c lifeisfurniture@gmail.com

ABSTRACT | With rapid urbanization, urban food systems face growing challenges from the spatial and temporal separation of food production and consumption. This study explores urban agriculture as a solution to mitigate these challenges by integrating food production into cities, reducing environmental impact, enhancing food security, and improving system resilience. Using a multiple case study methodology, six representative urban agriculture models from international contexts were analyzed. The findings informed the development of the "Concentric Ripple" model, a three-tier system comprising peri-urban farms, community hubs, and urban core flagship stores. This model strengthens food distribution networks, fosters consumer engagement, and optimizes resource recycling, while leveraging technology-driven production technics. The study concludes that urban agriculture effectively bridges the production-consumption divide, though persistent challenges in economic sustainability, stakeholder coordination, and sustained community participation requires further attention. This research offers a scalable framework for building sustainable and resilient urban food systems, adaptable to different urban contexts.

KEYWORDS | Food system resilience, urban agriculture, sustainable community, Metropolitan Area, food supply chain

1. Introduction

As urbanization advances and human society develops rapidly, economic and social divisions of labor have undergone profound changes, leading to significant transformations and challenges in human production systems. A critical issue has emerged in the agricultural sector: the spatial and temporal separation of food production and consumption within urban food systems (Dong et al., 2021). From a temporal perspective, the introduction of harvesting, processing, storage, distribution, and sales has significantly extended the food supply chain. From a spatial perspective, the rapid expansion of urban areas has consumed vast amounts of arable land, forcing agricultural production to relocate to rural and remote regions.

This spatial and temporal separation has led to a series of complex issues. Environmentally, extended transportation and prolonged storage have increased fossil fuel consumption and carbon emissions, while widespread intensive farming and genetically modified technologies have contributed to biodiversity loss, soil erosion, and ecosystem degradation (Lan et al., 2022). Socially, consumer rejection of "imperfect" produce and the rise of bulk purchasing have resulted in substantial food waste, exacerbating the global food waste crisis. Additionally, this separation has narrowed consumer choices, aggravated nutritional imbalances among urban residents, and diminished their awareness and trust in food sources. Economically, traditional smallholder farming models have been replaced by large-scale distribution systems, reducing farmers' bargaining power in the supply chain. Consequently, their profits are often squeezed by intermediaries, while consumers face higher costs (Proctor & Berdegué, 2020). Moreover, sudden events (e.g., the COVID-19 pandemic) have further exposed the fragility of urban food systems that depend heavily on external supply (Fan et al., 2021). Any disruption in the supply chain can lead to food shortages, severely impacting urban residents' quality of life and social stability.

Despite the global slowdown in urbanization, China remains in a phase of rapid urbanization. Due to its large population and regional disparities, the complexity of spatial and temporal separation in the food system has been further intensified (Zhang et al., 2017). On one hand, rural-to-urban migration and urban land expansion have increased food demand, while an aging population has exacerbated supply-demand imbalances. On the other hand, the loss of agricultural land and the urban-rural divide have placed additional pressure on food production. In this context, exploring ways to bridge the "production-consumption" gap in urban food systems and enhance their resilience and sustainability is a pressing priority.

Urban agriculture offers an innovative solution to mitigating spatial and temporal separation in urban food systems. Unlike traditional agriculture, urban agriculture integrates food production directly into urban environments, engaging city residents in agricultural activities and significantly reducing the spatiotemporal distance between production and consumption. Moreover, urban agriculture leverages modern technologies to achieve efficient, low-impact farming, optimizing urban land and water resources while improving food self-sufficiency and system resilience.

This study explores three key research questions:

- RQ1: How can systemic innovation reduce the spatiotemporal distance in urban food systems and redefine the relationship between production and consumption?
- RQ2: What roles do different urban agriculture models play in mitigating spatial and temporal separation, and how can these models be adapted to local contexts?
- RQ3: How can a resilient urban food system be developed in alignment with China’s socioeconomic and cultural characteristics to address both current and future challenges?

In recent years, the rapid development of urban agriculture worldwide has provided valuable insights into restructuring urban food systems. Urban agriculture can optimize limited urban space by utilizing rooftops, vacant lots, and urban peripheries for agricultural production. At the

same time, it connects producers and consumers through models such as community-supported agriculture, reducing intermediaries and enhancing the efficiency and transparency of food systems.

To answer the proposed research questions, this study examines urban agriculture case studies from both China and abroad, aiming to identify innovative models well-suited to Chinese cities. The goal is to offer both theoretical insights and practical pathways for developing a sustainable and resilient urban food system in China.

2. Methodology

Given the complexity of urban environments, global urban agriculture practices exhibit trends of diversity and actively innovation trends. This study employed a multiple case study methodology to explore strategies for constructing resilient urban food systems in China, facilitating understanding of dynamic interactions and contextual influences in complex settings. To address the limited integration of global insights into China's urban food systems, the method enables systematic analysis and comparison of diverse global urban agriculture models, identifying context-specific best practice while adapting them to China’s unique socioeconomic and cultural conditions.

To ensure comprehensiveness and representativeness, selected cases spanned various geographical regions, social backgrounds, and practice types (Dorr et al., 2023). The research process consisted of four key steps. First, the study defined research objectives and identified cases that can effectively reduce the spatiotemporal distance between production and consumption through systemic innovations. Second, selection criteria were established, including the extent to which cases address challenges such as production models, energy consumption crises, shifts in sales and purchasing patterns, food system resilience, and biocycle and waste management. Additional criteria included data availability, geographic and social diversity, and feasibility for implementation in China. Third, a comprehensive literature review and keyword-based case search were conducted to generate an initial cases pool. Subsequently, case relevance was assessed based on predefined inclusion criteria. Finally, the shortlisted cases underwent rigorous analysis and validation, resulting in the selection of six representative cases: three domestic cases, including Beijing Chaoyang Joy City Rooftop Farm, Shared Harvest Organic Farm, and Clover Community Garden, and three international cases, including South Philly High School Farm, Farm Urban, and Patchwork Urban Farms. These cases demonstrate innovative urban agriculture practices across different social contexts and provide valuable insights for advancing urban agriculture in China.

3. Cases analysis

Quzhou Luming Park, located in Zhejiang Province, China, was initiated by Professor Yu Kongjian. It continues his "New Peach Garden" urban vision (Yu, 2024), integrating agriculture, landscape, and ecology while leveraging the expertise of landscape architects. The project transforms urban green space into a productive landscape, incorporating rotational farming, native vegetation, and an ecological water system to create a self-sustaining urban oasis that balances food production, recreation, and environmental restoration. By embedding seasonal crop cultivation within the park’s design, it offers residents hands-on agricultural experiences and ecological education, fostering public awareness of food systems, sustainability, and biodiversity while enhancing social engagement. The integration of agriculture within the city core promotes multifunctional land use, strengthens urban food resilience, and reduces transportation-

related emissions, demonstrating the potential of landscape architecture in bridging the urban-rural divide. While well-suited for newly developed urban districts and ecologically sensitive areas, the project faces challenges in long-term policy support, operational management, economic viability, land use conflicts, and climate adaptability, which may influence its broader implementation and sustainability.

Located in Beijing, China, Shared Harvest Organic Farm is one of the earliest adopters of the Community-Supported Agriculture (CSA) model in the country. The project connects farmers and consumers through a membership system, where consumers prepay for farm products to support operations, and the farm delivers fresh organic produce to members regularly. In addition, the farm organizes hands-on farming experiences, allowing consumers to gain a deeper understanding of agricultural production and build trust in food sources. By eliminating intermediaries, the project shortens the production-consumption chain, improves food distribution efficiency, and reduces resource waste. Its membership-based model provides stable financial support for the farm while enabling consumers to actively participate in agricultural production. This shared-risk approach ensures income stability for producers and contributes to the long-term sustainability of the farm (Sun & Zhang, 2013). The project serves as a model for optimizing food distribution systems in peri-urban areas. However, its high level of participant commitment may limit large-scale adoption.

Initiated by Professor Liu Yuelai, the Clover Nature School is a government-led community co-construction initiative and a model for urban agriculture in China (Liu et al., 2019). As of 2024, the project has directly established or empowered residents to create over 1,200 mini community gardens across the country. The project consists of community gardens, nature education bases, community-building initiatives, and nature schools. By embedding agricultural production into communities and regularly organizing environmental education activities, it helps residents, especially children, learn about sustainable agriculture while integrating food production, ecological enhancement, and community interaction. Supported by an extensive "point-line-plane" community garden network, the Clover Nature School shortens the distance between food production and consumption, reduces dependence on external supply, and provides a platform for ecological education and engagement. It is particularly suitable for resource-constrained areas with high levels of community participation (Liu et al., 2016). However, the project's success relies on sustained enthusiasm and involvement from residents, as well as continued policy and financial support from the government. These factors pose challenges for its large-scale promotion and long-term sustainability.

Located in Philadelphia, USA, the Southern Philadelphia High School Farm is a community-initiated and managed farm project that integrates school and community resources. It primarily supplies fresh and healthy produce to school cafeterias while providing agricultural education and hands-on experiences for students and community members. Through its innovative integration of agriculture and education, the project enables engages students in growing, harvesting, cooking, and consuming food from their school gardens, reinforcing their understanding of food production (U.S. Department of Education, 2012). This significantly shortens the spatiotemporal distance between food production and consumption, strengthens community cohesion, and raises awareness of food security. The model is particularly suitable for resource-constrained areas with high community engagement, especially where strong ties exist between educational institutions and local communities. However, the farm's sustainability depends on long-term support, and its limited production scale constrains broader implementation.

Located in Asheville, North Carolina, USA, Patchwork Urban Farms was initiated by Asher

Wright in 2014. Through community land-sharing and a decentralized farming network, the project integrates multiple micro-farms into a flexible production system, maximizing the use of fragmented urban spaces and promoting local food production. By adopting a decentralized farming model, the project shortens the spatiotemporal distance between food production and consumption. Its produce is supplied directly to local consumers, restaurants, and farmers' markets, while financial sustainability is supported through the Community-Supported Agriculture (CSA) model. Although this approach demonstrates the advantages of multi-location production, the complexity of decentralized management and the high dependency on resident participation may limit its scalability.

Located in Liverpool, UK, Farm Urban was initiated by the company Farm Urban. By integrating hydroponic and aquaponic technologies, the project repurposes abandoned urban spaces for efficient agricultural production. The project establishes a closed-loop ecological system, enhancing production efficiency through water resource recycling while reducing transportation demands and resource waste. Its technology-driven model demonstrates the potential for advanced agricultural solutions in urban environments. However, the high cost and technical barriers of aquaponic systems limit its scalability and broader adoption.

Figure 1. The six aforementioned typical cases of urban agriculture.

Through an in-depth examination of these cases, this study employs narrative analysis and cross-case analysis to extract key patterns and design elements. Narrative analysis helps the research team understand the practical pathways and contextual background of each case, while cross-case analysis is used to compare the characteristics and applicability of different models. These methods reveal effective strategies adopted by the six cases in mitigating the spatial and temporal separation between food production and consumption and identify commonalities and differences in spatial design, service design, and system innovation. For instance, Quzhou Luming Park addresses energy consumption challenges by integrating agricultural production with urban public spaces and introducing productive crops; Shared Harvest Organic Farm and the Southern Philadelphia

High School Farm optimize sales models and purchasing methods; the Clover Nature School and Patchwork Urban Farms enhance the resilience of urban food systems; and Farm Urban focuses on waste management and resource recycling. These cases provide valuable insights for the sustainable development of urban food systems in China. If properly guided by designers, self-organized urban agriculture holds great social and ecological potential (Wu, 2022).

4. Result-"Concentric Ripple" model

Building on the above analysis, this study proposed the "Concentric Ripple" model to address the challenges of spatial and temporal separation between food production and consumption in China's urban food system. This model structures a resilient and sustainable urban agriculture system through a three-tier framework consisting of the urban core, urban communities, and peri-urban areas. While incorporating the strengths of global urban agriculture practices, the model adapts to different contexts to enhance its applicability. By optimizing the flow of capital, resources, and information, it establishes a highly efficient and collaborative agricultural network. See figure 1 for the "Concentric Ripple" model.

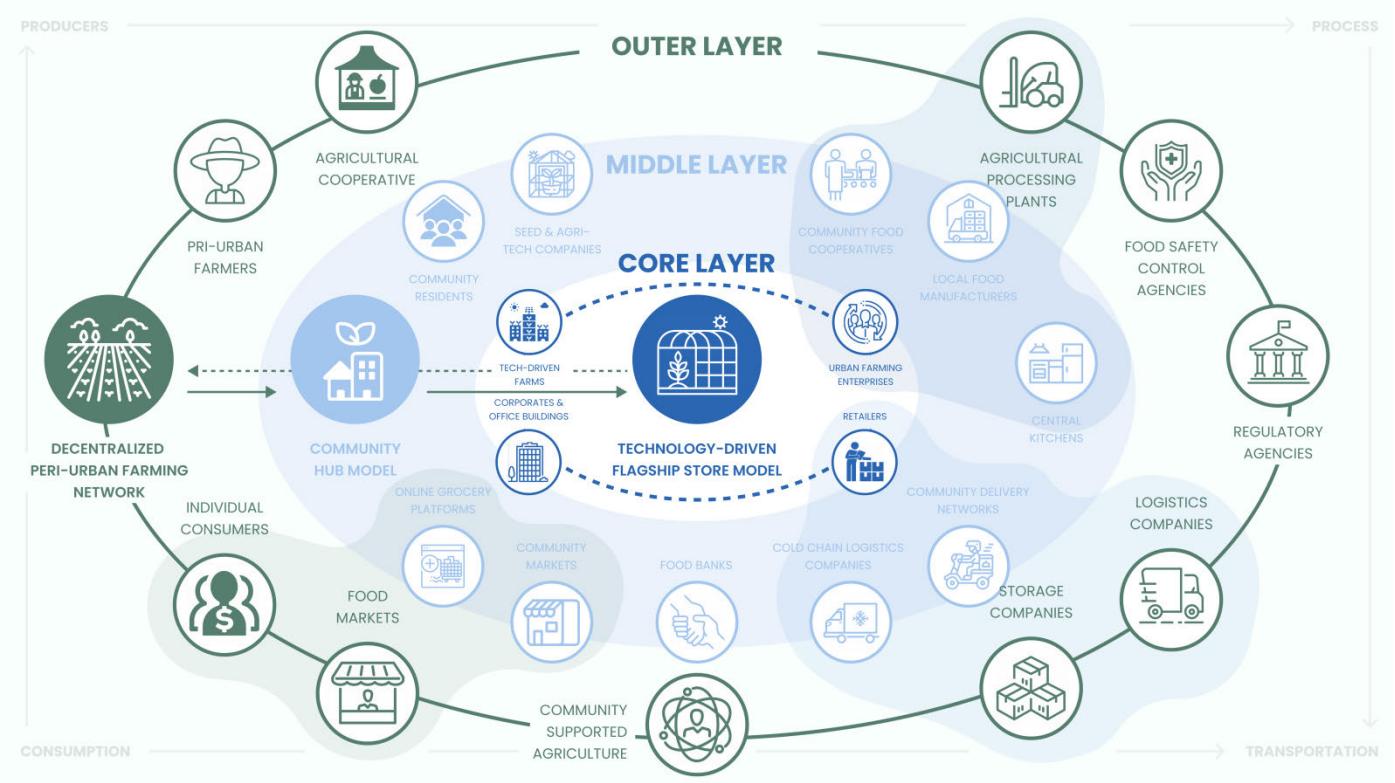

Figure 2. The system diagram of the 'Concentric Ripple' model illustrates the stakeholders within the core, middle, and outer layers. Each layer is structured according to the six key stages of the food 'production-to-consumption' cycle, with dynamic interactions between them, collectively shaping a more resilient urban food system.

4.1 Urban Core: Technology-Driven Flagship Store Model

At the innermost layer, flagship stores serve as showcases for agricultural technology and sustainable living concepts. These stores adopt modern agricultural technologies such as vertical farming, hydroponics, and closed-loop ecological systems to efficiently produce small-scale organic food within limited urban spaces, meeting the demand for healthy food while establishing a strong brand identity and attracting social resources.

Beyond production, flagship stores also function as education and engagement hubs, offering skills training, agricultural education, and sustainability experiences. Smart management systems gather consumer demands and market feedbacks, transmitting them to community and peri-urban areas to refine production and distribution strategies, creating a closed-loop interaction.

4.2 Middle Layer: Community Hub Model

Situated within urban communities, community hubs act as key intermediaries, linking peri-urban farms with urban consumers while serving as logistics, resource circulation, and education centers. Embedded in residential areas, campuses, and industrial parks, they establish a regionally integrated service network based on a point-line-plane approach, embedding food production in daily life.

These hubs handle food quality inspection, sales, and distribution while facilitating waste management by converting organic waste into compost, returning it to peri-urban farms. They also promote gardening toolkits and training programs, enhancing food system transparency.

Furthermore, consumer purchasing behavior and demand insights are transmitted across both inner and outer layers, allowing the system to optimize planting plans and distribution strategies at the production end while refining marketing and engagement strategies at the consumption end.

4.3 Outer Layer: Decentralized Peri-Urban Farming Network

The outermost layer functions as the production core, leveraging land and agricultural expertise for large-scale food production. A decentralized farming network ensures a stable material foundation, with grid-based management allowing flexible scheduling. Peri-urban farms supply food through two main channels:

- **Consumer-Direct Model (CSA-inspired):** Consumers pre-subscribe to farm produce, which is then delivered to households or schools via an optimized logistics system.
- **Centralized Distribution Model:** Fresh produce is transported in bulk to community hubs, where it is either sold or distributed.

In addition to production, peri-urban farms also function as agricultural training centers. Through collaborations with communities and schools, farming knowledge and techniques are disseminated, fostering urban-rural interaction and enhancing agricultural capacity at a broader societal level.

In conclusion, the “Concentric Ripple” model forms a highly integrated circular system by coordinating the flows of capital, materials, and information across three interconnected tiers. In the urban core, flagship stores utilize smart systems to collect real-time data on consumer preferences and nutritional needs. This information is aggregated at community hubs, where it is combined with sales and logistics data, then transmitted to peri-urban farms to guide adaptive crop planning and precision agriculture.

Community hubs serve as pivotal intermediaries linking production and consumption. They manage logistics and distribution while processing organic waste into compost, which is returned to peri-urban farms—thus closing the material loop. Peri-urban farms, as the primary

production base, apply grid-based management to ensure flexible scheduling and supply stability.

Capital, facilitated by government subsidies, product sales, and brand partnerships, flows across all three layers, supporting long-term economic sustainability. This multilayered, bidirectional framework transcends the single-function limitations of traditional urban agriculture, demonstrating enhanced adaptability, responsiveness, and scalability.

5. Conclusion

This research contributes to the field of food ethics by introducing the "Concentric Ripple" model—an innovative and practical framework for reconstructing resilient urban food systems. The model integrates three interdependent layers—peri-urban areas, urban communities, and the urban core—to address the spatial and temporal disconnect between food production and consumption, offering a systemic solution for sustainable urban development.

Moving beyond the single-function paradigm of traditional agriculture, the model embeds food production within urban ecological and socio-cultural contexts. It coordinates capital, material, and information flows across all layers to form an integrated circular system. In the peri-urban layer, a decentralized farming network enabled by grid-based management and technology supports large-scale organic food production. Community hubs serve as centers for logistics, distribution, and resource recycling, linking producers and consumers while enhancing transparency and civic engagement. At the urban core, flagship stores utilize vertical farming, hydroponics, and closed-loop systems to facilitate efficient, small-scale food production while building brand identity and attracting social capital. These layers interact through bidirectional feedback loops, collectively creating a responsive, adaptive, and closed-loop urban food network.

Continued technological innovation and cost reduction will further enhance the model's adaptability and scalability. Its multifunctional structure allows for context-specific customization, making it suitable for both dense megacities and smaller urban areas. To realize system-level transformation, three leverage points are critical:

- Land-use policies and spatial planning frameworks that support peri-urban agriculture and empower local governance bodies;
- Digital infrastructure that enables real-time integration of production, distribution, and consumption data;
- Community-based incentive mechanisms and educational initiatives that sustain long-term citizen participation.

Despite its promise, the model faces several implementation challenges. Effective cross-layer coordination and real-time information exchange demand robust management mechanisms, particularly in multi-stakeholder settings. Economic sustainability remains a concern, as high initial investment costs may hinder large-scale adoption; attracting long-term capital and ensuring financial self-reliance are essential. Additionally, maintaining consistent community engagement is uncertain and will require targeted incentive structures, participatory governance strategies, and supportive policy frameworks. Future research should explore these pathways to enable a more inclusive, resilient, and sustainable urban food system.

Sensory Dimensions and Ethical Challenges: Rethinking Technology in Contemporary Food Art

Guo Jin, Sichuan Fine Arts Institute, jg_chloe@163.com
YanTing Liao, University of the Arts London, liaoyant0127@163.com

INTRODUCTION

As technology continues to reshape food and design, ethical concerns regarding safety, authenticity, and cultural significance have become increasingly pressing (Behrokh Mohajer Maghari, 2011). While artists experiment with innovations such as genetic modification and 3D printing, these advancements also raise critical questions about their impact on food's sensory and social value. Works such as Enrico Becker and Matt Harris's *GMF fruits* (2015) and Open Meals' *Eight-bit sushi* (2019) exemplify this tension. Do these technological interventions expand the artistic potential of food, or do they risk detaching it from its cultural roots? This study examines how artists, through works by HE+HU (2022), Bompas & Parr (2014), Jinhyun Jeon (2018), and others, navigate the balance between innovation and ethical responsibility, advocating for a more conscientious approach to food-based art.

Figure 1. Work Selection for Case Study

• *ELECTRONIC+FRUIT WALL*, HE+HU

• *STIMULI x rndg*, Jinhyun Jeon

• *P.O.TH.A.A.VFB*, Dieter Roth

• *Flavour Fireworks*, Bompas&Parr

CASE STUDY

We've selected several works focused on real food, created by iconic '90s artists and emerging talents from the past decade (see Figure 1). They are:

- ***Electronic+Fruit Wall***, HE+HU, 2022, Fruits, LED;
- ***Stimuli x rndg***, Jinhyun Jeon, 2018, Ceramic;
- ***P.O.TH.A.A.VFB***, Dieter Roth, 1968, Chocolate, Birdseed;
- ***Flirting Goblets***, HE+HU, 2017, Wine Glass, Feather Device;
- ***PH Series***, HE+HU, Fruits, Vegetables, pH Reagents;
- ***Flavour Fireworks***, Bompas & Parr, 2013/2014, Fruit Scent, Edible Confetti, Fireworks;
- ***Soul City (Pyramid of Oranges)***, Roelof Louw, 1967;
- ***Creation***, Jenifer Rubell, 2019, A buffet-style performance art piece made of massive amounts of food;
- ***Stoke***, Anya Gallaccio, 2014, Melting chocolate to coat a room for interaction.

METHOD

Classification	Work Title	Artist or Designer	Vision	Touch	Hearing	Smell	Taste
Light diets	Electronic+Fruit Wall	HE+HU	😀				
	Soul City	Roelof Louw	😀			😀	
	Loaf	Laila Gohar	😀	😀		😀	😀
	PH Series	HE+HU	😀

Table 1. Classification of Works and Sensory Statistics

① The five senses are our most primal way of experiencing the world—and the most essential way we engage with food. Using them as a lens, we break down food art, drawing on aesthetic theories from Susanne K. Langer, Roger Fry, and Clive Bell to ground the analysis in its core essence.
② Light and heavy diets are basic food categories—one linked to health, freshness, and ease, the other to high energy and indulgence. We use this contrast as a lens to analyze food art (see Table 1).

FINDING

① For the public, this framework (see Table 2) makes food art easier to understand by linking its interpretation to personal experience. It brings food art closer to the audience, sparking deeper reflection on the self and reality.
② For young artists and designers, embracing new technology doesn't mean abandoning old techniques—it means evolving them. This study reinterprets traditional methods by using sensory interplay to amplify perception, much like how digital technology enhances artistic creation today. In the digital age, this approach offers another way for tradition to remain relevant, proving that technology isn't the only future for art and design.
③ For seasoned curators and art professionals, this framework allows food art exhibitions to be presented in a way that feels more grounded in real life, better reflecting the true essence of food itself.

Framework of food art

Deconstruct food art by types of food

Light Diets

Cooking Behavior :
Reduce oil and seasoning use for a healthy, balanced diet.

Element:	**Method**:	**Exhibition**:	**Meaning:**
● Use one or up to three elements. ● Use eco-friendly or recyclable elements. ● Use easily accessible or unprocessed elements.	● Use simple creation and design methods, such as repetition, stacking, and arrangement. ● Create or design with handmade or traditional tools.	● The final work presents a comfortable and light visual character. ● The final work is small in size, easy to display.	● Reflect the relationship between humans and nature, and its impact on the environment. ● Envision the future of food or offer new sensory experiences through ordinary foods.

Heavy Diets

Cooking Behavior :
High-calorie, unhealthy diet with excessive oil and seasonings.

Element:	**Method**:	**Exhibition**:	**Meaning:**
● Use more than three elements. ● Use processed or artificially made elements. ● Use high-cost elements.	● Use complex creation or design methods, such as concentration, explosion, and fusion. ● Design or create using emerging technologies or interdisciplinary methods.	● The final work delivers an impactful visual effect. ● The final work is large and requires a controlled display environment.	● Reflect the real issues food faces in society. ● Explore communication issues between individuals, nations, and regions.

Table 2. A Deconstructive Framework for Food Art Categorized by Light and Heavy Diets

CONCLUSION

This study uses a sensory approach to analyze food art, drawing on aesthetic theories from Langer, Fry, and Bell, and utilizes the concept of light and heavy diets to create a framework for understanding food art from sensory and cultural perspectives. The study shows that this framework makes food art more accessible to the public by connecting it to personal experience. For young artists, it demonstrates how traditional techniques can evolve through sensory interactions with new technologies. For curators, it aids in presenting food art more authentically. This study balances tradition and technology, fostering deeper engagement with food art through sensory exploration. The framework will be further developed, and we invite arts practitioners to contribute to its refinement.

Reflections on Food's Agency in the Process of Becoming Response-able and Relational Designers

Josymar Rodríguez Alfonzo*, Liesbeth Huybrechts

UHasselt
*Josymar.rodriguez@uhasselt.be

ABSTRACT | Designers hold the potential to support transformative ways of living by rethinking our engagements with food. Yet, food is often treated as substance—produced, manipulated, and consumed—neglecting its relationality. However, we propose to shift how we design and relate to the world, by embracing a relational ontology of food. This research investigates how food and its "strings of withs" (Boisvert, 2010)—as living organisms with processes, labour, and relations—can reshape designers' ways of being and relating, fostering capabilities to address environmental challenges and ethical entanglements. Through a participatory "soma design experience", 16 designers engaged in cooking, eating, and digesting to explore food's transformational capacity and how these processes can support our endeavours to become relational and response-able designers.
We reflect on three workshop anecdotes: massaging a cherry compote, making whipped coconut cream, and collectively eating fresh green bean soup in silence—each revealing food's embedded agency and relationality. Our methodology blends experiential engagement—with food, tools, and designers as eaters—with a "thick description" (Geertz, 1973) of interactions, transcriptions, and reflections. Findings highlight how eating's relationality fosters collectivity, vulnerability, and sensory connection, expanding our convivial human condition and opening pathways to engage deeply with our social and environmental responsibilities. By "turning our insides into the outside" (Mol, 2021), we propose design approaches rooted in embodied, response-able and relational practices, where even cherries can undress us.

KEYWORDS | relationality, food, participatory design, soma design, ethics.

1. Introduction

We all eat. Eating is an activity we perform every day. And what do we eat? We eat food, of course. Every day, food goes in and out of our bodies. Also, food has designed our bodies, habits, societies, and environment long before we were even humans (Steel, 2020). Yet, it is so intrinsically part of our everyday life that most of us cannot even see its effects or consider it the matter that makes up our lives, our thinking and our bodies (Groys, 2022; Probyn, 2004).

Consequently, our current ways of engaging with food, such as the substances we produce, manipulate, and consume, ignore the relational aspect of eating (Mol, 2008, 2021). Philosophical research into the relational self has mainly focused on the way we, humans, are constituted through relations with other humans as part of a web of social, cultural, economic, political and biological relations, reorienting toward "withness" and interdependency and away from individualism and autonomy (Boisvert, 2010). Paying attention to the *relationality of eating* supports this expanding intention as it acknowledges relationality inside us, with the world moving through and becoming us at every moment (Heldke, 2012; Mol, 2021; Van Daele, 2022).

We, with many others, argue that a relational ontology of food, moving away from the substance ontology, is needed to shift our ways of relating and, therefore, ethically designing with the "withness" of food and the "withness" of the world (Boisvert, 2010; Heldke, 2018; Shotwell, 2021). We approach ethics as an everyday doing that connects the personal to the collective and decentres the human (Puig De La Bellacasa, 2010) —ethics as a matter of becoming *response-able*, a question of 'inviting, welcoming and enabling the response of others' (Barad, 2006). Embedding acts of nourishment within design practices helps catalyze a broader ontological reorientation in Design—expanding its fields of study and enriching its processes through more relational and situated approaches (Hayes-Conroy & Hayes-Conroy, 2010; Heitlinger et al., 2024; Huybrechts et al., 2022; Rodríguez Alfonzo et al., 2024; Rodríguez Alfonzo & Huybrechts, 2025a). This brings us to our research question: How can food, as living organisms with their processes, labour, and relations, play a role in shifting the designer's ways of being and relating with the world? In doing so, we transform and expand our design processes as we embrace relationality, intimacy, and the messiness that comes with it.

This paper discusses a *designerly translation* of a self-ethnographic approach of the primary author to fieldwork, specifically the experience of making *caraotas en coco* (black beans in coconut milk) in *El Sinai* Community Kitchen in Caracas, Venezuela. This experience significantly influenced how we, as a research team, started to relate to food, research, and design[1]. This experience was translated into a communal cooking, eating, and digesting workshop at Budapest's 2024 Cumulus Design Conference[2].

In the following sections, we will describe, first, what we call a "food awakening"—an ethical rouse driven by deeply felt engagement with food—making *caraotas en coco*; second, its translation to a food-centred workshop and how, through its *soma design*—a process that alters our bodies, movements, subjective experience and values (Höök et al., 2019)—we were able to bring ourselves, our bodies and positions, as well as of the participants, to the table. Lastly, we will reflect on food's agency in the process of becoming relational designers through the analysis of participants' observations and interpretations during the workshop, drawing a "thick" description of the different layers of interaction (Geertz, 1973). We will do so through three anecdotes: making a cherry compote, massaging and crushing with our bare hands, making whipped coconut cream with all our body and a simple whisker, and collectively eating fresh green bean soup in silence.

---

[1] The authors' approach to Participatory Design (PD) and Research focoused on cooking, eating and digestion processes was further developed in the PDC2024 conference proceedings: Rodríguez Alfonzo, 2024.

[2] *Gut feelings,* the workshop, was carried out in three different opportunities and contexts. It's first iteration, the one we describe in this paper, in Budapest and later in Caracas and Sibu. A more extensive description of the workshop was published in the PDC2024 conference proceedings: Rodríguez Alfonzo & Huybrechts, 2024.

2. *Caraotas en coco*. A "food awakening" in *El Sinai*

El Sinai is a precarious, self-built settlement in Caracas, Venezuela's capital. My fieldwork[3] in *El Sinai* consisted of days filled with cooking, eating and digesting. Days working in an improvised and poorly ventilated Community Kitchen where five women make lunch every day for 60 children from the neighbourhood. As a researcher, I was interested in learning about women's space transformation capacities using food as a medium. But, 'food was more than a capacity-building medium', I realized, eating beans and rice while Elvia shared her *caraotas en coco* recipe (Figure 1). This recipe was like a story containing many stories. It is a tale of longing, belonging, other waters and geographies, warmer weather, wind, other ways of relating with palm trees and food and the characteristic coconut flavour present in her life before coming to the city and being exposed to the precarity that comes with displacement.

"I'm not from here; none of us is from here. I am from the coast, close to the Orinoco River Delta. The Delta is filled with coconut trees, and we use it in most of our cooking, not the young and green coconut, the brown one; we let it ripe on the tree, and the taste is much more intense. My family likes to eat lowland paca in coconut milk, rabbit in coconut milk, iguana in coconut milk, coconut milk rice and black beans in coconut milk—caraotas en coco.
[Elvia, a mother from the Community Kitchen.]

Figure 1: The story of the connection between Elvia and the recipe. Drawing by Liisalota Kroon.

A week later, I brought six coconuts, and we made *caraotas en coco* together. Breaking, grating, squeezing, and massaging coconut, we shared our stories. Our hands helped our bodies process food, and sharing experiences enriched our understanding of one another, highlighting our similarities and differences, thereby strengthening our sense of togetherness. I had a "food awakening", which I am trying to account for here as we follow the "strings of withs" (Boisvert, 2010) this dish trails. It was a moment of becoming aware and being roused to the potentiality of food for embodied and expanded relationality, to travel in space and time, and to transform myself from within. This "food awakening", paying close attention to the process of making and digesting *caraotas en coco,* made me relate and think about design differently, as participatory in very detailed, small gestures, sensorial, and inevitably always collective, and ask about designers' attitudes needed to embrace response-able and relational design.

This expanded way of relating with food and food's capacity to shape caring, vulnerable, and affirmative designers is what we wanted to bring to the table at the Cumulus Conference through our participatory *soma design* exploration.

[3]This section has been written in first person by the FIRST author to provide insight into their position and experience at the study site. The author's decision aims to highlight the importance of personal experiences and sensitivities towards sense-making. This approach is consistent with Ballestero, Winthereik and Pink's (Ballestero & Winthereik, 2021; Pink, 2021) suggestion of incorporating different ways of knowing into research.

Figure 2: Plan drawing of the soil table and the aftermath of all the interactions. Drawing by Liisalota Kroon and Josymar Rodríguez Alfonzo.

3. Making Caraotas en coco. Translation from fieldwork to workshop.

In July 2023, we organized a food-centered workshop in Cumulus Budapest titled "Gut Feelings: An Edible Exploration of Participatory Design". Along with 16 designers, we cooked, ate, and digested a meal over a ground-level soil table (Figure 2). The workshop was informed by the making of *caraotas en coco* in *El Sinai* and the material precarity of this environment, as well as the small-gestured, sensorial collective engagements from our experience there.

The recipe was adapted to incorporate seasonal produce available in Budapest while considering the time, materials, and space constraints we encountered. Here, we align with Evan's (1997) interpretation of "translation as a translatory motion with no requisite of evenness and continuity; things can get bent, broken or lost on the way" as they move through different spaces. In translating the recipe to Budapest, we lost contact with grating and massaging fresh coconut. We bent the experience to incorporate a dessert that included whipping coconut cream and massaging seasonal cherries as a way to retain similarity to the material encounters from the original recipe.

3.1 Bringing my body and position to a "different" table

Designing the workshop was a process of bridging parts of me and my fieldwork with the new site, with Budapest. I arrived two days before the start of the conference. I went to fresh produce markets and tried recipe variations with seasonal beans. I made coconut milk at the hotel and gathered cooking tools from friends' and conference organizers' households. This process allowed me, as a researcher, to recognize my position as an outsider and gain awareness of myself as my body sensed and made sense of the socio-material conditions I was working with. It also reinforced the notion of design as a collective rather than an individual endeavour and as a relational experience.

Translating the making of *caraotas en coco* required situating and bringing myself to the table, which meant relating to the Community Kitchen in Caracas and the design conference in Budapest differently. As I enacted its instructions, I became aware of the expansiveness of the recipe as it adapted itself to a different context, stretching to hold more, growing its "strings of withs" to expand its relationality (Boisvert, 2010; Brandt et al., 2012)[4]. It showed how translation entailed building relations with local actors, markets, and venues and, thus, already in its local preparations, shifted the workshop set-up.

3.2 Bringing estrangement to the table

Designing the workshop was a process of translating my fieldwork and the Community Kitchen material conditions to a high-education setting, a design conference space and an international audience. A decision to confront the overly ordered, white, clean and modern classroom with a more grounded, earthy, messy and precarious reality. The workshop intended to make participants strangers to eating, remove learned etiquette and table manners, overcome cultural biases, and open ways to engage with all the actors involved, including food. The workshop made use of "making strange," a *soma design* strategy "where the underlying idea is that movements and experiences become more clear in our minds if we shift from habitual movements, so deeply ingrained in our habits that we cannot 'see' them anymore, into non-habitual, strange movements" and

[4] The expansiveness of the recipe is further developed in a forthcoming article: Rodríguez Alfonzo & Huybrechts, 2025b.

settings (Höök et al., 2019; Lindegren et al., 2023; Wilde et al., 2017).

The workshop invited designers, soil, water, cushions, buckets, camping stoves, bowls, plates, graters, knives, cutting tables, hand towels, cherries, coconut cream, lemons, spring onions, radishes, and fresh green beans to work together. The soil table created a setting to challenge what a "conference lunch" is and its hygienic, formal, ready-to-eat format. The conference participants and organizers were asked how life-affirming practices (cooking, eating and digesting) shape our design thinking, processes, institutions and academic settings. Minna, one of the participants, described it as messy and uncomfortable, a change in proceedings allowing for shared ideation.

"This was, especially at first, kind of uncomfortable. I usually teach in this room, but now it's a mess! You can feel it is different. So, it sets the stage for something different. In co-creation processes, we have to get people into an ideation mindset, which is difficult, but you cannot do it when you leave them in the same environment. So, when you make such a change in the proceedings on how we usually discuss things, it's uncomfortable, but if you get over that, you can get into a shared reflection space."
[**Minna, workshop participant.**]

Figure 3: Participant's intervention during the workshop. Drawing by Liisalota Kroon.

Minna mentions the need for estrangement in a design process, but between the lines, we can also read the need for time to bend ourselves to acknowledge and engage with something different (Figure 3). We usually eat sitting in chairs over a clean surface, but now we are on the floor cooking over dirt. Our bodies and minds can bend to difference, but it is uncomfortable. However, if you can work with it, you can design from a spacious perspective of yourself and others.

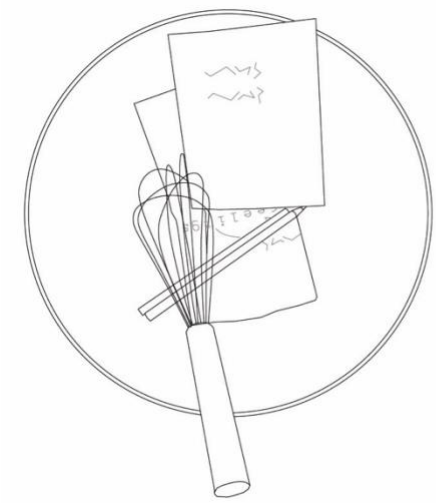
4. Three anecdotes: Reflections on food's agency and its embedded relational potential

The workshop invited the participants to work in pairs, transforming food while descriptively writing about their recipe enactments. This was a moment for collectively smashing, massaging, crushing, cutting, and squishing foodstuffs. After cooking comes eating, a process of transformation inside our bodies. Eating was a collective silent moment where we gave space to our insides to be an active participant. While eating, participants were encouraged to reflect on how, during the session, their senses expanded their understanding of design.

In this paper, we will describe and analyze three anecdotes leading to collective "food awakenings", two of which belong to the cooking moment: whipping coconut cream with a simple whisker and making a cherry compote with our bare hands. In contrast, the third anecdote travels through eating fresh bean soup. In the three cases, we will share the participant's comments pointing towards why we must pay attention to the relationality embedded in eating and foster the collectivity, vulnerability, and pleasure of a deepened relationship with food (Mol, 2021).

4.1 Making whipped coconut cream with our whole body and a simple whisker. Describing to stress the present with-ness and without-ness.

We intentionally focused on «doing». While cooking, we asked participants to write to describe how their senses relate to their companions and their doings, human and more-than-human. In Gwendolyn's recount, three points of attention come across (figure 4):

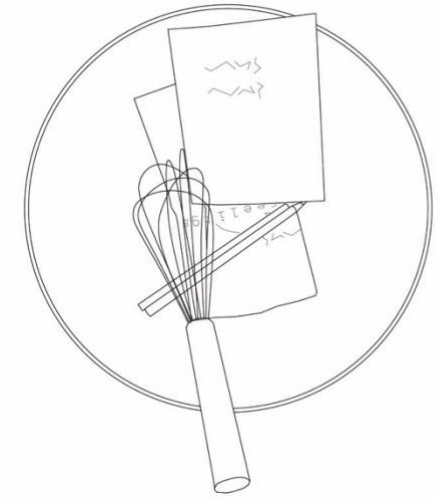


"There was this moment of familiarising with the tools. So first, okay, let's start. And then it becomes faster and faster and very rhythmic. And there's tiredness, so changing, doing it in another way or using the other hand. We get dirty. Dirt gets in the tool. ***It is splashing and going off the bowl,*** *then they're scratched back into the bowl, becoming a whole thing again. The rhythm of beating becomes slow and fast and slow and fast, and he realises when he gets tired and when the bing, bing, bing gets slower. And there's the smell (she sniffs inside the bowl) if you put your nose in there. So I think it's a very* ***bodily experience.***"
[**Gwendolyn. Workshop participant.**]

Figure 4: Participant's intervention during the workshop. Drawing by Liisalota Kroon.

1. The use of the progressive verb tense (*ing*) and active voice not only for her actions and sensations but also for those of the coconut cream, as it splashed and made her dirty, and the whisker, as it made her tired and demanded more work from her body.
2. Whisking constantly creates a moment of familiarisation with the tool and builds an intimate relationship; with less friction, they grow accustomed to each other as the action is repeated. Whisk and body work together, taking into consideration their limitations (available energy, experience) and capacities.
3. "It is a very bodily experience". Her body needs to work intimately and in tune with whisk and coconut cream. The action drives her focus, makes her sweat, and helps her know her body better. The cream splashes and modifies her, making her dirty. She and the whisk together turn the cream from liquid to creamy and stable.

These points of attention surface as design reflections from the participants (Figure 5):



Gwendolyn: *I felt the* ***relationship between and with food and tools*** *because these are low-tech. The kind of tools in which we prepare the food and it's not like we put it in a mixer and here, done. Everything was more time-consuming, like using the mortar and the whisker and tasting the cream to see if it was ready.*

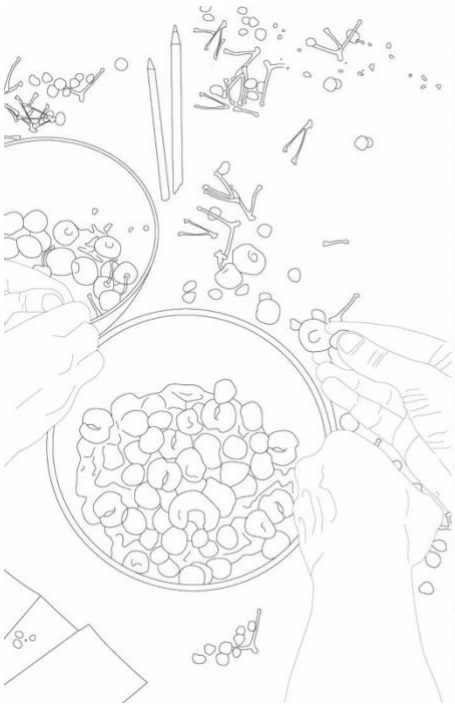
Bert: *Something we often do as designers is make things easier for us. We kind of get rid of the agency of other beings or other actors. So,* ***I feel that we always design to make it easier while disconnecting us.***

Figure 5: Participants discuss actors' agency and relationality. Drawing by Liisalota Kroon.

Making whipped coconut cream with your whole body and a whisker is a weaving of agencies, putting forward a sense of neediness, of interdependency. We cannot whip cream with our bare hands. Our relation with the intermediary, a design object, the whisker, is deeply felt. It requires our time, energy, attention and body. The whisk becomes an extension of you. This contrasts with a standing mixer and our human drive to make things more efficient "while disconnecting us". This was the first "food awakening", arousing a reassessment of our design practices and prompting the following questions: What are we leaving out when designing for efficiency and productivity? What do we allow *in* when designing to engage with all our senses? How does our approach to design shift when we take the whisker and the coconut cream seriously?

Figure 6: Whipping coconut cream and assembling the dessert—photos by Eumilis Arellano.

4.2 Making a cherry compote, massaging and crushing with our bare hands. Surrendering, stripping mind and body.



Gerardo: *We got the messiest part. We got the cherries and had to smash them with our hands. We smashed it. Today was the day I chose to come in white (laughs). I didn't want to mess up my shirt, so I had to take it off. And I was like: Aahh!! Now I am relaxed. This was a great way to break from the conference.*

Andrea: *We realised that the cherries made him undress! (laughs). He literally said he had to undress, mind and flesh. In the beginning, we were like: Oh my god, we are gonna get so dirty! We were taking care in the beginning, but then, at a certain point, it was just so nice (hand gestures of feeling the cherries between the fingers). And I was thinking why, if I were at home, I would use a knife and make it differently. So, it feels like, wow, it's so playful, and you feel the best, feel the most with your hands. (...) What I feel is that the non-human agency was very present. We could feel that food had a lot of agency here because we were touching things, and he had to take out the clothes.*

Gerardo: I had to strip myself!

Andrea: *Come on, a cherry has this power! I was very impressed that people were relating to this in a totally different way, and I could imagine the non-human being differently.*

Figure 7: Participants discuss actors' agency and relationality. Drawing by Liisalota Kroon.

Gerardo and Andrea worked together with the cherries (Figure 8). In their account, there is first resistance, refusal to use their bare hands, refusal to engage and be messy. In a conference setting, the cherries showed their power over this particular human, afraid of the implications of being dirty, so much so that he opted for stripping, removing his

clothing, but also stripping his mind, surrendering. The cherries assisted him in scraping his rigid conference persona and relaxing. In this situation, the cherries loudly and staining reveal their power, their agency over us. Such experience expands how we relate *with* cherries, *with* food, and *with* others, helping us embrace vulnerability. It also facilitated a reassessment of their senses and the pleasure and sensuality that come with it. They questioned why this experience was so rare. While reflecting together about all these layers or intermediaries hindering our senses, a second "food awakening" aroused us into inquiring: How might we design if we dare to embrace a whole array of ways of knowing and making that are more tactile, smelly, tasty, and loud?

Figure 8: Pitting and massaging the cherries—participant's notes. Photos by Eumilis Arellano.

4.3 Eating green bean soup in silence. Turning ourselves to the inside.

*"I remember the metallic sounds of the spoons on the plates. Also, the sounds of mastication. I felt weird at first, but afterwards, **I felt relieved** from socialising and conversing with others."*
Emma, conference participant.

*"I liked the silent part and, I think, also as a facilitator, what I take from this is that we should have more silent exercises in workshops because that **gives time – time to digest – and to reflect** and to be mindful and concentrate on the food, concentrate on the tasks."*
Minna, conference participant.

*"It's actually an exercise in mindfulness. When we do silent eating, we are able to **reflect on what is happening** inside **our bodies and our mouths**, what we do, and what we feel."*
Fanny, conference participant.

"For me, it is about having time to process."
[Sophie, conference participant.]

Figure 9: Participants discuss the relationship between digestion and design. Drawing by Liisalota Kroon.

In these four accounts, the participants reflect on the experience of collectively eating in silence (Figure 9), muting the outside. Muting human voices and their need to be attentive to what others say gave them permission to pay attention to other sounds as they become loud, as we allow them to take space. Eating in silence and paying attention to food and how it traverses our insides allowed them to reflect on the things and processes we give time and space to and those we don't. It shifted attention to the sensations in their bodies and mouths, as well as other less loud or self-evident processes, actors and situations. This gave space to our third "food awakening": Turning ourselves to the inside might facilitate our own process of becoming attentive and responsive to the more-than-human world in our design processes.

Participants chew on the time needed to digest, literally and metaphorically. And the pressure we have in our everyday lives to move on, give feedback, and immediately know the answers to any questions. As participatory designers, we constantly ask for immediate responses from participants. This was evident in the workshop when we asked, 'How can the process of digestion inform design?' As participants were physically moving food through their bodies, it was clear how, *as digestion was still taking place and still happening, it was not possible to voice out a conclusion.* Syncing, becoming attentive to our digestion, its processes and the time it takes, can give us space to form inclusive, affective, caring and joyful ideas.

Figure 10: Eating in silence while reflecting on the relationship between digestion and design—photos by Eumilis Arellano.

5. Conclusions. "Food awakenings" guiding response-able and relational design.

Participants explored socio-material and relational sensibilities as they cooked, ate and digested together. While doing so, they raised questions about their practices and ways of living, acknowledged the work ahead, and started crafting visions to foster ethically responsible design approaches to confront current social and environmental challenges. Through "food awakenings", designers and researchers became "entangled with multiple sensitive experiences and affective histories" (Pihkala & Karasti, 2022), intending to open difficult conversations, not to seek answers but to pose meaningful open questions.

Through "food awakenings", designers and researchers reflected on (1) digestion in relation to the time needed to process materials and meanings and the need to refrain from immediate response, giving space to time. (2) the possibility of becoming more attentive to more-than-human actors in our design processes by attuning to our own bodies, specifically to digestion. (3) Design objects, specifically tools, are ambivalent; they can enable, facilitate, or disconnect. This revelation asks for a reassessment of our practices: What are we leaving out when designing for efficiency and productivity? What do we allow in when designing to engage with all our senses? And lastly, (4) we nibbled over the need to surrender, strip our minds and bodies to embrace a whole array of ways of knowing and making that are more tactile, smelly, tasty, and loud.

Intentionally and whole-bodily engaging with the story of Elvia and *El Sinai*, *with* coconut, *with* beans, *with* whisk and *with* cherries brought into dialogue ethical concerns and our response-ability as designers to acknowledge more-than-human relationality, questioning how they could enable matters to be explored in different ways, across contexts, devising ways to align to "wider ecologies of practices" (Pihkala & Karasti, 2022). Following the notion of "strings of with" so intimately embedded in food, engaging with its times, processes and matter in a relational way, helps us reflect on the "with-ness" of food and the "with-ness" of the world. Giving us "more opportunity to see nuance, shade,

degree, and alternative interpretation" (Boisvert, 2010) in designerly endeavours and foregrounds a way of living that "embraces the complexity of the world in which we are making decisions" (Heldke, 2018).

Acknowledgements

We sincerely thank the women and children of the *El Sinaí* Community Kitchen, along with our allies from *Alimenta la Solidaridad* and *Estar Vivo*, for their trust and collaboration. We are grateful to the workshop participants, the MOME and Cumulus Budapest organizing team, as well as to Eumilis Arellano and Béla Kunckel, our hosts who helped translate the recipe into the local food landscape. We extend our appreciation to our colleagues—particularly Steffie de Gaetano and Stefan Gzyl—for their thoughtful engagement and ongoing dialogue, and to the anonymous reviewers and conference organizers for their valuable feedback. This work was partly supported by travel funding from the Research Foundation – Flanders (FWO).

yadira.ornelas@tec.mx

ABSTRACT | This paper examines how multidisciplinary collaboration in design enhances experiential outcomes in food design, art, and science, particularly through the lens of Food Serenity. This concept describes the state of calm and stimulation achieved when a balance of neurochemicals like serotonin and dopamine enriches our interactions with food (Tarman & Werdell, 2014). Using the co-design and production of a ceramic vessel for Koli, a Michelin-starred restaurant in Monterrey, Mexico, as a case study, this research demonstrates how design can foster mindful consumption and environmental awareness while providing a framework for food born from science and innovation. Developed by the Futures Design Lab at the Monterrey Institute of Technology and Higher Education (ITESM) in partnership with Casa Celeste and Forma Foods Lab, the project sets the stage for Koli's autumn 2024 dish, El betabel que quiso ser carne ("The Beet That Wanted to Be Meat").

This project exemplifies "design for territories," grounding the culinary experience in the cultural and ecological narratives of Northeast Mexico. It shows how food design can reflect the principles of Food Serenity by promoting local ingredients and sustainable practices. The design encourages mindful consumption, fostering a deeper connection between the diner and the environment. Furthermore, it serves as a platform to explore how integrating scientific, artistic, and design approaches in food innovation can create

immersive experiences that enhance consumers' appreciation of the food's origins, sustainability, and the potential of scientifically produced foods.

A central element of the project is The Future is Fluid, a ceramic vessel crafted specifically for the dish. This vessel functions as a powerful metaphor for sustainability and transformation within food systems. Through its design, the vessel blends form and function into a visually cohesive and conceptually rich culinary experience. Additionally, the principles of chaos theory, particularly Chaotic Flows, influence both the 3D food printing process and the tableware's design. This fusion creates a dynamic interplay between predictability and adaptability, enhancing the overall dining experience (Molina et al., 2024).

The plate also features celestial and molecular motifs, such as a star map commemorating Koli's Michelin star award and the molecular formula of essential elements in plant-based proteins. These symbolic elements bridge the organic and technological realms, enriching the dish's narrative while reinforcing the principles of Food Serenity.

The impact of multidisciplinary collaboration in food design points toward a future aligned with Food Serenity principles, where thoughtful design fosters harmony, sustainability, and connection in the culinary experience. By integrating disciplines like material science, technology, art, and design, this approach enables a deeper exploration of food narratives. Looking forward, this model of interdisciplinary engagement positions designers as strategic leaders in the food sector, empowering them to redefine culinary boundaries and advocate for deeper, sustainable practices.

KEYWORDS | food design, sustainability, multidisciplinary collaboration, 3D food printing, and Mexican cuisine.

1. Introduction

Food design has emerged as a multidisciplinary field that bridges culinary arts, design, and science, emphasizing the creation of experiences that are as meaningful as they are functional (Schwarz et al., 2022). By examining the cultural, ecological, and sensory dimensions of food, food design enables us to rethink our consumption habits and their broader implications for sustainability and mindfulness (Rockström et al., 2009). The discipline thrives at the intersection of creativity, science, and cultural storytelling. It involves the deliberate integration of artistic expression, scientific innovation, and sustainable practices to shape the way we interact with food, not just as nourishment but as an experience. Over the past decades, food design has evolved from focusing on aesthetic considerations to becoming a critical tool for addressing global challenges. The significance of multidisciplinary collaboration has come to the forefront, highlighting how the convergence of diverse expertise—spanning design, material science, culinary arts, and environmental studies—can lead to groundbreaking innovations. By combining these perspectives, food design emerges as a powerful medium for fostering mindful consumption, ecological awareness, and cultural preservation.

The intersection of design, science, and art is particularly significant in advancing the principles of Food Serenity—a concept that advocates for mindful consumption, sustainability, and a deeper

connection to the origins of our food. This framework underscores the potential of design to create immersive culinary experiences that inspire ecological awareness and foster a sense of harmony. As the demands of modern society continue to evolve, food design offers a platform to explore innovative approaches that integrate tradition, technology, and sustainability. The integration of design and science is not just a methodological approach but an essential pathway to achieving the broader goals of food design, such as promoting sustainability, enhancing sensory experiences, encouraging mindful consumption, and fostering cultural and ecological connections. In the case of the ceramic vessel designed for the autumn 2024 dish, El betabel que quiso ser carne ("The Beet That Wanted to Be Meat"), this approach enables a deeper understanding of the relationship between food, its environment, and the overall dining experience.

The multidisciplinary collaboration involves key actors from both scientific and creative disciplines. On the scientific side, Forma Foods, a lab dedicated to exploring innovative food technologies, played a critical role in designing plant-based solutions that align with the principles of sustainability and culinary innovation. The creative dimension of the project is led by the Futures Design Lab (FDL), a research group at the Monterrey Institute of Technology and Higher Education (ITESM), which focuses on the intersection of design, sustainability, and culture. FDL was responsible for conceptualizing and designing the ceramic tableware that would enhance the sensory experience of the autumn 2024 dish. Casa Celeste, a renowned ceramic studio, contributed its expertise in material design and craftsmanship, bringing the conceptual designs to life through precision and sustainable materials. Finally, the Michelin-starred restaurant Koli acted as the culinary partner, incorporating the design of the tableware into the final dining experience and ensuring the seamless integration of the artistic, scientific, and culinary components. Together, these actors illustrate the power of interdisciplinary collaboration, each contributing their unique expertise to create a harmonious and innovative culinary experience.

In this context, the Futures Design Lab at the Monterrey Institute of Technology and Higher Education (ITESM) has partnered with Casa Celeste and Forma Foods to conceptualize, design, and produce a ceramic tableware piece for Koli, a Michelin-starred restaurant in Monterrey, Mexico. This project, anchored in the principles of Food Serenity, including mindful consumption, the balance of neurochemicals like serotonin and dopamine, and a deep connection to local ingredients and sustainable practices, culminated in the creation of a ceramic vessel specifically designed for the autumn 2024 dish, El betabel que quiso ser carne (Tarman & Werdell, 2014) . Developed under the name The Future is Fluid, this tableware piece encapsulates the synergy of art, science, and sustainability, illustrating how food design can bridge cultural narratives, technological innovation, and ecological stewardship.

This paper examines the transformative potential of multidisciplinary collaboration through the lens of food design, focusing on the conceptualization, design, and production of The Future is Fluid. It delves into the intricate processes that defined this project, highlighting the role of scientific and artistic approaches in creating immersive culinary experiences.

Through an exploration of the multidisciplinary efforts behind The Future is Fluid and its integration into the dish El betabel que quiso ser carne, this paper offers insights into how design can transcend aesthetics to shape narratives deeply rooted in sustainability and cultural identity. As we move towards a future where collaboration becomes increasingly necessary, the potential of food design

to redefine the boundaries of culinary innovation is exemplified, showcasing how cross-disciplinary efforts can drive transformative change.

2. Cultural and ecological narratives: Aesthetic and symbolic dimensions in design

The ceramic vessel, titled The Future is Fluid, serves as more than a functional object—it is a profound narrative artifact that encapsulates cultural, ecological, and technological stories of Northeast Mexico. Through its intricate design, the vessel bridges the organic and technological realms, creating a multidimensional narrative that deepens the connection between food, culture, and sustainability.

The vessel's narrative elements amplify its impact, elevating it beyond its material presence. By engraving celestial coordinates and symbols from organic chemistry, the design constructs a bridge between the natural world and the technological advancements underpinning the dish. This duality emphasizes adaptability and transformation, mirroring the evolving nature of food systems in response to environmental and cultural shifts. Moreover, these design choices resonate with the principles of sustainable innovation, reminding diners of the interconnectedness of food, place, and global responsibility.

The project's focus on "design for territories" further underscores the importance of local ingredients and sustainable practices in its conceptualization. By rooting the culinary experience in the cultural and ecological stories of Northeast Mexico, the vessel not only supports the principles of sustainable gastronomy but also fosters a profound connection between the diner and the region's rich history. This approach highlights how thoughtful design can serve as a medium for storytelling, creating a dialogue that transcends the plate and engages the diner in a narrative of place, culture, and future possibilities.

3. Multidisciplinary approach and cultural integration in food design

The project "The Beet That Wanted to Be Meat" began with a collaboration between Forma Foods and Koli, driven by the realization that the culinary experience lacked a visual framework to contextualize the dish. This gap led to the co-design and conceptualization of a ceramic vessel, one that would not only complement the dish but also reflect the cultural and ecological narratives of Northeast Mexico. The design process, shaped by the intersection of science and art, integrated material innovations with cultural storytelling. Ultimately, the creation of the vessel aimed to serve both functional and symbolic purposes, embodying the broader principles of Food Serenity and enhancing the overall dining experience.

The success of this project lies in its multidisciplinary approach, which brought together designers, material scientists, chefs, and sustainability experts, each contributing distinct expertise to the endeavor (Arús-Hita et al., n.d.). This collaborative framework was essential in addressing the complex challenges inherent in food design, particularly in ensuring the vessel's functionality and sustainability while preserving its aesthetic and narrative integrity. By emphasizing the experiential aspects of food, designers can elevate gastronomy into an immersive cultural journey (Pine & Gilmore, 1999).

The value of interdisciplinary collaboration in food design is evident in the way diverse expertise combines to produce innovative, culturally significant outcomes (Reficco et al., 2018). By integrating art and science, the collaboration behind this initiative highlights how a collective approach can deepen the impact of culinary experiences, making them both meaningful and contextually rich (Rittel & Webber, 1973).

4. The role of design in food innovation

Design holds a pivotal role in food innovation, serving not only as a practical solution to functional challenges but also as a powerful medium for storytelling, cultural expression, and experiential engagement (Helmut Traitler et al., 2014). In the case of The Future is Fluid, design was the cornerstone that united sustainability, technological innovation, and cultural relevance to create an immersive dining experience. By addressing both tangible and intangible aspects, the project demonstrated how design could elevate food from mere sustenance to an expression of meaning and purpose.

One of the defining aspects of the design process was its integration of advanced methodologies to harmonize aesthetic, functional, and cultural objectives. For example, the plate’s eccentric axis and dynamic geometries were carefully crafted to evoke a sense of fluidity and transformation—an intentional reflection of the adaptability inherent in sustainable food systems (Tait, 2021). These design choices were not arbitrary; they embodied the underlying principles of resilience and change that are central to ecological and culinary innovation. By marrying form and function, the design contributed to a dining experience that was not only visually stunning but also thought-provoking, challenging diners to consider the broader implications of their food choices.

Beyond functionality, the design was imbued with symbolic meaning, enriching the narrative of the dining experience. The celestial map engraved on the plate, commemorating Koli’s Michelin star achievement, created a metaphorical connection between the earthly and the cosmic. This element invited diners to reflect on the interconnectedness of human creativity, natural systems, and technological progress. The celestial map was further emphasized through molecular motifs, bridging the realms of science and art and highlighting the interplay between organic and technological elements in modern food systems. The choice of gold in these motifs added sophistication and timelessness, aligning with the overarching narrative of the dish. Gold, chosen for its aesthetic harmony with the rose tones and for its historical associations with value and transcendence, embodied the fusion of tradition and innovation. Additionally, gold’s conductivity underscored the idea of energy and progress, reinforcing the project’s forward-thinking nature.

The plate's design, coupled with the ceramic vessel housing the dish, harnessed material storytelling to communicate cultural and ecological narratives. The color gradient on the plate—from beetroot magenta to soft pink hues—symbolized the balance between tradition and modernity in Mexican gastronomy, with magenta referencing the region's cultural perception of meat and its masculine associations, counterbalanced by the feminine-coded pink. This design choice contributed to the project's concept of a "new meat," one that challenges traditional gendered food norms while embracing plant-based alternatives. The vessel itself mirrored this symbolic use of color and form, incorporating earthy tones that evoke the plant-based origins of the ingredients, while gold accents represented technological advancement. Its intentionally distinct form, which evokes transformation and adaptability, serves as a metaphor for the future of food systems—fluid and responsive to evolving environmental and social dynamics. The combination of these materials and forms tells a story not only through the function of the dish but also through its aesthetic representation of sustainability, innovation, and a future-oriented vision of gastronomy.

Importantly, the design process was deeply collaborative, integrating expertise from disciplines such as material science, sustainability, and culinary arts (H. N. J. Schifferstein, 2016). This multidisciplinary approach allowed the design team to address complex challenges in food innovation, such as creating a plate that was visually striking, environmentally responsible, and capable of enhancing the dining experience. For example, the team optimized high-temperature ceramic processes to minimize energy consumption, showcasing how design can actively contribute to sustainable practices.

Ultimately, the role of design in The Future is Fluid transcended traditional boundaries, positioning it as a strategic tool for innovation and cultural storytelling. By integrating symbolic, functional, and sustainable elements, the project offered a holistic approach to food design that resonated on multiple levels (H. N. Schifferstein, 2015)—ecological, cultural, and technological. It demonstrated that design, when executed thoughtfully, has the potential to redefine our relationship with food, inspiring a deeper appreciation for the narratives and systems that sustain us (H. N. J. Schifferstein, 2016). Technological advancements, such as 3D food printing, provide innovative opportunities to integrate sustainable practices into food systems (Chen et al., 2024). Furthermore, by combining sensory and scientific insights, food design can create more meaningful gastronomic experiences (Spence, 2017).

This case study highlights the transformative power of design as an agent of change in the food industry. By fostering connections between disciplines, design not only solves practical challenges but also elevates food innovation into a medium for connection, reflection, and transformation. As we navigate the future of food systems, the lesson from The Future is Fluid underscores the need for design to remain at the forefront of efforts to create meaningful and sustainable culinary experiences.

dialogue that transcends the plate and engages the diner in a narrative of place, culture, and future possibilities.

5. Scientific and artistic integration

Scientific innovation was a fundamental pillar of ¨The Beet That Wanted to Be Meat¨ project, driving

much of its design and execution. One of the primary scientific principles applied was the concept of Chaotic Flows, derived from chaos theory (Ma et al., 2016). This principle, which explores the inherent unpredictability and self-organizing patterns found in complex systems, was crucial in both the creation of the ceramic vessel and the 3D printing of plant-based proteins. The chaotic flows concept influenced the intricate flow patterns that characterized both the surface of the ceramic plate and the texture of the food it contained. By drawing on advanced material science and computational modeling, the project team achieved a seamless integration of form and function, where the aesthetics of the ceramic piece and the textural qualities of the food were not merely decorative but essential to the overall dining experience (Alvarez & Trujillo-de Santiago, 2021).

Image 1: Forma Foods 3D printing.

In addition to the integration of chaos theory, the project made significant strides in the development of sustainable materials. The ceramic plate was crafted using compounds based on silicon and aluminum, materials that are abundant, low-impact, and easily sourced. These choices were made with sustainability in mind, reflecting a broader commitment to minimizing the ecological footprint of the project. Not only did these materials serve a practical function, but they also carried symbolic weight, reinforcing the cultural and ecological context from which the dish emerged. Furthermore, a beetroot-based glaze was developed through a series of rigorous experiments to provide an environmentally friendly, visually striking finish to the ceramic vessel. This glaze further emphasized the project's commitment to both scientific innovation and sustainability, highlighting how the material properties could support and enhance the artistic vision behind the design.

The integration of scientific and artistic elements in ¨The Beet That Wanted to Be Meat is a prime example of how these two domains can work in harmony to create something both innovative and meaningful. The dish itself features 3D-printed plant-based proteins, primarily derived from peas and beetroot. These ingredients were not only chosen for their ability to mimic the texture and flavor of meat but also for their environmental benefits. Peas and beetroot are sustainable crops, offering a reduced ecological footprint compared to traditional animal-based protein sources. This selection aligns with the broader principles of sustainability and innovation that permeate the entire project.

At the heart of this integration is the application of chaotic flows, a key component of chaos theory, which was utilized both in the 3D food printing process and in the design of the ceramic vessel. The

flow patterns derived from chaos theory created a dynamic interplay between predictability and adaptability in both the food and the vessel. The unpredictability of these flows in the design process highlighted the tension between the organic and the manufactured, between nature and technology. This approach reinforces the collaborative nature of the project, where the scientific processes underlying material selection and 3D printing methods were in constant dialogue with the artistic vision of the ceramic design, resulting in a harmonious fusion of both fields.

Ultimately, the integration of science and art in this project goes beyond aesthetic appeal or technical achievement—it speaks to a deeper, philosophical exploration of how innovation in one field can inform and enhance the other. Through this cross-disciplinary collaboration, the project demonstrates that science and art are not isolated spheres but interconnected forces that, when aligned, can create powerful and transformative experiences. This holistic approach is what makes the project not only a culinary innovation but a statement on the future of food design, sustainability, and artistic expression.

6. Designing connections: Storytelling, symbolism, and sustainability in The Future is Fluid

At the heart of The Future is Fluid lies a profound interplay between design, symbolism, and storytelling, creating an experience that is both visually striking and deeply meaningful. This project demonstrates how design can serve as a medium for narrative, connecting aesthetic form with broader themes of transformation, sustainability, and cultural reflection.

The concept of fluidity was central to the design process, serving as a metaphor for adaptability, evolution, and the boundless possibilities of future scenarios. The plate's distinctive form, featuring smooth concave and convex geometries set on an eccentric axis, embodied this theme with elegance and intentionality. This design choice was not only a visual representation of change but also addressed practical needs. The curvature of the plate ensured the seamless containment of liquids, merging functional utility with conceptual depth. The fluid, organic shapes symbolized the interconnected nature of sustainable systems and their capacity to adapt to shifting ecological and cultural landscapes.

Beyond its physical design, the project incorporated a rich tapestry of symbolism and storytelling that added layers of meaning to the dining experience. Celestial motifs engraved onto the plate celebrated Koli's Michelin star achievement, creating a metaphorical connection between earthly culinary excellence and the infinite cosmos. These motifs encouraged diners to consider their place within larger natural and universal systems, fostering a sense of interconnectedness and introspection.

Image 2: Image 2: Top view of The Future Is Fluid. **Image 3:** Image 2: Side view of The Future Is Fluid.

In addition to celestial imagery, the design featured molecular symbols for plant-based proteins, emphasizing the project's commitment to scientific innovation and ecological awareness. These elements highlighted the collaborative effort between culinary artistry and scientific research, demonstrating how food design can bridge diverse disciplines to create a cohesive narrative. The molecular motifs symbolized not only the technological advancements involved in crafting sustainable food but also the potential for innovation to address global challenges such as food security and environmental degradation (S R Jaeger & Hal MacFie, 2016).

The integration of storytelling within The Future is Fluid extended beyond symbolic elements to the dining experience as a whole. Each aspect of the project—from the materials used to the cultural references embedded in the design—was carefully curated to evoke a sense of connection and reflection. By blending form, function, and narrative, the design invited diners to engage with the broader implications of their food choices. It encouraged mindfulness about sustainability, cultural preservation, and the role of innovation in shaping future food systems (Choi & Blevis, 2010).

