an open, digital, and interactive community map, conceived to foster the diffusion of territorial knowledge and to generate long-term transformative impacts—including increased awareness of heritage value, the strengthening of social networks, the enhancement of place identity, and ultimately, the improvement of local quality of life.

The practices described here suggest a vision of design as an infrastructure for cultural and social innovation, capable of sustaining collaborative models that are both adaptable and replicable across diverse contexts.

*silvia.dambrosio@polimi.it

ABSTRACT | The multi-dimensional concept of placemaking represents a significant effort to infuse urban spaces with vitality and a community-centric ethos. However, the specific contributions of design in placemaking processes require further exploration, especially in addition to urban planning studies. This paper reflects on the various contributions of design in placemaking, examining its transformative potential from an educational standpoint. It builds upon an inquiry conducted by the Cumulus Working Group, "Design for Placemaking," which seeks to investigate this field as distinct from architecture and urban planning.

Drawing from a literature review, the paper provides a preliminary definition of design for placemaking as a collaborative process that leverages cultural, relational, and policy elements to enhance communal value and sustainability. A central theme emerging from this definition is the recognition that design for placemaking primarily addresses the intangible and soft aspects of the city—such as the design of services, policies, collaborative processes, and accessible spaces that foster meaningful interactions and relationships. This approach adopts a community-centered, inclusive, and regenerative design perspective.

The paper then presents a selection of results from the inquiry, which collected case studies from design universities worldwide (UK, Canada, China, Spain, Australia, Mexico, among others). These case studies focus on the soft aspects of placemaking rather than its hard, infrastructural components. The intangible dimension of placemaking arising from these case studies is filtered through approaches such as the '15-minute city,' 'more-than-human,' 'service logic,' and 'community empowerment': they contribute to a more holistic understanding of placemaking, extending beyond physical spaces and the traditional human-centered approach.

Although still a work in progress, the inquiry has reflected on the reciprocity of care between urban spaces and citizens, the balance between community involvement and diverse stakeholder engagement, and the relationships between humans, non-humans, and the environment. These reflections are useful to suggest new educational paths for design students. Such paths would move beyond the design of physical spaces to envision how people can meet, work, and live while fostering a sense of community and shifting from mere 'space' to meaningful 'place'—where human and natural systems co-exist and co-evolve over time. While current design curricula may not fully support such programs, this inquiry offers a first step toward igniting a discussion on the need for comprehensive educational frameworks in design for placemaking.

KEYWORDS | PLACEMAKING, DESIGN EDUCATION, SOFT INFRASTRUCTURE, COMMUNITY

1. Introduction

Placemaking has emerged as a transformative concept within the broader discourse of urban development, characterized by its emphasis on shaping the public realm through inclusive, participatory, and community-centered approaches. While traditionally associated with urban planning and architecture, placemaking increasingly intersects with design, that is a discipline primarily concerned with the meaning and quality of the experience of the users, highlighting the role of intangible and relational dimensions—such as culture, collaboration, and shared meaning, indeed—in creating spaces that resonate with people's lived experiences. This paper explores these intersections through the design lens, positioning it as an enabler of placemaking because it looks at urban life's softer, and relational aspects before and beyond the physical interventions.

The inquiry presented here is grounded in the work of the Cumulus Working Group (CWG) on Design for Placemaking, an initiative that seeks to investigate design contributions in this field from an educational standpoint. The CWG aims to establish a shared framework that integrates diverse perspectives, methodologies, and practices, recognizing the potential of design education to foster innovative approaches to placemaking. This collaborative effort is driven by the hypothesis that it would be meaningful to discuss design for placemaking as a distinct area of inquiry and practice. An area that synthesizes insights from multiple design disciplinary fields while maintaining a focus on intangible elements such as community relationships, participatory processes, and cultural narratives.

To achieve this, the research adopts a dual approach: reviewing the existing literature and collecting case studies. The literature review provided an initial exploration of placemaking's conceptual foundations and its connections to design, setting the stage for a collaborative exchange of ideas during the CWG's inaugural meeting at the Cumulus 23 conference in Antwerp (Sedini et al., 2023). Following this, a global call for case studies was

launched to gather insights from educational institutions worldwide, focusing on how design for placemaking is practiced, taught, and conceptualized across different cultural and disciplinary contexts.

This paper is structured to guide the reader through the multifaceted nature of design for placemaking. After this introduction, Section 2 offers a contextual background, synthesizing key themes and definitions from the literature on placemaking and its intersections with design. Section 3 focuses on the case study collection and analysis, presenting the study's preliminary results and highlighting the contributions of design education to placemaking practices, and the recurring themes identified in the collected case studies. Section 4 attempts to draft possible educational implications, reflecting on how the findings inform the development of pedagogical frameworks that support design for placemaking. Finally, some reflections on future directions are proposed, envisioning a roadmap for expanding the discourse and practice of design for placemaking through collaborative and interdisciplinary efforts.

Through this exploration, the paper aims to contribute to the growing recognition of design as a vital force in placemaking, advocating for a holistic understanding of the city as a system of relationships, i.e., a truly regenerative city, while emphasizing the need for educational programs that equip designers to engage with its complexities.

2. Placemaking and Design: Contextual Background

The concept of placemaking has evolved as a multidimensional approach to shaping the public realm, emphasizing the importance of people, community, and sustainability. This section outlines a brief overview of the origins of placemaking and identifies possible intersections with the design disciplines. Lastly, a set of emergent themes is highlighted as they served as the basis for the collaborative inquiry conducted within the CWG on Design for Placemaking.

2.1 Placemaking: Definitions and Origins

Placemaking is broadly defined as a process and philosophy aimed at transforming "*spaces*" into meaningful "*places*" through community engagement and creative collaboration. The literature underscores its roots in the ideas of urban visionaries such as Jane Jacobs and William H. Whyte in the 1960s, who highlighted the need for cities to prioritize human-scale design over car-centric urban planning. Jacobs' emphasis on "eyes on the street" and Whyte's focus on social life in public spaces laid the groundwork for placemaking as a participatory and community-driven process (LeGates & Stout, 2020). The term itself was popularized by the Project for Public Spaces in the 1980s, but its principles trace back to earlier initiatives such as Whyte's 1980 The Street Life Project (1969–1975). These early projects demonstrated how observing, listening to, and involving local communities could create vibrant public spaces tailored to users' needs and aspirations (LeGates & Stout, 2020).

Placemaking is more than an urban design methodology—it is a strategy encompassing public and private spaces' planning, management, and programming. It is rooted in bottom-up processes, encouraging active participation from end users in all design and implementation phases. Schneekloth and Shibley (1995) describe placemaking as a human act of transforming environments into meaningful places where community members engage in thoughtful and responsible actions to create a shared sense of belonging (Buser et al., 2013 in Romeiro, 2017).

Wyckoff (2014) identifies three specialized types of placemaking and two main intervention approaches. The first specialized type of placemaking is *Strategic Placemaking,* aimed at attracting talented workers while creating quality places, creating "talent hubs" and therefore attracting businesses, promoting job creation, and improving the neighborhoods income and quality of life. The specific characteristics and timeframes of Strategic Placemaking projects are slower and bigger in scale, having a bigger impact at the urban level. The second type is *Creative Placemaking*, which refers to a process where partners from public, private, nonprofit, and community sectors collaborate strategically to shape the physical and social character of a neighborhood, town, tribe, city, or region through arts and cultural activities. This approach enlivens public and private spaces, revitalizes structures and streetscapes, enhances the viability of local businesses and public safety, and unites diverse communities to celebrate, inspire, and draw inspiration from one another (Markusen & Gadwa, 2014). The third type is *Tactical Placemaking*, it is derived from the concept of tactical urbanism, also known as DIY urbanism, guerrilla urbanism, and pop-up urbanism. It is described as small-scale, incremental urban design interventions that serve as a foundation for facilitating larger-scale investments (Lydon & Garcia, 2015). This concept implements low-risk trial and error concepts before making greater political and financial commitments. The aforementioned types of Placemaking can be achieved through two main intervention approaches, Projects and Activities (Wyckoff, 2014). *Placemaking Projects* are more permanent types of interventions, while *Placemaking Activities* are less permanent and faster to implement and usually intervene in the "soft" aspects of places.

2.2 Possible Contributions of Design in Placemaking

Design can provide multiple contributions to placemaking, serving as both a process and a tool for fostering connections between people and the places they inhabit. As Manzini, Fuster, and Paez (2023) suggest, designing for placemaking requires viewing the city as a complex system of relationships. This perspective transcends traditional disciplinary boundaries, integrating fields such as architecture and urbanism with emerging domains like service design, interaction design, and graphic design. Such an interdisciplinary approach reflects the inherent complexity of urban systems, which demand the integration of "*hard*" infrastructures—such as physical spaces and structures—and "*soft*" infrastructures, which include relational, cultural, and social dimensions (Landry, 2000). Landry (2000) highlighted that soft infrastructure is particularly critical in this process. It focuses on creating environments that encourage networking, communication, and interaction—what Landry refers to as "third spaces," existing outside the realms of home and work. These spaces are essential for fostering vibrant communities, shifting the emphasis from purely physical developments to cultivating social and cultural connections that enhance the quality and amenities of public spaces.

This duality aligns with Sennett's (2018) distinction between "*ville*" and "*cité*". According to Sennett, the *ville* represents the physical, built environment of the city, while the *cité* refers to the social networks, cultural narratives, and collective meanings that give urban life its depth and vibrancy. Design for placemaking seeks to bridge these two dimensions, ensuring that the tangible aspects of the *ville* are imbued with the relational and cultural richness of the *cité*. By doing so, design creates spaces that support meaningful human interactions and foster vibrant, inclusive communities.

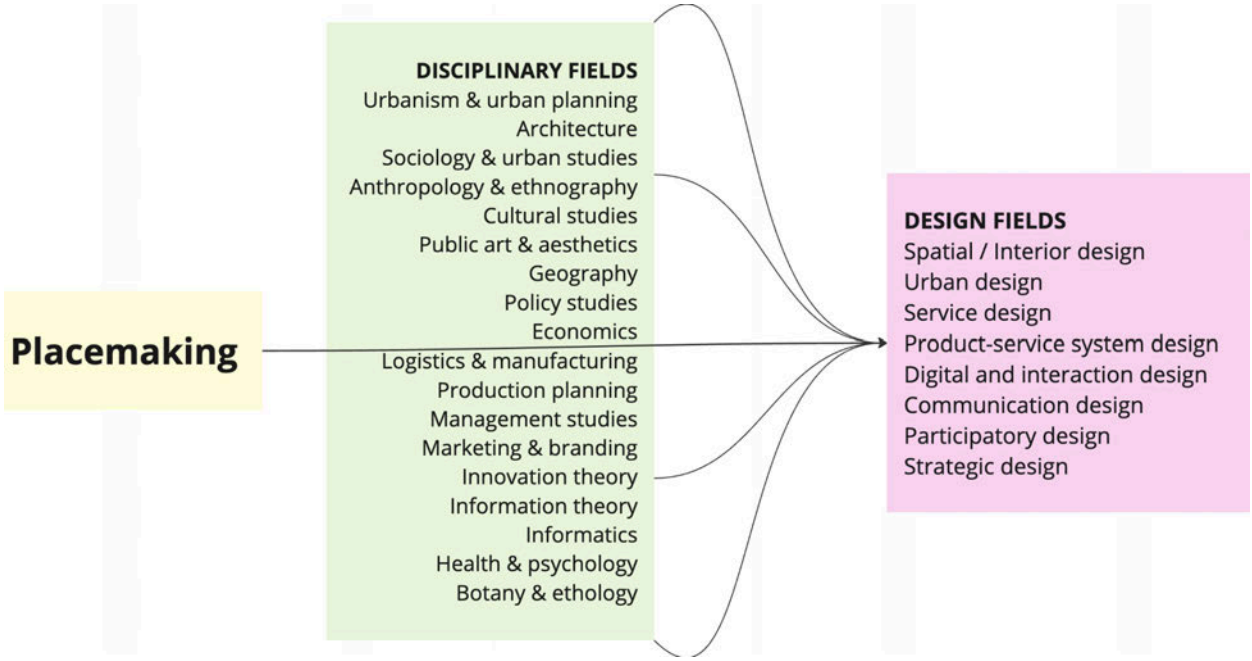

Figure 1. Attempt to position design for placemaking across different fields to explore overlaps and intersections.

The literature review carried out revealed several recurring themes that frame the discourse on design for placemaking. Key aspects among these are:

- **Community-Centricity and Sustainability:** Placemaking aims to maximize communal value and promote sustainability, particularly through socially inclusive practices (Buser et al., 2013; LeGates & Stout, 2020).
- **Participation and Empowerment:** Rooted in collaborative processes, placemaking involves engaging communities in shaping their environments, anticipating or managing conflicts, and so ensuring that design outcomes reflect local needs and aspirations (Schneekloth & Shibley, 1995).
- **Creative and Cultural Integration:** Creative placemaking integrates arts and culture into community development, leveraging these elements as catalysts for urban revitalization and social cohesion (National Endowment for the Arts, 2022).
- **Eventfulness and Social Life:** Placemaking manifests through events and activities, reinforcing the idea that vibrant public spaces are created through active use and engagement (Richards & Duif, 2019).
- **Service design for urban commons: Placemaking has a tight connection with** urban commons, because they can be approached through design. More specifically, they can be, i.e., co-designed and they can find a theoretical framework to address their intangible dimension in the theory and practice of service design (Meroni & Selloni, 2022).

These themes were presented at the inaugural meeting of the Working Group during the Cumulus 23 conference, sparking a dialogue that shaped the group's ongoing inquiry into placemaking practices. This gathering not only established a shared foundation for exploring the intersection of design and placemaking but also set the stage for deeper international collaboration and knowledge exchange. As a premise for the group work, there was the question of whether design, as a multifaceted discipline focused on user experience and meaning, had its own distinctiveness in approaching placemaking, and, therefore, a unique voice.

The broader aim of the Cumulus Working Group was, and still is, to create opportunities for design communities to engage in knowledge exchange and shared reflection. Over the

first year, the focus was building relationships among participants, framing the topic, and cataloging existing initiatives of educational projects and research activities. These efforts were intended to produce a shared, comprehensive framework, as well as collect and review case studies and narratives from across the globe. By focusing on educational contexts, the group sought to understand how design for placemaking is explicitly or implicitly already being integrated into curricula and projects across institutions. This approach provided a grounded starting point, enabling participants to showcase their experiences and perspectives while building a shared knowledge base.

3. The Collaborative Inquiry "Design for Placemaking"

To collect case studies from across diverse educational contexts on the contribution of design in placemaking practices, the researchers set up the collaborative inquiry "Design for Placemaking". This section outlines the inquiry, providing a brief overview of the case study collection and its preliminary analysis.

3.1 Case Study Collection

The case studies were collected through an online survey, inviting design universities and schools to submit projects developed with students. The first call was issued in May 2023 and remained open for seven months.
By this phase's conclusion, 51 case studies were collected from 13 respondent universities across geographically diverse regions, including the UK, Canada, China, Spain, and more. These cases were developed during Bachelor's and Master's programs, thesis projects, workshops, and research initiatives involving students, reflecting the global diversity and interdisciplinary nature of design for placemaking.

Among the 51 case studies submitted through the survey, a significant number came from the same university (Name of the Institution), reflecting a widespread focus on the topic of placemaking. However, despite this concentration and properly balancing this share, the majority of the cases were well-aligned with the key objectives of the CWG, which are:

- Demonstrating a clear connection between design and placemaking practices.
- Representing diverse geographic, cultural, and institutional contexts.
- Involving educational activities or outcomes tied to design disciplines.

The collected case studies were then analyzed using both qualitative and quantitative approaches. Textual and thematic analysis were applied to identify recurring patterns, themes, and insights. Key focus areas included stakeholder involvement, project objectives, methodologies, and impacts. This mixed-methods approach ensured a systemic understanding of the data, capturing both the richness of individual case studies and broader trends across the collection.

The findings from this analysis were first presented at the IASDR conference in October 2023 (Sedini et al., 2023), where a panel discussion provided critical feedback and emphasized the need for further data collection. This iterative process allowed the CWG to refine its inquiry and expand the case study collection, ultimately contributing to a deeper understanding of design for placemaking in educational contexts.

3.2 Case Study Analysis

These results offer valuable insights into how design education contributes to placemaking, emphasizing the different fields of application, stakeholder engagement, and sustainability.

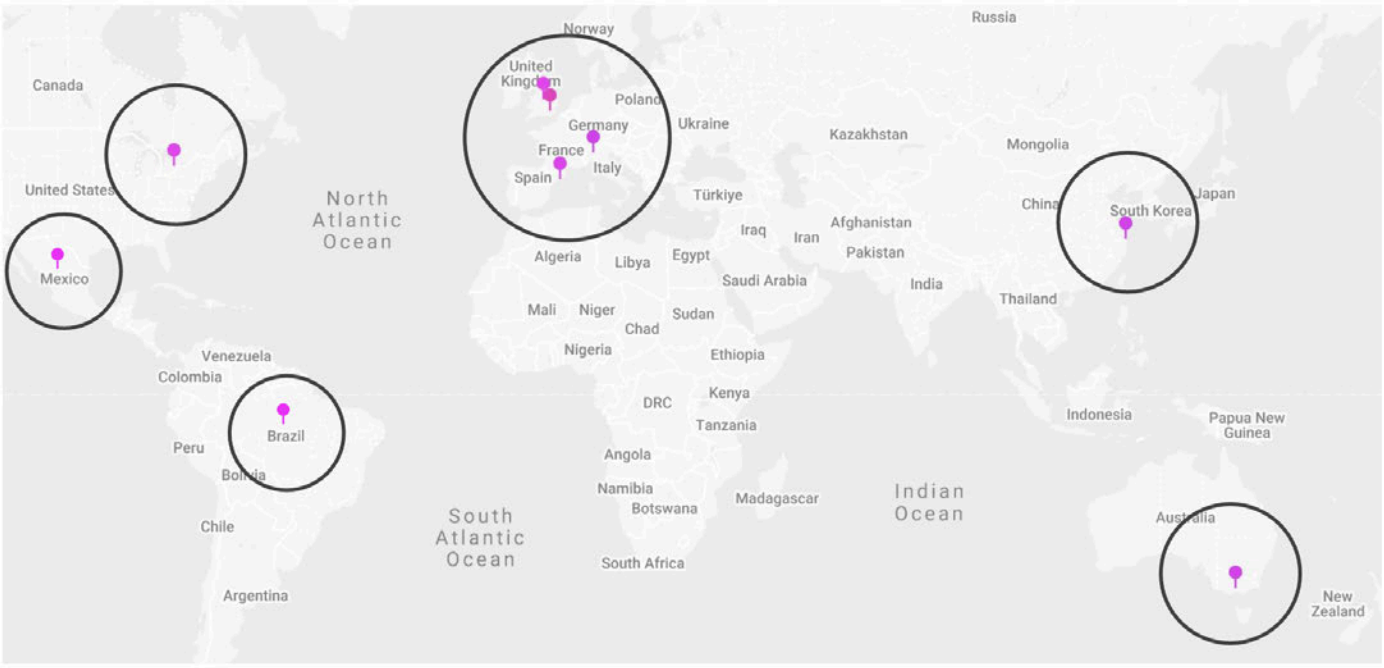

Figure 2. Ranking map of the responding universities. Figure developed by the authors as part of the CWG Design for Placemaking inquiry.

Representing various design disciplinary fields, the submissions highlight significant contributions from spatial and interior design, urban design, communication and visual design, service design, digital interaction, and product design. This diversity underscores the multifaceted essence of placemaking as a domain of design practice. To maintain clarity, the results of the case study collection will be referred to as 'projects.' The term 'project' in our study encompasses student initiatives submitted by respondents as outcomes of their courses and educational programs.

Thematic analysis reveals that the overarching goals of the projects emphasize inclusivity, participation, accessibility, a sense of belonging, and a strong focus on the social dimensions of sustainability. Additionally, the analysis of project descriptions highlights recurring themes such as community participation, social inclusion, heritage preservation, and arts integration. Emerging keywords—such as active ageing, social change, innovation, and reflection—further illustrate these educational initiatives' diverse aspirations and significant impacts.

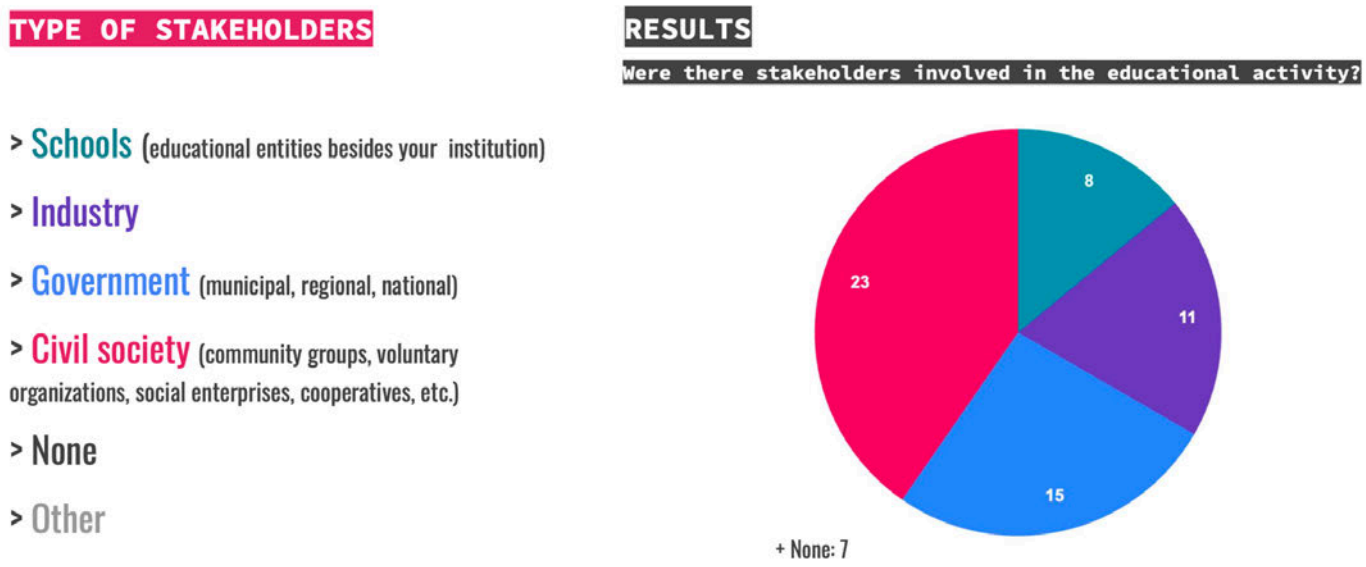

Figure 3. Results for the question: *Were there stakeholders involved in the educational activity? Figure developed by the authors as part of the CWG Design for Placemaking inquiry.*

Stakeholder engagement emerged as a cornerstone of these projects (Fig. 3). Most of them involved multiple stakeholders, including government bodies, civil society organizations, schools, and industries. Notably, only seven case studies reported no stakeholder involvement. This highlights the participatory ethos of placemaking, fostering co-creation and collaboration among diverse actors.

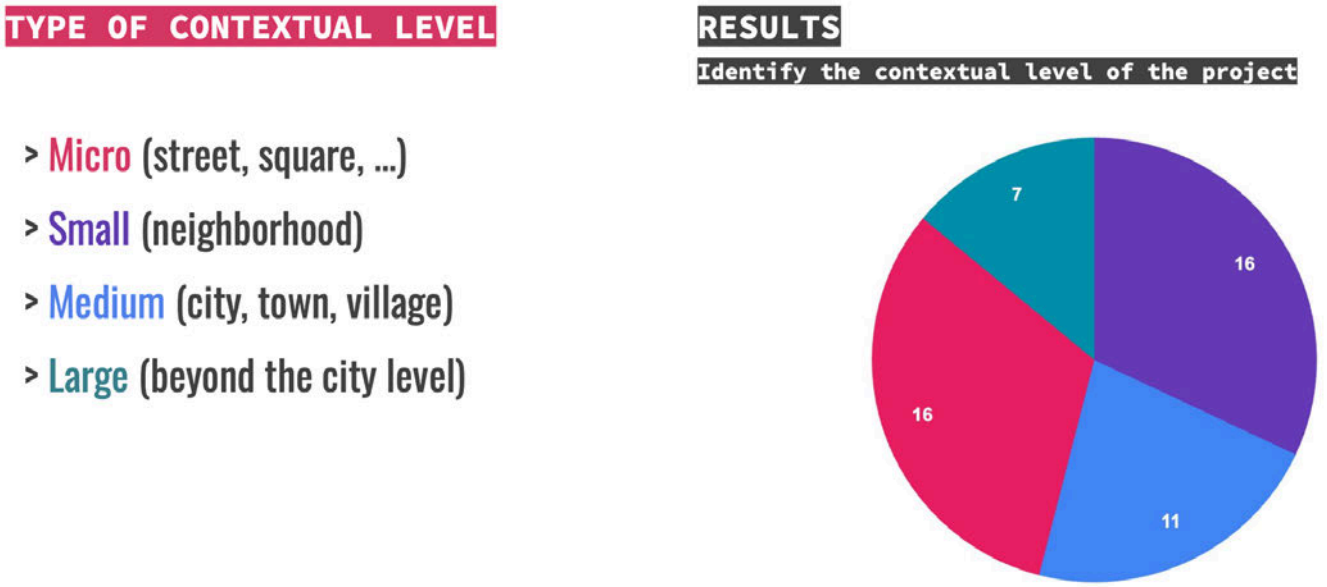

Figure 4. Results for the question: *Identify the contextual level of the project. Figure developed by the authors as part of the CWG Design for Placemaking inquiry.*

The projects strongly emphasize interventions at micro, small, and medium contextual levels (Fig. 4), reflecting the grounded and community-oriented nature of design for placemaking. Large-scale projects were less represented, which aligns with the localized and human-centric priorities of many educational initiatives in this field.

A significant number of case studies reported active involvement of final users throughout the project lifecycle. Specifically, 34 projects included users in the research phase, primarily through interviews and other qualitative methods, while 21 involved them in the

concept generation phase, often through co-design activities. This highlights a strong emphasis on participatory approaches in the early stages of design for placemaking, reinforcing the value of user insights in shaping project directions and outcomes.

Final users were actively involved throughout the project's research, development, and implementation phases (Fig. 5). The research phase predominantly employed primary and qualitative methods, such as interviews, while co-design activities featured prominently in subsequent phases, such as prototyping.

Table 1. Results for the question: *Was the project actually implemented, or will it be implemented?*

Response	**N.**
No	29
Yes and it is still on	10
Yes but it is ended now	6
No but it will	5

Notably, despite the involvement of stakeholders and end-users, most projects did not reach final implementation (Table 1). This reflects the educational focus of these initiatives, which are designed primarily as learning experiences rather than for immediate realization. Nonetheless, some projects achieved temporary or sustained real-world impact, showcasing the potential of educational activities to transcend their original context and deliver tangible results.

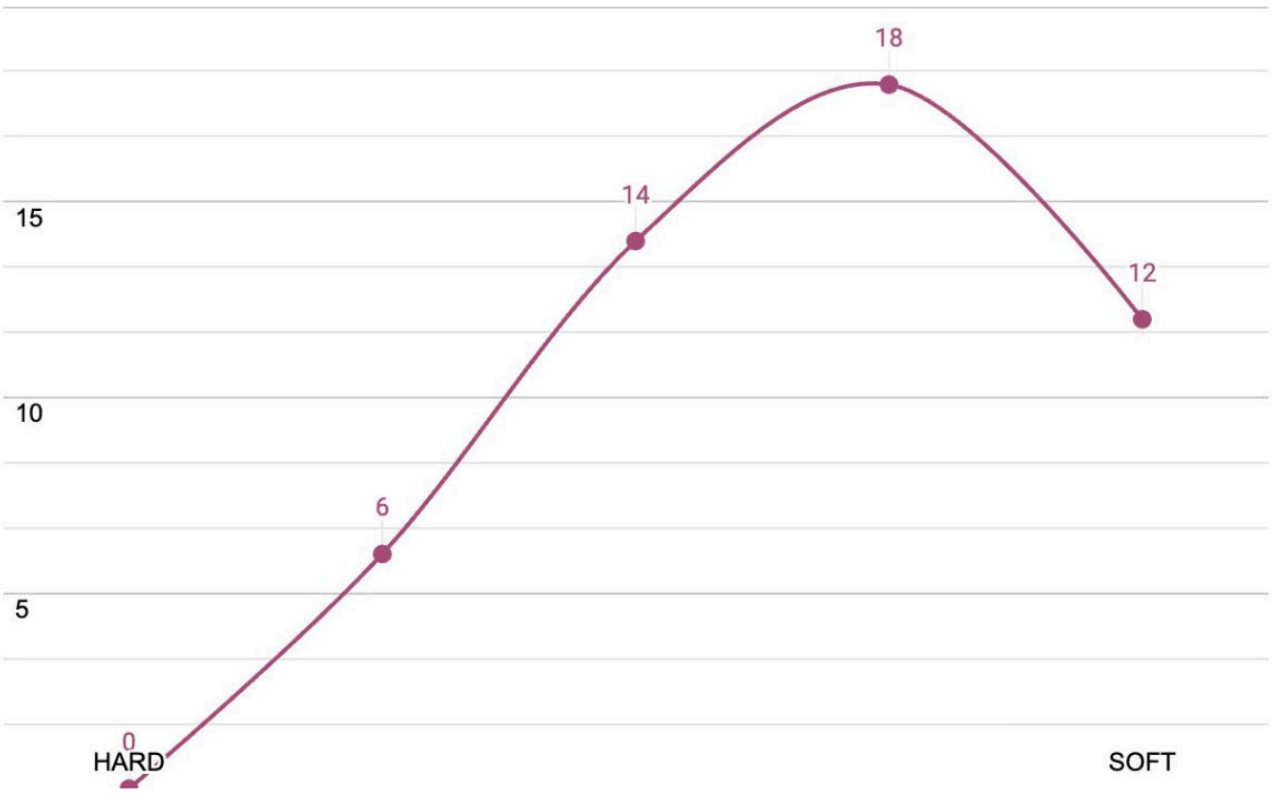

Figure 5. Results for the question: *Did the project focus more on infrastructural aspects (hard) or on cultural, relational, and policy aspects (soft)? Figure developed by the authors as part of the CWG Design for Placemaking inquiry. Figure developed by the authors as part of the CWG Design for Placemaking inquiry.*

A notable observation from the case studies, which recalls the initial discourse about "ville" and "cité", is the distinction between tangible ("hard") and intangible ("soft") outcomes. In fact, while many projects focused on "soft" outcomes, such as fostering relationships or enhancing community engagement, the interplay between these "soft" and "hard" infrastructures is critical to placemaking, because the latter can eventually hinder or enable the former

Before launching the case study collection, the researchers identified a very preliminary, and actually ill-defined, 20 tentative approaches and objectives to define design for placemaking. These were intended as ways of tackling placemaking in design projects, driven by principles, goals or perspectives. They are summarized in Table 2.

Table 2. 20 Key Approaches resulted from the literature review.

	20 Key Approaches	
1	**Community empowerment**	Enhancing local agency and collective decision-making.
2	**Proximity and 15-minute city**	Promoting access to daily needs within walkable distances.
3	**Policy design**	Shaping frameworks that support inclusive and participatory urban development.
4	**Urban transformations**	Driving systemic change in urban structures and dynamics.

5	**Spatial affordability**	Ensuring equitable access to public and private spaces.
6	**Safety and inclusivity**	Designing spaces that are secure and welcoming for all.
7	**Urban regeneration**	Revitalizing neglected or underused urban areas.
8	**Social Entrepreneurship**	Leveraging business models for social and community benefits.
9	**Services**	Designing public or community-oriented service interactions.
10	**Urban spaces (public/private)**	Rethinking how space is shared, owned, and used.
11	**Digital/Spatial interconnections**	Integrating digital tools into spatial experiences.
12	**Citizen activism, guerrilla**	Supporting bottom-up, informal, and spontaneous actions.
13	**Participatory and/or performative art**	Using art to engage communities in place-making.
14	**Participatory design and stakeholder engagement for Placemaking**	Involving users and stakeholders in shaping places.
15	**Tactical urbanism**	Testing small-scale interventions to prompt larger urban change.
16	**Historical perspective and framework**	Embedding historical context into design processes.
17	**Service Logic**	Framing place as a network of value-generating interactions.
18	**Mega events, events**	Leveraging events to activate and transform places.
19	**Multidisciplinarity**	Combining diverse disciplines to address urban complexity.
20	**More than human**	Including ecological and non-human perspectives in design.

At the beginning of the inquiry, the vagueness of these approaches was kept by purpose, to understand if the answers to the survey could have helped disentangle the issue. Hence, the research team decided to share this inquiry with respondents using a Likert scale to address this complexity. Community empowerment, participatory design, stakeholder engagement, and urban spaces and services received the highest ratings (Fig. 7).

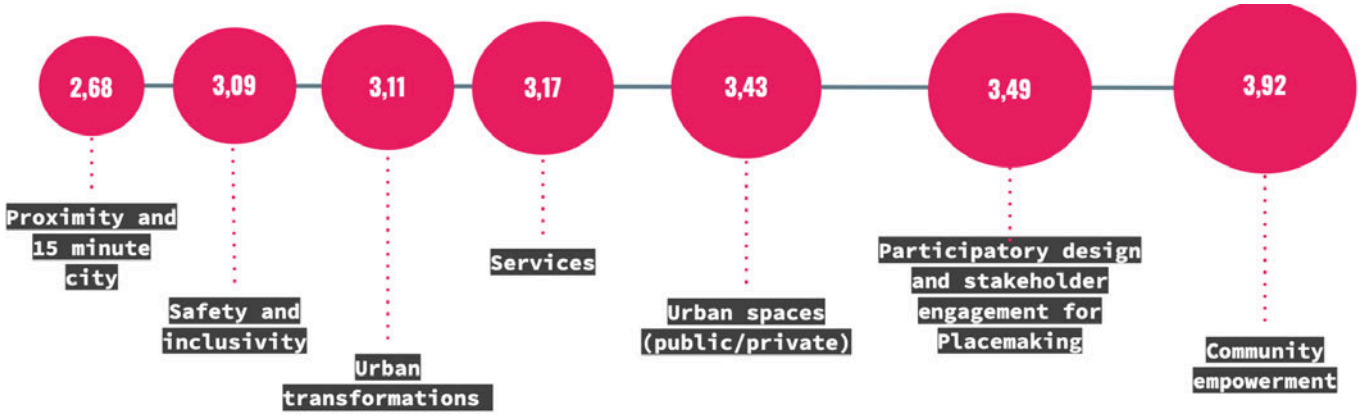

Figure 6. Results for the question: How much does the project consider the following Placemaking perspectives/approaches/objectives? Figure developed by the authors as part of the CWG Design for Placemaking inquiry.

Open-ended responses further highlighted the significance of bottom-up approaches, dialogical design, connectedness, design for remote and rural areas, accessibility, and immersive interaction as essential aspects of placemaking practices.

4. Discussion and Future Directions

Based on the presented case studies analysis, some very preliminary educational implications can be summed up in 3 main possible strategies to be applied in study programs or specific courses that address Design for Placemaking.

First strategy: a focus on users and stakeholders is mandatory. Community engagement emerged as a foundational aspect of successful placemaking projects. According to participatory theory and its application, early engagement is a precondition for fostering community ownership and co-production. Educational activities should include co-creation, participatory design methods, and stakeholder involvement as fundamental competencies that foster a deeper understanding of collaborative dynamics and the social dimensions of sustainability. This aligns with the principles of creative and tactical placemaking identified in the study, where projects originate from people and stakeholder engagement, whether as a result of spontaneous bottom-up initiatives or top-down calls to action. This strategy is particularly important when it comes to project briefs that prioritize community empowerment and spatial affordability goals. Programs should then include specific training on designing (more than) human-centered, accessible spaces through the systematic integration of marginalized voices, so that social equity and safety are actually considered in a project.

Second strategy: the outputs of design projects for placemaking are often of a "soft" kind, that is, interactions and services. For these kinds of artifacts, the design of the "hard" infrastructures is key: physical spaces and environments may foster or hinder certain interactions in a very straightforward way. In fact, they are possible "touchpoints" of service encounters that may happen or not. Service design theory (Vargo & Lusch, 2016) teaches that what matters in service design is the "logic", i.e. the rationale that can connect different artifacts and people for the purpose of providing a service in a use context (Stappers et al, 2023). Accordingly, city spaces can be seen as means for service provision: space embeds strategies, social relations and activities in a dynamic way, and the design of these interrelations together with, or prior to,

the design of the space is a strategy to foster civic engagement and sense of belonging. This is why curricula should strategically balance spatial and service design, teaching students how to integrate physical interventions with strategies that foster servitization, communication, and social interactions in public (or private) spaces. This aspect underscores the multifaceted nature of placemaking, which needs educational programs to integrate multiple design fields.

Third strategy: experiential and field learning must become part of designing for placemaking education programs, so incorporating real-life projects, workshops, and partnerships with local communities and stakeholders to bridge the gap between theoretical knowledge and practical application. While this strategy has proven to be effective across all fields of design, it is particularly demanding and relevant when it comes to urban commons and territorial contexts and requires new competences. On one hand, rapid ethnography is becoming part of every designer's skill set, laying the foundation for solid primary research and fieldwork. On the other hand, this must be complemented by personal relational abilities, social intelligence, and ethical competence, which shape an individual's capacity to understand specific circumstances, situated knowledge, and conflicting interests. Hence, teaching design for placemaking involves developing these abilities in students and creating opportunities for them to practice in real-life settings. For universities and educators, this requires establishing collaborative relationships with local authorities and policymakers, enabling students to gain awareness of territorial challenges and "safely" practice strategic dialogue with real players.

Looking ahead, the CWG aspires to collaboratively prepare a position paper and a set of education formats, and strategies to set a more solid, informed and networked approach to design for placemaking. This work, therefore, will serve as a foundation for future pedagogical developments, fostering a shared understanding of the topic and its multifaceted potential.
In the longer term, the CWG envisions more ambitious initiatives, such as dedicated colloquia, structured exchanges of students and faculty, summer and winter schools, and even international study programs. These aspirations underline the collective commitment to not only explore but also actively shape the evolving field, ensuring its relevance and impact in academic and professional contexts worldwide.

ABSTRACT | This paper explores the notion of the "good life" in design futures, critiquing neoliberal individualism and proposing an ecological, collective, and more-than-human approach. It integrates perspectives from Indigenous philosophies (sumak kawsay), speculative design, and ontological design while incorporating empirical case studies and practical frameworks for implementation. It argues that design should move beyond Eurocentric imaginaries and individualistic future-making towards inclusive, deliberative, and context-specific approaches that acknowledge interdependence across human and non-human actors. In this sense, this article explores how the notion of a "good life" could help to define design practices and the social and political dimension of place making. It also challenges some core assumptions embedded in the notion of future and the idea of design as a world-making practice.

The paper explores the neoliberal approach to the good life, which centers on individual freedom and market success (Brown, 2021). This viewpoint isolates the self from its social and environmental context, suggesting that individuals thrive solely through their own efforts. However, given the climate catastrophe, rising political polarization, and growing inequality, this narrow view seems increasingly inadequate. In this sense, following ideas of Escobar (2019) or Weber (2017), we will argue that we must rethink the idea of a good life, integrating human and non-human relationships, recognizing the deep interdependence between individual well-being and the broader ecological world. This will have a deep impact on design practices as it has been argued in (Álvarez et al, 2024).

Drawing inspiration from thinkers like Gregory Bateson (2000), the paper explores an ecological approach to design. This framework encourages us to unlearn traditional human-centered thinking and reshaping design practices to include more than human concerns (de la Cadena and Balser, 2018). The contribution that this paper makes

revolves around the need to move beyond individualistic approaches, offering a more-than-human way of thinking about the good life. By doing so, the intention is to prove that an ecological approach can be introduced to contemporary design, and that the idea of a good life can guide and shape creative practices towards more plural and integrative ways of worldmaking.

KEYWORDS | Design futures, ecology, more-than-human, interdependence, worldmaking

1. Introduction: Designing Futures

> "Everyone designs who devises courses of action aimed at changing existing situations into preferred ones" Herbert Simon, 1969.

Over the past two decades, since the emergence of so-called speculative design, the notion of imagining futures has gained significant traction within the field of design. Ever since the popularization of the diagram proposed by Dunne and Raby (2013), which suggested that designers should work around possible, plausible, or desirable futures, numerous design contexts and programs have embraced the concept of future-thinking. The idea of being able to influence, shape, or even generate a desired future has undoubtedly been enticing for a field traditionally constrained by briefings, deadlines, and material limitations. A key inference from this framework is the assumption that all possible futures are available for designers to ultimately select the most desirable one. From this perspective, the future might come to be understood as an object of individual preference.

The following article will examine some of the main challenges and issues that design faces when oriented towards the design of futures. To do this, some of the major advances in the field will be discussed, along with the conceptual and political problems that this practice entails. As Ramia Mazé argues, "The future—indeed—has only entered substantially into design discourse relatively recently. Design and other disciplines such as architecture, geography, and geology have long been preoccupied with space rather than time" (Mazé, 2019:23). Despite this, the futurist turn in design is now well established. This can be observed in the growing number of academic programs and educational initiatives in design that incorporate future-oriented perspectives. Notable examples include the Design Futures MDes at the Royal College of Art in London, the Design Futures MA at Lancaster University, the Master of Design Futures at RMIT in Melbourne, and the Speculative Design Futures Certificate at the Institute of Art, Design + Technology in Dublin, to name a few. Recent publications such as *Design and Futures* (Candy & Potter, 2019), *Making Futures Work: Integrating Futures Thinking for Design, Innovation, and Strategy* (Balagtas, 2024) or *Designing Futures: speculation, Critique, Innovation* (Gross & Mandir, 2024) attest to the growth of the subject in the field.

Design researcher Marina Lozada Mondragón asserts that "Design for the future is the term assigned to the grouping of certain traditional and disruptive design practices that enable a more structured, holistic, and above all, distinctive approach to crafting design proposals. These proposals facilitate engagement with the analysis and reflection of

future scenarios, aiming to make effective decisions in the present to bring us closer to the desired outcomes in the future" (Lozada Mondragón, 2024:14). This inevitably raises pressing political questions: What future is preferable? What kind of world do we want to contribute to designing? More importantly, for whom is that future desirable, and who is left out?

As Luiza Prado convincingly argued, a significant portion of speculative design projects reproduce Eurocentric and white imaginaries, disregarding the aspirations and needs of large segments of the global population (Prado Martins, 2014). It is crucial to acknowledge the biases of gender, class, and race embedded in such projects while also examining the stereotypes and lived realities they contribute to legitimizing and perpetuating over time.

The concern for thinking about the future through design encompasses debates on the sustainability of the planet in the face of an unprecedented climate crisis, the role of digital technologies and their hegemonic influence on daily life, questions about the future of public policy and institutional organization, and a rich legacy of projects on urban design, planning, and modes of inhabiting cities. In this sense, when design enters the realm of futurology, it shifts from referring to a set of discrete practices to becoming a preventive mechanism against multiple potential threats—essentially, a broad-spectrum antibiotic. As design theorists Stuart Candy and Kelly Kornet argue, "Efforts to map images of the future have begun to be systematically articulated to a full array of strategies for mediating them, and designers are increasingly exploring futures in the plural as well" (Candy and Kornet, 2019:4). This plurality of futures reflects the diversity of design practitioners, each aspiring to inaugurate a new future embedded in their practices, proposals, and prototypes. The multiplicity of individual worldviews contributes to the proliferation of potential future scenarios.

The challenge, then, lies in articulating collective or shared imaginaries of desirable futures. That is, shifting design practices from speculative exercises that warn about the consequences of present decisions to deliberative spaces where different people or communities can collectively negotiate the kinds of lives they wish to share. In this context, both the spheres in which design can operate and the futures it can generate have expanded significantly. The following section will explore some of the inherent problems and contradictions of linking design to the production of futures.

Ontological Design

In recent years, an ontological perspective on design has gained prominence, a notion insightfully captured by Anne-Marie Willis (2016). From this viewpoint, designed artifacts are not merely representational objects. They are not material entities serving to transmit, mediate, or represent the world. Nor are they mere spokespersons of certain human ideas or intentions. Rather, artistic and design artifacts are ontological entities; they actively contribute to producing the world they inhabit. In this sense, they are objects that deploy politics, consolidate or challenge aesthetics, engage with markets, and either reinforce or contest hegemonic imaginaries and shared sensibilities. As material entities, they shape realities and condition the world in which we live. Only by understanding the ontological dimension of art and design can we grasp how these artifacts both produce and are produced by reality, how they influence and are influenced by the subjects, social contexts, and environmental conditions in which they exist.

Researcher Tony Fry asserts that "There is not a single thing around us that has not been designed. All designed objects have certain consequences, whether minor or major (...). Designers design within a world that is itself the result of design activity, and that in turn

designs their actions and objects" (Fry, 1999:5). This argument builds on an earlier formulation by Anne-Marie Willis, gradually leading to the idea of the designer as a world-maker. If every design artifact has the capacity to shape the world it will inhabit, we must ask: what kinds of worlds do we want to reproduce, and which should we seek to avoid? This perspective aligns with the ideas of Arturo Escobar, who emphasizes the need to move away from the concept of a single, dominant world and instead design for a pluriverse (Escobar, 2018). Challenging Victor Papanek's idea of designing for "the real world," Escobar questions which of the worlds we live in is the most real. If the "real world" Papanek refers to is a modernist and Eurocentric construct, Escobar prompts us to ask, "Can design be extricated from its embeddedness in modernist unsustainable and defuturing practices and redirected toward other ontological commitments, practices, narratives, and performances?" (Escobar, 2018:15). In a similar vein, scholars Marisol de la Cadena and Mario Blaser call for an escape from what they term "a one-world world" in order to design for alternative possible worlds (de la Cadena & Blaser, 2018).
Thus, the ontological perspective compels us to interrogate both the material consequences of design practices and the worldviews we have internalized from a Eurocentric perspective. It urges us to recognize and engage with other suppressed worlds and alternative horizons of desire that have been excluded from the dominant narrative of the world in which we live.

2. The Future as Individual Choice

One of the major issues with future based design practices is that they generally present the future as if it were the result of individual decisions. As if it depended entirely on a demiurge hand capable of imagining, designing, and determining that future. Speculative design, with its use of fiction to alert us or open conversations about the less desirable consequences of consumer objects or contemporary social systems, used the future as a kind of diachronic time that prompted us to empathize with the consequences of decisions made in the present.