This harmonious blend of design and storytelling underscores the transformative potential of food design as a medium for cultural and ecological dialogue (Pollan, 2007). The project illustrates how thoughtfully crafted narratives can elevate dining experiences, transforming them into opportunities for reflection, education, and inspiration (Barham, 2003). Through its design, The Future is Fluid became more than a functional object; it was a vessel for storytelling, connecting diners to the values of sustainability, scientific progress, and cultural heritage.

Ultimately, The Future is Fluid exemplifies how design, symbolism, and storytelling can converge to create a multifaceted experience that resonates on both practical and emotional levels. By embedding deeper meanings into its physical form, the project demonstrated how design can transcend aesthetics to foster meaningful connections between individuals, their environment, and the broader world. This approach serves as a blueprint for future endeavors in food design, showcasing the power of narrative to inspire transformative thinking and action in the realms of sustainability, culture, and innovation (El Bilali, 2020).

7. Expanding collaboration beyond design

Collaboration was a defining pillar of The Future is Fluid, extending far beyond the boundaries of traditional design practices. This project exemplified how multidisciplinary teamwork, encompassing chefs, food scientists, and designers, can lead to groundbreaking innovations that harmonize sustainability, technology, and cultural storytelling. By engaging diverse stakeholders, the project highlighted the potential of collaborative efforts to reshape food systems and foster a deeper understanding of the interconnected challenges facing our world (Thompson, 1993) .

At the heart of this collaboration was Forma Foods, whose expertise in plant-based protein technologies played a crucial role in developing a dish that mirrored the texture, flavor, and sensory experience of meat. This achievement was not merely a technical feat, but a demonstration of how culinary science can align with sustainability goals. By utilizing plant-based ingredients, the project addressed pressing issues such as reducing the environmental footprint of food production, conserving natural resources, and promoting dietary shifts toward more sustainable consumption patterns. This alignment with ecological responsibility underscored the principles of Food Serenity, which advocate for mindful, sustainable, and culturally rooted culinary practices (Wiseman et al., 2018).

The interdisciplinary approach also ensured that the final product transcended its individual components, emerging as a holistic experience. The design of the ceramic plate, crafted to complement the dish, reflected the fluidity and adaptability of sustainable systems. Together with the innovative culinary creation, it formed a cohesive narrative that invited diners to engage with the broader themes of sustainability, cultural heritage, and technological progress. This synergy between design and culinary science emphasized the importance of collaboration in achieving transformative results.

Involving chefs in the project added another layer of complexity and depth. Their understanding of flavor profiles, textures, and cultural significance brought authenticity and nuance to the dish, grounding it in the culinary traditions of Northeast Mexico. This connection to local culture was reinforced through the use of regional ingredients, which not only celebrated the area’s biodiversity but also supported local agricultural practices. The chefs' insights ensured that the dish resonated with diners on an emotional level, creating a sense of place and identity that enhanced the overall dining experience.

Beyond the immediate stakeholders, the project also highlighted the importance of involving broader networks, including material scientists, sustainability experts, and technologists. The high-temperature ceramic processes used to create the plate were optimized to reduce waste and energy consumption, demonstrating how advanced technologies can complement sustainable practices. Meanwhile, the incorporation of symbolic elements, such as the engraved celestial map and molecular motifs, required input from disciplines like astronomy and chemistry, showcasing the breadth of collaboration needed to realize the project’s vision.

By expanding the scope of collaboration, The Future is Fluid demonstrated the potential of multidisciplinary approaches to tackle complex challenges. This model of teamwork reflects a growing trend in the food and design industries, where diverse expertise is increasingly recognized

as essential for innovation. It also serves as a call to action for future projects to embrace similar strategies, breaking down silos between disciplines and fostering environments where creativity and science can thrive together.

The success of The Future is Fluid offers valuable lessons for industries seeking to address global challenges such as food security, environmental sustainability, and cultural preservation. Collaboration beyond design is not just an option but a necessity in a world that demands holistic solutions to interconnected problems. By bringing together chefs, designers, scientists, and technologists, this project set a precedent for how efforts can lead to meaningful, impactful innovations that inspire change at both individual and systemic levels.

8. Redefining the role of designers: Multidisciplinary collaboration and its broader impact on food systems

The Future is Fluid project illustrates the profound impact that multidisciplinary collaboration can have on food design, demonstrating the ways in which diverse expertise can shape innovative and meaningful culinary experiences. The integration of knowledge from design, science, sustainability, and cultural storytelling highlights how food design can become a powerful tool for addressing complex global challenges, such as ecological sustainability and the preservation of cultural heritage.

At its core, the project emphasizes the importance of holistic design practices. By merging elements of artistic design with scientific innovation and sustainability, the project exemplifies how design can influence broader food systems. This approach, which incorporates principles like Food Serenity, sustainability, and cultural narratives, is foundational in shaping a more responsible and forward-thinking food landscape. It shows how design can move beyond mere aesthetics to influence cultural and ecological consciousness, driving future possibilities in food systems.

Furthermore, the role of designers is expanding in this rapidly evolving field. In the past, design was primarily concerned with the visual and functional aspects of food-related products. However, as the challenges facing contemporary food systems become more complex, designers are now positioned as key players in facilitating interdisciplinary collaboration. Designers are increasingly becoming mediators—bridging gaps between scientific research, cultural storytelling, and consumer needs. This expanded role involves not only an understanding of form and function but also a strategic consideration of systems and long-term impact.

Designers now find themselves working in partnership with experts from fields such as food science, agriculture, sustainability, and technology, understanding that the future of food design is dependent on interconnected approaches. The Future is Fluid project serves as an exemplary case study of how designers can leverage their creativity and problem-solving skills to lead initiatives that address global issues such as sustainability, food security, and environmental impact.

This shift in the role of designers has significant implications. It positions them not only as creators of beautiful, functional products but as architects of systems that shape the future of food. This expanded responsibility requires designers to hone skills that go beyond traditional design knowledge, such as systems thinking, cross-disciplinary collaboration, and a deep commitment to creating sustainable, ethical solutions. By adopting this expanded perspective, designers can lead the charge in rethinking food systems in a way that values both human and environmental well-being, paving the way for transformative change in the culinary world.

In summary, the Future is Fluid case study showcases how multidisciplinary collaboration, and the expanded role of designers can reshape food systems. The project exemplifies the importance of integrating design with science, sustainability, and cultural awareness to create meaningful, long-lasting impact. The evolving role of designers as mediators and system thinkers will be crucial in addressing the complex challenges that lie ahead, making them indispensable players in the transformation of the food industry.

9. Embedding sustainability in food design: Practices, impacts, and future directions

Sustainability served as the cornerstone of The Future is Fluid, a project that explores how scientific, artistic, and design practices can converge to create innovative and immersive food experiences. By emphasizing the origins of food, promoting the use of local ingredients, and implementing sustainable practices, the project highlights the profound potential of food design to influence broader ecological and cultural contexts. Through its multidisciplinary approach, the initiative not only addresses current challenges in food systems but also teases future possibilities, demonstrating how design-driven innovation can contribute to a more sustainable and inclusive food industry.

A guiding principle throughout the project was the deliberate alignment of design and production processes with ecological awareness and sustainable practices. Every aspect of the ceramic vessel's development—ranging from material selection to manufacturing techniques—was chosen to minimize environmental impact. The use of abundant and naturally occurring elements, such as silicon and aluminum, exemplified this commitment, showcasing how these materials can provide both durability and low ecological footprint. Additionally, the beetroot-based glaze, developed through meticulous experimentation, served as a powerful symbol of the synergy between sustainability and aesthetic quality, proving that ecological responsibility need not come at the expense of functionality or beauty. User-centered approaches ensure that sustainability is seamlessly integrated into the design process (Norman, 2013).

Beyond the materials, the project integrated sustainability into its production methods and lifecycle considerations. The ceramic plate's creation relied on high-temperature processes that were carefully optimized to reduce energy consumption and minimize waste. These technical advancements highlight the potential for innovation within traditional craft, demonstrating how ancient techniques can be adapted to meet contemporary environmental standards. Moreover, the

collaboration with Forma Foods emphasized the use of plant-based proteins derived from ingredients like peas and beetroot. This focus aligns with global efforts to mitigate the environmental footprint of food production, particularly by reducing reliance on resource-intensive animal-based proteins.

The project also emphasized the role of design in fostering ecological and cultural awareness. By prioritizing local materials and drawing from the rich heritage of Northeast Mexico, the vessel serves as a narrative that connects diners to the land and its stories (Lando & Labiner-Wolfe, 2007). This approach reinforces the principles of "design for territories," where sustainability extends beyond environmental considerations to include cultural preservation and community engagement (Lee, 2009). The integration of sustainability into food design extends to every stage of the process, from ingredient sourcing to packaging. For instance, reducing the greenhouse gas emissions of food production is a critical component of sustainable innovation (Sonesson et al., 2010). Moreover, designing sustainable packaging, such as edible coatings, enhances ecological responsibility without compromising functionality (Verma et al., 2024).

Looking to the future, The Future is Fluid underscores the transformative potential of collaboration in driving sustainable innovation. By merging insights from science, design, and art, the project demonstrates how holistic approaches can address complex challenges within the food system. The vessel's design—grounded in material science, ecological principles, and cultural storytelling—becomes a blueprint for how sustainability can be embedded into every stage of the food design process.

Ultimately, this initiative serves as a powerful reminder of the interconnectedness of food, culture, and the environment. By balancing aesthetic excellence with ecological responsibility, The Future is Fluid presents a vision of what food design can achieve when sustainability is at its core. It not only minimizes environmental impact but also deepens our relationship with food, inspiring diners to appreciate the stories, people, and landscapes behind each meal. Through its thoughtful integration of sustainable practices and future-oriented design, the project establishes a new benchmark for innovation in the food sector, offering a model for how the industry can evolve in harmony with the planet and its people.

10. Conclusion

The Future is Fluid project exemplifies the power of design when intertwined with scientific innovation and cultural storytelling, driving meaningful change in food systems. By blending fields such as material science, gastronomy, and sustainability, it showcases how collaboration can foster both aesthetic and functional innovation while promoting ecological awareness and cultural preservation.

Central to the initiative is the principle of Food Serenity, which advocates for mindful consumption and a deeper connection to the origins of our food. Through the creation of a unique ceramic vessel and a plant-based dish, the project illustrates how design can transcend its utilitarian role, becoming

a narrative medium that connects diners to the cultural and ecological landscapes of Northeast Mexico while pushing the boundaries of sustainable food practices.

Furthermore, Future is Fluid redefines the role of designers as key drivers of innovation. No longer confined to aesthetics alone, designers are becoming facilitators of cross-disciplinary collaboration, enabling the fusion of tradition and technology. This evolution positions designers at the forefront of global challenges, addressing issues like food security, sustainability, and cultural resilience.

The vessel, crafted with deliberate symbolic meaning, further emphasizes this narrative. It serves not only as a functional object but as a symbol of harmony between cultural heritage, technology, and ecological awareness. The gold accents, reflecting both the technological and the transcendental, juxtapose with the earthy tones that reference the natural origins of plant-based proteins, creating a visual and conceptual bridge between tradition and innovation. As a whole, the vessel invites reflection on the origins of the meal, transforming the dining experience into an opportunity for connection, reflection, and understanding of the complex relationship between food, culture, and design.

Looking to the future, the Future is Fluid project sets a compelling example of how food design can inspire broader societal transformation. It calls on those in the culinary, scientific, and design communities to approach food not just as nourishment, but as a catalyst for connection, education, and sustainability. In the face of pressing environmental and social challenges, projects like this offer a promising path toward a more inclusive and sustainable future (Manzini, 2014).

In conclusion, by integrating sustainability, cultural heritage, and technological advancement, Future is Fluid reimagines the role of design in food systems. It challenges us to rethink our food choices, inspiring not just diners, but creators and innovators to envision a future where food transcends necessity to become a profound expression of human creativity and responsibility.

ABSTRACT | This study examines the far-reaching influence of environmental awareness on food art, contending that sustainability is reconfiguring culinary beauty not only as a moral responsibility but also as an inspiration to creativity. Traditionally defined by excess—from Baroque sugar work to the transitory "unicorn foods" of Instagram popularity—food art is being reimagined through practices prioritizing ecological balance. By examining visionary works such as zero-waste restaurant Silo, upcycled pop-up restaurant WastED, and Chloé Rutzerveld's Edible Growth through case studies, the research illustrates how these cases inspire innovation, combining ingenuity with breakthrough form. Technological innovations such as 3D-printed food and lab-grown meat also testify to how digital media and biotechnology redefine material possibility. The study envisions an interdisciplinary future and encourages food professionals, scientists, and policymakers to work together with the aim of building areas such as biodegradable materials and circular systems. By positioning food art as a tool for ecological stewardship, the project challenges the discipline to look beyond beauty and think about its role in planetary resilience.

KEYWORDS | FOOD ART, SUSTAINABILITY, CULINARY AESTHETICS, ZERO-WASTE RESTAURANT, FOOD AESTHETICS

1. Introduction

Food art is a human practice that unites gastronomy with visual art and design; it has fascinated audiences through its two expressive forms: culinary presentations and installations using food as a medium. In the field of haute cuisine, chefs such as Ferran Adrià (Wikipedia contributors, 2024) and Massimo Bottura (Wikipedia contributors, 2025) have elevated plating to an art form, crafting dishes that evoke narrative, emotion, and cultural critique through meticulous arrangement. Besides the art of plating, food art performers like Jennifer Rubell transform food into immersive art experiences, as noticed in her "Creation," 1,000 pounds of ribs on a white pedestal with honey dripping from the ceiling, a kind of buffet-themed performance piece that served as the opening night event for the Performa biennial in New York in 2009 (see Figure 1), tapped into the general hedonism that defines much of the art world (Miller, 2019). However, in the face of undeniable environmental destruction by the global food system, 26% of all global greenhouse gas emissions are attributed to food production, processing, and distribution (Poore & Nemecek, 2018), so it makes the once-celebrated excesses of food art are being reexamined.

Figure 1. Scene from Jennifer Rubell's "Creation (2009)," 1,000 pounds of ribs from Daisy May's BBQ with honey dripping from ceiling installation, Credit by Jennifer Rubell.

Historically, this field of food art prioritized spectacle over sustainability. From Baroque-era sugar sculptures (Keyser, 2014) that glorified colonial trade to Victorian gelatin molds dyed with toxic pigments (Colebrooke & Miele, 2017), food art has often relied on resource-intensive practices. Even today, social media platforms prioritize visually appealing content, leading to a culture where aesthetics dominate food choices, often at the

expense of sustainability (Irimiás & Volo, 2022), such as gold-leaf desserts or rainbow-colored "unicorn" foods, they perpetuate a culture of disposability, where aesthetics eclipse ecological ethics, for fleeting social media moments rather than nutritional value (Pellegrino & Shannon, 2021). Along with the awareness of climate change, food waste (1.3 billion tons annually) (World Wildlife Fund, n.d.) and supply chain inequities are driving a paradigm shift. An increasing number of chefs, artists, and technologists are redefining food creativity through sustainability, treating environmental responsibility not as a limitation but as a catalyst for innovation.

This paper focuses on the discussion of environmental issues in the contemporary food art, however it can't avoid the essence of food. Although the healthiness and taste of food are extremely important throughout the entire "life cycle," due to the complex origins of these factors and the subjective nature of evaluation data, they are not discussed in detail in this paper. Therefore, the issue this article concentrates on is the profound transformation that contemporary food art is undergoing, which involves merging aesthetic ambitions with food stewardship. One that merges aesthetic ambition with food stewardship, as Douglas McMaster exemplifies this shift, whose zero-waste restaurant Silo in London reimagines haute cuisine through circular systems. He frames sustainability itself as an artistic statement by eliminating packaging, composting all organic waste, and crafting menus from hyper-local ingredients. Similarly, Chloé Rutzerveld's 3D-printed edible ecosystems challenge the notion that sustainability compromises creativity. Instead, they prove that constraints —— whether ethical, material, or ecological —— can inspire new forms of beauty.

Through historical analysis and case studies, this paper positions sustainability as a necessary evolution for food art, not as a fleeting trend. We interrogate how the field can reconcile its legacy of indulgence with the urgent demands of environmental consciousness, proposing that the future of food art lies in its ability to balance visual aesthetics with ethical accountability.

2. Historical Context of Food Art

The history of food art reflects a paradoxical journey - oscillating between grandiose waste and mindful restraint. This duality is evident in how food has been represented in art, serving both as a medium for excess and a commentary on sustainability and social issues.

In Renaissance Europe, banquets became theatrical displays of power (Albala, 2007). For example, specially designed trenchers required diners to engage in performative acts, enhancing the theatricality of the event (Yeoman, 2017). This physical manipulation of these trenchers contributed to a culture of sociability, where guests participated in a shared experience that reinforced their social status (Yeoman, 2017). Nobles hosted feasts featuring gilded peacocks, sugar-crafted sculpture (Belozerskaya, 2005), and wines flowing into ornamental fountains (Krohn, 2016; Scully, 2011). These events focused on opulence over nourishment. Leftover food was discarded or donated to servants, reflecting a disconnection between artistry and sustainability. And the Victorian-era phenomenon of "dessert architecture," characterized by elaborate sugar sculptures, served as a luxury status symbol while obscuring their ties to colonial exploitation and enslaved labor (Keyser, 2014). The dessert architecture has visually stunning edible structures (Tarantino & Terziani, 2010), such as spun-sugar swans (Mason, 2002) and marzipan palaces (Borsato, 2023). They were designed to dazzle guests before being discarded, symbolizing a culture of conflated artistry with disposability.

The parallel food traditions embraced nature. In Japan, the kaiseki culinary tradition, deeply influenced by Zen Buddhist principles, its seasonal ingredients epitomized minimal-waste artistry through its preparation and presentation. This tradition emphasizes aesthetic beauty and aligns with Buddhist values of mindfulness and respect for nature, resulting in a cuisine that minimizes waste and maximizes flavor and visual appeal. Guided by shun (seasonality), Kaiseki chefs transformed local, ephemeral ingredients, such as wild mushrooms in autumn and bamboo shoots in spring, into multi-course meals where every stem, leaf, and broth carried intentionality. It reflects a broader Buddhist ethos of sustainability and mindfulness, encouraging a deep appreciation for nature and the environment (Payne, 2024). Kaiseki is about taste and visual appeal, where the arrangement of food reflects seasonal themes and cultural significance (Andoh, 2005). This artistic presentation enhances the dining experience, making it a feast for the palate and the eyes ("Washoku, Japanese Food," 2022).

Indigenous cultures, too, practiced sustainable food art, the Māori hāngī feast cooked root vegetables and meats in earth ovens (Borolla et al., 2024), rooted in cultural values that emphasize respect for the environment, fostering community resilience and biodiversity conservation (Adefila et al., 2024; Rathoure, 2024), honoring the land through cyclical use of natural materials.

The digital age, however, reignited food art's fraught relationship with excess. Social media platforms democratized culinary creativity but prioritized visual shock over substance. The #foodporn hashtag, with nearly 10 million posts showcasing visually appealing food (Mejova et al., 2021), reflects a cultural obsession with food aesthetics, the presentation overshadows nutritional value, leading to a potential normalization of excess consumption (Mcdonnell, 2016). Viral trends, including rainbow bagels and glitter —— coated coffees, fueled a demand for hyper —— aesthetic products designed for screens rather than sustenance. The emotional and visually engaging narratives associated with these products enhance their shareability, further fueling their popularity (Koçyiğit, 2018). This "disposable aesthetics" reflected a new form of indulgence: one where food art served algorithms rather than communities, and sustainability became an afterthought.

This brief demonstrates a complex shift from opulent waste to conscious restraint, reflecting deep contradictions in cultural values and social structures. Particularly in modern times, facing global environmental challenges and resource scarcity, the practice of food art is increasingly emphasizing sustainability and respect for the environment. However, the digital age's social media has driven the popularity of visually-centered food art, a trend that, while increasing the accessibility of food art, may also lead to resource overconsumption and waste. Currently, we must reconsider the direction of food art to ensure that it not only enhances visual appeal but also places a greater emphasis on long-term food sustainability. In this way, food art can become a force in pushing society towards more sustainable consumption patterns.

3. Critiques of Traditional Food Art

The above traditional food art, celebrated by its creativity and cultural resonance, faces mounting criticism for its environmental and ethical contradictions. As the climate crisis intensifies, practices once lauded as artistic achievements are now scrutinized for their ecological footprints and social inequities.

Since 2014, the number of people affected by hunger has been slowly on the rise, and tons

and tons of edible food are lost and/or wasted every day. Around 13.2 percent of food produced is lost between harvest and retail, while an estimated 19 percent of total global food production is wasted in households, food service, and retail (United Nations, n.d.). The carbon footprint of resource —— heavy ingredients exacerbates this toll. Black truffles require approximately 1,000 liters of water per kilogram for cultivation (Büntgen et al., 2019), and their transport via airfreight results in 12.5 kg of CO^2 emissions per kilogram, contributing to the overall carbon footprint of this luxury food item (Liu et al., 2015). In addition, transporting out-of-season ingredients contributes to greenhouse gas emissions (Qin & Horvath, 2021) , such as tropical fruits in Nordic tasting menus or imported caviar in Japanese kaiseki imitations undermine regional sustainability.

Beyond environmental harm, traditional food art often relies on ethically fraught practices. The globalization of culinary aesthetics has normalized ingredients sourced from ecologically vulnerable regions, such as vanilla from deforested Madagascan farms or bluefin tuna from overfished Pacific stocks. In Madagascar, around 70,000 farmers produce the majority of the world's vanilla, yet many face socio-economic challenges (Hänke et al., 2018). Overfishing of bluefin tuna has led to drastic population declines; they are at risk of collapse due to unsustainable fishing practices (Jeswani & Azapagic, 2019). These supply chains impact low-income communities, which bear the brunt of environmental degradation, while elites enjoy the artistic end products. Such practices "aestheticize extraction," turning systemic inequities into curated experiences.

In contemporary art, material selections in food art installations also provoke anger. Many contemporary artworks use non-biodegradable materials (resin, styrofoam, plastic polymers) to preserve perishable ingredients, as seen in Kara Walker's installation "A Subtlety" (2014), which mixed sugar, polystyrene, plastic, and molasses. While intended to critique consumerism, such works ironically replicate the wastefulness they aim to condemn. Food art's ephemerality considers its inevitable decay, which mirrors human mortality, a theme explored in works like "The Dinner Party" by Judy Chicago (Broude, 2018, Chapter Judy Chicago's Dinner Party). However, the urgency of climate change calls for a shift from thoughtlessness to responsible action, where artists and society must reflect on their impact on the environment (Raepple, 2019).

4. Case Studies in Sustainable Food Art

The following case studies exemplify how chefs, designers, and artists are redefining food art through sustainability.

4.1. Silo (London)

Douglas McMaster's Silo Restaurant opened in 2014. It is the world's first zero-waste restaurant, and its new paradigm introduces sustainability, culinary innovation, and visual beauty. Silo is founded on the "closed-loop" principles of sustainability, where all aspects of its supply chain are designed to reduce waste (see Figure 2). As its website comments: "Zero Waste is just a system with no loose ends (*Douglas McMaster*, n.d.)." At Silo, 85-90% of the original materials of food that come in are very effectively processed into things that end up in the customer's and staff's bellies rather than those are around 50% in most restaurants. The last 10-15% is more challenging, and 5% is recycled (Chessé, 2022). Silo sources a majority of its produce from local farms, working with small-scale farmers. This ranges from "ugly" fruit and vegetables rejected by supermarkets (knobbly celeriac, knotted Jerusalem artichokes, and bruised apples), that McMaster turns into meals such

as koji-fermented vegetable steaks matured in-house for six months. Spent grains from nearby breweries, typically wasted as waste, are turned into sourdough bread via a 72-hour fermentation process[1].

Figure 2. The way of Silo is to use absolutely every gram of each ingredient that enters its kitchen, using processes such as fermentation, pickling, and preserving to ensure nothing is thrown away. Anything that can't be reused is composted except the food itself, Credit by Silo Restaurant.

McMaster's strategy reminds us of the Japanese philosophy of mottainai (a feeling of remorse for waste), where imperfection is a visual and ethical statement. The building itself reflects its principles. Everything at Silo is recycled or recyclable, even the furniture – the tables and the counter are made of recycled plastic packaging, the lights out of wine bottles, and there is an aerobic digester, which is capable of turning 60kg of organic waste into compost, overnight (De Gamme, 2021), which is fed back to partner farms. At the same time, these materials either biodegrade or easily disassemble for repurposing in the future (*Silo, the World's First Zero-waste Restaurant by Award-winning Chef Douglas McMaster, Designed by Nina+Co.*, 2020). Silo's furniture redesigns rejected natural materials for a serviceable, sustainable design. The host stand is made of offcuts and other unusable timber parts laminated together and sculpted to the likeness of a tree stump. Above it hangs a pendant light ingeniously molded from foraged seaweed. The floor is made of natural cork, hand —— harvested without harming the tree from cork oak bark; this carbon-negative product points out that regenerative materials are key, with the cork oak forests absorbing five times more CO^2 than is emitted from manufacturing. The front of the bar is clad in recycled leather, while the dining counter is made from waste polyester packaging that has been reworked through an exhaustive hand-manufacturing process into a smooth, refined surface. Even the 12-meter-long bartop is designed by Smile Plastics using recycled materials and can be recycled ad infinitum to create a circular lifecycle (*Silo, the World's First Zero-waste Restaurant by Award-winning Chef Douglas McMaster, Designed by Nina+Co.*, 2020). No single piece of furniture in Silo is just a piece of furniture; rather, it has a story of innovation, sustainability, and the beauty of waste being repurposed.

[1] This restaurant is priced on the higher end and has some negative reviews regarding its cost. There are not many comments about its taste. In writing about this restaurant, I primarily referenced various online sources. The article attempted to incorporate the views of culinary critics; however, given the ambiguous definition of "food critic," this effort did not achieve the expected results. This also complicates the reliance on more subjective information such as "taste of the food" and "public reviews," which can impact the main arguments of the article.

McMaster even combined his personal experience with practical advice and wrote a book called "Silo: The Zero Waste Blueprint," which offers a comprehensive guide to revolutionizing the way we think about food, waste, and sustainability (McMaster, 2019). It explores Silo's philosophy, emphasizes its closed-loop systems, and the importance of rethinking how we source, prepare, and dispose of food. McMaster considers that if we can see what waste is and how it got there, we have the understanding to design it out of our world (*Douglas McMaster*, n.d.). Silo's procurement policies of "ugly food[2]" (see Figure 3) also stimulated the EU to recognize the importance of integrating sustainability into food quality policies, EU proposed a roadmap for enhancing food supply chains, emphasizing the need for cohesive procurement policies that include ugly produce (Mattas et al., 2021).

Figure 3. Samples of "ugly food" and their fate, Credit by www.usesilo.com.

4.2. WastED (NYC)

Dan Barber's WastED pop-up, launched in New York City in 2015, aimed to show the dining world how much can be done with scraps (see Figure 4), leftovers, and industrial byproducts by transforming them into gourmet experiences (Roth, 2015). Hosted in a Greenwich Village space adjacent to a dumpster, the project served over 5,000 meals crafted from ingredients typically deemed waste, such as juice pulp, fish bones, and overripe fruit. The menu included such as kale rib stew, pasta trimmings, and dog food with a glossary that doubled as education on all the perfectly edible food we don't eat—from broken razor clams to immature eggs (*Let's Get Wasted!*, 2023). Meals were served on upcycled cardboard plates alongside "dumpster wine," a blend of unfinished bottles from local restaurants, forcing diners to confront the arbitrariness of food aesthetics and the value of discarded materials. During the first WastED pop-up, the restaurant served 10,000 dishes, and it saved 600 pounds of "ugly" vegetables, 150 pounds of kale ribs, 30 gallons of beef tallow, 475 pounds of skate cartilage, 350 pounds of vegetable pulp, and 900 pounds of waste-fed pigs (January, n.d.).

[2] "Ugly food" refers to edible fruits, vegetables, and other food items that are deemed imperfect or unattractive because of their unusual shapes, irregular sizes, discoloration, or minor surface blemishes. But it is no less valuable than its "perfect" counterparts. By promoting awareness, changing market and consumer behavior, and finding innovative ways to use imperfect food, we can reduce food waste, conserve resources, and create a more sustainable and inclusive food system.

Figure 4. Wasted revisited during the WastED, Credit by Clerkenwell Boy and WastED.

The creative menu of WastED includes:

- Veggie Pulp Burgers: A blend of carrot, beet, and kale pulp from juice bars (30% of NYC's food waste), bound with spent barley from Brooklyn's Sixpoint Brewery.
- Fish Bone Soup: This soup is simmered for 12 hours using salmon spines discarded by seafood wholesalers and vegetable trimmings from Michelin-starred kitchens like Eleven Madison Park.
- Dessert "Waste": Chocolate-covered strawberry tops and ice cream from overripe bananas sourced from Union Square Greenmarket vendors.

The transient nature of this project underscored the systemic challenges of food waste; nearly 60 million tons (120 billion pounds) of food are wasted each year in the US, which accounts for almost 40 percent of the entire US food supply. The majority of this discarded food ends up in landfills, occupying 22% of municipal solid waste, with the wasted food valued at approximately $218 billion, equivalent to 130 billion meals (RTS - Recycle Track Systems, 2025). Barber used WastED to advocate for systemic shifts in consumer and retailer perceptions of "ugly" or surplus food, emphasizing the need for circular supply chains and policies that reduce waste. While critics argue such initiatives address symptoms rather than the root causes of overproduction, WastED's enduring legacy lies in its inversion of value—using creativity to transform waste into something meaningful, as he proposed: "The future belongs to people who care about food (Bonneau, 2016)." His book The Third Plate (2014) has made him a leading spokesperson for sustainable food (Barber, 2014).

4.3. Chloé Rutzerveld's "Edible Growth"

Eindhoven-based designer Chloé Rutzerveld's Edible Growth (2014) (see Figure 5) merges 3D printing, biotechnology, and gastronomy to envision a sustainable food future and discuss the potential use of 3D printing (also known as additive manufacturing) in food production (*Chloé Rutzerveld Food Design*, n.d.). Edible Growth fully natural, healthy, and sustainable food made possible by combining natural growth, technology, and design (Escalante-Aburto et al., 2021). With the rise of more high-tech food and new production methods, consumers are becoming increasingly more concerned about the quality and "realness" of the food and their health, this project features 3D-printed edible structures made from pea protein, seeds, and mycelium. It uses a modified 3D printer to extrude edible "soil" from pea protein, agar, and seeds (e.g., basil, mustard) into porous, geometric structures. Mycelium (Rhizopus oligosporus, refers to the network of thread-like structures, called hyphae, that make up the vegetative part of a fungus.) spores are injected into the matrix, which colonizes the structure over five days, digesting the substrate and sprouting

microgreens. Over five days, the seeds sprout, and mycelium colonizes the shell, creating a living snack that evolves in form and flavor. This "food as process" approach eliminates packaging waste, reduces transportation emissions through hyper-local production, and invites diners to engage with food's lifecycle as an artistic experience. It exemplifies how biotechnology can disrupt traditional food art, prioritizing ecological harmony over fleeting visual spectacle.

Figure 5. The Edible Growth, Credit by Chloé Rutzerveld.

Rutzerveld considers himself a food printing skeptic. She challenged herself to find a way to use the technology of 3D printing to create healthy food while shortening the food production chain in the process (*Chloé Rutzerveld Food Design*, n.d.). Although Edible Growth is future food, Rutzerveld's work exemplifies critical design, using provocation to challenge norms. Food art shouldn't just feed bodies but also feed thoughts.

Rutzerveld, by challenging traditional methods of food production, not only explores how technology can assist in providing healthier food solutions but also emphasizes the thought-provoking nature of food art. This perspective suggests that food art is not only about providing physical nutrition but also serves as a means to inspire visions and challenge conventional thinking. It reflects an ideal where art and technology collaboratively contribute to advancing society and culture toward deeper awareness and sustainability. Rutzerveld's work provides a commendable model, demonstrating how the integration of technology and art can propel the food industry toward greater sustainability.

4.4. Other Restaurants

Meanwhile, restaurants worldwide are taking matters into their own hands, going zero-waste and implementing sustainable practices, hence making a path toward eco-friendly dining. Helsinki-based restaurant Nolla doesn't have a trash bin; instead, it sources its ingredients without single-use packaging and composts waste on-site. Two-Michelin-starred Roganic in London brings in a farm-to-table approach by partnering with small-scale, sustainable farms and creatively reusing ingredients, such as vegetable trimmings, to reduce waste. The Sustainability Pavilion Restaurant at Expo 2020 Dubai has pledged to zero food waste by introducing innovative cooking methods that turn leftovers into compost or animal feed. In Copenhagen, Amass combines fine dining with zero waste principles: fermenting, pickling, and preserving its ingredients, using food waste to compost for its urban garden. In Sydney, Australia, Olio is based on a full-cycle

philosophy-composting organic waste, donating surplus food, and highlighting local seasonal ingredients. London's Berber & Q concentrates on nose-to-tail cookery whereby every part of the animal, including bones and trimmings, is used to make stocks.

These cases demonstrate that sustainability is not a limitation but a catalyst for redefining food art. Whether through Silo's closed-loop systems, WastED's waste-to-luxury alchemy, Rutzerveld's living snacks, or even the spreading global sustainability trend, each project challenges the historical equation of artistry with excess, implies that these projects are redefining the relationship between creativity and resource use. They show that creativity, innovation, and high-quality outcomes can emerge from sustainable practices, efficient use of resources, and even from what is traditionally considered "waste." The common thread is clear: ecological constraints inspire innovation, proving that the future of food art lies in its ability to harmonize beauty with planetary resilience[3].

5. Technological Innovations

Integrating advanced technologies into food art has opened new frontiers for sustainability, enabling creators to reimagine aesthetics, ethics, and resource efficiency. We will analyze three transformative innovations: 3D printing, lab-grown foods, and digital surplus platforms.

5.1. 3D Printing: Precision and Nutrient-Dense Design

3D food printing (3DFP) has emerged as a tool for radical resource efficiency, allowing artists to craft intricate edible structures with minimal waste, such as Fused Deposition Modeling (FDM) and Liquid Rope Coiling (LRC), to create complex food structures with controlled properties (Millán & De La Torre, 2024). Contrasting with traditional subtractive manufacturing methods, the additive nature of 3D printing minimizes excess material usage (Nyika & Dinka, 2024), aligning with sustainable manufacturing practices, embed functional nutrients into aesthetically daring forms.

According to Ghorbani et al. (2024), LRC allows for the creation of coiled food structures with adjustable porosity and fracture properties, enhancing textural experiences. Many chefs and gastronomy experts utilize 3DFP to create visually appealing and nutritious meals, contributing to the evolution of modern cuisine (Elshaer et al., 2024), and it is particularly beneficial in developing foods for special medical purposes, catering to unique dietary needs and enhancing sensory experiences (Shi et al., 2024).

However, while 3DFP enables hyper-local production (e.g., restaurants printing with on-site grown ingredients), its energy footprint remains a challenge. The high energy consumption raises concerns about its environmental footprint (Annibaldi & Rotilio, 2019). The market for 3D-printed foods also faces challenges related to regulatory frameworks and production costs (Shi et al., 2024).

[3] Planetary resilience refers to the Earth's ability to absorb disturbances, adapt to changes, and maintain stable environmental, ecological, and social systems that support life. It is a concept rooted in sustainability and ecosystem resilience and emphasizes safeguarding the planet's systems in the face of challenges like climate change, biodiversity loss, pollution, and resource depletion. It emphasizes the need to preserve ecosystems, address climate change, and manage resources sustainably. By fostering global cooperation and adopting innovative, sustainable practices, humanity can enhance the planet's resilience and live within its ecological limits.

5.2. Lab-Grown Foods: Cellular Agriculture as Ethical Canvas

Lab-grown foods - produced by culturing animal cells or plant tissues in bioreactors - offer a groundbreaking medium for ethical food art. By decoupling aesthetics from industrial animal farming, artists can interrogate concepts of life, consumption, and ecological harmony.

Bistro In Vitro, the world's first lab-grown meat restaurant, invited participants to explore the possibilities of cultured meat (*Welcome to Bistro in Vitro - Bistro in Vitro*, 2015). During the Creativity World Forum 2019 (CWF 2019), they showcased conceptual dishes like "synthetic steaks" and "lab-grown meatballs," emphasizing the potential to create protein-rich foods without slaughtering animals (*Chloé Rutzerveld Food Design*, n.d.). For example, participants could imagine redesigning traditional dishes into entirely new forms, such as "printed chicken wings" made from cultured cells, which retained the taste and texture of conventional meat while eliminating ethical and environmental concerns. By exploring and pushing the boundaries of food culture, they want to do away with the idea that cultured meat is an inferior meat substitute; they serve a digital selection of sustainable, animal-friendly, exciting, and delicious dishes that will prompt thought and discussion on in vitro meat (*Welcome to Bistro in Vitro - Bistro in Vitro*, 2015).

Companies like Mosa Meat and Aleph Farms now collaborate with chefs to design cultured meat dishes and reduce land use compared to traditional livestock. However, the energy-intensive bioreactor process, which requires more electricity than conventional butchery, and cultural resistance to "Frankenfoods (a term used to describe genetically modified or lab-created foods that combine "Frankenstein" and "food")" pose barriers (Martins et al., 2023). Some consider the Lab-grown art must confront the creepiness factor to achieve mainstream resonance, they consider artificial meat or synthetic food somewhat strange

5.3. Digital Tools: Rescuing Surplus Through Data

Mobile apps such as Too Good To Go and Olio leverage real-time data to rescue surplus food, transforming waste into opportunities for sustainability and community connection. They provide artistic and practical solutions for minimizing food waste, with curated "surprise bags" or local exchanges of surplus items (*Too Good to Go Marketplace App | How to Pick up a Surprise Bag*, n.d.). For example, Too Good To Go allows restaurants and cafes to sell surplus food at reduced prices. In November 2024, a user reported purchasing various "surprise bags" from local bakeries and restaurants. One bag from Lady Glaze Doughnuts contained 12 assorted gourmet donuts valued at $40, purchased for just $11.99. Similarly, a Markham Bakery & Cafe surprise bag included 10 assorted bakery items for $6.99, featuring pineapple buns, cheese buns, and egg tarts (Stenoodie, 2025). These curated bags reduce food waste and provide customers with affordable, high-quality meals, turning surplus into a curated artistic experience.

Moreover, Olio's broader mission extends to all household items, encouraging users to share, lend, or sell pre-loved goods (Ormesher, 2023). Its emphasis on community-driven action has led to significant environmental and social benefits, such as preventing millions of items from ending up in landfills. By fostering local connections and promoting sustainability, these digital tools demonstrate how technology can be harnessed to rescue surplus food and materials while building stronger communities.

In addition to the food app, at CWF 2019, this principle was applied creatively by recycling coffee grounds. All coffee grounds from the event were collected in a transparent cylinder

and later donated to ZuiderZwam (a local food company), a local oyster mushroom farm (*Chloé Rutzerveld Food Design*, n.d.). These grounds became a substrate for mushroom cultivation, illustrating how even "waste" can be transformed into valuable resources.

These innovations of resource transformation underscore a dual role of technology in sustainable food art: a catalyst for precision and ethical reimagining, yet constrained by energy costs, accessibility, and cultural biases. While 3D printing and lab-grown foods offer visionary alternatives, their scalability depends on renewable energy integration and public education. Similarly, digital platforms democratize waste reduction but risk-reducing systemic change to individual acts. For food art to truly align with planetary health, technological advances must be paired with policy shifts and grassroots advocacy.

6. Discussion and Conclusion

The rise of sustainable food art has ignited profound debates about the relationship between aesthetics, ethics, and economics. The ecological constraints foster creativity—exemplified by Douglas McMaster's Silo, where ingredient limitations inspired fermented celeriac steaks and brewery grain sourdough. Similarly, Dan Barber's WastED transformed pulp and fish bones into dishes that redefined luxury through scarcity. However, when every plate must tick an ethical box, we risk losing the anarchic spirit of food as art. This sustainability risks homogenizing artistic expression. This tension is not a binary but a dialectic: sustainability challenges creators to reimagine beauty through symbiosis rather than excess.

There is a growing appetite for eco-conscious artistry, and consumers increasingly prioritize sustainability, with zero-waste practices resonating strongly with their values (Berrones-Flemmig et al., 2022). These zero-waste dining experiences show that restaurants adopting zero-waste practices can enhance the restaurants' appeal and competitiveness (Zaman, 2022). The development of zero-waste systems, such as anaerobic digestion for food waste, can significantly improve waste management efficiency and sustainability. However, a paradox persists: many people claim that they would pay for sustainable meals, but they do not for the reason that the perceived high cost of sustainable food options discourages many consumers from following through on their intentions (Muñoz-Martínez et al., 2024; Köse, 2024). This gap underscores the economic realities facing sustainable food art. Silo's expensive tasting menu and lab-grown meat's prohibitive production costs reflect systemic inequities in green technology access. However, solutions are emerging: crowdfunded initiatives like WastED's community feasts and Barcelona's Espigoladors (a nonprofit turning "ugly" produce into affordable art jams) demonstrating scalable models for democratizing eco-art.

In order to match food art with environmental sustainability, three general directions need to be followed. First, there need to be policy incentives, where governments subsidize sustainable practices by offering grants and tax deductions, as the EU's Farm to Fork program does (*Farm to Fork Strategy*, n.d.), encouraging circular models of production in the food sector. Second, material innovation needs to be emphasized, speeding up the development of biodegradable materials. Lastly, cross-disciplinary discussion by policymakers, scientists, and chefs is required to create guidelines for ethical sourcing. Food art's future is not forsaking tradition but interpreting it in light of today's challenges. Just as Renaissance feasts once reflected the colonial extractivism of their time, sustainable practices today reflect a culture confronting climate collapse and attempting

to innovate.

Thus, a radical reimagining of the role of food art is essential: it should transition from being a reflection of human indulgence to a symbol of ecological stewardship. By fostering collaboration among chefs, artists, and scientists, we can transform dining experiences into powerful acts of environmental advocacy—each plate, policy, and microbial culture contributing to a broader revolution. This transformative approach not only addresses the immediate impacts of our food choices but also ensures a healthier planet and population for future generations, effectively intertwining food sustainability with broader ecological and public health objectives.

ABSTRACT | This conceptual paper sheds light on the possibilities of discursive design and AI-assisted sketching in food-related innovations. Food — products, services, and events — is often conservative and rooted in tradition. The design methods presented here can bring new and radical perspectives to incremental product and service development in the field of food, and to eating as a cultural element.

A discursive and critical view offers opportunities for surprising possibilities that can be further applied in practice during the product development phase. It also allows for reflection on existing and potential challenges within food systems. The methods of discursive design help to break free from rigid realities and provoke perspectives on the futures of food while stimulating various stakeholders' engagement in taking responsibility.

Sketching food ideas is, based on our experiences, challenging for design students, let alone for developers without a design background. This difficulty creates barriers to free ideation. Using AI as a sketching tool enables visualization even for non-experts and encourages imaginative experimentation. The discursive approach combined with AI in food design allows for the presentation of unimagined ideas, concepts, and prototypes as a basis for discussions in product development. The article is based on the authors' experiences from a student project conducted for a food company.

KEYWORDS | FOOD DESIGN, DISCURSIVE DESIGN, AI-ASSISTED DESIGN, DESIGN EDUCATION

1. Introduction

This conceptual working paper presents a unique perspective on food design and design education: a discursive design approach combined with the use of generative artificial intelligence. This approach produces a new model for the challenging food design discipline.

Global problems of food systems – climate change, food security, hunger, obesity, etc. (Wise 2019, Patel 2008) – pose new challenges to the established practices of eating and the material nature of food products, which are reflected in how food products are designed. However, due to the conservatism, traditions and practices of the industry, developing – and visually communicating – new food concepts is demanding for those without a design background or just learning creative ideation. The testing task of a design teacher is to guide students towards undiscovered technologies and design assignments so that they can find solutions to unrecognized problems (Darling-Hammond, 2010). How can the combination of AI-assisted ideation and discursive design support the designing of unprecedented food concepts?

Using artificial intelligence as a sketching tool in food design removes obstacles enabling opportunities for wider participation and encouraging imaginative experimentation. The designer way of thinking (Cross 2023) together with a discursive approach offer the traditional food industry a basis of new perspectives for discussion and novel ideas closer to the consumers' experiences.

2. Food design

Food design can encompass design that concerns industrial food production and its products, local food, dining environments, cultural practices: everything related to nutrition. A designer should see food as a material object of design, just like any physical product. But how can design guide people to a broader understanding of future possibilities – also related to the areas of food and eating? Design scholars are beginning to recognize the potential of design, not only in producing products, services and strategies, but also in changing mindsets and behaviors, including the way we design, produce and consume food products.

This shift requires a different view of design practice. Borrowing from the framework of practical design, the first step in these processes is to broaden participants' understanding of future possibilities. In opening up future prospects, the designer identifies a broader spectrum of futures and, ideally, engages in dialogue with other people and their spectrum of possibilities. (Otto 2019.)

The analysis of food design trends and goals creates different outcomes, which are determined by background knowledge and expertise (Zampollo 2016), and no single food

design project should aim to address or resolve all aspects. Therefore, understanding one's own area of activity and abilities is also important when defining a food design project. Ogata and Mizuno (2023) found in their food design workshops that focusing on food and its social environment often led to thinking about food design and eating moments, while focusing on food imagery promoted thinking around food preparation and raw materials. This way of thinking was present also in our previous food design course; students who thought more about the appearance and appeal of food focused on the food's raw materials and actual feasibility, and students who thought about eating events mainly focused more on the ways in which food and its packaging are used.

2.1 Food design challenges

The potential of creative approaches is enormous, as they can produce new unexpected sustainable products, services and practices for food design, production and consumption. At the same time edible material as the basis for ideation and conceptualization is unusual, strange and difficult to approach for design students. Food design is partly influenced by the experience of food as a conservative area. Food is strongly associated with ideas of familiarity and safety, tradition and continuity. At the same time, while it is easy for top chefs to develop and experiment with new dishes and create trends, it is difficult for large manufacturers, despite their will, to participate in rapid and radical innovation, as the pace of change in the food industry is slow (Spence 2017).

The boundaries between food types seem difficult to break. However, the histories of foods and dishes can reveal surprising stories of development, albeit slow ones, and they have often happened under the influence of chance and circumstance. Perhaps this influences our ideas about the rapid renewal of food, making food an area where radical changes are scary and difficult to accept – and therefore also to imagine and visualize.

The impact of food beyond our own experiences is enormous, especially in terms of culture, environment and human justice. A deliberative design process that considers its consequences and impacts could open up challenges in understanding and experiencing food. The field of food design is vast and challenging to define, and it is inevitably interdisciplinary and multidisciplinary due to all the knowledge and skills it contains (Zampollo 2016).

Designers not only design food but also the ways it is produced, creating a good area to reflect on current problems, future values, and the social and political impacts of food systems. The combination of food and design widens our attention, and the role of design in future thinking is particularly compatible with solving broader challenges related to food. (Sweetapple & Warriner 2017; Flood & Rosenthal 2019.) Designers should primarily consider food design starting from the background and effects of food with the help of discursive design methods as tools for future thinking and a way of perceiving changes and possibilities in food-related topics. Within food design, design thinking's core principles along with empathy and understanding the users –benefiting also innovation (Castanho et al. 2024; Olsen 2015) – might be enhanced with the discursive method, which widens our views and reconsideration on the issues.

3. Discursive design

Discursive, and critical, design is an opportunity to spark discussion through design, by doing design. The material language of design is harnessed for intangible purposes where the object or concept interprets the culture – real or unreal – in which it might occur provoking reflection by speculating on the consequences of our behavior or suggesting changes (Dunne & Raby 2013; Tharp & Tharp 2018). The aim is to discuss the real desirability of things, what we should and not do. Morality and design can work together to change behavior and values, or to encourage a more thorough understanding of the short- and long-term effects. (Dunne & Raby 2013; Allen 2019.) Discursive design is a creative and emotional research method not dominated by reactive problem solving but by envisioning new possibilities and involving people in critical thinking asking more questions than it seeks to answer: the core are subjectivity, ambiguity and arousing ideas (Koskinen et al. 2011; Malpass 2017).

The method can be used to understand problems and discover new unnoticeable things – making things has its value, whether they are prototypes, scenarios or detailed concepts (Koskinen et al. 2011). Speculative design in all areas of society helps define factors that can influence the realization of more desirable and malleable futures (Dunne & Raby 2013). According to Dunne (2008), the most important element of discursive design is directing attention to alternative legal, cultural and social rules, and Allen (2019) believes the rhetorical means of design being one force that help improving different issues.

Discussion through design makes the issues more concrete and easier to approach. Ambiguity and contradiction appeal to emotions and act as reflections of reality making us consider whether what is presented is possible, our own role in it, and especially its desirability. While a discursive designer must be confident in effectiveness, responsibility about harmful consequences is important: which things and parties benefit from the work's discourse and which do not – intentionally or accidentally (Tharp & Tharp 2018).

3.1 Discursive design as a participatory method

Design for the people through the people could be one way to describe discursive design's subjective and goals in general, and it exists only through its perceivers. It also challenges the underlying habits of thinking and acting by questioning in general who does what, whose ideas matter and why.

Design practices that include more diverse partaking in both beyond and within design are needed. Engaging those most affected by the results is a way of ensuring relevance in research. This secures the designed products meeting all needs, and one goal of participatory design is bringing more democracy into design processes (Foth & Axup 2006; Crouch & Pearce 2016). “If people are authors of their experience they are doing and not just undergoing” (Dixon 2020, p.44). This also makes discursive design methods inherently participatory if we manage to see people not as users but as co-doers. The changing social, cultural and political areas also direct the discussion of what participation means and for whom, and design thinking methods with human-centered design can help with the question how we approach design (DiSalvo 2022; Gioia 2015).

Discursive and participatory design are able to offer novel forms of inquiry in combining the artistic and imaginative features of the former and the political aspects of the latter, and if an audience is to appreciate these kind of works of design, they too must work to understand: they are taking part in creating (DiSalvo 2022; Dixon 2020). The discursive approach cannot be seen only as a method seeking for the reactions of its audience but rather participating them in the presented issue. Taking part in action and directing the ways of seeing and using design are elemental in discursive design and participatory design approaches, but also in expanding the areas design – and people – can involve in.

4. AI-assisted sketching and ideation

Some design tasks can be automated with AI just as the early CAD softwares were created to make certain steps easier to perform for everyone (Tholander & Jonsson 2023). AI-supported sketching and ideation should also be seen as such; using time and knowledge on more efficient areas of design processes, faster presentation of detailed concepts while expanding inclusion. Just like reflecting sketches expands creativity and new concepts the use of AI can also lead to spotting new trends while helping faster testing of ideas (Holliman & Brisco 2024; Moreira da Silva 2023; Sreenivasan & Suresh 2024).

AI generated suggestions might support defining the design space, and adding "chance-based interaction" encourages reflection and unforeseen course changes while maintaining meaningful actions (Tholander & Jonsson 2023). The readjustment and selection should designate design processes supported with AI systems, and concentrating on creating series of alternative solutions before the final concept (Moreira da Silva 2023) should be as essential as in conventional sketching processes.

Fast generation of ideas and in-depth images with low requirements for drawing skills, identification of design problems, but also the involvement of less experienced people have been the identified benefits of AI in different design processes (Holliman & Brisco 2024; Tholander & Jonsson 2023). AI-powered images might enhance the clarity of the common language and the collaborative chances, like with conventional sketching where the peculiar process in conversion of thoughts into communicable ideas takes place, but it might also increase creative innovative exploration (Moreira da Silva 2023; Sreenivasan & Suresh 2024).

AI-assisted process as a co-design operation between humans and machines is a post-humanist view on design. More-than-human perspectives and this novel way of co-creation helps combining different potentials. (Tholander & Jonsson 2023.) The human-centric methodology of design thinking integrated with AI's explorative character provide possibilities for innovation, but it must be stressed that AI cannot replace the value of human emotion, empathy and ethical reflection (Sreenivasan & Suresh 2024).

Artificial intelligence will change the way we do design; designers will increasingly become curators of product and service ideation and definition, steering the course of AI-generated solution options in the desired direction. One might think that the role of designers in innovation is more focused on exploring alternatives and possibilities than on quick innovation process: more design, less production. At the same time, the traditional

principles of design are shifting from the idea of striving for the perfect product to learning systems that are good enough – for now.

Artificial intelligence can support a designer's divergent thinking by creating connections between things and generating unexpected and novel ideas among the design team. A non-typical idea generated by AI can inspire a designer to think outside the box, both in terms of function and form. This makes it easier to question people's ways of designing and avoid the Einstellung effect, where a designer abstains from new ways of solving problems due to their previous experience.

5. Add together: AI + discursive design + food design

In our experience, sketching food is a difficult task for design students as realistic visualization of food is hard and thus limiting the actual idea generation and confidence. Here, artificial intelligence acts as an effective assistant offering several different options to support the designer's thinking process around the challenging food material. Design students have also over-considered the actual challenges of preparation of food products. These issues could be avoided by making the concepts speculative from the outset – and essentially only conversational – through discursive design.

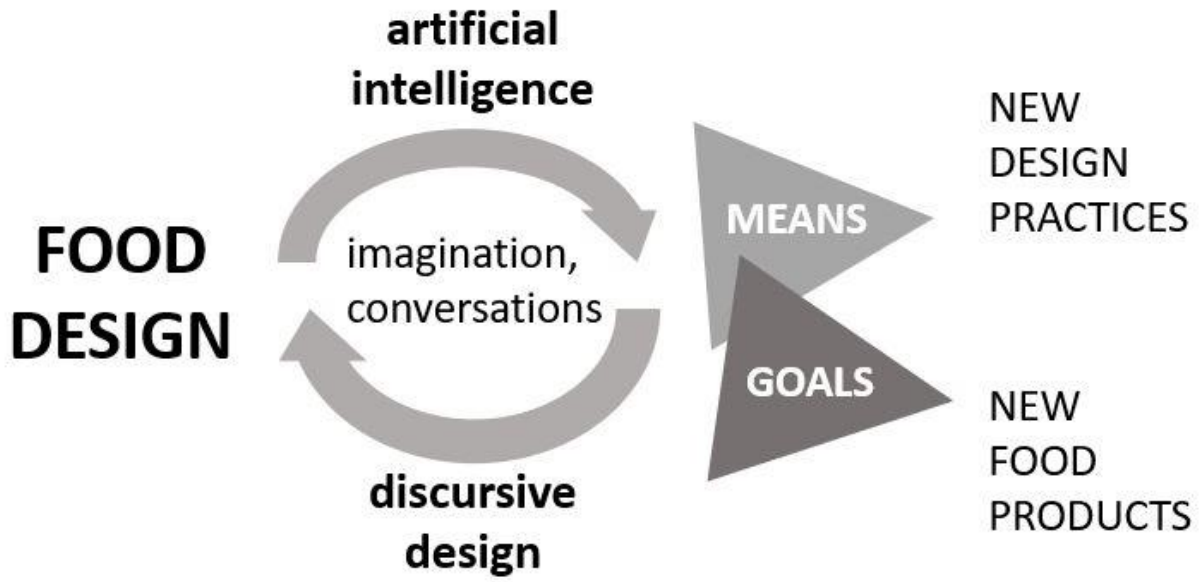

Figure 1. A framework for constructing new meanings in food design.

Discursive design takes design prototyping and conceptualization beyond the usual by distorting reality – possible in some way but not completely believable (Tharp & Tharp 2018; Dunne & Raby 2013), while minding responsibility. Paying attention to consequences must also be present in speculation with AI. Artificial intelligence is not yet capable of interpreting or reproducing complex social interactions, nor of empathy or strategic

thinking, and therefore the human role is emphasized (Markovitz 2024). Creating new visions of the future and especially the topic of food requires responsibility and consideration.

The designer's challenge is to address a topic through a scenario that resonates with the perspective and language understood by people (Tharp & Tharp 2018). Even if the content of a discursive design work is ambiguous, a more familiar presentation helps the examination. This can be facilitated with AI, making visual communication easier and less open to interpretation while the refined visuals can support the design process and the associated self-confidence also reinforcing speculation. The designer acts like a storyteller when utilizing rhetorical contexts to give them additional meanings, and interactivity makes the discursive scenarios more credible for creating discussion (Malpass 2017). With the assistance of AI, the goal should not necessarily be flawless appearance but rather deepening of the presented discourse. Seeing design thinking as sensemaking clarifying also the sensibility of designers (Rylander Eklund et al. 2022) connects it with discursive design as well.

Just as discursive design will not provide clear solutions to issues, the same applies to AI. However, finding problems and discussing them are valuable outcomes. Discursive design can also identify areas for development that other fields than design could address. A more empathetic approach could help companies prepare for change, and interactive experiences can be used to create new, more fun interventions in the food sector (Hermannsdóttir et al. 2016; Altarriba Bertran et al. 2020). Speculative food-related experiences created with AI and discursive design can probe consumer opinions, being also a unifying factor bringing different actors in food-related fields together to discuss common topics.

6. Conclusions

The vagueness and strangeness of food as a designed material will be aided by the use of AI in the sketching and ideation processes, freeing the designers from the limitations in imagining new kinds of food. Although while imagining different futures of food and using the aid of technology we should recognize ourselves as users being variable and the technology only as a tool creating events we react upon (Ogata & Mizuno 2023), and this is central in the approach suggested in this paper. The use of AI will not be seen creating things for the designers but creating with them, minding a critical lense throughout the design process. AI can help in the visualization of wild discursive concepts, as designers aware of resource limitations often have to consider their ability to materialize the idea and presentability, which in turn prevents detached ideation. Handling difficult or hard-to-visualize materials –such as food – and communicating ideas becomes easier. AI-assistance creates the possibility for even non-designers or people with less advanced drawing skills to collaborate.

AI can help innovators and future users of a new product collaborate making co-creation easier and cheaper. For those who are unable to communicate their ideas in writing or visually, artificial intelligence gives them the opportunity to bring innovations to light. It can also make the priorities, and the time spent on the design process more efficient. If the discursive design approach is intended to bring forth appealing design concepts that

provoke discussion and thought, AI-assisted ideation can be fruitful, but the outputs created by artificial intelligence should also be critically evaluated and discussed.

The usual feedback loop of design work will exist even if we let go of the conservative idea of who is a designer and with what ways the results of designing will be achieved. The use of AI-assisted sketching and ideation could therefore bring more democracy into design and its' true participatory goals. We are not suggesting AI-assistance to replace the traditional sketching but rather using its help involving a wider range of people sharing their ideas of future eating. People have all the thoughts and potential ideas, but they might need help with using the right language.

The discursive design method claims the aim of finding problems rather than solving them as one its main goals. It suggests, or provokes, discussions on different topics. The discursive design and participatory methods also share a deep belief on the voice of people mattering, and on making a change by activating thinking. Discursive design works are aimed at the people, the participants of making sense of the discursive scenarios. The meaning is created at the moment when the audience reacts: as co-creators of the work.

The theme of food concerns all humans. It is relevant to expand the democratic opportunities of participation in designing the future of food with the help of AI-assisted visualization and communicating issues with speculative future scenarios with discursive design to which everyone is able to respond to, without special design skills needed. Creating change requires combining new methods and new roles.

ABSTRACT | In the context of media convergence, traditional popular science journals are facing the challenge of transitioning to digitalization in new media. Public reading habits are gradually changing, with fragmented reading becoming a common phenomenon, forcing popular science journals to reposition their methods of communication. Nature History magazine, as a representative, is actively promoting its digital transformation, primarily targeting young readers. The magazine integrates online and offline resources, establishing a digital content distribution system and proposing development strategies such as "content plus service" and "Internet plus popular science." However, unlike general information, popular science information is distinctive, and readers tend to trust printed media more than digital content, which leads to relatively low trust in digital science communication. Therefore, building readers' trust in digital popular science content has become a core issue in the transformation process of science magazines. This study, taking Nature History magazine as a case study, explores readers' willingness to accept the digital transformation of popular science magazines based on the Unified Theory of Acceptance and Use of Technology (UTAUT2) and the Technology Readiness Index (TRI) theoretical models. The focus of the study will be on digital information design, readers' willingness to accept digital content, and the establishment of trust in the information, aiming to provide theoretical foundations and practical references for the transformation of popular science magazines in the new media environment.

KEYWORDS | Nature History magazine; popular science magazine; digital transformation; information design; information acceptance; information trust

1. Introduction

In the era of new media, information dissemination technologies are rapidly evolving, with mobile internet becoming widely popular [1]. The availability of alternative sources for popular science information continues to increase, and the importance of popular science magazines as a medium of communication is gradually declining [2]. People can now access knowledge through various channels, such as the internet, making the process more convenient and accessible. At the same time, with the rise in knowledge levels and changing interests, readers of traditional popular science magazines are increasingly seeking more specialized and personalized content. Against the backdrop of personalized market demands and diverse choices, the popularity of traditional science magazines is gradually fading, and their readership is becoming more fragmented. On the other hand, the continuous emergence of new media and the rapid iteration of technologies have created an entirely new environment for receiving popular science information.

Nature History is a popular science magazine founded by the China National Geography magazine in 2004, under the supervision of the Chinese Academy of Sciences and the Institute of Geographic Sciences and Natural Resources Research. It is primarily aimed at young readers and covers various fields, including astronomy, geography, biology, and history [3]. Despite its relatively short history, Nature History has gained significant recognition among young audiences, laying a solid foundation for its digital transformation [4]. In response to the rise of new media and the segmentation of reader interests, as well as the challenges of internal reform and upgrading in traditional popular science magazines, Nature History has developed an innovative practice that emphasizes content development, building digital platforms, and enhancing brand value [5].

In line with these new forms and strategies, Nature History has constructed a digital content dissemination system that incorporates various formats and channels. This system integrates the magazine’s official website, Weibo, WeChat, Douyin, Bilibili, and other digital platforms to provide readers with personalized information options.

The difference between popular science information and general information lies in its specificity, especially in the context of digital dissemination, where the credibility of popular science information becomes more prominent. Although digital content dissemination is fast and convenient, readers still tend to trust traditional print media more than digital science information, leading to relatively low trust in digital content. This presents a critical issue: how to enhance readers' acceptance and trust in digital popular science information during the digital transformation of science magazines has become the core challenge in their transformation process.

This study will take Nature History magazine as a case study, utilizing the Unified Theory of Acceptance and Use of Technology (UTAUT2) and the Technology Readiness Index (TRI) theoretical models to explore readers’ willingness to accept the digital transformation of popular science magazines. The focus of the research will be on digital information design, readers' willingness to accept digital content, and the establishment of trust in the information, aiming to provide theoretical foundations and practical references for the transformation of popular science magazines in the new media environment.

2. Theoretical Models and Research Hypotheses

2.1. Theoretical Models

UTAUT2 (Unified Theory of Acceptance and Use of Technology 2) is an extension of the original UTAUT (Unified Theory of Acceptance and Use of Technology) model, proposed by Venkatesh and colleagues in 2012. It aims to provide a more comprehensive explanation and prediction of users' acceptance and usage behaviors regarding technology. UTAUT2 expands on the original UTAUT model by incorporating additional variables related to user experience and behavioral motivation to adapt to the usage scenarios of modern consumer technologies and services, especially in the domains of individual behavior and consumer technology. The model primarily includes factors such as Performance Expectancy, Effort Expectancy, Social Influence, Facilitating Conditions, Price Value, Hedonic Motivation, and Habit [6,7].

The TRI (Technology Readiness Index) model is used to assess users' psychological readiness to accept technology, particularly their state of acceptance when encountering new technologies. The TRI model was proposed by Parasuraman in 2000 and primarily explores an individual's attitude and emotional responses to new technologies, especially in the context of technological innovations and digital products. The TRI model is based on four dimensions: Optimism, Innovativeness, Discomfort, and Insecurity, to analyze users' level of acceptance towards technology [8,9].

In the study of digital transformation of popular science magazines, UTAUT2 and TRI serve as the theoretical foundation, aiming to explore young readers' willingness to accept digital science magazines. By combining these two models, a comprehensive analysis of the psychological motivations and acceptance behaviors of young readers facing the digital transformation of science magazines can be conducted. UTAUT2 focuses on the multidimensional influences on technology usage behaviors, while TRI emphasizes users' technological readiness [10,11]. The integration of both models provides a multidimensional perspective for optimizing the digital transformation of popular science magazines in areas such as content presentation, system design, promotion strategies, and user support. This approach can enhance young readers' willingness to accept, increase their participation, and foster loyalty. The UTAUT2 and TRI models provide a solid theoretical framework for the study of young readers' acceptance willingness, offering in-depth insights into various influencing factors and providing strong support for formulating precise and effective transformation strategies.

2.2. Research Hypotheses

1.Application of the UTAUT2 Model in the Digital Transformation of Science Magazines

Performance Expectancy refers to the degree to which an individual believes that using a particular technology will enhance their work or life performance [6]. It is similar to the perceived utility of the technology, meaning that users believe the technology can help them achieve their goals effectively. If young readers believe that a digital science magazine can improve their learning efficiency or provide easier access to science knowledge, they are more likely to accept and use this digital platform. Based on this, the following hypothesis is proposed:
Hypothesis 1: Performance Expectancy has a positive impact on young readers' acceptance intention.

Effort Expectancy refers to the expected effort or cognitive investment required to use a technology, essentially the user's perception of the difficulty or ease of using the technology [6]. If the digital science magazine provides a simple and easy-to-use experience, reduces the learning curve, young readers will be more likely to accept and continue using the platform. Based on this, the following hypothesis is proposed:
Hypothesis 2: Effort Expectancy has a positive impact on young readers' acceptance intention.

Social Influence refers to the degree to which individuals are influenced by their social circles, friends, family, colleagues, etc., when using technology. This factor reflects the influence of social networks on an individual's technology choice [6]. If significant individuals in the social circle (such as family, friends, teachers, or experts) recommend or endorse the digital science magazine, it will strengthen young readers' sense of recognition and willingness to use it. Based on this, the following hypothesis is proposed:
Hypothesis 3: Social Influence has a positive impact on young readers' acceptance intention.

Facilitating Conditions refer to the resources and support available to users when they use a technology [6], including hardware resources, network connectivity, and technical support. If young readers have sufficient resources (such as stable network connections, compatible devices, and timely technical support), barriers to using the digital science magazine will be effectively removed, which will improve their willingness to accept it. Based on this, the following hypothesis is proposed:

Hypothesis 4: Facilitating Conditions have a positive impact on young readers' acceptance intention.

Price Value refers to the perceived costs associated with using the technology, including monetary costs, time costs, etc [7]. This dimension assesses whether the value obtained from the technology is in line with the costs paid. If the subscription fees for the digital science magazine are reasonable and it provides high-quality content, readers will perceive good value for money, thus increasing their acceptance intention. Based on this, the following hypothesis is proposed:
Hypothesis 5: Price Value has a positive impact on young readers' acceptance intention.

Hedonic Motivation refers to the enjoyment or pleasure that users derive from using the technology [7]. This factor considers the entertainment value and the enjoyment that may come with using the technology. If the digital science magazine offers entertaining, interactive, and engaging content that brings fun and enjoyment to young readers, they will be more willing to accept the platform. Based on this, the following hypothesis is proposed:
Hypothesis 6: Hedonic Motivation has a positive impact on young readers' acceptance intention.

Habit refers to the automatic behavior that users develop after long-term use of a technology [7]. Habits are typically formed through repeated use, and users may continue using the technology naturally, without making many cognitive decisions. If young readers have already developed the habit of using digital platforms (such as e-books, social media, etc.), they will be more likely to accept the digital transformation of the science magazine and maintain their usage behavior. Based on this, the following hypothesis is proposed:
Hypothesis 7: Habit has a positive impact on young readers' acceptance intention.

Behavioral Intention refers to the degree to which an individual intends to use a particular technology or service. It reflects the individual's intention and plan to use the technology or platform in the future. Behavioral Intention is often a strong predictor of actual usage behavior. Specifically, individuals are more likely to exhibit high usage intention if they believe the technology will bring expected benefits and is feasible to use. Use Behavior refers to the actual behavior of individuals using the technology or platform in real-life situations. It reflects the extent to which individuals adopt and use the technology in practice. Use behavior includes indicators such as frequency of use, duration of use, and level of interaction, and can be measured by observing the individual's actual usage. In the UTAUT2 model, there is typically a positive relationship between Behavioral Intention and Use Behavior. That is, the stronger the behavioral intention, the more frequent and lasting the actual use behavior [7]. If young readers have a high acceptance intention for the digital science magazine, they are more likely to demonstrate actual use behavior. Based on this, the following hypothesis is proposed:
Hypothesis 8: Young readers' Behavioral Intention has a positive impact on Use Behavior.

2.Application of the TRI Model in the Digital Transformation of Science Magazines

Optimism reflects the user's trust and expectations about the benefits that technology can bring [8]. Optimistic users believe that technology can improve the quality of life, enhance efficiency, and provide convenience. If readers are confident in the digital science magazine and believe it can bring convenience and benefits, their willingness to accept it will be higher. Based on this, the following hypothesis is proposed:
Hypothesis 9: Optimism has a positive impact on young readers' willingness to accept the digital science magazine.

Innovativeness reflects the user's degree of acceptance of new technology, especially their attitude toward trying new things [8]. Innovative users are eager to explore and adopt new technologies, typically having a higher tolerance for risk. Young people generally have a stronger sense of innovation and are more accepting of new technologies. If the digital science magazine is innovative, it will be more likely to be accepted by readers. Based on this, the following hypothesis is proposed:
Hypothesis 10: Innovativeness has a positive impact on young readers' willingness to accept the digital science magazine.