Author Wendy Brown has effectively explained the correlation between the proliferation of neoliberalism and the idea that life is determined by individual preference (Brown, 2019 and 2021). For Brown, growing neoliberal individualism poses a threat to democracy, as in this framework, citizens cease to be collective agents and become atomized actors, reducing the capacity for political action against inequality. This hinders deliberative action and jeopardizes the collective ability to debate and find solutions or consensus frameworks for collective problems. Brown argues that this economization of existence erodes the foundation of democratic citizenship and the concept of the common good, leading to the disappearance of "homo politicus" and weakening popular sovereignty. The author contends that this process not only affects individuals but also transforms institutions, such as public universities, which are invaded by neoliberal logic.
It would be important to analyze how much of this logic is transferred in the trend of designing futures. Especially how it materializes in the figure of the individual designer who, through personal preferences, ends up identifying a future scenario as preferable over other possible futures and how it ends up reproducing unipersonal worlds in which the ability to deliberate or debate collectively is absent.

Cultural critic Jaron Rowan has analyzed how an aesthetic fracture has become hegemonic, reproducing the perception that the subject lives disconnected from their environment or the communities in which they were raised and belong (Rowan, 2024). This aesthetic fracture has important consequences in how social institutions are

narrated and organized, ultimately reproducing the fiction of individuality. In this sense, he invites us to "break with the aesthetic fracture that leads us to dissociate culture from other areas such as the political or social. It is key, in this sense, to blur the artificial boundaries that separate the subject from the communities they inhabit and break with individualizing views to understand how cultural practices respond and always occur in specific contexts. This leads us to focus on power relations, economic conditions, and material limitations that determine these contexts" (Rowan, 2024:49). In this sense, the growing trend toward individualization, as analyzed by Brown, is reinforced by an aesthetic bias that obscures the connections and relationships that shape the subject within the world. Rather than viewing history as a dynamic interplay of material, economic, symbolic, and human forces, an individualized and neoliberal perspective may suggest that the future is solely determined by individual choices, detached from the social and material conditions in which they occur.

All of this forces us to rethink the idea of designing futures as a unipersonal activity or one that can be assumed from the design studio. It compels us to reconsider whether behind this idea lies a neoliberalized subjectivity that considers that the future can be articulated in relation to individual preference. This should lead us to think about how the future could be conceived if it is not the result of a set of non-linear decisions, actions, and dynamics over which no individual subject has total agency. This would imply moving away from the narrative of future design as an idealistic activity to force us to rethink the very notion of the future, which can only happen in a non-linear way and not anchored in unipersonal decisions.

3. Future Parliaments

It could be argued that one of the main challenges associated with the idea of designing futures is the lack of deliberative or debate spaces where we can collectively question what futures we want to contribute to creating. When future-making practices become individualized, as we have seen, it may appear that the future depends solely on personal preferences or individual decisions. This detaches the idea of design from the idea of politics, understood as a practice of agreements and tensions between individual wills and collective needs.

Theoretically, scholars have articulated the need to create new discussion forums and deliberative spaces that include the voices of those who have historically remained unheard. In this context, proposals emerge urging us to invite both human and non-human entities that collectively shape their futures into these discussions. The philosopher Bruno Latour famously proposed the idea of a "parliament of things" as a new deliberative space where the needs of non-humans could be addressed and heard (Latour, 1986). This concept challenges narratives surrounding the subject-object divide and the centrality of human agency, deeply rooted in humanist thought. While partially intended as a provocation, this idea reminds us that, in future-making processes, more actors are often excluded than included.

Similarly, philosopher Isabelle Stengers, through her notion of "cosmopolitics," invites us to articulate new forms of politics capable of giving voice to communities—both human and non-human—concerned with the decisions we make about issues affecting our collective future (Stengers, 2010). This notion opposes the idea of a singular scientific truth dictating political decisions, emphasizing the importance of uncertainty and dissent. Consequently, breaking away from regimes of absolute truth and cosmologies centered on rational, Eurocentric visions compels us to articulate heterogeneous ways of thinking and to facilitate dialogue between different worldviews. This perspective leads us to work within

an ecology of practices (Stengers, 2005), capable of integrating diverse ways of understanding and making sense of reality. From this standpoint, speaking of the future—or futures—in a singular sense appears reductive, as every future is articulated within a specific worldview. The ability to integrate multiple worldviews presents a vast and necessary political challenge if we aim to move beyond closed future frameworks dictated by hegemonic imaginaries.

In his recent book *Designing for Interdependence* (2022), designer and author Martín Ávila urges us to bring these ideas into practice by designing for more-than-human worlds. The core concern of his work invites us to reflect on what it would mean to design while considering the needs and possibilities of more-than-human entities and realities. In other words, how would design look if it shifted its focus away from human needs to create spaces for listening to and granting agency to non-human entities? For instance, how could we design with animals or plants? Ultimately, Ávila encourages us to explore and prototype non-anthropocentric design approaches that foreground notions of mutualism, interdependence, and relationality with non-human entities. In this sense, his work serves as an invitation to rethink possible ecologies of design and their articulation within a world marked by heterogeneity and complexity.

Despite the increasing problematization of singular perspectives, in practice, we continue to face a lack of concrete spaces or solutions for collectively deliberating or negotiating the kinds of lives, cities, and worlds we wish to inhabit. The interdependence of life forms and communities compels us to radically rethink who should be present in the design of futures and what kinds of voices, imaginaries, and worldviews should be integrated into such processes. Design researchers as Gabriela Baron have developed interesting tools as the Design4Conservation toolkit, which addresses these issues providing specific methodologies to integrate and take into account different voices and needs. In this sense there is evidence that these debates do not only occur on a theoretical level but there are specific practices acknowledging the importance of non-western ways of thinking and including the voices of more-than-human actors in participatory design projects (Barón, 2023).

4. A Good Life for Whom?

Following the debates above, we argue that in order to reach a consensus on collective futures, we must first revisit one of the fundamental questions of moral philosophy: what constitutes a good life? Despite the significance of this question, few design spaces or critical environments engage with it in all its complexity. In Latin America, particularly in Bolivia and Ecuador, the concept of *buen vivir* (good living) has gained political relevance. As Walsh (2009:214) describes it, *buen vivir* represents "the communion between nature and human beings, and their way of conceiving and constructing life based on complementarity, relationality, and solidarity as an ethic of coexistence and co-living." Though this notion gained political traction and was even enshrined in Ecuador's constitution, it never fully entered political debates in Europe.

There is some controversy over the origin of the term, as evidenced by the Kichwa linguist and analyst Armando Muyolema, who argues that "Sumak Kawsay seems to me the most surprising invention of tradition" (Muyolema, 2019). Nevertheless, it was one of the conceptual pillars that supported Rafael Correa's government.

According to the National Plan for Buen Vivir 2009–2013, Buen Vivir consists of "the satisfaction of needs, the achievement of a quality life and a dignified death, the ability to love and be loved, the healthy flourishing of all individuals, in peace and harmony with nature, and the indefinite continuation of human cultures. Buen Vivir implies having free

time for contemplation and emancipation, and ensuring that the freedoms, opportunities, capacities, and real potential of individuals expand and flourish, allowing them to simultaneously achieve what society, territories, diverse collective identities, and each individual—viewed as both a universal and particular human being—value as a desirable life goal (both materially and subjectively, and without exerting any form of domination over others)."(Vanhulst, et all. 2020).

Questioning whether we are living a fulfilling life pushes us beyond political agendas and into concerns typically explored in moral philosophy. To answer this, we must ask: what exactly is a good life? What defines it? And, more importantly, why is it so likely that we are not living it? To assert that our lives are good, we must feel that they have meaning—that is, we must adopt certain values that guide our actions in a specific direction. These values are inherently social; they shape how we organize ourselves, what we prioritize, and how we relate to others. "El buen vivir" includes human and non-human lives and their interdependence on the basis of a programme for collective wellbeing, challenging liberal ideas of happiness and individual prosperity. This differs from western traditions of moral philosophy in which individual and emotivist versions of what a good life implies have become prevalent (Macintyre, 2020). This is contributing to the difficulty at defining shared values or the ability to define a good life in common.

In this sense, we must ask what a good life is, acknowledging, as ecologist Jorge Riechmann argues, that life must be understood and agreed upon "for all, not just for me or my own" (Reichmann 2024:72). Moving beyond individualistic perspectives is essential for anyone reflecting on the world we want to inhabit and the kind of lives we wish to lead. Opening-up to new cosmologies and ways of thinking allows us to rethink the "cosmo-ecologies" of design, expanding notions of care and well-being (Uğur Yavuz et all, 2024).
A More-Than-Human Good Life

If we cannot define a good life without considering the lives of more-than-human beings or the environments we inhabit, we need tools that reconnect human concerns with the needs and possibilities of the planet. Ecology—understood as the ability to identify and work with a vast number of interconnected heterogeneous entities and phenomena—offers a crucial framework. Bateson (2000) notes that due to disciplinary and academic limitations, we tend to analyze separately three deeply interconnected spheres of life: individual human existence, social reproduction, and biological or environmental sustainability. These three complex systems shape and condition one another.

For Bateson, the root of our problem lies in an epistemic bias—beginning with the subject-object divide, the artificial separation of humans from their environments, and the entrenched culture-nature dichotomy. Liberal-Enlightenment interpretations have led us to believe in the inherent independence of the subject, ignoring the social, energetic, and biological networks that shape and define us. He argues that humans are systems embedded in broader systems that condition and give meaning to their existence. Following this reasoning, scholars have called for an ecological perspective in design practices (Álvarez et al., 2024), urging us to embed design firmly within the communities and biophysical environments where it operates. Instead of projecting fictional scenarios about the worlds we wish to inhabit, an ecological perspective compels us to critically examine the present world through the lens of complexity, fostering connections between beings and environments.

Expanding on this notion, philosopher Timothy Morton (2021) argues that art offers access to the phenomenal world in ways that complement and enrich our understanding of reality. He encourages us to explore partial truths revealed through aesthetic experiences,

suggesting that what we perceive as causal relationships are often aesthetic encounters. Art thus becomes a means of attuning to the world, breaking the illusion of human exceptionalism and reaffirming our place in a more-than-human reality.
Ultimately, Morton urges us to embrace stillness, patience, and deep listening, moving away from reactivity and the pressure to respond immediately to external circumstances. Instead of guilt, anxiety, or urgency, he reminds us that we have always been ecological beings. Andreas Weber (2017) similarly calls for rethinking our aesthetic connection to the world, recognizing the wonder of inhabiting a universe of dense relationships and improbable connections. In this sense, aesthetics, ecology, and an awareness of complexity become essential tools for living fully in the present rather than using the future as a means of disconnecting from material life on Earth.

5. Complex Practices

The artist and designer Serafín Álvarez, in his series of works *A Synthetic Forest Whithin a Stone*, explores these complex connections between beings, compelling us to marvel at the proliferation of hybrid entities that resist categorization or naming. According to Álvarez, this proposal involves "the conception, design, and prototyping of a small digital world that feels alive, using video game technology to produce a miniature ecosystem populated by artificial life forms that act autonomously and unpredictably[1]." Through his work, he challenges the divisions between nature and culture, as well as between organic and synthetic beings, urging us to move beyond certain frameworks of understanding reality inherited from European modernity.

By creating devices that integrate digital screens into large stones, he prompts us to reflect on the boundaries between biology and geology, while proposing a contemplative experience centered on forms of synthetic organization and emergence. He also invites us to think beyond human time scales, opening the question of what a future without humanity looks like. By creating artificial beings that share biologic and synthetic traits, one can not now exactly where in time these beings exist, as he writes “These artificial life beings behave autonomously, interact with each other and undergo diverse biological processes in real time. A speculative simulation that imagines possible life forms beyond our planet, perhaps also beyond our time”.

Similarly, Paula Bruna, in projects such as *Embolismo por Soleá* and *Plantocene*[2], compels us to reconsider the links between human action and the well-being of the plant world around us. As she writes, "*Plantocene* is an artistic investigation into the confrontation between the plant kingdom and human society, questioning the hegemony of our species and presenting images that evoke a para- or post-human scenario. The project's name arises in opposition to the Anthropocene (a recently distinguished geological epoch whose protagonist is the human being and their impact on the planet)." Through her work, she blurs the boundaries between human action and plant life, highlighting forms of interdependence and mutual affectivity. In this sense, her work makes visible the connections and relationships that have been rendered invisible by world descriptions based on rigid taxonomies and disconnected categories.

These practices displace the human as the central agent of world-building, opening space for more-than-human perspectives and agencies. By envisioning hybrid ontologies that resist clear distinctions between the natural and the synthetic, they

[1] https://serafinalvarez.net/unbosquesinteticodentrodeunapiedra.html
[2] https://paulabruna.com/plantoceno/

cultivate a more intricate and nuanced understanding of ecological systems—one that acknowledges the entanglement of diverse, autonomous life forms. Through their engagement with deep time and speculative posthuman futures, these works unsettle the anthropocentric temporal scale, encouraging us to imagine scenarios in which the future is no longer exclusively human-centered. In doing so, they reinforce the necessity of rethinking subjectivity itself—shifting from individual human dominance to networks of multispecies interdependence. This reorientation is essential for designing ecological futures that are truly inclusive.

By going beyond an ethnocentric future, these projects invites us to continue reflection on more complex visions of reality—ones not centered solely on human well-being. Their projects, alongside those of designers such as Martín Ávila, open the possibility of imagining more intricate speculative scenarios in which the interdependence between human and more-than-human lives compels us to radically rethink future concepts traditionally centered around human welfare.

6. Conclusions

In conclusion, we can affirm that the rise of future-oriented design presents both significant opportunities and challenges for the discipline of design and society as a whole. In summary, the ontological perspective of design compels us to recognize that design artifacts are not mere objects but entities that actively contribute to the production of realities. This entails a great responsibility for designers as "world-makers." The political question of what kind of world we are contributing to creating thus aligns with the question of what futures we want to inhabit.

In this way, future-oriented design raises important questions about who holds the power to imagine and shape possible futures. It is crucial to address the reproduction of Eurocentric imaginaries and the lack of diversity in these visions of the future. At the same time, there is a danger that future design becomes an exercise in individual preferences, reinforcing neoliberal tendencies that erode collective action and democracy. In this sense, it is important to prevent working with future-oriented frameworks from leading to a disengagement with present challenges. For this reason, it has been argued that overcoming the "aesthetic fracture" mentioned before requires an approach that acknowledges the interconnections between design, culture, politics, and society.
In conclusion, while future-oriented design provides valuable tools for imagining and potentially shaping desirable futures, it is imperative that designers and educators carefully consider the ethical, political, and social implications of their work. The challenge lies in developing design practices that are inclusive, that foster collective deliberation, and that recognize the complexity of the social and ecological systems in which we operate. Only in this way can we aspire to design futures that are truly sustainable, equitable, and desirable for all.

This article has identified some of the main issues associated with the notion of future design. Notably, the tendency to generate individualistic futures that do not require negotiation or debate. The inability to define deliberative spaces where we can reflect on what constitutes a good life from a holistic perspective—one that includes the interests of more-than-human beings with whom we share the planet. It also opens new avenues to be explored in order to find spaces and practices in which collective negotiations about the future can take place.

Finally, there is a concern that future design comes at the expense of understanding the present in its complexity and from a perspective capable of articulating many of the

invisible connections that shape it. Ultimately, if we are unable to articulate the question of what a good life is—including other cosmologies and more-than-human lives—we risk perpetuating imaginaries, institutions, and ways of life that are currently being deeply questioned.

DESIGNING FOR MULTISPECIES CITIES: ENVISIONING COEXISTENCE EXPERIENCES BETWEEN HUMANS AND PLANTS.

Francesco Vergani[a*], Maria Maramotti[a]

a Department of Design, Politecnico di Milano
*francesco.vergani@polimi.it

ABSTRACT | Urban ecosystems have been significantly impacted by anthropization, with cities now often seen as toxic environments for both humans and other lifeforms. This issue – also framed by the 11th (Sustainable Cities and Communities) and the 15th (Life on Land) United Nations Sustainable Development Goals - arises mainly from human-centred design, which has created contexts that are often extremely hard to tackle, particularly in terms of health and well-being. Cities are generally considered as places made by and for people, "artificial" environments that, since the creation of the Greek polis, have deliberately excluded plants, animals, and other non-humans from the social and political realm (Escobar, 2019). However, over the past few years, designers, city planners, as well as policymakers, have been working to incorporate nature-based solutions into urban design, reintroducing trees and other non-human lifeforms to promote ecological sustainability. Concepts such as the "Multispecies city" (Houston, 2019) – or the "More-than-human city" (Heitlinger et al., 2024; Franklin, 2017) - are offering new perspectives for cohabitation and coexistence, prioritizing the needs and well-being of non-human entities, both organic and inorganic.

At the same time, emerging knowledge in Critical Plant Studies and empirical research into plant intelligence are reshaping our understanding of plant behaviour, interaction, and communication. These findings challenge the traditional view of plants as passive and silent, instead highlighting their active and political roles in ecosystems. In this framework, "Multispecies Design" (Wakkary, 2021; Westerlaken, 2021; Roudavski, 2020) acknowledges that plants – along with other non-human agents – have agency, and their inclusion in design processes is vital for addressing today's environmental crises.

This shift requires a new approach to design that fosters collaboration between multiple species as part of the solution to sustainability challenges.

The paper presents insights from "Designing in a Multispecies World", a brand-new elective course launched at the School of Design of Politecnico di Milano University, which places the relationship between humans and plants in urban environments at the heart of this evolving design paradigm. The course encouraged students to rethink urban environments as “assemblages” of different entities, rather than solely human-made spaces. Through the development of 35 projects, each exploring a specific multispecies relationship, students designed everyday experiences involving humans, plants, and other non-humans within the city of Milan (Italy). They were challenged to shift their perspective as designers, moving beyond the Cartesian mindset that divides the world into the “artificial” and the “natural” realm. Over three phases, students engaged in: 1. multispecies ethnography (using practices of *decentering* and *attuning* to connect with non-human actors), 2. active reflections on the need for legal and political recognition of plants (through a speculative/performative design activity), and 3. future relationships between plants and humans in the city (designing a *terrestrial experience*). Students not only explored new design paradigms but also envisioned urban-life scenarios where humans and non-humans can continuously interact, forecasting experiences of multispecies care for inclusive futures.

KEYWORDS | MULTISPECIES DESIGN, SPECULATIVE DESIGN, CRITICAL PLANT STUDIES, DECENTERING, POST-ANTHROPOCENE

1. Introduction

Urban ecosystems have been profoundly affected by anthropization, with cities now frequently regarded as inhospitable environments for both humans and other life forms. This issue — highlighted by the 11th (Sustainable Cities and Communities) and 15th (Life on Land) United Nations Sustainable Development Goals — primarily stems from human-centered design, which has shaped urban contexts that are often challenging to navigate — particularly in terms of health and well-being. Historically, cities in the western part of the world have been conceived as human-made and human-oriented spaces, artificial environments that have deliberately excluded plants, animals, and other non-human entities from social and political domains (Escobar, 2019). However, in recent years, designers, urban planners, and policymakers have been increasingly integrating nature-based solutions into cityscapes, reintroducing trees and other non-human lifeforms to promote ecological sustainability. Concepts such as the “multispecies city” (Houston, 2019) and the “More-than-human city” (Franklin, 2017; Heitlinger et al., 2024) are offering new perspectives on cohabitation and coexistence, prioritizing the well-being and agency of non-human entities, both organic and inorganic. Yet, designing with non-human agents remains a complex challenge (Head et al., 2017), fraught with ambiguity, biases, and limitations.

Within this context, plants play a crucial role in sustaining urban ecosystems as they provide environmental, social and economic benefits for people. However, despite their ecological significance, they are still often perceived as “ontologically inferior” to humans

(Gibson & Baylee, 2018). Throughout history, the way we have understood plants from a design perspective has been deeply shaped by anthropocentric reasoning, frequently reducing them to mere resources serving human needs (Sandler, 2018; Turner-Skoff & Cavender, 2019; Višak, 2018). This perspective is rooted in the long-standing belief that the creation of what we call "artificial environments" is an exclusively human skill (Nelson & Stolterman, 2014). However, in recent decades, scientific disciplines have undergone a profound shift, challenging the traditional view of plants as passive, voiceless entities (Plumwood, 2002) and instead recognizing them as active, political agents capable of shaping and interacting with their surroundings (Marder, 2013).

This transformation has been largely driven by Critical Plant Studies — a transdisciplinary field between the environmental humanities, plant sciences, art and aesthetics, philosophy, literature and ethics (Gibson, 2018; Laist, 2013; Lawrence, 2022; Marder, 2013) — and empirical research into plant intelligence, reshaping our understanding of plant behaviors. The recognition of plants as "individuals" (Calvo, 2007) — that is, as agents with distinct roles and standing — is closely linked to the notion of intelligence, traditionally regarded as an exclusively animal (and therefore human) trait (Segundo-Ortin & Calvo, 2022). While biologist Charles Darwin first postulated plant intelligence in the 19th century — particularly concerning root systems and their role in directing movement (Viola & Mancuso, 2015) — only in recent years research has provided compelling evidence to support this intuition (Gibson & Baylee, 2018). Emerging studies in Plant Neurobiology — a discipline investigating how plants acquire, process, and respond to environmental stimuli (Brenner et al., 2006; Mancuso, 2018) — are now dismantling long-standing knowledge barriers, revealing extraordinary insights into plant cognition and behaviors. Unlike animals, plants lack a central nervous system or brain; instead, their functions are distributed throughout their entire structure, decentralizing cognition (Calvo et al., 2017; Segundo-Ortin & Calvo, 2019). Plants interact with their environment using biotic and abiotic signals, both above and below ground, to determine optimal survival strategies (Gagliano et al., 2018; Pelizzon & Gagliano, 2015).

Even before formal scientific recognition of plant intelligence, fields such as Anthropology and Philosophy had already begun acknowledging plants' inherent worth (Sandler, 2018), fostering discussions about their agency and their vital role in global ecosystems. This shift has even prompted reflections on their political representation. Nevertheless, the field of Design has been relatively slow to embrace this evolving perspective, often maintaining an anthropocentric approach that limits the significance of plants to their advantage for humans. Within this evolving framework, "Multispecies Design" (Roudavski, 2020; Westerlaken, 2020) recognizes that plants, along with other non-human agents, possess agency and that their inclusion in design processes is essential for addressing today's environmental crises. This shift calls for a new design paradigm that fosters collaboration across species to create sustainable and resilient urban environments, moving beyond human-centered design, which has proven inadequate for addressing the complex challenges of the contemporary world (Forlano, 2017; Giaccardi et al., 2025; Tironi & Garretón, 2024).

This paper presents insights from Designing in a Multispecies World (DMW), a newly introduced elective course at the School of Design of Politecnico di Milano University that places human-plant relationships in urban environments at the heart of this emerging design approach. The course challenged students to reconceive urban spaces not as exclusively human-made domains but as dynamic assemblages of diverse entities. Through the development of 35 projects — each exploring a specific multispecies

interaction — students designed everyday experiences that engaged humans, plants, and other non-humans within the city of Milan (Italy). By shifting their perspective beyond the Cartesian division between the *natural* and the *artificial*, students were encouraged to embrace more inclusive and ecological modes of designing, challenging the process with methods such as "noticing" (Tsing et al., 2017), "attuning" (Abbott, 2021; Lynch & Mannion, 2021) and "decentering" (Forlano, 2016; Giaccardi et al., 2016; Nicenboim et al., 2025).