Discomfort refers to the user's concerns about potential problems and difficulties when using new technology, particularly feelings of discomfort or inconvenience during the process [8]. If young readers feel confused or uneasy about using the digital platform (such as complex operations or platform instability), their willingness to accept it may decrease. Based on this, the following hypothesis is proposed:
Hypothesis 11: Discomfort has a negative impact on young readers' willingness to accept the digital science magazine.

Insecurity refers to the user's concerns about the security, privacy protection, and data safety of new technology [8]. Concerns may include issues like privacy breaches and information misuse. If readers are worried about the privacy security or data protection of the digital platform, it may affect their willingness to accept the digital science magazine. Based on this, the following hypothesis is proposed:
Hypothesis 12: Insecurity has a negative impact on young readers' willingness to accept the digital science magazine.
In summary, this study constructs a model to explain the willingness of young readers to accept the digital transformation of science magazines, as shown in the figure.

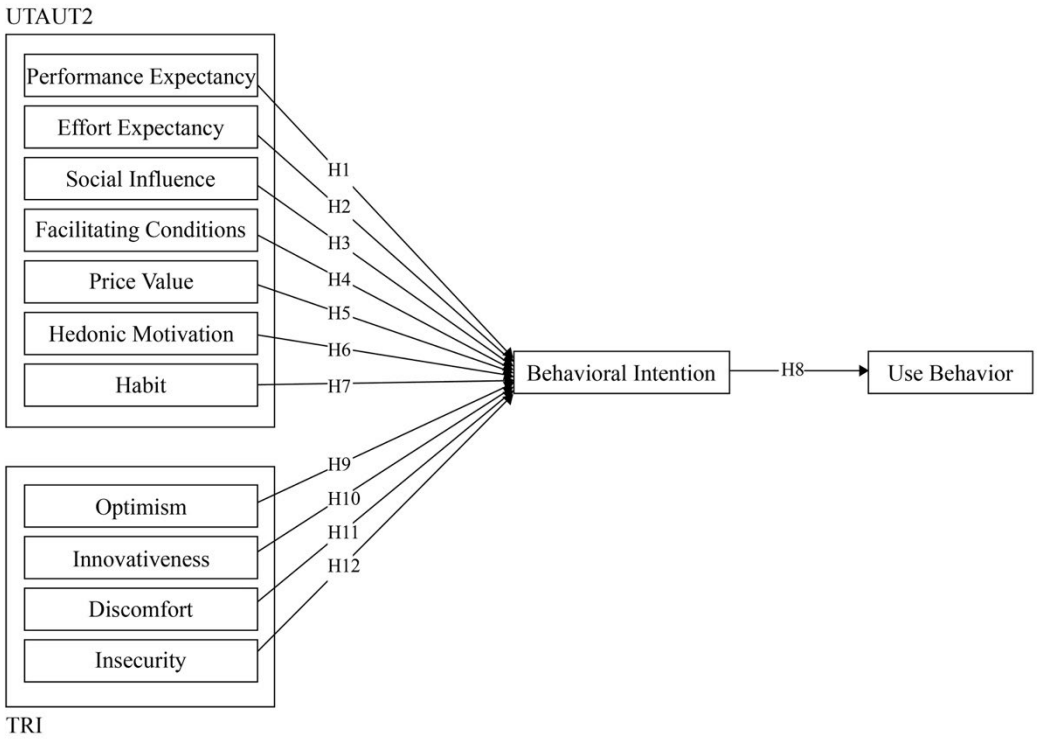

Figure 3. Hypothetical Model of Young Readers' Acceptance Willingness for the Digital Transformation of Nature History Magazine

3. Research Plan and Questionnaire Design

3.1 Research Framework

The research framework of this study consists of three main stages: questionnaire design, data collection, and data analysis.

In the first stage, the questionnaire for this study was carefully designed by combining the UTAUT2 model and the TRI model. The questionnaire is divided into several sections, with each section focusing closely on one specific factor to better collect young readers' willingness to accept the digital transformation of science magazines.

In the second stage, the study plans to collect survey data through both online and offline methods, with the target respondents being young readers of Nature History magazine. For the online portion, the questionnaire will primarily be distributed through social media and digital communities, including platforms like WeChat, Weibo, TikTok, and Xiaohongshu, to collect responses more widely and quickly. The offline collection will involve posting questionnaire posters on university campuses to attract participants. To ensure data validity and coverage, the study will use Tencent's survey platform to distribute the questionnaire to respondents, who will provide feedback based on their willingness to accept the digital transformation of Nature History magazine.

In the third stage, the study plans to conduct comprehensive data analysis using IBM SPSS23 and AMOS23 to ensure the accuracy and scientific rigor of the analysis results. Through in-depth exploration of the data and discussion of the findings, the study aims to draw targeted conclusions and offer recommendations.

3.2 Questionnaire Design

Dimension	Question Item	Question Content	Question Source
Performance Expectancy	PE1	I think that the digital communication channels (such as official website, Weibo, WeChat, Douyin, Bilibili, etc.) of "Natural History" magazine can help me obtain popular science information more conveniently.	Venkatesh [6]; Qasem [10]; Zhang Fangjie [12]
	PE2	I think the digital communication method of "Natural History" magazine can improve my learning efficiency.	
	PE3	I think the content of "Natural History" magazine disseminated through digital means can stimulate my interest in popular science knowledge.	
Effort Expectancy	EE1	I think it is very easy to obtain the content of "Natural History" magazine through digital platforms (such as official website, Weibo, WeChat, Douyin, Bilibili, etc.).	Venkatesh [6]; Qasem [10]; Zhang Fangjie [12]

	EE2	I think it is very simple to search for content through platforms such as Weibo, WeChat, and Douyin of "Natural History" magazine.	
	EE3	I think obtaining the content of "Natural History" magazine through digital platforms will not make me feel confused or overly difficult.	
Social Influence	SI1	My friends recommend that I obtain the popular science knowledge in "Natural History" magazine through digital communication platforms.	Venkatesh [6]; Zhang Fangjie [12]; Qu Linyun [13]
	SI2	I see that many people around me (such as classmates, colleagues) obtain the popular science knowledge in "Natural History" magazine through digital platforms, which has influenced my view of these platforms.	
	SI3	The editors and authors of "Natural History" magazine share popular science knowledge through digital platforms, making me more willing to use these platforms.	
Facilitating Conditions	FC1	I have sufficient equipment (such as smartphones, computers) and network conditions to read the content of "Natural History" magazine disseminated through digital platforms.	Venkatesh [6]; Zhang Fangjie [12]; Qu Linyun [13]
	FC2	I think the digital platforms (such as official website, Weibo, WeChat, etc.) relied on by "Natural History" magazine have extremely high stability. There are very few problems such as lagging and malfunctions during use, always providing readers with a smooth content browsing experience.	
	FC3	I can easily find the relevant resources of "Natural History" magazine disseminated on digital platforms.	
Price Value	PV1	I think the content provided by "Natural History" magazine through digital communication platforms is	Venkatesh [7]; Qasem [10];

		worth the time and effort I invest.	Qu Linyun [13]
	PV2	I think the content provided by "Natural History" magazine through digital communication platforms is of high quality and meets my needs.	
	PV3	I think "Natural History" magazine provides a cost-effective information acquisition experience through digital communication platforms.	
Hedonic Motivation	HM1	Reading the popular science content of "Natural History" magazine through digital platforms makes me feel happy and satisfied.	Venkatesh [7]; Qasem [10]; Zhang Fangjie [12]
	HM2	I feel happy when watching the popular science content of "Natural History" magazine on digital platforms.	
	HM3	I like to obtain the popular science content of "Natural History" magazine through digital platforms with strong interactivity (such as Douyin, Weibo, etc.).	
Habit	HA1	I am already used to obtaining the content of "Natural History" magazine through platforms such as Weibo, WeChat, Douyin, and Bilibili.	Venkatesh [7]; Zhang Fangjie [12]; Qu Linyun [13]
	HA2	I often obtain the popular science knowledge of "Natural History" magazine through Internet media.	
	HA3	Reading the electronic version of "Natural History" magazine has become a part of my life.	
Optimism	OP1	I am optimistic about the digital dissemination of "Natural History" magazine and believe that they can better serve my needs for obtaining popular science knowledge.	Parasuraman [8]; Warden [14]; Na, Tae-Kyun [15]
	OP2	I believe that the content of "Natural History" magazine disseminated through digital platforms will provide more and	

		more learning opportunities and content.	
	OP3	I think "Natural History" magazine can provide me with more convenient ways to obtain knowledge through digital platforms in the future.	
Innovativeness	IN1	I support "Natural History" magazine in using emerging digital communication platforms and innovative technologies.	Parasuraman [8]; Warden [14]; Na, Tae-Kyun [15]
	IN2	I am willing to use the new digital communication platforms or new functions launched by "Natural History" magazine.	
	IN3	I am interested in the innovations of "Natural History" magazine on digital platforms and am willing to experience these new functions.	
Discomfort	DI1	Obtaining the content of "Natural History" magazine through digital communication platforms makes me feel complicated and inconvenient.	Parasuraman [8]; Warden [14]; Na, Tae-Kyun [15]
	DI2	I have encountered technical problems when using the content of "Natural History" magazine disseminated through digital platforms, which makes me dissatisfied.	
	DI3	I am worried that the content of "Natural History" magazine disseminated through digital platforms does not meet my needs or expectations.	
Insecurity	IS1	I have doubts about the authenticity of the content of "Natural History" magazine disseminated through digital platforms.	Parasuraman [8]; Warden [14]; Na, Tae-Kyun [15]
	IS2	I am worried that "Natural History" magazine may disseminate false content through digital platforms.	
	IS3	I am uncertain about the accuracy of the content of "Natural History" magazine disseminated through digital platforms.	

Behavioral Intention	BI1	I am willing to obtain the content of "Natural History" magazine through digital communication platforms (such as official website, Weibo, WeChat, Douyin, Bilibili, etc.).	Venkatesh [6,7]; Qasem [10]; Zhang Fangjie [12]
	BI2	I am willing to recommend to my friends to obtain the content of "Natural History" magazine through digital platforms.	
	BI3	I am willing to continue to use digital platforms to obtain the content of "Natural History" magazine in the future.	
Use Behavior	UB1	I often obtain the content of "Natural History" magazine through digital platforms (such as official website, Weibo, WeChat, Douyin, Bilibili, etc.).	Venkatesh [6,7]; Qasem [10]; Zhang Fangjie [12]; Qu Linyun [13]
	UB2	I often recommend to my friends to obtain the content of "Natural History" magazine through digital platforms.	
	UB3	I will continue to use digital platforms to obtain the content of "Natural History" magazine.	

4. Research Progress and Outlook

4.1 Research Progress

This study aims to explore young readers' willingness to accept Nature History magazine's digital transformation, particularly focusing on its performance and acceptance on digital platforms. So far, the research has completed several key stages:

1. Research Framework Construction and Theoretical Foundation: This study has chosen the UTAUT2 (Unified Theory of Acceptance and Use of Technology 2) model and the TRI (Technology Readiness Index) model as the theoretical framework. These two models effectively explain readers' willingness to accept Nature History magazine's digital dissemination platform and their psychological motivations. UTAUT2 primarily focuses on the multidimensional factors influencing technology usage behavior, while TRI emphasizes users' technology readiness. By combining these two theoretical frameworks, we can better understand the behavior characteristics and acceptance willingness of young readers in the face of digital transformation.

2. Literature Review and Refinement of Research Questions: In this stage, we systematically reviewed the literature in related fields, covering recent advancements in the digital transformation of science magazines, reader acceptance models, and behavioral studies. Through analysis of domestic and international literature, we identified research gaps and innovations, further refining the research

questions. Specifically, we aim to explore which factors influence young readers' willingness to accept and engage with Nature History magazine's digital dissemination.

3. Questionnaire Design and Preliminary Testing: Based on the UTAUT2 and TRI models, the research team designed a questionnaire aimed at young readers. The questionnaire includes dimensions such as performance expectancy, effort expectancy, social influence, facilitating conditions, price value, hedonic motivation, habit, optimism, innovativeness, discomfort, and insecurity, among others. Each dimension includes multiple quantitative questions to measure young readers' willingness to accept Nature History magazine on digital platforms and their psychological motivations.

Currently, the questionnaire has been designed and a small-scale pre-test has been conducted. The pre-test results show that most questions are clear and easy to understand, but a few questions need further optimization. Based on feedback, the research team is adjusting the questionnaire to ensure its comprehensiveness and measurement accuracy.

4.2 Research Outlook

The next steps of the study will focus on the following areas:

1. Formal Implementation of the Questionnaire: After modifying and refining the questionnaire, the study will enter the formal data collection stage. The questionnaire will be widely distributed both online and offline to ensure a representative sample of young readers. Data collection is expected to be completed within the next two months.

2. Data Analysis and Model Validation: Once the data is collected, the research team will use statistical analysis software such as SPSS and Amos to process and analyze the data, verifying the applicability and effectiveness of the UTAUT2 and TRI models in the context of science magazine digital transformation. The relationships between different variables will be explored to reveal the key factors influencing young readers' willingness to accept the magazine's digital transformation.

3. In-depth Analysis and Discussion: Based on the data analysis, the study will delve into young readers' behavior characteristics in digital science magazine dissemination. It will explore how to optimize digital dissemination strategies to enhance Nature History magazine's influence and loyalty among young readers. Additionally, the study will assess the impact of different social media platforms on the dissemination effectiveness of science magazines, providing feasible recommendations for future digital transformations.

4. Writing Research Reports and Papers: As the research progresses, the research team will organize and summarize the data analysis results and write related research reports. We plan to submit the findings to academic journals and conferences to provide theoretical and practical references for the digital transformation of science magazines.

In conclusion, this research will further enhance the understanding of young readers' willingness to accept digital science magazines and offer valuable insights for the innovative transformation of magazine publishing in the digital age.

Developing an Interactive Mental-Mapping Application with Pictographic Representations through Participatory and Co-Design Methods

Robin Coenen

University of the Arts Berlin / Visual Intelligence
*mail@robincoenen.de

ABSTRACT | This X-Format presents an innovative, tablet-based mental mapping application developed to capture young people's spatial experiences across digital, physical, and hybrid environments. Leveraging a drag-and-drop interface with pictographic representations, the application simplifies mental mapping for digitally adept youth. Employing participatory co-design methods, young adults actively shaped the tool through three methods—User-Guided Blueprinting, User-Driven Iconicity, and User-Driven Visual Language—to define its structure, aesthetics, and functionality. A live X-Format demonstration at the conference offers an interactive demonstration of these methodologies, presenting their effectiveness in establishing trust in research processes through Information Design.

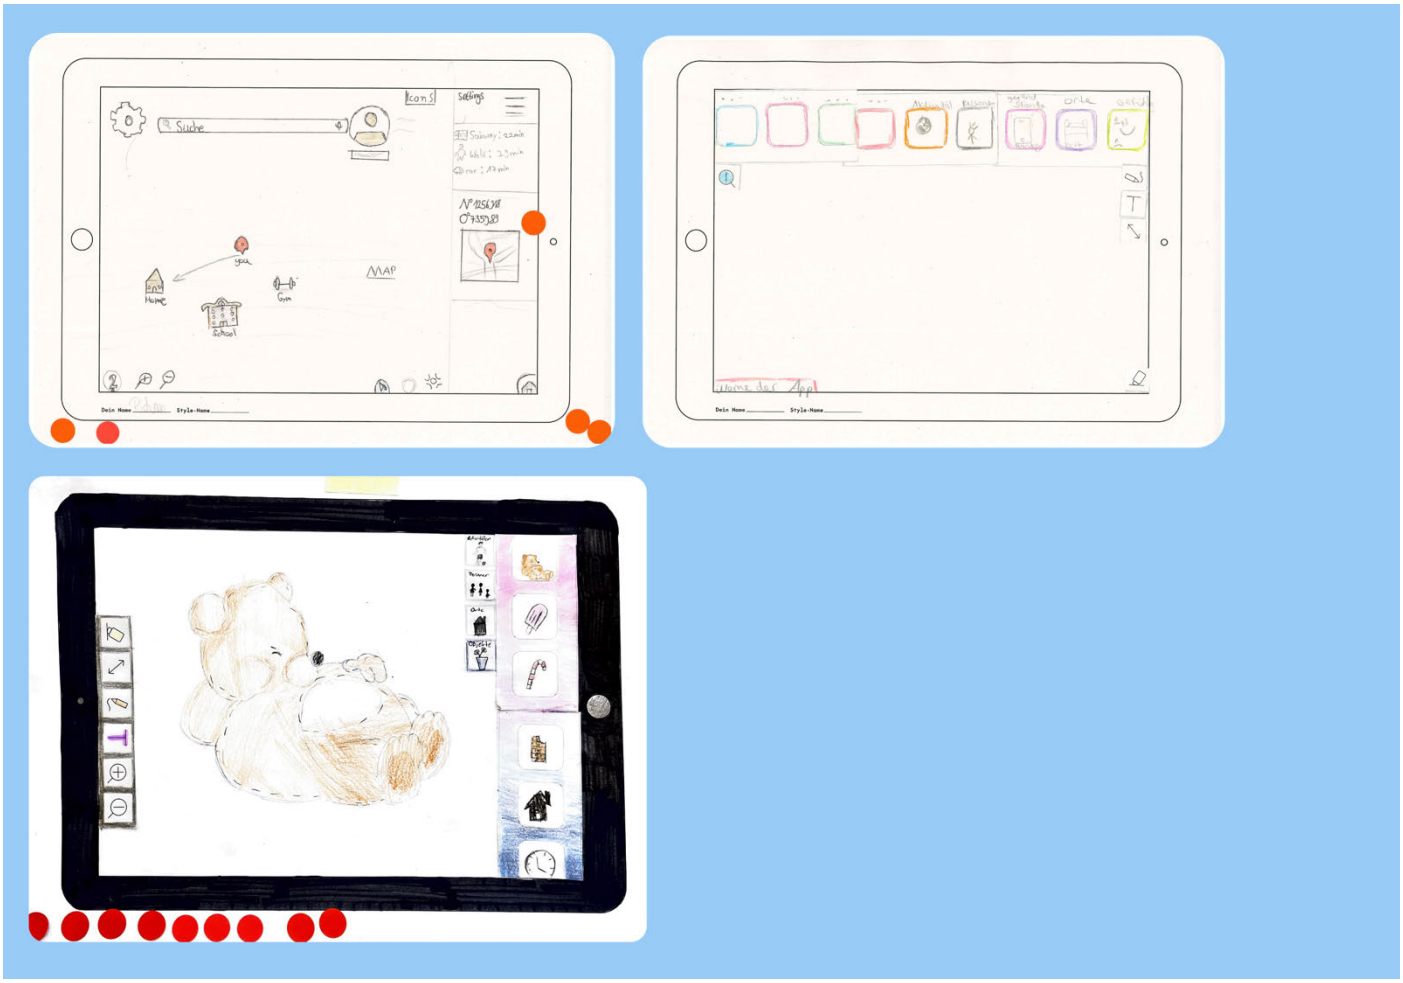
KEYWORDS | information design, trust through co-design, mental mapping, interactive application, participatory design, transdisciplinary

1. Investigating Spatial Perception: Rethinking Mental Mapping

The research project in which this application was developed investigates how young people perceive and navigate the complex interplay between digital, physical, and hybrid spaces. At its core is a mental mapping application designed to capture these spatial experiences, routines, and emotional landscapes of young adults. By integrating traditional mental mapping functionalities with innovative pictographic representations, the application serves as a research instrument that leverages the extensive use of handhold devices by young adults. Rather than requiring participants to produce detailed drawings as in conventional mental mapping research, this approach allows them to simply drag and drop elements to express their spatial understandings. Given that young people are technologically adept, this method comes naturally, potentially enabling them to map not only their physical surroundings but also include the digital spaces they inhabit. A further advantage of this digital-first approach is that, in addition to the qualitative data (the mental maps), it also generates quantitative data—such as timestamps, spatial relationships among pictograms, and precise positions on the canvas— which additionally can be included in the analysis process.

2. Co-Creation Methodologies: Empowering Young Adults through Participation

Central to our methodology is the use of participatory and co-design methods, which not only enhance the relevance of the mental mapping application but also build trust between researchers and participants. Rather than positioning young people as passive subjects, we engage them as active co-creators in the research process itself.
Three primary methods underpin our co-design process: User-Guided Blueprinting, User-Driven Iconicity, and User-Driven Visual Language.
In the User-Guided Blueprinting phase, participants contribute to the structural design of the application, helping to identify key functionalities and organize spatial categories that reflect their lived experiences. The focus then shifts to User-Driven Iconicity, where participants evaluate different levels of iconicity to determine which representations most effectively capture the nuances of their surroundings. This process also involves deliberate exploration of how gender and various socio-political backgrounds should inform the design of these icons. Finally, through User-Driven Visual Language, participants influence aesthetic aspects such as color schemes, typography, and overall branding, ensuring that the application is both functional and engaging. The here presented methods were implemented with young adults in Berlin and Lima.



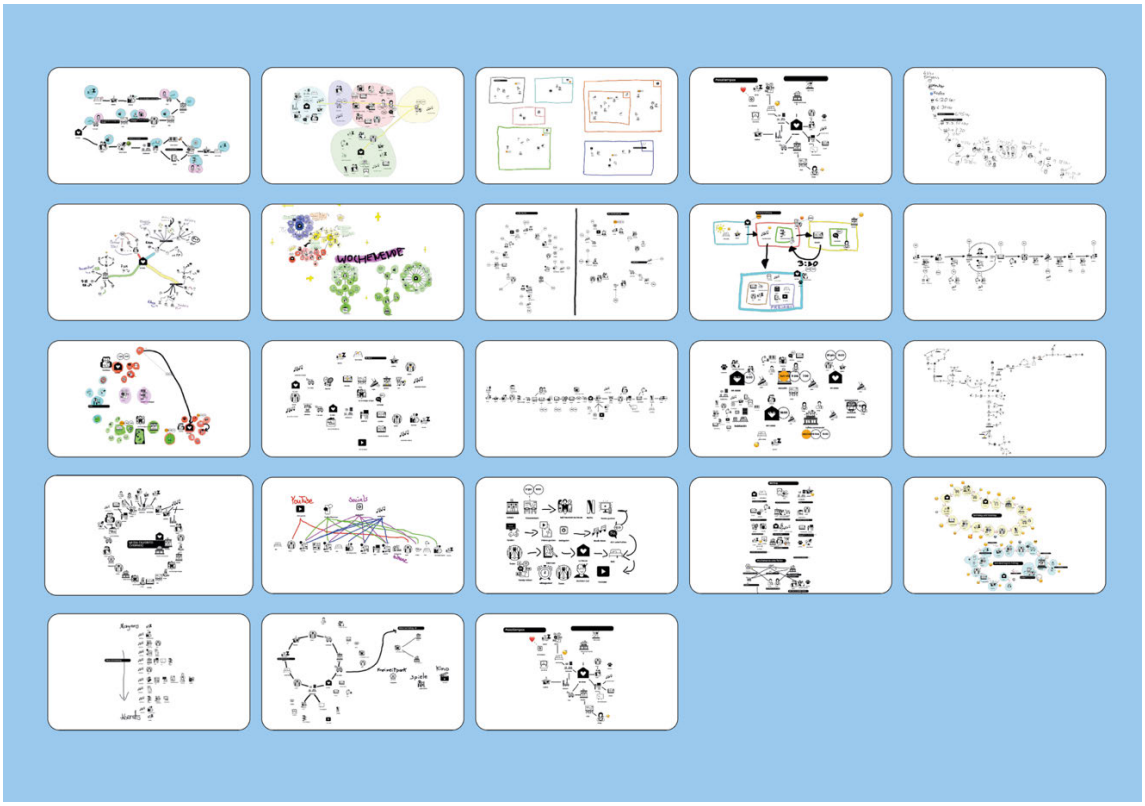
Developed Methodology for participatory User Guided Blueprinting, structuring the Apps visual and content structure, including needed functionalities, ux and ui design and spatial categories.

3. X-Format Engagement: A live Demonstration of Co-Creation

In our conference X-Format session, we will mirror and demonstrate these co-design methods through an interactive workshop. This 30–45-minute session will simulate the full spectrum of our participatory approach. The workshop will begin with a rapid blueprinting exercise, where participants sketch and discuss the fundamental components of a mental mapping tool, highlighting the spatial elements most significant to them. Following this, the session will transition to an iconicity and representation test. Attendees will examine different levels of iconicity, assessing which visual forms best capture their perceptions of space, and they will deliberate on how factors such as gender and socio-political backgrounds should inform the design of these icons. Finally, participants will engage with a live demonstration of the mental mapping application, using it to create their own maps in real time. This hands-on experience not only illustrates the practical application of our co-design methods but also reinforces the trust and collaborative spirit essential to the research process.

Impression of the final Application completely designed through a participatory and co-designed methodologies.

By integrating participatory design with an engaging, interactive format, our approach redefines the relationship between research and its participants. This X-Format session serves as both a demonstration and a call to action for more inclusive, user-driven information design methodologies in research processes.



Selection of created Maps from young adults, showing diverse diagrammatic representations (networks, diaries, matrixes). For anonymity reasons, these maps are only shown as small thumbnails.

CONSPIRACY FICTION AS A TOOL FOR CRITICAL THINKING. DESIGNING EMBODIED NARRATIVES BASED ON CONSPIRACY THEORIES TO REFLECT ON CONTEMPORARY ISSUES AND COMMUNICATION DESIGN.

Martina Esposito[a], Francesco E. Guida[b], Enrico Isidori[a], Claudia Tranti[b]

aSchool of Design, Politecnico di Milano

bDepartment of Design, Politecnico di Milano

ABSTRACT | Conspiracies are a form of narrative, and each piece of information is also, in part, a form of narration. Stories are a fundamental part of culture and our way of perceiving reality. As stated by Harari, humans "are the only species with the ability to use language—not just to describe things we can see, taste, and touch, but also to invent stories about things that don't exist" (Gallo, 2024). Storytelling permeates every aspect of daily life and is used as a tool to give meaning to products, services and experiences. This phenomenon extends to the news, where the boundaries between facts and storytelling are more blurred than ever. Communication is largely driven by social media platforms, which have fragmented the information landscape. Informing has become a participatory practice: news and opinions are shared widely across many platforms, often leaving people struggling to make sense of events and phenomena.
Originally designed for entertainment, social media platforms now host all forms of communication. However, the way these platforms are built favours the content that answers their original purpose. Information has evolved in the form of opinions and storytelling to adapt to the algorithms. In this environment, conspiracy theories thrive.
The trust in the sources of information is dramatically low. The news volume and the speed at which they travel make verifying the sources increasingly difficult. In Italy, only a third of

news readers report trusting the media, reflecting deep scepticism toward information channels seen as driven by political or commercial interests (Reuters Institute for the Study of Journalism, 2024).
Communication designers need to be trained to operate in such a complex landscape. Our proposal presents the aims and results of a Communication Design Studio at the Bachelor level in Politecnico di Milano. Students were asked to research conspiracy theories and craft a project that would make the effects and consequences of these beliefs tangible and real.
The studio consists of shaping a scenario in which the conspiracy theories are found to be true, followed by the design of a fictional brand and an interactive experience revolving around a prototype set within the scenario. The studio aims to develop communication design ecosystems within an anti-disciplinary approach, adopting a speculative design framework.
Students are prompted to discuss the role of communication and interaction design in building public trust. The topic of conspiracies is a tool for reasoning about the ethical dimension of storytelling and their responsibility as communication designers. The projects aimed to challenge preconceived opinions and instil self-doubt in the viewer, fostering a critical attitude that encourages deeper engagement with the complexity of issues.

KEYWORDS | CONSPIRACY, COMMUNICATION DESIGN, SPECULATIVE DESIGN, INTERACTION

1. Introduction

Nowadays, society is asked to tackle new political, environmental, and social issues, which are not only complex to understand, but also feel unprecedented to a vast majority of people. The idea that we are living in the “darkest timeline” or just the “wrong timeline” has gained increasing popularity within online communities, and can be interpreted as a sign of a wider feeling of uncertainty and distrust towards national and international authorities (Salvia, 2022).
With the weakening of previously trusted authorities and what they claimed as true, the ontological nature of “truth” itself has been questioned. As Harari (2024) states:

> ‘Truth’ is understood as something that accurately represents certain aspects of reality. […] Truth and reality are nevertheless different things, because no matter how truthful an account is, it can never represent reality in all its aspects.

If reality can’t be grasped by any form of truth, information can be completely unrelated to both truth and reality:

> What the example of astrology illustrates is that errors, lies, fantasies, and fictions are information, too. Contrary to what the naive view of information says, information has no essential link to truth, and its role in history isn’t to represent a preexisting reality. Rather, what information does is to create new realities by tying together disparate things […]. (Harari, 2024)

The “naive view of information” can be a risk, as people tend to believe that, by gaining more information, they will eventually reach some form of truth. However, the overwhelming flow of contrasting information in the era of digital communication is the proof that opposite theories about the same topics can not only co-exist, but also feel credible and true to digital and traditional media users.

> It’s not only a matter of an unhinged circulation of news, an increased amount of

> information that we are subject to and our difficulty in processing a flow of events that nowadays runs at increased speed. The feeling, if anything, is an impression of a qualitative change. Only a few years ago, it seemed to us that the world still made sense. Today it doesn't make sense anymore. The result is that, at this point, we are not even sure if this sense ever existed. (Salvia, 2022)

This feeling of confusion and disorientation regarding the information provided by media, can be further analysed through what Byung-Chul Han (2015) defines as "Transparency Society". Transparency is a fundamental trait of the contemporary digital world, in which anything is manifest, easily accessible, already revealed. Transparency is then distant from both truth and knowledge, which must be searched and unveiled. From this point of view, digital media contributed to a weakening of true/false and good/evil dichotomies, which were previously set by the dominating narrative: this weakening is an opportunity for new and old counter-narratives to flourish, and for contradictory elements within these theories to exist.
Social media also act as an echo chamber for such theories, as people have constant access to information that reinforce their beliefs (Hood, 2023).
Moreover, in this historical moment, western society lacks a single "source of truth" as the authorities we relied on after WWII have become decreasingly influential and their narrations lack the credibility they had before, whether true or not. As stated by Reuters Institute for the Study of Journalism (2024) in their Digital News Report: "[…] across the world, much of the public does not trust most news most of the time."
The trust in the sources of information is dramatically low. The amount of news and the speed with which they spread make source verification increasingly challenging. In Italy, only one-third of news consumers report trusting the media, highlighting widespread skepticism toward information channels perceived as being influenced by political or commercial interests (Reuters Institute for the Study of Journalism, 2024).

The weaknesses, contradictions, and injustices of our society are now exposed, as they are no longer covered by a dominating source of truth. In this context, no matter how intricate or unbelievable conspiracy theories may appear, to a certain degree, they always address worries that are related to real, tangible issues.

> If we don't settle for a mere debunking, if we actually listen, we find not only seeds of truth, but also warnings towards real dangers that loom over us. (Wu Ming 1, 2023)

The popularity of conspiracy theories rises when people, instead of relying on official and rational explanations for their worries, tend to believe in narrations that feel more epic, despite them not being sufficient to explain extremely complex problems. The need for engaging narratives, together with the decreasing popularity of journalism, politics and other traditional "sources of truth," caused a viral diffusion of conspiracy theories and counter-narratives. As stated by Bianchi (2021):

> At the basis of every conspiracy theory, in fact, there is the idea that historical processes are the result of a perfect causal concatenation of events: something that can be planned from start to finish. […] However, as psychology has demonstrated since Freud, in many cases we don't even really know what we want and we often behave in a completely irrational way. […] As sociology and political science have long pointed out - social systems are complex, which sometimes generate unpredictable and unexpected situations.

2. Before Misinformation: The Narrative Structure of Conspiracy Theories

Every conspiracy theory is based on the idea that historical processes derive from a perfectly orchestrated causal sequence, magnifying intentionality beyond measure. Everything unfolds by meticulously following the conspirators' plans as if history were completely manoeuvrable by human beings (Bianchi, 2021). Psychology, however, teaches us that, as human beings, we often act in deeply irrational ways. Similarly, sociology and political science have long pointed out that social systems are inherently complex, capable of generating unexpected and unpredictable events that "have a life of their own and generate consequences that no one expected" (Butter, 2020).
To understand conspiracy theories, distinguishing between "complicated" and "complex" systems is necessary. A complicated system is characterized by a concatenation of simple events, which are consequential to each other; in contrast, a complex system is composed of elements that coexist without immediate and predictable relationships (Bertalanffy, 1968). Conspiracy theories tend to reduce the complexity of reality to a complicated, linear structure, offering seemingly coherent explanations but ignoring the unpredictable nature of social phenomena. In general, the conspiracy has the form of an articulated storyline, cum-plicated, with folds. In contrast, the nature of an event is cum-plexus, with plexuses, which are parts of a whole interacting with each other (Fig. 1). Thus, we have at the base a complex system in which events happen and a complicated narrative superstructure, that is essentially linear and accessible, but convoluted. As mentioned earlier, the conspiracy always arises from one or more real events, builds on a point of contact with reality, and builds a narrative that rests on itself.

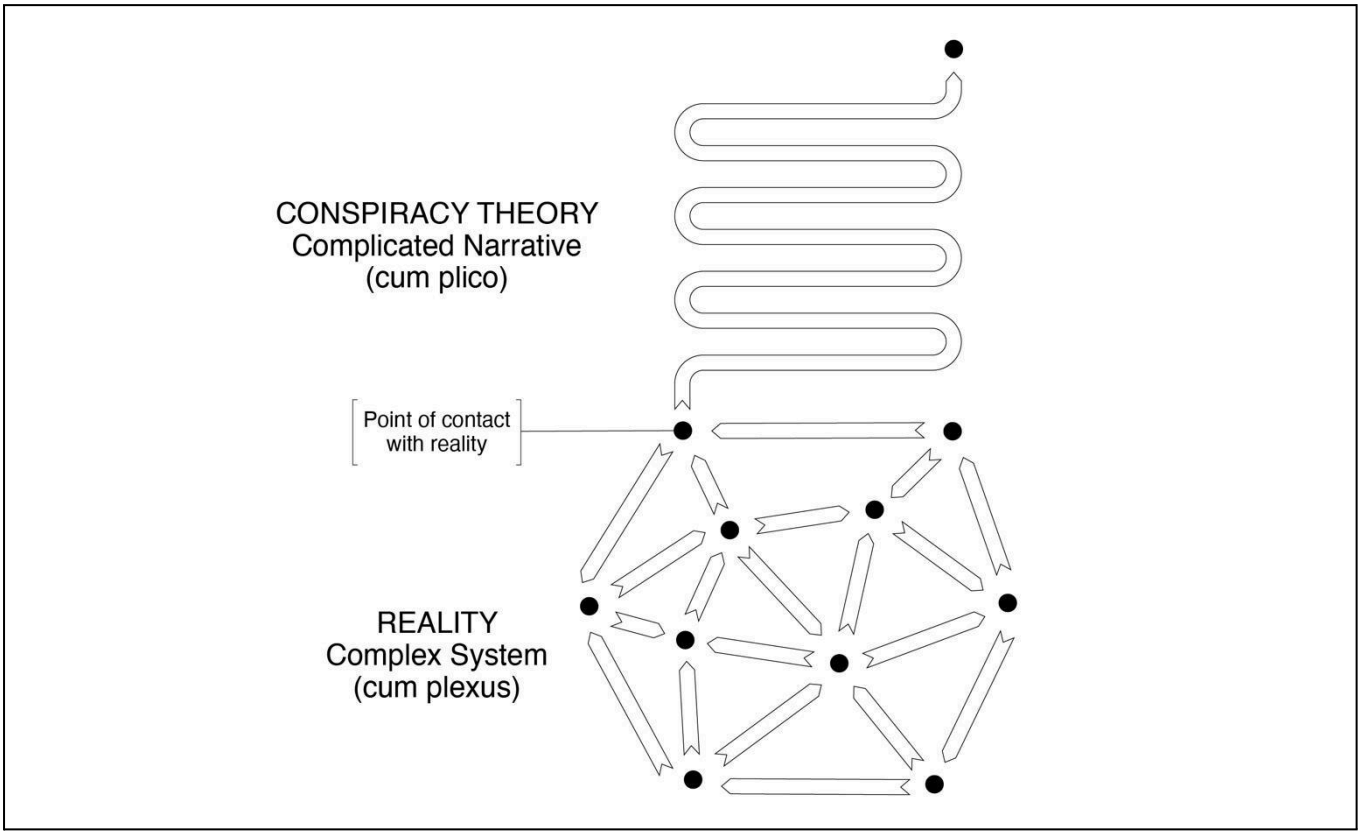

Figure 1. Conspiracy as a complicated narrative and reality as a complex system. Conspiracy structures do not take into account the complexity of reality but repurpose a narrative complication (authors, 2025).

Delving into a phenomenon's complexity offers a less compelling story, requiring more critical thinking and cognitive effort. The ease of thinking that goes with complicated narratives allows a free association of ideas, creating a narrative flow that seems natural and intuitive. Daniel Kahneman (2011) describes this phenomenon in his book "Thinking, Fast and Slow," where he distinguishes between "fast thinking" (intuitive and automatic) and "slow thinking" (analytical and deliberate). Conspiracy theories fit neatly into the first system: they are easy to understand and offer satisfactory answers to complex questions. It is important to note that the conspiracy theorists are not reductionists, people who simplify reality. On the contrary, they tend to possess vast information, but they associate it in a completely arbitrary way. Conspiracy theorists complicate reality, generating intricate and articulate conjectures and stories.

> Conspiracy theories - feverishly creative, meticulously concocted - are, in fact, fictional stories that some people believe with conviction. Proponents of conspiracy theories link real data and imaginary data into a coherent and emotionally rewarding version of reality. [...] They fascinate us because they tell compelling stories with the classic problem-based structure and a clear definition of good and bad guys. They offer bleak and sensational plots that are easily transformed into exciting popular entertainment. (Gottschall, 2013)

Gottschall (2013) points out how each individual possesses, to some extent, a kind of "inner Sherlock Holmes." This mental mechanism has the function of retroactive reasoning from present observations, identifying possible causes of the observed effects. This evolutionarily adaptive narrative capacity allows people to perceive reality as an ordered system with meaning, avoiding being overwhelmed by chaos. The narrative mind, however, is allergic to uncertainty and constantly seeks meaningful patterns in the external world; if it cannot find them, it tends to impose them.
Thus, conspiracy theories are, before being disinformation, attempts by conspiracy theorists to construct a coherent narrative in a fragmented world; they are not a mere simplification of reality but a more satisfying complication.

3. Worlds Within Worlds: The Role of Communication and Speculative Design

As information systems provide an increasingly fragmented view of reality, the role of communication in building public trust through clear and cohesive narratives becomes crucial.
Narratives are an essential dimension of communication design and our way of understanding and experiencing the world. "As Immanuel Kant pointed out in 'The Critique of Pure Reason', if there is an objective reality, it is unknowable. All we can know is the reality we construct. That reality takes the form of a story" (Wilson, 2005).
Stories shape our experience of the world and define how the world exists for us. Through a communication system, it is possible not only to express a point of view on reality but also to create an alternative version of it, imposing new order and meaning on some of its elements. This set of meanings can be defined as a narrative, a value system, or a world.
As Ian Cheng (2024) states, "A world allows one to live in a different world than we would in the chaos outside. A world creates consensus about what is relevant. A world assigns meaning to certain actions within it." A world is therefore a system within another world, governed by laws and values that are coherent and valid therein.
Within the C1 Final Synthesis Studio of the Communication Design course at the School of Design, Politecnico di Milano, students are invited to create worlds within worlds —

narratives to critically reflect on the complex challenges facing our society.
Communication design obviously plays a role in these relevant issues, however, traditional design methods alone can't entirely grasp them.

> To address such problems it is necessary to adopt a transdisciplinary approach, capable of overcoming the separation between natural sciences, social sciences, and the sciences of the artificial, outlining the profile of a designer whose task is to select results from heterogeneous disciplinary fields in order to reveal analogies and isomorphisms, activating a transdisciplinary circulation of concepts. (Pizzocaro, 2000; Scagnetti et al., 2007)

The methodological approach of the Studio draws from the practices of speculative design, a branch of design that engages with complexity through a process "that implies to cope with wicked problems, where the goals are uncertain and the solutions are many and sometimes at odd." (Scagnetti et al., 2007).
With its critical and provocative stance, speculative design enables the exploration of crucial issues in contemporary society, which are deeply embedded in our daily lives.
By constructing scenarios set in hypothetical futures or alternative presents, students tackle topics such as climate crisis, loss of privacy, and institutional power—complex challenges that do not offer immediate or definitive solutions.
The complexity of these themes and the impossibility of finding meaning or logic in such central yet ordinary questions become fertile ground for the emergence of conspiracy theories. As Mattia Salvia (2021) writes in the introduction to the issue of "Iconografie" magazine titled "Apparenze. Sulle estetiche del complottismo":

> The general point, of which I am convinced, is that conspiracy theories are a kind of wunderkammer that contains the paroxysmal expression of the spirit of the times — the zeitgeist, which is indeed the title of a famous conspiracy documentary — of society.

There is a very tight relationship between the forms taken by conspiracy theories over time and the vulnerabilities of the period in which they developed.
Addressing this theme means immersing oneself in stories constructed to cope with the dramas of current historical reality — narratives that seek to provide answers to otherwise unsolvable questions.
The topic of conspiracy theories provides an important opportunity to examine the ethical role of stories and communication design in shaping our understanding of the world and our approach to such central and complex issues. As creators of narratives through communication systems, designers need to reflect on both the power and impact of the stories they create and those that surround them, developing a responsible and ethically aware stance towards their profession.

4. Final Synthesis Studio Design Methodology

The brief of Final Synthesis Studio C1 2024/2025 was to build a speculative scenario where a particular conspiracy theory is considered true. Within this scenario, students must build a communication design project that can indirectly communicate this world.
Eleven themes were selected from the proposals individually identified by students during an initial research phase. These themes include: *Moon Hoax* (the belief that the Moon landing was a historical fabrication), *Birds Aren't Real* (the theory that birds are actually surveillance drones), *Reptilian Theory* (the idea that alien elites live among us in disguise to manipulate humanity), *Tinfoil Hat* (a supposed method of protection against

mind-control waves), *Water Fluoridation* (the belief that fluoride in drinking water is used to degrade cognitive abilities), *VIP Island* (the theory that celebrities believed to be dead are actually alive and hidden on a secret island), *Project Blue Beam* (a conspiracy about a staged global event to establish absolute control), *Mandela Effect* (the idea that collective false memories stem from parallel realities), *Rubber Fruit* (the belief that synthetic or chemically altered fruit is used to poison people), *Plandemic* (the claim that global pandemics are deliberately orchestrated), and *Voting Pencil* (the suspicion that pencils provided in polling stations are rigged).

Students worked in teams of five to six people, in which each member took on a specific role based on their skills and interests. After being assigned a theme, they explored and deconstructed its narrative through in-depth research and critical analysis. They then created a fictional brand that could plausibly exist within the chosen scenario, applying the knowledge and expertise gained during years of study. Building on this foundation, they developed a core concept and a communication strategy, which they then translated into a multidimensional and multichannel execution by selecting relevant media and touchpoints. The identity ecosystem revolves around a product or object proposed by the fictional organization or company: the *Communicative Machine*.
Communicative Machines are prototypes that serve as the linchpin of immersive narratives. By functioning as a kind of narrative catalyst, these interactive devices invite users to engage with fictional worlds. According to Mitrović (2016), these diegetic objects have the power to materialize narratives, allowing users to suspend their disbelief and fully immerse themselves in the story. Beyond their role as entry points into fictional realms, Communicative Machines can also be seen as "provotypes" – design artefacts that provoke reflection and discussion among diverse stakeholders (Casnati et al., 2024; Boer & Donovan, 2012). This concept underscores their capacity not only to entertain but also to stimulate critical thinking and dialogue. Furthermore, these machines are part of a broader communication ecosystem that includes touchpoints designed to provide users with a comprehensive understanding of the narrative universe. These communication ecosystems form narrative systems, comprising touchpoints, artefacts, and interactive devices.

In developing *Communicative Machines* during the prototype-making phase, students delve into tools such as Arduino alongside coding environments to interactively engage with technological processes — a practice highlighted by Lukens and DiSalvo's (2012) emphasis on integrating technology for enhanced fluency. The goal here is not specialization but acquiring literacy across various toolsets; understanding which methods best translate concepts into tangible artefacts through appropriate mediums like print or code-based platforms (Cangiano, 2016).
Coding and prototyping intersect with communication design and visual systems, fostering work that moves across domains. Instead of adhering to fixed categories, students approach communication design as a space of convergence. Bernstein (2011) highlights how working with technology often requires crossing disciplinary lines. A speculative design perspective leads students to explore media and tools beyond standard methodologies, enabling them to experiment with techniques and references from diverse fields (Mitrović, 2019). Lukens and DiSalvo (2012) describe speculative design and technological literacy as inherently cross-disciplinary, framing design as an ongoing process of inquiry and integration.
This process follows an evolving, anti-disciplinary model that moves beyond structured methodologies. Rather than assembling multiple disciplines, it draws fluidly from different areas (Childress, 2016; Brin, 2016) and resists fixed specializations. This approach shifts from solving predefined problems to framing new questions (Blauvelt & Davis, 1997). In this process, iteration is fundamental, allowing students to work within areas where expertise is

still forming. Prototyping progresses from initial exploration to refined development through hands-on engagement. This aligns with the concept of "thinkering" (Antonelli, 2011), where understanding emerges through direct interaction and repeated refinements. Trial-and-error cycles inform each stage, from ideation to completion, reinforcing an adaptive design process (Berglund & Grimheden, 2011).

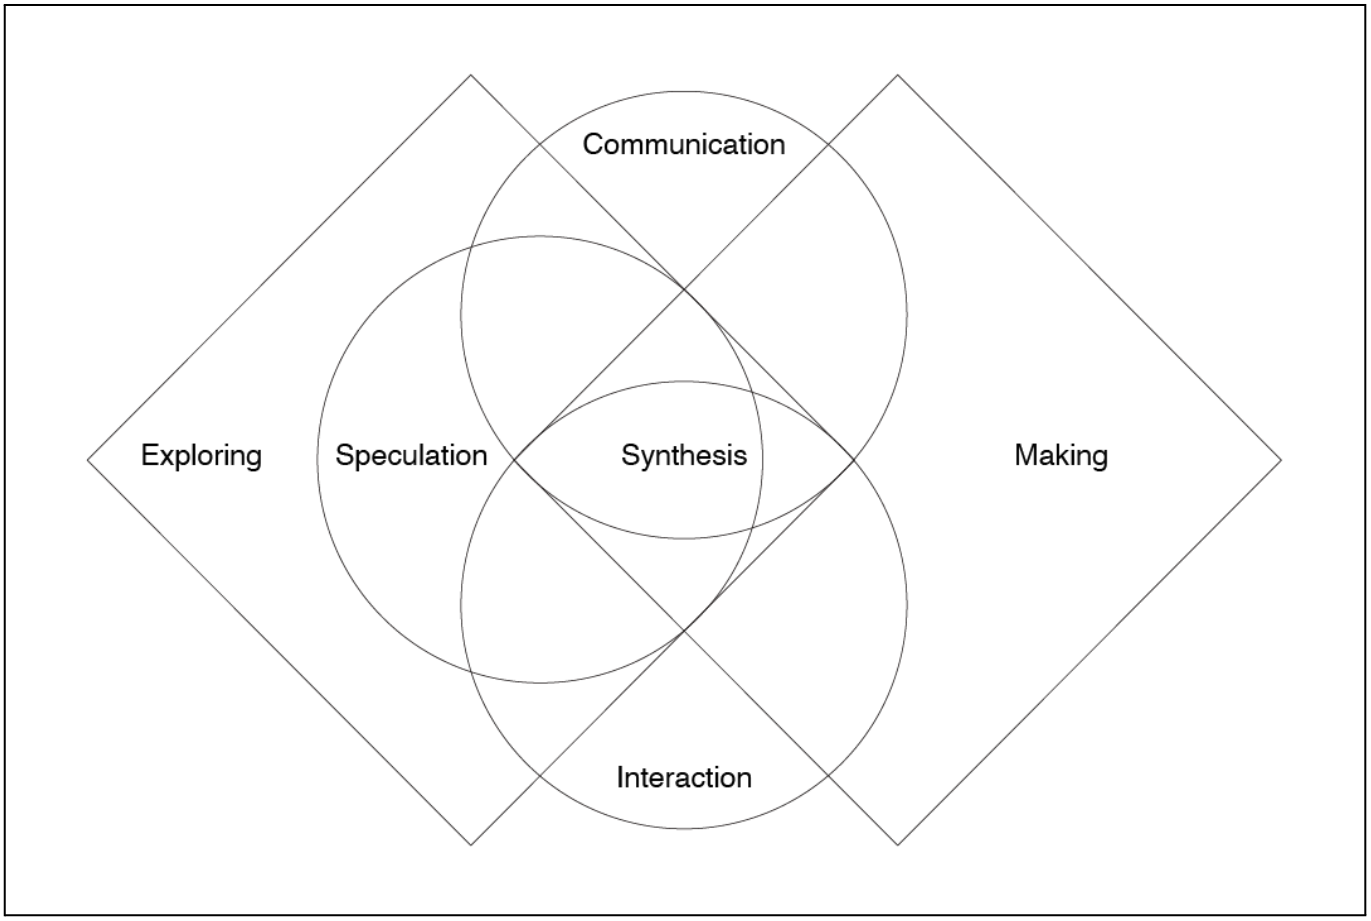

Figure 2. Speculative Overlapping Double Diamond (authors, 2023).

The learning-designing process can be summarised in five main parts, two overlapping phases crossing three design areas, as it is in the Speculative Overlapping Double Diamond model (Fig. 2):

- Exploring: the phase of research on the assigned subject.
- Speculation: scenario building, what if, concept definition, narrative.
  Communication: from concept to visual identity, defining a communication strategy into and out of the narrative.
- Interaction: definition of the prototype's main functions and the experience's user journey, considering all the touchpoints consistently to the communication strategy.
- Making: the phase of building and verifying the prototype through progressive refinements.

The overlap of the various phases and areas, defined as Synthesis, is indeed the moment of transformation into key intermediate project outputs. In the central area, where the

exploration gradually stops (converging) and the making begins (diverging), the project's genesis occurs. The field represents the transition from definition to development. The central Synthesis overlap merges into a Define-Develop phase.

In this design framework, conspiracy theories as a design tool represent an unconventional approach to stimulate critical debate. As mentioned, students are invited to create fictitious brands and *Communicative Machines* based on conspiracy theories to explore the narrative and emotional dynamics that make these stories so persuasive. This process does not aim to perpetuate misinformation but to deconstruct it, highlighting the inner workings and social implications. Through this approach, conspiracy theories become tools of provocation: they pose questions and invite students to think critically about the underlying issues. The project ultimately becomes a generator of uncertainty.

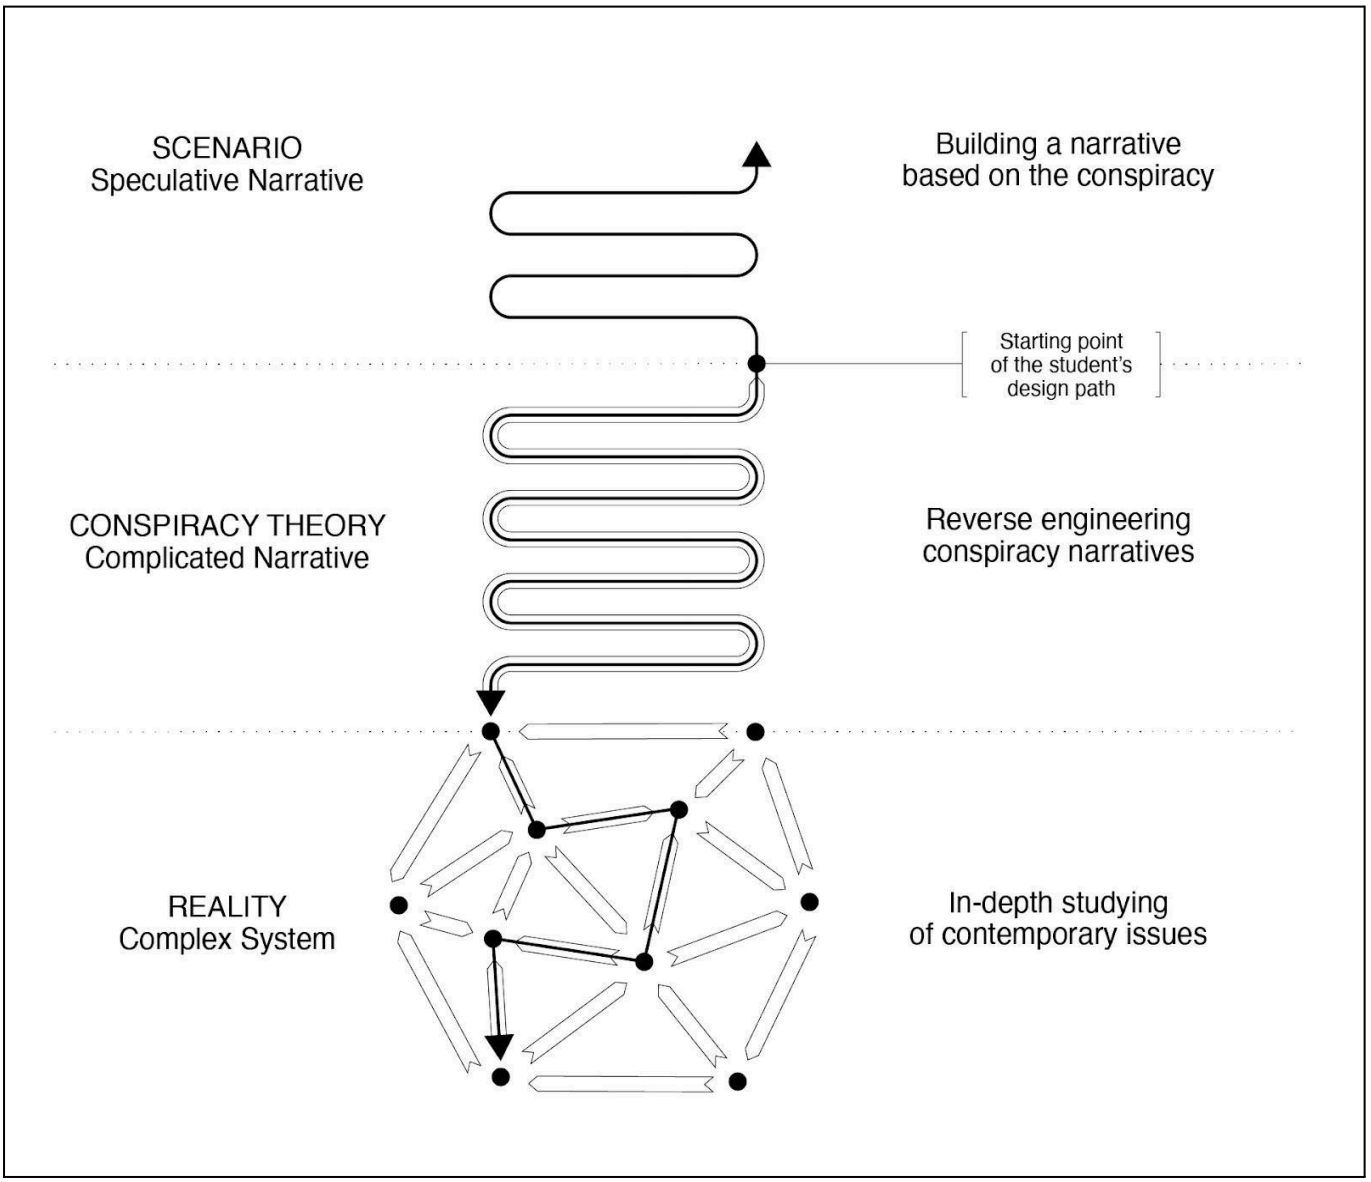

Figure 3. Student's design process path made during the 2024/2025 Final Synthesis Design Studio C1: starting from the analysis of the conspiracy narrative, through the study of the problematics it brings out, to the construction of a speculative scenario.

In summary, during the studio, students embark on a backward design journey (Fig. 3), starting with the plot to analyze and understand its narrative structure through the reverse engineering process. This approach leads them to examine and deepen the system of

matters that the conspiracy brings to light, both as a communicative phenomenon and as a manifestation of the tensions and issues from which it originated. Finally, once the narrative mechanics of the conspiracy are established, a speculative scenario is built upon it by integrating logic from the theory into the design output. The aim of this exercise is to provide the students with the tools to analyse these narratives, developing a critical approach that allows them to distinguish between the initial complex issues and the convoluted responses given to them.

5. Selected Design Results

To understand how the vision of the Studio has been re-interpreted by the students, the following paragraphs briefly describe a few projects from the 2024/2025 Final Synthesis Design Studio.

The first project is based on the so-called Plandemic, a conspiracy theory that argues that the COVID-19 pandemic was not entirely accidental and that the virus may have been deliberately released or manipulated to achieve broader goals, such as increasing control over populations or pushing specific political agendas. The project consists of a conspiracy theory within a conspiracy theory: the group of hacktivists ANTI-STREAMING ARMY discovers that the pandemic was planned by the Digital Content Consortium (D.C.C.), a powerful lobbying group representing the world's largest streaming platforms. Their investigation reveals secret communications between the D.C.C. and influential institutions, pointing to their role in exploiting the pandemic to earn new subscribers and increase their profits, cementing their dominance over global media consumption. The hacktivist group decides to reveal their knowledge by broadcasting the content of encrypted messages found by analyzing frames from popular streaming content. From billboards in city squares to digital ads on major websites, the group of hacktivists takes over these communication channels and replaces their content with the truth about the pandemic. Citizens are then invited to build themselves a digital tool that enables the detection of hidden messages within movies and series hosted by the most popular streaming platforms: the ANTI-STREAMING ARMY provides all of the instructions to create this device and keep spreading the truth.

This project is a fine example of the research and design process promoted by the Studio: deconstructing the conspiracy theory, understanding its logical connections, to recreate a new narrative that takes a critical stance. The students highlighted the social issue that gave rise to the conspiracy theory in the first place: the fear and suffering related to the period of the pandemic, but they also took into consideration the inevitable reliance that people had on entertainment to carry on (Fig. 4).

Figure 4. Anti Streaming Army (2025). E. D'Ancona, G. Ferrari, F. Morsia, F. Pecorari, M. Pina, F. Zannoni.

A different take on criticism towards contemporary means of communication can be seen through guMMM: a project that starts from the conspiracy theory of rubber fruits—which is the belief that, in the US, some fruits are fake or filled with rubber. By choosing this theory that spread through TikTok and Instagram, the students propose a reflection on the manipulative power of digital communication tools on influencers and users. This

conspiracy theory has in fact been born through videos and images of fruit that looks and behaves like gum, shared by common social media users and the students imagined that an actual brand took advantage of this viral phenomenon by sending gummy fruits: a remark on the predominance of the images through digital means of communication, which often blend the boundaries between imagination and truth.

Figure 5. guMMM (2025), E. Bonaiuti, L. Collaviti, J. Pace, M. Quendoz, A. Ragazzo, R. Villanueva.

guMMM is a brand that, with a funny yet bold tone of voice, produces and sells rubber fruit to assess the performance of influencers on TikTok. guMMM's products include rubber fruits of various types—bananas, mangoes, and watermelons—that are sent to influencers, who must demonstrate and prove their skills in manipulating objects and showcasing their characteristics. The more they stretch and bend the fruit, the higher their score will be. After the influencer creates a promotional video manipulating the fruit, the experience concludes with the final ranking of the best TikTokers (Fig. 5).

Figure 6. Habit System (2025), E. De Beni, G. Galenda, A. Parente, A. Santocchi, G. Stanziano.

Other critical aspects of contemporary society, which involve a lack of privacy and lack of representation within politics, have been analysed in the project Habit System. Starting from the conspiracy theory of voting pencils—which argues that votes expressed through a pencil are too easy to manipulate and that there is no value in voting within a corrupt system—Habit System proposes a complete overhaul of the voting method.
The new voting system is based on the recording and processing of data related to the daily actions of citizens, including those in the digital sphere. Every choice—such as purchases, media consumption, participation in public events, and other activities—is tracked through a vast network of electronic devices and digital platforms that collectively determine a vote for one of the two parties that make up the new political landscape: the Conservative Party and the Progressive Party.
There is no separation between the moment of voting and everyday life: the political result becomes a constant and accurate reflection of citizens' habits. Voting becomes a direct and unalterable expression of people's real needs, a dynamic process that evolves with society itself.
In a historical moment when voter abstention is increasing year after year, and people place more trust in CEOs than in governments (Elkind, 2021), changing the voting method would represent a true revolution. The project reflects on the issue of lack of privacy and data collection by companies and governments, using these concerns to raise awareness about abstention and the lack of political representation. Byung-Chul Han (2021), reflecting on these topics, asks himself if democracy and traditional forms of voting still make sense in a society that lacks a public sphere of dialogue, where isolated digital citizens are not able to create an actual common ground for a shared ideology (Fig. 6).

6. Conclusions

The experience at Final Synthesis Studio C1, with its speculative approach, led students towards the deconstruction and reconstruction of conspiracy theories' narratives. At first, students entered the world of their conspiracy theory, then they identified the characteristic elements, and eventually, they extended that world through a variety of communication artefacts.

Apart from the research and design process that has been carried out by the students inside the classroom, the aim of the studio is also to show the projects to external observers. In fact, after the end of the studio and after the projects have been evaluated by the teacher and assistants, an exhibition is usually organised to let the students themselves show their projects to the public. This year, this confrontational moment is even more significant as it brings back to the public the narrations that have been born outside the academic context. The students will be able to reflect on their projects and how they are received by the public; the observers will have the chance to experience a new point of view on some narrations they probably already know about.

It's not the Studio's role to define what is true and what is not, however, it serves as an invitation for both students and observers to avoid accepting any narrative as is; to have a critical approach enriched by the tools of speculative design. Avoiding misinformation and the spread of fake news is a crucial topic of our time, however, the tools of debunking and "prebunking" have often proven to be ineffective (Bianchi, 2021).

The psychologist Jovan Byford (2020), who has been studying conspiracy theories for twenty years, has developed six "rules of engagement" on the website The Conversation, one of which is to find a "common ground", the kernel of truth on which conspiracy theories are based. The goal, in fact, is not to make conspiracy theorists less curious or less sceptical, but to change the direction of their curiosity and scepticism. Along this path, the projects carried out during the Studio propose a method of doubtful thinking, which does not seek an immediate solution but knows how to linger.

Even if it's not possible to embrace the complexity of the world as a whole, the tools of speculative design can help people at least identify it and point out its critical aspects with irony and sharpness.

> The pandemic hasn't been planned by some billionaires in cahoots with governments. Vaccines are not weapons of mass extermination. No anonymous user on the internet will defeat paedophilia with questionable prophecies. Reptilians from another dimension did not take over heads of state to launch useless and bloody wars. Economic crises are not deliberately set by a handful of Jewish bankers who meet secretly in a cemetery, or on the upper floors of a skyscraper in some metropolis. The climate emergency was not triggered by chemtrails.
> It's all much scarier than that; therefore, everything is incredibly more difficult to accept. "The world is a ship adrift," Moore reiterates, and no one really has control of the rudder. (Bianchi, 2021)

DESIGN, DIALOGUE, DEMOCRACY: POST-TRUTH AND THE CRISIS OF POLITICAL PARTICIPATION

Lawrence A. Marcelle,[a] Matthew H. Robb[b]*

a Parsons School of Design
b Parsons School of Design
* robbm@newschool.edu

ABSTRACT | Healthy, functioning democracies depend on a body of shared beliefs whose truth is not in serious question. In many societies today, this condition does not obtain. Between innocent misinformation and intentional disinformation, the "post-truth" regime characterizing modern societies has left people unable to debate political values because they cannot agree on basic facts. Behavioral scientists claim to locate the source of the post-truth phenomenon in a general propensity toward certain types of cognitive error, often thematized under the rubric of "cognitive illusions." Intractable and incorrigible, such illusions underpin a distinctive pessimism about the prospects for rational human action, which has led in turn to workaround strategies such as "nudging," an effort to design choice situations that steer individuals toward actions that accord with axiomatic accounts of reasoning. Against this conventional social-scientific view, the authors advocate a more ambitious application of design in defense of democracy. Offering an analysis inspired by American philosopher John Dewey, we characterize misinformation not as a series of inaccurate beliefs held by individuals but as a maladaptation between individuals and their larger social environments. On this analysis, rehabilitating genuine political participation is the most promising way to overcome the epistemic fragmentation and confirmation bias that are the hallmark features of the post-truth regime. As a paradigm of adaptive and integrative intelligence, design contains important capacities for addressing and remediating these problems but may also help to accelerate flows of misinformation. Accordingly, the paper concludes with a discussion of several recent developments in design theory that highlight ways contemporary design practice may itself be contributing to the current post-truth condition, while also pointing out the potential of design for countering misinformation, not through post hoc strategies like nudges but by

promoting greater critical media literacy among users of internet-based communication platforms, thus encouraging a more broadly shared understanding of problems that are confronting contemporary societies.

KEYWORDS | MISINFORMATION, BEHAVIORAL SCIENCE, ADAPTIVE INTELLIGENCE, PARTICIPATORY DESIGN, PREBUNKING

1. Lippmann and Dewey: Technocracy or Democracy

> "If there is a dividing line between liberty and license, it is where freedom of speech is no longer respected as a procedure of the truth and becomes the unrestricted right to exploit the ignorance, and to incite the passions, of the people." (Lippmann, 1955, p. 126)

In this famous statement, the American political journalist Walter Lippmann identified a problem at the heart of modern democracy: the ease with which the norms, rights, and institutions of free expression can be distorted, whether inadvertently or intentionally, altering people's beliefs and attitudes in nonrational ways that degrade the political process. In contemporary contexts this has come to be referred to as the problem of "misinformation," a word used generically in this paper to mean falsehoods circulating among individuals that bear on matters of politics and public policy. Lippmann's claim that people not only can be, but in fact regularly are, misled for political advantage has received substantial empirical grounding in recent decades, in part through the scientific exploration of psychological biases and "cognitive illusions" that alter people's judgment (Kahneman, 2011, pp. 26-28, 216-217). The science has shown how, for example, sensational news media accounts of particular crimes tend to exaggerate people's sense of overall rates of crime, and thereby their support for "law and order" political agendas and candidates. For some researchers, our susceptibility to such illusions, and their frequent exploitation by politically interested parties, leads to a distinctive pessimism about the prospects for rational action under an ostensible "post-truth" regime characterizing modern societies. One prominent contemporary response to this pessimism is "nudging," a strategy for leveraging common cognitive biases in service of beneficial outcomes by guiding individuals toward actions that accord with conventional accounts of rationality such as rational choice theory (Thaler & Sunstein, 2008/2021; see also Marcelle & Robb, 2024). Although the nudge strategy rejects Lippmann's call for the direct administration of public affairs by specialist experts, claiming to respect people's freedom by making nudge initiatives relatively easy to ignore or avoid, both approaches to combatting misinformation nevertheless exhibit a strongly technocratic understanding of modern liberal societies. And "nudge theory" in particular envisions a specific political role for designers, who are to be enlisted as part of an expert elite which frames the way information is presented to the public, influencing popular opinion by orienting people toward considerations that the experts deem relevant to a given policy dispute. A pop-up message asking social media users to consider the accuracy of a news item before reposting it is an example of a nudge targeting misinformation, illustrating the approach's characteristic combination of paternalistic guidance with the individual's freedom to ignore the

guidance (OECD, 2022, p. 15). Simply put, this particular application of behavioral science to the political arena, like Lippmann a century ago, proposes to steer public opinion for the public's own good, having despaired of more traditional approaches like informing or educating.

Responding to an earlier statement of Lippmann's technocratic recommendation, the American pragmatist philosopher John Dewey acknowledged that "those who have ability to manipulate social relations for their own advantage have to be reckoned with" (Dewey, 1927/2008, p. 341). And like contemporary behavioral scientists, he recognized that this manipulation of popular opinion is more than a superficial matter of substituting easily disproved false claims for truthful ones, since it gets much of its power by leveraging deep-seated and widespread "emotional habituations and intellectual habitudes" (p. 341). Despite these points of agreement, however, Dewey's general position differs both from Lippmann's and from the contemporary program of nudging. For whereas the technocratic perspective understands the problem of political misinformation mostly in terms of a failure of *individual* citizens to think clearly (OECD, 2022, p. 4), for Dewey misinformation reveals the irreducibly *social* nature of human rationality. In his words, "knowledge is communication as well as understanding" (1927/2008, p. 345), and rationality, therefore, is not the correspondence of individual belief and objective reality, but the cooperative, intelligent resolution of experiential problems as they arise. Thus, the problem of misinformation is above all a "social pathology" (p. 341). It is best understood as a *maladaptation* among the constituents of a social and political environment: a distortion in the process of inquiry by which communities pursue adaptive solutions to problems through a process of open communication aimed at mutual understanding, accommodation, and compromise. From Dewey's perspective, therefore, rearguard actions like asking individuals to consider the truthfulness of a social media message before reposting it focus on symptoms, not root causes, and will be of only limited help as a result.