2. Context and objectives

Designing in a Multispecies World (DMW) course is part of the School Bachelor programme, targeting 35 third-year students from different design disciplines including Interior (x3), Fashion (x8), Communication (x7), and Product (x17). The course is one of the few available in English at undergraduate level, which has resulted in a diverse mix of both national and international students (x23 Italians, x7 Erasmus students, x5 international programs extra EU), bringing together a range of linguistic, cultural, and interdisciplinary backgrounds. DMW is an elective course lasting one semester, promoting collaboration and transdisciplinarity in a field – More-than-human and Multispecies Design - that is constantly rising only in the last years. The course was created in response to the growing need to provide answers (and develop scenarios) for a world in constant transformation. While environmental concerns have been present since the 1970s, the sense of urgency surrounding these issues continues to intensify, exacerbated by unclear and often counterproductive global policies. Within this framework, the fluid nature of design plays a crucial role in equipping new generations with the skills to question the future and envision new pathways for coexistence in an increasingly complex world.

At the same time, the exchange of knowledge within academic settings extends beyond the boundaries of the university itself. Discussing multispecies cities also means actively engaging with these environments, creating opportunities for field research. For this reason, DMW course combines traditional in-class lectures with experiential learning through field activities conducted at Off Campus Nolo, the living lab of Politecnico di Milano located in the Nolo neighborhood of Milan. Within Off Campus Nolo, the POLIMI DESIS Lab research group promotes action-research initiative, community co-design and innovative teaching, exploring themes such as proximity, circular economy, fair food access, and More-than-human Design to foster sustainable, equitable and inclusive transformations in the neighborhood (Fassi & Vergani, 2024). Throughout the course, Off Campus Nolo has become a headquarters for students, giving them the opportunity to conduct on-field explorations, interact with the local human and non-human community and experiment with new forms of experiential learning.

The main goal of DMW is to encourage students to critically reflect on design as a non-human-centered practice. It challenges the designers' anthropocentric perspective by considering the agency of other non-human lifeforms — with a focus on plants — in a world that is constantly asking for a paradigm shift. By developing scenarios that foster new interaction strategies between humans and non-humans, the course seeks to promote a Multispecies Design perspective, trying to offer a less-anthropocentric approach to design. In this framework, during the weeks, students were asked to see plants not as resources but as agents and stakeholders with active social and political roles that influence and shape their environment. Besides developing a process in line

with a multispecies worldview, DMW also offers insights for rethinking the designer's role in the context of sustainability and multispecies coexistence, with particular focus on:

- **Expanding our perception of the surroundings, acknowledging the impact and importance of what we do**. Students are encouraged to expand their awareness of their environment, reflecting on how design decisions impact ecosystems. At the same time, the course emphasizes the fact that humans too are constantly "designed" by others (Escobar, 2018), revealing the deep interconnections between humans, plants and other entities.
- **Recognizing the power dynamics existing within a human-centered type of design that marginalizes the voices of non-human entities**. The course calls for a more inclusive approach, paying attention to listening to voices that are too often silenced due to social, political, and economic factors. By engaging with plants, students recognize those power structures, trying to reshape design processes that can foster equality and mutual respect.
- **Anticipating futures through design**. In a rapidly changing world, designers are often called upon to anticipate and envision the future, working through unpredictable scenarios with current resources, tools, and mindsets.

3. Methodology

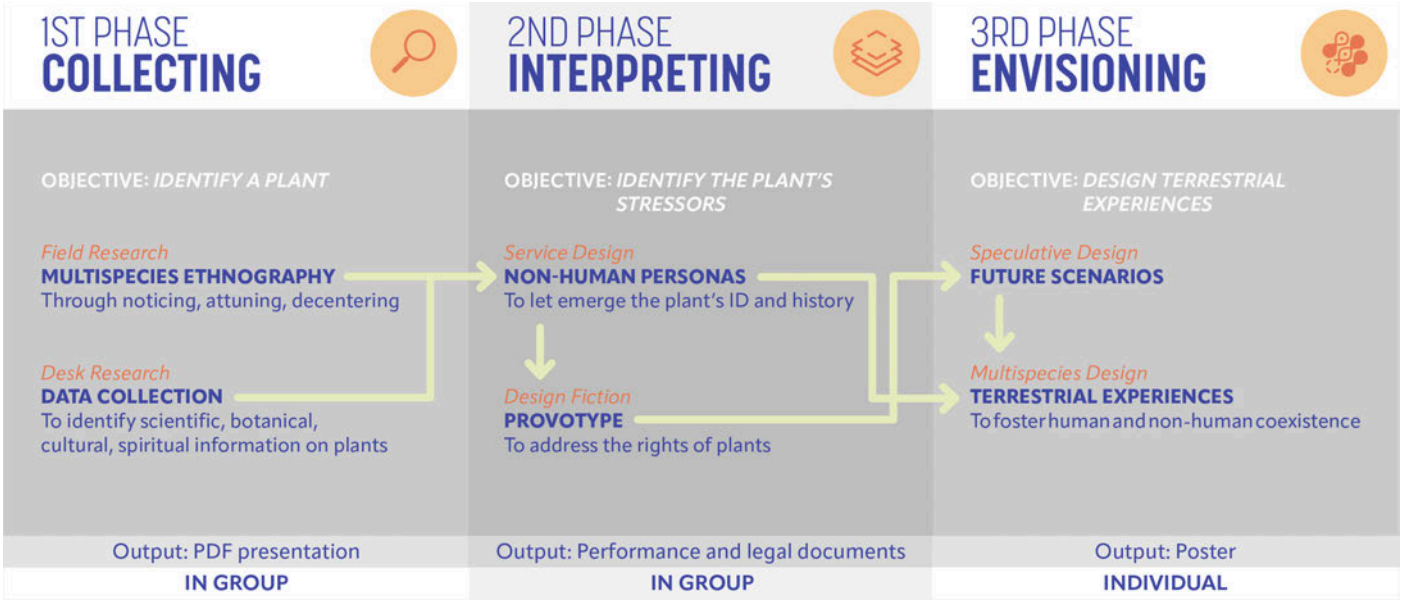

Figure 1. Diagram of the three interconnected phases of the DMW course. (Diagram by the authors)

The topics addressed by Multispecies Design lie at the intersection of various disciplines: Natural Sciences (Ecology, Ethnobotany, Plant Neurobiology), Social Sciences (Sociology, Political Science), Humanities (Philosophy), and Applied Sciences (Design, Urban Planning). With the aim of exploring the intersection of these disciplines in a more integrated manner — while striving to maintain the complexity inherent to the subject – the DMW course is structured in three interconnected phases (Figure 1). Each phase is specifically designed to guide students throughout the process, while experimenting with research and specific design methods. While lectures supporting both theoretical and practical knowledge on the subject were given throughout the semester, the three phases were conceived as a way to collect data, transform data into insights and design possible

multispecies interventions (named in the course as *experiences*). In order to work cohesively, the first two phases were managed as group works, as the third one as individual, in which each student could experiment with projects based on their own curriculum. Each of the three phases was structured to balance theoretical grounding and design practice through lectures, feedback sessions given by the teaching staff, and final presentations followed by collective feedbacks.

Collecting (group phase)
The initial two-week phase introduced students to a multispecies ethnographic approach, encouraging them to expand their perception of their surroundings. This involves recognizing the impact and the importance of human actions on other lifeforms and, at the same time, understanding that our context is constantly lived and impacted by non-human entities. Then, each group of 2 up to 4 students was called to explore the Nolo neighborhood to identify a plant living in the area that, from their perspective, expresses a specific discomfort (*stressors*) regarding the conditions of its surrounding environment. To focus on plants in challenging urban conditions, conventional green areas (such as gardens, small or big parks) were considered as off-limits spaces, encouraging students to choose plants that live in poor conditions due to human presence. This process was enhanced with methods such as:

- **Noticing**: observing and bringing to light the diverse entities that inhabit and shape urban spaces through fieldwork and urban walks.
- **Attuning**: harmonizing with the context and developing the capacity to listen to the needs of non-human entities.
- **Decentering**: adopting the perspective of other species (thus shifting away from an anthropocentric viewpoint) through the embodiment of these entities in performative activities.

The 11 groups identified 11 specific plants in the neighborhood and started to engage with them by observing them, analyzing the surrounding context, and trying to adopt their point of view to understand their behaviors and strategies. Following the field research, each group deepened their knowledge of the chosen plant by carrying out desk research, in order to collect data not only about botanical aspects (how the plants grow, behave, interact, etc.) but also on cultural knowledge (symbolic aspects, historical roles, artistic interpretations or related popular/spiritual beliefs). In this phase, notions of "decolonizing" practices (Escobar, 2018; Haraway, 2016; Ingold, 2015; Schultz et al., 2018) were introduced to support students in critically examining the emotional and conceptual frameworks that shape our relationships with the world.

Interpreting (group phase)
After completing the first phase of data collection, each group was tasked with synthesizing all the gathered knowledge into a plant's ID, which served to capture both scientific and cultural insights about the selected plants. This ID was later expanded and reworked into a variation of a non-human persona, specifically targeting the chosen plant. Groups were asked to translate scientific data that they collected in the previous phase into insights that outline the plant's identity. This step unfolded over three weeks and encouraged students to move beyond traditional stakeholders, fostering a deeper understanding of the plant’s role within its environment and its interactions with human and non-human agents. With the aim of helping students engage with the collected data, this second phase was strongly shaped by Speculative Design and Design Fiction methodologies. Students were provided with a future artefact — or "provotype" (Boer, 2011;

Mogensen, 1992) — a legal form coming from the year 2048, supposedly used by a fictional legal aid collective called "Arboreal Assistance". The given backstory proposed the existence of an interaction system between humans and plants — a “proxy” — capable of tracking the needs of the plants. Students were then asked to develop specific legal strategies to defend the plant, using storytelling tools to assume the role of the collective's legal team. Using this artefact — and performing the second delivery pretending to be lawyers — they designed a profile of the plant, providing fundamental information and speculating on possible legal interventions to safeguard their "plant client". This work resulted in the identification of plants' personalities, behaviors, characteristics, and strategies, considering their living conditions, their stressors, and their role in the urban environment (Figure 2).

Figure 2. Students presenting the outputs of the second phase while pretending to be lawyers discussing a cold case. The documents – provided by the teaching staff – were intended to be filled with information gathered about the specific plant chosen, detailing its needs and behaviors. During this phase, students used the *provotype* of the Plant Bill of Rights to devise a strategy, ultimately addressing the stressors perceived by the plant. (Picture by the authors)

Envisioning (individual phase)

The last phase — extended over four weeks — was meant to encourage reflection on the evolving role of designers, positioning them as facilitators, activists and “provocateurs” (Mogensen, 1992) that are often called upon to anticipate and envision the future. Playing the role of the *multispecies designer*, students were individually asked to design experiences that foster a win-win interaction between non-human and human stakeholders. With the intention of applying design as a process not solely focused on creating a "solution," students were challenged to design a *terrestrial experience* — a relationship carefully built and nurtured between a human and a plant. This relationship could be expressed in any form (spaces, products, services such as rituals, communication strategies, and wearable technology), depending on each student’s skills and curriculum. Additionally, students had the option to introduce another non-human agents — whether organic or synthetic — to enhance or mediate this interaction.

4. Results and discussion

4.1. Project outcomes and reflections

At the end of the third phase, students were asked to create a poster to describe their designed *experience* (Figure 3). This final output was envisioned as part of an imaginary future exhibition showcasing traces of *terrestrial experiences*. This exhibition featured 35 different projects of human-plant coexistence, each highlighting specific agents — both human and non-human — as key protagonists. The posters included the following information:

- A) The project concept expressed through: title, claim, short text, and key image.
- B) Information about the stakeholders (human and non-human) and any other non-humans involved in the relationship.
- C) An image of the proxy/interaction system specifically designed.
- D) A storyboard illustrating the experience between the agents, supported by the use of the proxy/interaction system.

Given the limitation on the amount of information to be presented, the teaching staff provided students with a standard format to follow.

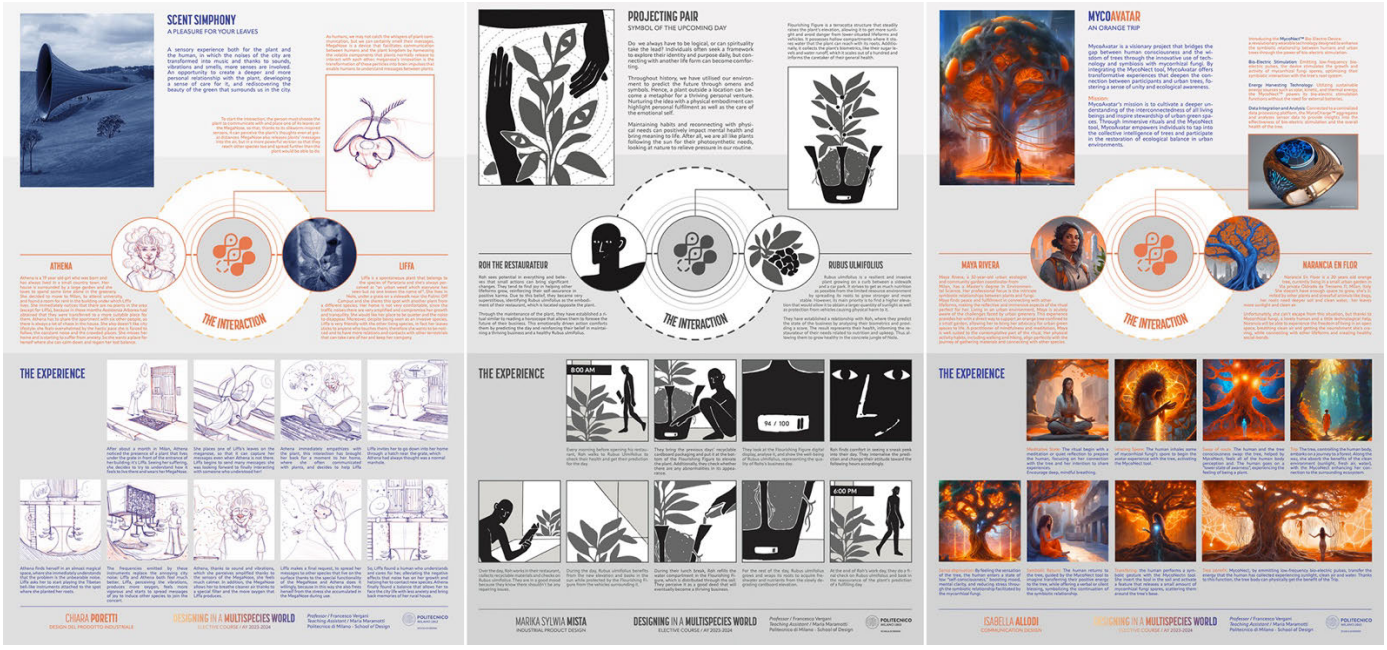

Figure 3. Three posters presenting projects by students. The first project (n° 26), *Scent Symphony* by Chiara Poretti, explores the relationship between a girl and a Parietaria plant growing under a grate on the sidewalk. Using *MegaNose*, a device that facilitates communication between humans and the plant kingdom by harnessing the volatile compounds plants naturally release to interact with one another, Chiara's idea involves transforming these particles into brain impulses, allowing humans to understand the messages exchanged between plants. The second project (n° 14), *Projecting Pair* by Marika Sylwia Mista, uses *Flourishing Figure*, a terracotta structure that gradually increases the height of a spontaneous plant growing on the street pavement, enabling it to receive more sunlight, water, and avoid hazards posed by lifeforms and vehicles situated in the surroundings. The third project (n° 8), *MycoAvatar* by Isabella Allodi, presents *MycoNect™*, a ritual – powered by a wearable technology – designed to enhance the symbiotic relationship between humans and trees through bioelectric stimulation. By emitting low-frequency bioelectric impulses, the device stimulates the growth and activity of mycorrhizal fungal spores, optimizing their symbiotic interaction with the tree's root system. (Pictures by the students)

The projects presented a variety of perspectives, showcasing relationships that were sometimes enhanced by new and speculative technologies and other times nurtured

through physical exchanges (Figure 4).

N°	Group Plant	Individual Project Title	Design				Experience Typology
			Prod.	Comm.	Spat.	Fash.	
1	*Moss*	Mossbyte	■	■	■		Spiritua conntection, Data storage
2		Fragmented Health	■		■		Information exchange, Physical care
3		Water Moss Totems	■				Physical care, Mutual exchange
4		Harmony of life	■		■		Information exchanges
5	*Nerium Oleander*	SYN-HELU – DEEP CONNECTION: TERRESTRIAL SOULS	■	■			Connection, Physical care
6		Light back up	■				Ritual, Mutual exchange
7		Rehab garden	■		■		Physical care
8	*Orange Tree*	MycoAvatar	■		■		Ritual, Physical connection
9		Good luck tree	■		■		Ritual
10		Life Belt	■			■	Mutual exchange
11		Rooted in presence			■		Meditation, Spiritual relation
12	*Rubus Ulmifolius*	Grumpy Pal	■				Digital app, Game interaction
13		Garden Glide	■		■		Digital interaction, Virtual space
14		Projecting Pair	■				Biometric exchange of data, Care
15		The Theremin Tree	■				Emotional connection
16	*Alfredo Laurustinus*	Reconnector	■				Game interaction, AI assistant
17		Plant a Pet	■				Care, Game interaction
18		Harmony Harvest: Hydrolink	■				Mutual exchange
19	*Nerium Oleander*	Common Ground	■		■		Emotional connection
20		Air Sanctuary	■		■		Physical care, Urban regeneration
21	*Ivy*	Vesty – The Symbiotic Vest	■			■	Physical connection, Symbiosis

32		WisyOn: I See You I Got You	■				Care, protection
33	*Dandelion*	Safety Above All	■				Physical care, Collaboration
34		PlantPal	■				Physical care, Data exchange
35		Bubble Friend	■				Facility

Figure 4. Diagram illustrating the information about the 35 student projects. From left to right, the columns indicate: 1. Project number, 2. The plant selected by the group during the first two phases of the course (and used as the non-human agent in the individual project), 3. The names of the individual projects, 4. Project type (Product, Communication, Spatial, or Fashion), and 5. The type of experience designed. (Diagram by the authors)

No specific limitations were imposed, apart from the request to engage creatively and design scenarios that transcended current technological knowledge. This proved particularly challenging for students, as many tended to present ideas firmly rooted in existing realities, struggling to demonstrate strong speculative abilities regarding the future of human beings and their practices. Although the field of More-than-human Design is now deeply intertwined with synthetic non-human agents, the course sought to focus more on the biological dimension of the human–plant relationship, deliberately setting aside digital components. During feedback sessions on *terrestrial experiences*, students were encouraged to rethink their approach and design *experiences* that could cultivate a physical, close-proximity relationship between human and non-humans, emphasizing the value of tangible engagement in the relational design process. However, many projects focused on interactions involving current digital devices (x30), such as apps or AI-driven technologies, revealing students' difficulty in moving beyond existing technological paradigms. Throughout project reviews, we encouraged them to explore physical low-tech alternatives (x5) and speculative futures, prompting a critical reflection on the limits of prevailing digital trends. Nonetheless, many final projects still included a basic digital component – including AI – despite the fact that neither the brief nor the theoretical inputs explicitly referenced it. This highlights a deep-rooted bias towards digitally-mediated futures and underscores the pervasive influence of the digital paradigm, even within More-than-human design frameworks.

Similarly, it proved particularly challenging to encourage students to move beyond a

strictly anthropocentric perspective, which viewed multispecies experience and relationships as merely instrumental or transactional (Figure 5). While the idea of a multispecies experiential relationship is especially complex from a non-human standpoint, it remains more readily accessible from a human one. For this reason, the outcomes revealed two main types of relationships:

- **Experiential relationship**: conceived as a mutually regenerative exchange, where – from the human side (which is more easily examined) – the benefit is less utilitarian and more emotional or affective.
- **Transactional relationship**: defined as a mutual exchange more akin to a trade of resources, aimed at achieving specific goals.

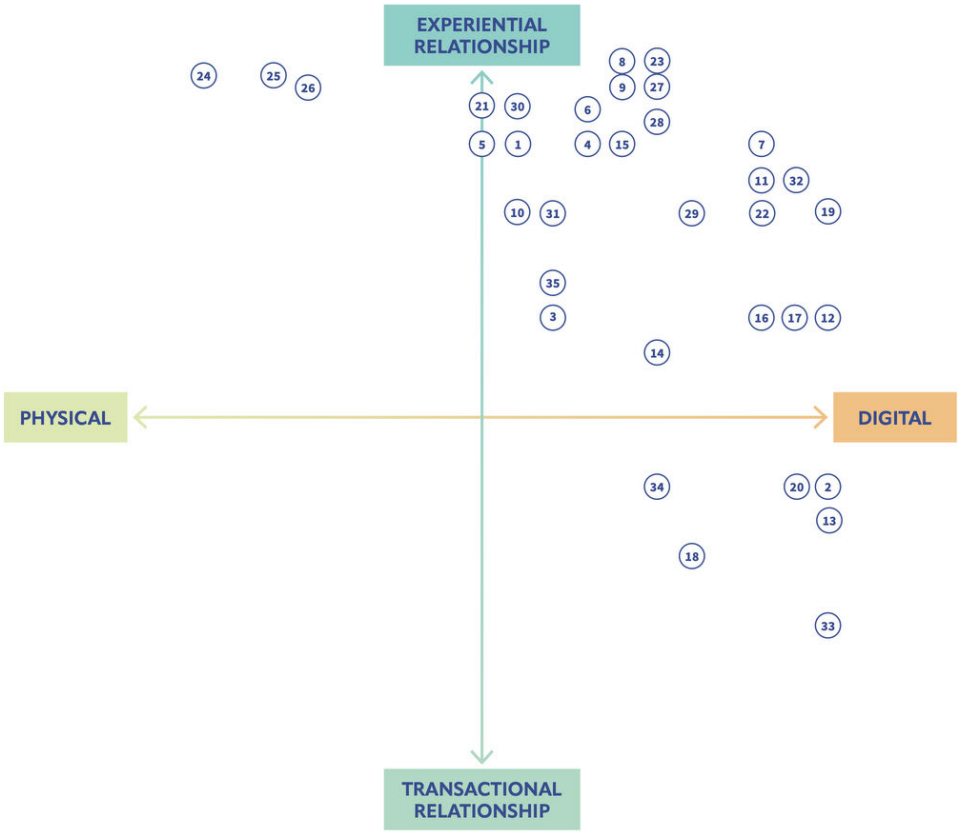

Figure 5. Positioning map of the 35 student projects. The horizontal axis represents the proxy/interaction system: on the left are projects in which the human-plant relationship is enhanced through physical means, while on the right are those mediated by digital technologies. The vertical axis shows the type of relationship: at the bottom are projects characterized as transactional, and at the top those that are framed as experiential. (Diagram by the authors)

The assessments of the three phases were based on the following criteria: A) the ability to grasp multispecies and more-than-human perspectives; B) the richness and coherence of the submitted materials; and C) presentation skills. For the final phase – the only individual and fully design-based task – criterion A was further devided into: A.1) the ability to move beyond an anthropocentric perspective; A.2) the capacity to create a "win-win" situation of mutual benefit for both human and plant; and A.3) the creativity and originality of the designed *experience*.

4.2. Challenges and key points

Analyzing the course results, it became evident that shifting to a non-anthropocentric perspective was neither simple nor immediate for students. This is reflected in the final *terrestrial experience*, where in some cases the interaction between humans and plants is not balanced, favoring the human entity at the expense of the non-human one.
To support students throughout the process, each of the three phases included feedback sessions — group sessions for the first two phases and one-to-one meetings for the final phase. In particular, the final phase focused on encouraging students to create projects that considered mutual benefit and avoided anthropocentric assumptions about the plant. Students were continuously prompted to revisit the data collected in earlier phases and to reinforce the idea that, just like humans — albeit in different ways — plants have specific needs and behaviors to consider. Additionally, it was emphasized that even if future communication with agents like plants becomes possible, the nature and quality of that relationship is unlikely to be mediated by a codified language.