Dewey's understanding of rationality as social intelligence accords a much greater importance to democracy than do pessimists like Lippmann or contemporary nudge theorists. Far from being a merely mechanical procedure for achieving majoritarian rule by tallying up pre-existing individual preferences, democracy for Dewey represents an epitome of reasoning as such: it is a quintessential manifestation of social intelligence oriented to the resolution of shared real-world problems. Clarifying the import of his recasting of individual rationality as adaptive social intelligence embodied in communication, Dewey states that "there is no limit to the . . . intellectual endowment which may proceed from the flow of social intelligence when that circulates by word of mouth from one to another in the communications of the local community." (pp. 371-72)

2. From Participatory Design to Design for Participation

Dewey saw most of the problems of American democracy as resulting from a failure to secure the effective involvement of the people impacted by the concrete issues of the day. The crisis of democracy analyzed by Lippmann was, for Dewey, really a crisis of

political participation, to be addressed by finding ways to include nonspecialists in thinking through the consequences of various policy proposals, thereby increasing the breadth and depth of social intelligence being applied to them and enhancing the legitimacy of the resulting political agendas. Dewey's commitment to participatory democracy suggests a new framing for the possible political role of design. Perhaps most obviously, if a lack of genuine participation is the ultimate source of the social and political pathologies afflicting contemporary democracies, it is natural to ask whether "participatory design"—a well-established field of practice which actively seeks to include end-users in the creative development process—might serve as a method or model for ameliorating the crisis of political engagement. Despite the clear merits of maintaining a more inclusive design practice in many contexts, however, the specific issue of political misinformation may not be the most promising area for the application of this method. One reason is that the participatory creation of public policy recommendations would appear to remain far too susceptible to precisely the kinds of biased and self-serving misinformation that is undermining contemporary democracy. There's no guarantee, in other words, that a "co-creation" process seeking to establish a discrete political agenda under the auspices of "free speech" might not become one more source of just the sort of ignorant, bigoted, or incurious discourse that needs to be counteracted. The participatory design program, at least as it is typically described in the literature (e.g. Sanders, 2015; Simonsen & Robertson, 2013), risks relinquishing too much control over the development process to be helpful in combating misinformation, and thus may not effectively address the problem pointed out by Lippmann: the ease with which public opinion can be redirected toward nonpublic ends. In regard to the problem of political misinformation, a sincerely held desire to move design practice in a more "democratic" direction, or to "include all voices," might in fact have precisely the opposite effect—further effacing the "dividing line between liberty and license" Lippmann correctly identifies as an essential boundary within political discourse in a functioning democracy.

A second, more conceptual problem with applying participatory design methods to the challenge of misinformation is that the putative consensus envisioned as the outcome of a participatory design process may itself be in tension with the essential meaning of democracy in the context of contemporary, pluralistic societies. Total agreement on any complex issue is likely an impossibility, and may not be an appropriate goal even in principle. The rehabilitation of a more genuinely participatory democratic process, therefore, must involve establishing opportunities for people to *disagree*, albeit in reasoned and respectful ways. Discussing challenges of participatory design based on their long experience in the field, Erling Bjögvinsson, Pelle Ehn, and Per-Anders Hillgren stress that in political contexts, design should focus on creating "a common place where conflicts can be negotiated"—a focus that acknowledges the "diversity of perspectives, concerns, and interests" characterizing modern societies (Bjögvinsson et al., 2012, p. 102). This goal, of keeping political conversations going while opening people to other perspectives, yields a view of design's political role that contrasts with the consensus-seeking orientation of conventional participatory design. For much the same reason, Bjögvinsson and colleagues' discussion also deviates from the prevailing "user-centered" paradigm of industrial design, in which an iterative prototyping process is supposed to converge toward a

final artifact suitable for mass production. By contrast, they argue, in the context of political discourse within modern democracies, a key rationale for professional design can be understood as helping to "transform antagonism into agonism, moving from conflict between enemies to constructive controversies among 'adversaries'—those who have opposing matters of concern but who also accept other views as 'legitimate'" (p. 109). Design's political role, the authors suggest, should consist in encouraging, *while also structuring*, political participation: mitigating the polarizing effects of misinformation while also accounting for the fact that "political communities are characterized by heterogeneity and difference . . . They are in need of platforms or infrastructures, 'agonistic' public spaces—not necessarily to solve conflict, but to constructively deal with disagreements" (p. 116).

3. Design, Technology, and the Reconstruction of Participatory Democracy

Political misinformation, whether deliberately or inadvertently circulated, undermines the conditions of genuine democratic participation, replacing opportunities to learn about others' concerns with invitations to an uncritical tribal affiliation and an unreasoned suspicion of outsiders. As is well known, social media has today become a main vector of misinformation. Contrary to the rhetoric of "connectivity" that has helped social media platforms become a ubiquitous feature of everyday life, in many cases these platforms are instead helping to create populations fragmented into mutually antagonistic groups defined by ideology or by cultural, racial or ethnic identity. The algorithms that power these platforms actively contribute to this fragmentation, rewarding members for maximizing "engagement," including by trafficking in reductive stereotypes, provocative half-truths, and baseless conspiracy theories.

Several recent writings by design scholars illuminate some specific ways in which contemporary design practice has contributed to the problem of misinformation, while suggesting corresponding ways that design might help to counteract this problem by promoting more informed types of political participation. In general, these writers point to the increasing untenability of the user-centered paradigm for design in the face of rapidly emerging developments in digital technology. Jodi Forlizzi, for example, sees a growing gap between the primary values of user experience and interface (UX/UI) design, which continue to prioritize a single user, and the current reality of web-based communication platforms, which can serve millions of users at once. An overly narrow focus on creating an intuitive user experience, she argues, is now preventing designers from fully accounting for the broader ecosystem of internet-mediated communications; accordingly, she calls for a more self-consciously "stakeholder-centered design" (Forlizzi, 2018, p. 22). In the case of misinformation disseminated through social media, Forlizzi implies, the stakeholders include recipients as well as propagators (of course recipients of misinformation may become propagators in turn, through liking or reposting). A stakeholder-centered approach to UX/UI design, therefore, would involve expanding the frame of reference to consider potential recipients of web-based communications, and the harm that

recipients, and the wider society, may suffer if those communications contain inaccuracies. Such an expansion would dramatically alter the focus of UX/UI design, reducing its predominant emphasis on "user-friendliness" and inviting the development of new features designed to elicit more thoughtful and deliberate—that is, more intelligent—postings and replies in the social media space.

An even more radical challenge to contemporary design practice stems from a reflection on the rapidly developing technologies of machine learning and artificial intelligence. As Elisa Giaccardi and Johan Reström point out in a comment with direct relevance to the problem of political misinformation, devices like smart phones are becoming "autonomous or semiautonomous entities that increasingly do business with humans and with each other" (Giaccardi & Reström, 2020, p. 34). In other words, networked computational technologies, which observe, learn, and refine outputs such as newsfeeds based on prior user engagement, have *themselves* become de facto stakeholders of design, possessed of an independent and growing agency that must be accounted for in the development of new products and services. The emergence of networked devices reinforces Forlizzi's point about the narrowness of the user-centered paradigm for design, clarifying not only how this paradigm insufficiently accounts for stakeholders other than the individual user, but also how it can undermine the interests of users themselves. At present, interface design mostly keeps hidden the massive networks that link the user to other people, and to computational entities like bots. With the algorithmic provenance of most items in their newsfeeds opaque, users cannot know how those items ended up in their feeds, or the intentions (or identities) of the producers of those items. Of course when an item is reposted, that opacity is preserved and extended to other users. The ensuing dynamic is more or less the opposite of what Dewey would have recognized as a democratic process of intelligent social inquiry, which draws the members of a community together in thinking through a shared challenge.

The upshot of these analyses is that, in facilitating the proliferation of misinformation, the very smoothness and seamlessness of contemporary UX/UI design is now having a debilitating effect on public discourse and social intelligence. Technological change has overtaken the operating principles of user-centered design, superseding a main achievement of the field and increasingly turning it into a liability. Recognizing and responding to this supersession, Marzia Mortati argues that henceforth, design expertise and creativity must be applied further upstream in the development process. The emerging challenge posed by networked machine learning and AI will necessitate a change in the role designers play, combining their traditional form-giving activity with "a sociological role, where a project starts from problem setting (or the understanding of the most pressing challenges) to provide hands-on support for transformation to communities and organizations" (Mortati, 2023, p. 31).

Today, internet-mediated political misinformation easily qualifies as one of the "most pressing challenges" facing democratic societies. Design needs to turn its attention and capacities to this challenge, to which it has itself contributed through its focus on frictionless UX/UI. As noted earlier, nudge initiatives represent one kind of design response,

effectively applying the goal of frictionless-ness to outcomes deemed appropriate by the designers (or their employers) themselves, but bypassing the reasoning capacity of individuals and preventing opportunities to apply a more adaptive social intelligence to the issues, as Dewey recommended. Given their downstream location in the communication process, in which users are asked to consider verifying the truthfulness of a message only at the point of reposting (i.e. *after* they have read the message, possibly being influenced by any misinformation it contains), nudges represent a primarily passive, post hoc approach to combating misinformation. Focused on symptoms, not causes, nudging to counter misinformation consists in inviting users to try to debunk material they have already read—a method that relies on the users' motivation not to share falsehoods within their social networks. A more proactive and promising approach is suggested by the psychologist Sander van der Linden's program for "inoculating" individuals against misinformation through the strategy of "prebunking," his term for warning people *in advance* about the types of misleading message they are likely to encounter online, while simultaneously providing tools for seeing through and rebutting them (van der Linden, 2023, pp. 169–194). These tools might be developed as browser extensions that scan social media newsfeeds, calling out possible misinformation based on keywords or phrases or on the origin of messages, and pointing users toward additional journalistic, historical or scientific context. Or they might take the form of a standalone app or web presence to which users could refer in thinking about the controversial issues of the day and in developing their views and opinions on them, providing a structured communication environment designed to ensure that the "dividing line between liberty and license" is maintained. In sum, van der Linden's proposals suggest a possible role for design that aligns with Dewey's call to bolster socially adaptive forms of intelligence focused on shared problems, that avoids the pessimistic paternalism characteristic of the nudge strategy, and that hints at the enormous potential in the "problem setting" approach to design recommended by Mortati.

The challenge posed by political misinformation has elicited a range of proposals for countering it. The top-down technocratic management of public discourse recommended by Lippmann, and given scientific backing and designerly sophistication by nudge theory, misconstrues the social nature of intelligence and the indispensable value of democracy as the preeminent venue for the manifestation of intelligence. A wide-open participatory design approach to hosting public policy conversations remains susceptible to the same techniques of manipulation Lippmann first identified, and imports a goal of consensus that fails to account for the legitimacy of ongoing disagreement and agonistic debate within pluralistic societies. But a renovated design practice, attuned to the social environment beyond the user interface, and sensitive to the technological dynamics that are making networked devices stakeholders of design in their own right, will recognize design's proper upstream role, oriented to setting rather than solving problems. Regarding the misinformation crisis, a problem-setting design attitude yields a goal of prevention rather than cure, and points toward educating users in the techniques of manipulation as "the way of the future" (van der Linden, 2023, p. 275) in the design of web-based communication platforms.

DESIGN, GREENWASHING AND DATA VISUALIZATION. Visualizing the unsustainability of sustainability as a strategic ethical tool through design

Alessio Caccamo*[b], Chiara Caleandro[a],

[a]Department of Planning, Design, Technology of Architecture – Sapienza University of Rome

*alessio.caccamo@uniroma1.it

ABSTRACT | The carbon footprint and greenwashing concepts are interlinked in their impacts on consumer perceptions and behaviors related to sustainability. The rise of greenwashing has the potential to make it complicated for consumers to understand genuine sustainability and thus may lead to distortions in their perceptions about the habits related to sustainability. Such misrepresentation can lead consumers to believe that they are making environmentally responsible choices, as the communicated motives for environmental policies can affect public perceptions of greenwashing. The cognitive biases that consumers exhibit in response to greenwashing serve to further complicate the landscape of sustainability. Extant literature suggests that consumers often face difficulties in recognizing real sustainability efforts and greenwashing. This can result in a process called moral decoupling, where the consumer may rationalize their purchases despite knowing the product is really not sustainable. Thus, the portrayal of sustainability habits contributes to the overconsumption and degradation of the environment through misleading consumers to feel responsible for what they have been doing, which is wrong. Data visualization is important in addressing these challenges that emanate from greenwashing. By effective visualization, the consumer is helped to comprehend such complex data regarding carbon footprint and sustainability issues. Presentation of data in a more transparent and accessible way could also improve consumer awareness and support better decision-making. In fact, understanding the data on sustainability is of paramount importance for building trust. In the light of the above, the paper puts forward that embedding awareness of one's carbon footprint, avoiding greenwashing bias, and presenting effective data visualisation represent an inalienable key aspect of design to promote sustainable consumer behaviour and an ethical use of sustainable data. The following research will collect, interpret, and visualize data related to the sustainability behaviour of a structured sample of people, illustrating how consumer behaviours are unsustainable if biased by greenwashing activities. They

show the role of information design as an important guiding strategy for consumers to orient themselves within the complex landscape of environmental questions and find their way to the truth.

KEYWORDS | INFORMATION VISUALIZATION; DATA VISUALIZATION; GREENWASHING; SUSTAINABILITY

The growing understanding and recognition of climate change and its multifaceted impacts underline the urgency and challenges of environmental communication in the contemporary world. Effective communication strategies are vital for articulating the urgency of environmental issues and prompting public action. Evidence suggests that portraying climate change as an acute crisis improves environmental activism; for example, Vu et al. (2020) demonstrate how international NGOs use social media to mobilise audiences and action. Andersen (2023) offers a similar critique of existing communication efforts for failing to convey the urgency of the situation sufficiently and argues that better public outreach is necessary. Because environmental problems are often quite complicated, this requires a careful approach to communication. Willoughby and Smith (2016) investigate the intersectionalities of health and environmental communication and suggest repurposing well-established strategies from one field to the other. Royne et al. (2016) also point to the complexities of environmental messaging and advocate for tailored marketing approaches to facilitate maximum impact. There is increasing recognition of the role of digital platforms in environmental discourse, but limited research into their potential. Ardoin et al. (2013) acknowledge the potential of social media in environmental education, whereas Kadykalo et al. (2021) highlight that the accessibility of communication is crucial to the successful transmission of urgent environmental science. Based on these perspectives, we can conclude that there is a need for more nuanced, targeted approaches to communication that would be more effective in informing and engaging people on environmental matters.

1. The Phenomenon of Greenwashing

Most disturbingly, 'greenwashing'-or the issuance of false, inaccurate, or deceitful environmental information by companies-is a concept of increasing prevalence. This number has grown within recent years along with the emerging demands for greater accountability from end consumers. The term greenwashing, first introduced in 1986 by Jay Westerveld, has evolved to encompass a wide spectrum of corporate behaviour prioritising image management over actual stewardship of the environment (Miao et al., 2023). Researchers generally define greenwashing as the deliberate attempt to mislead customers about a firm's environmental record or the environmental benefits of a product (Nisa et al., 2023). Greenwashing can take many forms, including vague or inflated sustainability claims, selective disclosures of environmental data, and misleading eco-labels that do not adhere to stringent criteria (Lu, 2024). Greenwashing has serious implications, not least in terms of undermining trust and fostering scepticism surrounding corporate sustainability. Consumer awareness of (and scepticism towards) the disparity between corporate claims and actual environmental performance is increasing, and scepticism towards sustainability messaging is also deepening. This growing mistrust is compounded by the prevalence of greenwashing; it not only erodes trust in individual brands but also disseminates distrust across the overall market, thus undermining the credibility of sustainability credentials (Mu, 202). Research indicates that

if consumers perceive a company as engaging in greenwashing, they may extend their scepticism beyond that offending brand, adversely affecting the perceptions of other businesses within the same sector (Sari, 2023). This erosion of trust can, therefore, dissuade consumers from purchasing green products altogether, stalling the expansion of the sustainable market (Nisa et al., 2023).

In addition to undermining consumer confidence, greenwashing compromises the integrity of environmental communications. However, the proliferation of dubious and misleading sustainability claims from corporations complicates the promotion of genuine environmental actions and increasingly hinders stakeholders from distinguishing authentic corporate activity from questionable marketing tactics (Ferrón-Vílchez et al., 2020). This lack of clarity can diminish the effectiveness of sustainability communication—consumers bombarded with questionable assertions are likely to become desensitised to or indifferent about environmental issues (Torelli et al., 2019). Consumer reactions to greenwashing are shaped by psychological processes. According to cognitive dissonance theory, when consumers encounter information that contradicts their established beliefs about a company's environmental practices, they feel psychological discomfort that leads them to either revise their beliefs about the company or rationalise their purchasing decision (ibiden). An additional defensive response to misleading marketing strategies is the rise of green scepticism, where consumers critically evaluate corporate environmental claims (Urbański & Haque, 2020). This scepticism is heightened by negative experiences consumers have had with greenwashed products, resulting in a vicious cycle in which distrust poses challenges for companies that are genuinely sustainable at heart.

Due to the increasingly urgent calls regarding environmental issues, transparent and breathable environmental media is necessary. With the rising climate crisis and ecological degradation, companies face increased pressure to address these problems (Aparna, 2024). Guided by transparency and accountability, effective sustainability communication is essential to restore consumer confidence and create impactful engagement with environmental initiatives. This growing awareness of greenwashing underscores the pressing need for a robust regulatory framework and industry standards to ensure that corporate sustainability claims are genuine, thereby creating market confidence (Ma, 2024).

2. The Challenge of Sustainable Communication

Effectively communicating sustainability in environmental discussions is a complex challenge. The information itself is often complex, there is an overwhelming amount of it, and many remain skeptical about corporate sustainability claims. All of this affects how well environmental messages land and whether people actually pay attention. To effectively deliver sustainability messaging, it has to be clear, relatable, and trustworthy. Communication through the noise to create real engagement means that people can understand and relate to it. One of the major challenges involves the complexity of the data itself in sustainability. Scientific reports often include technical terms that may not be understood by the average man, making them hard to understand. This could further lead to confusion or scepticism. Han et al. (2017) raise the issue of more lucid and accessible communication of sustainability, especially in those industries like sustainable fashion, where consumer awareness greatly differs and forms the basis for buying decisions. There is no single way of communicating sustainability that fits all.

Research into digital communication (Saker, 2024) illustrates that the message is more effective if it is adapted to specific audiences. By using targeted, audience-focused strategies, organizations can communicate about sustainability more clearly and foster deeper engagement. In fact, Han et al. (2017) note the need for clearer, more accessible messaging, particularly in industries such as sustainable fashion, where awareness among consumers can vary widely and affect purchasing decisions. Tailoring sustainability messages promotes better comprehension and more active participation. Adding to the complexity in discussing sustainability, there is information overload: the constant bombardment of people in digital platforms over sustainability topics, as one cannot help but become overwhelmed, mentally fatigued, and even disengaged. Misra and Stokols (2011) examine how incessant digital distractions and fragmented information contribute to cognitive overload, hindering people's ability to absorb and respond to vital sustainability messages. Similarly, Chen and Wei (2019) emphasise a curvilinear relationship between social media use and information processing—while digital platforms facilitate the spread of sustainability content, excessive exposure can, in fact, diminish attention and engagement. To avoid these pitfalls, organizations need to focus on clear, concise, and relevant messaging (Sun, 2024). Refining sustainability communication to cut through the noise can prevent information fatigue and keep key environmental issues at the forefront of public attention. Furthermore, one of the biggest hurdles in sustainability communication is public scepticism. People have seen too many companies make big environmental promises only to fall short—or worse, engage in greenwashing by exaggerating their efforts merely for marketing. Over time, this has eroded trust, making transparency more essential than ever. CRG Indonesia, for instance, has worked to rebuild credibility by employing a marketing approach that prioritises honesty and accountability (Kaloka & Zain, 2024). To genuinely connect with stakeholders, businesses require sustainability strategies that are clear, verifiable, and underpinned by real action. Social media has only made this challenge more complex. Whelan et al. (2020) point out that while digital platforms are powerful tools for spreading sustainability awareness, they can also amplify misinformation and public doubt. That's why companies need to take a fact-based, transparent approach—one that reinforces credibility and keeps people engaged in meaningful ways.

Finally, beyond corporate and institutional strategies, community-based conservation offers a powerful way to boost public engagement in sustainability efforts. Ngwenya (2024) highlights the importance of integrating local knowledge and participatory governance, emphasizing that when communities have a direct stake in environmental initiatives, they're more likely to take ownership and drive meaningful change. This bottom-up approach not only strengthens sustainability programs but also helps rebuild public trust by delivering visible, community-led results.

3. The potential role Information design as a tool for transparency

Effective data visualization makes sustainability information clearer and easier to work with. Schneider et al. (2022) point out that in green data mining, good visuals don't just share information—they capture interest and encourage deeper understanding. When complex environmental metrics are translated into clear, intuitive formats, they become more useful—helping people stay informed and make better decisions. Good information design isn't just about looking nice; it's about making data truly meaningful and actionable. Tomsho et al. (2022) emphasise the importance of effective communication

strategies for environmental health data, particularly in addressing issues related to understandability, appropriate levels of concern, and visual clarity. This aligns with the findings of Wästberg et al. (2020), who highlight the necessity for urban planners to employ visualisation tools tailored to specific stakeholder needs, thereby enhancing the communication and application of environmental data. In sum, applying certain visualization strategies helps an organization to bridge the gap between sophisticated environmental data and public comprehension, thereby enhancing community involvement in sustainability initiatives. Effective information design communicates information about sustainability both through physical interactions and digital, developing better stakeholder engagement and fostering informed decision-making. At its core lies the key to data visualization, which turns challenging environmental data into understandable and actionable insights.

This information system design is an interdisciplinary activity for sustainability with theoretical and methodological approaches that include aspects in environment, human-computer interaction, and information systems. Integrating multidisciplinarity, best practice in environment information design can develop in terms of transparency, access, and effective information representation. Theory of sensemaking forms a key part of this field, a key tool for both organisations and individuals in managing complexity in terms of sustainability. As argued by Seidel et al. (2017), not only is sensemaking key in achieving environment sustainability, but it is key in supporting decision-making in a range of organisational and governance environments. Nyström and Mustaquim (2014) go a stage further in supporting such an argument, arguing that information system design for sustainability must involve consideration of HCI in terms of maximising effective use and understandability through application of such principles. Integrating such, information design for the environment can make decision processes more efficient, and in doing so, contribute towards developing objectives for sustainability.

Transparency – far being just a best practice – is a key principle in environmental information system design, supporting trust, accountability, and legitimacy in sustainability programs. Graaf and Squintani (2021) highlight that access to environmental information is a fundamental right, giving people the ability to engage with and influence sustainability decisions. Watson et al. (2012) note that an information strategy that complements engineering interventions through providing relevant and reliable information to stakeholders is a key necessity. Gholami et al. (2016) reiterate this through a demand for information systems that move beyond providing raw information, with a view towards supporting an increased level of understanding regarding sustainability concerns in its users. Data visualization is particularly important in such a scenario, with its potential for effectively and engagingly communicating complex datasets in an environmental context. Environmental data infrastructure is seen, according to Goldstein and Faxon (2020), to have a role in supporting transparency and participatory governance, with an important role for well-designed data structures in countering public scepticism and supporting trust in sustainability programs. Metze's (2020) systematic review reiterates such a position, with a demonstration that such data visualisations have a significant impact in shaping public understandings of environmental issues and, in turn, the perceived legitimacy of intervention through policy interventions. When organizations commit to clear, data-driven transparency, they do more than make promises—they earn trust. This trust strengthens environmental policies and corporate sustainability efforts, ensuring accountability is more than just a trendy phrase.

4. METHODOLOGY

The research adopted a mixed methodological approach, combining qualitative and quantitative analyses to explore both students' perceptions of sustainability and their actual daily environmental impact. The project developed through three distinct but interconnected phases: a preliminary phase dedicated to literature analysis and problem definition, followed by a data collection phase using a detailed questionnaire, and finally an AR Data-Exhibition design phase based on the collected data. The project timeline extended from October 2023 to March 2024, with the data collection phase concentrated in the first two months and the subsequent AR Data-Exhibition design in the following months. This timeline allowed for the construction of an experience based on real, verifiable data, actively counteracting the phenomenon of greenwashing through methodological transparency.

4.1 Data Collection

The present study collected data from a sample of 72 students from [omissis for review], specifically from the Faculty of Architecture. The selection of this particular target group was not arbitrary; students embody the generation that will be confronted with future environmental challenges and possess the capacity to act as agents of societal transformation. The key tool for collecting information in this case was a survey tool titled 'Which Eco has your day?', carefully crafted in an attempt to evaluate students' ecological footprint. With 45 questions, taking about 8-10 minutes to answer, and crafted in a manner that could be completed and not cause frustration, it helped in collecting information in a friendly and engaging manner for respondents. All 45 questions were carefully arranged in a sequence following students' morning and evening routines, and even including leisure times and commuting between university and home, in an organized and sequential manner, providing a thorough and in-depth picture of students' daily routines and impact on the environment.

4.2 Framework Analysis

The analysis of information collected proceeded with a multi-level evaluation model through a combination of quantitative and qualitative analysis. Quantitatively, CO2 emissions generated through a range of daily actions, consumption of water sources, and occurrences of both sustainable and non-sustainable behaviors were considered. Qualitatively, the assessment focused on students' environmental awareness, their ability to perceive the consequences of their actions, and their willingness to change behavior. Engagement levels were also evaluated by observing participation in activities and analyzing qualitative feedback collected during interactive sessions. This comprehensive approach provided a deeper understanding of behaviors, motivations, and barriers to change.

4.3 Design Process

This design process was developed in a series of iterative steps, starting with the in-depth analysis that outlined significant behavioral patterns from data collected. These insights guided the development of data visualizations and the design of the interactive

installations. Each element of the AR Data-Exhibition was designed to maximise transparency in the presentation of data and to encourage active visitor engagement. The design choices were guided by the need to create an experience that not only communicated sustainability information, but actively engaged sample in a process of discovery and critical reflection. The utilisation of verifiable data and reliable sources, in conjunction with clear visualisations of cause-effect relationships, facilitated the construction of an authentic and transparent narrative, in stark contrast to greenwashing practices. This methodological approach established the foundations for an AR Data-Exhibition that transcends the mere communication of environmental information, thereby creating a space for dialogue and critical reflection on the impact of our daily actions. The result is an experience that not only raises awareness but also stimulates behavioural change through deep understanding and active engagement.

5. Unsustainable Sustainably: a data-driven journey

The performance-data concept arises from a profound contradiction in speaking about the environment: actions and awareness for cutting down emissions have multiplied, but a definite lessening in overall impact continues to escape them. *$FaCO_2$ Conti (I do the maths)*, a pun title, conveys a definite calculation of emissions and a general consideration of everyday options. This double meaning underscores the necessity of working with empirical data to counteract the shallow language often associated with greenwashing.

5.1 Concept Development

The site for hosting the data exhibition was a deliberate choice aimed at maximizing its impact. Being a site regularly frequented by hundreds of students, the atrium serves as an ideal location to maximize the exhibition's visibility and engagement. Universities are not just academic institutions but also forums for discussion and critical thinking, making them particularly well-suited for raising awareness about environmental issues.
The target audience for the data exhibit is university students, selected based on two key factors. First, their accessibility ensures easier engagement. Second, as a group most susceptible to the direct impacts of climate change, students have significant potential to drive social change. Their active participation in sustainability discussions is crucial for fostering meaningful environmental progress.

5.2 Anti-greenwashing strategies

$FaCO_2$ Conti employs meticulous design methodologies to combat greenwashing, prioritising transparency and verifiability of data within the AR Data-Exhibit experience. These methodologies are implemented across various domains, ranging from the selection of data to its presentation and the material selections of AR Data-Exhibit design. The primary strategy emphasises transparency in data presentation, with each display being accompanied by explicit indications of the underlying sources and calculation methodologies. The data is sourced from verifiable entities such as Our World in Data, the

Green Italy report of 2023, and specific studies on energy consumption, enabling sample to verify the information presented independently and to establish a foundation of trust based on direct observation rather than passive acceptance. The utilisation of an analogue-interactive approach constitutes a pivotal strategy in addressing the abstract nature prevalent in environmental communication. By physically materialising data, sample can personally experience the impact of their daily actions. In the 'Life in Plastic' section, for instance, sample have the opportunity to make a direct contribution to the monitoring of plastic waste by depositing their waste in a container that displays the accumulation in real time. This direct experience stands in contrast to the typical vague statements about recycling, thereby rendering the individual impact tangible and measurable. The coherence between message and means is reflected in the material choices of the AR Data-Exhibit. The use of plywood recovered from production waste, treated with fireproof varnish, and the use of recycled PETG for the 3D printing of the AR Data-Exhibit objects concretely demonstrate the possibility of making sustainable choices, in contrast to the greenwashing typical of many environmental communications that preach sustainability but use high-impact materials.

The AR Data-Exhibit's narrative structure is meticulously designed to unveil the incongruity between perception and reality, commencing with seemingly innocuous everyday actions such as breakfast or the home-college commute, and progressively exposing the cumulative impact of these behaviours. This approach eschews the accusatory tone frequently seen in environmental communication, favouring a gradual and reflective awareness. A pivotal element of the anti-greenwashing strategy is the direct comparison between perceptions and actual data. At the commencement and conclusion of the tour, sample are invited to evaluate their lifestyle in terms of sustainability. This juxtaposition of self-perception and objective data unveils the disparities between our beliefs and the tangible impact of our actions, thereby facilitating a more nuanced and informed understanding of environmental issues. The interactive installations have been designed to produce verifiable results in real time. For instance, in the transport section, sample can map their journeys and immediately see the CO2 impact, based on verifiable emission data per kilometre. This immediacy of verification contrasts with the typical vague statements about reducing emissions. The communication uses clear and direct language, avoiding vague or misleading terms typical of greenwashing. Units of measurement are always specified and contextualised, rendering even the most complex data understandable. This linguistic clarity is further enhanced by the graphics and visualisations, where every element is designed to maximise comprehensibility. Data is always temporally contextualised, showing the evolution of impacts over time, in contrast to the tendency of greenwashing to present data in isolation or without temporal context. This approach allows a deeper understanding of trends and changes over time. The AR Data-Exhibit is notable for its dual function as both a platform for highlighting environmental issues and a source of concrete, verifiable alternatives. Each section of the AR Data-Exhibit includes practical suggestions for reducing environmental impact, with these suggestions being based on verifiable data and achievable actions. This action-oriented approach is a marked contrast to the vague promises of sustainability typical of greenwashing. The integrated and coherent strategies of the AR Data-Exhibit create a communication system that not only counteracts greenwashing but actively builds a new form of environmental communication based on transparency, verifiability and direct involvement. The effectiveness of this approach is manifest in the AR Data-Exhibit's ability to stimulate critical reflection and conscious behavioural change in sample.

5.3 Design Choices, Visual Language and Data Materialization

The AR Data-Exhibit is divided into five sections, each characterised by a distinctive visual language that translates abstract data into tangible experiences. Each section uses a specific colour palette that not only helps with orientation but also communicates precise concepts through colour.

'At breakfast: milk and emissions' uses shades of blue and green that evoke an artificial, contaminated nature, and the plate metaphor is realised through 3D printed objects of different sizes combined with radar graphics, materialising the emissions associated with different food combinations. This approach establishes an immediate connection between the everyday object and its environmental impact.

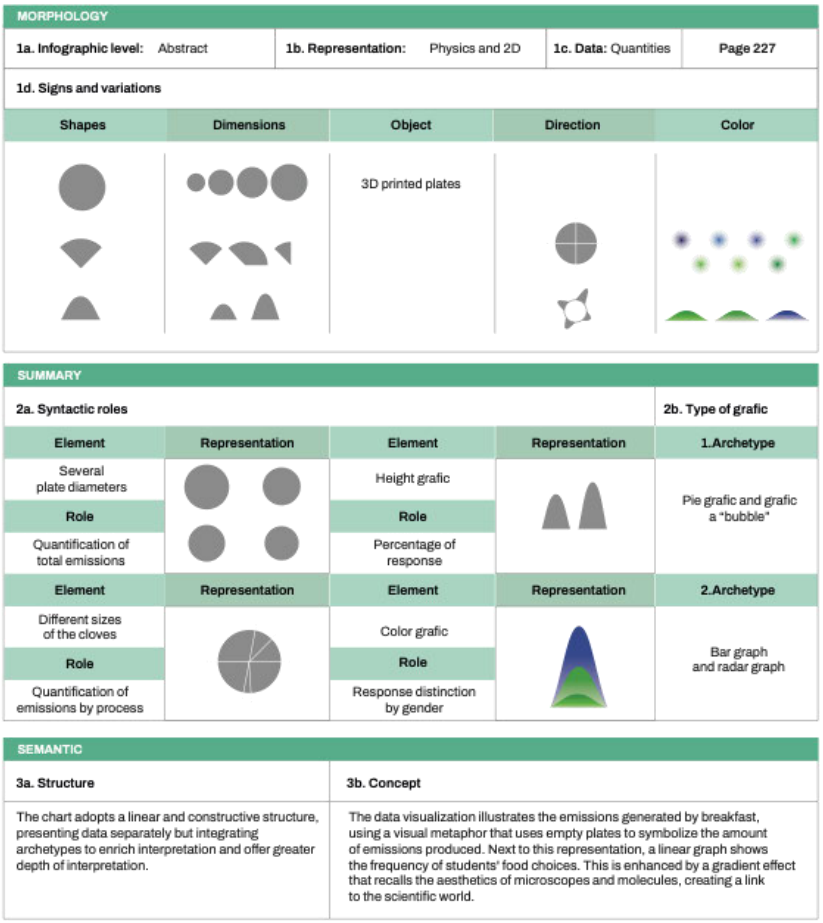

Figure 1. Visual Structure Analysis of the Infographic Components

'Data in Appeal' is developed in three subsections characterised by purple and orange tones, which create a visual tension between artificiality and nature. 'Hefty Commute' transforms mobility data into a three-dimensional map through the use of pins and wires; 'A sip of pollution' visualises coffee emissions through graduated containers that gradually fill up; and 'Life in plastic' makes the accumulation of waste tangible through a container that visually grows with sample' contributions.

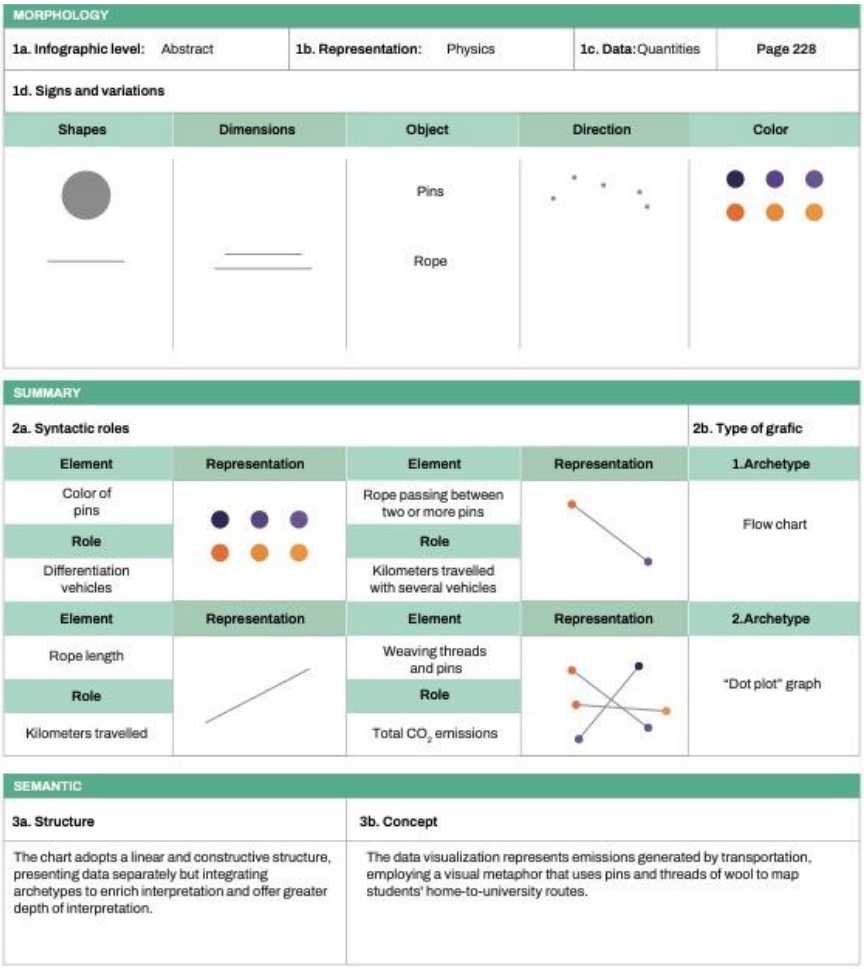

Figure 2. Visual Structure Analysis of the Infographic Components

The section entitled Polluttion&Chill and 'Statistics Under the Carpet' utilise colour theory to symbolise the artificial nature of digital emissions, employing magenta and yellow to represent the concept of 'sofa pollution' and 'statistics under the carpet', respectively. The incorporation of hazy, blurred shapes in these visualisations serves to create a visual bridge between the tangible and intangible aspects of digital pollution, thereby illustrating the concept of 'sofa pollution' and 'statistics under the carpet'. 'Statistics Under the Carpet' combines blue and orange to represent the contrast between natural resources and human consumption and utilises gradually blending shades to suggest the possibility of a synergy between human action and resource preservation.

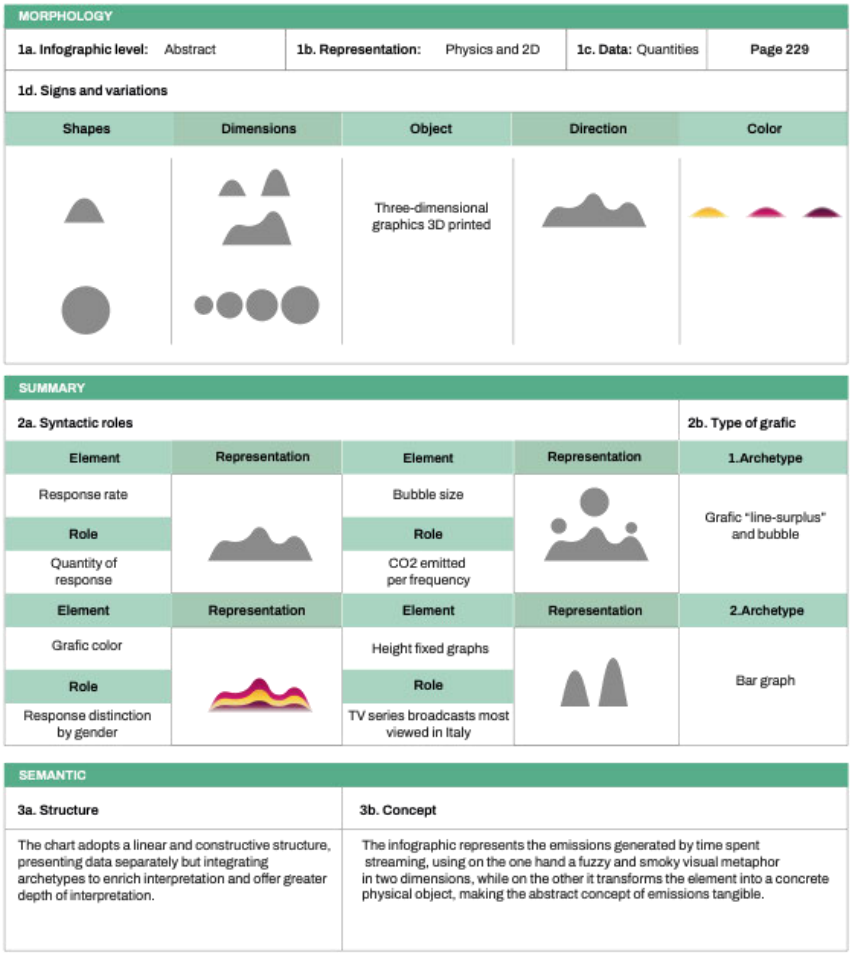

Figure 3. Visual Structure Analysis of the Infographic Components

The visual language employed in the AR Data-Exhibit has been developed with the objective of translating abstract emission data into tangible and comprehensible experiences. Each visual element was meticulously designed to overcome the cognitive barriers frequently encountered in environmental communication, where the invisibility of impact often impedes comprehension and subsequent action. The materialisation of data is manifested through different visual archetypes developed for each section. In the breakfast section, the conventional pie chart is rendered in physical plates of varying dimensions, thereby establishing an immediate association between the quotidian object and its environmental impact. The dimensions of these plates correspond precisely to the quantities of CO2 emitted, thereby facilitating immediate visual comparisons between different food choices. The integration of these visual elements is meticulously designed to facilitate immediate comprehension of the relationships between everyday actions and their environmental impact. The consistent use of familiar visual archetypes (plates, bowls, containers) facilitates immediate connections with sample' own experiences, while more abstract graphic representations support the understanding of quantitative data. In the consumption sections, the utilisation of transparent containers, which are progressively filled with balls for coffee or real waste for plastic, engenders a dynamic visualisation that evolves in tandem with the contributions of sample. This approach not only renders the accumulation process perceptible but also transforms sample into active participants in the visualisation process. The colour palettes employed in each section have been meticulously curated to convey specific messages. The teal and green tones of the breakfast section evoke a controlled artificiality, whilst the purple and orange

of the university section create tension between nature and artifice. Magenta and yellow in the digital section symbolise the hidden impact of technology, and finally, the blue and orange of the domestic section represent the contrast between natural resources and consumption. The employment of colour nuances and the gradual transitions between colours allude to the potential for transformation and change, thereby circumventing a binary depiction of the environmental issue. These colour selections are underpinned by a theoretical framework that explores the psychological implications of colours and their influence on the interpretation of information. A particular emphasis has been placed on the representation of imperceptible information, such as digital emissions or energy consumption. The employment of hazy, shaded shapes in two-dimensional graphics serves to establish a visual connection between the tangible and the intangible, thereby rendering the invisible visible. This graphic choice assists sample in visualising the hidden impact of their everyday actions, thereby overcoming the 'invisibility' issue that is characteristic of environmental communication. The consistency of the visual language across all sections of the AR Data-Exhibit establishes a reference system that sample gradually learn to interpret. The progression through the AR Data-Exhibit is characterised by the incremental integration of novel elements that are grounded in the established visual conventions of preceding sections, thereby facilitating the comprehension of increasingly intricate data in subsequent areas.

5.4 AR Data Exhibition Layout

The AR Data-Exhibit layout has been meticulously designed to follow a precise information hierarchy, thereby guiding sample through a logical progression of discoveries. The predominantly horizontal arrangement of AR Data-Exhibit elements, realised through the use of counters, ensures unobstructed views through the expansive atrium windows, thereby creating an open and accessible experience. The information structure is developed on three distinct but interconnected levels:

- A first level of immediate, visual data that captures attention through three-dimensional objects and dynamic visualisations
- A second level of contextual information that explains the meaning of the data through explanatory panels and in-depth graphics
- A third level of detail that the information structure is developed on three distinct but interconnected levels.

Firstly, there is a level of immediate, visual data that captures attention through three-dimensional objects and dynamic visualisations. Secondly, a second level of contextual information is provided, explaining the meaning of the data through explanatory panels and in-depth graphics. Thirdly, a third level of detail allows sample to further explore the themes through references to complementary sources and data.
The AR Data-Exhibit counters have been designed in two different heights (to optimise the ergonomics of interaction and create a rhythm in the fruition of content. This variation of heights also supports the information hierarchy, visually distinguishing active interaction areas from observation areas. The display system utilises vertical elements, including banners suspended by nylon ropes, which contribute to the visual lightness of the space and function as markers for the various thematic sections. Stainless steel rods are employed to suspend stickers and interactive media, creating additional points of engagement distributed along the route. The AR Data-Exhibit route evolves in a natural and intuitive manner, commencing with familiar everyday actions such as breakfast and progressing to less obvious yet equally impactful behaviours such as using social media or streaming video. This progression enables sample to progressively construct their

comprehension, correlating each new piece of information with previously acquired knowledge.

5.5 Preliminary Finding

What comes out of this study is that routine actions have an impact that doesn't register in our consciousness. Greenwash deflects concern towards environmentally friendly production, but real consumption repercussions fall through the cracks. Step back, and, in a big picture, statistics paint a picture of deep and systemic unsustainability.
Coffee consumption demonstrates the carbon footprint of daily habits, with bar-served coffee emitting 0.02 kg CO_2 per cup and vending machine coffee 0.01 kg CO_2. Despite higher power usage, vending machines consume energy more efficiently. With 40% of students drinking over three coffees daily, the total sample impact reaches 0.7 kg CO_2 per day. Disposable cups from vending machines further contribute to plastic waste, aligning with ISPRA's findings on catering-related pollution [Figure 4] [Figure 5].

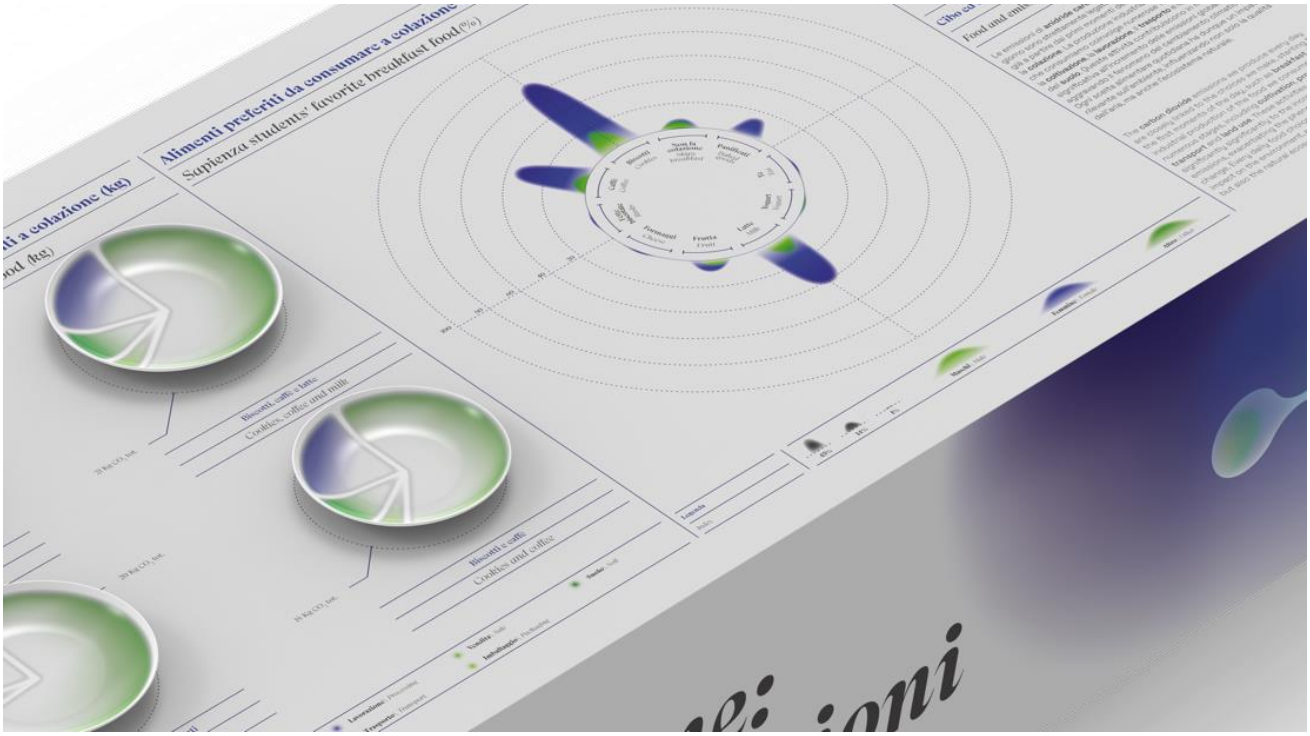

Figure 4. Breakfast – Data Exhibit

Figure 5. Coffee Consumption – Data Exhibit

Urban mobility visualizes the emissions associated with student commutes, exposing the contradictions of seemingly sustainable choices. Conventional cars produce 0.84 kg CO_2 per 5 km, while public transport, electric cars, and active mobility show a decreasing gradient of impact. The cumulative emissions for the student sample reach 103 kg CO_2. A life cycle analysis underscores the hidden footprint of electric vehicles, including production emissions and energy sourcing [Figure 6]

Figure 6. Urban Mobility – Data Exhibit

Single-use consumption of plastics reveals a concealed paradox in sustainable thinking.

Real-time observation reveals a single 500 ml plastic bottle releases 0.1 kg CO_2 in its production. With 60% of students using single-use bottles a day, its contribution overall is significant. All these statistics validate ISPRA estimates, with a spotlight thrown over emissions in production, transportation, and disposal, veiled in most cases with stories of recyclability.

Figure 7. Plastic Waste – Data Exhibit

Social consumption through social media reveals a symptomatic case of invisible virtual pollution. The 'Atmo-scrolling' visualization quantifies the carbon footprint of online activities, showing that one hour of social media emits 0.16 kg CO_2, with prolonged use increasing the impact exponentially. Given that 72% of students spend over two hours daily on social platforms, their total impact reaches 26 kg CO_2. Data centers powering social media contribute 1–2% of global emissions, a rarely perceived but significant environmental cost. Linked to this, streaming content consumption is another underestimated source of emissions [Figure 8].

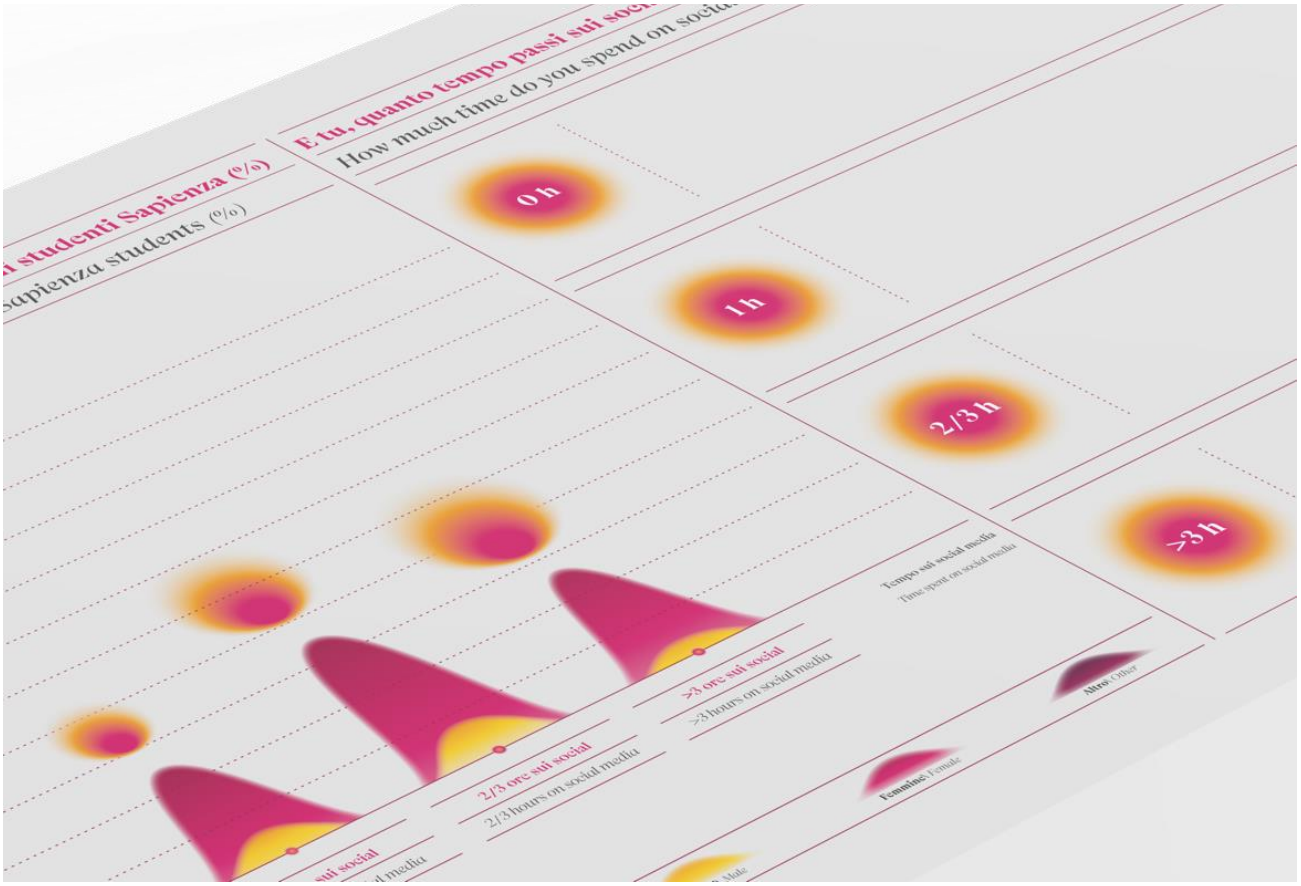

Figure 8. Social Media Pollution Impact – Data Exhibit

The 'Pollution&Chill' infographic illustrates that one hour of streaming produces 0.45 kg CO_2, with daily habits among students contributing a cumulative 52 kg CO_2. Streaming services, often perceived as low-impact, account for 1% of global emissions—comparable to the aviation industry. The visualization materializes this impact through 3D representations of emissions from popular TV series [Figure 9].

Figure 9. Streaming impact – Data Exhibit

Fashion consumption is examined through 'Clothes&Co,' revealing the environmental burden of frequent purchases. Buying clothes 2-3 times a month results in 120 kg CO_2 per individual, with the sample's total impact reaching 95 kg CO_2. Fast fashion, responsible for 0.4% of global emissions, exemplifies the distortion of sustainability through greenwashing. A participatory visualization using pins on a T-shirt makes this cumulative impact tangible [Figure 10].

Figure 10. Clothes impact – Data Exhibit

Water consumption is visualized in 'Spilled Gold,' showing how routine activities contribute to resource depletion. A 10-minute shower uses 270 liters of water, while standard laundry cycles consume 48 liters per wash. With 58.3% of students taking long showers multiple times a week, the research underscores the hidden wastefulness of domestic water use, supporting findings on urban water inefficiency. Food delivery exemplifies the misleading sustainability of convenience. The 'Carbon to Go' infographic breaks down emissions from packaging, online transactions, ingredients, and transport, revealing that even a single pizza delivery generates notable carbon output. Frequent use among students results in a cumulative impact of 0.2 kg CO_2 per order, with disposable packaging adding to municipal waste [Figure 11].

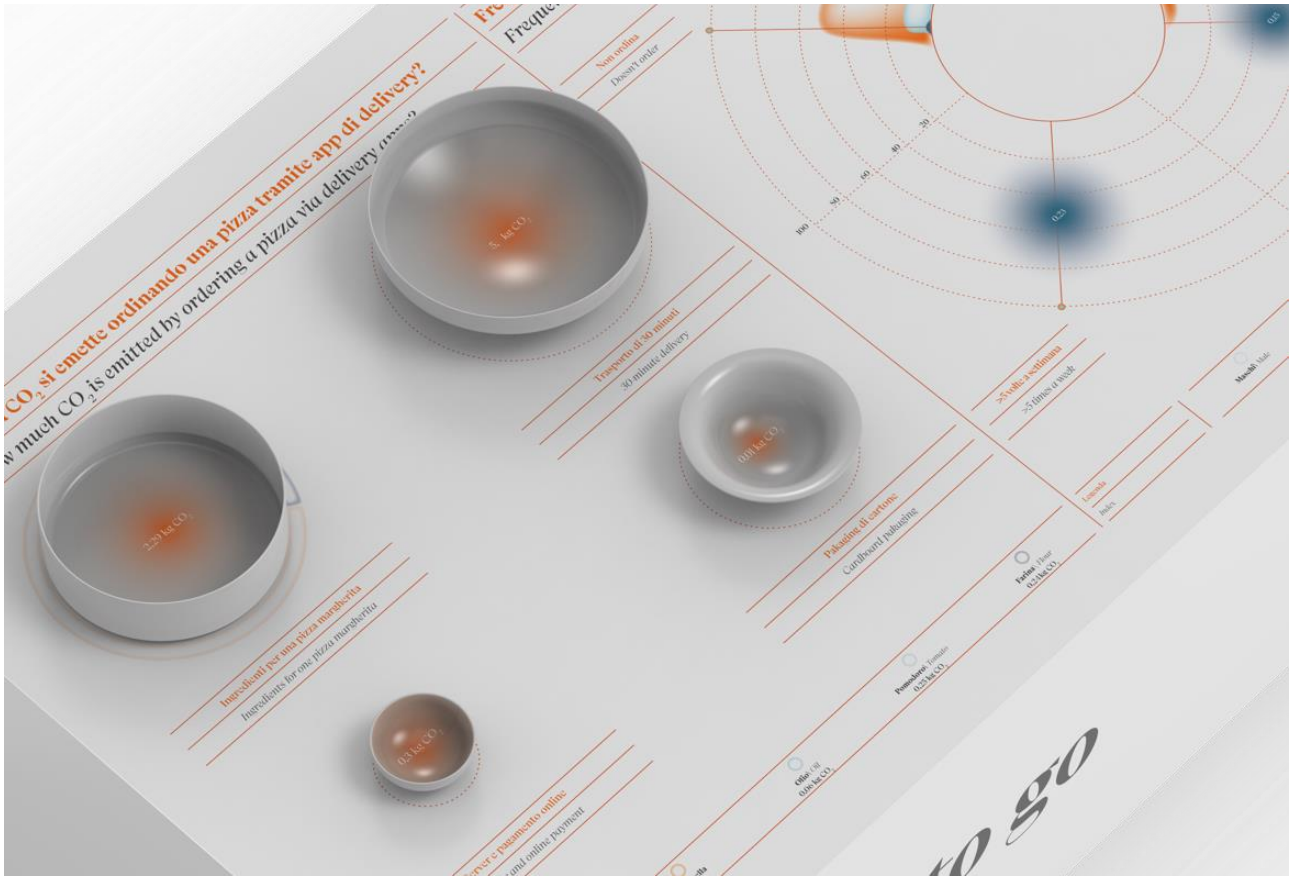

Figure 12. Delivery impact – Data Exhibit

But, even dietary choices emerge as a major factor in systemic unsustainability. The 'Raw Data' visualization contrasts the emissions of different diets: omnivorous (7.35 kg CO_2/day), vegetarian (3.35 kg CO_2/day), vegan (2.17 kg CO_2/day), and flexitarian (4.24 kg CO_2/day) [Figure 13].

Figure 13. Dietary choices impact – Data Exhibit

A review of meat production between 1961 and 2022 reveals its exponential rise, with Asia producing 155 million tonnes in 2022 alone. Besides, intensive rearing of animals releases ammonia, with 11,600 tonnes in one region, specifically Lombardy, alone in a single year.

6. Data Discussion: visualization, physicalization and impact

The study's findings present an effectiveness in embodying information about the environment in an installation in overcoming awareness obstacles regarding sustainability. The materialization approach performed consistently in all nine installations, with each one employing a range of representational strategies in a concrete form in representing invisible consequences in a concrete form. Effectiveness manifested in three forms: transforming invisible information into a concrete form, visualization of aggregated consequences, and revealing paradoxes in perception regarding sustainability. Physical information embodiment through hands-on manipulation became a powerful tool for communicating about the environment.
In the "Life in Plastic" installation, the physical accumulation of waste created an immediate and memorable visual impact, with 85% of sample reporting heightened awareness despite prior environmental knowledge.

Figure 14. Plastic bottle Data Exhibit

This supports Xiao et al.'s (2021) findings on tangible visualization's role in overcoming "moral decoupling." Similarly, the "Hefty Commute" installation's pin-and-wire mapping system effectively materialized emissions through collective route visualization, leading 65% of sample to reassess their transport impact perceptions (Wang & Walker, 2023).

Visualization strategies proved particularly effective in revealing hidden environmental impacts across different consumption domains. The "Atmo-scrolling" installation's use of blurred and hazy shapes created a visual bridge between digital actions and physical impact, addressing what Wedari et al. (2021) term the 'perception gap' in understanding intangible impacts. The "Pollution&Chill" installation's three-dimensional representation of streaming emissions similarly made visible the hidden environmental costs of digital

consumption, with 85% of sample expressing surprise at the impact's magnitude. The materialization approach was particularly successful in exposing contradictions between perceived and actual sustainability. In coffee consumption, 65% of students chose vending machines believing them more sustainable, overlooking waste generation impacts. This aligns with Sdrolia & Zarotiadis's (2018) findings on sustainability perception complexity. Similarly, in urban mobility, 45% of electric car users considered their choice completely sustainable, demonstrating how focused messaging can mask lifecycle impacts.

The research uncovered effectiveness in various techniques of materialization in consumption spheres. "Spilled Gold" installation's use of gradated containers made consumption of water concrete, with 90% of sample having never measured consumption in such a manner beforehand. "Clothes&Co" installation's accumulative T-shirt with pins effectively represented fast fashion's aggregated impact, corroborating Vries et al.'s (2013) work regarding materialization and its contribution to behavior change. Digital consumption posed a particularly challenging consumption sphere for awareness about the environment, with virtual impact materialization proving key to raising awareness about it. "Atmo-scrolling" installation's sticker visualization showed 90% of sample having never taken into consideration digital impact, and 75% having been surprised at seeing such a high level of emissions. That result corroborated current studies regarding perception of digital impact, and it showed how seeming immateriality is a cause for impact underestimation.

Analogy with an analog, interactive character consistently showed effectiveness in closing gaps between awareness and behavior in relation to the environment. By providing a hands-on, concrete form and a visualization, installations translated virtual, abiotic environment information into concrete experiences, supporting critical thinking about daily actions. Nevertheless, persistent gaps between perceived and real sustainability, and most notably in seemingly "green" options, reveal ongoing difficulty in overcoming greenwashing and the necessity for systemic approaches toward educating for sustainability.

That conclusion proposes effective environmental communication not only in presenting but in transforming data into interactive, concrete experiences. Effectiveness in a variety of techniques of materialization and visualization in a range of consumption spheres brings important insights for future environmental communications strategies, but at the same time, the study reveals the necessity for ongoing development in making the invisible impact of the environment apparent and overcoming complex interdependencies between perception and reality in awareness for sustainability.

Conclusion

The work opens a range of avenues for future investigation with significant development potential. First, long-term studies can investigate long-term behavior change through extended duration of embodied information about environments. Second, transposing practice for use in new environments, such as workplace settings and public spaces, can seek to generalize its effectiveness in a variety of environments. Third, real-time information feeds and IoT sensors could, together, allow for real-time installations that respond to real consumption behavior. Though in proving effectiveness in communicating with the environment through visualization and materialization, several limitations must be taken into consideration. That university students in a single faculty have been targeted in the study may not necessarily generalize a larger population

response towards visualization of environmental information. That a short-term basis for such a study is conducted is a cause for concern in terms of long-term behavior and attitude change.

In the future, such a path for conveying environmental information through visualization and materialization can become even more beneficial in working with new emerging environmental concerns. That success in discovering hidden environmental effects can have future application in new emerging industries such as mining for cryptocurrencies, cloud computation, and artificial intelligence and its environmental impact. All these can bridge the growing divide between technological development and awareness regarding the environment. The study identifies a critical imperative: developing communications that not only reveal environmental impact but that can have a sustained momentum over a period of time. There is an imperative for future inquiry into sustaining the impact of materialization through ongoing dialogue and feedback processes, potentially through a blending of virtual platforms and real-life installations to generate enduring awareness of environmental impact.

*Alessio.caccamo@uniroma1.it

ABSTRACT | As companies come under greater pressure to show that they are serious about ESG principles, being able to present clear, accessible, and engaging data on sustainability has become increasingly important, thus providing stakeholders with the data they need to evaluate corporate responsibility and sustainability practices. These reports are a factor affecting a company's access to finance, as investors and other stakeholders are increasingly making decisions based on sustainability; they enhance comprehension and retention of complex sustainability data, making information more accessible to a wide audience. It amplifies such benefits by giving a more active and dynamic insights view in real time on the dashboards' ability to permit access and interaction of stakeholders dynamically with sustainability data included within complex data sets and transforming it into very easy, nice-to-consume forms. This enhances the engagement of a user not only in understanding it better but also in creating opportunities to make more accurate decisions with in-depth analytics of data. Furthermore, impressive use of visual variables in a sustainability report not only enhances aesthetic appeal but also serves as a commanding tool in the management of impressions. By deploying enhanced visualization techniques, a firm communicates powerful narratives related to its core sustainability initiatives in shaping stakeholder perceptions and leveraging brand reputation. All these reports, however, inherently have varying levels of effectiveness, and at this juncture comes clarity-the art of communicating complicated data in a manner that can be understood-where data storytelling techniques play a crucial role. This is a practice to be undertaken with care. Ensuring the visual representations match the actual performance in sustainability will help avoid 'greenwashing', whereby organisations may seem to be exaggerating their

efforts in sustainability. Appreciating this precedent, the paper explores how the dual roles of sustainability reporting and data visualization designs support a brand in being more responsible through better stakeholder comprehension and trust.
Examples will be provided by the analysis of case studies with leading energy companies, such as Enel and Eni, on how firms are facing up to the challenges relating to transparency and accountability through the use of data visualization. They discover how design has become a major leading strategy for modern organizations in pursuit of better articulation of their commitment to sustainability, preparing stakeholders to make informed decisions with data as the backbone, and giving form to the complexities of today's sustainability landscape with design.

KEYWORDS | INFORMATION VISUALIZATION; DATA-DRIVEN DASHBOARDS; SUSTAINABILITY REPORTING; DATA-DECISION MAKING

1. Introduction

In the context of Big Data and increased scrutiny over corporate responsibility, sustainability reporting has come to mean much more than a list of environmental and social metrics. Digital platforms represent today the tool on which judgments about organizational commitment to ESG are based by all kinds of stakeholders, from investors and policy-makers to NGOs and the general public. The volume, complexity, and real-time nature of ESG data can either illuminate or obscure genuine progress, depending on how effectively information is gathered, interpreted, and presented. The challenge for companies is to leverage interactive dashboards, UX design, and thoughtful information architecture in order to engender public trust, engage visitors in substantive analysis, and reduce the risk of "greenwashing" (Gelmini, 2017; Šimunović, 2024). Eni and Enel, two leading energy corporations based in Italy, provide illuminating case studies of how design-driven dashboards can shape or reshape public discourse around sustainability. Both companies operate in a sector that is central to global climate challenges, and both have declared significant commitments to greener operations, yet they must consistently demonstrate verifiable progress to maintain credibility (García-Sánchez et al., 2019). They have risen to this challenge by building online platforms-"Eni for" and "Beyond Reporting"-aimed at making ESG metrics more engaging and interactive. While both platforms pursue similar goals, they differ dramatically in design philosophy, data visualization style, narrative choices, and levels of methodological disclosure.
This paper discusses how information design, interaction design, user engagement strategies, and team structures come together in shaping user perceptions of Eni and Enel's sustainability initiatives. Drawing on observational data, analysis of published materials, and interviews with designers, product managers, and sustainability professionals, this research places the dashboards within a broader theoretical context that deals with trust-building, impression management, and ethical design choices. These comparative insights lead to a proposed design framework that considers best practices, which can be applied across industries in the pursuit of clarity and credibility for digital sustainability reporting. This paper seeks to outline a more holistic approach to designing sustainability dashboards with deeper reflections on interface architecture, user agency, brand narratives, and cultural norms in an effort to create robust, transparent, and engaging communications.

2. Theoretical Framework

2.1 Information Design and the Construction of Credibility in Digital Media

If anything, information design conventionally underlined the use of clarity, conciseness, and coherence principles in visually presenting complex data. Within digital media, these core principles converge with elements of perceived credibility and user trust. Typographic consistency, informed colour decisions, and harmony in layouts create an aura of credibility in work related to visual cognition and human-computer interaction well before a user will start digging deeply for data evidence to support the contention. Conversely, design inconsistencies (e.g., misaligned labels, crowded charts, and a lack of consistent colour) may inadvertently sow doubts about the truthfulness of the information depicted (Tong 2023). While in sustainability contexts, organizational dashboards embed not only numerical figures but also narratives around corporate values, long-term strategies, and accountability structures. For data to inform public discourse, it has to be both accurate and meaningfully framed. Information design thus becomes the vector for weaving these contextual layers around quantitative metrics, connecting sustainability performance to broader social, economic, and ethical concerns. This process rhymes with what Tufte insisted upon-the "quality, relevance, and integrity of the content" (Tufte, 2001)-as data integrity. An organization's capability to engender trust, therefore, partially relies on the congruence of its design decisions with verifiable substance in its sustainability claims.

In respect to information design for trust-building, especially around data visualization, a set of factors encourages perceived credibility within the audience (Smith et al., 2022). Colour schemes, typography, and layout significantly shape users' willingness to trust the information they encounter (Jones et al., 2021). Visual aesthetics can enhance perceived data quality, as users often associate cohesive, well-structured visuals with higher informational integrity (Brown et al., 2023). Consistent design patterns and familiar metaphors encourage more intuitive navigation of complex datasets, fostering a greater sense of reliability (Lemon et al., 2020). Similarly, whitespace and clear hierarchies play the role of reducing clutter and making visual narratives more digestible Marques et al. (2021). Even further, the presence of transparency and accessibility enhances the level of trust in visualizations. Users are likely to find data credible when access to metadata, methodological notes, and clear source citations can be made. Data-driven dashboards represent a paradigm shift from static PDF reports by enabling real-time or near-real-time data updates, interactive exploration, and dynamic visualization (Satpathy & Gavaskar, 2022). The significance of engagement in these systems extends well beyond initial user clicks. Trust is closely linked to user experience (UX) as well. Whereas a very intuitive, pretty platform inspires confidence, one with a befuddling interface undermines confidence-even when the information in it may be accurate. Santoso & Schrepp, 2019; Tong, 2023. Equally, in presentation, the designers have to balance sophistication, simplicity, and emotional resonance if they want their users to both feel informed and welcome. Kusuma et al., 2022. The principle of "progressive disclosure" constitutes one helpful guide in this respect. While broad coverage of sustainability metrics is highly desirable, very dense visualizations impede insight into the key facts that are being communicated (Ryu & Kim, 2019). Gradual exposure to deeper layers of data allows users to explore at their own pace, enhancing user engagement and user trust (Buono et al., 2020). Interactive elements in visualizations that allow user-driven inquiry further magnify understanding in a self-reinforcing circle between clarity of design and credibility of presentation (GONÇALVES, 2023).

2.2 Data-Driven Dashboards, User Engagement, and Attention

Management

Data-driven dashboards represent a paradigm shift from static PDF reports by allowing real-time or near-real-time data updates, interactive exploration, and dynamic visualization. According to Satpathy & Gavaskar (2022), the importance of engagement in these systems goes far beyond the first clicks that users make. It includes the depth and duration of user immersion, how thoroughly users comprehend the data, and whether they feel motivated to investigate more or share insights (O'Brien & Toms, 2008). In dashboards with accessible explanations, dynamic filtering, or scenario simulations, for example, users might develop a deeper sense of agency, leading to better insight into the base metrics (Blascheck et al., 2019). However, it is critical to be sensitive about the interaction between engagement and attention management. The use of gamification or other persuasive strategies in design can take advantage of cognitive biases and thus increase user interactions, potentially overshadowing critical discourse (Sakir, 2024). Genuine empowerment differs from superficial attention capture. A dashboard supporting critical thinking displays contradictory data against positive trends, enables comparisons, and points to less favourable metrics when necessary. According to Meqdadi et al. (2020), authenticity in the presentation of data on sustainability therefore is inseparable from the general aesthetic appeal of the entire platform. While dashboards present nice visuals, if they do not encourage critical engagement with the data, there is a risk that they may actually promote passive consumption of information rather than meaningful learning and action.

User engagement in sustainability communication is a multifaceted challenge and can be approached through strategic interaction design. Gamification, for instance, is one such element that has proved to motivate more active involvement in making sustainability goals enjoyable and rewarding according to Arceiz et al., 2022. Incorporating storytelling techniques, including narratives or case studies, makes issues more relatable and captures user attention (Ji & Darnall, 2020; Meqdadi et al., 2020). Providing immediate feedback to users about their actions—such as showing real-time energy consumption—reinforces positive behaviours and sustains ongoing participation (Orr & Jadhav, 2018; Cavicchi et al., 2022). The feature of social sharing, through features like achievements or community challenges, helps develop a collective sense of responsibility and further enhances user engagement (Santana & Gil, 2019; Agost & Vergara, 2020). Besides, it is important to develop critical thinking in users. Interfaces designed to encourage the user to investigate and question-allowing, for instance, the manipulation of variables in an interactive visualization-enable a deeper grasp of sustainability at a more personal level (Makhubele et al., 2021). Access to a variety of perspectives and sources of information empowers independent opinions and more informed decision-making processes. Irizar-Arrieta et al. (2018), Smith et al. (2020) Ethical considerations in attention design add another layer of complexity: while gamification can draw users in, designers must ensure they do not unintentionally promote superficial participation or distract from core sustainability objectives. Sakir (2024). Pravis' such as transparent communication of goals and possible consequences increase trust, as does inclusive interface design that caters for a variety of user needs (Yang et al., 2022; Akhtar, 2024). In general, considerate interaction design, real-time feedback, critical thinking features, and ethical attention strategies can, in combination, result in meaningful experiences that engage not just the users but also mobilize them towards concrete sustainability action.

2.3 Visual Impression Management, Transparency, and Greenwashing

Visuality management refers to organizational strategies of manipulation through design elements, such as charts, infographics, or framing narratives, to elicit desired emotional

and cognitive responses. In sustainability reporting, for example, color-coded progress bars might highlight positive trends while relegating disclaimers about methodological shortcomings to fine print. Not all of it is necessarily unethical; it may be a clear message to a larger audience. However, excessive aesthetic curation bears the risk of concealing relevant information and ultimately damaging user trust (Rodrigues & Franco, 2019). Authors point out that in the case of dashboards that present only selective successes or exclude unfavourable metrics, there is a heightened risk that such stakeholder communication may be perceived as deceitful (Šimunović, 2024). Greenwashing underlines the tension between appearance and reality within sustainability discourse. Corporations that tout ESG credentials without aligning them with verifiable metrics may suffer reputational harm and alienate stakeholders (García-Sánchez et al., 2019). Although external audits or adherence to frameworks like the GRI and TCFD can bolster legitimacy, these signals must reflect authentic performance rather than serve as mere window dressing. Designers play a vital role here in incorporating disclaimers and transparent data sources that temper scepticism while keeping visuals comprehensible. A balance between stylistic impact and verifiable reporting is key to maintaining public trust.

2.4 Digital Product Teams and the Role of Designers as Information Mediators

The development of sustainability dashboards reflects wider changes in digital product development. Traditional reporting teams would often operate in siloed structures, where sustainability experts compiled the ESG metrics, which then needed to be formatted as static reports by communication specialists. In contrast, modern approaches integrate design, data science, sustainability management, and user research in agile feedback loops (McMahan et al., 2021). An integrated model allows for real-time adaptation of dashboards in response to new frameworks, changing user expectations, and the ever-changing ESG landscape. Designers' roles have grown to be much more than just aesthetically pleasing, now acting as an "information mediator." Designers team up with data scientists and subject matter experts to translate technical data into an engaging, user-friendly interface. They embed narratives or educational aids that could help general audiences understand complicated metrics and make sure navigation remains intuitive (Wiyanto 2016; McMahan et al. 2021). This role also involves reconciling brand identity with methodological integrity so that a desire to showcase positive achievements does not overshadow the need to present a balanced representation of organizational sustainability practices (Kunneman & Filho, 2020). User-informed iteration cycles allow them to be iteratively refined, incorporating user-cantered principles with ethical considerations of reporting. Recent research has shown that these integrations of design, data science, and sustainability are not only improving the quality of the products but also foster much more responsible use of data. This collaborative mindset, which has permeated these evolving digital product teams, as expounded in detail by Yanran 2023 and Mulyani et al., 2020, reflects a greater shift toward seeing ESG communication not as some static, one-way flow of figures and claims but rather as a dynamic conversation.

3. Methodology

3.1 Research Design and Rationale

This qualitative comparative case study will seek to understand how design principles and interaction strategies shape trust in corporate sustainability dashboards. Eni and Enel are the two dominant players in the Italian energy sector, with well-publicized

sustainability ambitions, representing an ideal contrast in terms of data visualization, narrative integration, and user engagement. These cases will enable further interrogation of design's capacity to structure user perceptions of progress and accountability.

3.2 Data Collection

Data are collected in multistage. Publicly available documents were sourced, including annual and sustainability reports from 2019 to 2023 of each company under study, with the purpose of understanding how its messaging evolved, the extent to which data are disclosed, and what strategic goals have been declared. Direct dashboard analysis, "Eni for" and "Beyond Reporting," was performed multiple times on several devices and in different screen resolutions, capturing interface structures, interactions, visual designs, and text comments. This observation gave real anchor points for interviewing the interviewees on design decisions and the integration of user feedback.
Semi-structured interviews then followed, averaging an hour each, conducted with a total of fifteen professionals across both organizations. Participants included designers, product owners, sustainability managers, and UX researchers to account for diverse insights into design, data integrity, brand communication, and user-centric goals. Interviews were coded as transcripts using the method of Thematic Analysis on issues such as how data complexity was dealt with, how design was used to maintain or improve credibility and how the teams aimed to engage different user personas. Due to confidentiality agreements, it is not possible to directly cite the quotes by individual roles. However aggregated findings form the basis of comparative insights presented in this paper.

3.3 Evaluation Dimensions

The core analytical framework focuses on four dimensions in which similarities and discrepancies between Eni and Enel are tracked: information design, trust-building, engagement, and critical thinking. Information design here examines coherence, hierarchical structuring, and visual clarity; trust-building investigates the presence of transparency practices, methodological references, and external validation signals. Engagement assesses levels of interactivity, UX fluidity, emotional or narrative resonance, and user empowerment in data exploration. Critical thinking takes into account the way in which each platform supports or constrains comparative analyses, reveals uncertainties, and uses ethical design features that may facilitate or hinder objective interpretations.

This multilayered approach offers a balanced view of how each company's design decisions shape stakeholder perceptions. In triangulating the findings, the study accounts for potential distortions, such as the presence of brand-specific colour palettes, differences in user feedback channels, or the selective nature of interviewee experiences. Although the analysis reflects a specific temporal snapshot, these case-based observations highlight recurring design patterns, trade-offs, and best practices that can be generalized to other contexts where sustainability reporting seeks to earn public trust and encourage more informed engagement.

4. Comparison Cases

4.1 Eni’s “Eni for”

The sustainability dashboard of Eni welcomes visitors with high-impact visuals strongly reflecting brand identity. Bold colour contrasts, often involving the company's signature yellow and black, punctuate the homepage with quick snapshots of strategic pillars, narratives describing transitions toward greener operations, and short success stories.

The initial impression is one of confidence and forward momentum, underlined by banners proclaiming reductions in emissions or expansions in renewable energy partnerships. [Figure 1]

Figure 1. Eni For – Landing Page

A deeper examination, reveals that Eni's platform offers limited real-time manipulation of data within the dashboard itself. Interactive elements exist—such as hover-enabled tooltips for charts—but the platform tends to redirect users to external PDF reports or embedded links if they seek comprehensive data sets or detailed methodological explanations [Figure 2]. According to one of Eni's design leads, this approach arose from the internal tension between providing immediate, highly distilled information to broad audiences and allowing deeper exploration for experts. The final result leans toward a streamlined experience, guiding casual visitors through summarized infographics, while leaving more specialized data analysis to downloadable documents.

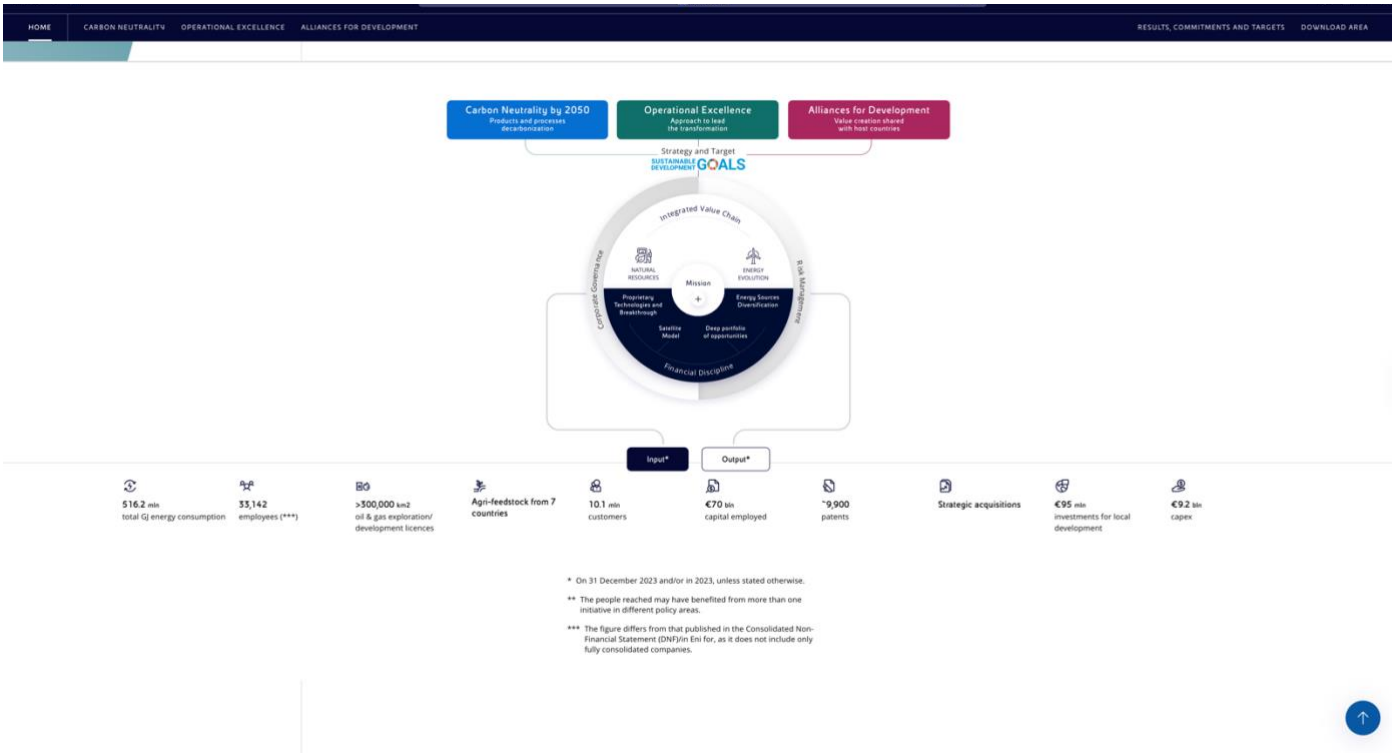

Figure 2. Eni For – Infographics of the Goals

The main positive here is that it keeps the website uncluttered and can communicate, rather quickly and visually, the major achievements by Eni. However, it also limits the possibility of immediate user-driven comparisons for different indicators or time spans. Looking from the trust viewpoint, the platform references recognized frameworks, usually in footnotes, and signals alignment to global standards like TCFD. These textual disclaimers suggest data are "verified" or "externally assured," but here the user would need to make an additional step in order either to access them or confirm it. This aspect of design, though readable from the perspective of pragmatic simplicity, can also lead to concerns the platform accentuates favourable data with much more strength than ambiguous data or challenging metrics [Figure 3].

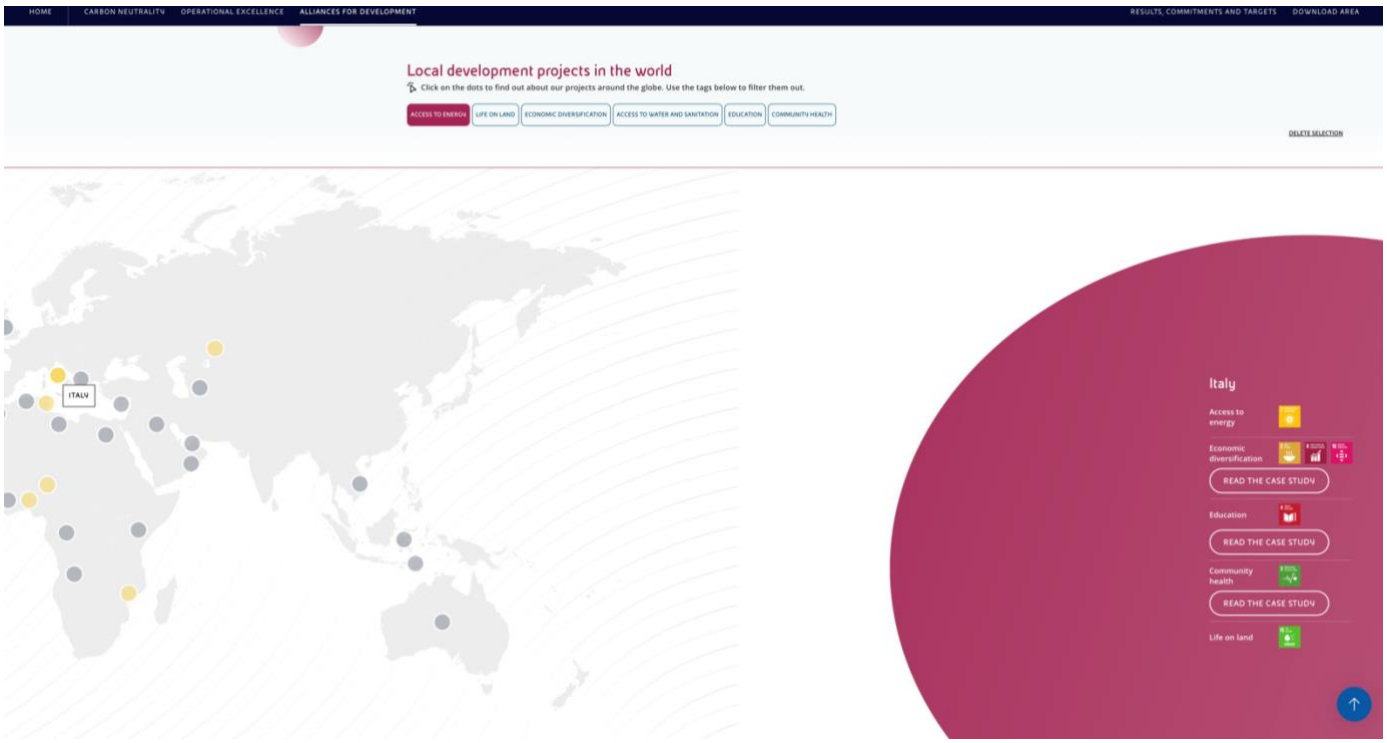

Figure 3. Eni For – Infographic Maps

According to these, they aim to keep positive milestones front and centre, viewing the website as a window into Eni's evolving trajectory rather than a "raw data clearinghouse." While the platform might embed disclaimers and references to partially met goals, it remains more celebratory than self-critical in tone. This characteristic can also raise scepticism in users, who might expect interactive dashboards to balance achievements and ongoing-perhaps underdeveloped-aspects of performance (Šimunović, 2024). Though the choice by Eni might be appropriate in a brand communication strategy, this underlines how complex the relationship between marketing imperatives and imperatives of transparency in reporting can be when one is designing a sustainability dashboard.

4.2 Enel's "Beyond Reporting"

The "Beyond Reporting" platform of Enel runs with a cleaner and more minimalist aesthetic, using lighter background tones, expansive whitespace, and well-orchestrated typographic hierarchies. It was scrolling through the homepage by users with scarce narratives in measured sequences, referring to matters such as decarbonization, the circular economy, and social development initiatives. Each segment brings on a story with data visualizations responding to user inputs like year selections or geographic filters [Figure 4]. This approach points toward a more integrative perspective on data exploration-that is, guiding the user from an overarching narrative to specialized details without switching to separate reports

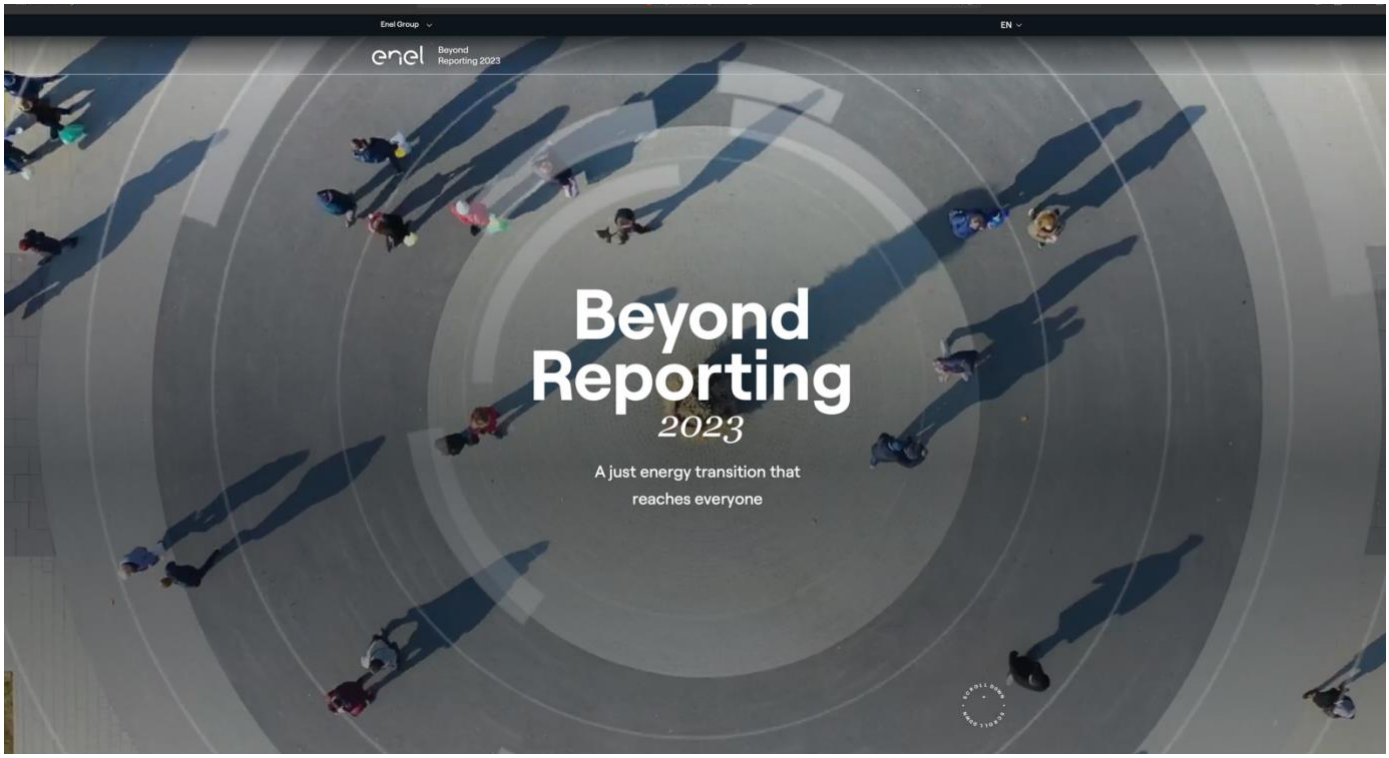

Figure 4. Enel Beyond Reporting – Landing Page

Methodological transparency in Enel often extends beyond the usage of short footnotes, locating data definitions, references to third-party audits, and alignment to recognized frameworks in side panels or collapsible sections within the main interface. This design choice helps to respond to user concerns with "where the numbers come from,"

alleviating the friction created by opening several PDFs. It frames the platform as an evolving, living repository rather than a promotional page.
Engagement strategies for Enel's users are based on scroll-telling, short animations, and interactive visualization of historical and current performances. One could follow how the renewable capacity of the company has grown over several years, embedded links explaining how that capacity is calculated, cross-referencing with greenhouse gas emission reductions. Their ambition was to go further in creating a deeper user connection by merging brand messaging with active learning tools through interviews.

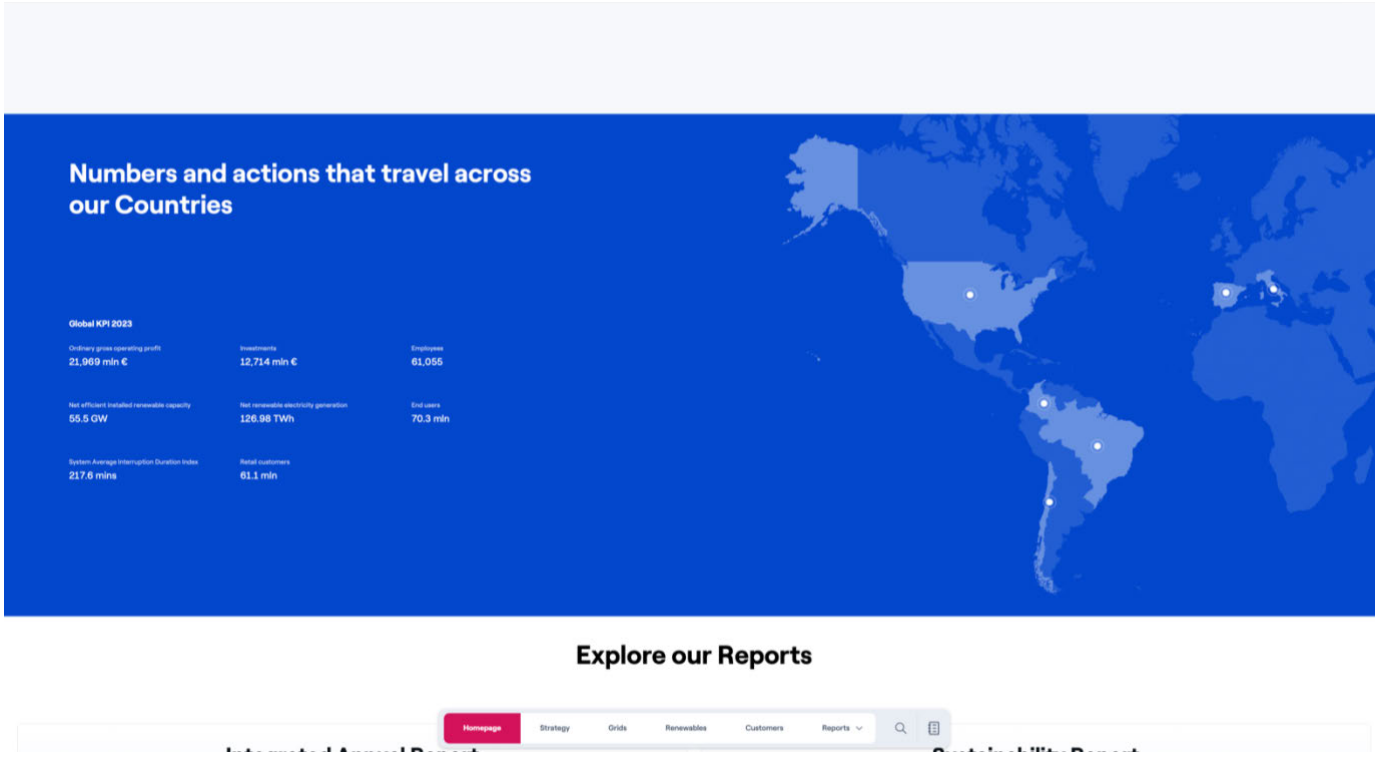

Figure 5. Enel Beyond Reporting – Infographic Maps

Although there are apparent strengths in the platform, a number of glaring criticisms regarding framing the narrative somewhat selectively do tarnish its result [Figure 6]. Indeed, although Enel does discuss some challenges, mainly setting these against the context of transition hurdles towards ambitious targets will probably soften some realities that will be delayed or missed. Yet, the presence of disclaimers and footnotes throughout the site reduces the risk that users view it as overtly promotional.

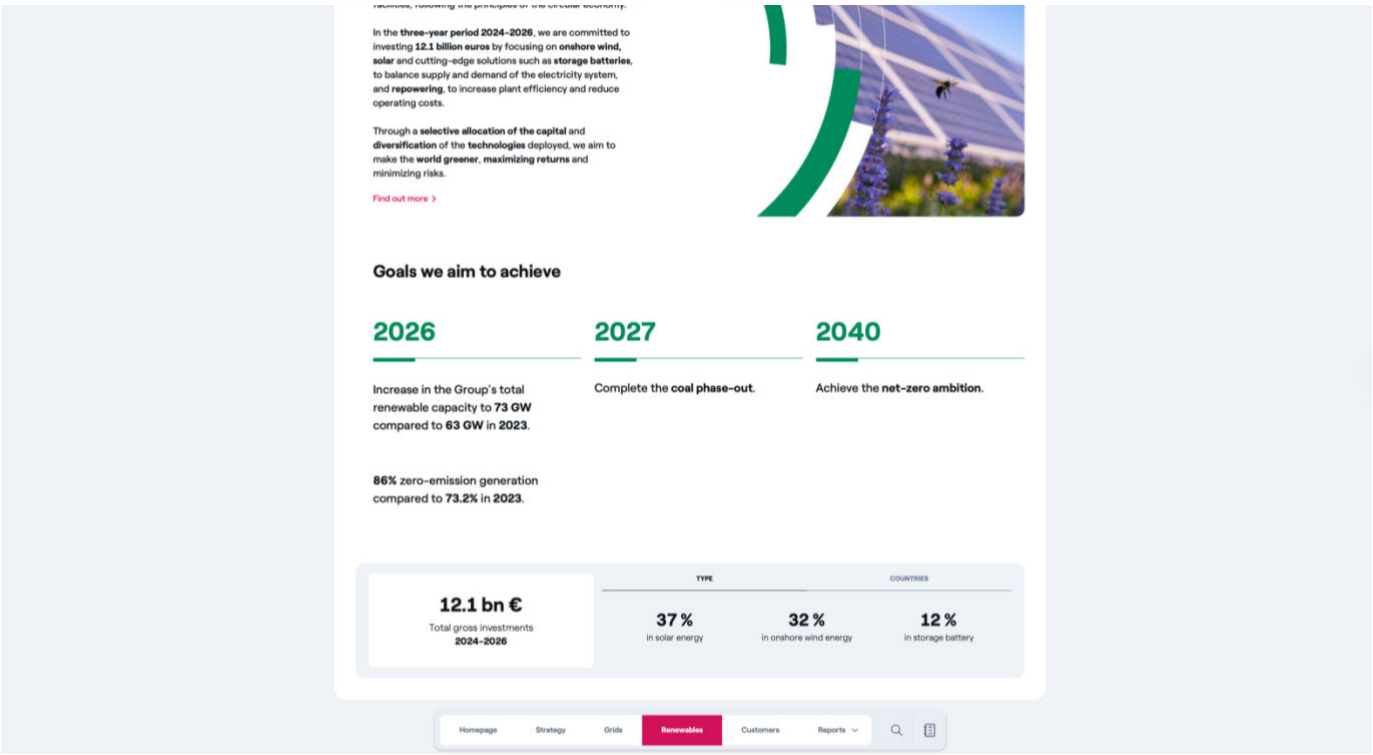

Figure 6. Enel Beyond Reporting – Some data reports

Feedback from the users through interviews and partial user testing data indicates that the investment professionals and policy analysts go for deeper explorations or downloading of data within the tool, while casual visitors remain at top-level narrative blocks or videos. This may hint at the dual nature of this website: professional scrutiny and general public outreach.

5. Discussion

5.1 Observed Commonalities and Divergences

Eni and Enel have a common strategic objective in using design-based storytelling and interactive visuals to build perceptions about their respective energy transitions. Both firms draw on colour theory, brand-specific iconography, and short narratives depicting either community projects or technological breakthroughs. Their reports denote commitments to known frameworks, and both dashboards refer to external validation or audited metrics. The key divergence is found in how each platform structures user exploration. Eni encourages a concise, aesthetically driven “first impression,” relegating granular data to external PDF resources. Enel attempts to embed detail within the platform itself, enabling real-time data toggles and direct references to methodological clarity in-situ.

This duality reflects each company’s internal decisions regarding what user segments to prioritize. The Eni website, on the other hand, encourages quick scanning and brand-based storytelling, probably better suited to the general audiences or potential partners who want an overview. Here, Enel's approach definitely better accommodated users who had an appetite for deeper data interrogation and ongoing updates, possibly offering a stronger bulwark against greenwashing suspicions. Neither approach is "wrong," but they represent different design philosophies about how to balance clarity with detail. They also

show how two organizations in the same sector can deploy design in divergent yet purposeful ways.

5.2 Tensions Between Marketing Aims and Ethical Transparency

One common tension was the conflict between marketing imperatives and the ethical imperative to be transparent with regard to the sharing of data. Respondents from Eni and Enel both agreed that top management would prefer underlining success, brand identity, and forward-looking statements, while domain experts or user researchers would propose deeper, even-handed coverage of achievements and setbacks. These tensions materialize in design decisions, such as how to position disclaimers or how to word textual explanations for partially met goals, among other design decisions (Rodrigues & Franco, 2019). In each case, design is not solely about visual aesthetics but about strategic trade-offs between brand messaging, user autonomy, and the moral imperative to present data honestly.

Therefore, the notion of "ethical design" in sustainability dashboards involves not only how well the user experiences the interface but also how the organization balances promotion with forthright disclosure. Greenwashing can thrive under conditions where marketing overshadows data accuracy or omits critical context (Gelmini, 2017). Accordingly, in mitigating such risks, Enel embedded references to external assurance, more interactive modules function as a possible safeguard by putting details and disclaimers within users' immediate paths. As Eni operates more through their external downloads, it may come under suspicion on the part of those who find hidden data dubious. Yet these perceptions will also depend on user motivations: an inquisitive stakeholder may accept Eni’s system if they trust the externally assured documents, while a casual viewer might remain unaware of the deeper data behind the polished visuals.

5.3 Facilitating Critical Thinking Through Design

Designers interviewed at both firms voiced aspirations to guide users beyond mere acceptance of corporate narratives toward active questioning. They made reference to the use of progressive disclosure: making simple visuals, for example, but then displaying richer layers for a click or hover, letting different user groups find their comfort zone (Buono et al., 2020). Still, they express a need toward standard frameworks indicating anomalies or estimates, which themselves support stakeholders with posing critical questions. However, in practice, these platforms go differently. Eni speaks about deeper metrics only after it bounces the user to a PDF, potentially breaking the interactive flow. InEnel's in-dashboard disclaimers and toggling direct data foster a more continuous learning experience, though not all visitors will choose to avail themselves of those resources.

Building critical thinking capacities requires transparency over data derivation. Both speak about their auditing processes, but presence and accessibility diverge. Overcoming user skepticism often relies on how swiftly and clearly a platform can address questions about where numbers come from or how they are validated (Šimunović, 2024). Visual explanations, side panels specifying the source of each metric, or short videos featuring sustainability experts can reinforce user confidence while underscoring the complexity of ESG measurement. This approach also follows the thinking that design can act as knowledge intermediary between distinct data sources and larger groups without specific knowledge relating to energy or emission accounting.

5.4 Reflections on Cross-Disciplinary Collaboration for Sustainability

Dashboards

A significant part of both sites is a function of cross-functional teams, bringing together design, data science, and sustainability disciplines. In fact, interviewees identified iterative sprints and user feedback as key in refining not just the user interface but also the data narrative: everything from deciding which metrics to foreground, to calibrating how often updates should appear on the dashboards. Often, the friction between brand custodians and data analysts itself produced constructive debates about user experiences that led incrementally to modification. This corroborates the arguments by Mulyani et al. (2020) that agile frameworks, in collaboration with domain expertise, will create stronger and better-adaptive final products in ESG communication.

Such frameworks also explain the trend to evolve responsibilities of designers as information mediators. The designers at Eni described balancing leadership's emphasis on brand identity with technical inputs from sustainability managers and arriving at a compromise focused on simplified visuals for general audiences. According to their product managers, the design teams at Enel started off with similarly brand-driven constraints but increasingly championed deeper in-dashboard detail, partly to appease specialized user segments-e.g., investors, analysts, NGOs-who had asked for more robust real-time explorations. It is in such an environment that design decisions will be less about a monolithic and static phenomenon but more a continuous outcome of negotiations across corporate hierarchies, user needs, and ethical aspirations.

6. Toward a Design Framework for Interactive Sustainability Dashboards

The comparative insights provided by Eni and Enel's practices create a wider perspective on how such a dashboard can reach credibility, engage different audiences, and balance aspirational messages with transparent disclosure. Each one of the two platforms demonstrates some trade-offs, but a number of recurrent strategies are present that could form the base for a design framework for organizations willing to enhance their sustainability reporting. Ideally, the design framework for sustainability reporting platforms would be composed of conceptual pillars: information design, ethical commitments, user-cantered engagement, and agile adaptation.

One core principle is to align the visual hierarchy with the data hierarchy. Accomplished designers make sure that the very most important data points are most visually prominent, while complementary or secondary data are available through progressive disclosure in a layered presentation that suits casual users interested in an overview and specialists needing in-depth analytics. The Eni and Enel platforms reveal variations on how to sequence information: from quick visual summaries that funnel deeper exploration to direct real-time toggles embedded within the main page. At the core, there is one principle: data significance shall guide its appearance, not solely brand aesthetic.

A second key pillar deals with providing pathways for user-driven critical inquiry. Sustainability data often consists of many variables, with overlapping time horizons. Dashboards can enable critical thinking by comparing across metrics, visualizing historical trends, and performing scenario analysis. Enel's interface best depicts interactive timelines and scroll-telling that foster curiosity, while Eni underlines the role of external, more technical documents. Advanced filtering or data overlays within the main interface, integrated by at least some dashboards, will increase user autonomy. By

adding disclaimers, clarifications, or "Why this metric matters" panels around each chart, organizations encourage reflexivity rather than blind acceptance.

Another fundamental building block is Embedding Transparent Methodological References directly in the interface. It should not be that users have to search through long PDFs to validate data credibility. Similarly, footnotes, side panels, or collapsible text boxes outline the standards that are applied to create the metrics, such as GRI, SASB, and TCFD, when auditing is taking place, what assumptions were used, and so on. Doing so would parallel research into how digital trust may be established-the ease of accessing and comprehensiveness of explanations about data origins can allay suspicions of selection bias (Smith et al., 2022; Šimunović, 2024). While Eni relies more on linked external documents, Enel's embedded references hint at a more integrated model that fosters in-the-moment check.

A fourth pillar pertains to Ensuring Narrative Integrity, wherein the storytelling elements-textual overviews, embedded videos, or case studies-of the dashboards truthfully reflect the substance of the data. The risk of greenwashing escalates when "success stories" overshadow or omit contradictory metrics, inviting doubts about authenticity. Effective dashboards would have both successes and challenges together on display, pointing out partial or unmet targets and explaining how the organization will address them. This balance may actually serve to increase user trust by demonstrating an intent to share current struggles, rather than simply providing marketing stories (Rodrigues & Franco, 2019).

A fifth foundation would be to create mechanisms for continued feedback and iteration. Agile digital product teams may embed mechanisms within dashboards where users can communicate confusion, seek clarification, or suggest additional depth. Such recursive processes spur iterative interface refinements and data augmentations. This helped Eni manage brand constraints through design sprints, while Enel employed user feedback in support of sophisticated interactive capabilities. In both cases, cross-functional dialogues among designers, data analysts, and sustainability stakeholders proved to be pivotal in shaping final outcomes. A formalized feedback channel might stimulate more vigorous community involvement and real-time alignment with the evolving nature of the data [Figure 7].

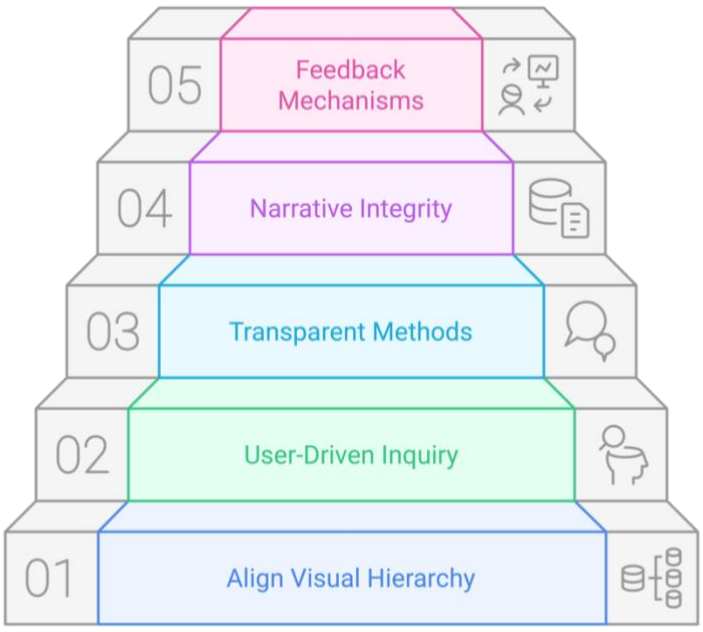

Figure 7. The Five Pillars for a Sustainable Dashboard

Taken together, these pillars put forward a robust design framework leveraged from best practices identified in both the Eni and Enel dashboards. By marrying layered information presentation with methodological transparency, balanced storytelling, and iterative user testing, the dashboard can move beyond one-dimensional brand promotion into serving as a credible, dynamic resource. The framework would have a number of wide-ranging applications well beyond the energy sector itself: from consumer goods to financial services, the ESG issues are no less pressing. But across all fields, the alliance of design thinking and ethics will change static disclosures into transformational vehicles of communication.

7. Conclusion

The comparison of Eni's "Eni for" and Enel's "Beyond Reporting" underscores the centrality of design and user interaction strategies in shaping trust and engagement within corporate sustainability reporting. While both dashboards represent serious attempts to communicate ESG data visually, they reflect divergent philosophies regarding data depth, user autonomy, and brand emphasis.

Eni's succinct layout and brand-centric visuals appeal to broader audiences seeking quick overviews, though readers must consult external resources to verify details. Enel's integrated interface, offering interactive toggles, in-dash methodological references, and scroll-telling, caters more thoroughly to varied user expertise levels. Yet both platforms demonstrate how design elements can enhance or potentially compromise perceptions of transparency, depending on how thoroughly corporate challenges, uncertainties, and partial progress are disclosed.

These findings chime with more general discussions around digital trust-building, greenwashing, and the interaction between design and ethics. Accordingly, there is an increased need by stakeholders for nuanced, user-friendly dashboards that go beyond showcasing achievements to include obstacles and ongoing targets in a balanced presentation. When design choices fall short of this demand, accusations of selective reporting or impression management can arise rather too easily (Šimunić, 2024). Conventional dashboards, on the other hand, provide open data references, real-time comparisons, or disclaimers related to incomplete metrics because their visual narrative corresponds to real-world performance complexity. Designers function instrumentally, nor merely as aesthetes, in deciding how users encounter data, navigate uncertainties, and make judgments.

The proposed design framework articulates several guiding principles that may lead organizations toward more authentic and interactive sustainability reporting. The design teams could transform dashboards into catalysts of informed discussion and continuous learning by embedding the visual hierarchy in data importance, methodological transparency within dashboards, and offering storylines that account for failures alongside triumphs. Set within agile product development, feedback loops can help distill this over time, enabling the evolution of dashboards that reflect the evolving realities of ESG. And in the final analysis, clear content, user-focused interfaces, and ethical imperatives may turn out to be just what it takes to change not only how companies do their measurements but also how they collaborate with their stakeholders to carve out more responsible and accountable pathways forward. Although Eni and Enel belong to a unique sector and cultural context, the examples derived from their dashboards give

meaning for a variety of industries around the world on how design principles, data integrity, and public trust can combine in a strong engine for sustainable innovation.

Epistemic Virtues and Vices in the Design of Digital Media: The Case of Legal-Checking in the Media Les Surligneurs.

Daniel Uribe[a]

a Institut Jean-Nicod (Département d'études cognitives, ENS, EHESS, CNRS, PSL) and Où sont les Dragons, *daniel.uribe@outlook.fr

ABSTRACT | This paper examines the epistemic virtues and vices embedded in digital media design, using the case of Les Surligneurs, a legal fact-checking platform. By integrating virtue epistemology and the Values in Design (ViD) framework, this study highlights how design choices shape epistemic values such as understanding and transparency, while also exposing potential epistemic risks.
Virtue epistemology offers a normative perspective that links knowledge acquisition to intellectual virtues such as impartiality. Traditionally applied to individual agents, this approach has been extended to institutional and digital contexts, where platforms can foster virtuous engagement or reinforce epistemic vices. In parallel, the Values in Design (ViD) approach critiques the notion of technological neutrality, emphasizing how artifacts embed moral values. Combining these perspectives, this paper proposes a framework for analyzing epistemic virtues and vices in digital media at three levels: designers, platforms, and users. By structuring the analysis through these three dimensions, this study offers a comprehensive understanding of how digital environments can shape knowledge practices. Furthermore, this analysis examines how key epistemic values are embedded in digital media design and how their realization depends on the interplay between epistemic virtues and vices. While epistemic virtues facilitate the actualization of these values, epistemic vices create obstacles that hinder their realization.
To illustrate this relationship, this study examines Les Surligneurs, a platform uniquely positioned at the intersection of law, journalism, and digital design. Unlike traditional fact-checking initiatives, Les Surligneurs specializes in "legal-checking," assessing the accuracy of legal claims made by public figures.

Les Surligneurs exemplifies the epistemic value of understanding by integrating legal expertise and pedagogical design into its digital platform. By relying on legal scholars to verify claims and structuring content for accessibility, the platform fosters public comprehension of legal reasoning. Its design, featuring journalistic aesthetics, progressive explanations, and color-coded labels, balances clarity with complexity, countering legal misinformation while mitigating the vice of oversimplification. The platform embodies the virtue of pedagogy by prioritizing clarity while maintaining the depth required for legal accuracy. However, challenges remain, including the risk of reducing legal nuances and limited outreach beyond fact-checking-engaged audiences.
Transparency, another core epistemic value, is realized through rigorous verification processes, methodological disclosure, and participatory engagement. The platform upholds the virtue of

sincerity by openly presenting its verification methodology and encouraging public scrutiny. Yet, transparency also introduces vulnerabilities, as fact-checking platforms like Les Surligneurs are targeted by disinformation campaigns led by actors who exhibit the vice of insincerity and exploit open verification mechanisms. Additionally, the opacity of claim selection and content curation risks perceptions of bias, potentially undermining trust in the platform's neutrality. To enhance epistemic integrity, greater editorial disclosure, clear criteria for claim selection, content diversification, and strategic safeguards against manipulation are needed.
Thus, this study argues that embedding epistemic values in digital design is essential for fostering responsible information ecosystems. Beyond epistemology, this discussion intersects with broader ethical and political considerations.

KEYWORDS | DIGITAL DESIGN, INFORMATION, SOCIAL EPISTEMOLOGY, LEGAL DESIGN, TRUST, VIRTUES, VICES, VALUES, UNDERSTANDING, TRANSPARENCY

1. Introduction

Digital environments reshape information production, sharing, and understanding, influencing knowledge acquisition and dissemination (Choo, 2016). As designed artifacts, they mediate user interactions, structuring engagement through algorithmic content delivery, shaping epistemic experiences, and impacting trust in knowledge.

Political epistemology provides tools for analyzing digital media's influence on misinformation and public trust. The rise of "post-truth" discourse and epistemic bubbles heightens these concerns (Hannon & de Ridder, 2021). Trust, central to digital interactions (Doueihi & Domenicucci, 2018), is undermined by engagement-driven design. Hidden ads, dark patterns, and opaque algorithms foster epistemic opacity and user manipulation. Given these challenges, fact-checking platforms have emerged as institutional responses to the erosion of trust. Fact-checking platforms such as PolitiFact, Snopes, and Les Décodeurs strive for neutrality and transparency but face scrutiny over their effectiveness. Their credibility hinges not only on content accuracy but also on how design fosters trust and engagement.

A particularly complex domain is legal misinformation, where misinterpretations of legal rules influence public debates and policy decisions. Legal discourse's complexity necessitates accessible legal information, which legal design aims to improve (Ducato, Strowel, & Marique, 2024). The legal-checking media Les Surligneurs exemplifies this approach, ensuring legal verification is both rigorous and comprehensible. While not explicitly within legal design, its concise formats balance accessibility with legal precision, addressing misinformation and trust challenges in legal discourse.

This paper integrates virtue epistemology and Values in Design (ViD) to analyze digital media and in particular fact-checking platforms' role in shaping knowledge. Virtue epistemology assesses epistemic virtues and vices in knowledge practices, while ViD emphasizes embedding human values in technology. Extending ViD to epistemic values such as understanding and transparency highlights how design impacts knowledge production. The case of Les Surligneurs illustrates virtuous design fostering these values while acknowledging potential epistemic vices. This dual perspective underscores design's centrality in fostering epistemically responsible digital environments.

I am conducting a doctoral research (CIFRE) at *Où sont les dragons*, a design agency that shares part of its ecosystem with *Les Surligneurs*. While the agency has collaborated with the platform by providing design services, it was not involved in the strategic development or management of the platform. The two entities share a co-founder, but this connection had no influence on the research or analysis conducted in this paper.

2. Theoretical Framework: Exploring Epistemic Virtues, Vices, and Values in Digital Media Design

2.1. Virtue Epistemology and Values in Design: Two Approaches to Understanding Virtues and Vices in Digital Media Design

First, virtue epistemology is a relevant approach for capturing epistemic vices and virtues in digital media design. Virtue epistemology links intellectual virtues, such as impartiality and intellectual perseverance, to knowledge. As Linda Zagzebski argues, this normative approach redefines knowledge as a state achieved through acts motivated by intellectual virtue, moving beyond classical epistemology's focus on justified true belief (Zagzebski, 1996). Zagzebski highlights virtues as traits rooted in motivation and excellence, while Quassim Cassam critiques this motivational emphasis, defining intellectual vices as intellectual failures, such as arrogance or superstition, that negatively impact our intellectual conduct by obstructing the acquisition of knowledge (Cassam, 2019). Pascal Engel extends the analysis by associating virtues with adherence to epistemic norms and contrasting high-level moral virtues with lower-level cognitive limitations (Engel, 2019). Virtue epistemology also examines the epistemic behaviors of individuals and institutions. While traditionally focused on individuals, thinkers like Miranda Fricker apply virtues to institutional contexts, emphasizing ethos and collective responsibility (Fricker, 2020). Furthermore, virtue epistemology proves insightful for analyzing digital environments. Platforms foster or hinder epistemic virtues, influencing users' behaviors. Richard Heersmink's proposed virtues, including intellectual humility and perseverance, are crucial for promoting responsible engagement in online spaces (Heersmink, 2018).

This approach finds enrichment through the multidisciplinary perspective of Values in Design. Values in Design (ViD) is a broad interdisciplinary approach that examines how artifacts, in general, incorporate and promote values such as autonomy, privacy, and equity. Originating in Batya Friedman's Human Values and the Design of Computer Technology (Friedman, 1997), ViD critiques the notion of technological neutrality, building on Langdon Winner's assertion that artifacts, from infrastructure to everyday tools, often embed political or social values (Winner, 1980). While ViD is not limited to digital artifacts, its principles apply effectively to digital media, where tensions between moral and economic values often surface.

Virtue epistemology and Values in Design (ViD) offer complementary frameworks for addressing epistemic and ethical challenges in digital media. The literature includes contributions that integrate perspectives analyzed by both frameworks, demonstrating shared goals of fostering epistemic responsibility and ethical design. Building on the notion of "online intellectual virtues", Lukas Schwengerer proposes an account that links individual epistemic responsibility to platform design, emphasizing critical evaluation and resilience against misinformation (Schwengerer, 2024). Online intellectual virtues involve applying epistemic virtues while recognizing the inherent limitations and dangers of the Internet, such as filter bubbles and rapid misinformation. He also argues that user-friendly design encourages an overly trusting attitude by making information seem reliable simply because it's easy to access. This vulnerability can be exploited for manipulation. He advocates for designs that promote both usability and critical thinking (Schwengerer, 2022). Similarly, Figà-Talamanca and Hunting critique Facebook's opaque design for exploiting cognitive integration and fostering ignorance. This process embeds digital platforms into human cognition, shaping how individuals process information. Unlike neutral cognitive aids, Facebook's algorithms and design choices reinforce user dependency while concealing its mechanisms and designers' intentions (Figà-Talamanca & Hunting, 2022). Moreover, Regina Rini highlights how platform design can institutionalize virtuous practices, proposing reputation systems to evaluate user credibility based on the reliability of shared information (Rini, 2017). Jacobs et al. expand this discussion by analyzing power dynamics in socio-technical ecosystems, showing how design constraints shape values like transparency, justice, and autonomy (Jacobs, Kurtz, Simon, & Böhmann, 2021). Both ViD and virtue epistemology advocate improvement through embedding values into artifacts and cultivating virtuous epistemic agents. These frameworks address responsibility at individual and collective levels. These perspectives jointly promote epistemically responsible digital ecosystems.

2.2. Epistemic Values Realized Through Design in Digital Media

Digital Media embodies epistemic values, realized through users, platform design, and designers. Our contribution lies in attributing virtues and vices at all three levels, offering a comprehensive framework for understanding their epistemic impact.

1. **User Virtues and Vices:** Intellectual virtues like impartiality, sobriety, and tenacity, discussed by Boudewijn de Bruin and Luciano Floridi, enhance critical engagement with digital content, while vices like negligence, distraction, and overconfidence hinder epistemic practices (de Bruin & Floridi, 2018).
2. **Platform Design:** Digital Media influence knowledge production through design features such as interface components or default settings. Some designs may increase false beliefs, making it possible to classify platforms as epistemically virtuous or vicious based on their impact on truth production. Alvin Goldman's "veritism" provides a framework for this evaluation by focusing on the quantity of true or false beliefs a system generates (Goldman, 1999). However, veritism misses normative and motivational dimensions, which virtue epistemology can address. We suggest that design elements are virtuous if they foster epistemic virtues and vicious if they promote epistemic vices.
3. **Designer Responsibilities**: Designers bear responsibility for embedding values into platforms. Virtues like epistemic altruism or vices like insouciance shape whether platforms support or undermine epistemic goals.

By attributing virtues and vices to users, platforms, and designers, this paper establishes a nuanced framework that integrates epistemic values at multiple levels of digital media.

Virtue epistemology and ViD provides a framework to integrate a plurality of epistemic values into digital media. While digital media can incorporate various epistemic values into their design, such as clarity, informational balance, or disinterestedness, our analysis will particularly highlight understanding and transparency. These two values are key to evaluating how reliable and well-structured digital environments are, making them worth exploring in this article.

1. **Understanding** involves integrating information into a coherent whole, enabling depth and completeness. Unlike knowledge, which consists of accumulating true beliefs, understanding emphasizes grasping relationships between pieces of information, providing a structured and meaningful perspective. While knowledge can exist in isolated facts, understanding requires connecting these facts to reveal underlying patterns and causal relationships. Moreover, understanding often demands an active cognitive effort, synthesizing information rather than merely receiving it, making it a more holistic and encompassing cognitive achievement (Khalifa, 2017; Kvanvig, 2003; Trout, 2017; Zagzebski, 1996).
2. **Transparency** is a foundational epistemic value linked to the metaphor of light and clarity, enabling scrutiny, accountability, and trust. It lies at the heart of the scientific method (Shapin, 1996). Transparency enables tracing processes behind knowledge claims, ensuring reliability. In contrast, opacity obstructs understanding, as seen in black-box information systems.

How epistemic values manifest in digital media platforms depends on the intellectual virtues of both designers and users. The role of platform design is crucial in this process, as specific design elements can either support or hinder the actualization of these values. A design element is epistemically virtuous if it fosters the exhibition of epistemic virtues and the realization of epistemic values; conversely, it is epistemically vicious if it promotes epistemic vices or obstructs the realization of these values. These criteria provide a framework for evaluating digital media design in relation to its epistemic impact.

To put this theoretical framework into practice, we will explore a concrete example: legal-

checking by Les Surligneurs.

3. Epistemic Virtues in the Design of Digital Media: A Critical Study of Les Surligneurs

3.1. Why Les Surligneurs? A Case Worth Examining

Les Surligneurs, an innovative platform at the intersection of law, journalism, and digital media, specializes in 'legal-checking', verifying the accuracy of legal claims made by public figures. Unlike traditional fact-checking initiatives that verify statements using journalistic and scientific sources, Les Surligneurs relies mainly on primary legal sources. The platform was founded by a researcher in law and a designer with the objective of countering misinformation about the law while making legal reasoning accessible to a broader audience. Les Surligneurs is a relevant case study due to the specific challenges associated with legal information. Legal misinformation is particularly harmful as it distorts public understanding and is frequently leveraged for political purposes. This type of misinformation is especially pernicious, as it exploits both the uncertainty inherent in law and the difficulty of accessing reliable and comprehensible sources. Thus, les Surligneurs helps prevent the spread of false legal beliefs that can serve to justify political decisions or manipulate public discourse.

As a digital media project rooted in academic and journalistic practices, Les Surligneurs exemplifies the importance of integrating epistemic values, such as understanding and transparency, into digital design. The platform's aim to foster trust and improve the quality of information underscores its alignment with the broader thesis of this article: the need for digital media to embody epistemic virtues through deliberate design choices.

By examining the epistemic virtues and vices embedded in the design of Les Surligneurs, this study highlights how specific design elements can support or undermine the realization of epistemic values.

3.2. The Epistemic Value of Understanding: Between Pedagogy and Oversimplification

Les Surligneurs embraces this epistemic value of understanding through both its organizational structure and digital design.

At its core, Les Surligneurs is designed as a knowledge-driven project, embedding expertise into its structure to ensure both accuracy and accessibility in legal verification. This commitment is reflected in its reliance on a team of legal experts, professors, researchers, and practitioners, who not only verify legal claims but also contribute to making complex legal reasoning comprehensible to a broad audience. Les Surligneurs exemplifies epistemic virtue by integrating knowledge by design, aligning with Zagzebski's view that intellectual virtues are driven by the pursuit of knowledge (Zagzebski, 1996, pp. 168-176). Above all, Les Surligneurs seeks to educate a broad audience by enhancing public understanding of legal reasoning while also training law students in legal verification.

This pedagogical mission is also realized through the visual and functional design of the website itself. The platform's visual design reinforces its pedagogical goals. Les Surligneurs adopts a journalistic aesthetic, prioritizing clarity and accessibility, an uncommon approach for legal platforms, which are often dense and text-heavy. Key conclusions appear in yellow boxes, ensuring readers grasp essential rulings before deeper analysis. Articles follow a progressive format, starting with summaries before detailed explanations. This tiered approach allows users to engage with legal information at varying degrees of complexity, aligning with the perspective that understanding exists on a spectrum, one can understand a subject to varying degrees

(Kvanvig 2003, Khalifa p. 215), from basic recognition to deep comprehension.

Figure 1. An article from the legal-checking section of Les Surligneurs

Another notable design feature is the use of color-coded labels such as "exaggerated" or "requires clarification," which introduce nuance absent from binary fact-checking approaches (true/false). This is particularly relevant given that misinformation actors often manipulate legal rhetoric not by making outright false claims, but by exploiting ambiguity, omission, or misleading phrasing. These nuanced labels introduce elements of intentional complexity. They foster an open-ended engagement with legal discourse, counteracting the risk of vicious clarity that could prematurely close off inquiry (Nguyen, 2021). This is particularly crucial in the legal domain, where multiple interpretations coexist, and the law remains an evolving field.

Figure 2. Preview of an article on Les Surligneurs website, yellow label "Exaggerated"

Nevertheless, the pursuit of understanding also introduces epistemic risks. A key concern is epistemic authority: as simplification increases, users must rely more on the platform's judgment in assessing claims labeled as "complicated," or "false." This reliance necessitates recognizing the platform's epistemic authority, raising the question of why users should trust Les Surligneurs over, for instance, a government official. Moreover, the risk of oversimplification remains a persistent challenge, despite efforts to introduce complexity. Summarization is essential for accessibility, yet it can sometimes strip away critical legal nuances, particularly in short-form content such as social media posts. Legal matters often have multiple interpretations, and oversimplification risks obscuring complexities. Furthermore, the reliance on text-heavy formats may hinder engagement for audiences unfamiliar with legal terminology. Expanding multimedia formats, such as infographics or explainer videos, could help mitigate this issue by catering to diverse learning preferences. Additionally, while Les Surligneurs facilitates legal understanding, it primarily reaches those who are already engaged in fact-checking. The platform's effectiveness in countering misinformation is thus constrained by the challenge of engaging individuals who are less predisposed to critical engagement with information. Overcoming this epistemic barrier requires exploring alternative outreach strategies that foster curiosity and facilitate access for broader audiences.

3.3. The Epistemic Value of Transparency: Between Sincerity and Insinserity

Transparency is a core epistemic value in Les Surligneurs' design. The platform realizes this value through concrete design choices: each article follows a well-defined process of drafting, reviewing, and correction, ensuring a rigorous verification framework. It systematically cites legal sources, explicitly outlines its methodology, and employs a double-review process by legal scholars. These practices reinforce trust by allowing users to trace the reasoning behind each claim and independently assess the validity of legal arguments. Furthermore, transparency is reinforced through participatory mechanisms, as Les Surligneurs actively invites readers to engage, submit corrections, and challenge analyses, fostering an open epistemic environment. Les Surligneurs realizes the value of transparency by exhibiting the virtue of sincerity, ensuring that its verification process remains accessible and accountable to the public.

While honesty has received more attention in the literature, we prefer to speak of sincerity, which better captures the epistemic dimension relevant here. Honesty is typically a moral virtue, whereas sincerity is an epistemic one, grounded in the agent's commitment to truthfulness in communication. Sincerity can manifest through transparency, yet transparency alone is not sufficient: one may disclose complex information without genuine effort to make it accessible, thus remaining insincere despite being ostensibly transparent.

However, the commitment to transparency can be distorted by insincere actors who seek to undermine the integrity of fact-checking platforms. Campaigns such as the Russian "Overload" and "Operation Matriochka" illustrate how fact-checkers, including Les Surligneurs, have been targeted through deliberate diversion tactics. These campaigns flood fact-checkers with fake claims and false evidence to drain resources and distract from real misinformation. This strategy exploits the media's transparent processes, where anyone can report potential misinformation, turning a strength into a vulnerability. Transparency must be reinforced with strategies to prevent such deliberate manipulations.

Despite its commitment to transparency, certain aspects of the platform's design introduce epistemic opacity. One significant issue is the selection process for legal-checked claims. Les Surligneurs does not explicitly disclose the criteria for choosing which legal statements to analyze. This lack of transparency can create a perception of bias, particularly if some political or ideological perspectives appear to receive more scrutiny than others (Figure 3). Establishing and publishing a clear selection framework would reinforce the platform's epistemic credibility by demonstrating impartiality in topic selection.

Additionally, the way articles are displayed on the homepage can unintentionally shape public perception of legal controversies. Without explicit guidelines on which pieces are featured prominently, certain topics may seem more pressing than others. This design choice, while not intentionally misleading, illustrates how transparency in content curation is as crucial as transparency in legal analysis itself. Clarifying the rationale behind editorial decisions would enhance the perception of fairness and further solidify the platform's role as an epistemically responsible media outlet.

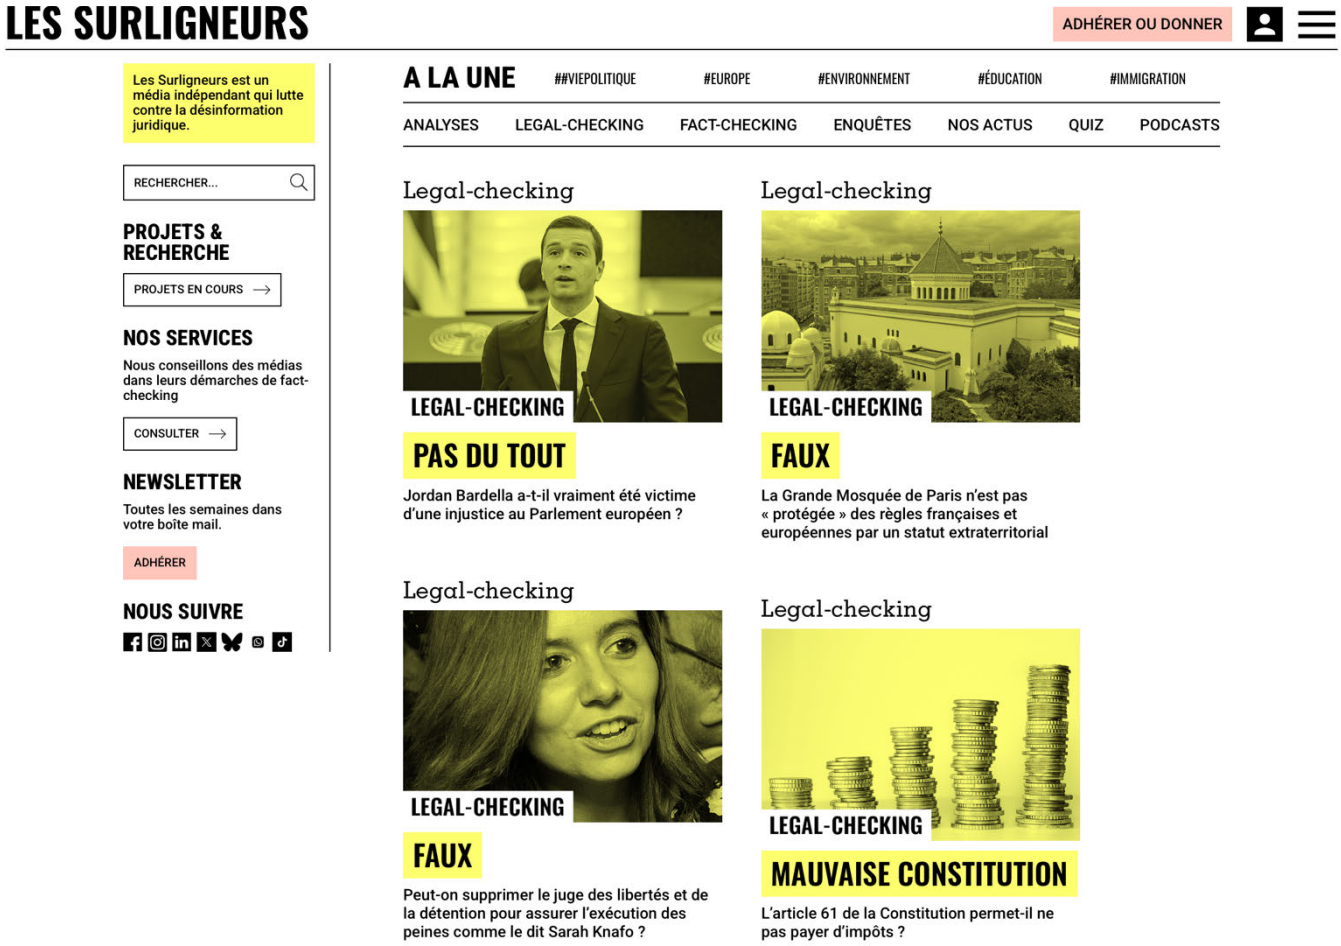

Figure 3. The Legal Checking page. The displayed political figures are from the same political side (French far right).

By analyzing Les Surligneurs, this study highlights how epistemic values such as understanding and transparency can be embedded in the design of digital platforms. Epistemic virtues like pedagogy and sincerity facilitate the realization of these values, whereas vices such as oversimplification can hinder them. These challenges underscore the need for continuous improvements, enhancing editorial disclosure, diversifying content formats, and reinforcing defenses against misinformation, to further align the platform with its epistemic commitments and ensure the rigor and accessibility of legal knowledge.

4. Conclusion

This article has explored the interplay of epistemic virtues, vices, and values within the design of digital media, focusing on Les Surligneurs as a case study. By drawing on theoretical frameworks from virtue epistemology and Values in Design (ViD), the analysis highlights how specific design elements can either realize or hinder epistemic values. The findings emphasize the multiple responsibilities in digital media environments: while designers carry a significant ethical responsibility to embed epistemic values into platforms, users must cultivate intellectual virtues to engage critically and effectively with the information presented. This study extends beyond

epistemics to ethics and politics. Digital media shape both knowledge and democratic engagement. Les Surligneurs aligns its epistemic mission with broader ethical and political goals, striving to protect democratic freedoms and enrich public debate, showing that fostering epistemic virtues also helps sustain democratic values. Future research could explore ways to engage fact-checking skeptics and address disinformation tactics that exploit epistemic virtues. It should also examine how design reconciles competing values, such as balancing clarity and depth. Ultimately, this study underscores the centrality of design in shaping the epistemic landscape of digital media. By embedding epistemic values into platforms and fostering virtuous practices, designers can contribute to the development of epistemically robust ecosystems.

Exploratory Ethics in Communication Design: Developing a Pedagogy for Lively Ethical Engagements

Hera Winata

University of the Arts Singapore, LASALLE College of the Arts,
hera@lasalle.edu.sg

ABSTRACT | Almost from the onset of a design situation, a communication designer performs processes that involve tricky ethics, such as issues of representation, environment or politics. Design students in the midst of their graduation project often mention a fear of committing unintentional "ethical blunders", which may be difficult to completely circumvent as designers are increasingly aware of their entanglement with the world. This working paper explores how design students can learn to develop critical understandings that lead to lively engagements with design ethics.

Over the last year, working as a lecturer in a communication design degree programme in Singapore, I have developed an optional design ethics workshop for students working on their graduation projects. In the workshop, ethics are not considered as an absolute set of values, but as socially, culturally and personally situated. In this orientation, tricky ethical situations that tend to be nervously avoided can be approached with renewed curiosity.

This working paper will discuss the insights collected from the workshops so far. The workshop application process provides interesting information on why students would opt for an additional ethics workshop. The workshop outcome as a work-in-progress reflects the students' state of knowledge and thinking process as future communication designers in the making.

KEYWORDS | Communication Design, Design Ethics, Design Pedagogy, Ethics

1. Introduction

Almost from the onset of a design situation, a communication designer performs processes that involve tricky ethics, for instance, crafting representations, or communicating messages with political significance. However, design ethics are rarely given adequate emphasis throughout a designer's education.

Given the vast breadth and diversity of design knowledge and practices, design education institutions can only cover a limited scope in their curricula. Modules with significant theoretical elements tend to be at risk of being eliminated, especially due to "the paradox of the vocational and the humanistic". The humanistic describe philosophic grounding and disciplinary reflexivity, while the vocational refers to a mastery of skills, medium and methods (Parvin, 2019, p. 108). In a neoliberal economy, employability remains a priority, often sidelining ethics in favor of vocational training. As a result, many design institutions dedicate minimal time to ethics at the undergraduate level.

However, in recent years, we have also seen an increasing awareness of design ethics which is driven by pragmatic factors in the form of crises and uncertainties. In the design education institution that I work in, one of the biggest push factors for including ethics in design education come from the students. Design students in the midst of their graduation project often mention a fear of committing unintentional "ethical blunders" which may be difficult to completely circumvent. The notion of ethics in design education tends to be described in a way that is quite fraught with anxieties. For instance, we look to ethics to avoid getting into "mistakes", "misconducts" or "moral failings" such as plagiarism, cultural appropriation, discrimination and more. Thought in this way, ethics become a set of rules that is rigid and inflexible.

Many design educational institutions have research ethics guidelines such as an ethical review board for research involving human and animal subjects, their protective functions are undeniable. However, guidelines are regulatory and do not necessarily engender flexible or creative design ethical thinking.

Over the last year, I have developed an optional design ethics workshop[1] for students working on their graduation projects. "Exploratory Ethics in Communication Design" is a three-part workshop where ethics are not considered as an absolute set of values, but as socially, culturally and personally situated. The challenge that I set for myself and the students is: could we see ethics as a natural part of our design process that is rife with creative opportunities?