Beyond the challenges students faced in shifting to a multispecies perspective, the course process highlighted several key points:

- **Non-human personas**: By recognizing plants as stakeholders to engage with and advocate for, the creative development of personas — even if unconventional — could help in better understanding them as active agents with social and political implications. However, non-human personas are often seen as an overly anthropocentric tool, making it challenging, if not impossible, to genuinely reflect a non-human perspective. For this reason, the decision to use the legal form of the "provotype" was adopted to provide greater meaning to the act of decentering and adopting a non-human point of view. This effort leads the students to recognize that, sometimes, the designer – even if not an expert on biology - needs to explore the not-known realm of the non-humans and be able to listen to voices that are silenced due to cultural, political, social and economic factors.

- **Human personas**: If students struggled to grasp the role of the non-human persona, they faced a similar challenge when creating the human persona. They were asked to identify a key persona rather than imagining random groups of people, with the aim of targeting the project towards a unique relationship. This request was specifically made to help students understand how the will to create universally applicable and scalable solutions is frequently problematic. Every relationship is inherently unique, shaped by a complex, situated system of human and non-human agents, influenced by social, cultural, and political elements that are difficult to replicate.

- **Multispecies justice:** The second phase of the course was aimed at reflecting on power dynamics and the not-recognized role of plants in human society by exploring the concept of “multispecies justice” (Celermajer et al., 2021; Fitz-Henry, 2022). By using Speculative Design and Design Fiction tools, students were asked to address the marginalization of non-human voices in societal decision-making as well as the critical concept of multispecies participation. Through this process, students were introduced to political and biopolitical perspectives, challenging them to integrate the multispecies dimension into new emerging paradigms of (cosmo)politics (Stengers, 1997) and ethics.

- **Time:** By introducing the idea of the future showcase for the 35 projects allowed students to reflect on the concept of temporality. Designing with non-humans raises compelling

questions about the differing timescales of growth and evolution between plants and humans (Fry, 2009). This idea was particularly emphasized throughout the course to help students recognize the need to expand their temporal horizons when approaching design itself. Temporality is an inherent challenge in Multispecies Design, as it represents one of the most significant differences in how various agents behave. Plants have vastly different growth cycles, and the idea of designing *experiences* based on simultaneous interactions — such as those often found in the animal kingdom — initially posed a considerable challenge for students. Beyond the design *experiences*, the element of time also played a crucial role in the initial phase of data collection. The use of multispecies ethnography required students to immerse themselves more deeply in the context, further complicated by the inability to rely on conventional human systems of communication and interaction. Students were tasked with closely observing plants, attempting to understand why they behaved in certain ways. Focusing on the plant's external qualities — such as the condition of its trunk, roots, canopy, and interactions with the surrounding environment — led to extensive field research. This process encouraged students to perceive the urban environment differently, shifting their attention towards an often-overlooked biological world that typically escapes the human gaze.

5. Conclusion and final considerations

The DMW course represents a significant step toward integrating non-human perspective into design education and practice, addressing urgent environmental issues and social challenges across the various design disciplines.

This paper outlines the first edition of the newly introduced course, reflecting on its strengths and areas for improvement. A second iteration is currently underway, offering an opportunity to further refine both the teaching practices and evaluation methods. By encouraging students to recognize non-humans as active and political agents within our society, the course fosters the practical application of critical theories while promoting a paradigm shift in design towards a multispecies coexistence perspective. This not only expanded their perception of the environments but also fostered a deeper awareness of the entanglements between human and non-human existence.

The thematic focus of the course challenged students to confront knowledge gaps, barriers and limitations in field research, allowing them to experiment with different approaches and methodologies. Through the hybridization between classroom and field work, the course promotes open and dialogic teaching that encourages critical reflection and speculative exploration. On-field learning allows students to immerse themselves in the real-world context, discovering new ways of conducting research and acquiring knowledge beyond the traditional academic setting. By immersing themselves in urban environment students were encouraged to attune to non-human presences that often remain silenced. At the same time, speculative design played a crucial role in engaging students in the design process, emphasizing the importance of envisioning solutions for unpredictable futures and facilitating the difficult shift in perspective.

Despite the difficulties encountered in embracing a multispecies point of view and moving beyond a human-centered perspective, students demonstrated a high level of engagement throughout the process. The positive feedback from students at the end of the course and project outcomes indicate that the course — besides the various issues addressed in the paper — successfully achieved its objectives, stimulating critical thinking and design creativity. Discussions and reflections that emerged during the semester reflected a growing openness to actively question plants' political representation and role in the urban environment. In the currently ongoing second edition of the course, we strengthened certain aspects to make the shift in perspective more effective. First and foremost, methods such as noticing, attuning, and decentering played a more prominent role compared to the original version described here. Secondly, a greater number of case studies — with extensive explanations of best and worst practices from a multispecies perspective — were presented to students in the early stages of the course.

The DWM course reinforced the awareness that design can no longer ignore the existence of other life forms in the design process. Multispecies practices must be recognized as a fundamental feature in designing inclusive and sustainable future scenarios, capable of addressing the urgent global challenges. By challenging students to move beyond human-centered paradigms, the course contributes to shape a new generation of designers that are aware of their own anthropocentric biases and equipped with the tools and sensitivities to contribute to new perspectives on cohabitation and multispecies coexistence.

Housing for Good: Catalysing Ecological Citizen(s) a Method of Designing 'Sustainable Conditions'.

Rob Phillips*[a], Luke Gooding [b]

a Royal College of Art, School of Design, Design Futures

b University of York, Stockholm Environment Institute, Ecological Citizen(s) Network +

*robert.phillips@rca.ac.uk

ABSTRACT | The UK is tackling crises in climate change, living costs, social inequalities, rocketing housing prices and a disengagement from our natural world. These factors impact human health, wellbeing, societal cohesion, and also accessible and equitable opportunities. Sustainable design interventions are: interconnected, complex, place-based and culturally contextual. Sustainable proposals should be embedded into our lives, equitably and accessible to all citizens. In contemporary times, it is also sadly notable that humans are not formally given the knowledge, or resources, to look after ecosystems *Homo sapiens* relies on for life. This often leaves sustainable practices polarised, seemingly draconian or seen as a luxury.

Society needs new ways to navigate socially equitable, accessible and designed models that are financially stable, catalysing sustainable action(s). Relationships with nature must be built into our communities, lives and homes. Authors believe social constructs live alongside pro-active rejuvenation of the natural world, with overlapping co-benefits to humans and more-than-humans. Buckton *et al*, *The Regenerative Lens* states societies must "transform their dynamics to support the flourishing of life. [As] there is increasing interest in regeneration but also limited cohered understanding of what constitutes regenerative systems at social-ecological scales" (2023).

Authors introduce Ecological Citizenship (EC): activities establishing and catalysing sustainable practice(s) addressing ecological inequalities (Phillips *et al.,* 2024). The Ecological Citizen(s) Network is intent on catalysing transitions with communities by

providing autonomy, accessibility to design, initiating sustainable conditions and open pro-social possibilities. The Housing for Good (HFG) concept perceives preferable futures where thousands of people can catalyse communities inclusively empowered by; affordable housing, time, accessible space and security. HFG is an ambitious initiative providing highly affordable housing to citizens in exchange for their contributions in making communities healthier, greener, stronger and more joyful.

The design-led HFG connects design practice(s), social constructs and philanthropic finances, requiring lived experience and expertise to navigate. HFG explores social inequalities, while exploring contemporary and future designers' roles in city transformation, through tangible examples. The article's main argument unpacks an accessible housing opportunity, benefiting nature, citizens and communities, engaging 30+ citizens in two UK locations, with transferable lessons and insights. The work trialled more inclusive and accessible strategic design methods.

Our intention supports climate-positive post-participatory design, with citizens, providing a repeatable internationally applicable framework, for place-based application contexts. The Ecological Citizen(s) Network is UKRI funded and mandated to prioritise the UK. Authors are against imposing colonialist activities; hence the work's focus is UK-centric in practice, whilst unpacking a scalable international concept. Other parties can build on HFG, as place-based contextual nuances and cultural understanding is paramount. Resilience signifies moving beyond governmental systems and establishing citizen legacies. Authors are intent on designing beyond generations and believe co-designing to benefit people and nature concerns nurturing community autonomy with the means to become Ecological Citizen(s). The UK has recently emerged from 14 years of self-interested political rule, stripping public services (Knight, 2024 & Elledge, 2024) … Citizens deserve more resilient, nature-aligned approaches.

Research Objective | Unpacking a housing opportunity, benefiting nature, citizens and communities, engaging over 30 citizens in two UK locations. Trialling more inclusive and accessible strategic design methods, unpacking wider pitfalls, benefits and opportunities of The Housing for Good Concept.

KEYWORDS | Ecological Citizenship, Regenerative Design, Inclusive Design, Nature-inspired Design, Resilient Design.

1. Introduction

In this article we are designing, operating within a contemporary time and unpacking new design-led opportunities, through collaborative post-participatory design. The links between: climate change, biodiversity loss, and social inequalities are complex and hard to unpack. They are all bound by: where we live, the communities we are part of, and what those infrastructures can provide. Where we live is not always accessible and (as we see within the UK), local communities get priced out (Smith, 2023), leaving little time for voluntary actions or socially-led developments (Kear-Davies, 2024). The power of accessible living, community and nature require realigning so that the developments of co-designing can be embedded into contextual situations. *The Ecological Citizen(s) Network* has a UK perspective, bound by our funding remit and working reach. This work is UK-centric as we explore: legislation, probate, social design and charity statuses. The challenge however is international, with evidence in: Australia (Dumas, 2024), Europe (Carbonell, 2024 & EU Commission, 2024), USA (Callaci, 2024) and more. We do not want to colonialise (Kobayashi, 2019) but seek to open the discourse for a working typology, bound by our lived experience and context, hence our UK-centred frame.

The article unpacks the intent of equitable means for cities and citizens to have autonomy, for nature's benefit. The insights are beneficial to; social design constructs, preferable futures and enabling the development of citizen-led infrastructures. The role of *The Ecological Citizen(s) Network* was design-led, convening and uniting the initiative

strategically, with originator Daniel Raven-Ellison: Slow-Ways (slowways.org) & National Park Cities (nationalparkcity.org) founder. Design as a practice is a "powerful agent for change, and a tool for progress in all fields - social, political, and environmental", and design "is fundamental to shaping our climate futures" (Johnson, 2024, p.106 & Johnson, 2024, p.104).

Authors aligned themselves with "designers tak[ing] on new roles and mediators and conveners between research, politics and society" (Groß, & Mandir, 2024, p.18). The intention was to inform the *Sustainable Digital Society*, defined by the UKRI as the "social and economic sustainability are interconnected with environmental sustainability" (UKRI, 2020). Technologies can connect people, creating a more sustainable resilient society, providing benefits for people, nature and more-than-humans. Authors introduce topics of: Ecological Citizenship, One Health, Contemporary Design Examples, and UK Housing. We foresee the links between climate change, biodiversity loss, and social inequalities building on Wilkinson's view that "sustainability is inseparable from the campaign for greater equality" (2020). The work Informs: current and future roles of designers in city transformation around places, we call home.

1.1 Ecological Citizenship

Ecological Citizenship (EC) is "an activity or a skill that anyone can do, which helps establish sustainable practice(s) and address ecological inequalities. This includes community-led sustainability approaches leading to scalable, transferable 'design values' for wider application(s)" (Phillips, *et al.*, 2022, p.2). Our EC position is intent on enabling: sustainable purpose, autonomy and equality in citizens as cross-disciplinary creatives through Public-Interest Technologies (PITs). PITs are "technologies used to serve the public good" (Ford Foundation, 2024). PITs should be appropriate to their application and context with different lenses, not solely conventional or traditional views of 'high technologies' (Hooton, 2018). For example, Indigenous Technology demonstrated in naturally drying Cod (for preservation) in the *Lofoten Islands, Norway* (Hung, 2023). The air temperature is cool, and the fish does not spoil, requiring; local knowledge, skill, and environmental expertise. Contextual Technology is site-specific and place-based, an example is an Ice Stupa: an "artificial glacier, designed to refreeze glacier meltwater and facilitate water storage, a techno-scientific intervention" (Kleinman Center for Energy Policy, 2023). Participatory Technology e.g. Park(ing) Day a global, public, participatory project where people internationally 'temporarily repurpose' curbside parking spaces, converting them into public parks and social spaces advocating for safer, greener, and more equitable streets for citizens (Park(ing) Day, 2024). The work builds on *Mead's*, "Never doubt that a small group of thoughtful, committed citizens can change the world. Indeed, it's the only thing that ever has" (Institute for Intercultural Studies, 2001). We frame EC touchpoints as 'design proposals' that are appropriate to their contexts, accessible and equitable to their communities.

1.2 One Health |

Our "human-nature relationship is an important one, to understand, enhance, and protect" (Brymer, *et al.*, 2019). The need to transform the human-nature relationship has never been more important. People "who feel closer to nature are happier and more satisfied with life and are more likely to take actions that help wildlife and the environment" (Miles, 2022). The One Health approach deals with "the health-related interactions that occur between these systems at differing levels of complexity" (Rabinowitz, *et al.,* 2018). Having the One Health approach in place "makes it easier for people to better understand the co-benefits, risks, trade-offs and opportunities to advance equitable and holistic solutions" (WHO, 2022). Parallel organisations refer to the human-nature relationship as the *Natural Health Service* (NHS) "part of a holistic approach to health and social care reducing pressure on NHS and local authority resources in the medium term" (Oliver, 2022). Recent reporting on the NHS states "a social return of £8.50 for every £1 invested in Wildlife Trust volunteering

programmes strengthens the argument for a community-based approach to health" (The Wildlife Trusts, 2023). The UK Government's inaction in recent years requires contemplation. The Government has only protected 5% of England, against its own target of 30% by 2030 (RSPB England, 2021), ignoring the advice of Natural England to meet COP commitments (Greenfield, *et al.,* 2023). The UK failed to reach 17 out of 20 UN biodiversity targets agreed on 10 years ago, in six areas the UK has gone backwards (RSPB, 2024). In summary, interacting and cultivating engagements with the natural world result in: positive personal health, community cohesion and biodiversity benefitting all – whilst current UK government initiatives are not adequate.

1.3 Designed Examples

There is an inherent link between: cultures, people, place(s) with an agenda toward pro-social behaviour (Wittek, *et al.,* 2015). Recently designers and sustainability leaders advocated for designing the 'conditions to enable change', in the provision of equitable access (Manzini, 2020). A historical example of this is positively linking people to communities and places, for example: tenant farming (TFA, n.d.), lock keepers' cottages, on-site caretakers (TrustedHousesitters.com, 2024), live-in childcare (Hampstead Nannies, 2024), armed forces family housing (Army Families Federation, 2024), amongst others. However, these examples are all solely transactional, not social innovations or featuring a component that regenerates the area surrounding its deployment. Social Innovations consist of new products and "services, processes, markets, collaborative platforms, organisation forms (social movements or institutions), and business models" (Caulier-Grice, *et al.,* 2012). The following examples are more complex, intervening at specific touchpoints in social-design spaces. They are contemporary (at time of writing) and empower citizens in new typologies toward a sustainable digital society:

1. *Fat Macy's* (2024), a social enterprise supporting people to accrue a housing deposit, navigating the 'benefits trap' where people are incentivised not to work. After 200 hours, *Fat Macy's* trainees can access a 'Housing Deposit Grant' as a deposit on rented accommodation – with ongoing transition support into independent living. *Fat Macy's* provides accessible, practical means enabling people to progress through dysfunctional legislation.
2. *Casserole Club* (2014), helps people share home-cooked extra food portions with neighbours who are unable to cook for themselves. Club members serve meals to neighbours strengthening neighbourhood relationships. On average (at time of writing) it costs councils £4.90 to provide one meal, if 100 diners get on average two meals a week from a neighbour, "Casserole Club would save councils £50,960 a year" (Casserole Club, 2014). A design-led intervention supporting accessible support and overtime results in pro-social behaviour with members undertaking different tasks for Club members.
3. *Team Dominica* (2024), a cafe enabling neurodiverse individuals to gain work, through innovative employment programmes. It supports young candidates to emphasise their role, ready for paid work. *Team Dominica's* holistic approach is personalised to candidates, developing their independence, confidence, communication, and skills ready for employment. This accessible catalyst nurtures and develops people holistically.
4. *Nature Neighbourhoods* (RSPB, 2024b), follows in the footsteps of *The People's Plan for Nature* (Cdunn, 2023): a vision to protect and renew nature in the UK. All around the UK, amazing people have been flocking together to bring nature back to their communities through the Nature Neighbourhoods project.
5. *The Community Power Act* (Bell, *et al.,* 2020), created by *The Young Foundation*. Away from Westminster, thousands of community leaders have been working tirelessly to tackle these very challenges as they find them in their neighbourhoods: challenges like inequality, local decline, loneliness and mistrust. The Community Power Act, is a major

piece of legislation (in progress) which would fundamentally change where power lies in this country. It is made up of three parts: Establishing new community rights: 1) A Community Right to Buy 2) A Community Right to Shape Public Services, and 3) A Community Right to Control Investment.

6. *Play Streets* (2024) enable children to play freely, without organised activities. This means children: cycle, scoot, chalk, skip, kick a ball, etc. These neighbour-led short road closures, create safe spaces for children to play on their doorstep. With council permission and consensus from neighbours, residents legally close the road, using signs or other barriers. Volunteer stewards are guardians of the street restricting vehicles, keeping it safe. The model (developed by parents) has now scaled to street communities throughout the UK supported by councils and organisations.
7. *Oosterwold, Netherlands* (Knikker, 2024), *Oosterwold* is an (non-UK) experiment that takes 'citizens' seriously and leads to an abundance of innovation and sustainable lifestyle options, in which self-organisation prevails over market thinking. Industrial-scale farmland has been turned into a small-scale food-producing landscape. Oosterwold (about 1,000 residential units) is a sprawl of gardens, from greenhouses to pastures. It is bound together with a social contract "if you want to live in Oosterwold, you have to produce food on at least 50% of your property" and is operating successfully (Docter-Loeb, 2024).

These examples present alternative social and community design space(s) building-off: broken government infrastructures, local responses, and place-based employment – and enable communities to navigate some scenarios that impact them. They build on *Visions of Climate Futures*, providing metrics of "what brings you joy, what are you good at, what work needs doing?", however not all of them build accessible opportunities to enable those dreams (Johnson, 2024, p. 424). They build on existing failing governmental systems, but point toward 'better' where citizens have some autonomy informing their circumstances, they are also 'place-based' providing new opportunities.

1.4 UK Housing

The current status of UK housing is "failing", with demand outstripping supply and construction costs increasing. Factors, coupled with rising living costs, mean that homelessness is set to accelerate unless addressed. The amount of people "experiencing homelessness could double, reaching 620,000 by 2045", without action (National Housing Federation, 2024). This will be exacerbated as "social housing waiting lists will grow to 1.8 million households by 2045 – an increase of more than 50%" (National Housing Federation, 2024). *The Joseph Rowntree Foundation* reports on the rising cost of living (in parallel to the housing crisis) with families: reducing food portions, impacting their health (2024). In recent social housing studies "86% of tenants reported the cost-of-living crisis was affecting their ability to 'get-by', financially" (Thomas, 2024).

With phenomena such as 'boomerang children' moving back in with parents on the increase, housing is in freefall (Seiter, *et al.,* 2024). Finally, communities suffer the 'Airbnb effect' (Gant, 2016) similar to gentrification, slowly increasing an area's value to the detriment of indigenous residents, "many of whom are pushed out due to financial constraints" (Barker, 2021). This situation is only exacerbated by recent reports that housing developers are failing to deliver on their ecological "mitigations and enhancements" across England (Chapman *et al.,* 2024 p.29). The combination of: costs of living, rising house prices, gentrification, developers not delivering on ecological promises, and time-poor residents, is impacting 'accessible housing' and our ability to interact with the natural world.

1.5 The Housing for Good Proposition

Housing for Good (HFG) is an ambitious initiative aimed at providing highly affordable housing to residents in exchange for their contributions in making communities healthier,

greener, stronger and more joyful. The concept unpacks multiple elements. *1)* Recruit residents who contribute to the wellbeing of people, places and communities - through projects that boost health, nature, joy, art, play, fairness, and more - offering the opportunity to rent a home for as little as £100 a week. *2)* The properties and community organisers will be managed by non-profit organisations, with clusters of housing enabling greater impact, professional networks, and economies of scale. *3)* The moonshot goal is to establish a House for Good (HFG) in every neighbourhood across the country, counteracting shortages of:

- Professional community organisers in communities, that result in less community activity/fewer pro-social benefits (Guerrilla Foundation, 2024).
- Financial models to give residents security to work and stay in neighbourhoods (Reporter, 2022).
- Charitable gifts provided to secure neighbourhood assets, that can be used to benefit communities in perpetuity (GOV.UK, 2024).
- Affordable Houses and intergenerational inequalities (Shelter England, 2024).