This working paper will discuss the insights derived from the process of the workshop application, implementing the workshops, examples of student outcome in the workshop and beyond.

2. Relevant Studies that Have Informed this Paper

Historically, there has been debates around how design as a professional practice should respond to ethical values and ideals. Terms such as "environmental design" (Papanek, 2011, pp. 248–284) or "critical design" (Malpass, 2017) show introspective attitudes towards

[1] Exploratory Ethics in Design Communication is officially described as a "lab" within the final year programme in BA(Hons) Design Communication, LASALLE College of the Arts. The term "workshop" is used in this paper as it is commonly used.

a designer's position and accountability but may not explicitly emphasise "design ethics."

Recently there is more literature that attempts to unpack and frame design ethics. Lindberg et al. proposes that "[e]thical considerations in design can refer to for example ethical concepts or principles related to what to design and the objects of design, methods and tools for ethical design, unintended consequences of design, or the values of designers and design outcomes." Lindberg et al. also considers the notion of ethos to emphasise the pragmatist approach to ethics, in that "[e]thos shapes actions, and actions shape the ethos in return." (Lindberg et al., 2022)

Similarly, Glenn Parsons frames design ethics in three ways (Parsons, 2016, pp. 180–181), firstly "the way that Designers confront and handle ethical rules, regulations and norms that apply to the objects they are creating", secondly "the Designer's very choice of what to create, thirdly, "whether a consideration of the role of Design in how we live implies a fundamental reconsideration of the very concept of ethics itself." The third way of relating design and ethics have been expanded by scholars of design ethics as the possibility of "designing ethics", or, in Chan's words, "in a reversal of directionality from design to ethics, the new possibilities engendered by design may transform existing ethical values."(Chan, 2020, p. 3)

On the other hand, *Tricky Design*: *The Ethics of Things* (Fisher & Gamman, 2019) frames design ethics from the perspective of the designers' frequent encounters with dilemmas. The notion of "tricky design" acknowledges that inherently design and designers are situated within a "problem ecologies", a difficult position that offers both challenges and opportunities.

3. Exploratory Ethics in Communication Design: Process and Discussions

3.1 Brief Background about the Workshop and the Student Profile

"Exploratory Ethics in Communication Design" is a three-part optional workshop for final year students of BA(Hons)Design Communication programme in University of the Arts Singapore, LASALLE (henceforth referred as BADC). The degree focuses on modes of communication design, this include both creative practice skills in a range of digital, print and experiential media as well as writing and research. In their third-year, students would work on their research project with a writing and studio project outcome. Most final year students have gone through reading, writing and critical theory education, without necessarily emphasising design ethics.

3.2 Motivations for applying for a design ethics workshop

The workshop has been run twice over two academic years. In the second-round application, students are asked to describe the research project ideas and their reasons for applying. To interpret this collected data, I coded students' responses to find patterns and insights (see figure 1). The student's sign-up reason and graduation project description are analysed qualitatively to identify relevant themes.

Student: Sign-up reason	Student: Describe your graduation project (maximum of 150 words)	Themes
I use biofeedback data (brain activity) in my research. I believe I need to make sure participants give informed consent, fully understand how their data will be used, and that their privacy is protected. I also need to establish clear guidelines about who owns the resulting artwork and manage participants' expectations about how accurately their unconscious mind is represented. And more...	From my RPO: "The purpose of this research is to explore the use of physiological data as a potential means to foster a sense of authorship. By using a Research through Design (RtD) approach, the study aims to prototype iterations for an interface that generates art based on brain activity, using the unconscious mind to guide the creative process. This research intends to urge critical reflection on the issue of authorship in generative art and offer an experience that can empower artists with their own physiological data."	confidentiality (data), representation (individual), representation (community), technology ethics, ,

Figure 1: This table shows a student's reason for signing up and a brief description of their graduation project on the first two columns. They are then coded with relevant themes on the third column.

The themes selected are categories that are broad and useful enough for analysis without being too general so as to disregard the students' underlying motivations. Conversely, they are not too specific to generate excessive unique codes that hinder productive analysis, especially as the research continues for another year or two. The themes identified pertain to either an area of study in ethics (e.g. technology ethics), issues with ethical conundrums (e.g. interspecies entanglement), or design research methods (e.g. participatory design).

The themes may directly align with students' writing or closely match. If ambiguity arises, I may interpret their work minimally and ensure that eventually the students' own understandings are reflected. More themes may be added in the future as more data is collected. The current full list of themes is shown in figure 2, while the final count of themes is shown in figure 3.

Themes	Subtheme
border politics	
challenging existing values	
confidentiality	data
confidentiality	experience
creativity ethics	
cultural practices issues	
emerging socio-cultural system	
emotional wellbeing	
environmental ethics	
ethical relativism & taboo	
ethnography study	
interspecies entanglements	
moral ethics	
participatory design	
relationship	family
relationship	romantic
relationship	work
representation	community
representation	cultural
representation	individual
technology ethics	

Figure 2: The full list of themes used to code the students' motivation for applying to a design ethics workshop.

Theme (unique)	Count (student)	Breakdown
technology ethics	7	
emotional wellbeing	6	
ethnography study	6	
confidentiality	6	confidentiality (data): 4 confidentiality (experience): 3
relationship	6	relationship (family): 4 relationship (romantic): 1 relationship (work): 1
representation	4	representation (individual): 3 representation (community): 2
cultural practices issues	3	
ethical relativism & taboo	3	
participatory design	3	
emerging socio-cultural system	2	
environmental ethics	2	
border politics	1	
challenging existing values	1	
creativity ethics	1	
interspecies entanglements	1	
moral ethics	1	

Figure 3: Theme count from student responses.

The themes indicate popular study areas among applicants but are specific to this sample. Local context influences trends; for example, technology ethics is prominent, likely due to technology's role in Singapore's knowledge-based economy and design education. Our communication design program also emphasises technology through computing studio modules and theoretical perspectives.

Examples of student projects tagged with "technology ethics" can include studies on AI and its impact on creativity, data surveillance or UX dark patterns in digital platforms. Digital design can have a significant effect towards implementing fair and ethical interactions, or to articulate critiques towards issues in the technological societies. More students now explore emotional and relational topics, such as family dynamics, workplace loneliness, or digital breakups. These projects pose ethical challenges as they

may involve emotionally distressed individuals or personal experiences rarely shared publicly. In such cases, design alone may be an insufficient framework.

Students' responses also often indicate research methods that involve participants, for instance interviews, observations, or participatory research methods. The use of these research methods can become sources of ethical dilemmas, especially when students have insufficient knowledge on research ethics, or are unsure about the best way to position their interaction with the participants.

3.3 Developing a Design Pedagogy for Lively Ethical Engagements

To approach ethics as an intrinsic part of a designer's creative process requires familiarity with ethical thinking. However, seeing ethics as a creative opportunity may be a challenging task, especially if students were previously taught that moral and ethical codes cannot be broken. A classroom that engenders lively ethical engagements should not be too quick to judge "right" or "wrong", but should provide a generous space for design "mistakes" which could be ethical experiments. Hopefully this can become the basis of renewed curiosity and future socio-ethical engagements.

As students come into the workshop with their in-progress research projects, the workshop becomes a gathering place for varying ethical situations, moral, ethical and religious codes. Participating students were divided into groups with similar themes. They were then given a series of exercises, which should be attempted with one of the group members' projects as a perimeter. Students were encouraged to rotate between projects for each exercise.

These are some of the exercises the student attempted over the two workshop cycles, with slight variances:

1. Stakeholder Mapping & Roleplaying
2. Negative brainstorming
3. Milton Glaser's Road to Designer Hell, with a discussion of "care" and "obligation"
4. Exploring moral ecology

Within this paper, the exercise Stakeholder Mapping & Roleplaying will be discussed in more detail. In viewing the student outcome, please bear in mind that the responses are a result of rapid in-class exercises, therefore they may contain inaccuracies or answers that are less measured.

The Stakeholder Mapping exercise has been used in design thinking workshops to identify key partners, audiences, improve team alignment and anticipate issues. Beyond that, stakeholder mapping can also be a map of power, influences and oppressions. In this workshop students map out stakeholders that have a vested interest in the decision making of the project, as well as those who may not have a voice, but are affected nonetheless. They are also required to include at least 20% of non-human stakeholders (eg. animals, objects, spaces etc.). This allows the consideration of the agency of non-humans in their projects. Figure 4 shows an example of a stakeholder mapping done by a group of four students, focusing on one of the group member's research projects.

The project selected by the group considers the challenges and experiences of children of single-parent families in Singapore. Currently, the notion of a family nucleus in Singapore is still based on a heterosexual married couple and their child/ children,

reinforced by policies such as public housing (Ong, 2000). There are government schemes directed towards supporting marriage and parenthood. The National Shared Values is an ideological framework that asserts "[f]amily as the basic unit of the society". Furthermore, in media discourses, images and descriptions of families often exclude people belonging to unconventional family structures.

As shown in figure 4, the students note the agency of non-human stakeholders such as places of leisure and the media have in the daily realities that treat people in single-parent families as "others".

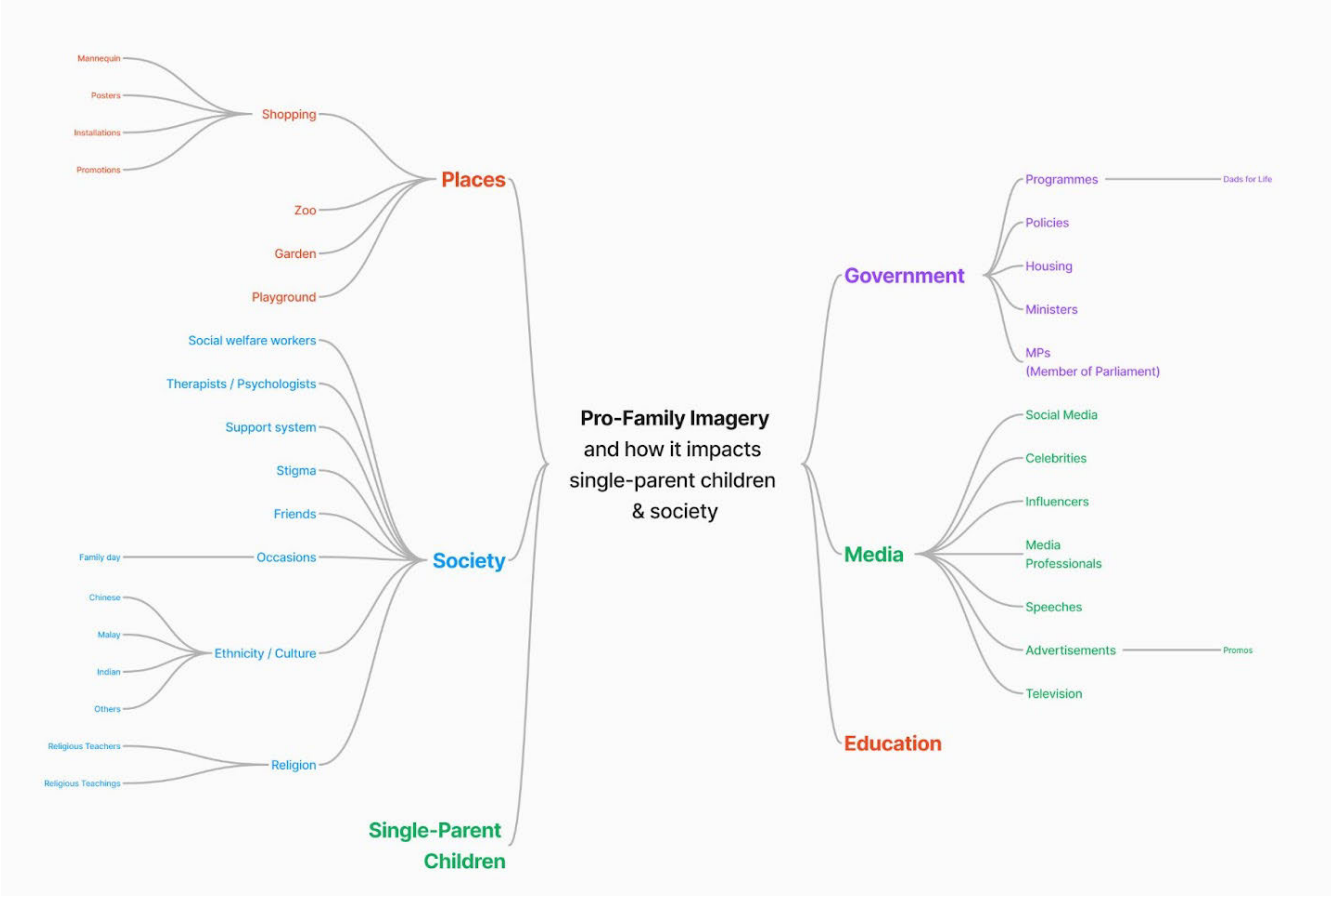

Figure 4: Outcome of one group of students attempting stakeholder mapping. This figure has been digitised and redacted for clarity as well as to remove sensitive information.

Afterwards, each student in the group is then invited to take on the role of one stakeholder, they were given a few moments to imagine "being in the skin" of this stakeholder, with some guiding questions to respond to:

- What are the changes that are taking place that are affecting you?
- How do you feel about these changes? Or the lack thereof?
- What are your wishes and needs for the future?
- What is your ideal future?
- How would you like to contribute to this ideal future?

Each student is then invited to present the stakeholder that they have chosen. They were encouraged to attempt to consider stakeholders that may have different value systems than themselves to begin understanding what different perspectives can look like. The written response of this role-playing exercise is shown in figure 5.

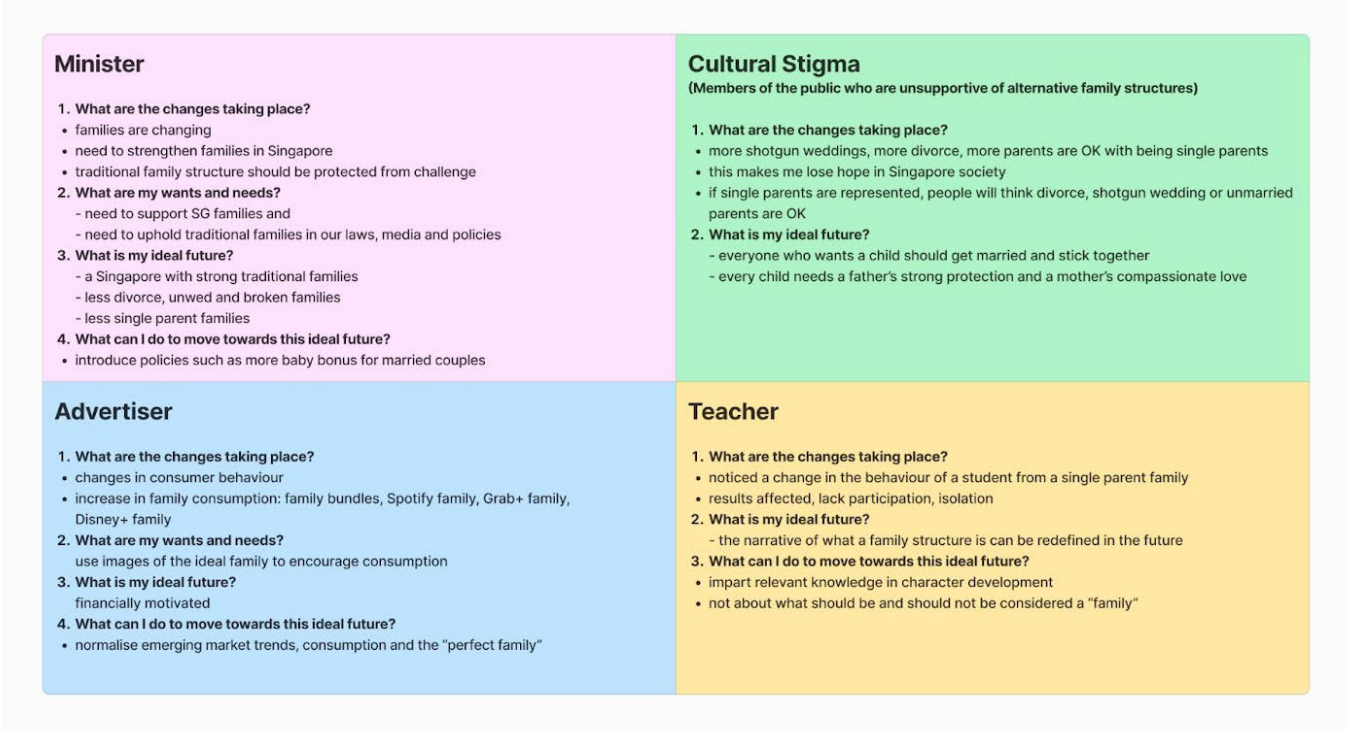

Figure 5: Outcome of students attempting stakeholder role playing for one of their groupmate's research projects. All personas are speculative. This figure has been digitised and redacted for clarity as well as to remove some sensitive information.

During the process of presenting and role playing their stakeholders, some students have difficulty empathising with a persona that is different from themselves. The fictive persona is a rough sketch of people whom they have encountered in person or through media. As such, even though it is a first step in empathising with others, the persona also reflects the students' experiences. It was emphasised during the session that this character sketch is hypothetical and could be followed up with more systematic studies.

Apart from engendering empathy, another way which this exercise becomes meaningful is in highlighting the different experiences and motivations from different subjectivities. In many of the projects discussed, design actions may benefit one group of people but negatively impact another. This ethical dilemma is often encountered in design, designer and researcher Anja Groten argues for more openness in this regard:

> "We have to stop convincing and become vulnerable. We have to present our work in ways that it can be attacked and open to the facts that our projects are partial, discriminating and flawed. Instead of asking: What are you designing? Or: Who do you design for?, we could ask: Who are you designing against? Which communities do you affect with your design?" (Groten, 2019, p.63)

3.4 Beyond the Workshop: Student Project Outcome

Beyond the brief workshop, students went on to complete their final year project and continued their engagements with design ethics. This section follows the work of a student, Lance Tan, who was part of the group that produced the Stakeholder Mapping and Roleplaying exercise featured above. The student had been guided by his graduation project supervisor, Yasser Suratman, whose graduation class focuses on "Design Advocacy and the Community", a framework with good opportunities for exploring design ethics. This paper does not imply a direct causal relationship between the Exploratory

Ethics workshop and the design students' final outcome, but is interested in the process by which a design student continues to tackle tricky ethics on their own merits.

The Lance's project, *I Grew Up Fine*, positions design as a social commentary on the representations of non-conventional families in Singapore's socio-political and media discourses. His outcome includes a public campaign, a microsite and a reimagination of a future family policy report that is inclusive to all families.

One main strategy is the appropriation of typical family imageries used in local mainstream media. These often depict the normative heterosexual couple family nucleus with a child (see figure 6). Upon a closer look a QR code leads to a microsite where the removal of the stereotypical family images reveals the textual description of a single-parent child's experience (see figure 7 & 8).

The act of being visible, especially in public spaces, can be both an assertion of one's right and a form of contestation to a hegemonic, exclusionary discourse. Images of non-conventional families, in particular positive representation of non-conventional families, are absent or minimal in Singapore. The project reflects a desire for the material appearance of the realities that have been othered, in quotidian public spaces. Furthermore, the "Singapore Family Plan 2030" component (see figure 9 & 10) reimagines a future where non-conventional families could one day become recognised in Singapore's public policies and national ideology.

Acting along one's moral ideals may put one at odds with societal norms and national ideals. *I Grew Up Fine* is one of the student projects that question the failures of utilitarianism. Ultimately, Lance's strategy to navigate this conundrum is to adopt a non-confrontational but hopeful tone.

Figure 6: *I Grew Up Fine*. This component is a public banner design installed around the public housing residential neighbourhood. There is a QR code amongst the photographs that lead to a microsite.

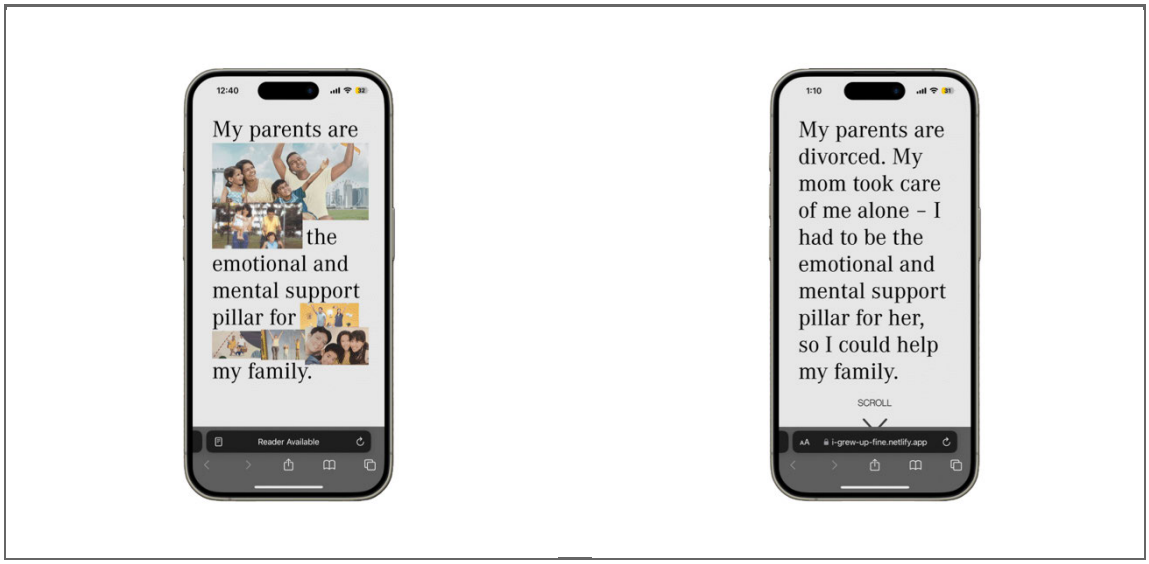

Figure 7 (left) & 8 (right): *I Grew Up Fine*. This component is a microsite that can be accessed by scanning a QR code from the printed banner in figure 6. Figure 8 shows an underlying message from the subjectivity of a member of a single-parent family.

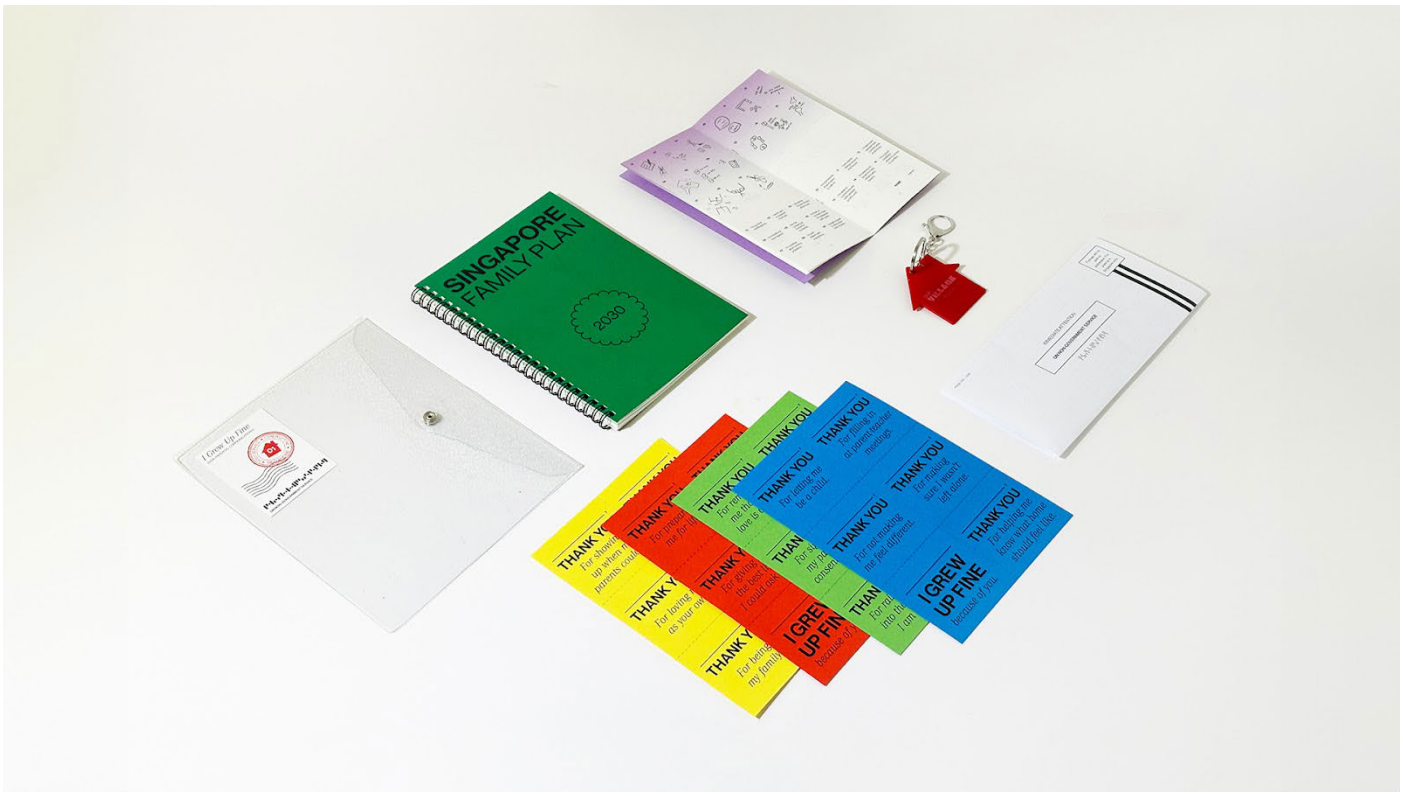

Figure 9: *I Grew Up Fine*. A speculative mailer kit designed for family related government strategy groups that reimagines a future where non-conventional families could become recognised in public policies and the society.

Figure 10: *I Grew Up Fine*. A spread from "Singapore Family Plan 2030", a speculative report that reimagines a future where non-conventional families could become recognised in public policies and the society.

4. Conclusion and Possible Future Directions

Developing ethical thinking in design practice is a long-term pursuit. Furthermore, knowledge on design ethics does not necessarily bring about certainties or closures but may at times lead to more questions as one's awareness of real-world complexities grows. A society's ethical values and norms are rarely homogeneous, but this can also lead to novel responses that are characterised by its context, as shown by the student project by Lance Tan that has been analysed in this paper.

The workshop format provides opportunities as it can be considered concurrently with other long-term modules. That said, the 3-session workshop format produced a time constraint. As students already had a significant workload outside the workshop, homework was also avoided, hence the current focus on ideation and presentation. Future iterations will focus on pedagogy and tools that integrate primitive making.

Beyond the three-week workshop, longer term connections need to be explored. This can come in the form of a longer module or simply connecting between different existing modules so that the learning points from the workshop can be utilised. However, at present not all educators are comfortable with discussing design ethics due to lack of expertise or interest. Hopefully design educational institutions continue to examine the balance between vocational and humanistic pedagogical interests in a period of rapid

global cultural and technological shifts that engender new ways of thinking about design practices.

Guerrilla Information Battles: Publishing in Public Spaces

Laurens Kolks[a]*

a Delft University of Technology, Faculty of Industrial Design Engineering
* l.a.g.kolks@tudelft.nl

ABSTRACT | Publics are associations of people – both physical crowds and virtual communities (Kelty, 2005; Taylor, 2004; Warner, 2002) – that are actively constructed and sustained through socio-material articulation (DiSalvo, 2009; Marres, 2007). A salient example of such a public-sustaining articulation is the largely unauthorized activity of publishing in public spaces through 'guerrilla tactics' such as graffiti, posters, banners, and stickering. As the Cumulus 2025 theme track *Informational Issues* seeks to critically investigate public engagement with published information in its many shapes and forms, the role of urban environments as dynamic and informal political bulletin boards should not be ignored. This working paper presents ongoing research into the built environment as an unofficial platform for political discourse. It draws on research into graffiti, posters, banners, and stickering as media to informally (and mostly illegally) publish political statements in public spaces, and comment on the political communications of others. Of these 'guerrilla publications' I have identified distinct types. I use the term *aesthetics of vandalism* to denote aesthetic experiences invoked by specific acts of mischief that target these unofficial publications. Moreover, this paper draws on three self-initiated workshops in which students were challenged to engage in political design (DiSalvo, 2012) through the creation of temporary, site-specific, monumental text installations in public spaces. These case studies explicate several challenges and opportunities workshop participants came across, as the cases render visible some of the 'designerly means and forms' participants implemented while seeking to engender public engagement with their political concerns.

KEYWORDS | PUBLIC ENGAGEMENT, GUERRILLA PUBLISHING, AESTHETICS OF VANDALISM

1. Introduction

In times of hyper-personalized and precisely targeted message content that is dispersed through lightning-fast and ephemeral digital media, one would almost forget the collective, pluriform, and omnidirectional bulletin board that is public space. A collective bulletin board, moreover, made up of mixed media that vary widely in their temporality, materialisation, and state of permanence. Instead of being informed by an ever-growing set of carefully harvested personal data, communications disseminated through public spaces are often targeted at unknown publics that consists of random passers-by. As I shall illustrate in this paper, the omnidirectional nature of these communications does not necessarily imply that the locations in which they are published are arbitrarily chosen.

In this article, the notion of public spaces refers to environments characterised by *various forms of 'publicness,'* both in terms of accessibility and as "spaces for encounters with difference" (De Magalhães, 2010, p. 562). Rotterdam is a good example of a city in which public spaces are actively used as an unofficial and informal communication platform. The city's building facades, infrastructure, and street furniture serve as a lively and dynamic bulletin board that facilitates the largely unauthorized activity of publishing in public spaces through 'guerrilla tactics' such as graffiti, posters, banners, and stickering. These 'guerrilla publications'[1] cover a wide variety of topical content, ranging from advertisements by small local businesses to content about Rotterdam's various subcultures and underground scene; and from communications supporting regional football clubs to unofficial statements that address political concerns. This paper focuses on the last of the above-mentioned categories, where I understand political concerns as circumstances that need *collective action* to change their current condition – a condition which is deemed problematic by a particular public (Dewey, 1927). Public engagement with these political problems and issues[2] is actively constructed and sustained through socio-material articulation (see, e.g., Kolks, 2023; 2024), and publishing in public spaces is a salient example of one of the many ways to do so.

Through guerrilla publications, the relative anonymity of Rotterdam's public spaces is being used to articulate a wide variety of (frequently conflicting) political concerns: from shaming "slum landlords" to warning against "5G hazards," from addressing the Israeli-Palestinian conflict to problematizing COVID-19 regulations, from supporting LGBTQIA+ emancipation to opposing gender self-identification, from promoting access to safe abortions to challenging fossil fuel industries, from articulating the discrimination of Uighurs to disputing the criminalisation of sex work (for a selection of these topics and how they are being articulated, see Figure 1). As such, the city of Rotterdam's lively guerrilla publishing culture appears to contradict sociologist Zygmunt Bauman's (2000, p. 60-61) suggestion that "public space is increasingly empty of public issues" as it "not much more than a giant screen on which private worries are projected without ceasing to be private or acquiring new collective qualities in the course of magnification." Contrary to Bauman's observations, Rotterdam's public spaces feature numerous guerrilla publications that articulate collective concerns rather than "private worries," be it often in *unobtrusive ways*.

[1] In the remainder of this paper, I will use this (inevitably reductionist) shorthand.
[2] Elsewhere (Kolks, 2023) – following scholars such as sociologist Noortje Marres (2007) – I describe the conceptual difference between problems and issues, and its important consequences for design discourse.

Figure 1. Rotterdam's public spaces are being used to articulate a wide variety of political concerns. Source: author.

2. Guerrilla publications fuel political engagement

Political guerrilla publications come in many media, shapes, and sizes. Although most of them are published using physical media, many connect to digital communication platforms via URLs, QR-codes, and hashtags. These communications are often materialised as modestly sized stickers and tags that easily go unnoticed, or as graffiti pieces created in lowkey locations such as highway underpasses. Political guerrilla publications, however, can also take on monumental sizes and grotesque forms. A notorious example in Rotterdam's recent history were the large-scale racist slogans – referring to white supremacy theories – that were laser-projected onto the city's iconic Erasmus bridge during New Year's Eve 2022 (NOS Nieuws, 2023).

Illegally projected onto the bridge's pillars from a nearby location, fragments of racist slogans were aired to a nationwide public via a live television broadcast that reported on the festivities around the bridge (RTL Nieuws, 2023). Further fuelled by posts on social media, these locally executed guerrilla publications had an impact on publics well beyond those spectators that witnessed them directly (Bir, 2023). Possibly encouraged by the controversy and media attention it caused, this specific 'guerrilla publication format' was later repeated in the cities of Alkmaar and Eindhoven, with similar slogans being projected onto the city halls of these municipalities (De Bekker, 2023; Polder, 2023).[3] As such, in an era vastly dominated by digitally mediated communications, guerrilla tactics of publishing in public spaces still show their worth as impactful forms of socio-material articulation that construct and sustain political engagement – for better, or for worse.

To identify specific ways in which guerrilla publications sustain public engagement and invoke aesthetic experiences, I have analysed an ever-expanding personal collection of photographs. When possible, I have selected examples written in English for this paper's figures to facilitate readability for an international audience. In what follows, I will first

[3] In February 2023 two suspects – members of the racist activist group White Lives Matter (Bir, 2023; Kraak, 2025) – were arrested for these activities (Polder, 2023). After being prosecuted for insulting a population group and incitement to discrimination, they were sentenced to six months in prison (Kraak, 2025).

describe ways to understand the communications and interactions mediated through guerrilla publications by relating them to social theory on public engagement. Next, I will home in on the specific subcategory of *political* guerrilla publications and the interactions they mediate by identifying several of these publications' distinct modes and varieties. Finally, I will present three self-initiated workshops in which I teamed up with design students to actively join the unofficial debates taking place in public spaces. In these workshops design students were challenged to address collective concerns through the creation of temporary, site-specific, monumental text installations in the public realm. Three workshops, moreover, that explicated both challenges and opportunities participating design students encountered when trying to engender public engagement with their political concerns through this specific form of publishing in public spaces.

3. Understanding public engagement

Publics are associations of people – both physical crowds and virtual communities (Kelty, 2005; Taylor, 2004; Warner, 2002) – that are actively constructed and sustained through socio-material articulation (Dewey, 1927; DiSalvo, 2009; Kolks, 2024; Marres, 2007). Social theorist Michael Warner (2002) argues that a public can consist of a well-defined group of people brought together by an occurrence at a physical space of assembly (e.g., a crowd at a party), but also of an ill-defined community of strangers – a virtual association of individuals, solely unified by their collective *attention to the same communication(s)*. Hence, publics are inherently *unstable* entities that only exist as long as they are actively sustained. To last, they "must continually predicate renewed attention" (Warner, 2002, p. 419). Correspondingly, guerrilla publications are socio-material articulations that seek to construct and sustain publics by catching and renewing their members' attention and interest.

Following scholars such as Dewey (1927) and Warner (2002), anthropologist Christopher Kelty (2005, p. 199) proposes three distinct types of publics: (1) an assembly of bodies (a crowd or an audience), (2) a "topical public" bound by its members' attention to specific communications (e.g., the persons reading this paper), and (3) a "meta-topical public" made up of individuals that imagine to participate in a particular discourse. While the first type of public depicts a relatively well-defined group of people, the latter two categories mostly represent ill-defined, virtual associations of individuals. As these three different types of publics are related to distinct circumstances, individuals are often involved in several publics simultaneously.

Therefore, within the same crowd attending the festivities around Rotterdam's Erasmus bridge on New Year's Eve 2022, some spectators ignored the laser-projected racist slogans while others actively paid attention to them – 'automatically' rendering this latter group a topical public. As some members of this topical public might additionally consider themselves participants in the discourse on discrimination and racism, this last subgroup of spectators – through different modes of participation and involvement – partook in three publics simultaneously: a crowd attending New Year's Eve festivities, a topical public, and a meta-topical public. While the New Year's Eve crowd fell apart when festivities around the Erasmus bridge ended, the topical public that came into existence that very day only ceases to exist when people stop paying attention to that night's racist laser projections, just like the meta-topical public on discrimination and racism only disintegrates when its members no longer imagine themselves partaking in its discourse.

Most of the political guerrilla publications described in this paper are not intended to be crowd-pulling events in themselves. Instead, they rather seek to sustain the engagement

of topical and meta-topical publics. As we shall learn in what follows, the transient nature of most guerrilla publications – as well as their often flimsy materialisation – can actually be valuable communicative assets that specifically support their aesthetic appeal.

4. Variations in spontaneity and situatedness

Within public spaces, guerrilla publications are published on platforms such as facades, infrastructure, and street furniture, using media like stickers, posters, the ink of felt-tip pens, or spray paint. While some are one-off manifestations, others are serially produced. Consequently, as some might be the direct creative result of individual spontaneity, others explicitly require forethought, planning, pre-production, and/or outsourcing. Moreover, where some serially produced guerrilla publications are stand-alone entities, others are individual components of (unofficial) overarching campaigns (Figure 2).

Figure 2. One-off publications versus serially produced items, individual entities versus campaign components. Source: author.

Guerrilla publications vary in their degree of situatedness. While some seem arbitrarily positioned within – or randomly distributed throughout – the urban landscape, others explicitly relate to their specific context. Within this latter category, location-specific and contextual elements can intensify both the communication's appearance and meaning. Guerrilla publications can accomplish this via (1) physical interventions that comment on the specific content of other actors' statements in public spaces, for example through *subvertising*[4] (Figure 3). They can also intensify their communicative capacities by (2) tuning their content in to meanings associated with their physical surroundings, or (3) by incorporating elements from their physical location as form components (Figure 3, right).

Figure 3. Contextual elements that intensify guerrilla publications' meaning and appearance. From the left: (1) Location-specific *subvertising* via a billboard that advertises luxury apartments. (2 & 3) The added stickers read "Unaffordable Rotterdam – Stop market forces – Housing is a fundamental right" and "Rotterdam. Is it happening?" (a pun on the city's marketing slogan "Rotterdam. Make it Happen"). (4) A location-specific physical element incorporated as a form component. Source: author.

[4] Writer Mark Dery (1991) coined the term "subvertising" to describe the production and dissemination of anti-advertisements, often through illegal material interventions (see also Dekeyser, 2021).

5. Aesthetics of vandalism

One can identify specific ways in which guerrilla publications invoke aesthetic experiences. I understand "aesthetic experiences" as *conditions of intensified attention* in which perceptions and/or interactions promote curiosity, engagement, and/or imagination (Petersen et al., 2004; Ross & Wensveen, 2010). Thus, aesthetic experiences go well beyond encountering pleasure and beauty (Folkmann, 2023; Koren, 2010) as (for example) puzzling, frightening, or repulsive sensory stimuli can also trigger curiosity, engagement, and the imagination. Moreover, instead of regarding aesthetics *intrinsic* features of specific artefacts or conditions, I consider aesthetic experiences to be individually constructed through interactions (Dewey, 1958) that are both informed by biological (Ware, 2022) and sociocultural factors (see, e.g., Folkmann, 2023).

I use the phrase *aesthetics of vandalism* as an umbrella term to describe the ways in which the *violation* of guerrilla publications through specific acts of mischief invokes aesthetic experiences. Acts of vandalism such as tearing away, scratching out, or covering up other actors' guerrilla publications can bring about "attentional tuning" to those communications (Ware, 2022, p. 52), as the results of these actions can promote curiosity and spark the imagination regarding the political articulations that were removed, damaged, or obscured. Rotterdam's public spaces host several examples of guerrilla publications that have been cancelled[5] by other guerrilla publications that carry opposing messages. Interestingly, the very act of cancelling can *intensify* attentional tuning to the controversy that is being addressed by *both* publishing parties and unintentionally solicit curiosity to the (literally) underlying perspective in particular (Figure 4). Just like David Carson defends his experimental graphic design work by stating that one should not confuse legibility with communication (Blackwell, 2000), the aesthetic appeal of these vandalised, partly legible, guerrilla publications is increased by the extra effort publics must invest to make sense of their content (see, e.g., Hekkert, 2006).

Figure 4. Aesthetics of vandalism: specific acts of mischief invoke aesthetic experiences. From the left: (1) scratching out, (2 & 3) tearing away, and (4) cancelling. Source: author.

6. Students engaging in political design

After describing and analysing other actors' guerrilla publications, I will use the final part of this paper to share some of my own educational experiences with publishing political concerns in public spaces. Design scholar Carl DiSalvo (2012) uses the term "political design" to denote designed artefacts that support societal conditions of ongoing

[5] I understand *cancelling* as the deliberate attempt to obliterate and/or neutralize the force, effectiveness, and/or validity of a communication (see, e.g., Merriam-Webster, n.d.).

opposition, contest, and engagement with political concerns through "designerly means and forms" implemented *outside* the realm of institutional politics. As part of an ongoing research into the built environment as an unofficial platform for political discourse, I initiated three workshops that challenged design students to engage in political design through the materialisation of a temporary, site-specific, monumental text installation in public space. These workshops sought to investigate which pressing collective issues participating students were eager to make public, and which designerly means and forms they would use to engage unknown topical publics (made up of random passers-by) with these political concerns.

The end results of all three workshops were executed at locations with relatively high volumes of traffic passing by. However, the workshops varied in their duration, location, and possibilities for students to co-design physical outcomes. The first workshop was a one-day event executed in the city of Breda. Design students were asked to collectively decide upon a text that would be published on a premanufactured framework situated near a busy road (Figure 5, left). This workshop's brief prescribed that the text installation should address a political concern inspired by a news item published on the same day the workshop took place (4 October 2018). The second workshop ran the following year, this time executed in a vacant interior space at Breda's central railway station. Its less restrictive brief, week-long duration, and higher material budget gave students more possibilities to co-design the overall manifestation of the workshop's outcome (Figure 5, centre). The third workshop took place in the city of Den Bosch in 2022; lasted one week; featured an open design brief; and used pre-existing rooftop frames on abandoned buildings near the central railway station as publishing structures (Figure 5, right).

Figure 5. Publishing in public spaces, workshop results. From the left, the signs read: (1) "sharing supposedly is the new having," (2) "reacting endlessly - hoping for a reply" and (3) "on & on." Source: author.

In the first workshop, participating design students had to exclusively work with text. As most participants were more used to engage with sensory-oriented design projects, this proved to be challenging – especially within the constraints of a pre-designed output format. Although numerous statements were produced, the phrasing was often rather straightforward, lacking much associative depth, and leaving little room for interpretation. Moreover, the assignment to address public issues was often ignored as many texts articulated private problems rather than collective concerns. Conversations with participants suggested that a key factor contributing to these results was that students insufficiently *imagined* the publics they aimed to address. They also tended to overlook the influence of site-specific conditions on the formation, composition, and attention span of these publics. The following workshops were therefore set up in such ways that more time was allocated to practice articulating public issues through the medium of text, map specific aspects of the unknown topical publics students sought to address, and allow participants more space to (co-)design the workshops' physical output.

7. Articulating political concerns through designerly means and forms

The second and third workshop's briefs urged participants to consider the formative impact of site-specific circumstances when developing their design proposals, such as variations in velocity and viewpoints provided by different transport modalities passing by the text installation. Moreover, participants were encouraged to vividly imagine the topical publics they aimed to address and empathize with their diverse members' lived experiences. Although both workshops saw participants again struggle with writing evocative texts, private problems were now mostly shunned in favour of collective concerns. Also, more text proposals were indeed being informed by location-specific considerations (e.g. differences between a site's day- and nightlife) and empathy with the varied and ill-defined community of strangers that participants sought to engage.

Thematically, the installations that came out of both workshops articulated social pressures perceived by participants about having to continuously react to an overload of incentives from their physical and virtual surroundings. In contrast to the slow writing phase, participating design students enthusiastically explored the communicative capacities of form, experimenting with sensory and interactive aspects. They incorporated site-specific conditions and strategically considered the deployment of spatial elements, materials, colours, and lighting to intensify the installation's communicative capacities and engender attentional tuning (Ware, 2022) to its political content. In their final designs, participants sought to provoke engagement through curiosity rather than communicative clarity. By intentionally playing with legibility, and by disclosing content information piecemeal, publics were challenged to cognitively invest in making sense of these text installations. To increase their aesthetic appeal through subtle interactions, passers-by had to mentally stitch together letters, words, and characters that were spatially dispersed (Figure 5, right) or read a text fragment via a mirror (Figure 5, centre). In short, instead of opting for straightforward legibility (figure 5, left), workshop participants used designerly means (their aesthetic sensitivity to form and interaction) to translate the social anxieties they perceived into carefully staged *efforts* that publics had to make to both experience and understand the text installations' content and meaning.

8. Conclusion

In this paper I have described how the activity of publishing in public spaces through 'guerrilla tactics' such as graffiti, posters, banners, and stickering have transformed Rotterdam's public spaces into unofficial political bulletin boards. Of these "guerrilla publications" I have identified distinct types and used the term *aesthetics of vandalism* to denote aesthetic experiences invoked by specific acts of mischief that target these unauthorised publications. I have described three self-initiated workshops that can be considered attempts to engage in political design and design activism, as they evoke "revelation, contest, and dissensus" through "aesthetic means and expression" that alter "the condition for urban experience" (Markussen, 2012, p. 50). These workshops explicated some challenges and opportunities that participating design students came across, while also rendering visible the "designerly means and forms" (DiSalvo, 2012) participants implemented when articulating their political concerns through collectively designed public text installations. To support the ongoing political discourse in public spaces, I will add my own guerrilla publication to Rotterdam's urban landscape: a custom-designed sticker with a QR-code that directs readers to an online version of this paper.

HYPERREAL CONSUMPTION: HOW SOCIAL MEDIA SHAPES MOTHERS' PRODUCT DECISIONS.

Pelin Ozturk*[a] , Cigdem Kaya[a]

a İstanbul Technical University
*ozturk20@itu.edu.tr

ABSTRACT | This study aims to evaluate how influencer marketing activities resonate with the needs of contemporary individuals who possess a lifestyle informed by hyperreality through Baudrillard's perspective. To understand this effect, a case study focuses on mothers who seek product and childcare advice via Instagram, a widely used social media platform. In the first stage, in-depth interviews were conducted with participants who follow influencers on Instagram. These interviews were analysed regarding consumers' approach to influencers and product acquisition from promotions. The analysis revealed trust in influencers and that users were often influenced to buy many products with meanings beyond their functional use. In the next phase, a survey will be conducted among mothers who do not follow the influencers to evaluate insights gained from a broad audience. As a result of these analyses, the study aims to understand the factors influencing users' product purchasing preferences and the impact of these promotions on individuals. This understanding will lead to recommendations from a designer's perspective regarding product-user interaction. Thus, in line with changing communication forms, it will facilitate the shaping of collaboration between designers and marketers, creating an environment that better meets user needs.

KEYWORDS | SOCIAL MEDIA, INFLUENCER MARKETING, PRODUCT MEANING, USER NEEDS

1. Introduction

This study examines the role of influencer ads in Instagram users' need identification and product acquisition processes. As a case study, mothers who are Instagram users with babies were taken in the supplementary food process. The study will detail users' product perception and evaluation processes following mother-baby-themed Instagram influencers.

The proliferation of social media has led to significant changes in consumption habits and marketing strategies. Influencers with a sizeable following influence their followers by promoting products with their experiences on social media platforms. These individuals make product recommendations and give their followers the feeling of using them.

Social media's practical and continuous use has become essential in shaping consumers' purchasing decisions. Consumers now research the experiences of individuals who have previously used a product before purchasing it and make decisions accordingly. In this context, brands are moving away from classical promotion methods and prefer cooperating with influencers who have already experienced and recommended their products.

In the contemporary post-truth period, emotional and belief-based arguments shape individuals' perceptions of knowledge and reality. Baudrillard (2023a) defines today's human being as a consumer society individual with a lifestyle that gains meaning only through motivated needs. In this context, users' exposure to influencer ads does not only mean seeing a product; it also allows consumers to recognize their own needs and choose products that meet those needs. In this process, emotional ties and popular beliefs play a decisive role in individuals' purchasing decisions.

Especially in sensitive issues such as baby feeding, the reliability and scientific basis of products are crucial. Since mothers often view influencers' recommendations as reliable, promotions with misleading or incomplete information may pose risks. However, the perceived honesty of influencers through the world they construct may be misinterpreted by audiences evaluating the product’s role in that lifestyle, leading to unnecessary consumption and unrealistic expectations. Therefore, protecting vulnerable consumer groups and ensuring transparent information are key elements within the ethical framework of influencer advertising.

In line with the interdisciplinary nature of the study, design methods such as user-centered inquiry and scenario-based evaluation were integrated into the research. These methods helped analyze how and why users engage with products in specific everyday contexts, rather than merely what they consume.

2. Background

Jean Baudrillard's views on consumption, which are the source of this study's theoretical framework, shed light on Influencer culture and consumption habits influenced by this culture. In his book Simulacra and Simulation, Baudrillard argued that reality consists of an illusion and that copies behave like originals. At the same time, he argued that our postmodern age has lost its reality, and artificiality prevails in today's world (Baudrillard, 2023b).

According to Baudrillard (2023b), simulacra is an appearance that wants to be perceived as reality; simulating presents the unreal as accurate; and simulation is the artificial reproduction of a phenomenon. Baudrillard argues that simulacra reflects reality, conceals it, and finally reaches a hyperreality that has nothing to do with reality. Hyperreality is the derivation of reality through models and makes objective reality questionable.

In the postmodern age, it enters a new subjectivity in the universe of simulacra created by the media or mass media. Signs and images determine the subjectivity in question here. These images and signs constitute individuals' happiness/unhappiness and satisfaction/dissatisfaction (Şaylan, 2009).

According to Baudrillard (2023b), the individual's universe becomes an imitation (simulacra network) of the reality determined by the media or television. Models, images and codes of hyperreality begin to guide thought and behaviour. The end of the spectacle brings with it the transformation of reality into hyperreality and the careful copying of reality, primarily through other means of reproduction, such as advertising or photography (Baudrillard, 2021).

Instead of witnessing an imitation or copy indistinguishably similar to the original, we see that the line between the original situation and the imitation disappears. In this case, there is no difference between the real and its representation. The only thing that remains is a simulacra. In this world where everything is imaginary, the absence of reality evokes hyperreality (Baudrillard, 2023b).

The concept of consumption is traditionally based on the notion of need. However, in our current period, concepts such as desires, pleasures and status have prioritised consumption; consumption has moved away from use value and need and turned into a sign value. Baudrillard (2023a) emphasises that objects outlived human lifespans in the past, but today, the lifespans of rapidly produced and consumed objects have shortened. The consumer's relationship with the object has been transformed. Consumption has become the primary goal of individuals, and under the pressure of their habits, individuals have lost their ability to think critically.

In his first book, “The System of Objects/Le système des objets”, Baudrillard demonstrated how alienation can be understood through different semiotic dynamics. In the system of objects, it can be said that elements such as personalisation, pressure to differentiate, dissemination of elements of secondary importance, associating the technological structure only with production and consumption, making it dysfunctional, and the transformation of the system into a unique structure through advertising are prominent. In this context, it is possible to state that the system has become unique and structuralised under the influence of advertising (Baudrillard, 2020). Apart from the function and necessity of purchasing the product, acquiring the product through the scenario the system establishes for the user is emphasised.

According to Baudrillard (2020), advertising is an ideal representation of the system of things, an entire of powerful symbols and has become the source of the most accurate information about consumption. Advertising is based on a fairy tale that is believed rather than on evidence and promises. The product can be consumed physically, but its meaning is grasped through advertising. In this study, Baudrillard's advertisement is discussed in the context of social media advertising.
Influencers shape buyer decisions through their perceived honesty and the world they

create. Trust, rooted in perceived honesty, integrity, and expertise, is key to influencer marketing. Greater trust enhances the persuasiveness of endorsements, making it a fundamental aspect of influencer marketing theory (Chu & Kamal, 2008).
A key ethical question for influencer marketing practitioners concerns the disclosure or non-disclosure of the influencer's financial interests, i.e. the person communicating about a particular brand, product or service. Wellman Stoldt, Tully and Ekdale note that the ethical principles guiding sponsored content production are poorly understood (2020, p. 68). In many cases, influencers hesitate to disclose the commercial nature of their relationship with the marketer because they fear losing close relationships with their followers.

Influencers attract followers through personal communications based on values such as authenticity and honesty; as such, the disclosure of a sponsorship harms the influencer's credibility (Veirman & Hudders, 2020, p.1). Many users are annoyed and confused by sponsored posts integrated into various social media content, which can ultimately harm their reactions to sponsored posts (Stubb & Nyström, 2019, p.110). Despite the risk to influencer-follower trust, disclosing financial arrangements ethically justifies sponsored content on social media.

3. Methodology

This study examines the product perceptions formed by influencer advertisements and the experiences of using these products in daily life. The research, which is evaluated through mothers whose babies are in the process of supplementary food, addresses the impact of the lifestyle that influencers offer with the products they promote on user perception. It aims to discuss product acquisition motivations, expectation-reality differences, and the impact of long-term use on daily routines.

The study was designed in 3 stages. In the first stage, as a pioneering study, in-depth interviews were conducted to determine the consumers' view of influencers so that the study was based on a foundation by making sense of the relationship between consumers and influencers. In this context, in-depth interviews were conducted with 4 participants, and the qualitative content analysis method was used for data analysis. Qualitative content analysis is a method used to systematically define the meaning of qualitative material (Schreier, 2012, p.1). The material obtained as a result of the research is classified as examples of the categories of a coding framework. From the data from in-depth interviews, themes were created and analysed in line with mothers' relationships with the mother-baby product advertisements made by influencers. The interview analysis revealed how influencer marketing efforts affect the mothers' process of acquiring baby care products.

The themes that emerged from the analysis are **reasons for trusting influencers**, **expectations about the influencer role**, **the effects of influencer ads on participants**, and **practical and expected influencer ad formats**.

- **Reasons for trusting influencers:** The first of the prominent topics in the responses of the participants regarding the reasons why they find mother-baby influencers trustworthy was coded as “sharing experiences”. By documenting their time with their children, influencer moms inspire others and connect with other moms in similar situations.

  “At the same time, I am going through the same things, and even, let us say, I am

about to give birth, but the person on Instagram's baby is 6 months old; I looked at her posts from 6 months ago. What she has been through. So she is experienced. She instantly shares what she does with her baby; she has the same impulse as me. How she cares for her baby at home is attractive to people."

The other codes in this category were analysed under "sharing the daily routine" and "naturalness and natural environment".

"Full make-up and well-groomed influencers do not feel sincere at some point; being in a natural environment is meaningful. At some point in motherhood, it is impossible to be well-groomed and make-up because I experience it."

- **Expectations about the influencer role:** Another category that emerged from the participant's responses were the participants' emphasis on the influencer role. Among the subcategories that emerged, the striking ones were "showing the relationship of the promoted products with the child and its environment" and "the influencer being honest and natural". When Instamoms advertise honestly, the disappointment afterwards will be minimised if a purchase is made about the promoted product.

  "They have to be honest, which is a matter of conscience. We are not a normal segment. We are a needy segment. We buy a product out of desperation. Honesty and sincerity are essential. Otherwise, it is not sustainable."

  Participants are a group that identifies themselves as helpless, which may be due to the difficulties and inexperience they have with baby care. At this point, the honesty of the influencer may be an important factor for mothers to meet their expectations from the products they purchase through Influencers.

  Product advertisements that are far from the natural environment and do not include scenes of interaction with children cause consumers to distrust the product being promoted.

  "I do not like overly sterile environments and product-oriented displays in commercials. I think an environment with children is always messy. Despite this, showing a car seat in a spotlessly clean car in commercials is not convincing. I think it is not used in reality because our car seat is full of crumbs between the seams. So I question whether it is recommended based on experience."

- **The effects of influencer ads on participants:** The analysis of the impact of influencer promotions on participants reveals a negative picture. The subcategories that emerged are "feeling of inadequacy" and "attributing meaning to products". Participants reported that following influencers created a feeling of inadequacy.

  "The thing that affects me the most is food. Some influencers prepare a wide variety of meals for their children and put it in front of them, and they eat it all. Then, when my child does not eat it, it makes me feel that I cannot present it or feed my child."

  Advertisements manipulate a situation that mothers can easily manage with

instinct or what they know through products. The feeling of inadequacy may make mothers feel obliged to do and try different product options for tasks they find difficult to do.

Influencers' product promotions cause the participants to attribute meaning to the products and evaluate their instant situation through the product.

"For example, a pacifier that glows at night and one inserted with a finger. I bought many pacifiers, but it did not work. It is thought that the pacifier is the trick. Nevertheless, the child will not take it. You want the product to achieve this."

- **Practical and expected influencer ad formats:** When the participants' expectations from influencer promotions were analysed, the subcategories of "influencers being honest," "conveying all the positive and negative aspects of the products they promote," and "sharing long-term experiences about the products" emerged.

  In product use, influencers are expected to know the scenarios and honestly reveal the entire flow.

  "For example, a bib filled with leftover food. The advertisement's argument is very nice; all the leftover food goes inside, but there is no aftermath. I found it very difficult to clean. I found it restrictive, and I do not use it. The whole story is important".

  Here, scenarios frequently used in the design process should be considered in the product promotion fiction.

The first phase of the study focused only on mothers who follow influencers. When the results were evaluated, it was considered appropriate to compare the participants who follow influencers and those who do not follow influencers in identifying needs and making product decisions.

In the second stage of the study, based on the results of the in-depth interview, which is the first stage, a survey study is planned to obtain the opinion of a wider audience and determine the target audience of the focused study. In the survey, mothers who follow and do not follow influencers will be reached, and their approaches to product selection will be revealed.

The data from the survey, will be used as a semi-structured interview setup, which is the final stage of the study. The data planned to be obtained from the second stage of the study design is determined as the customisation of the target audience to be focused on and the determination of the products that consumers specifically purchase for the supplementary food period through influencer advertisements.

In the third stage, in-depth interviews will be conducted with participants selected from the target group. These interviews aim to compare the preferences of those who buy products by following influencers on Instagram during the supplementary food process and those who do not follow influencers. The data targeted to be obtained includes the reasons for following influencers, the process of identifying needs, the products purchased and their alternatives, other products used for the same function, and the motivations for storing or sharing products when they expire.

4. Conclusion

The rise of digital platforms in the hyper-reality era has diversified the ways in which influencers interact. Social media platforms such as Instagram, which is the focus of this study, have changed the way products are marketed and the habits of consumers with their increasingly diverse content delivery. This development and transformation have also led to scepticism towards influencer marketing. De Veirman and Hudders (2020, p.25) argue that influencer marketing faces more authenticity and transparency issues and may need innovative strategies to maintain consumer trust.

The Instagram user who follows the mother-baby influencers, taken as a case study in the study, sees and passes by the images shared in the hyperreality defined by Baudrillard. Mothers either encounter a miracle for a complex subject or define a need. These evaluations are instantaneous and do not require long and hard work. At this point, the distinction between the real need and which need is based on the media disappears, leaving only the simulacra.

When data on whether the usage experience of products obtained through influencer advertisements overlaps with the contribution mothers expect to their routines is evaluated, the product encountered via influencers may yield a different result in real life. The tale presented in hyperreality through Instagram may not always match reality. Misleading content and misperception of product function or necessity are possible. What mothers perceive as real may not be objective reality; influencer promotions can mislead inexperienced mothers and lead to overconsumption by encouraging them to buy more products than needed.

This study examines the effects of influencer marketing on product experience, with a focus on baby care products. It examines the influencers' product promotion in terms of the impact of the products on the user. In this way, it aims to reveal the difference between the users' expectations of the product and the designers' design purpose in this contemporary period called Post-truth.

Based on these findings, the study contributes to design practice by emphasizing the importance of aligning product narratives with real user needs and experiences. Design plays a critical role in ethically navigating the blurred boundaries between perceived and actual product value, especially in emotionally sensitive domains such as baby care.

Information Design for Change in Public Sector. Methods to Decode Complexity for Policy and Decision-Making.

Aureliano Capri[ab]

a ISIA Roma Design
b Sapienza University of Rome
aureliano.capri@uniroma1.it

ABSTRACT | In public sector communication aimed at engaging citizens in participatory processes, service design promotes the entry of designers in facilitating foresight activities (Kimbell & Vesnic-Alujevic, 2020) to co-design public policies. In imagining future scenarios, the text becomes a "place of engagement" (Pasa & Sinni, 2024) to understand regulations and rights that underpins effective participation (Perry-Kessaris, 2019). Leaders have always been recognized for their visualization skills (Mirzoeff, 2015), and today managers can use more visual techniques to coordinate strategic changes (Perondi, 2022; Berger-Walliser et al., 2016). The ongoing research investigates whether public communication can be made more efficient by introducing methods of visualization (Hill & Lachenmeier, 2022), which can be traced back to 'inscriptive practices' (Lucas, 2020) and to 'graphicacy' (Balchin & Coleman, 1966), the ability to communicate and understand through visual artifacts. At the methodological level, the first step will compare two national contexts and explore legal writing practices through desk analysis. Subsequently, local case studies of foresight-based participation will be researched, and criticalities and opportunities identified through in-depth interviews and surveys. Prototypes of visual information facilitation will then be defined and tested in co-design sessions. The expected outcome is a method consisting of techniques and activities that can be shaped into a curriculum to train decision making skills through visualisation, both for designers and public sector operators.

KEYWORDS | PUBLIC SECTOR, PUBLIC COMMUNICATION, DECISION-MAKING, INFORMATION DESIGN, LEGAL DESIGN

1. Introduction

The rise of the information-based 'network society' impacts communication and engagement between people and organisations (Papini, 2014; Castells, 2014). The “infosphere” (Floridi, 2023) led to a general shortening of the attention span (Simon, 1971), while digitisation and servitisation have created an invisible infrastructure that hinders understanding (Downe, 2023), affects decision-making (Giorello & Donghi, 2019) and definitely endangers democracy (Cassese, 2014; Sartori, 2023).

Approaching the phenomenon from a interactional perspective, communication between people and organisations - or between people within organisations - takes place through the transmission and understanding of information (McLuhan, 1967; Floridi, 2024), generally mediated by the production of written documents, where the text becomes a "place of engagement" (Pasa & Sinni, 2024). However, organisations often do not have the time to engage with all the information (Aricò, 2024), and this risks undermining effective understanding of the regulations and rights that underpin effective participation (Perry-Kessaris, 2019).

One of the organisations that most permeates a person's life through communication is the public sector (Cammelli, 2014), which is also an organisation that is increasingly adopting design to support communication and foster change (Buchanan, 1992; Kimbell, 2019; Mager & Davis, 2024). In particular, the entry of service designers into the public sector is due to the ability of designers to ‘overcome the limits of words’ and to propose visual solutions that facilitate communication (Mager & Davis, 2024). Leaders have always been recognised for their visualisation skills (Mirzoeff, 2015), and today managers in different areas of the public sector can use visual techniques to coordinate strategic changes and make sense of the status quo (Aricò, 2024; Perondi, 2022; Berger-Walliser et al., 2016).

Considering that visual communication underpins the design of strategies such as laws and policies (Buchanan, 1992), and that change and decision making needs to be informed by a good understanding (Ducato & Rossi, 2024), the research aims firstly to study the current state of public communication and public engagement, in order to investigate than the performative, contextual and time-related impact of information design techniques in service design practices, with the aim of defining a method that allows decoding and facilitation of discourses conducted in a real-time collaborative context.

2. Scientific Framework

In the public sector, public communication is the discipline that addresses how the State can communicate to staff and citizens through the operators of the public administration, using methods and techniques of public engagement (Lovari & Ducci, 2019). Rolando (2018) visualises the Italian public administration

as a "building", dividing its activities into floors: the ground floor is about laws and regulations, where the government acts through the legislative offices to explain "to itself" - and then to its staff and citizens - who it is, what it does and what its powers are; while the fifth floor is about policy-making and it is related to public debate, participatory processes and to “the maintenance of the democratic aspiration for change”.

In the change of public communication caused by the information age (Lovari & Ducci, 2019), design contributes in various ways to support the public sector. Municipalities use foresight and anticipatory techniques to co-design policies with policy-makers and citizens during in-presence workshops (Apolloni, 2021; Kimbell & Vesnic-Alujevic 2020). The platform gov.uk (UK Government, 2024) strengthens the relationship between citizens and government, through the work of service, visual, content and interaction designers. The model is contextualised in Italy by Designers Italia (2024), in a wide movement that can be seen as a reconstitution of ‘graphic of public utility’ (Sinni, 2018). Recently, design has attracted the interest of lawyers, giving rise to Legal Design (Hagan, 2020; Perry-Kessaris, 2019), a community exploring the role of design in legal practice and policy-making, that seeks for a robust methodology in policy prototyping, concept mapping and visualisation (Hagan, 2020; Berger-Walliser et al., 2016).

These trends respond to the international interest in more transparent institutions, as confirmed by specific points of the Sustainable Development Goals (SDGs) (United Nations, 2015): in SDG 16 'Peace, Justice and Strong Institutions', is asked to supporting effective and transparent institutions (16.6), by ensuring participatory and open decision-making processes (16.7) and access to information (16.10); in SDG 17 ‘Partnership for the Goals’, is asked to promote the role of public sector as an “honest mediator”, ensuring clear direction to all other actors involved in the change process. Moreover, the three pillars to shape 'the democracy of the future' identified in the report 'The Future of Government 2030+. A Citizen Centric Perspective on New Government Models' (Vesnic-Alujevic et al., 2020) are design, foresight and citizen engagement.

Within the international regulatory framework, the guidelines of the EU AI Act (European Commission, 2024) require accessibility, transparency and accountability of information systems. In the Italian context, the adoption of the Italian Transparency Code for Public Administrations, introduced by the Anti-Corruption Law of 2013, the Freedom of Information Act (FOIA), introduced by Legislative Decree No. 97 of 2016, and DM Giustizia 110 of 7 August 2023, which establishes a maximum number of pages for administrative acts, are documents that highlight a growing sensitivity to the way the public sector manages information and communications to staff and citizens.

Since public sector information passes through an informatics system - requiring, for example, the creation of a dataset - the public sector is experiencing a phenomenon of 'datafication', which is changing the relationship between governments and citizens and the way governments address policy problems (Maffei et al., 2020). For example, 'digital twins' are data visualisation tools

designed to nudge a decision-making process (Thaler & Sunstein, 2021). In such a context, design begins to play a 'regulative role', influencing decisions and nudging behaviour through interfaces or visual representations (Prifti et al., 2024). Moreover, the public sector often engages people through complex real-time collaborative discussions and through oral or text-based communication using bureaucratic language that lacks transparency and inhibits the effective reception and use of information (Downe, 2023). These challenges represent an interesting area of research that requires an approach that integrates service design, which has so far been applied in the public sector, with information design logic.

Information design is an interdisciplinary practice (Pettersson, 1999) focused on decoding and visualising complexity (Lima, 2014; Hill & Lachenmeier, 2022) through 'inscriptive practices' (Lucas, 2020), such as mark-making activities that overcome the limitations of verbal and text-based contexts (Buchanan, 1992). Inscriptive practices, such as mind maps, notations and diagrams promote visual thinking and drawing as strategic and knowledge-producing agents (Mendelsund, 2014; McCloud, 1993; Mirzoeff, 2015).

The data of a text, whether words or numbers, are the 'raw materials' from which visualisations and methods can be generated to make an argument more comprehensible (Hill & Lachenmeier, 2022). In some cases, the data are not given at the outset, but are contextual, resulting from exploratory research in the field: this is the case of the experiments promoted by the Institute of Carthopology, aimed at public administrations that need to map and visualise an urban and social situation (Dear Hunter, 2024). In other cases, the data are time-based, as in the case of scribing activities, through the real-time sketching of an oral discourse at an event or during a discussion (Brand, 2017).

In the public sector, and more specifically in the context of legislative design, these activities are usually carried out 'after the event' and not simultaneously with the moment of decision making, which risks lacking interactivity in collaborative contexts (Johnson, 2014). Therefore, in order to contribute with a clear, honest and participatory approach that is required of the public sector (Downe, 2023), it seems urgent to intervene in the time and context of 'text production' (Rega, 2018; Perondi, 2024). When involving stakeholders who do not come from a design background, the degree of 'graphicacy', which is the ability to read and represent information using graphic and visual languages (Balchin & Coleman, 1966), must be taken into account and fostered, in order to define a common and effective language.

Thus, to improve public sector communication, it seems that design can propose itself as a discipline that empowers leaders, practitioners and citizens through visual thinking (Brand, 2017). Designers can contribute to the production of visual models that create a link between stakeholders and disciplinary experts (Mager & Davis, 2024), but above all to the definition of scalable methods for mapping, documenting and representing "design things" that create a shared language (Koskinen et al., 2011), with the ultimate aim of supporting an informed decision-

making process (Aricò, 2024).

In defining this approach and methods, the research generally aims to investigate the contextual and temporal impact of information design techniques in service design practices for the public sector. To validate the research, it will be necessary to assess whether inscriptive practices can be a trigger for promoting change in the public sector. Could inscriptive practices help to understand complexity? Could design support the actual textual and oral communication of the public sector to engage in a more effective and visual way? The study explores how visual communication affects strategies such as laws and policies, and examines its role in promoting informed decision-making and change. It examines the performative, contextual and temporal effects of information design in service design, with the aim of establishing methods for decoding and facilitating collaborative discourse in real time.

3. Objectives and Methodology

The scientific aim that runs through this ongoing research is the interdisciplinary extension of the field of design research. During the research, efforts will be made to involve and collaborate with different disciplines, in particular: linguistics, pedagogy, cartography, cognitive ergonomics, neuroscience, anthropology and law.