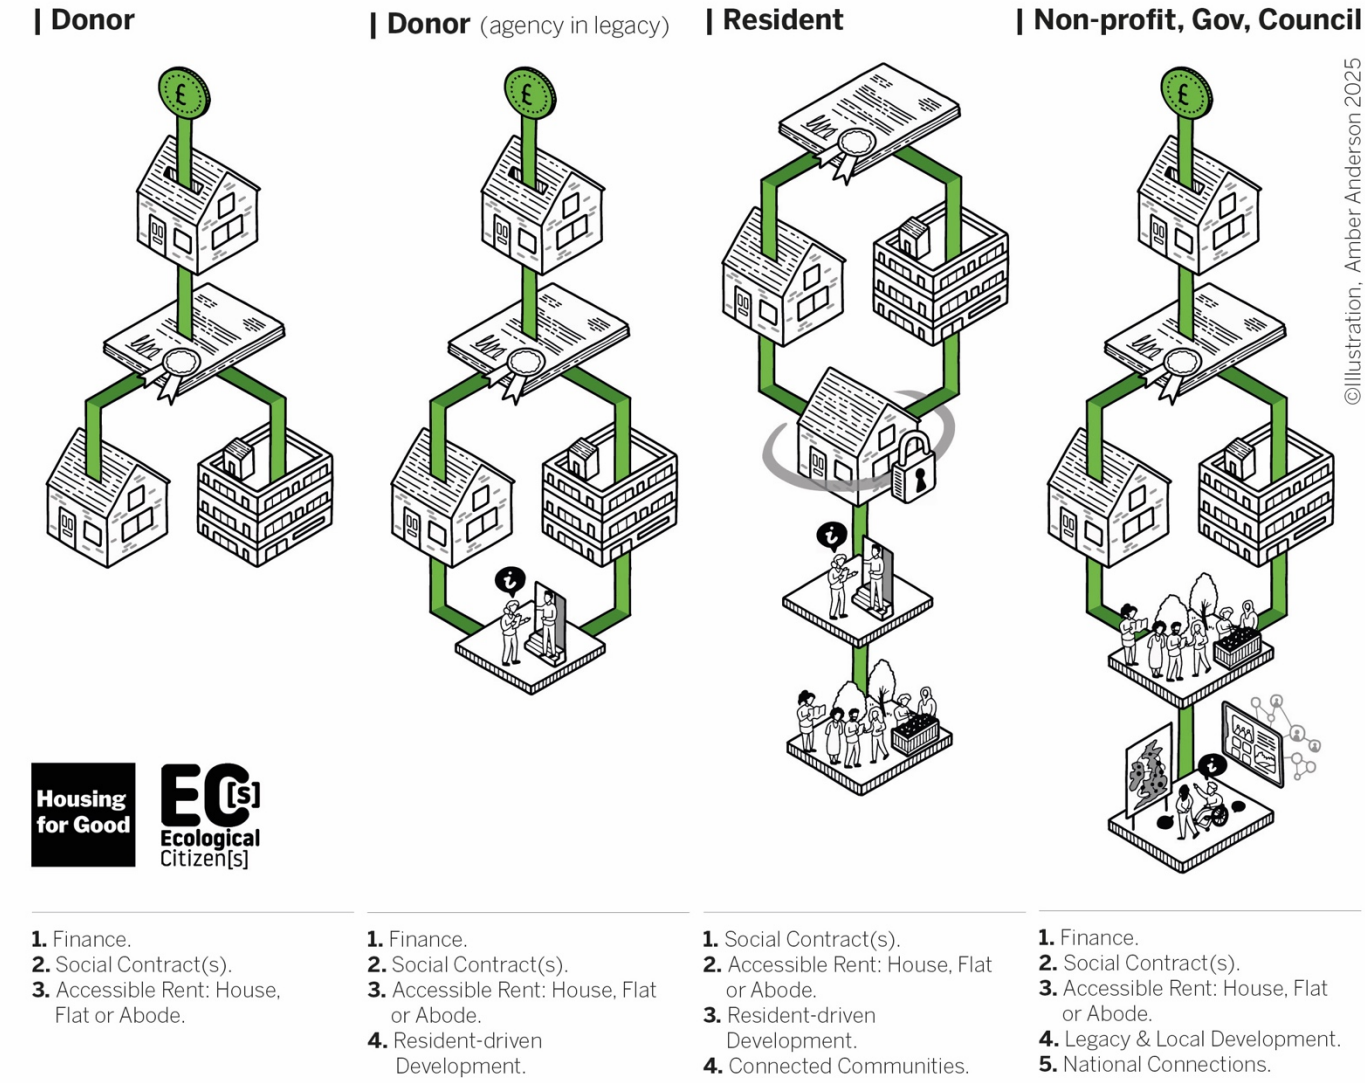

Figure 1; introducing the key partners within Housing for Good. **Donors** (with or without influence on potential legacies), **Residents** (people who would live there) and **Non-Profits / Governments and Councils**. The illustrations break down the overview with steps-in progress.

1.6 Key Partners within Housing for Good

Donors: Have the knowledge that they are creating a lasting and meaningful legacy.

Donors may also benefit from tax advantages. **Communities:** Benefit from having dedicated individuals focused on helping communities and places to flourish - facilitating events, organising activities, connecting people, sharing skills, supporting projects and more. **Residents:** Gain affordable housing and support, giving them the confidence, time, and space to invest deeply in their communities. They get access to a professional community and professional development. **Non-Profits:** Strengthen their impact and expand their reach within communities. They might make affordable housing available to employees and use properties as a form of income. **Governments and Councils:** Support community activities aligned with public agendas while increasing affordable housing and fostering citizen collaboration. Housing for Good will also become a charity in its own right that works to make the initiative a success - the nature of its objectives and services are yet to be determined.

The government could catalyse the HFG initiative with income from *Bona Vacantia* (ownerless) properties where profits go to the 'Crown' (GOV.UK, 2024b). In the 2022-2023 fiscal year, the Crown Nominee Account reported £76 million in revenue from unclaimed estates and assets. That income could be used to support the initiative and to match-fund gifts (GOV.UK, 2024b). This work navigates a reduction in either rental or short-term lease (akin to tenant farming) where residents become 'Ecological Citizen(s) in Residence' using respite from full rent to cultivate their expertise within the local community. This could include: regreening (WeForest, 2023), rewilding (Rewilding Britain, 2024), reducing CO_2 impacts (European Environment Agency, 2024), helping people to insulate houses (Woodward, 2021), sustainable pro-social behaviours (Frey, *et.al,* 2004), supporting ecological pedagogy (British Ecological Society, 2024), providing accessible health walks and many other place-based activities (National Lottery Community Fund, 2024). Many might see a correlation with a "citizens advice bureau" but this concerns 'citizen action' for local, societal and ecological benefit (Citizens Advice, 2024). The HFG's financing model leverages gifts in wills, equity release gifts from downsizing homeowners or legalese (bona vacantia) that is often 'soaked-up' by the Crown when people pass away (GOV.UK, 2024b).

1.7 Introduction Summary

The introduced design space is interconnected and requires navigating within existing UK systems. The HFG complexity unites; design, legislation, citizens, legalise, charities, 'one health', natural-world stewardship, urban contexts, cities and finance. This article focuses on unpacking the systems within design and the methodological approach, contextually grounding the audience with insights into the challenge. The unification of these approaches, explores new socially-led models of design. *The Ecological Citizen(s) Network* is funded by the UKRI and thus activities must benefit the UK. Authors do not believe in imposing colonialist activities; hence the work is UK-centric, and we call it out. If other parties can build on these concepts, that is fantastic, as place-based contextual nuances and cultural understanding is paramount. The authors' collaborative concept comes from the notion that: being secure in your housing is a core that enables you to innovate with your local community. Authors believe in co-designing benefits for people and nature, that people need time capacity, and for potential benefits to be equitable.

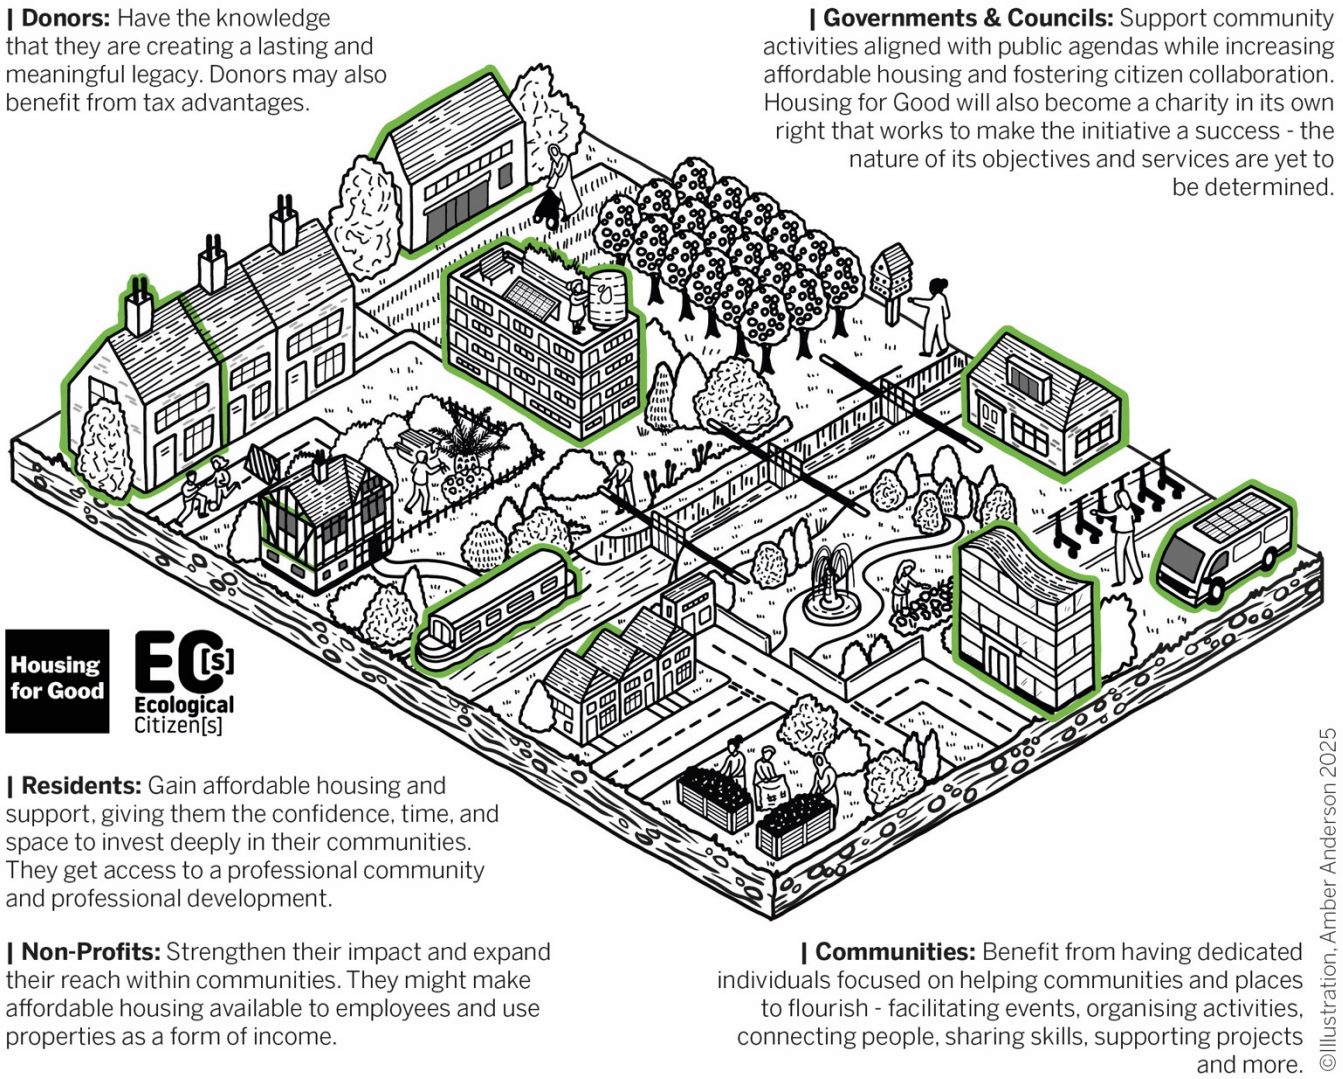

Figure 2; The vision of Housing for Good (within this remit) is to create 'Ecological Citizen(s) in Residence' cultivating their expertise within the community or communities, but it has broad reaching applications. EC in residence Includes (but not exclusive to): regreening, rewilding, reducing CO_2 impacts, helping people to insulate houses, sustainable pro-social behaviours, supporting ecological pedagogy.

2. Methodology

Within this design frame there is a unique combination of typologies and theories, including: participatory action research (Baum, 2006), participatory design (Muller, *et al.,* 1993), systems design (Mumford, 2000) and Engaging Design (Phillips, *et.al,* 2022). Firstly, the balance between expert/citizen(s) needs navigation, it is often polarised, rather than contextually nurtured but expertise can also unveil 'strategic intervention points' (Chen, *et al.,* 2022 & Lawrence, *et al.,* 2021). We rebalance our accounts of experts, as the epistemology of expertise requires "recentering onto one's current geo-cultural location" i.e. it should not be colonial by approach (Farina, *et al.,* 2024, p.254). We are not advocating for either/or, but more strategic inputs that simply benefit and empower 'people'. Technically we are all 'citizens' with areas of expertise and lived experiences, the difference is the power relationships, dynamics and accessibility. We believe that 'expertise' can build on knowledge and provide empowerment.

Participatory Action Research (PAR) a design approach, "involves collaboration between a community with lived experience of a social issue and professional researchers, often based in universities, who contribute relevant knowledge, skills, resources and networks" (Cornish, *et al.,* 2023, p.1). PAR can be a "problematic tool for facilitators and communities to apply due to power relations within the research process" (De Oliveira, 2023).

Participatory Research (PR) differs, and the main failing is the "trust is a core feature of PR (and all research involving relationships and/or partnerships" (Armstrong, *et al.,* 2022). Here we also scaffold off systems thinking "recognizing tipping points and transformative change rather than assuming linear changes" (Grewatsch, *et al.,* 2021). Our approach is closer to Engaging Design:

> (noun) "as another that borrows from design traditions and emergent design disciplines; to 'Engage Design' (verb) as a tool (for change), to design in ways that engage (adjective). Moreover, ED is a process that recognises its own capacity as a form of material, cultural language that has value in supporting interactions with critical issues of our time" (Phillips, *et.al*, 2021, p.26).

The methodological approach is more unique, designing for "collective autonomy", considering systems and how to unlock their potential to be Ecological Citizen(s) (Phillips, *et.al,* 2024b, p.6). Finally, we know imagination is needed to drive societal-scale decision-making, its governance and processes is a "wicked problem because of the complexity of the issues and the diversity of their conceptualizations; uncertainty about possible outcomes of decisions; and the difficulty of getting people together, at appropriate scales, to achieve a shared understanding" (Cork, *et al.,* 2023). Imagination "is central to empathy, to creating better lives, to envisioning and then enacting a positive future. Yet imagination is also demonstrably in decline at precisely the moment when we need it most" (Hopkins, 2019). The main difference between our approach is working strategically on all fronts, in parallel. On *The Ecological Citizen(s) Network* we work within the complexity of interdependencies and collective multi-domain knowledge, to seek collective autonomy. The role of *The Ecological Citizen(s) Network* was design-led convening and uniting the initiative strategically, i.e. 'creating the conditions' (Manzini, 2020) for critique and development. We borrowed our workshop structure and principles from co-design (Örnekoğlu-Selçuk, *et al.,* 2023), more importantly by inviting a participatory agreement (Groß, & Mandir, 2024, p.142) with a clear agenda and understanding of co-created knowledge.

1.1 Locations

Two workshops were organised: *1)* London and *2)* Exeter (2024), based on the required knowledge and audience(s).

Location 1) *Toynbee Hall* (TH) was created in 1884 with a radical vision as a place for future leaders to live and work as volunteers in London's East End, bringing them face-to-face with poverty, and giving them the "opportunity to develop practical solutions that they could take with them into national life" (Toynbee Hall, 2024). TH is a community organisation that pioneers ways to reduce structural disadvantage. Based in the East End of London, they work alongside people who live there, to tackle unfairness and make it a place where everyone has an equal chance to thrive, and they believe everyone has something valuable to offer in the fight for a fairer London. They constantly learn from their work in London we use to influence change across the UK. They also have an advice hub that proactively helps community members navigate: debt, benefits, housing, employment. Finally, TH houses *The Young Foundation*, the UK's home for community research and social innovation bringing communities, organisations and policymakers together to shape a fairer future (Toynbee Hall, 2024).

Location 2) *Positive Light Projects*, is a not-for-profit organisation in Exeter utilising visual arts to engage/inspire a diverse range of audiences and communities, focusing on socially engaged creative practices. They support local community groups and independent creative practitioners, especially those committed to socially engaged participatory practice (Positive Light Projects, 2024). The locations embodied deep connections with established communities, offering diverse perspectives and contexts.

1.2 Structure

The work's objective deployed co-designing benefits for people and nature: trialling more inclusive and accessible strategic design methods. The workshop structure built on: systems thinking (Cabrera, 2023), designing for wicked problems (Buchanan, 1992), service design (Stickdorn, *et al.,* 2018), imagination futures (Groß, & Mandir, 2024), and building 'What if' questions (Hopkins, 2019), to answer the objective. Authors broke the challenge into separate layers, making it easier to digest, explore and collaborate on. Invitees were strategically aligned based on their lived experience in: finance, end of life, probate, property, design, housing, land ownership, ecology, business, policy, communities, housing specialists and landlords. Citizens were pre-organised into groups, due to their expertise and how they could catalyse each other. We followed an Equity Diversity and Inclusion plan and ensured a gender balance, and sought to onboard people who would benefit from the network and could contribute through their lived experience(s).

The workshop format was initiated with an introduction to the HFG concept, a sharing session (designed to facilitate a culture of learning and collaboration) and an open discussion contextualising the work. Teams were then facilitated in dialogue around a collective 'design canvas' (Figure.1). The worksheet drew on existing research (Nagle, *et al.,* 2016), prototyping (Lauff, *et al.,* 2019) and applying principles (Hoda, 2024): identifying the domain/actors, phenomenon/topic to investigate, carefully assessing research ethics and considering the research values, the guiding research questions, the team's philosophy, deciding on the initial research protocols techniques, and tools, and desirable impacts.

Authors took the definition of a social contract to be a grant or guarantee of rights, franchises, or privileges. The social contract is an important set of rights that protect all parties, with clear expectations. We designed the format to capture what the Housing for Good social contract should contain and how this would work in unison with the 'perceived' tangible events enabling this design intervention to work. The Housing for Good research objective explores a housing opportunity, benefiting nature, citizens and communities. We engaged 30+ citizens in two UK locations, trialling more inclusive and accessible strategic design methods.

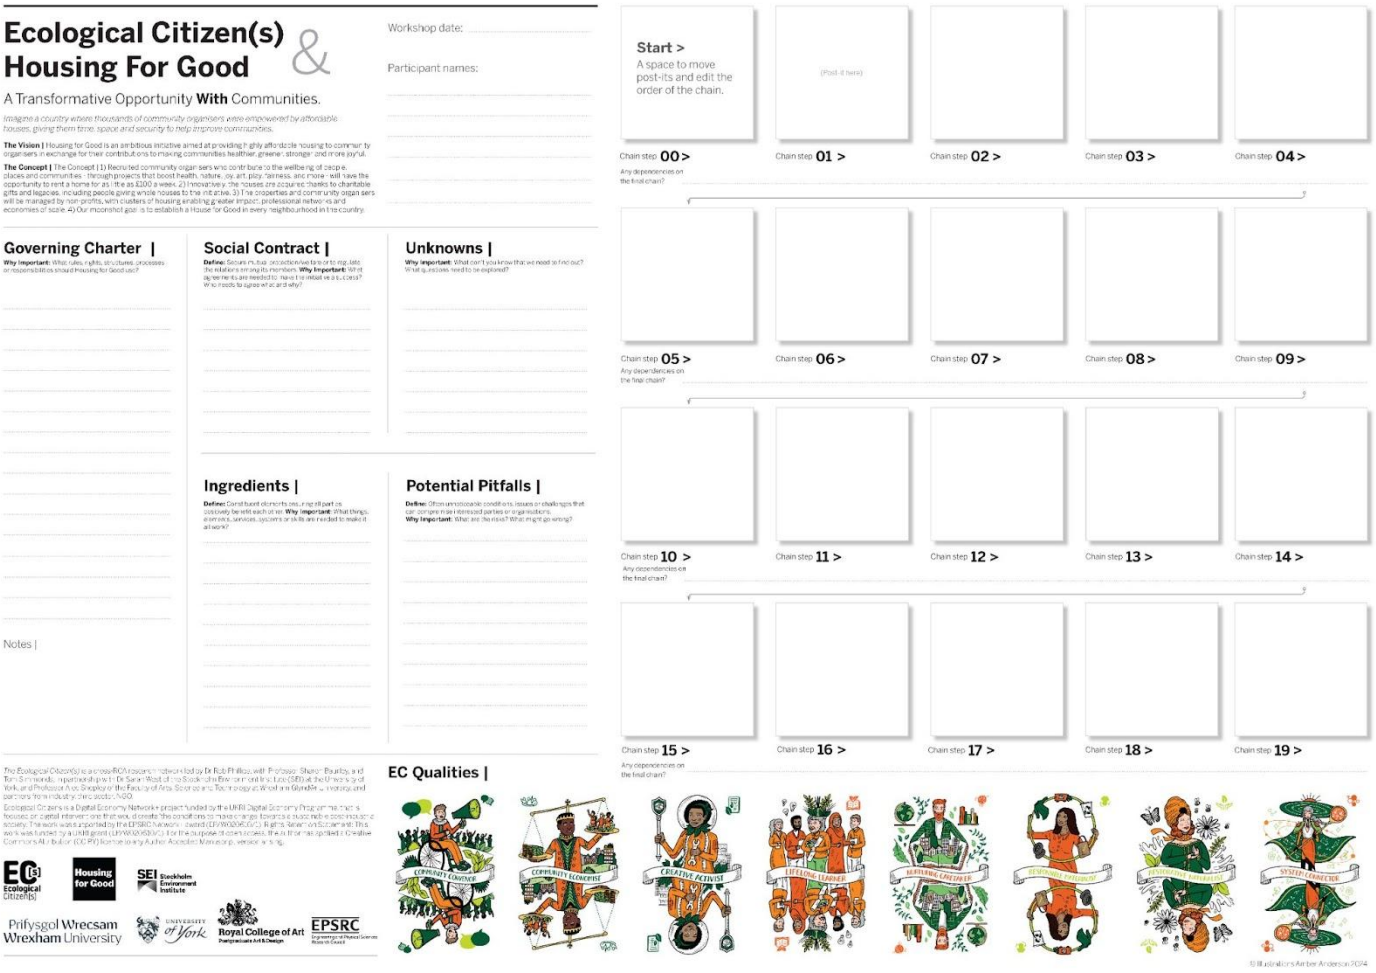

Figure 3; The worksheet was designed so citizens could create in combination. The cells enabled citizens to constantly edit the order of their decisions, by re-ordering post-it notes.

1.3 Elements

Each group was guided to solve their own challenge and advised that the other elements were resolved and working well. Assets were created aligning with business models guiding the citizens in the work. Each worksheet was specifically designed to be collaborative and iterative using post-its and working the layers together in individual groups focusing on perspectives of: *1)* Donors *2)* Residents *3)* Charities. Invitees were primed beforehand by email, and some introduced by video call. The workshop order followed: ethics processes, introduction to the design space, and an open discussion exploring the narrative of a design worksheet in small team(s). Authors perceived that we would learn from the negative aspects that our citizens would unearth, so were specific to mix Donors, Residents and Charities together.

1.4 Toynbee Hall, Workshop

Common themes raised included: placemaking and creating autonomy to local communities, charities or organisations with a governance structure that protects all parties. The invited citizens included: artists, charities, philanthropic donors, housing officers, strategic advisors and community groups.

Figure 4; Mapping work from the Toynbee Hall session.

1.5 Positive Light Projects (PLP), Workshop

PLP, Exeter is a not-for-profit organisation utilising the visual arts to engage and inspire a diverse range of audiences and communities, as well as developing emerging practitioners and aiding them to move their practise forward in exciting and innovative ways. They focus on community based, socially engaged creative practice. They enhance people's wellbeing and skills by offering engaging, collaborative, participatory, immersive and high-quality practical creative opportunities, enabling people to take part and have a go at exciting activities. We used the pop-shop space to host invited citizens: Artists, Planning Policy Advisors, Homes England (GOV.UK, 2024c), Devon Wildlife Trust, Dartmoor National Park, Labour MP (Exeter Labour Party, 2024) and City Councillors. They were grounded by the place. As with Toynbee Hall, we used the same process inviting them to catalyse their interest and introduce themselves, then the EC team guided them through the work (Figure 2). The salient points from gathered material have been thematically analysed through affinity mapping (Gupta, *et al.,* 2016).

3. Results & Discussion

The authors have combined the results and discussion sections as they are more integral and high level within this type of work. The authors foresee an overarching charity (or similar) that is established to ensure that e.g. a financial issue within a particular location or location doesn't jeopardise the system. It would encourage local and contextual scenarios of use, giving parties protection, but enabling appropriation by local elements aligning with the autonomy expected in Ecological Citizenship (Phillips, *et.al*, 2024b).

> Core strengths, "the proposition is truly accessible, as normally people simply value what they can get rather than being included, there is a lot of value in the choice that

anyone can make" **Participant 03**.