Due to its interdisciplinary nature, the research integrates several fields with different epistemological approaches. It experiments with merging information design methodologies and co-design practices in service design, while addressing ethical imperatives and contributing to the ongoing re-founding of the 'graphic of public utility'. Legal design, an emerging field seeking methodological rigour, is a focus, particularly in policy prototyping and concept mapping. It also explores foresight and anticipatory design, systematising knowledge and investigating the role of visual representation in regulatory decision-making.

Another key area of research is graphicacy, a largely under-explored academic field. It explores its importance as a fundamental intellectual skill, placing it alongside literacy and numeracy and linking it to pedagogy. Another focus is on education, in response to declining literacy rates and the need to improve transversal skills. By promoting visual thinking and graphic literacy, research aims to foster systemic thinking and metacognitive skills, reinforcing the lifelong learning perspective emphasised by global education policies.

The research project seeks social impact by developing a method that primarily addresses cognitive and ergonomic models of information reception, processing and exchange. It is relevant in compensating for the effects of information overload and reduced attention caused by social media and digital ecosystems.

3.1 Target and Audience

The main target group of the research is policy-makers who could benefit from a working method that makes the results of their processes more accurate,

supports participatory practices and reduces the time needed to produce a report. The policy makers could belong to any sector that involves an oral discussion or a written text to be summarised, in particular those in public offices in the legal field, such as legal drafters, and professionals responsible for communicating information to citizens.

The project has two indirect primary target groups. The first is citizens, who would benefit from greater transparency and better engagement by public administrations. The second is the regulatory authorities that ensure the transparency of information, such as the Garante della Privacy or the National Anti-Corruption Authority.

Academia is an indirect secondary audience, as the designed method could enhance service design curricula by introducing public sector knowledge and proposing graphicacy modules for legal education, fostering cross-disciplinary competences. Another audience is represented by realities that promote activities to facilitate change, such as professional associations and social innovation associations.

Regarding the field of intervention, Italy is the most appropriate starting point due to the linguistic and cultural components of the research. Comparative research will later be conducted in an Anglo-Saxon country, chosen for its differences in language, legal systems, political structures, design integration in the public sector and social attitudes towards change.

The research is scalable from local to international levels, although initial testing will focus on local or regional government for logistical reasons. Administrations that already involve designers in decision-making, such as those in Bologna and Bolzano, provide ideal pilot settings. The Municipality of Rome, particularly its districts, could provide a more complex field for testing the adaptability and scalability of the method. The presence of established policy labs in the UK could provide a fertile ground for innovation.

3.2 Phases and Methodology

The research project will be carried out over two years using a phased methodology.

Months 1 to 6 will focus on establishing the state of the art of information design within service design practices. This phase will include organising and attending seminars to explore current research, conducting a desk analysis to systematise the role of information design and inscriptive practices in the public sector, conducting fieldwork through concept mapping in co-design workshops and legal meetings. These activities will test the effectiveness of information design techniques and real-time representations. At the end of this phase, a taxonomy of techniques and practices relevant to the development of the methodology will be proposed. Linguists and lawyers will act as external consultants.

From month 5 to 7, the first period of mobility abroad will take place at the School of Innovation & Technology, Glasgow School of Art, where there will be the opportunity both to get in touch with the Anglo-Saxon system of service design and to support researchers working on design for policy through the methodologies of cultural probes and through visual mapping in support of performative co-design practices in complex collaborative contexts. At the end of this phase, the activities to be undertaken in the application of the method will be defined. Collaboration with anthropologists will add cultural and systemic insights to the research.

From month 8 to 11, the first pilot test of the method will take place, where text-based or verbal communication will be facilitated in an Italian public administration or social innovation context. Validation measures will be identified and cognitive ergonomists will help evaluate the activities to ensure usability and impact.

From month 10 to 13 the first version of the framework will be drafted. The framework will codify the method incorporating the taxonomy, activities and validation measures. Data collection for this phase, scheduled for months 11 to 12, will use a mixed research method involving semi-structured interviews and questionnaires.

From month 14 to 16, the second mobility abroad will take place in a location yet to be defined, likely in an Anglo-Saxon speaking country, to further contextualise and refine the method.

From months 17 to 19, a second pilot test will validate and refine the method in a different context. The results will feed into the second version of the framework, which will be developed from months 20 to 22. This version will integrate data from the second phase of the mixed methods research, conducted from months 19 to 20.

Finally, from months 19 to 24, the dissertation will be written, incorporating all the research findings. This phase will include preparing the results for dissemination in both digital and print formats and developing a comprehensive dissemination plan.

4. Expected Results

The project aims to contribute to research in the field of design, both at a theoretical level and, above all, at an applied level. On the theoretical and scientific production level, a publication will be produced and dissemination activities will be organised through participation in conferences within the interdisciplinary fields of the project.

At the applied level, all expected results will be products, interfaces and practices that can be used by others. The first level of this will be the development of a

method for the analysis and visual representation of written and oral texts, 'to train one to pay more attention, to observe more acutely and to listen more keenly' (Arnheim, 2004), and consequently to stimulate understanding of complexity and proactivity for change in the public sector. The method will be disseminated through the creation of a website so that the work can be 'open', and workshop activities and performance sessions will be organised to make the research results known through ad hoc events.

The second way in which the project will be tested is by experimenting with the method within an academic curriculum. A curriculum will be defined for any student who needs to study a subject with a strong textual component, or for any teacher who needs to coordinate a class discussion.

Keeping the order of difficulty in terms of feasibility, the third expected outcome is the definition of a minimum valuable product to provide visual facilitation, co-design and consultancy service for decoding complex subjects.

Finally, the fourth possible outcome of the project is the realisation of a software that incorporates logics, taxonomy and activities of the method.

SharIN'House. Shaping interactions within IoT ecosystem through tangible interfaces

Lorenzo Imbesi, Luca D'Elia*, Sonia Belhaj, Marcello Risolo, Alessandro Aiuti

Sapienza University of Rome

*luca.delia@uniroma.it

ABSTRACT | Emerging forms of interaction and interfaces transcend traditional social constructs, shaping and being shaped by cultural and technological shifts. As everyday life patterns evolve, interest in co-living solutions is growing, driven by the need for flexibility and rising housing costs. These dynamics rely on interconnected product ecosystems, where tangible interfaces convert quantitative data into qualitative insights, shaping user behaviour. While the Internet of Things (IoT) enables this exchange through connected devices, design guides interactions by offering explicit feedback that fosters engagement. This research explores the intersection of IoT ecosystems and product development through a laboratory setting, where international designers investigate the behavioural effects of emerging technologies. The study unfolds in two phases: a qualitative field study using ethnographic methods and surveys to analyse interactions in shared spaces, followed by a speculative design approach embedding sensors to collect user-environment data. Actuators then convert this data into adaptive product configurations, transforming quantitative insights into qualitative feedback. Through an analysis of outcomes, this study establishes a framework for impact-share design, mapping behavioural effects in human-technology interactions. The dual cause-effect approach shows how IoT data transforms into qualitative insights, enhancing design for behavioural change. The research underscores how interconnected products shape shared environments, guiding future interactive design.

1. Introduction

> "When everything is connected to everything else, for better or for worse, everything matters" (Mau & Leonard, 2004, p. 128)

Since the 'age of uncertainty' (Bauman, 2007), new interactions and interfaces have transcended traditional social constructs, shaping and being shaped by cultural and technological landscapes (Scolari, 2021). This shift demands adaptation to evolving work and leisure patterns, rekindling interest in co-living arrangements as responses to dynamic and flexible lifestyles (Ehrenberg & Keinonen, 2022). These transformations not only affect interpersonal relationships but also reshape the connections between individuals and their living and working environments (Piardi et al., 2012).

Co-living spaces, defined by the cohabitation of unrelated individuals sharing communal areas, offer an example of this evolving dynamic (Medar & Ćurčić, 2021). Residents of such spaces operate under specific codes and agreements that can influence individual behaviour (Meltzer, 2005), potentially leading to tensions. The type of interaction within co-housing environments is shaped by a variety of factors (Clitheroe et al., 1998), including personal traits, informal social dynamics, and formal structures such as house rules. Together, these elements contribute to the overall quality of the co-living experience. Conversely, artifacts within these spaces play a pivotal role in balancing the need for community-building with the preservation of individual privacy.

The interaction between interior space, artifacts, and social formats such as co-living highlights contemporary societal challenges, presenting design with opportunities to address new living conditions (Scullica et al., 2022). Future technologies - context-aware, networked, and proactive (Perera et al., 2014) - promise to dynamically adapt to individual needs, shaping spatial and social interactions. Research in interaction design (IxD) emphasises that engagement with technology emerges from the interplay between physical, cultural, and social elements. Understanding engagement with space should not only consider static configurations but also view it as an evolving interaction involving people, cultural practices, objects, and the surrounding environment (Anzani et al., 2022). Studies have identified key elements of engagement relevant to both technology and space, including cultural practices, physical conditions, and social interactions. Our physical presence in space influences our experience even before conscious sense-making, which is the foundation of an affective engagement (Fritsch, 2009). Sense-making is often supported by physical actions, emphasising the role of materiality in interactions with environments (Dalsgaard et al., 2011). In this context, IoT holds potential to provide valuable insights into behaviour by integrating physical devices within complex systems, thereby offering enriched, real-time data. Design can influence user behaviour (Fogg, 2009) by leveraging explicit feedback mechanisms, which facilitate new interaction models. While Fogg's concept of Persuasive Design lays the foundation for understanding how digital systems can shape behaviour, our approach diverges by focusing on how real-time, contextual feedback in IoT environments enable not only persuasion but also reflection and agency. Rather than purely steering behaviour, the design strategies explored here aim to support users in making informed decisions within dynamic, data-rich settings.

This study establishes a framework for impact-share design, mapping behavioural effects of human-technology interactions. By analysing laboratory outcomes, it illustrates how advanced, interconnected product systems drive behavioural change. A dual cause-effect approach translates quantitative sensor data into qualitative insights,

enhancing understanding of how IoT technologies facilitate new data exchange models and inform design practices that encourage behavioural shifts. As co-living expands as a living model, designers must balance "living and respect," ensuring social harmony. While conflicts may arise, understanding resident behaviours can guide design strategies that promote well-being, improve social bonds, and enhance overall co-living experience.

2. Critical interaction design

To shed further light on the design methodology deployed for this study, an in-depth analysis of Design Thinking and Critical Thinking is needed, to better tackle the role of empathy involvement and bring reflection on its implication in the design development. Moreover, the interplay between Design Thinking and Critical Thinking will be elaborated, to describe how those influenced the production of the results of the study.

The human-centred design approach is the backbone of Design Thinking (Verganti et al., 2021). Gathering user feedback is the starting point of this process that ends with the design and development of tailored solutions that fit customer needs. Building deep empathy through observation and ethnography with the recipients of the design aims at solving problems from their perspective (Brown, 2009).

At the same time as technologies become increasingly sophisticated and integrated into everyday life, making these technological advancements accessible and user-friendly become paramount. A salient example of this phenomenon is digitalisation; as Information Technology (IT) applications transition from business services to direct consumer use, the demand for design - particularly in the realms of User Experience (UX) and User Interface (UI) design - has surged.

Design Thinking drives the innovation process, UX Design examines the quality of the user experience, and Interaction Design shapes the dialogue between people and artefacts; together, these three perspectives guide the study and development of a product.

a. Empathic Design for User Experience

Empathy and active listening help designers understand user needs, desires, and motivations. In design thinking, this understanding is iteratively incorporated into solutions that address real user problems. Additionally, user interfaces can represent user behaviour data, subtly encouraging more socially acceptable actions.

User-centred design places user experience at its core while designers envisage empathic bridges to immerse themselves in users' lives - whether hypothetical, potential, or future - to ensure that products and services align with their needs (Koskinen et al., 2003). Gasparini (2015) defines that empathy can be either emotional - an instinctive, affective, shared, and mirrored experience - or cognitive, involving the ability to understand another's perspective (New & Kimbell, 2013; Spencer, 1881). According to this, an empathic approach becomes a crucial component in the design process that enables designers to connect with users on a deeper level for successful design outcomes (Kouprie & Sleeswijk Visser, 2009).

To foster this connection, tools and techniques adopted by designers include direct contact with users, supporting the first research part of a design process, effective communication of research findings, and ideation methods that leverage designers' own experiences. These approaches not only lead to a nuanced understanding of user needs

but also enable the creation of meaningful user-centred design solutions. As empathy can be conceptualised as a tool to design with, requiring the transformation of feelings into actionable attributes (Koskinen et al., 2003), designers can leverage empathy to gain valuable insights into users' needs, which subsequently informs the design process (Brown, 2009). For instance, in a Design Thinking framework, it is essential for all participants in a design team to empathise with the users for whom they are designing. This collective empathic engagement is crucial for generating relevant and effective solutions.

By these premises, using an emotional approach toward cognitive empathy bridge, designers apply different methods to build up that competence and insight, enabling them to prioritise the needs of the users and make the results of the process more desirable (Brown, 2008; Holloway, 2009; Ward et al., 2009). Communication of user study results could support both possibilities to immerse in the user's world and to reflect on it with the designer's own experiences. Communication tools should convey the expectations of the user's world, as well as an understanding of it. By using tools which combine raw data (e.g. video fragments, quotes) and suggestive leads towards interpretations, designers are supported in the act of designing. Data represented in stories, storyboards or in personas serves very well in allowing designers to step into and walk around in the user's world and connect with the user (Pruitt & Adlin, 2006).

b. Critical Thinking of Design interaction

Critical thinking complements design thinking by providing a framework for evaluating information, questioning assumptions, and analysing the implications of design decisions (Shelley, 2009). It encourages designers to reflect on their processes and outcomes, ensuring that the solutions developed are not only innovative but also ethically sound and socially responsible (Lilley & Wilson, 2013). For instance, the integration of critical thinking into the design process allows designers to assess the potential impacts of their work on user behaviour and societal norms, thereby promoting sustainable practices (Lilley, 2009). This refers to prompting individuals to consistently maintain positive behaviours over the long term and to do that it is essential to implement a strategy focused on behavioural sustainability. This approach strategically emphasises continuous engagement and reinforcement, helping people to adopt and sustain good practices over time. By creating lasting habits and fostering a culture of accountability, the strategy supports ongoing commitment to sustainable living behaviours, even as circumstances and dynamics evolve.

Reflective design practices challenge designers to critically examine their assumptions, encouraging them to reflect on the societal and ethical dimensions of their work. This approach ensures solutions are not only functional but also inclusive and socially responsive. These practices promote an iterative approach to uncovering and addressing biases, ensuring designs resonate with diverse user needs and contexts. Critical design, on the other hand, invites designers to interrogate societal norms, question dominant narratives, and propose alternative futures through speculative prototypes and thought-provoking scenario.

This reflective practice over sustainable practices is crucial in a rapidly changing technological landscape, where user needs and behaviours are continuously evolving. In summary, the interplay between design thinking and critical thinking is essential for understanding and influencing user behaviour. Design Thinking provides a structured approach to empathising with users and developing solutions, while critical thinking

ensures that these solutions are rigorously evaluated and refined. Together, they create a robust framework for addressing complex design challenges and fostering meaningful user interactions.

The iterative nature of UX design allows for continuous feedback and improvement, which is essential for refining how information is communicated. By employing methods such as user testing and feedback loops, designers can identify areas where the information relay may be lacking and make necessary adjustments to enhance the user experience. This iterative process is crucial for ensuring that the information provided is not only accurate but also resonates with users on a practical level.

This approach not only facilitates the implementation of innovative technologies but also ensures that these solutions are sustainable and socially responsible, ultimately contributing to behavioural change for an increased quality of shared living environments.

3. Beyond Data collection: tangible interfaces for IoT products

Since its conceptualisation in 1999 by Kevin Ashton[1], the IoT has rapidly integrated into everyday life, with projections estimating 55.9 billion interconnected devices by 2025 (Chan & Caprio, 2024). IoT refers to any electronic object with embedded sensors capable of collecting data and transmitting it to other components in the network. The European Commission highlights the role of IoT innovation clusters in fostering technological advancements and knowledge transfer (European Commission et al., 2019). Furthermore, McKinsey estimates that IoT could generate a global economic value between $5.5 trillion and $12.6 trillion by 2030, with consumer-oriented applications such as smart homes driving much of this growth (Chui et al., 2021).

Building upon its rapid adoption and projected economic impact, the influence of IoT extends beyond mere data collection, influencing the way information is interpreted and acted upon. While quantitative data provides numerical insights (e.g., temperature, energy consumption, traffic flow), qualitative data is equally crucial in design-driven applications. In the context of design, qualitative data encompasses user perceptions, contextual interactions, and emotional engagement with technology. Unlike purely quantitative metrics, qualitative data offers a deeper understanding of how users experience and interpret information, allowing for more meaningful interactions. IoT, through embedded sensors and tangible interfaces, has the potential to bridge the gap between raw data and human-centred insights, transforming data collection into a process that is not only analytical but also experiential.

By integrating tangible interaction principles with IoT ecosystems, designers and technologists can create richer, more intuitive experiences that leverage both quantitative and qualitative data. This approach not only enhances usability but also ensures that technology aligns with human behaviours, preferences, and sensory interactions. In this light, IoT becomes more than just a network of connected devices - it evolves into an ecosystem where data gains meaning through interaction, interpretation, and design-driven insights.

a. Interaction layers of IoT ecosystem

Interactions with digital devices increasingly combine graphical displays with sensors

that detect location, touch-less gestures and environmental cues, effectively tethering screen-based interfaces to the physical world. Yet, because feedback remains predominantly visual and confined to a private surface, these interfaces can limit multi-user engagement and embodied exploration. This form of interaction can Interactions with digital devices occur through abstract, screen-based interfaces that are disconnected from the physical world, creating a sense of alienation for users, as their interactions often feel unnatural or detached. According to Angelini et al. (2018), this alienation is a consequence of the abstraction and complexity of current IoT systems, which fail to align with the innate human abilities to interact with the physical environment. In this regard, tangible interaction may bridge the gap between the digital and physical worlds as it relies on embodied interaction, physical manipulation, material representation of data, and integration into real space (Hornecker & Buur, 2006). Modern touchscreen-based interfaces lack tactile depth and physical interactivity, reducing the effectiveness and naturalness of human interaction with technological tools - as envisioned by Bret Victor in one of his report[2]. By reintroducing the physical interaction, tangible interfaces can reduce alienation leveraging users' natural sensory and motor skills, fostering a deeper connection with IoT devices. Tangible User Interfaces (TUIs) address this gap by externalising digital state into graspable artefacts, offering spatial persistence, rich haptic feedback and opportunities for shared manipulation, thus complementing—not replacing—the role of screens within IoT ecosystems. Moreover, TUIs allow users to engage with digital systems in ways that feel more natural and intuitive, activating learning mechanisms (Revelle et al., 2005)

Conversely, richer interaction paradigms within IoT systems, grounded in tangible interaction, could foster deeper user understanding and stronger emotional bonds with objects, leveraging human abilities such as touch, spatial reasoning, and physical manipulation to create meaningful, reflective, and context-driven interactions (Krestanova et al., 2021). Furthermore, tangible interaction can provide immediate and intuitive feedback while also encouraging users to reflect on the system and its functionality. Rather than offering quick or superficial interaction, these interfaces allow users to explore and engage deeply with IoT devices, supporting collaborative use, influencing social dynamics as users share access to connected devices and engage in joint decision-making (Hofstra et al., 2008).

Tangible interaction enhances users' spatial awareness and physical engagement with the system, making interactions more intuitive and immersive. Additionally, it employs expressive, material representations that facilitate cognitive processes, making complex systems easier to understand and navigate (Shaer & Hornecker, 2009). One of the key advantages of tangible interaction is its persistence, as digital information is embedded in physical elements rather than being limited to transient screen-based displays (Rowland et al., 2015). This ensures that data remains accessible even when a system is inactive or temporarily disconnected, making tangible interfaces particularly valuable in IoT environments (van den Hoven et al., 2013). By maintaining a visible and interactive presence, these interfaces enhance both usability and system transparency, especially in shared spaces.

This persistence raises important questions about how interactive IoT devices can help users make sense of data. How IoT devices can enhance user interaction, simplify data interpretation, and support collaborative data collection and analysis (Rittenbruch & Donovan, 2019). Thus, offering an opportunity to transform the way users interact with IoT systems.

In this regard, a laboratory has been developed to investigate how tangible interaction through enhanced artifacts can provide immediate and intuitive feedback that encourages users to reflect on their co-living experiences. Particularly, if these shared interfaces could allow users to explore and engage deeply with IoT devices, supporting collaborative use, influencing social dynamics, and engaging in joint decision-making.

4. Interaction Design Studio: the SharIN'House lab experiment

The laboratory convened a group of young international designers to explore the potential of technological solutions tailored for the complexities of shared living environments. The laboratory adopted the Design Thinking process to guide the stages of empathy, definition of the problem, and rapid prototyping. During evaluation, UX design criteria enabled the measurement of the prototypes' perceptual quality and their impact on the roommates' daily lives. Finally, the tangible implementation of the prototypes was approached according to Interaction Design principles, with particular attention to physical-digital feedback and interaction timing. The participants were challenged to investigate the intentions behind emerging designs, particularly those leveraging the IoT to create ecosystems of interconnected products. The primary goal was to develop innovative solutions that facilitated seamless interaction between people, objects, and spaces, ultimately enriching information exchange for enhanced shared experiences.

To ensure a comprehensive evaluation of shared living dynamics and behaviours, three key areas were identified as a starting point: needs (e.g., daily personal needs), responsibilities (e.g., household management), and leisure (e.g., recreational activities).

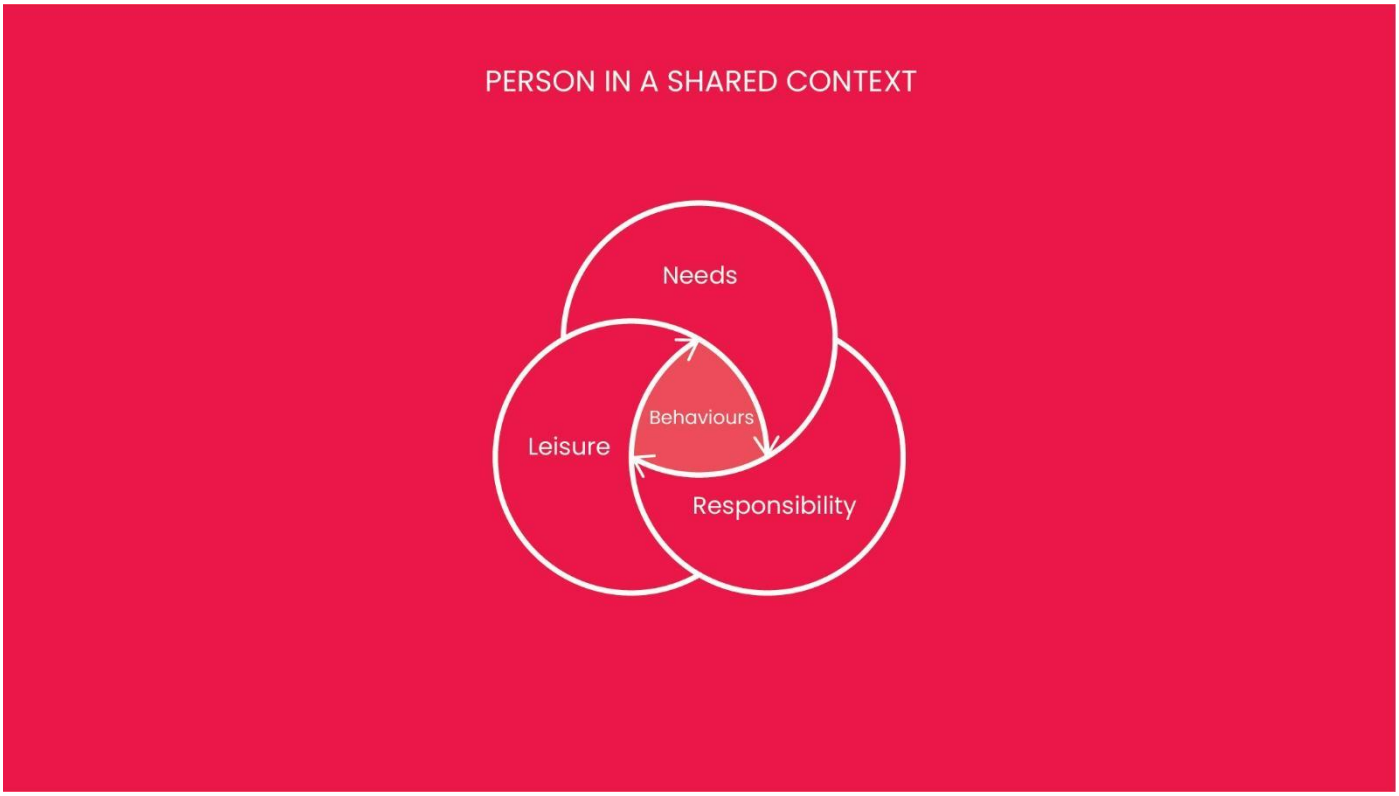

Figure 1. key areas identified by the laboratory as focus points.

The participants were organised into groups of three and assigned specific focus areas throughout the investigation and design process.

Through hands-on experimentation, designers were required to not only contribute to the development of products and services but also to consider the environmental contexts, cultural dynamics, technological possibilities that shape shared living while reflecting on the broader systemic implications of their interventions.

The lab was structured into two distinct phases: the first phase, which involved a qualitative field study to observe real-world interactions in shared housing environments; and a second phase, where designers integrated sensors and actuators into products, translating quantitative data into meaningful qualitative information.

a. First phase: co-living research

This phase is characterised by two iterative cycles comprising introductory interviews, design experiments, workshops, and follow-up interviews. Designers utilised a comprehensive analytical framework and an interdisciplinary approach to gather initial data from the ecosystem, including interactions within shared spaces and the use of everyday objects. The integration of design thinking and speculative design methodologies enriched this exploration, enabling a critical examination of contemporary shared living scenarios where housemates engage in diverse activities. To retrieve data around users and their experiences, qualitative methods such as ethnographic interviews (Fetterman, 2010), discovery templates, and 5Ws surveys (Su, 2014) were employed to elucidate key contextual aspects, namely: People, Spaces, Activities, Artifacts, and Behaviours which were collected through a grounded approach (Corbin & Strauss, 2008).

Structured prompts guided the investigation, focusing on:

1. Who: identifying users based on demographics, lifestyles, habits, routines, and specific needs.
2. What: mapping daily activities and tools to users' routines and the shared objects they interact with.
3. Why: exploring motivations and context to uncover reasons behind user actions and preferences.
4. When: analysing time allocation and routine patterns to determine activity frequencies and schedules.
5. Where: mapping spatial usage and interaction within shared environments.

To further contextualise the initial findings, designers employed a discovery sheet (figure 2) to develop a semi-structured, in-depth questionnaire. Interviews were then conducted with residents from distinct cohousing environments, selected for their contrasting spatial designs and social dynamics. This diversity allowed for a more comprehensive analysis of the potential influence of various factors, such as governance models, the organisation of shared activities, informal social structures, and individual attributes (Williams, 2005).

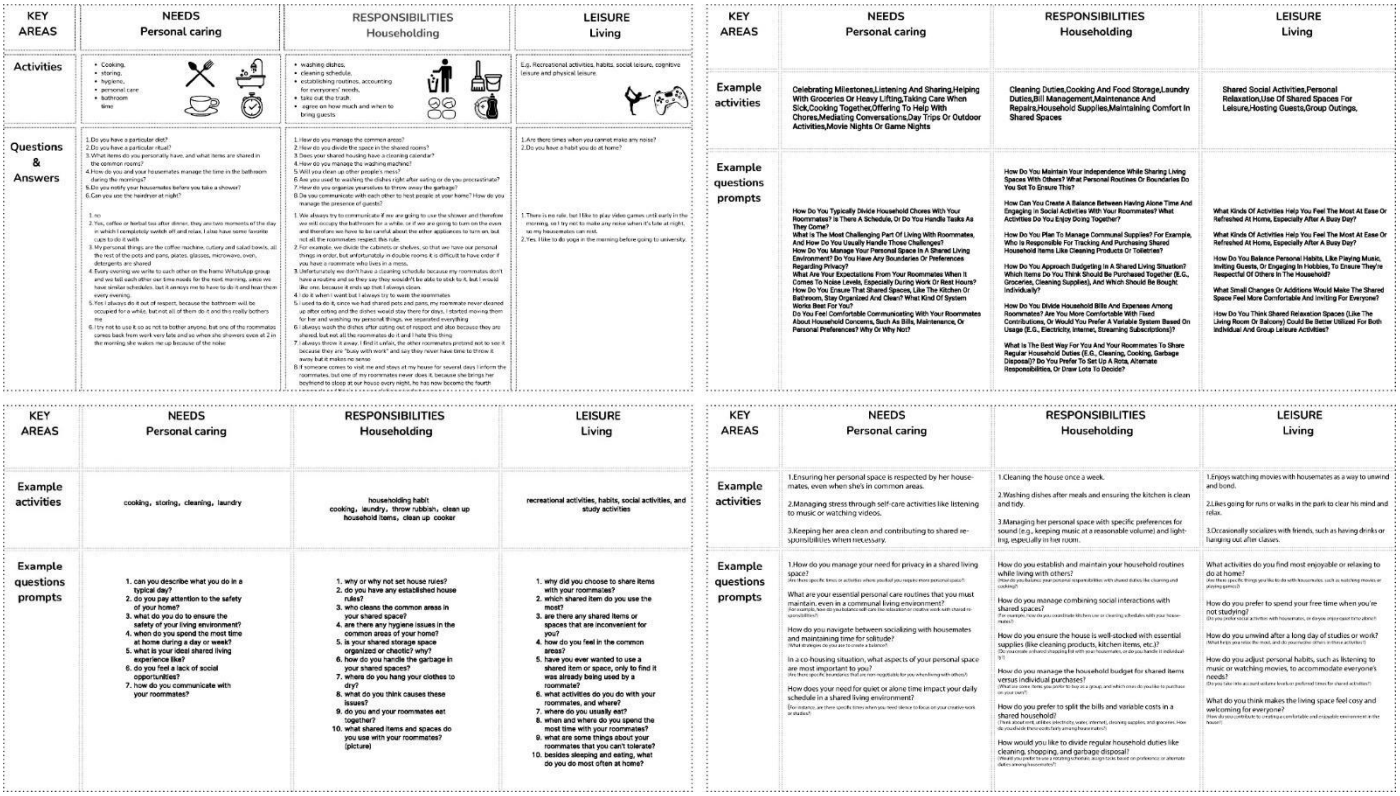

Figure 2. Filled Discovery Sheets examples.

The data collected provided valuable insights into the dynamics that govern housing, revealing user interaction pain points and areas of friction that could lead to tension among housemates. To further explore established routines, social norms, and opportunities for design in supporting sustainable practices in shared living, expert interventions in Design Thinking facilitated the design process through the implementation of a series of workshops.

b. Affinity clustering workshop

During the workshop's sessions, designers referred to the Double Diamond to generate actionable insights (Sanders, 2000). The process began with visual analysis, where participants used storytelling tools such as sketches and post-it to synthesise interview data (figure 3). Through affinity clustering, recurring responses were categorised, helping to uncover significant tendencies and representative behaviours. From these clusters, personas were developed, representing diverse profiles (e.g., introverted vs. extroverted, active vs. homebody), their behaviours, habits and interaction that influence how they interact with their environment, housemates, and resources (specific tools, devices, or spaces required for their tasks).

Figure 3. Visual data analysis and affinity clustering process.

Furthermore, detailed user journeys were created, revealing emotional responses including pains and gains. Through a comparison, critical points such as patterns of activity peaks (e.g., busiest times in the kitchen), their duration, and their impact on shared space usage were retrieved. Additionally, visual tools such as timelines and interaction flow/heat maps, clarified activity-space relationships, providing insight into spatial and functional design needs and the importance of shared norms in maintaining household rhythms.

Moreover, the workshops facilitated the designer to uncover the rationales for user actions (e.g., use of shared versus personal appliances) combined with their values, expectations (e.g., cleaning after use), and habits. Ultimately, it helped to identify opportunities for design intervention, acknowledging that successful co-living requires balancing individual behaviours and desires with effective governance, management, and the prevention of potential drawbacks. Thus, optimising the overall experience for residents.

c. Second phase: new scenarios

Initially, participants attended a workshop where they developed scenarios through collaborative design testing, simulations. These iterative processes allowed them to experiment with different rough prototypes (figure 4), configurations and systems, integrating sensors and actuators into products to generate real-time, quantitative data that enhanced understanding of user-environment interactions (figure 5).

Figure 4. Rough prototype iteration examples.

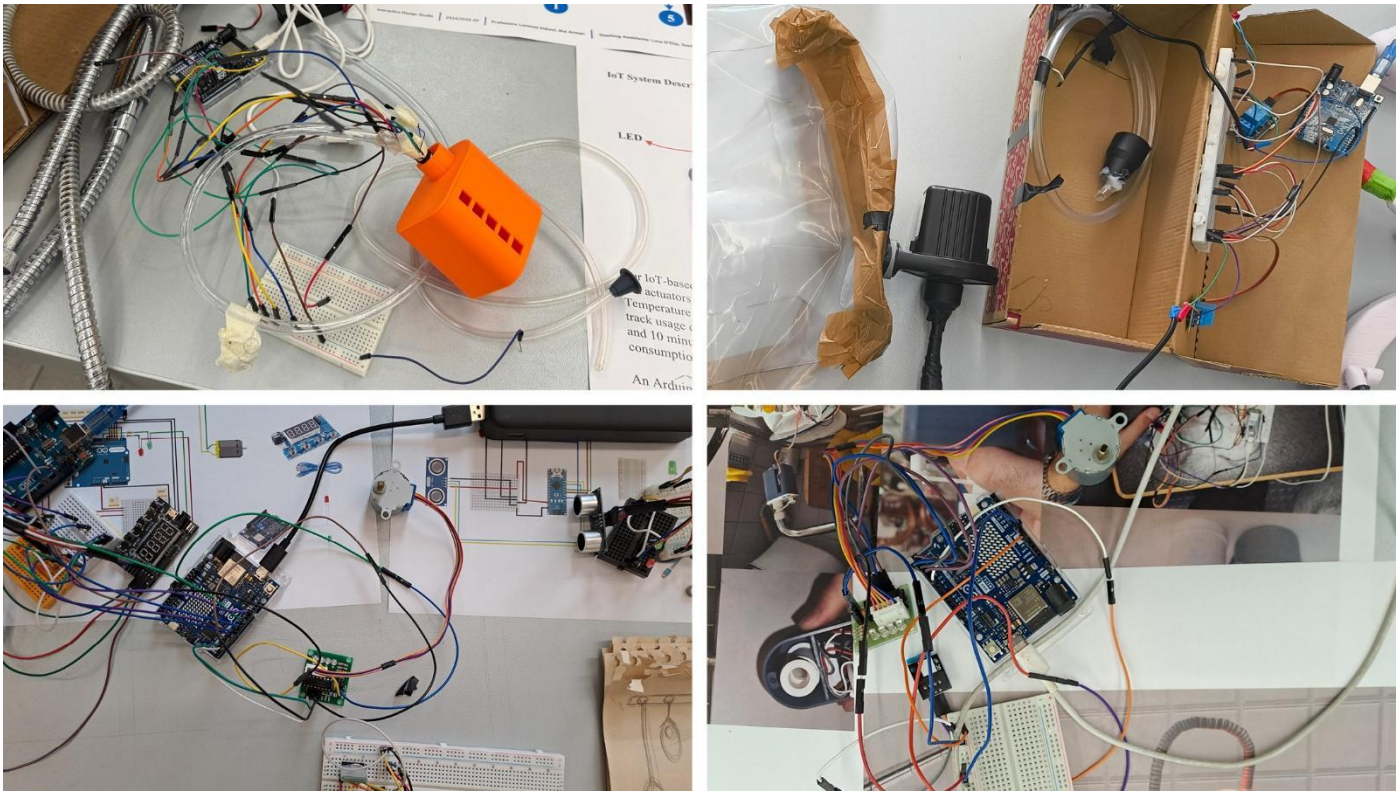

Figure 5. IoT system ideation and testing examples.

During the final phase, designers synthesised observations from the previous stages to design an interactive product system focusing on the quality of user interactions with their environment (figure 6). This phase emphasised translating quantitative data into qualitative information, creating systems that encourage reflection on shared responsibilities, daily habits, and collective values.

Figure 6. IoT system context application examples.

By processing data, designers reimagined the shared living ecosystem through interactive product systems that used data to inform decisions. These systems leveraged everyday activities and redefined the way shared spaces and artifacts are used, enabling communication exchange between housemates.

5. Interactive products

At the end of the design process, each group successfully developed products that effectively integrated a range of inputs and responded to the needs of shared living. From the analyses conducted, it emerged that the systems were capable of automatically filtering and prioritising the most relevant information, helping housemates manage their environment more effectively. In particular, it became clear that the success of co-living largely depends on three core factors: 1) Governance Structure, the effective implementation of organisational structures and rules to manage shared spaces ; 2) Qualitative Data Communication, the ability to convey complex information through communication physical artifacts; and 3) Behavioural Sustainability, the presence of a long-term engagement and reinforcement strategy, that creates lasting habits and supports ongoing commitment to sustainable living behaviours, even as dynamics evolve. These factors are critical for designing solutions that address specific behaviours and challenges, foster a sense of community and social interaction, reduce conflicts, and facilitate information sharing. All the factors and tools discussed thus far have been applied accordingly in the design process of the following projects.

a. KNOCKER X AIR SOFA

The *Knocker X Air Sofa* (figure 7) uses a connected knocker and modular sofa unit to promote fairer space-sharing behaviour. The sofa features an inflatable cushion that deflates when a user's emotional state - measured by the knock sensor - reaches a certain threshold. This creates an uncomfortable seating experience, encouraging users to leave the sofa thereby addressing any underlying tension.

1. Governance Structure: time limits on individual sofa use are defined by the system, regulating independent space.

2. Qualitative Data Communication: the inflation/deflation of the cushion visually and physically communicates the user's emotional state.

3. Behavioural Sustainability: the discomfort created by the deflation encourages users to leave the sofa, addressing conflict resolution and promoting healthy space-sharing behaviours.

Figure 7. Display of the final prototype and initial drafts of the *Knocker X Air Sofa* design, created by M. Ghods, K. Umitvar, T. Solakoglu.

b. RUG 'N' RACK SYSTEM

The *Rug 'n' Rack System* (figure 8) is designed to respond to spatial requirements and organisation while encouraging shared responsibility. By incorporating sensors to a combination of personal sanitary items such as a rug and individual holders, the system reminds users to return their belongings after use, using light, sound, and vibration cues.

1. Governance Structure: space limit on individual shower use is defined by the system, monitoring the presence of unwanted items.

2. Qualitative Data Communication: sensory feedback (light, sound, vibration) prompt users to return their belongings.

3. Behavioural Sustainability: automated reminders help users maintain communal routines and reduce friction.

Figure 8. Display of the final prototype and initial drafts of the *Rug 'n' Rack System* design, created by G. Tarantino, E. Zannetti, A. Aleksandrova.

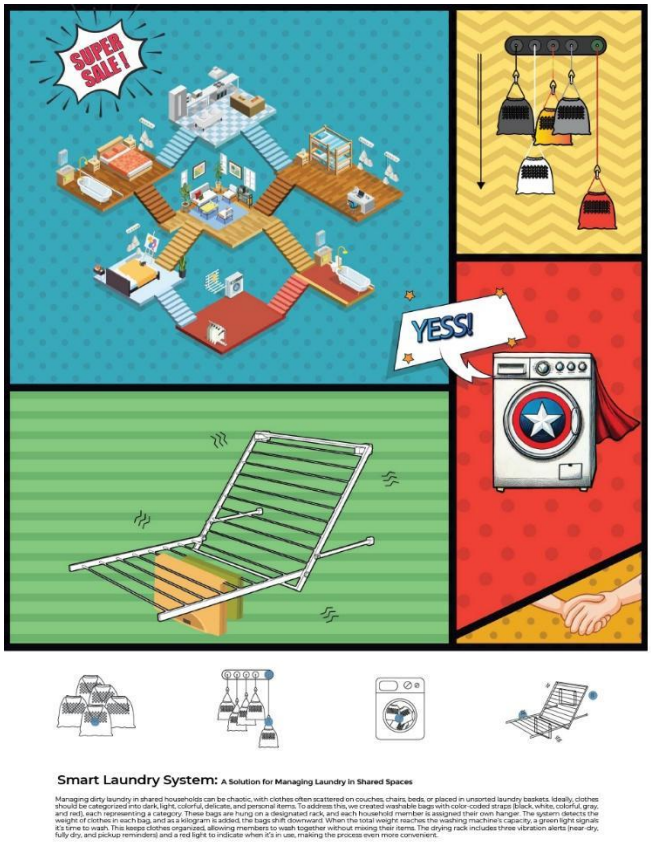
c. SMART LAUNDRY SYSTEM

The *Smart Laundry System* (figure 9) addresses the challenges of managing laundry in shared spaces while enhancing cooperation among housemates. The system uses wall-mounted hangers with different weight-sensing bags, to notify users when the collective amount of laundry is ready to be washed. The system features a smart drying rack that signals when clothes are dry, optimising laundry schedules and reducing conflicts.

1. Governance Structure: the system organises laundry schedules based on shared capacity and automated notifications.

2. Qualitative Data Communication: visual signals (green/red lights) and vibrations communicate laundry status to users. The rack vibrates at varying intensities to indicate drying progress.

3. Behavioural Sustainability: automated alerts reduce scheduling conflicts and promote cooperative laundry management.



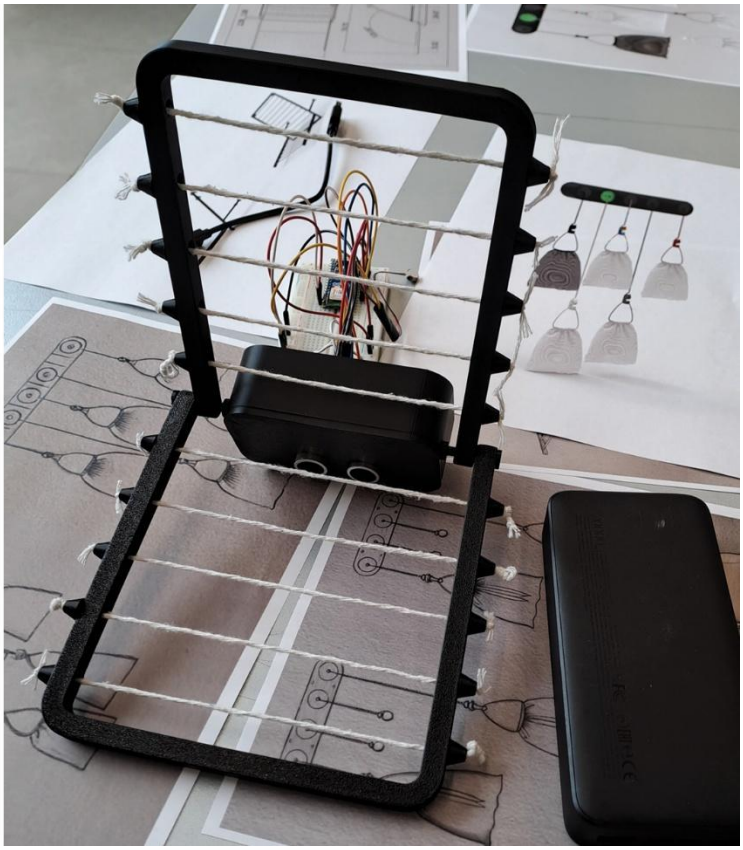


Figure 9. Display of the final prototype and initial drafts of the *Smart Laundry System* design, created by F. Esmaeilpour Amirikiasar, A. Mohebbi.

d. LEAFLINK

The *Leaflink* (figure 10) facilitates communication and social interaction in shared spaces through a central device (*Leaflink* Main) and individual devices (*Leaflink* Keyholder). It uses plant-themed devices to signal moods and availability, promoting social cohesion without disrupting personal privacy.

1. Governance Structure: the system allows housemates to communicate their moods or availability without direct confrontation.

2. Qualitative Data Communication: by blowing on the personal *Leaflink* device, mood and availability are signalled through light colours and plant movements on the central *Leaflink* main device.

3. Behavioural Sustainability: the system encourages a balance between social interaction and solitude, allowing for flexible communication and respect for privacy.

Figure 10. Display of the final prototype and initial drafts of the *Laflink* design, created by Y. Elkayam, G. Pan, L. Barberis.

e. SMART SHARING HOME WATER MANAGEMENT SYSTEM

The Smart Sharing Home Water Management System (figure 11) is designed to promote cooperation among users by regulating water flow in shared spaces during peak usage times. Thanks to devices specifically designed for the sinks and showers taps, the project ensures that hot water and water pressure is available to all housemates by limiting flow based on usage patterns.

1. Governance Structure: limits water usage per person, ensuring fairness during shared use.

2. Qualitative Data Communication: water usage is regulated and communicated through system cues, such as changes in water pressure.

3. Behavioural Sustainability: encourages mindful water usage while ensuring equitable access to shared resources.

Figure 11. Display of the final prototype and initial drafts of the *Smart Sharing Home Water Management System* design, created by S. Elyasi, F. M'Haimah Romero, D. Voskanian.

f. CLESSHYDRA

Clesshydra (figure 12) is a system designed to foster accountability among housemates by reducing conflicts over bathroom resources access. The project features a showerhead that measures water usage and a clepsydra (water clock) that visually displays consumption.

1. Governance Structure: regulates time and water usage, ensuring fair distribution and reducing overuse.

2. Qualitative Data Communication: water usage is displayed visually through the clepsydra, making data tangible.

3. Behavioural Sustainability: by promoting mindful usage, the system encourages water conservation and fosters shared responsibility.

Figure 12. Display of the final prototype and initial drafts of the *Clesshydra* design, created by E. Ricci, M. De Cagna, C. N. Putri.

g. LIVING VOID

The *Living Void* (figure 13) addresses waste management in shared living spaces, ensuring liability and proper waste disposal through automated alerts. The system features a bin and connects personal devices that notify users when the bin reaches its full capacity.

1. Governance Structure: the system regulates responsibility-sharing by ensuring each housemate takes turns managing the garbage.

2. Qualitative Data Communication: the system triggers visual and sensory responses (e.g., smoke or light) to indicate when it's time to take out the trash.

3. Behavioural Sustainability: automated alerts and reminders help users stay accountable for waste management, ensuring a clean and healthy living space over time.

Figure 13. Display of the final prototype and initial drafts of the *Living Void* design, created by L. Arena, Y. Zhang, A. Ponzi.

h. AURA

The Aura system (figure 14) is designed to foster social interaction among housemates. It consists of three objects: a carpet, a light cube, and an outer lamp. The carpet detects when someone is alone in the room and shifts to a "sad" mode. Tapping on it triggers signals to invite other housemates. Once they join, the carpet recognises the type of activity - whether it's socialising, calm socialising, or partying - and communicates with the light cube. The light cube adjusts accordingly, creating a relaxing atmosphere during calm socialising or emitting colourful lights during parties to encourage dancing.

1. Governance Structure: encourages social interaction by prompting users to connect when alone, fostering a shared experience in the living space.

2. Qualitative Data Communication: the carpet's change in mood and the light cube's responsive lighting visually communicate the activity type and emotional atmosphere.

3. Behavioural Sustainability: the system promotes increased social interaction, reducing loneliness and enhancing positive engagement within shared living spaces.

Figure 14. Display of the final prototype and initial drafts of the *Aura* design, created by O. Özder, S. S. Tok, C. Del Palacio.

i. GHOST HOUSE

The Ghost House (figure 15) is an ecosystem of products designed to monitor and manage noise levels in shared living spaces, particularly in the dining room. When the noise exceeds a predefined threshold, the ceiling lamp begins to swing like a pendulum. If the noise persists, the standing lamp dims its light, and if the noise level remains too high, the radio emits intermittent sounds to alert the housemates until the noise level is reduced.

1. Governance Structure: Regulates noise levels by encouraging quieter behaviour in shared spaces.

2. Qualitative Data Communication: The system uses visual cues (pendulum motion, dimming light) and auditory signals (radio noise) to indicate excessive noise, prompting users to reduce their sound levels.

3. Behavioural Sustainability: By encouraging quieter behaviour through intrusive alerts, the system reduces conflicts and fosters a respectful shared environment.

Figure 15. Display of the final prototype and initial drafts of the *Ghost House* design, created by A. Scardigno, M. Ladhiri, L. D. Guijosa Perez.

6. Interactive Design lab's findings

From the analysis and the consideration stated so far, it is possible to retrieve a first picture of a potential tendency of design outcomes when dealing with friction points and areas of tension that commonly arise in shared living environments. The insight gained throughout the design process has highlighted the same design paths when designers are exposed to specific key areas, namely needs, responsibility and leisure.

Table 1. Key areas of intervention for design, namely needs, responsibility, leisure and result.

Need	Responsibility	Leisure	Aim
Regulating independent space usage	Monitor shared space usage	Promote social interaction	Promote fairer space-sharing behaviour

It is evident that the design process has inevitably overlapped these areas to put into system the intricate interplay between individual physical, personal, and social factors influencing behaviour in shared living environments.

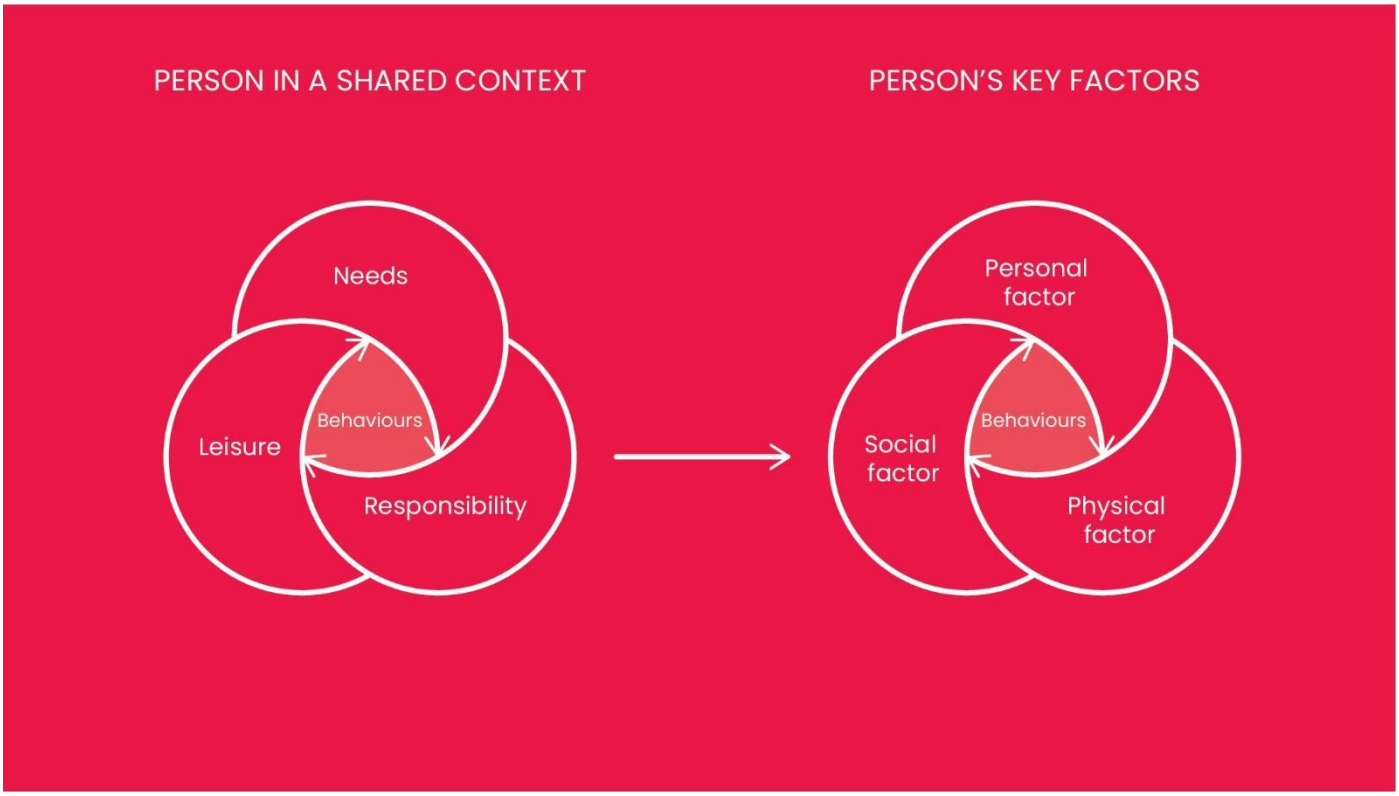

Figure 16. The interaction between physical, personal and social factors and impact on behaviour. Source: Adapted from Williams (2005).

It is possible to see a change in behaviour resulting in frictions as soon as people are put in shared environments, where the organisation of the physical space and the social context are significantly shaped. In such a scenario, the intervention of Design and the integration of advanced IoT technologies have shown the potential to escalate these challenges while enhancing new behaviours. By actively connect physical objects, new value-added information and functionalities for users are provided. Devices, information, users, and applications are integrated to create an IoT ecosystem in which new solution and products are developed in an organic way, mediating possible drawbacks.

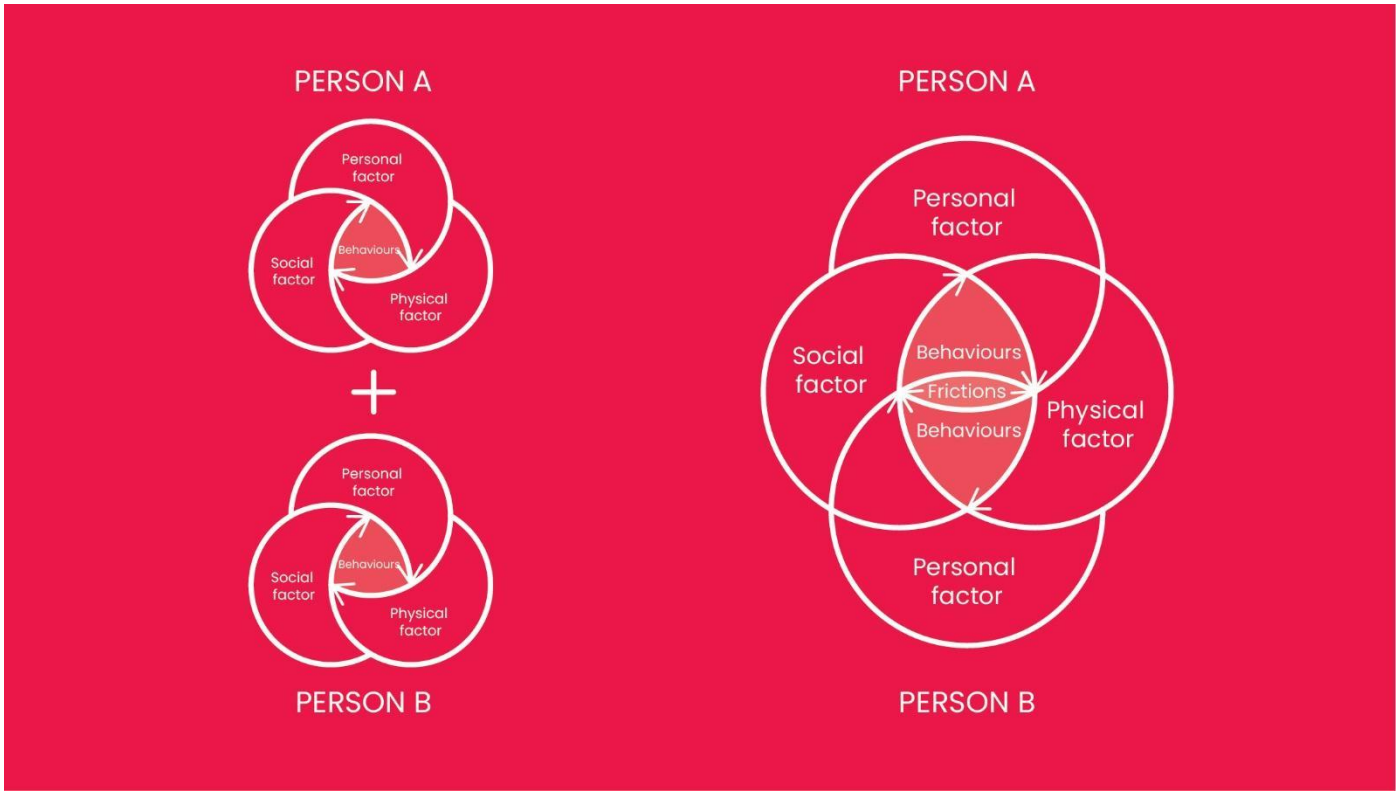

Figure 17. Interaction between more people in the same context causing frictions.

The findings suggest that through critical thinking approach, products not only become emphatic and tailored to the user needs but are capable of promptly picture, manage and reduce future tensions.

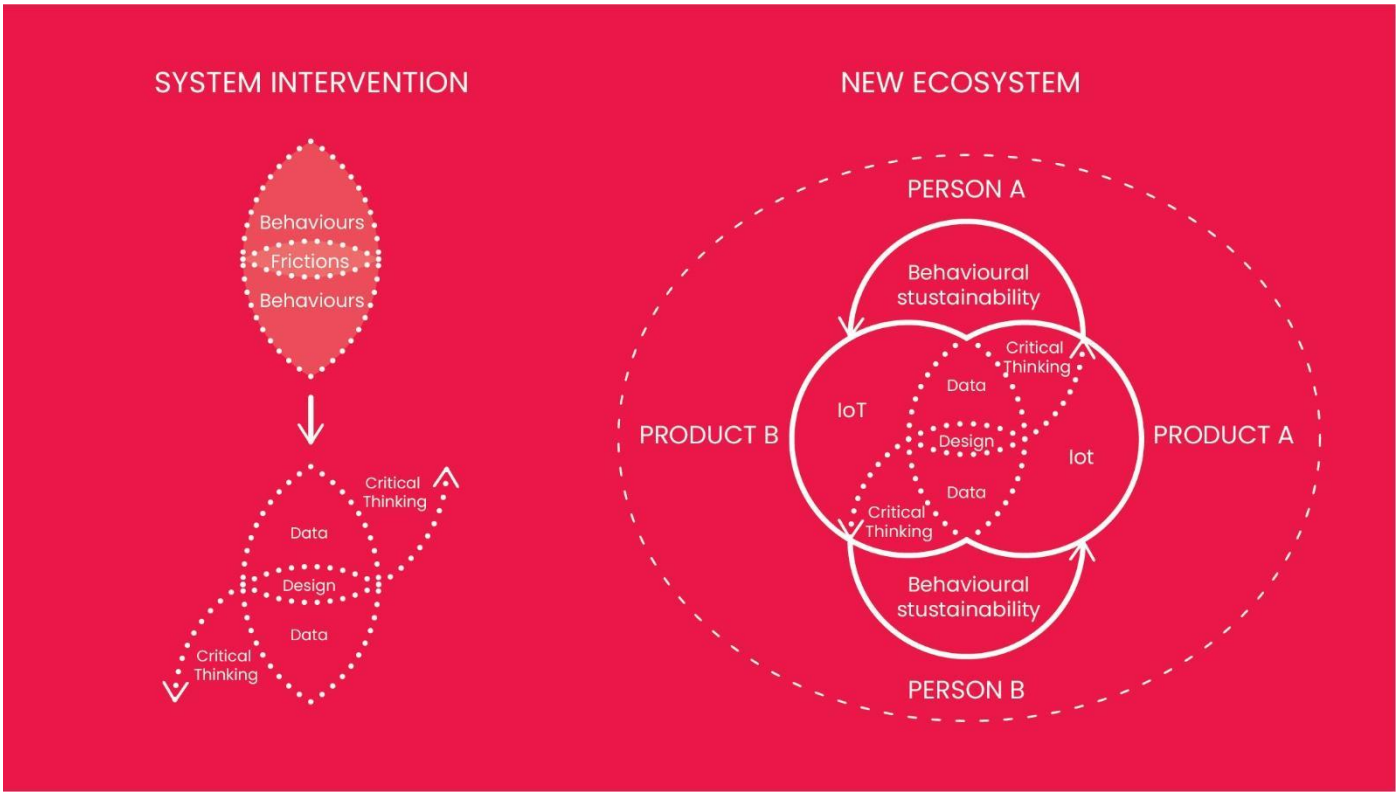

Figure 18. Design – System intervention and resulting new ecosystem.

Moreover, the study was able to establish a framework for impact-share design that traces behavioural effects of human-technology interactions. The findings suggest that richer interaction within IoT systems, grounded in physical products, could foster deeper user understanding of their behaviours with their surroundings, creating meaningful, reflective, and context-driven interactions. The dual cause-effect approach facilitates the transformation of quantitative sensor data into qualitative insights, enhancing our understanding of how IoT technologies can enable new forms of qualitative data exchange, ultimately informing new practices that promote continuous sustainable behavioural changes.

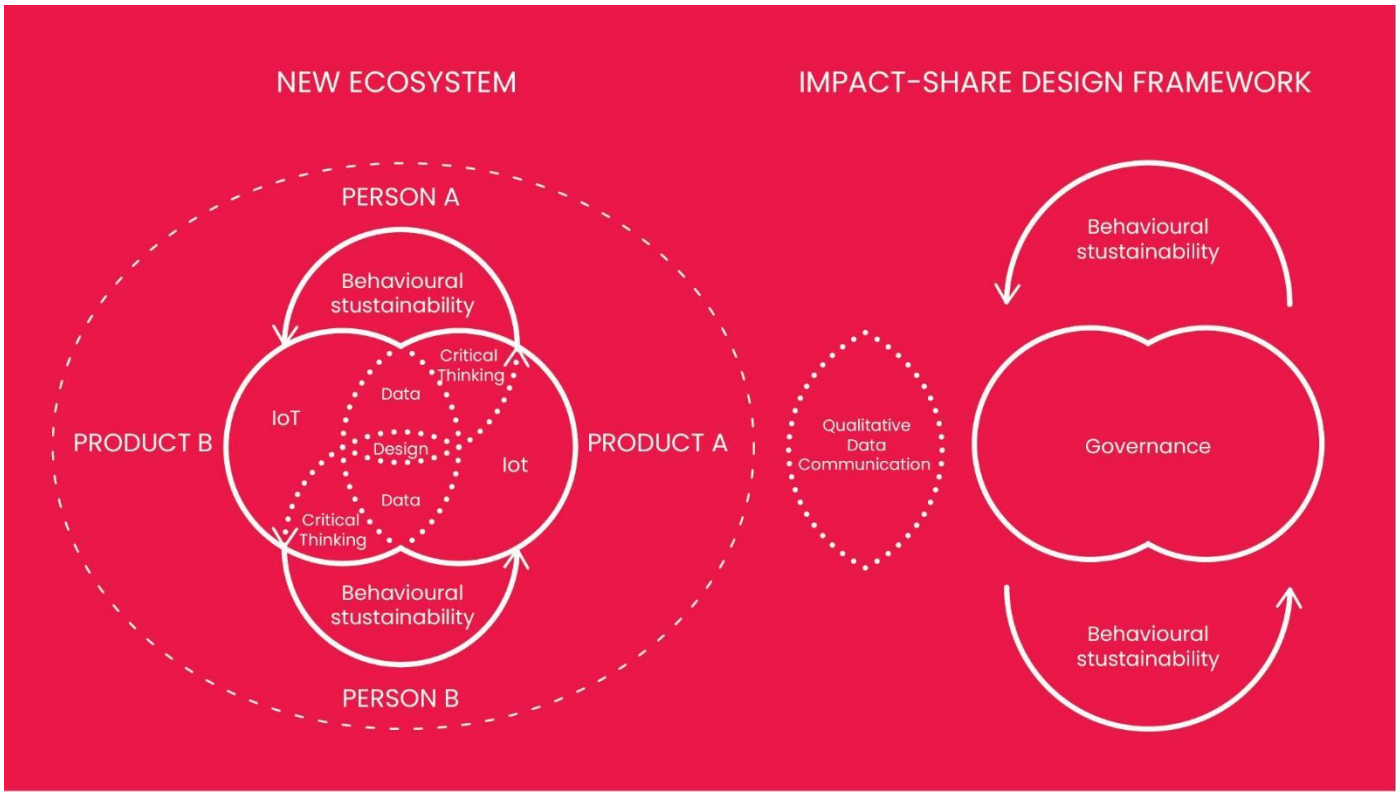

Figure 19. Impact-share design framework.

The dual cause-effect approach describes the bidirectional influence between IoT system implementations and user behavior in co-living situations. This approach recognizes that technological solutions shape social interactions while simultaneously being influenced by user feedback.
The approach emphasizes the interplay between causation initiated by design (e.g., IoT features prompting user interaction) and causation emerging from user behavior (e.g., feedback loops shaping future design iterations).
For this paper, the dual cause-effect approach was applied through iterative design sprints, user testing, and scenario-based evaluations. Each phase focused on capturing both designer-intended outcomes and emergent user behaviors.
Drawing on an example the IoT-enabled Shared Kitchen had as intent from the designer to reduce food waste by monitoring inventory and suggesting recipes. The emergent behavior was that users developed communal meal preparation routines, enhancing social cohesion.
To operationalize the dual cause-effect approach, designers should:

1. Identify bidirectional influences during the ideation phase.
2. Incorporate iterative feedback loops throughout development.
3. Leverage user insights to refine and evolve the designs.

7. Discussions

The findings of this study emphasise the critical role of design in addressing the inherent tensions and friction points that arise in shared living environments. When individuals engage in co-living arrangements, their behaviours inevitably shift in response to new social dynamics and spatial constraints. These behavioural changes can generate tensions, particularly in key areas such as personal needs, shared responsibilities, and leisure activities. Design, therefore, emerges as a fundamental mediator, capable of shaping interactions, fostering balance, and enhancing the overall co-living experience.

A central insight from this research is the potential of integrating IoT technologies into shared domestic spaces. By embedding sensors and actuators into physical objects, IoT facilitates the seamless exchange of information, allowing occupants to make more informed decisions about their communal environment. This technological integration enables products to act as intermediaries that encourage responsible behaviour, optimise shared resource management, and support more meaningful social interactions. Through real-time feedback mechanisms, IoT solutions enhance user awareness of their interactions with both their surroundings and cohabitants, ultimately promoting more conscious and pleasant living practices.

However, effective design solutions extend beyond the physical environment to include strategies for fostering fairness and cooperation among residents. Interfaces that encourage knowledge sharing, structured decision-making, and communal engagement can significantly contribute to reducing conflict and reinforcing a sense of collective responsibility. These design-driven interventions ensure that co-living spaces remain adaptable and supportive, accommodating the evolving needs of residents while maintaining a stable and cooperative atmosphere. In fact, beyond technological integration, the study highlights that the establishment of clear governance structures, and the enhancement of sustainable behaviour are enhanced through communication mechanisms within co-living settings.

Moreover, the transformation of sensor-generated quantitative data into qualitative insights is a key factor in understanding and enhancing co-living experiences. By analysing behavioural patterns and engagement levels, designers can refine interactions within shared environments, creating systems that actively shape and sustain positive behaviours. The research introduces a framework for "impact-share design," which traces the behavioural effects of human-technology interactions, offering a structured approach to designing solutions that reinforce shared responsibilities and collective values.

This approach strategically emphasises continuous engagement and reinforcement, helping individuals adopt and sustain positive behaviours over the long term. By creating lasting habits and fostering a culture of accountability, the strategy supports ongoing commitment to sustainable living behaviours, even as circumstances and dynamics evolve.

8. Conclusions

This study underscores the transformative potential of design in shaping in-house co-dwelling experiences. By integrating technology, behavioural insights, and effective governance strategies, design can mitigate tensions, foster meaningful interactions, and

create sustainable frameworks for shared living. Through a holistic approach that considers both social and spatial dynamics, the findings contribute to a deeper understanding of how tangible interaction through technological artifacts can enhance the quality of communication, ultimately ensuring that information exchange remain functional, inclusive, and enriching for all residents.

While IoT technologies offer considerable opportunities for translating sensor-generated quantitative data into qualitative insights - being context-aware, networked, and proactive - design must balance innovation with ethical considerations allowing users to explore, engage and reflect deeply with IoT devices, supporting collaborative use, influencing social dynamics, and engaging in joint decision-making.

Notes

1. On June 22, 2009, Kevin Ashton shared a definition on the RFID Journal website, recalling how the term "Internet of Things" was accidentally coined as the title of a presentation he gave at Procter & Gamble in 1999. The phrase was then used in a scientific publication for the first time a decade later. That 'Internet of Things' thing. RFID Journal. About the Authors:

Lorenzo Imbesi Full Professor of Design at Sapienza University of Rome, where he is the former Director of the Sapienza Design Research Interdepartmental Centre and the Coordinator of the PhD in Service Design for Public Sector. He is also the President of Cumulus Association, President of the Italian Scientific Society of Design (SID), and member of the Executive Committee of the European Academy of Design (EAD).

Luca D'Elia (PhD) is a designer and Researcher at the PDTA Department of Sapienza University of Rome. His Research activity focuses on digital manufacturing and co-design practices in urban context and within the Makers community.

Sonia Belhaj is a PhD student in Service Design for Public Sector at Sapienza University of Rome. Her research interest delves into the development of ground-breaking approaches that accelerate uncommon growth, innovate public sector services and foster holistic social development.

Marcello Risolo is a PhD student in Service Design for Public sector at Sapienza University of Rome. His research interest lies at the intersection of human centered methodologies and visualisation techniques to innovate the public sector, enhancing citizen participation with the aim of building engaging digital experiences.