Governance, "it can have core values but then be appropriated by the local citizens" **Participant 08**. *Author Reflection*: if it does not have a detrimental affect on legalities then the social contract can be evolved based on place-based needs. Governance, is highlighted as future work.

Being the sole overseeing organisation, "there is a challenge of being the charitable supporter and evictor, if it all goes wrong which can really cause ethical turmoil to those involved" **Participant 13**. *Author Reflection*: even though there are vulnerabilities, this initiative can accessibly build on initiatives as long as the vulnerabilities are transparent.

"What happens in the dystopian future, housing is the foundation of people's lives" **Participant 26**. *Author Reflection:* the notion of future proofing was heavily discussed.

The resulting HFG insights have then been translated into: pitfalls, benefits and opportunities (pertinent to the research objective), as the granular challenges are too finite to describe.

2.1 Pitfalls |

Accountability: The power structure and governance need careful consideration, being contextually agreed as a social contract, that is accessible and clear to all parties. This opens the processes to transition Housing for Good to bounded activities, so parties are safeguarded. We suggest stages and approval processes akin to a school's board of governors. Processes should remove 'unsaid' liability with a clear remit from each party.

Motivations and Values: These will be different for all parties; their alignment is critical, as if people are not aligned in their values, then the Housing for Good concept would have fundamental challenges in its collective aim. The motivational factors for donors also need consideration, as finances are very different to donating property.

Safeguarding: The biggest question is; how do we protect all parties, and what happens during potential Housing for Good conflict(s)? This framework needs attention with open reflection on colonialism/higher powers, perhaps within the framework of Citizen(s) assemblies or similar. It also draws attention to the structures of how charities can be run, owned or operated. The Housing for Good initiative might have an application process or 'external peer review', as systems of trust need transparency enabling: responsibility and accountability.

Decision making: Who decides if the tenant has done 'enough good' or if their actions are appropriate for the 'good'. This in turn opens the need for provincial 'terms' bounded by those citizens… almost like a Hippocratic Oath. An example of this is *Detroit SOUP*, a micro granting dinner supporting creative projects, originated in the USA, (Build Institute, 2024). For a $10 donation, attendees receive dinner and a vote, hearing from four presentations. Presenters have four minutes to share concepts and answer audience questions. At the event, attendees eat, talk, enjoy art and vote on the project they think benefits the city the most. At the night's end, organisers count votes, and the winner gets all the money raised to execute the project.

Boundaries: There must be mutual trust from all parties involved, the donor, the resident, the organisation and any suggested governance process. This is not just to protect the organisation, but also residents. Employment laws provide clarity of expectations and deliveries, voluntary systems are more opaque. For example, if everyone in your community knows where you live (in your role promoting place-based good) and your role is for the local community, how do you defend your personal boundaries? Finally, there might be processes of; resident selection, onboarding and exiting that requires careful handling.

2.2 Benefits

Placemaking: There is substantial benefit to the concept of place-making (Wyckoff, 2014) as it builds on 'who' people are a good citizen to, i.e. the place? More than humans? etc. Separating the 'good' (i.e. people subsidised for cultivating good) and 'housing' (the residential construct) was raised; there is complexity, but the importance is the place-making. The concept was seen as the 'modern blacksmith', i.e. placed to build within communities, with insights into materials and processes.

Legacy: Housing for Good offers the opportunity to create embedded contextual legacies with citizens (of that place) that extend past one generation. *The Ecological Citizen(s) Network's* intention is to create an exciting opportunity that can be handed down, built on and become embedded within communities and the places they reside. A strategic suggestion is aligned with the international co-op model of governance. The co-operative model of enterprise is versatile and flexible. It can be "adapted to any sector of economic activity and takes the form of small and locally restrained businesses, as well as multinational conglomerates" (ICA, 2024). The key element to this typology of endeavour is the motivation for all parties, for example the 'donors' could be eligible for inheritance tax relief. The potential for adding 'Ecological Citizen(s) in residence' into planning legislation(s) could also provide accessible means to citizen(s). The authors foresee an overarching charity (or similar) that is established so that each 'chapter' or location cannot financially ruin the system. It would encourage local and contextual scenarios of use, giving parties protection, but enables appropriation by local elements aligning the autonomy expected in Ecological Citizenship.

2.3 Opportunities

Re-appropriation: The important challenge is how communities can 're-appropriate' the concept, so it is elastic in terms of how it can be used 'with communities' but has a clear structure, safeguarding and means. This is paramount, as the intention is to unpack 'existing systems' that could enable the time-poor (Sullivan, 2008), providing accessible opportunities for contextual scenarios. Those scenarios need to be selected by those in the setting, i.e. the citizens. A process that is being considering is a franchise charity that has many local elements within an umbrella concept, and this would protect each organisation, independently. There are multiple opportunities to address loneliness or create more community cohesion, based on increased communication. There is great potential for places to embed locals who might not be able to otherwise afford to stay in the area.

Models: The main element are the models for how this would operate; for example: a commission, an organisation owns all the assets (the houses and the leases) or a more locally adaptive role where charities are matched with homeowners. The opportunity here also needs to build off existing laws, legislation and restrictions.

Reform: A recurrent point was finding ways in which any system(s) can 'fail to safe', i.e. whatever happens all parties are safe and not compromised. The opportunity to have ecologists, rewilding experts or ecologists within the place you call home opens new normal(s).

Governance: This is the largest challenge; the terms, conditions and who dictates those elements. This includes the terms and conditions of how we 'design for exit', before we have even started. It also has the conditions of trust and social contracts that need clarity. *Re-Permissioning the City* (2025) is an interesting parallel, its portfolio of tools introduces a citizen-centered approach to managing spaces, enabling adaptive and evolving rules based on real-world feedback. It opens the city for all kinds of civic activities by granting citizens convenient access to one of the city's most vital assets — space. The Housing for Good initiative requires a default governance process that protects the place-based

interests and the people. A hard challenge, as at some point there will be an abuse of power, even if unintentional, and this initiative operates outside of government legislation, as it is about hyper-local concerns. The practices of how it protects all parties and does not invite abuse need: navigation, creation and debunking for transparent opportunities as a piece of further work.

2.4 Conclusion

The article unpacks a specific instance of co-designing benefits for people and nature: trialling more inclusive and accessible strategic design methods, through housing provision. We build on *Visions of Climate Futures* providing metrics for climate action to include: "what brings you joy, what are you good at, what work needs doing", with a fourth value 'What should supported communities have access to' and supporting people in stable housing is step one (Johnson, 2024, p. 424). Embedding these opportunities for true support within our local ecosystems is vital and a core step to enabling these types of opportunities to be accessible. Within design practices there is often pressure to create material goods, rather than shift systems.

> "We don't need more [economic] growth to improve people's lives. We can accomplish our social goals right now, without any growth at all, simply by sharing what we have more fairly and by investing in generous public goods" (Johnson, 2024, p.179).

Housing and the 'places we call home' are complex, but they can be used to create capacity for people to deploy Ecological Citizenship. The bigger question is how we can continually build skills with citizens, to be strategic without eternal unproductive, unfunded dialogue. The workshops demonstrated the potential of concepts that should be locally appropriated, as the power relationships must be with citizens. The difference over other examples is the agenda for creating a place that is accessible to all, rather than just the financially or time rich. The Housing for Good concept is a design-led charitable entity with enormous potential for co-designing benefits for people and nature: trialling more inclusive and accessible strategic design methods. Like any material or process, the organisation and designer(s) need to define the boundaries of their remit. The following are the next steps in the Housing for Goods Development.

Scenario 1: Authors share the idea and case studies, without supporting its development.

Scenario 2: Create the Housing for Good concept and legal language available for charities to adopt.

Scenario 3: Develop a match-making service, to sign-post people to selected charities. Including registration and delivery standards that need to be upheld.

Scenario 4: Launch a charity that owns Housing for Good residencies that can house people working for good through charities or their own projects. Purpose built or renovated, the residence could house individuals, groups and families, with shared spaces and tools for collaboration.

2.5 Future Work

The Housing for Good concept demonstrates countless benefits to societies and overall should be truly accessible. The design space sits beyond the realm of volunteering as it is only viable for the time rich and opens new means for charitable organisations. Finally exploring place-based governance models in more depth is required. The role of the designer—as mediator, convener, or system-builder and ethical boundaries, needs unpacking in further work.

ABSTRACT | This paper presents a critical reflection on how hyperlocal design practices can help to address the current ecological challenges. It explores new forms of symbiotic coexistence between community and local territory as a possible alternative to contemporary problems.
The educational and research approach adopted promotes an eco-social design model rooted in the territorial context, through the combination of endogenous resources - such as native plant species, biomaterials and biological waste - with the active involvement of local communities.
The research focuses on the Venice Lagoon, a unique environment characterised by a delicate balance between social, cultural and ecological systems, where the urban form is permeated by water and the rhythms of life are marked by the tides. In this context, the rapid spread of civic actions represents a concrete possibility to develop a symbiotic relationship between the community and the lagoon socio-ecological system, favouring alternative ways of interacting with nature and local resources.
In recent years, our research experiences have focused on the relationship between the local context and the relevance of design in supporting such ecological practices. This is why they carry out experiments at an educational level.
In particular, this article presents and analyses the experimental activities conducted within the CTRL + Junk Lab Study Centre of the Iuav University of Venice. These projects promote production processes based on the use of local natural resources through forms of ecological activism that enhance the lagoon territory. The outcome of these investigations is the definition of the *Hyperlocal Ecologies Framework*, an educational and

design model aimed at developing hyperlocal design strategies capable of responding to the challenges posed by climate change and directing design attention towards alternative systems, in tune with the social and ecological dynamics of the local context. This methodology offers an alternative direction, reinforces the symbiotic coexistence between community and territory and design practice, and highlights the potential of design in fostering positive changes in the systems in which we live.
This paper emphasises the relevance of recovering and enhancing traditional knowledge systems and local biocultural practices by stimulating new forms of relationships between human beings, the environment and everyday objects.
Furthermore, the research highlights the need for an evolution in design education towards a hyper-contextual dimension that not only represents an opportunity for the discipline, but also a model of concrete intervention for the territory. In this way, design becomes a medium capable of actively responding to the ongoing ecological crisis, proposing adaptive and ecologically compatible solutions for the future of the communities and places in which we operate through design.

KEYWORDS | ECO-SOCIAL DESIGN, HYPERLOCAL DESIGN; SYMBIOTIC DESIGN; ENDEMIC MATERIAL DESIGN; LOCAL ACTIVISM

1. Introduction - Research directions

The paper aims to investigate how hyperlocal design practices (Fagnoni, 2022) can contribute to responding to the progressive deterioration of material and social resources (Wizinsky, 2022), and the ecological crisis (Morton, 2018; Franz, 2022) by combining local resources - endogenous plant species, biomaterials, waste - with the civic communities of the territory.
The climate regime (Latour 2018) is not only about ecological crises. However, it concerns political and cultural-historical issues, as well as ethical and epistemological shifts in perspective, from which a critical and participatory relationship with our living world begins.
It is crucial to examine the contribution of design in bottom-up practices with local communities for spreading awareness about the value of social and natural relationships.
The contribution explores the context of eco-social design, with references to the literature on the topic and through the framing of concepts such as 'hyperlocal design', 'symbiotic design', 'indigenous design' and 'biocultural design practices'.
Subsequently, the Venetian context is described, where educational and research initiatives on the topic are underway. These initiatives are characterised by the relationship between the social, economic, and cultural system and the ecological-natural system with which it interacts (Bookchin, 2021).
In particular, there will be a focus on experimental project initiatives related to the CTRL + Junk Lab Study Centre of Iuav University of Venice. These initiatives promote the adoption of local production processes, the use of endemic material (Karana, et al, 2015) and natural resources, such as biological waste and plant species, through ecological practices of local activism (Priola & Manfroni, 2024) useful to enhance the context of the Venice Lagoon.
The output of our critical investigations is the *Hyperlocal Ecologies Framework* an educational methodology oriented to ecologically appropriate hyperlocal design practices.
It provides a possible direction for research and project practices to address the critical issues and questions presented by climate change, through the connection between civic

realities, project and territory.
The presentation of the developed concepts aims to highlight and demonstrate the need to adopt a hyperlocal perspective to address complex challenges and to share a proposal of possible alternative design approaches. The proposed framework, which is still in the implementation and testing phase, is dynamic and rhizomatic and represents a design flow mapping that acts in specific contexts and interacts with heterogeneous design practices and civic actions of the realities rooted in the territory.

2. Different forms of eco-social design practices

The increasing environmental, social, political and economic crises highlight the urgency of reviewing the logic and dynamics characterising production and distribution systems. In response, design acts and takes root in specific territories and contexts, promoting relationships of proximity and circularity, and initiating critical reflections on the future of contemporary society.
The relationship between human beings, land, natural resources and social relations is a crucial element in addressing the current environmental crisis (Elhacham, et al, 2020). These aspects pose complex design challenges, which require drawing from theoretical knowledge from different disciplines and integrating social and ecological practices capable of overcoming an anthropocentric vision (Crutzen, 2006; Steffen, et al, 2011).
Design actions today are taking place within a social context that is already full of spaces, structures, objects, rubble and soil to be reactivated (DelSesto, 2022). Design is thus faced with complex realities and has to cultivate both a design capacity and a social imagination in order to re-act, in ways that are in line with the cultural and ecological needs of local realities.
In this sense, design is configured as a transformative discipline that can contribute to delineating and fostering an eco-social cultural transition (Fettes, Cole & Blenkinsop, 2024), represented by the intersection of ecological and social sensibilities, deeply intertwined components that historically characterise the discipline of design (Papanek, 1972; Maldonado, 2022).
In response to the ongoing climate crises, we are witnessing the spread of different ecologically and socially appropriate practices Table 1 and design approaches based on a deep connection with local contexts and the natural world, capable of reformulating and redesigning potential desirable futures.
This is a heterogeneous set of eco-social design practices and projects (Vacca, et al, 2022) that aim to contribute to a necessary transformation of the relationships between humans and nature, which are opposed to the extractive logics that have dominated the context and natural resources to date. They represent how design practices based on critical dialogue with civic realities rooted in the territories (Manzini & Thorpe, 2018; Villari, 2021) can foster processes of cooperation and hyperlocal relations, understood as a system of collective practices of involving active citizens in the development of potentially transformative solutions.
The shift proposed by Hyperlocal design (Fagnoni, 2022) consists in rethinking, repositioning and practising design activities within specific contexts, in a strictly local relationship, through the interdependence between people, resources, spaces and objects (Crippa & Fagnoni, 2024). In these hyper-contextual practices, design arises in relation to specific contexts, rather than as an exogenous element at high risk of rejection (Cardini, 2022). It thus empowers the possibility of imagining solutions from local resources available within the community, such as activities, materials, technologies, habits, and enhances traditional territorial skills and knowledge (Fagnoni, Manfroni & Priola, 2024).
The thesis supported by the authors is that through the adoption of hyperlocal design practices, design reconfigures itself as an interdisciplinary, distributed, plural and collaborative activity. Combining design knowledge with tacit knowledge of ecological heritage and related

material use practices, it can promote the development of culturally appropriate design solutions (Author, 2024) and in line with eco-social dynamics.
In the contemporary world emerges a cultural paradigm characterised by forms of ecological responsibility in which individual and collective well-being is based on the propensity for cooperation between humans and non-humans and the relationships between living beings and the environment (Lovelock, 1979; Kohn, 2021).
Symbiotic design-oriented research approaches manifest themselves, focusing not only on the design of individual artefacts, but of relational systems with nature, which promote renewed coexistence between living species and heterogeneous systems (Naess, et al, 2010).
In this sense, there is a proliferation of collective design strategies and modes in which designers promote ecological-symbiotic relational practices, implementing locally-based solutions to global problems and collectively building tools for survival (Yuan, 2024).
Moreover, new perspectives emerge, in which humankind is not just the passive beneficiary of the benefits nature can provide, but can help protect, proactively manage and restore natural ecosystems by contributing to addressing critical societal challenges.
Through the adoption of nature-inspired design approaches (Myers & Antonelli, 2012; Author, 2024) and Regenerative design (Lyle, 1996), projects aim to reverse the degeneration of natural systems through co-evolutionary perspectives (Mang & Reed, 2020).
The connections between humans and nature, although weakened in many contexts, remain strong in some communities, such as indigenous peoples (Borgnino, 2022) and other local realities that have maintained a close relationship with their natural environments. These relationships have given rise to adaptive cultures, shaped by reciprocal interactions with nature and Indigenous design practices (Watson, 2020).
However, the continuing loss of global biodiversity and the decline in cultural diversity raise critical questions about the relationship between culture, heritage and nature, highlighting the need for integrated approaches to address ecological crises.
The concept of biocultural diversity offers a perspective based on the interdependence between humans and the biosphere, recognising the complexity of socio-ecological systems as a network of dynamic, non-linear relationships that emphasise the interconnection between natural processes and human activities – Figure 1.
Today, thanks to the convergence of the social and natural sciences, the dichotomy between ‘nature’ and ‘culture’ takes on a new perspective, in which the intrinsic value of the environment is increasingly recognised in contemporary ethical thought and practice.
This relational vision leads to a greater awareness of interdependencies, inspiring concepts and practices such as Biocultural design and Terroir design (Rigobello & Evans, 2024). Design practices related to the concepts of bioregion and terroir offer further insights into the integration of ecological culture into product development.
The bioregion constitutes a framework of collective consciousness, where environmental conditions influence human life and culture. In parallel, terroir is a notion related to the relationships between place, cultural traditions and ecology, and provides a useful model for developing production systems anchored in the specificities of a territory and its resources (Paxson, 2010).
Common to all these perspectives is the valorisation of eco-social aspects as critical elements to enable individuals to locate and root themselves strongly to specific territorial dynamics, valuing the coexistence of multiple cultural and social realities and supporting plural visions of progress.
In line with the concepts of pluriverse and Ontological design (Escobar, 2018), these practices acknowledge the interdependence between humans, nature and technology, moving away from anthropocentrism to promote practices rooted in local particularities and co-generated with communities. These approaches aim to deconstruct the extractive logics typical of modernity, favouring future, equitable, pluralist and relational futures and offering strategic conceptual tools for design research and practice.

Table 1. Different forms of eco-social design practices.

Eco-social design practices	Social and ecological values	#
Hyperlocal design	Encourages the development of culturally appropriate design solutions starting from the local resources available within the community, such as activities, materials, technologies, habits, and enhancing traditional territorial skills and knowledge	local resources; endemic species; biomaterial; tacit knowledge; local activism; civic engagement
Symbiotic design	It integrates the relationships between living organisms and the environment, creating ecological and social systems that foster coexistence between humans, nature and other species. Combining natural experiences and behavioural changes, it develops design solutions to reduce human impact on ecosystems and promote a synergy between organic and inorganic life	ecological integration; multispecies interconnection; human-environment mutualism; biocentric design; living systems integration; interspecies
Regenerative design	Aims to restore, renew and revitalise ecosystems and communities by generating systems that actively contribute to environmental regeneration, promoting ecological balance and social well-being through co-evolutionary processes and nature-inspired strategies	ecosystem regeneration; coevolution; biophilia; nature based solution; waste regeneration; ecological restoration
Biocultural design	Integrates local cultural and biological diversity to promote rural and local community development by integrating traditional knowledge and practices to connect with the environment	biocultural diversity; local community involvement; traditional knowledge; holistic approach; bioregional; local biological resources
Terroir design	It promotes ecological and social diversity, valorising bioregional specificities, multi-species relations and the identity of a place through a relational and multi-sensory dimension rooted in the interconnections between nature, culture and community	bioregional approach; multispecies relationships; biocultural interconnections; local identity; eco-social diversity; cultural relevance
Indigenous design	It draws deeply on the cultural and environmental values of indigenous communities, integrating traditional knowledge and practices to develop adaptive solutions through the use of local materials and production techniques that minimise environmental impact while conserving natural resources	cultural relevance; community engagement; holistic approach; tacit knowledge; traditional practices; local materials
Ontologic design	It promotes the development of design solutions based on the interdependence between human beings, nature and technology, through equitable, pluralist and relational practices rooted in local specificities and co-generated with communities	holistic approach; multispecies relationships; pluriverse; radical interdependence; decoloniality; political

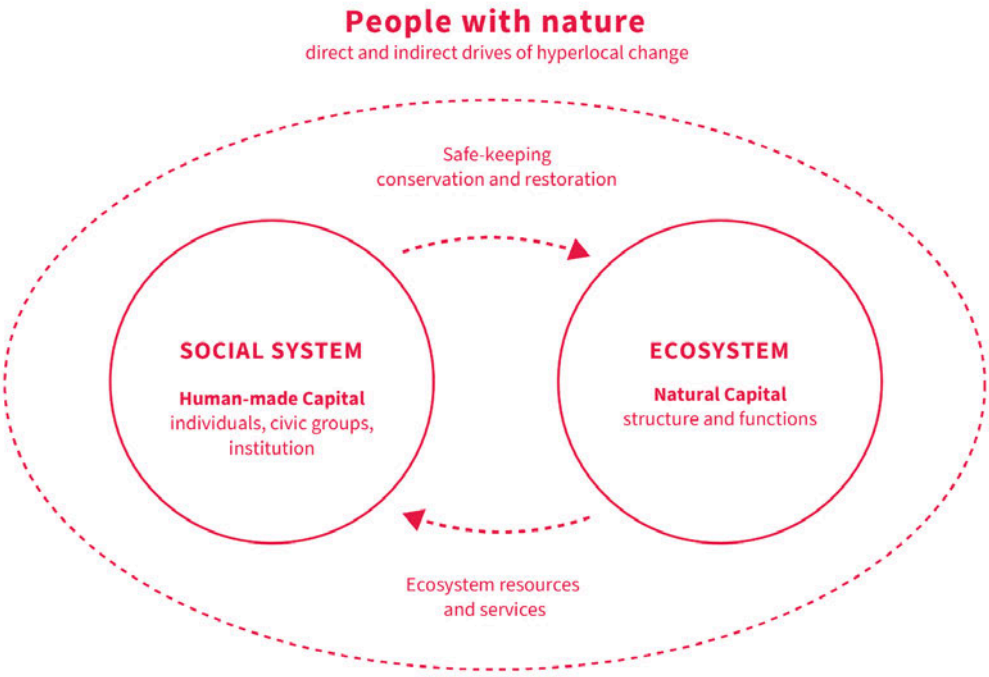

Figure 1. Conceptual diagram of social-ecological system reviewed by the authors on Resilience Alliance, 2007.

3. Method - Research activities and design practices

This paper analyses project experiences based on cooperation with civic realities, which operate for the promotion of local biocultural practices and knowledge. They are characterised by the adoption of local production processes and endemic material resources, through ecological practices of local activism with co-evolutionary perspectives.
The case studies presented belong to the CTRL + Junk Lab Study Centre of Iuav University of Venice and concern experimental project paths in which the collaboration between designers and associative realities re-activates a dimension of hyperlocal development.
In particular, the developed methodology was tested in the design of products and civic interaction spaces within the Venetian context. It was implemented in the Interactive Design Laboratory and the Product, Service and Interaction Design Laboratory of the Bachelor's Degree program, as well as in the Civic Space Design Laboratory of the Master's Degree program in Product, Visual Communication and Interior Design at Iuav University of Venice.
The concepts developed are the outcome of a design activity that starts from an analysis of the existing realities, peculiarities and traditions of the Venice Lagoon. This process is characterised by the adoption of four main phases: *HLocal Design Research* (Phase 1. Context and local stakeholders discovery), *HLocal Design Thought* (Phase 2. Eco-social values and practices definition), *HLocal Design Scenario* (Phase 3. Concept and design scenario development) and *HLocal Design Value* (Phase 4. Activated interactions evaluation).

The first phase *HLocal Design Research* (Phase 1. Context and local stakeholders discovery), aims to investigate the reference context, through a direct interview with some appropriately selected local stakeholders: Third Sector groups and enterprises, small productive realities, associations. The observation turns its attention to the activity of the stakeholder trying to focus on cultural, relational and environmental aspects.
Through ethnographic observation and interviews with actors and operators in the area, it is

possible to frame a system of actions aimed at exploring and rethinking ways of enhancing local processes and resources.
Each of the civic realities identified is analysed through direct interviews using specific tools such as Table 2 analysis sheets, used during the visits.
The observational research allows to focus on strengths and weaknesses, but also to bring out eco-social values in relation to the activities and initiatives undertaken. Furthermore, the hyperlocal research phase enables the identification of project possibilities based on the direct needs of the stakeholders to initiate the next project phase.
In order to establish contact with the local system, the research activity involves the adoption of a series of observation tools (photographic documentation, video interviews, literary quotations) that enable the re-establishment of a strong link with local traditions and cultural aspects.
During the research phase, there is the opportunity to deeply investigate the local civic realities, with direct and indirect investigations, references to case studies, and in-depth study of specific studies useful to support the subsequent phase of defining project goals and directions.
In particular, this *HLocal Design Thought phase* (Phase 2. Eco-social values and practices definition), is based on the analysis of the collected information and the interpretation of the realities' needs in relation to eco-social design practices.
In the third phase *HLocal Design Scenario* (Phase 3. Concept and design scenario development) the design development of hyper-contextual solutions that specifically respond to the needs of the local community and the characteristics of the venetian context is initiated. This phase allows the development of different concepts and possible solutions through brainstorming activities, sketching, 2D technical drawings, 3D models, renderings, brochures and scale models.
In the fourth *HLocal Design Value phase* (Phase 4. Activated interactions evaluation) the developed concept is evaluated on the basis of the connections and relationships generated in the project contexts, the potential direct and indirect benefits for the stakeholders and the ecosystem effects. The relationships, processes and structures that connect the concept to the actors involved, such as associations and citizens, are analysed, promoting involvement and facilitating action between different stakeholders.
The evaluation phase allows for a critical reflection of the design and process aspects, useful to identify possible unintended consequences and potentials and to stimulate new perspectives and hyper-contextual relationships.

Table 2. Structure of the interview with civic realities.

Key point	Questions
Presentation	Who are they? What objectives do they set themselves? What are their areas of work? What kind of services do they promote? What is their legal form? Which members do they involve?
Analysis	What activities do they carry out? What is the target audience? With what activities are their goals achieved? What methods do they use to involve citizens?
Relationship with ecological practices	What is the relationship between the relevant civic reality and ecological practices? What tools, methods or projects do they implement to make citizens aware of ecological practices?
Relationship with social practices	In which spaces do they intervene? What is the relationship between citizens and the civic reality in question?

4. Scenario - Interactions, connections and design perspectives in the Venice Lagoon

The reference area of the research is the Venice Lagoon, an intrinsically dynamic and constantly evolving context, located between islands, mainland and waterways.
The morphological characteristics of the territory determine a system that is open to innovation and transformation and constantly searching for balance (Pace, 2023). If in other places modernity and urbanisation have radically changed the face of cities, Venice, characterised by the extraordinary uniqueness of its geographical context, could represent a paradigmatic example for the contemporary world (Pascolo, 2020).
In this sense, the city, whose urban form is permeated by water and the rhythms of life are dictated by the tides (VITAL, 2023) together with its surrounding lagoon, could represent a matrix of interconnected natural social capital (da Mosto, et al, 2020).
Over the millennia, the Venetian community has developed alternative ways of relating to nature and lagoon resources that represent an emblematic example of how human settlements can evolve in response to complex phenomena such as rising waters and environmental changes.
The fragility and diversity of the area have led citizens to develop a great sense of resilience and adaptability to the various difficult situations they face on a daily basis.
Local traditions, culture and ecological sensitivity, brought forward by the civic realities active in the area, are closely integrated with the scientific and planning priorities emerging in the contemporary world.
Venetian associations have a very positive impact on the territory and, through active work, promote plural perspectives and values that integrate socio-cultural connections with lagoon ecology.
Civic behaviours and actions shape the territorial and aquatic landscape, and represent contrasting actions to negotiate Venice's position in the modern world.
These actions represent a possibility of symbiotic survival within the socio-ecological system on the border between the ‘artificial’ and the ‘natural’, in a city often overshadowed by its past, overtaken by tourism, declining resident population (Basso, Fregolent, 2022) and widespread ecological degradation.
This unique environment, thanks to its mutability and dynamism, is an open and experimental laboratory, offering endless possibilities for exploration and experimentation into research and design fields. In this way, it is possible to develop and promote alternative practices that highlight the urgency of socio-environmental change and encourage critical reflection on the relationship between humans and the environment.

4.1 Proposals - Eco-social design concept

The development of project themes and scenarios for the lagoon, starting from specific needs, enables the valorisation of the area's cultural roots, strengthening the link with natural resources.
The realities involved in the project research are active in protecting the territory and developing the local economy, resisting the obstacles and difficulties imposed by the system in which they operate.
It is a plural network of actors, small groups, associations and cooperative realities that are activated to make community enterprise, revitalise disused spaces and local economies, share knowledge and assets, design short supply chains and circuits of solidarity in all fields (Fagnoni

et al., 2024).
The cases presented in Table 3 propose a hyperlocal design approach in the educational sphere and represent research, experimentation and design paths to be further tested in order to overcome excessively impactful design practices.
The selected concepts arise from the direct relationship with the civic realities of the territory and promote the adoption of ecological practices useful to enhance existing actions and citizens' commitment in the context of the Venice Lagoon.
InFermento by Arban C., Ceccon L., Favaro M. and Primon T. – Figure 2, designed in *Sitopìa* workshop is a food fermentation kit developed for Venissa, a company that offers environmental cooking experiences, and works on the recovery of vines adapted to the salinity of the lagoon on the island of Mazzorbo, in the most uncontaminated part of the Venice lagoon. The kit, designed to make the fermentation process simple and accessible to more people in the home environment, consists of two borosilicate glass jars, with an analogue system for venting excess gas, and a set of essential tools for preserving and enhancing food in a natural and environmentally friendly way.
An online service is also provided, which through the use of preparation sheets allows a virtual community to exchange knowledge on fermentation techniques and methods. InFermento provides a safe and simplified experience, ideal for beginners. The kit guides you step by step into the world of home fermentation, allowing you to easily transform fruit and vegetables into fermented foods. In addition, the project promotes the reduction of food waste and the extension of food shelf life.

Figure 2. InFermento concept, Arban C., Ceccon L., Favaro M., Primon T.

Alofita by Beggiora V., Graziotto E., Oanta V. and Pagliarusco B. – Figure 3 is a project developed to address the expansion of saline areas and the regeneration of salinised soils in lagoon contexts such as Venice.
It stems from a dialogue with The Tidal Garden, a research laboratory that focuses on adaptation to climate change, and promotes the cultivation of halophytes, the plants capable of tolerating soil salinisation that thrive in saline environments.
Rising sea levels and the salt wedge phenomenon pose significant threats to agricultural land, compromising its fertility and the production of vital cultures for local food sustainability.
The device, equipped with a specific sensor, allows farmers to constantly monitor the salinity of

their fields, providing real-time data and indications on halophytes, suggesting how they can be used to rebalance the salinity of Venetian farmland.
The aim is to provide farmers with the necessary tools to tackle environmental challenges in an effective and ecological way, thus helping to preserve the valuable agricultural heritage of the Venetian region. Through this integrated solution designed to counter the complex dynamics typical of agriculture in lagoon contexts such as Venice.

Figure 3. Alofita concept, Beggiora V., Graziotto E., Oanta V., Pagliarusco B.

Toa, a project by Borogovac S., Egbo C., Pioli I. and Rainoldi G. is a nomadic, modular table and kitchen for public spaces. It stems from the reflection that the table and the kitchen constitute the central fulcrum through which the profound bond between the community that inhabits the lagoon and its landscape unravels. In line with the philosophy of Tocia! Kitchen and Community, an interdisciplinary collective based at the Spiazzi association in Venice, proposes a positive impact on the local community and territory through an idea of shared and participatory food.
Therefore, *Toa* is an artefact that acts as a catalyst for a space of conviviality, where the kitchen is in direct contact with the surrounding landscape. Furthermore, the ultimate goal of this artefact is to establish a true ritual around food preparation, creating a space for sharing and dialogue.
The system, which is easily disassembled and transportable, is designed to facilitate the organisation of the association's activities: workshops, pop-up dinners, experiments with raw materials, with the reuse of food waste, with edible vegetable species and with preservation techniques. One of the goals of this interaction is to provoke in diners a critical reflection on their natural surroundings.
Other concepts presented instead propose the adoption of local material and natural resources and can be considered as examples of waste treatment that follow processes of waste integration and regeneration.
Among these, *Refibra* by Cecchinato L., Gatti G., Gentile F. and Segna A., is a project created in collaboration with Sospiri Botaniche Veneziane, a company that produces local distillates using botanicals from the island of Sant'Erasmo, an oasis untouched by lagoon tourism, where attention and respect for the life cycle of cultivated plantations coexist.

Production is carried out with respect for traditions, rituals and wisdom, through the harvesting of vegetables, salicornia and aromatic plants typical of the lagoon. In particular, the project developed is based on the reuse of waste from the violet artichoke, a variety that grows on the island of Sant'Erasmo with specific qualities due to the unique properties of the soil and salty water of the lagoon. Through the adoption of Do-It-Yourself (DIY) waste regeneration techniques and the adoption of self-experimentation practices, a plant waste recovery process was initiated. The result is a semi-transparent bioplastic with fabric-like characteristics that, thanks to its distinctive aroma, texture and natural colours, is reminiscent of the plant elements of which it is composed.
El Barchin by Conti L., Damonte S., De Conti G. and Perchiazzi F., is a packaging composed of two main elements. The chitin and chitosan container is made from the waste from the processing of blue crab from the San Marco Cooperative - Pescatori di Burano, and also offers an environmentally friendly alternative to traditional plastic containers. Chitosan, derived from the chitin found in crustacean shells, is known for its antimicrobial properties and its ability to degrade naturally over time.
The second element is a perforated plate made of recycled Murano glass by Venetian start-up Rehub, which, through a process of recycling glass waste, transforms it into a paste that can be moulded at ambient temperature and injection-moulded or extruded using a 3D printer.
The *Alter_azioni* workshop (Costa & Fagnoni, 2023) includes bio-oriented projects experimenting approaches with natural materials that enhance their contexts. Among these is *Tressa* by Anderle M., Fabris G., Hyka A. and Vespini N. – Figure 4 is an open source product-service for the collection and reuse of algae, a natural element that is fundamental for the fragile balance of the lagoon ecosystem, but at the same time a versatile material in its adaptability of use. It is a material experiment begun following a discussion with biologists from the CNR-ISMAR in Venice and is based on the extraction of polysaccharides and other substances present in algae, used as a basis for the production of bioplastics that can degrade naturally over time.
The research explores the potential of non-extractive and often discredited local plant materials, such as invasive plants and algae, to contribute to an ecological and social transition.

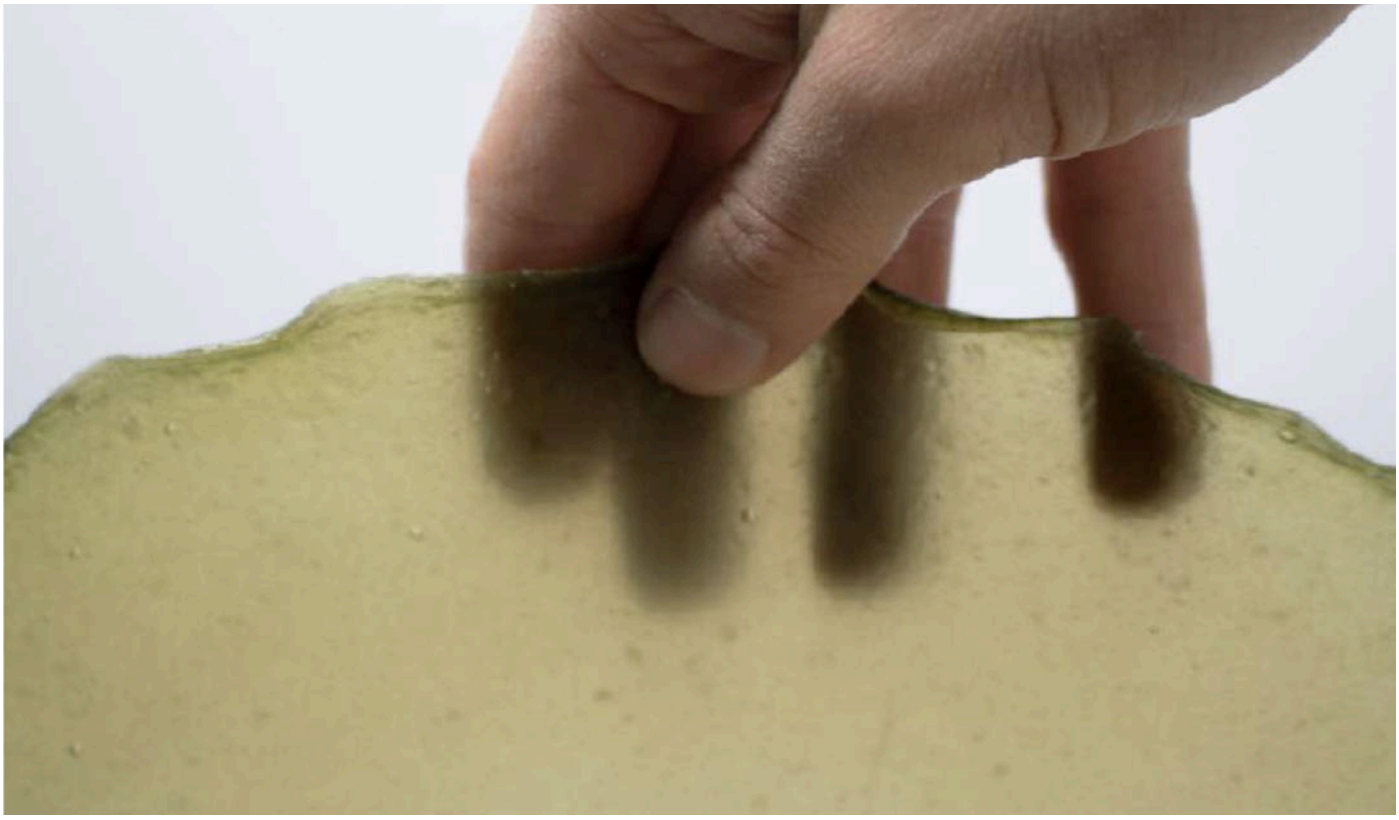

Figure 4. Tressa concept, Anderle M., Fabris G., Hyka A., Vespini N.

Finally, the proposed concepts focus on structures, systems and spaces aimed at fostering symbiotic relationships between humans, nature and other species.
The *Intersezioni* project by Marras, C., Rubino, F. and Scirè N – Figure 5, designed as part of the *Habi(li)tat* workshop, presents itself as a scenario of coexistence between man and other species, considered as his equals, through a design intervention aimed at supporting the evolution and organisation of the ecosystem that characterises the lagoon.
These structures are designed for the Vignole natural area, a state-owned area where VERAS operates, a non-profit association that involves and supports the local Venetian community through various social, cultural, and ecological activities. The objective is to move away from an anthropocentric vision of the project, with a view to respecting the times and modes of growth that belong to its inhabitants, people, fauna and vegetation.

Figure 5. Intersezioni concept, Marras, C., Rubino, F., Scirè N

BioMe by Arnoldi E., Dufour F., Serfilippi C. and Vit E. – Figure 6 of the *Inter_azioni* workshop is a floating space developed with the support of CNR-ISMAR, the Venice Institute of Marine Sciences, which carries out applied research in oceanography, biological chemistry and marine geology in the lagoon. It is a space designed to observe processes and climate variability, and to initiate pathways for the protection and sustainable management of the lagoon aquatic environment.
In particular, it is a platform that contributes to the restoration of the lagoon ecosystem by means of a reticular structure, located underneath, designed to generate an ideal habitat for marine organisms. In addition, a complementary space has been designed where users can be involved in processes of reuse and transformation of materials found in the lagoon by means of machinery to create biodegradable objects for everyday use.

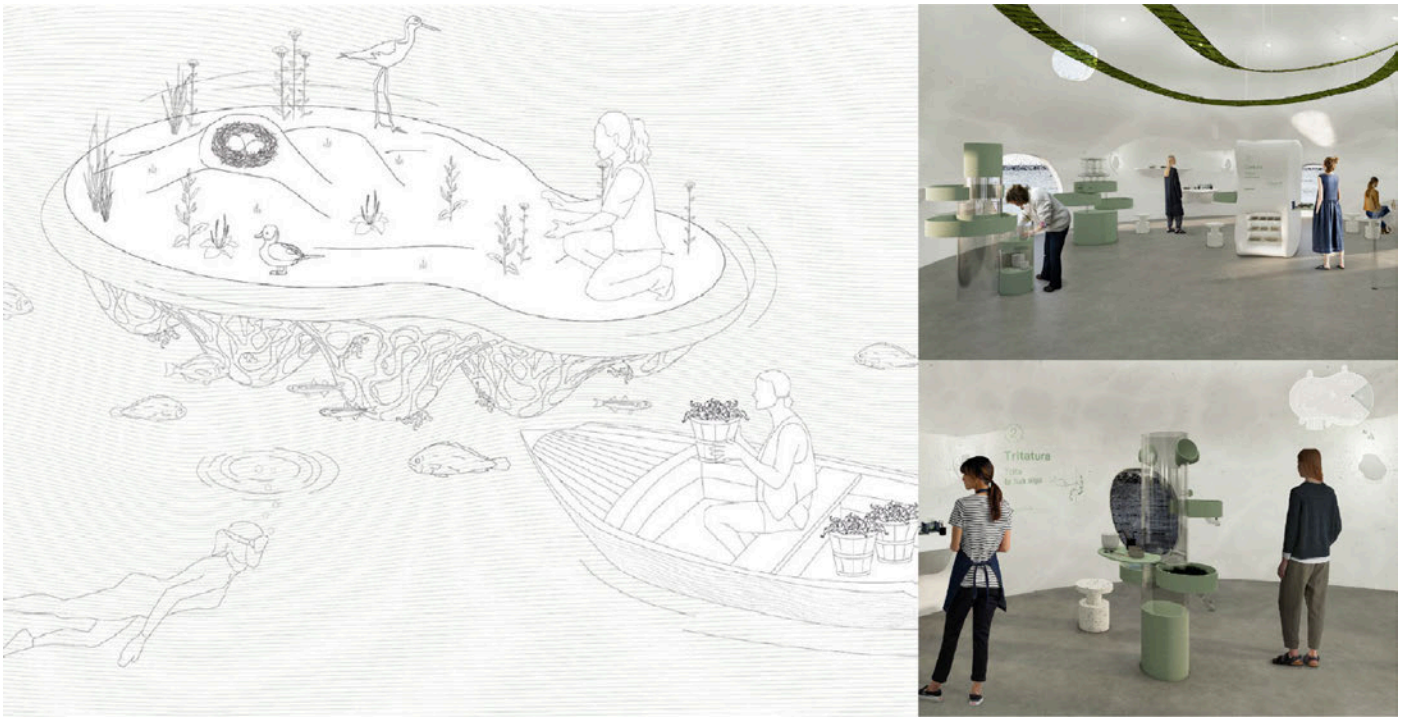

Figure 6. BioMe concept, Arnoldi E., Dufour F., Serfilippi C., Vit E.

Matassa by Stama D. is a thesis project that reimagines future living in the post-ancestral scenario, offering a possible response to the current climate emergency. The project presents a self-produced lagoon shelter, made of marsh reed and byssus, a waste product of mussel cultivation. This model proposes biophilic, energy-independent and adaptable living and, through the adoption of hanks of 'sea wool', creates walls, seats and beds in an organic flow, open to modification and change.
The decision to design in the lagoon responds to the need to address the climatic risks typical of the area, to dialogue with local fishing communities to understand, through traditional knowledge, the challenges and opportunities offered by local materials such as byssus and marsh reed.
The project proposes a modular and shareable shelter, designed to adapt to the instability of the lagoon. Going beyond the archetypal casone, it incorporates construction techniques that reduce the use of wood, contain material circuits and allow for modification and displacement, in keeping with a resilient and hyper-contextual approach.

Table 3. Eco-social design concept and Venetian realities involved.

Eco-social practices	Endemic material resources	Symbiotic relationships
InFermento Venissa	Refibra Sospiri Botaniche Veneziane	Intersezioni VERAS

Toa Tocia! Cucina e comunità	Tressa CNR–ISMAR	Matassa Fishing community

5. Hyperlocal Ecologies Framework

Over the years, the exploration of progressively complex scenarios has led to an evolution in design approaches. It also leads to a consequent transformation of design culture and the set of methodological and practical tools that designers can adopt (Design Council, 2021).
In order to generate a positive impact, methods and tools to support design practice should encourage the adoption of strategic approaches to design (Design Council, 2005) and stimulate reflection during the design process (Stolterman, et al, 2008). Such tools should be designed to be intuitive, facilitate the externalisation of ideas (Daalhuizen, 2014), allow for new design perspectives, enable stakeholder engagement and relate appropriately to the context.
In order to offer designers support and guidance in managing the hyperlocal design process, which characterises one of the challenges of contemporary design, a *Hyperlocal Ecologies Framework* has been developed - Figure 7. A strategic mode of action that is useful to direct design attention towards alternative systems, in tune with the social and ecological dynamics of the local context.
It is a visual representation that describes the key steps to be taken in hyperlocal design.
This didactic-design framework aims to provide guidance to designers, who focus on integrating local resources, knowledge and practices to develop design solutions appropriate to eco-social dynamics. This approach enhances territorial skills and traditional knowledge, promoting symbiotic coexistence between human beings and the environmental context. It therefore represents a reference for the development of design solutions that are environmentally conscious and culturally relevant, which can promote the synergy between organic and inorganic life.
One of the objectives is to encourage the dissemination of experimental design practices and approaches in which the collaboration between designers and associations stimulates alternative development paths rooted in the local context.
The proposed design model, tested in the Venetian context during the development of design concepts pertaining to the CTRL + Junk Lab Study Centre of Iuav University of Venice, is divided into four main phases: *HLocal Design Research* (Phase 1. Context and local stakeholders discovery), *HLocal Design Value* (Phase 2. Eco-social values and practices definition), *HLocal Design Scenario* (Phase 3. Concept and design scenario development) and *HLocal Design Value* (Phase 4. Activated interactions evaluation) as described in paragraph 3 of the paper.
This promotes the development of culturally and ecologically appropriate design solutions through the following principles of hyperlocal design:

- Eco-social practices - Promotion of cultural and environmental values of civic realities by integrating traditional knowledge and practices to develop adaptive solutions that reduce impact and preserve natural resources. Promotion of local cultural and biological diversity by incorporating traditional knowledge and practices for the development of indigenous communities;

- Endogenous material resources - Enhancement of local material circuits through the development of production systems anchored to the specificities of an area and local resources, endogenous plant species, biomaterials and waste materials;