Alessandro Aiuti PhD student in Service Design for Public Sector at Sapienza University of Rome. His work investigates how HCI and service design can transform urban mobility and sustainably regenerate public spaces, fostering more accessible and resilient cities.

TYPEFACE DESIGN TO PRESERVE CULTURAL DIVERSITY: THE MISSING SCRIPTS PROJECT.

Thomas Huot-Marchand

Atelier national de recherche typographique (ANRT), École nationale supérieure d'art et de design (ENSAD) de Nancy
thomas.huot-marchand@anrt-nancy.fr

ABSTRACT | The Missing Scripts Project started from the alarming realization that nearly half of the world's writing systems remain absent from digital platforms. Among these are not only ancient scripts, some of which remain undeciphered, but also a large number of minority or Indigenous scripts still in use today. Neglected by the digital industry, these scripts, along with the languages they represent face the threat of extinction. How can we fix this situation? The initial step involves encoding these scripts, a process that entails standardizing them by assigning a numerical identifier to each symbol.
This crucial task has been carried out by the Universal Unicode Standard since the early 1990s. However, mere encoding is insufficient. Equally imperative is the development of input methods such as keyboards to ensure compatibility across various operating systems, as well as the creation of appropriate fonts. Designing these "digital fonts" requires specialized expertise, involving collaboration with experts, including linguists, developers and native speakers. Making these scripts accessible on computers and smartphones requires an approach that combines technology, art, culture and typographic design.
This is the goal of the Missing Scripts Project, a collective project that brings together 3 institutions: the Atelier national de recherche typographique (ANRT) in Nancy (France); Designlabor Gutenberg, Hochschule Mainz (Germany), and The Script Encoding Initiative, in the Department of Linguistics of UC Berkeley (USA).
Since 2016, 14 students from around the world have joined the Missing Scripts project, for 2-year courses at ANRT dedicated to the development of digital fonts for unencoded or newly-encoded scripts. Along the way, very specific expertise has been developed and improved.

T. Huot-Marchand

KEYWORDS | TYPEFACE DESIGN, FONTS, ENCODING, UNICODE, DIVERSITY

1. Introduction

The Missing Scripts Project began from the alarming realization that half of the world's writing systems remain absent from digital platforms. Among these are not only ancient scripts, some of which remain undeciphered, but also a large number of minority or Indigenous scripts still in use today. Neglected by the digital industry, these scripts, along with the languages they represent, face the threat of extinction. How can we address this situation? The initial step involves encoding these scripts, a process that entails standardizing them by assigning a numerical identifier to each symbol.
This crucial task has been carried out by the Universal Unicode Standard since the early 1990s. However, mere encoding is insufficient. Equally imperative is the development of input methods such as keyboards to ensure compatibility across various operating systems, as well as the creation of appropriate fonts. Designing these "digital fonts" requires specialized expertise, involving collaboration with experts, including linguists, developers, and native speakers. Making these scripts accessible on computers and smartphones requires an approach that combines technology, art, culture, and typographic design.
This is the goal of the Missing Scripts Project, a collective initiative that brings together three institutions:

- **The Atelier National de Recherche Typographique (ANRT)**, a postgraduate research course created in 1985, established at the École nationale supérieure d'art et de design in Nancy, France;
- **Designlabor Gutenberg**, within the School of Design of Hochschule Mainz, Germany, and in particular, the *decodeunicode* project developed by Prof. Johannes Bergerhausen;
- **The Script Encoding Initiative (SEI)**, founded in 2000 by Prof. Deborah Anderson in the Department of Linguistics at UC Berkeley, USA, and led today by Anushah Hossain, PhD.

The Missing Scripts Project aims to:

- List and analyze scripts that are not yet encoded in Unicode;
- Draw attention to the importance of encoding these scripts;
- Facilitate exchanges between researchers, linguists, and designers;
- Design digital fonts for those scripts that have been recently encoded or are about to be encoded.

2. Historical Background

The **Atelier National de Création Typographique (ANCT)** was created in 1985 at the

Imprimerie Nationale in Paris to "relaunch" the French typographic scene. In the late 1970s, typography in France was in a critical state. The four main type foundries (Hollenstein, Olive, Deberny & Peignot, and Fonderie Typographique Française) had all closed, leaving the Imprimerie Nationale as the only remaining institution. The major figures of French typography (Charles Peignot, Roger Excoffon, Ladislas Mandel, José Mendoza, Adrian Frutiger, Fernand Baudin, Gérard Blanchard, etc.) collaborated to find solutions, leading to the founding of ANCT. In 1997, the Atelier moved to the École nationale des arts décoratifs in Paris and was renamed **Atelier National de Recherche Typographique (ANRT)**. In 2000, ANRT moved to the École nationale supérieure d'art et de design (ENSAD)in Nancy. After closing for six years between 2006 and 2012, it reopened with a new director (Thomas Huot-Marchand), a new team (Jérôme Knebusch, Charles Mazé, Émilie Rigaud, and Alice Savoie), and a new scientific project.
Two main research areas developed at ANRT during its reopening echo the heritage of the Imprimerie Nationale, which boasts over four centuries of history: the development of typographic solutions for scholarly publications, and the creation of typefaces for the world's writing systems.
The **Imprimerie Nationale** is the oldest typographic institution in the Western world, with a rich collection of "non-Latin" typefaces. It began with the **Grecs du Roy** by Claude Garamont (1544-1550) and covers a total of 65 writing systems in nearly 150 styles. In the 19th century, so-called "Oriental" typography flourished at the Imprimerie Nationale, driven by the discovery of ancient languages and the rise of philology. In many ways, the Imprimerie Nationale played a role similar to Unicode for several centuries, adapting a variety of writing systems to the typographic techniques developed in Europe. This included non-alphabetic scripts, such as the **Buis du Régent** (86,000 sinograms cut in wood by Étienne Fourmont between 1723 and 1730 and later completed by de Guignes from 1811 to 1813), or **Egyptian hieroglyphs** (3,325 punches cut between 1842 and 1852 by Delafond and Ramé fils). Though now obsolete and sometimes scientifically debated, these achievements continue to inspire contemporary researchers and designers, both graphically and methodologically[1].

3. Studied Scripts

Since 2016, 14 students from around the world have joined the Missing Scripts project, for 2-year courses at ANRT dedicated to the development of digital fonts for unencoded or newly-encoded scripts.

- 2016-2018: Arthur Francietta (Martinique, 1990) designed fonts for **Paleo Hispanic**, a set of writing systems which appeared on the Iberian Peninsula. Semi-syllabic rather than purely alphabetical, these scripts exist three kinds (Northern, Southern, and Greco-Iberian), identified in inscriptions on stone or on metal.
- 2017-2019: Morgane Pierson (France, 1994) worked on **Elymaic**, a writing system, derived from Aramaic, that was developed at the turn of the common era (from the 2nd century BCE to the third century CE) in the Middle East. It is an Abjad, non-joining, comprised of 46 glyphs. This script was integrated into version 12.0 of the Unicode Standard in March 2019. A few months later, Morgane Pierson produced the first digital font of this writing system: Noto Sans Elymaic, which is published under open-source license by Google Fonts.
- 2018-2020: Émilie Aurat (France, 1994) worked on the script of the Ndyuka people, settled along the Maroni river, in Suriname, South America. Ndjuka is the only creole

[1] See FOURNIER, P., L'écriture hiéroglyphique au prisme du design typographique : Un observatoire critique de l'égyptologie, PhD thesis, Projekt, Université de Nîmes, 2023

language that has a script of its own: it is **Afáka**, which came to its author, Afáka Atumisi, in a dream, in 1908.

- 2019-2021: Alexandre Bassi (France, 1993) studied **Mayan Hieroglyphs**. It is a logosyllabic writing system that combines logograms with a phonetic notation: a glyph can represent a word, a concept, or a syllable. It is comprised of a great number of allographs: several signs can express the same word. As part of The Missing Scripts program, Alexandre Bassi studied the Mayan writing system in contact with a team of international specialists . He looked in particular at the Dresden Codex, whose painted hieroglyphs are of a remarkable quality. A rigorous analysis of their drawing made it possible for Bassi to transpose them into a digital form: a technical challenge, considering the complexity of the forms, and their astonishing plasticity
- 2019-2021: Parimal Parmar (India, 1990) studied **Sharada**, a script derived from Brahmi, from the 8th to the 20th centuries Sharada is the principal writing system of Kashmir, India. It was used for writing Sanskrit, Kashmiri, and other languages of northern South Asia. It is an alpha-syllabary, or abugida, that uses signs or combinations of signs to notate phonemes.
- 2020-2022: Amir Mahdi Moslehi (Iran, 1990) worked on **Book Pahlavi**, a writing system from Iran, used until the end of the Sasanian period, in the 6th century of the common era. It is still used today in the Zoroastrian literary community. Its integration into Unicode is ongoing. Expert in persian calligraphy, Amir Mahdi Moslehi developed the first Book Pahlavi digital font, through a precise analysis of historical manuscripts. Much like Arabic, this alphabet is an abjad in which only consonants are notated. In the end of the project, Moslehi published Meraban, a typeface family in the Czech type foundry Rosetta, which also included Latin, Arabic and Avestan, another Middle Persian script.
- 2021-2023: Fernando Caro (Brasil, 1983) worked on **Dives Akuru**, the official script of the Maldive islands, between the 9th and 18th centuries. Like other writing systems from Southeast Asia, such as Sinhalese and Tamil, its origin lies in the Brahmi alphabet. Dives Akuru only existed in handwritten form and had not undergone any typographical adaptation. Many manuscripts and inscriptions still exist, and this script is currently the object of a renewed interest among native populations. With the help of anthropologists, linguists, and the Maritime Asia Heritage Survey, Fernando Caro analyzes the style of Dives Akuru in order to render its cursivity in a digital font.
- 2021-2023: Sina Fakour (Iran, 1987) studied **Linear Elamite**, one of the writing systems used to notate the Elamite language toward the end of the third millennium BCE, in Elam, on the land of present-day Iran. Discovered at the beginning of the 20th century in Susa, this writing system was deciphered between 2017 and 2020 by the French archeologist François Desset. 5 vowels, 12 consonants, and 60 combinations make linear Elamite the first alpha-syllabary in the history of humanity. Entirely abstract and phonetic, its deciphering upsets established conceptions regarding the origins of writing. Since 2021, Sina Fakour has been working at ANRT with François Desset on the typographical transcription of this script, and on a Unicode proposal for its encoding.
- 2022-2024: Kaveh Ashourinia (Iran, 1980) kept working with François Desset on **Proto Elamite**, from which linear Elamite is derived, and which is still undeciphered. Kaveh Nia (born in 1980 in Iran) has been studying their design at the ANRT since autumn 2022.
- 2022-2024: Adam Yeo (Ivory Coast, 1986) created a digital typeface for the **Bété** script, created by Frédéric Bruly-Bouabré in 1956 to note the Bété language, spoken

by more than 5 millions people in Ivory Coast. Based on an exhaustive analysis of existing documentation on the Bété script, Adam Yeo developed a consistent system to transcribe the 449 of the Bété syllabary in digital form.
- 2023-2025: Ariq Syauqi (Indonesia, 1994) first studied **Lampung** script, conventionally used to write Lampung language in Sumatra, Indonesia, about to be encoded in Unicode. This research led him to examine the related Rejang and Kerinci scripts in order to gain a better understanding of the relationships and stylistic particularities of Southern Sumatra scripts.
- 2023-2025: Fangzheng Li (China, 1990) worked on **Sidetic**, one of the ancient Anatolian alphabets (including Carien, Lycian, and Lydian) used to record Anatolian and Phrygian languages, and the only one to remain unencoded. In total, Sidetic contains 29 letters containing both vowels and consonants, strongly influenced by Greek, establishing connections with the diverse cultural and linguistic contexts of ancient Anatolia.
- 2024-2026: The current session of the program includes two new student-researchers, both working on indigenous scripts that are still in use but not yet encoded. Franco Jonas (Chile, 1995) is studying the **Eskaya** script of the Philippines, while Nunzio Mazzaferro (Italy, 1995) is researching the **Masaba** script of Mali. Their research projects, currently in development, will continue until September 2026.

4. Research Outputs

In most cases, missing scripts lack established typographic reference models. Whether dealing with living or historical scripts, the typographic adaptations within the Missing Scripts Project take into account:
- The **nature** of reference models (inscriptions in stone, metal, handwritten, or painted);
- The **ductus** (the order and direction in which the strokes are drawn);
- The **writing tool** used, which influences letterforms (e.g., ballpoint pen, reed pen, brush);
- The **plasticity** of the script (the degree of variation in the shapes of glyphs), studied to deduce formal archetypes for each glyph;
- The **formal logic** of each script, digitally transcribed in Bézier curves while maintaining fidelity to the original sources;
- **Encoding strategies**, ensuring font software programming aligns with the script's structure (alphabet, syllabary, abjad, ideographic system, etc.).

Depending on their level of complexity, projects may result in:
- Fully developed, digitally encoded fonts released under open-source licenses;
- Near-complete fonts with temporary encoding, awaiting definitive Unicode encoding;
- Vector-based glyph drawings to formalize reference characters for ongoing Unicode proposals;
- Vector transcription models of specific forms within studied scripts, to help design future fonts.

5. Dissemination

Since 2018, the Missing Scripts team publishes on a regular basis a poster which presents the world's writing systems, in the history of mankind, in chronological order. The data is established with help of SEI Berkeley, and peer-reviewed. It consist of:

- The list and names of the scripts;
- Their region and periods of use;
- The selected reference glyph to represent the script;
- The design of this reference glyph;
- A color code indicating the script's status: living or historical, encoded or not.

In 2018, for Unicode 11, the first edition of the poster listed 292 scripts. At the time, Unicode included 146 different scripts, for a total of 137,374 characters. And 146 scripts out of 292 were missing from Unicode: exactly 50% of the total. In 2023, the poster presents 161 scripts encoded in Unicode 15.1, for a total of 149,186 characters.
The database is also available on the website https://www.worldswritingsystems.org, which provides access to key sources for each script. Both the poster and website were designed by Johannes Bergerhausen at the Designlabor Gutenberg, Hochschule Mainz, while the ANRT team is responsible for the typeface design.
These documents aim to draw attention to the diversity of scripts, and the important role of encoding and typeface design in preserving them. Thanks to this joint effort within the Unicode Consortium, coverage of the world's writing systems is increasing. Along with the Script Encoding Initiative, the Missing Scripts program contributes to this effort by supporting the encoding process and developing functional digital fonts for these scripts, newly integrated into the digital world.

6. Process

It is our responsibility not only to make these fonts as accessible as possible, but also to achieve the highest quality and scientificity in designing it. Indeed, these fonts are often the only ones available for these scripts, and in fact become models.
Along the way, very specific expertise has been developed and improved at ANRT. It brings together different areas of expertise: Linguistics [A], computer sciences [B] and typeface design [C], represented in this Venn diagram.

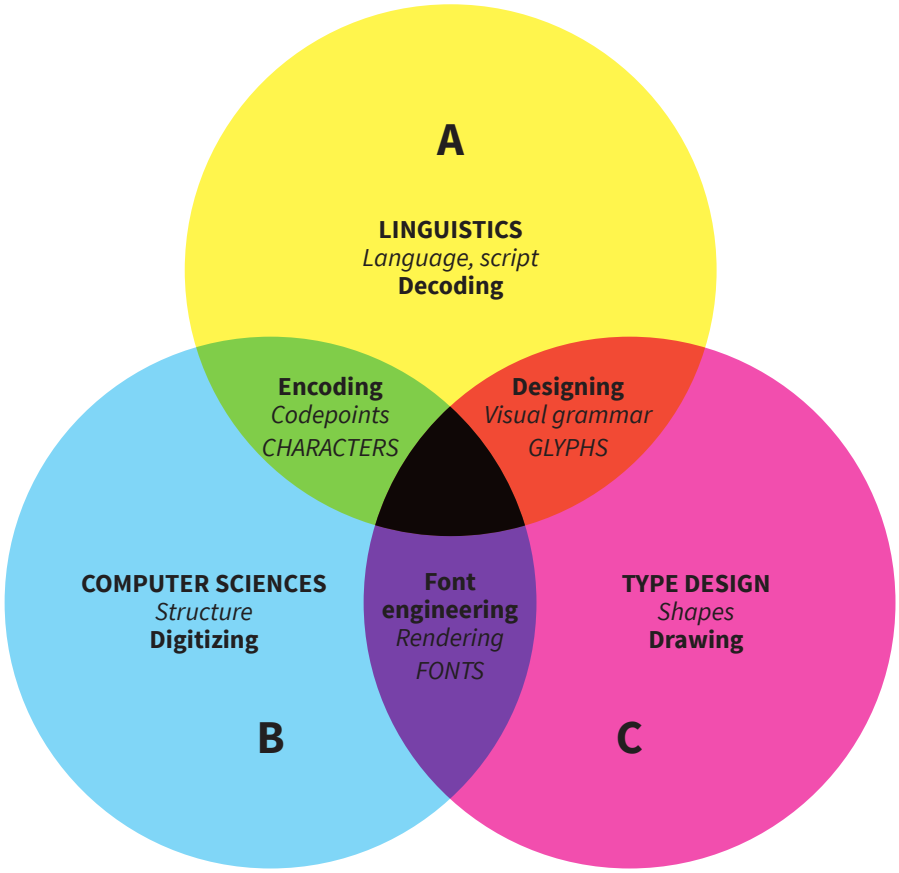

Figure 1. Diagram showing the interactions of the different areas of activity involved to encode a script, design a typeface and produce a font.

- Most of the time, it is mainly [A] and [B] who collaborate in the encoding process. For historical scripts, historians or archeologist may replace the linguists, but the idea is the same: first decode language and script, then encode characters, using the appropriate structure. A specific codepoint is allocated for each character.
- On the other side, between [A] and [C], typeface designers operate at a glyph level: according to the Unicode terminology, the visual representation of a character[2]. It's not only about drawing shapes, but also understanding the visual grammar of a script. This aspect can be decisive: designing a typeface is much more than digitizing a script.
- The third pair [B] and [C], operates at a font level, between computer sciences and typeface design. A close relationship is needed between engineers and designers when addressing problems of rendering or font programming.

7. Digital empowerment

By securing their presence in the digital realm, the Missing Scripts program strives to preserve and protect the rich diversity of the world's writing systems. This effort extends

[2] *https://www.unicode.org/glossary/*

beyond ancient scripts to include living, minority, and indigenous scripts—many of which remain unencoded or inaccessible to modern users.
Designing fonts for indigenous scripts is an essential issue of digital empowerment. Without proper encoding, the publication and exchange of digital texts is impossible. Supporting the development of fonts for indigenous communities and minority languages can have a significant impact on literary production for the communities themselves, as they can benefit from having tools —fonts— that can help the massification of their culture. Without it, the construction of vital datasets essential to current technologies, such as automatic translation, voice recognition, machine learning and AI becomes unattainable. It was therefore a natural progression for The Missing Scripts project to join hands with the International Decade of Indigenous Languages (IDIL 2022-2032)[3], launched by UNESCO in December 2022 to draw global attention to the plight faced by numerous Indigenous languages[4].

Introduction

Media and journalism play a crucial role in the transmission and interpretation of reliable information, especially in today's era marked by geopolitical conflicts and the influence of social media. With their interactive nature, video games present an emerging platform for raising awareness about ethical and societal issues.

Objectives

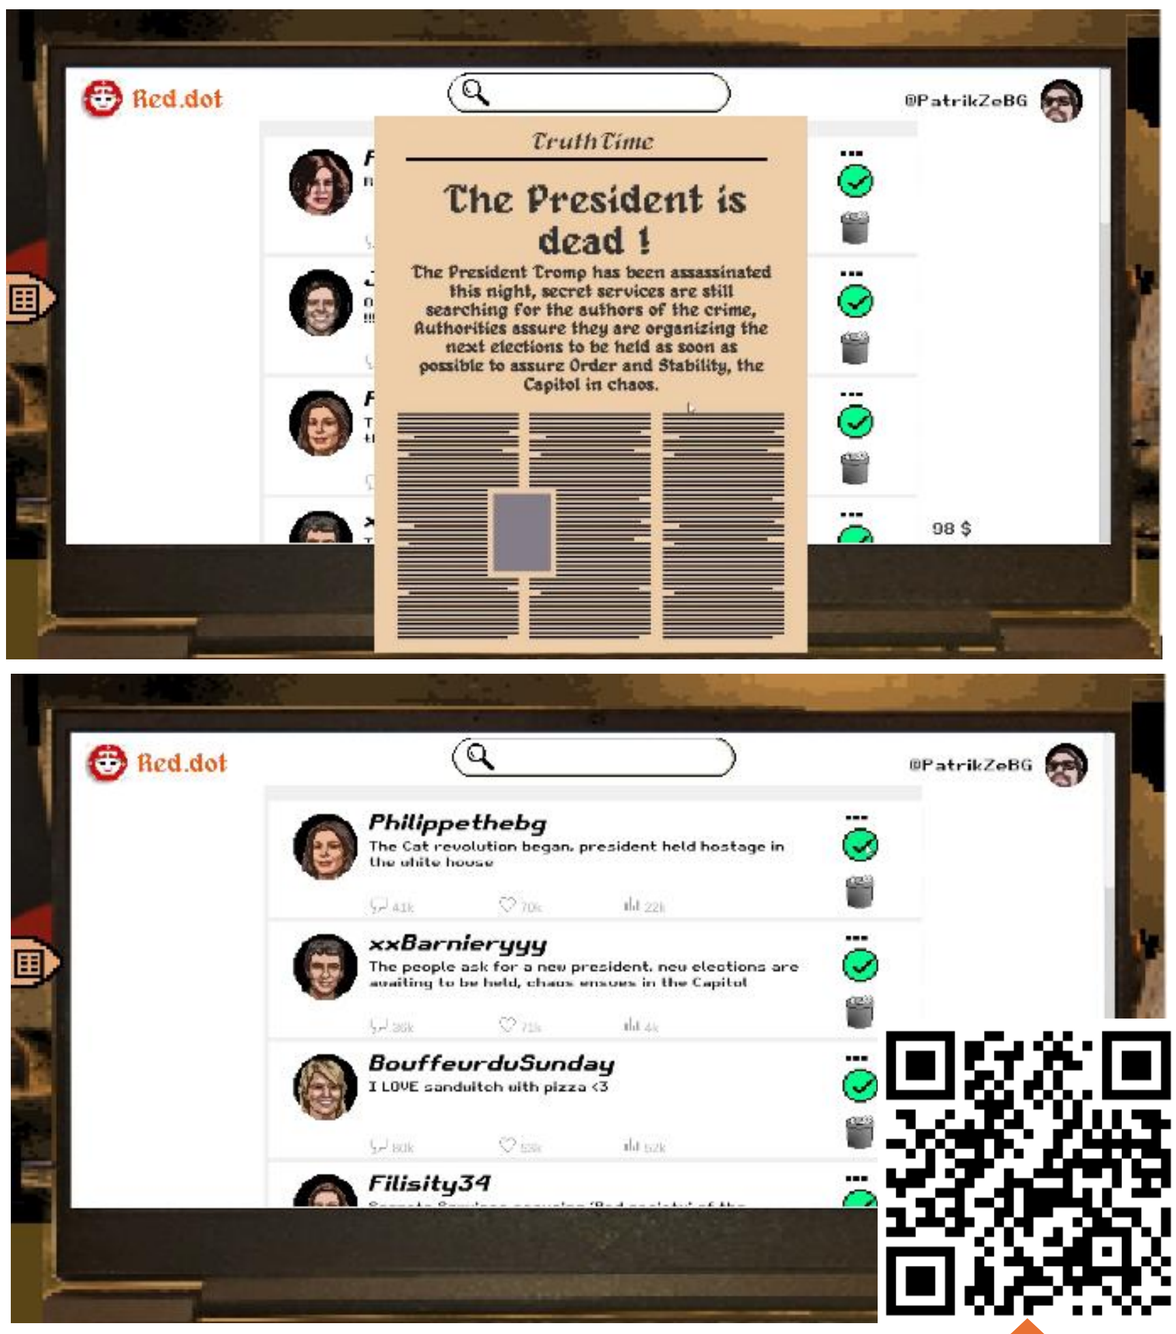
This work aims to simulate **real-world media dilemmas** using **gameplay mechanisms** designed to foster critical thinking. The objective is to encourage players to consider the consequences of their decisions in media and journalism. To achieve this, **two video game prototypes** were developed using the **Unity engine**:

Video Game 1 : *Picture Perfect*

Players embody a journalist tasked with capturing pictures of situations around the city. They can choose to represent these situations honestly or manipulate the story and attract a larger audience. The art direction is a Cartoon Cutesy style to bring a light and humorous tone while subtly addressing serious topics

Video Game 2 : *The president is dead*

Players act as moderators of a social media platform, and every day they receive a newspaper containing only truths. Their job is to fact-check the posts on the platform if they wish to be paid and survive. The game is modular and allows non-programmer users to integrate easily new contents.



Conclusion

This project illustrates the potential of game design as a conducive tool for conveying informational challenges through **gamification and simulation** of real-world media issues encountered by professionals.

DESIGNING CONNECTIONS: STRATEGIES FOR ENGAGING YOUNG DESIGN RESEARCHERS

Mariia Zolotova *[a], Nuno Bernardo[a],

a Xi'an Jiaotong-Liverpool University
*mariia.zolotova@xjtlu.edu.cn

ABSTRACT | This study investigates the role of technology-facilitated professional networking in advancing early academic careers in design research. With the proliferation of conferences and publications, effective networking has emerged as a crucial element for knowledge exchange and collaboration. However, the current digital networking landscape often blurs professional and personal boundaries, which can limit engagement for early-career researchers. This research focuses on the viewpoints of these early-career individuals, emphasizing the influence of digital networking on their professional endeavors, how they utilize technology to their advantage, specific needs not being met by existing platforms or desirable features frequently neglected. The objective was to identify essential features that could serve as the foundation for a new networking platform that empowers this particular group. Employing a mixed-methods approach, the study reviews existing literature on digital networking and conducts a brief survey among PhD students to ascertain their needs and preferences concerning the current digital networking landscape. Findings reveal that respondents are concerned about the merging of professional and personal boundaries, the credibility of information, content quality, and digital inclusivity. They collectively express a need for more transparent and inclusive services, improved visibility, and trust in information. Additionally, they seek enhanced control over content and more free opportunities to promote their projects. Overall, the research suggests that addressing these could have a transformative effect on digital networking, benefiting both their professional growth and the broader design research community, ultimately contributing to a more engaged academic network.

KEYWORDS | Participated Networked Scholarship, Digital Professional Networks, Early-Career Academics, Design Research, Community Building, User Experience

1. Introduction

The community of design researchers is expanding in the digital era, yet it is also becoming increasingly fragmented. Conferences like Cumulus represent one of the few remaining opportunities for personal interaction. Both active and passive networking at these events fosters a degree of engagement and knowledge exchange among both novice and experienced participants, often sparking inter-institutional collaboration, research partnerships or others. Regardless of the specific outcomes, such face-to-face interactions appear to encourage future participation and foster a sense of continuity among attendees. In the absence of these events, relationships are typically sustained through digital means; however, these online platforms frequently blur the lines between professional and personal life, struggle to meet user needs, or lack essential features. Given this context, the present study explores whether design can facilitate a reimagining of our online interactions and connections, enhancing the ways we share and engage with one another. Knowing so, this study asks if design can help to cultivate a more cohesive digital community through interaction design that prioritizes meaningful engagement and improved knowledge sharing?

In pursuit of this objective, the present preliminary investigation gathers insights aimed at developing a digital platform designed to facilitate the integration of early-career academics and strengthen connections within the design community. This platform would enable users to engage dynamically, explore a diverse range of individuals and opportunities within their discipline, foster discussions, and promote engagement and mutual support. A collaborative and supportive atmosphere is essential for academic networking, which seeks to share best practices, discuss methodologies, exchange research insights, and formulate funding proposals (Hewlett, 2018). Given the increasing pressure to develop research projects and secure funding, the demand for tools that encourage collaboration and knowledge exchange is both timely and critical. Individual research endeavors often necessitate mentorship, training, human resources, and financial support; however, identifying or accessing these resources without a reliable network can prove challenging. This project aims to delineate features that facilitate the search for collaborators while promoting both individual and institutional expertise and interests. Collaborations between institutions are crucial for enhancing visibility and generating new creative opportunities. Moreover, as noted by Hedges et al. (2021) in their examination of cross-institutional collaborative research, a well-defined branding strategy to raise awareness of expertise can effectively enhance collaborations. In contemporary academia, not only do institutions require branding and promotion, but the phenomenon of personal branding (Gorbatov et al., 2018) also necessitates that we apply similar principles to individual academics seeking self-promotion as a strategy for career advancement.

The initial phase of this endeavor involves a comprehensive understanding of the experiences, needs, and desires of emerging design researchers. The objective is to gather insights on how our community can effectively support their integration, as well as to identify the essential options, tools, or features necessary to enhance research synergies and collaborative opportunities. The existing body of literature provides a broad overview of this domain, addressing its significance, the stakeholders it serves, the current support networks for early-career professionals, the benefits and challenges faced by their members, and the research gaps that design can address. Following this, a survey was conducted among PhD students enrolled at the Design School of Xi'an Jiaotong-Liverpool University (XJTLU) to ascertain the platforms they predominantly utilize and the unmet needs they experience. This marks the preliminary stage of the project, with the

aspiration that upon completion, it will empower young researchers with improved tools for self-promotion, networking, and the identification of opportunities within their respective networks to foster potential collaborations. The process of seeking and engaging with future research partners from diverse fields or with specialized expertise is anticipated to become more streamlined and effective, ultimately leading to enhanced outcomes.

2. Literature Review

2.1. Design Community

When we talk about an academic community, we generally refer to a group of people in higher education who commit to education, research, participation in academic events, and collaboration with the industrial, cultural or governmental partners to advance and promote knowledge of a specific discipline. In case of design-related studies, this community will include the following groups: designers, design educators, researchers, students, and professionals working in academic institutions or research organizations. As of today, design in the academic context has significantly advanced its vision, approaches and methods as a response to the industrial, technological, cultural, and social developments. In 2008, Kyoto Design Declaration promoted the "ideals of democracy, equality, and freedom of movement", marked the shift from the materialistic values towards human-oriented, intellectual, and less materialistic values, established design as "means to create social, cultural, industrial, and economic values by merging humanities, science, technology, and the arts," and declared commitment of designers to the ideals of sustainable development. In addition to that, design research has been widely recognized as a means to address the complex challenges of our life and a driving force behind transformation (Michel, 2007). Eventually, with the popularization of Design Thinking and the idea of diffuse design performed by everybody (Manzini, 2015), creativity is now seen as accessible value for anyone who aims to achieve innovation.

Academic communities share and promote their values at different scales through individual lectures, educational and research programs, inter-institutional exchange programs such as Erasmus, professional competitions and exhibitions, and local and global associations, such as Cumulus Association, DESIS network, among others. The academic community of designers fosters an environment that encourages critical thinking, exploration of design theories and methodologies, and the application of research to design practice. It provides a platform for designers to advance their skills, develop innovative design solutions, and contribute to the broader design knowledge base. Through the promotion of common values across various touchpoints, academic design networks serve as facilitators for enhancing accessibility to the global design vision and its application in relation to the objects we create, our interactions with technology, the society we influence, and the future we envision. The subsequent section will address online networking, examining the challenges and advantages it presents to emerging researchers. The objective is to explore how design can improve the digital professional networking environment, particularly from the viewpoint of this distinct demographic.

2.2. Professional Networks and Digital Scholarship

In order to address the question of improving the use of professional networks assisted by technologies for advancing early academic career, we first start with some definitions

relevant to our purposes.

The concept of professional communities and networks has its roots in social capital theory (Bourdieu, 1986), which states that social relationships and networks are essential for accessing resources, information, and opportunities. In the context of early career professional development, professional communities and networks have been linked to career success, job satisfaction, and organizational commitment (Eby et al., 2012). In current research, networking is defined as building, maintaining, and using relationships to enhance career success through granting access to resources and facilitating working activities (Ansmann et al., 2014). Online tools for networking which allow users to create a profile and make connections with others are called Social Networking Sites (Boyd & Ellison, 2007; Jordan & Weller, 2018). In our research, we are interested in the academic use of such networks which is related to the advancement of scholarship and career. The term "Networked participatory scholarship" which was proposed by George Veletsianos and Royce Kimmons (2013) is used to refer to the studies of the online participation in social networking sites with the aim to develop scholarship. Scholarship is understood according to Boyer's framework of scholarly activity (1997): Discovery, Integration, Application and Teaching, – where Discovery refers to building new knowledge through traditional research; Integration to interpreting the use of knowledge across disciplines; Application to aiding society and professions in addressing problems; and Teaching to studying teaching models and practices to achieve optimal learning. In its turn, "digital scholarship" is concerned with how the internet and digital technologies are transforming scholarly practice and focuses on the potential of such tools (Weller, 2011). Thanos (2014) in the article on the future of digital scholarship mentions that "modern scientific communication should be characterized by modularity […] A scientific article will be composed of a certain number of "information modules" meaningfully connected by relationship" (p. 23), and characterized by the emergence of the "linked scientific data spaces of disciplinary or interdisciplinary scope" (p.24). In other words, ten years ago, researchers envisioned a world where scientific literature and data are online and interconnected thanks to the support of advanced online services and tools (Thanos, 2014; Gray et al., 2002).

Academic networking is recognized to be helpful for academics at different levels of their career, for example graduates can use it to find a job, assistant and associate professors network to seek collaborations and future job opportunities, and full professors can engage in mentorship and employ the novel skills of their mentees (Ansmann et al., 2014). As mentioned before, in this article, we want to explore how academics in early career use Social Networking Sites linked to their respective professional communities (i.e., Design field) to enhance academic career success and advance their scholarship, and we will refer to the understandings of relevant terms, such as "networking" or "digital scholarship", according to the definitions provided above.

Today, we can find several specific services that benefit academics in their early careers. For example, the European Association for Communication in Healthcare (EACH) supports early career academics with different forms of designated activities. For instance, a five-day "Junior Investigator's Workshop" that aims to exchange ideas and discuss challenges within their current work with the support of experienced senior researchers; "Pairing with Colleagues" program that allows them to discuss their research and teaching with more experienced academics during the annual conference; a designated committee for peer-to-peer support; and a grant that the early career academics can use for the purpose of writing retreats (Ansmann et a;., 2014). A small group called FRiENDs (Female Researchers in Education Networking and Dialogue) evolved as a "writing retreat" providing a peer mentoring environment and a protected space where early academics

can discuss failures and challenges without jeopardizing the professional reputation and can build the balance between "structure and flexibility, and between personal, professional, and emotional support" (Pegg et al., 2014, p. 52). In their article, Pegg et al. (2014) recommend formalizing informal networks to provide more consistent support for early academics, and the safe space they created provides a good example for young academics to overcome initial professional challenges. Within the design community, we can highlight Cumulus Association that has a service for PhD students, encouraging them to publish short papers to stimulate discussions and receive feedback on their ongoing research. This service is a mix of peer and non-peer support, as experienced academics review papers and peer feedback is obtained during presentations. NERD (New Experimental Research in Design) is a series of conferences that discuss design research practices produced by advanced graduate students, doctoral candidates, and early-career postdoctoral researchers. Design Research Society conducts biannual conferences and other initiatives, including discussion forums for PhD studies available for their members. DESIS Network has its "DESIS students" network that promotes students' initiatives about design through online meetings, yet it is not explicitly designed to advance early career but rather to engage in a design community that shares values of design as a means for social innovation and sustainability. JiscMail PhD-design list provides a platform for discussing "PhD studies in design and related research, teaching and supervision" and announcing research requests and opportunities. These are some examples of the opportunities for early career academics that can facilitate the integration with the international design research community. Some of them include online forms of participation, others more traditional onsite forms of participation.

Literature suggests three levels of participation: attendant, information provider and co-producer (Rodríguez-Rad & Rio-Vázquez, 2023). In our research, we focus on the attendant's and co-producer experience of using Social Networking Sites to advance their career and scholarship.

Jordan and Weller (2018) in their study on the benefits and problems in professional engagement with online networking qualitatively analyzed a dataset published by Nature Publishing Group (Research, Nature 2014), and they have noticed that the tendency among academics to report on the problems rather than benefits of online networking. They also compared their results with the results shared by Lupton (2014) on the same topic, and found that whilst there is an overall consensus about the benefits, there is less agreement in relationship to the problems between the two studies.

The benefits, as identified by Lupton include making connections and developing networks, openness and sharing, self-promotion, research, teaching, and support; the benefits as identified by Jordan and Weller include benefits for younger academics, directory of academics, discussions, dissemination, finding information and papers, finding potential collaborators, helping others, improving scientific process, raising own profile, recruitment and opportunities, staying up-to-date, supporting multiple profiles, and tracking impact. According to their studies, dissemination was the largest category of benefits reported by the academics.

Problems, as identified by Lupton included privacy issues and the blurring of boundaries, lack of credibility, concerns regarding quality of content posted, time pressure, excessive self-promotion by others, plagiarism, the risk of jeopardizing one's career, social media use becoming an obligation, and becoming a target; and Jordan and Weller identified the problems as concerns about commercialism, digital inclusion issues, digital literacy issues, restrictions on use imposed by institution, sites are not perceived as useful, preference of other types of networking, concern on privacy and security, social aversion,

spam, time concerns, plenty of sites, unreliable information online. The two biggest concerns reported by the academics were time concerns and the perceived uselessness of social networking sites. Regarding the latter, Donelan (2016, in Jordan & Weller, 2018) commented that "academics who engage more frequently, with a higher number of social media tools, tend also to have a wider range of motivations for using them, and experience a greater number of successful outcomes" (Donelan, 2016, p.727).

What rests underexplored is how the online platforms technologies are being used by the academics and the problems associated with that (Jordan & Weller, 2018). The role of design in digital scholarship is also insufficiently researched. Burdick and Willis (2011) explore its role at a theoretical level and see Design Thinking as a "point of connection between digital learning and digital scholarship" (p. 549) and as a mean of innovation for curricula, pedagogy, etc. However, no recent studies discuss the use of online professional platforms from a design perspective.

3. Methodology

The findings of this research study are based on primary data obtained through a mixed methods approach, which integrated both qualitative and quantitative data gathering inputs via an online survey administered from mid-January to early February 2025. The purpose of the data collection was to address three critical questions, thereby enhancing the practical implications of this research initiative. The questions are as follows:

- **RQ1.** What are the essential requirements of early-career researchers concerning digital networking and the establishment of professional relationships, and how effectively do current platforms meet these needs from their viewpoint?
- **RQ2.** Which online platforms do young academics prefer for career advancement or scholarship opportunities, and what specific features do they consider most important?
- **RQ3.** What gaps exist in the current digital networking platforms, and how might design improvements enhance user experiences and interactions online?

The study's aims and objectives warranted a focus on postgraduate students who are presently engaged in doctoral-level programs. Consequently, the sampling approach employed was purposive (judgmental) sampling, which targeted individuals who met these specific criteria and were also reachable through the researcher's established digital networks.

To answer each question, researchers selected an online survey as the primary method for data collection, which permitted the implementation of standardized questions, thereby minimizing variability in interpretation and responses. This approach also enabled access to a broader demographic of potential participants, including those who were geographically dispersed, ultimately enhancing the capacity for data comparison and analysis. The survey was structured into three distinct sections. The initial section concentrated on the demographic characteristics of the participants. The second aimed to establish a digital baseline, allowing researchers to assess the extent of participants' familiarity with and utilization of current digital networking platforms or services. Finally, the third section investigated the expectations of participants, particularly young researchers or academics, regarding such platforms or services.
Participants were recruited by email. The email content detailed the study's objectives and the rationale for their involvement. It concluded with an URL link that directed recipients to the online survey; the landing page reiterated the study's objectives and emphasized that participation was voluntary and that all results would remain confidential. Advancing to the subsequent page was interpreted as consent to

participate. All questions included in the survey received ethical approval from the Xi'an Jiaotong-Liverpool University Ethics Review Panel (No.: ER-LRR-00100000897202501210815 40), with a total of 14 participants (n=14) completing the survey. The sample does not adequately represent the broader population due to its limited numbers, geographical and cultural diversity; nonetheless, it is deemed sufficient for drawing context-specific conclusions relevant to this study and new research pathways.

Data analysis focused on descriptive statistics and qualitative insights. Quantifiable responses were summarized, calculating frequencies and percentages for categorical responses. Some are resumed and offered in a table while others take a graphic format. Thematic analysis was used for qualitative analysis as to identify recurring themes or patterns, and participant quotes were used to illustrate findings.

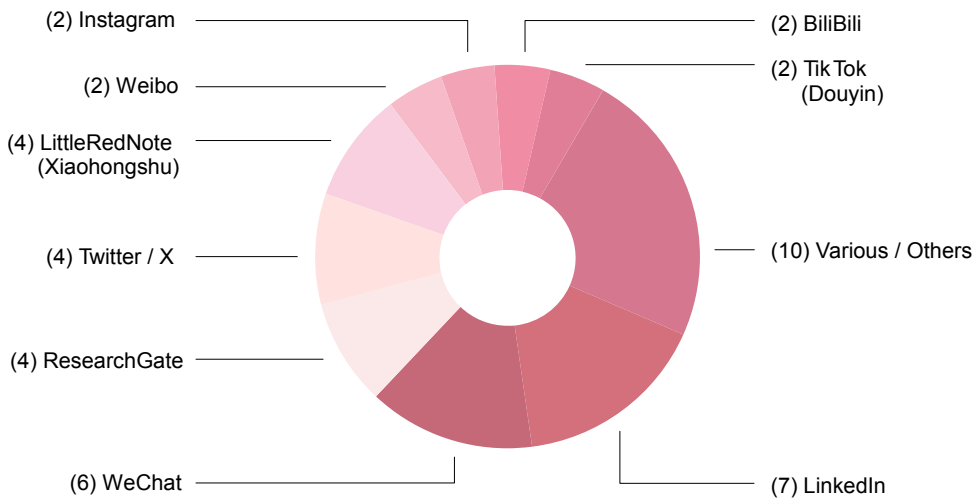
4. Results

4.1 Demographics

A total of 14 individuals (n=14) completed the survey in its entirety. In terms of gender distribution, there were 9 male respondents and 5 female respondents. The participants' ages ranged from 24 to 35 years, with the highest concentration in the 24 to 26 age group (6 participants), followed by the 27 to 29 age group (3 participants), the 30 to 32 age group (3 participants), and finally, the 33 to 35 age group (2 participants). With the exception of two natives from Nigeria and Indonesia, all other participants were Chinese nationals. The research expertise of the participants is categorized into three main fields: Urban Planning (7 participants), Design (4 participants), and Civil Engineering (3 participants). All participants are currently residing in Suzhou, China, and are pursuing their PhDs at Xi'an Jiaotong-Liverpool University (XJTLU).

4.2 Digital Baseline

When participants were requested to enumerate the digital networking platforms to which they were currently subscribed, their answers varied significantly across a spectrum of social networks. The inquiry did not specify any particular platforms for selection; rather, it offered an open-ended format to accommodate responses that might extend beyond the researchers' familiarity. The responses were as shown in Graph 1.



Graph 1. Digital networking platforms currently subscribed to.

The subsequent inquiry focused on identifying the platforms in which participants were

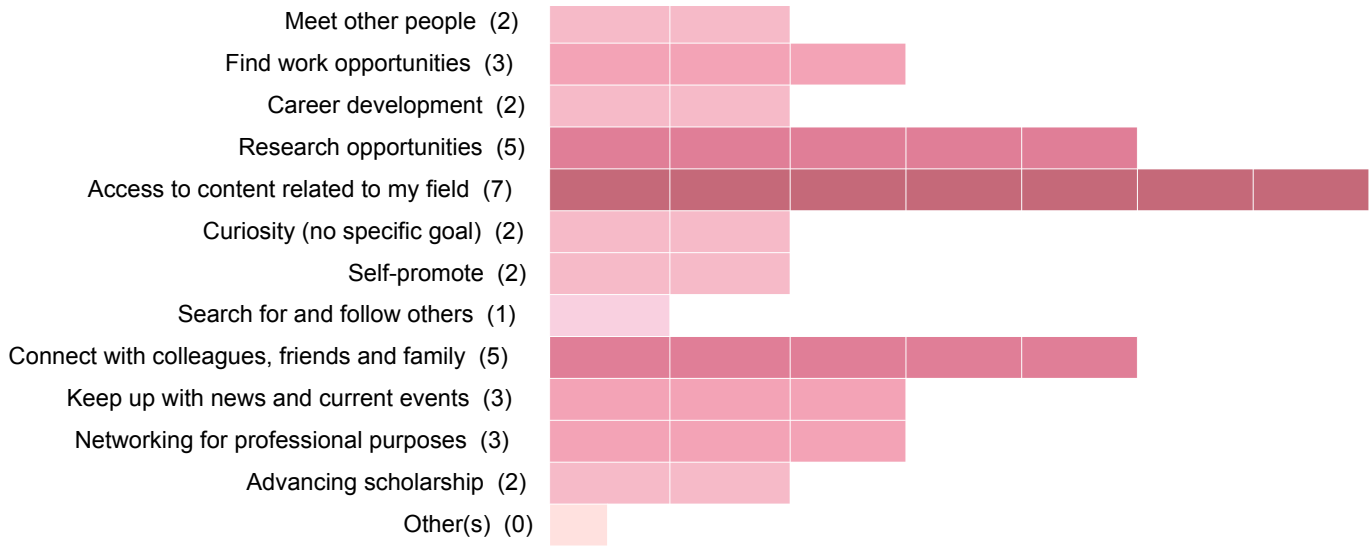
most active, with WeChat emerging as the leading choice. Following this, participants were questioned regarding their weekly usage hours on these platforms. The most common response was between 4 and 8 hours (5 participants), followed by "less than 1 hour" (3 participants) and "between 9 and 16 hours" (3 participants). Additionally, 2 participants reported spending "between 1 and 3 hours," while only one participant indicated spending "more than 24 hours."

Participants were subsequently queried regarding their perception of digital networking as an essential skill for enhancing career opportunities, and they were invited to provide brief insights reflecting their views on the matter. Two individuals responded negatively to the inquiry, while one expressed uncertainty. Among the negative respondents, only one provided a rationale, stating that the significance of digital networking "depends on the environment and timing," without further elaboration. In contrast, twelve participants affirmed the importance of digital networking, with the majority contributing additional commentary. Some responses highlighted that "digital networking can assist in locating numerous valuable papers," while another participant asserted that:

> — "digital networking is indeed a critical skill for improved career prospects. In today's interconnected world, the ability to effectively network online can lead to new opportunities, collaborations, and mentorships. It allows professionals to expand their industry connections, stay updated with the latest trends, and showcase their expertise to a broader audience. Digital networking through platforms like LinkedIn, industry-specific forums, and social media can be a powerful tool for career advancement and personal brand development."

Additional comments included observations such as, "it opens many opportunities I wouldn't get only by physical networking. Also, it's free," and "there is a wealth of information available, and someone could provide suggestions for you."

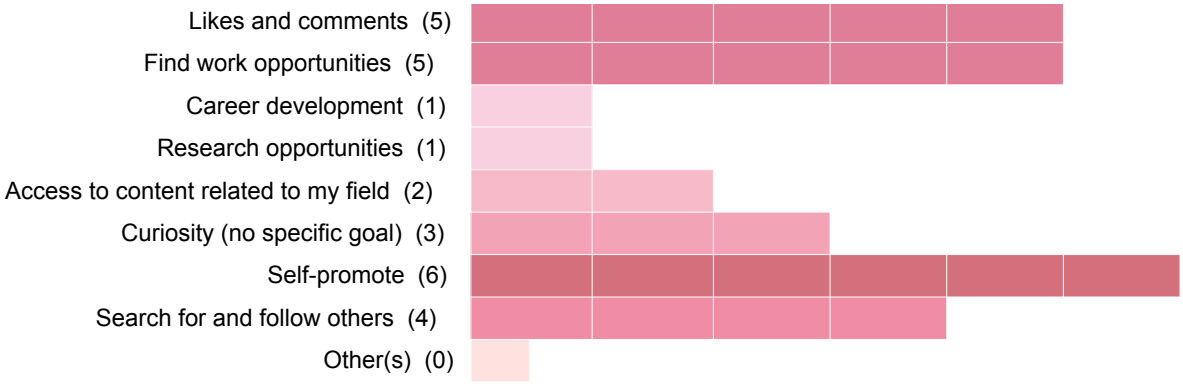
Responses regarding the motivations for joining digital networking platforms exhibited considerable diversity. Participants were presented with a list of twelve distinct options, along with an open-ended response field, allowing them to select up to three choices. The predominant motivation identified was "access to content related to my field" (7), closely followed by "research opportunities" (5) and the desire to "connect with colleagues, friends, and family" (5). A comprehensive summary of the results is provided below in Graph 2.



Graph 2. Motivations for joining digital networking platforms.

The question that followed asked which digital networking aspects did they find most

enticing or pertinent to their employment goals. As previously, participants could select three different options from a list of nine or write an additional in an open field. "Groups and communities" was the most frequently chosen response (6), followed by "direct messaging" and "likes and comments" (5 each), and "content share". None used the open field to add features that were not listed. The complete results are displayed in Graph 3. Next, participants were confronted with a series of statements about their knowledge and use of digital networking platforms/services, and asked to rate these on a 5-point Likert Scale. Statements and results are shown in Table 1.



Graph 3. Most enticing or pertinent features to their employment goals.

Table 1. Participant use and believes about digital networking platforms/services:

	5-point Likert scale					Total	Weighted Average
	1	2	3	4	5		
a. I believe digital networking plays a critical role in early career development	0.00% 0	0.00% 0	14.29% 2	**64.29%** **9**	21.43% 3	14	4.07
b. I feel like I have to join these platforms, even if I see little or no value in it	7.14% 1	21.43% 3	14.29% 2	**42.86%** **6**	14.29% 2	14	3.36
c. Digital networking platforms are a great way to connect and being connected to other people	0.00% 0	0.00% 0	21.43% 3	**64.29%** **9**	14.29% 2	14	3.93
d. I have developed and nurtured strong professional relations through digital networking platforms	0.00% 0	21.43% 3	**42.86%** **6**	**35.71%** **5**	0.00% 0	14	3.14
e. Having an online presence allowed for others to contact me to explore or discuss various types of projects	7.14% 1	7.14% 1	28.57% 4	**42.86%** **6**	14.29% 2	14	3.50
f. I have reached out to others using digital networking platforms to discuss past or on-going projects	0.00% 0	21.43% 3	**28.57%** **4**	**28.57%** **4**	21.43% 3	14	3.50

g. I have created and established strong professional links through digital networking platforms	7.14% 1	14.29% 2	21.43% 3	**57.14%** **8**	0.00% 0	14	3.29
h. I only browse these platforms for news feed and updates and rarely interact with others	7.14% 1	**28.57%** **4**	7.14% 1	**35.71%** **5**	21.43% 3	14	3.36
i. Since joining this type of platform I have developed feelings of self-doubt and low self-esteem	7.14% 1	**28.57%** **4**	**35.71%** **5**	**21.43%** **3**	7.14% 1	14	2.93
j. I leverage these platforms to participate in academic discussions or research groups	7.14% 1	7.14% 1	28.57% 4	**50%** **7**	7.14% 1	14	3.43
k. I actively engage with other people on these platforms who are active in the same field of research as me	21.43% 3	0.00% 0	7.14% 1	**71.43%** **10**	0.00% 0	14	3.29
(**1**) Completely Disagree, (**2**) Disagree, (**3**) Neither Agree nor Disagree, (**4**) Agree, (**5**) Completely Agree							

The final inquiry in this segment of the survey sought to determine whether participants utilize or are aware of any services tailored specifically for young researchers. The findings indicate that a significant majority are unaware of such services (9 participants), while a smaller group (5 participants) responded affirmatively. Those who indicated familiarity were subsequently asked a follow-up question, requesting them to identify the platform or service and to provide insights regarding their experiences with it. Some of their notes included "ResearchGate: An online portal where researchers can share their publications, connect with colleagues, and seek collaboration. It's particularly useful for young researchers to gain visibility and engage with the scientific community", "LinkedIn, Research ID (ORCID, Scopus, etc.), X -- So far, it has allowed me to get conferences and workshop information outside China and my home country" and "LinkedIn: easy to find similar perspectives."

4.3 Expectations as a young researcher or academic

The subsequent segment of the survey commenced with an open-ended inquiry directed at participants regarding their expectations or requirements that were not being met by the current platforms. Although a subset of participants either could not identify any unmet needs or expressed contentment with the available options (5), the others provided valuable suggestions for enhancements that could improve their experience. Some note these platforms could "list of scholars who provide information on research projects or wish to cooperate", others mention wanting to see or find "job opportunities" or being able "to collect all the available university position in University", have and access "online seminars for academic discussions." One respondent expanded a bit further and elaborated on the need to have a channel or option for "Feedback and Peer Review: There is a need for more effective and constructive feedback mechanisms and alternative peer review processes that can help young researchers improve their work."

This initial inquiry was succeeded by a related question that sought to explore how these platforms could enhance their support for academic careers. While not all participants

contributed, those who did (8) highlighted various features, including “access to academic journals”, “assistance in locating job or research opportunities”, “dissemination of targeted calls for academic publications”, “provision of early career pathways”, “recommendations for appropriate job opportunities”, and even the “option to disable notifications after work hours to reduce contact.”

In response to the previous inquiry, participants were prompted to identify what they perceived as the most significant drawbacks or shortcomings associated with this type of platform or service. The responses were diverse, highlighting issues such as limited interactivity, with some noting that "the platforms may not provide sufficient opportunities for substantial interaction beyond mere likes and comments, which can hinder the depth of engagement and collaboration." Additionally, concerns were raised regarding the lack of flexibility, as exemplified by comments on platforms like Academia and ResearchGate, which were described as having a rigid user interface that might deter non-academic users. Other participants expressed worries about "information privacy," citing "privacy issues, inadequate content quality control," and the inability to "aggregate all researchers," emphasizing that these platforms often operate on principles of "exclusivity and gatekeeping of information."

In examining the user experience associated with this platform, researchers sought to understand its potential influence on career development. The responses from participants were categorized into two distinct groups: neutral (4) and positive (10). Those in the positive group exhibited greater expressiveness and were more inclined to provide detailed insights regarding their experiences. One participant noted the platform's capacity to "share and promote progress on personal and professional projects to a wider audience," while another remarked that "individuals can easily connect with one another, facilitating work around the clock; this is certainly beneficial for professional endeavors, but it may not be conducive to personal life." The most insightful answer notes that operating through these platforms

> — “has expanded the reach of professionals, allowing them to connect with peers, mentors, and opportunities across the globe without the limitations of physical distance. For some, it has led to collaborative research projects, job offers, and the ability to build a strong professional brand. However, the impact can vary depending on the individual’s ability to navigate these platforms, the quality of their network, and the effort they invest in maintaining and leveraging their digital connections.”

The final inquiry in the survey prompted participants to share any additional thoughts regarding digital networking that might contribute to this research. While most chose not to provide further comments, two individuals did suggest that enhancing "algorithmic transparency" would be advantageous, as they frequently express apprehensions about data utilization on networking platforms. They emphasized that comprehending the algorithms that dictate content visibility is essential for users to maximized their engagement with these platforms. Additionally, they advocated for a more effective balance between online engagement and real-world networking, and raised concerns about the potential for an information cocoon effect resulting from prolonged usage.

5. Discussion and Conclusions

The findings, although limited, offer insights into perceptions and viewpoints that postgraduate students hold regarding contemporary digital networking services and platforms. It is noteworthy that, in digital networking, participants believe that any platform

will do, irrespective of its primary focus on social or professional interactions. The most important is to have an online presence. Some users effectively merge both dimensions, utilizing the same platform for diverse purposes, although it is unclear how practical this approach is on digital scholarship.

The importance of maintaining an online presence and being accessible is widely acknowledged, regardless of the time and effort required. Participants appreciate the ability to locate and connect with others on these platforms, share information, engage in direct messaging, join groups or communities, and disseminate content; they consider these features to be valuable resources. Nevertheless, whether participants actively utilize these functionalities for personal branding, career advancement, academic opportunities, or other objectives remains unclear. While there is a general agreement that these platforms and their related activities may impact their future, it is apparent that simply joining these networks is a minor step; the more significant challenge lies in comprehending how to effectively harness the advantages these platforms offer for personal gain. Responses indicate a lack of thorough understanding regarding how to leverage these tools beyond basic social interactions to improve their chances of obtaining positions in academia and research or achieving greater visibility. Consequently, postgraduates in digital networking navigate this landscape independently, with many uncertain about the steps or actions necessary to utilize this resource effectively. A trial-and-error approach seems to dominate; however, this can quickly become a time-consuming endeavor without any assurance of a beneficial outcome, prompting researchers to question whether postgraduates should receive training in digital networking skills to complement their academic programs.

One participant notably raised an additional concern that exacerbates the “trial and error” approach, specifically regarding algorithmic transparency. The lack of clarity surrounding the operational mechanisms of these algorithms complicates the comprehension of how content is prioritized, promoted, or suppressed, thus rendering self-promotion particularly difficult. Moreover, the regular updates to these algorithms imply that even those who attain success may experience it as a transient achievement. This scenario invites a critical examination of whether platforms ought to be more transparent about their algorithms; however, it remains uncertain whether such transparency would lead to beneficial or detrimental effects and how this information could be effectively conveyed to users. Despite the abundance of accessible networks for participation, many users express that these platforms often lack comprehensive features that could benefit postgraduates and researchers. Participants indicated a desire for enhanced visibility regarding scholars interested in collaboration and information pertaining to ongoing research projects. They also seek improved control over the content displayed in their feeds, the introduction of channels dedicated to seminars and discussions, and mechanisms for feedback and peer review. These features are perceived as potentially beneficial for the digital scholarship of postgraduate students, yet they remain either absent or unknown to the users.

In the literature review, we introduced the term “Networked participatory scholarship,” which refers to online participation in social networking sites to develop scholarship. The results of our primary research show that, in the given context, respondents did not explicitly link the use of digital professional networking sites with scholarship development. In the literature review, we mention that scholarship refers to the new knowledge development (“Discovery”), its interpretation across disciplines (“Integration”), “Application” in society, and learning it through “Teaching” practices – and none of the respondents interpreted the use of digital professional networks in this way.

In reporting on the benefits of using digital networking sites, the highest number of

responses mentioned easy access to information, opportunities for promoting their projects, and the fact that it's free and doesn't require financial investments. In reporting on what those platforms have not yet covered, their expectations revolve around establishing meaningful connections, finding job opportunities, and targeted calls for academic publications. Some more insightful answers included a request for an alternative peer review process with more transparency and inclusion, facilitation in getting replies from others, an option for shutting down the service for off-work time, improved usability of the platforms, and specialized online seminars. We can summarize that the respondents' expectations regarding the use of digital professional networking sites are about establishing meaningful professional connections and experiencing well-designed, transparent, and inclusive services. Among those, obtaining feedback, transparency, and the need in online seminars can be interpreted as "discovery" and "teaching" from the "scholarship" definition. At the same time, its "integration" and "application" were not covered by the respondents. In that sense, it opens for us opportunities to explore why these aspects remain out of the respondents' interest and how good design can help young academics become aware of the academic career advancement process driven by and towards scholarship advancement. In the literature review, we find some offline and online activities designed to help young academics advance their scholarship. "Teaching-" oriented activities, such as writing retreats by FRiENDs, online seminars by DESIS students network, and workshops on early career challenges by EACH; "Discovery-" oriented activities, such as designated funding for young academics by EACH and PhD Network by Cumulus Association. Designing a platform that would accumulate these opportunities and provide tools for proposing and sharing new opportunities of this kind can become a new service for promoting the values of the academic design community and the opportunities for scholarship advancement.

In conclusion, we would like to provide intermediate research answers (RA) to the research questions we posed in the methodology section.

RA1 (User Needs): The essential requirement from the respondents' perspective is to establish meaningful professional connections and experience well-designed, transparent, and inclusive services. They look for the enhanced visibility of the scholars interested in collaboration and information on the ongoing research projects. Users seek improved displayed content control, channels dedicated to seminars and discussions, and guiding feedback and peer review.

RA2 (Platform Features): In the analyzed context, the respondents reported that WeChat is the leading platform for career advancement and scholarship opportunities. The respondents pointed out such features as "groups and communities," "content share," "direct messaging," and "likes and comments" as most important in that platform. They appreciate easy access to information, opportunities for promoting project with no financial costs.

RA3 (Gaps): The respondents mentioned the following gaps in current digital networking platforms that match those mentioned in the literature review, such as the blurring of boundaries between work and personal life, lack of credibility, concerns regarding the quality of content posted, and digital inclusion issues. New ideas included having access to specialized online seminars for academic discussions, a list of targeted job opportunities and calls for academic publications, off-work time mode, and an alternative peer review process with improved transparency, inclusion, and facilitation in getting replies from others. Eventually, we noticed a missing link between the use of digital professional

networking sites and scholarship development. Currently, the existing platforms partially meet the "discovery" and "teaching" and leave unaddressed the "integration" and "application" areas of scholarship. Taking this into account, a new question arises on whether postgraduates should receive training in digital networking skills to complement their academic programs?

In the subsequent phases of our project, we aim to conduct further research to address the newly evolved questions, such as the reasons behind interpreting participation in online professional networking similar to how they engage with social media networks rather than advancing scholarship. We believe in the importance of promoting awareness regarding the value of scholarship advancement among early-career academics and that there is a strong opportunity to design a platform that would provide services covering all four areas of scholarship as stated in Boyer's model. Design can bridge the gaps in networking and scholarship by employing Research through Design approach. As “Integration” and “application” remain out of the respondents’ interest, we will leverage on the existing examples covering those areas of scholarship, for instance, “Teaching” is covered by writing retreats by FRiENDs, online seminars by DESIS students network, and workshops on early career challenges by EACH; “Discovery” covered by a designated funding for young academics by EACH and PhD Network by Cumulus Association.
In the platform prototype, we also aim to address algorithmic transparency and explore mechanisms for formalizing evolving informal networks. This will allow us to provide unique features specifically designed for the needs of young design academics.

When we edit ourselves endlessly: HABITAT, a speculative space design based on inconsistent virtual identity.

Junya Duan

Royal College of Art
*nicolette1999@163.com

ABSTRACT | The Internet has empowered individuals to self-expression with unprecedented freedom. However, digital world has the power to both liberate and isolate. Through qualitative research, it has been revealed that obsession with crafting and maintaining online images may cause cyber-identities to overshadow our actual existence, distorting self-perception from appearance to social relationships.
Set in the future, HABITAT envisions an extreme endpoint of digital identity, where all human features have faded, leaving only an arrangement of bones and musculature. By presenting a world where identities are over-edited, this speculative project invites reflection on the balance between online profiles and embodied realities and reinforces the value of physical identity in an increasingly virtual world. According to interviews with exhibition visitors, this project was effective in evoking critical thinking about virtual selves.

KEYWORDS | Avatars, Virtual identity, Self-discrepancy, Speculative, Self-perception

1. Introduction

According to anthropologist Victor Turner, it is in a time and place of withdrawal from normal modes of social action- which he calls “liminal”- that we can explore our identities most freely. The anonymity of online worlds removes users from their real-life constraints, offering them greater freedom and opportunities to experiment with minimal threat of physical consequences or social exclusion. Today, digital identities have become an integral part of our overall sense of self, allowing individuals to present themselves in new and creative ways that transcend traditional social hierarchies and boundaries. Managing one's digital identity has become a compulsory subject for everyone in today's media world. People enthusiastically engage in various online self-expression activities, such as personal websites, blogs, social networks, and interest-related online communities. People may present a curated or idealized version of themselves online, highlighting their best qualities while hiding their flaws or vulnerabilities - athough this could be inauthentic.

For entertainment, self-identification or psychological needs, humans show a long-standing fascination with changing various aspects of their identity and experimenting with other roles (Gilbert. et al., 2011). In his book The Presentation of Self in Everyday Life (1956), Erving Goffman uses the dramaturgical metaphor arguing that individuals behave like actors in a play, strategically presenting themselves through symbols and interactions to shape others' perceptions. Elaborately made-up digital identities are causing disorientation in self-perception. Some people have developed a stronger identity with their virtual avatars that display their “ideal self” rather than their real self. Additionally, the pressure to maintain a certain online persona can lead to a sense of disconnection or alienation from our real-world selves and relationships.

The dominant discourse on the analysis of the new technologies usually involves the economic, social or cultural spheres while ignoring the subtle but fundamental reorganization of psychology and identity brought by it (Kasza, 2017). As our reliance on technology continues to grow, it is increasingly important to consider the ways in which our digital and real-world identities intersect. We need interdisciplinary methodologies to understand the profound impact of digitization on identity. HABITAT explores the speculative future of avatars based on current concerns about virtual identity, while inviting critical reflection on virtual identity in artistic ways that relate to behavioral norms, values and intentions.

2. Conceptual Framework

2.1. Digital Self-Presentation

Digital identity is more a projection of one's true self than an exposure of it. We think we will be presenting ourselves on social-networking sites such as Facebook, but ends up as somebody else— and it’s usually the ideal version of ourselves. We always underestimate the strong subjectivity of personal information generated by users behind the data. Modifying one's own profile is both instrumental and strategic, as well as a new form of impression management. On the online platforms, people keep their true thoughts to themselves and only ambiguously present a portion of their identity that is likely to attract attention and empathy. People do not present their image in order to – or not only to –

show their true self. When people write their own profile on social media, they are often trying to shape the way others perceive them. Here, digital identity is a process of establishing connections, which ultimately aims to attract others.

Managing virtual identities is not an easy task. As Sherry Turkle said in her book Along Together, In the course of a life, we never “graduate” from working on identity; we simply rework it with the materials at hand. Turkle describes the pressure of socializing with a virtual identity as “presentation anxiety”, such as worrying about getting caught in a fake profile, modifying one's appearance to fit different social groups, and feeling anxious about the attention received. Internet users generally have multiple virtual identities (Gilbert et al., 2011), which undoubtedly adds extra mental effort to everyday life.

Virtual identities have the potential for exploitation. Social networking sites offer possibilities for cataloguing human beings as if we were documents (Ertzscheidcen, 2009)。In the era of big data, digital identity is a commodity itself. The internet is increasingly linked to surveillance technologies, which not only change the relationship between users and information, but also turn individuals into targets of commercial advertising. Furthermore, the psychological, social and political motivations for creating a digital identity are multifaceted and complex. According to Dominique Cardon, the jumble of personal signals spread chaotically on social networking sites is far from providing objective, uncontroversial, verifiable and calculable information. It is merely a collection of banter, parody, irony and exaggeration.

Nevertheless, this trend towards self-expression will not stop. Internet users do not seek stability and permanence in their online image, they simply want to engage in the communication of “attention economy” on an ongoing basis (Kessous, 2012). Our identity moves rapidly and continuously between multiple apps or platforms every day: switching between different social media accounts, checking email one after the other, playing different avatars in multiple games. The rapid cycle of identity switching stabilizes into a sense of continual copresence. Even a simple cell phone brings us into the world of continual partial attention (Turkle, S. 2011). People are so addicted to it that they still proudly display themselves on social networks, even though most internet users do not believe that their privacy is well protected.

2.2. Self- discrepancy of avatars

According to Higgins (1987) self-discrepancy theory, there are three self domains: actual-self, ideal-self, and ought-self. Discrepancies between these aspects of the self causes negative affect, including sadness, disappointment, and dissatisfaction (Li et al, 2011). People are naturally motivated to reduce this emotional discomfort (Green et al., 2020). An avatar is a special way of representing oneself: it symbolizes the user's body in virtual space. Avoiding the actual-self through avatar-self is considered a strategy for reducing self- discrepancy in some cases, although this may worsen the discrepancy with actual-self.

Online gaming activities have become increasingly sophisticated in the types of experiences offered to players, particularly in regard to creating and animating complex characters in immersive environments. Modern gaming characters can be highly realistic or stylized, with many customization options that alter personal attributes, abilities, and appearance. These features are thought to enable players to develop a unique identity

(Przybylski et al. 2012) and provide opportunities to act out roles of who they might aspire or wish to be in real life (King et al, 2019). The tendency of creating distinct digital avatars is usually based on several motives: seeking attention, reducing loneliness and the desire to connect with others, impression management, looking for creative and self-expressive outlets, emotional and sexual desires, and the desire to express hidden aspects of oneself as well as experimenting with different personalities (Gilbert et al., 2011). Several studies (Jin, 2010; Ducheneaut 2009; Bessiere et al. 2007) have shown that users tend to attribute more positive or idealized personality traits to their avatars. Psychologists Mancini et al. (2017) believe that ideal avatars will motivate users to explore and socialize online, but some studies have also shown that this positive avatar modification can also cause cognitive biases: when avatars are superior to real selves in terms of personality and socio-emotional characteristics, people feel significantly more social connected as avatars than in real life (Gilbert et al., 2011).

Numerous studies (Mancini et al, 2019, Looy et al., 2014, Przybylski et al., 2012, Bessière et al., 2007) have shown that players create idealized avatars as a way to relieve psychological tension caused by the perceived discrepancy between the actual self and the ideal self. This explanation is consistent with Higgins' theory. It is almost a psychological placebo: while this way of escapism can briefly blur the user's perception about the flaws in reality, it triggers deeper cognitive issues. Players who consider their identity as being ‘fused’ with their avatars were more likely to be problematic gamers than those who perceived their avatar as being differentiated from their identity. Addicted gamers reported significantly poorer self-concept compared to nonaddicted and inexperienced gamers(Lemenager et al. 2013). Survey-based studies have reported that negative self-concept, avatar identification, and large self-avatar discrepancies are significantly associated with problematic gaming(Green et al. 2020).

2.3. Future identity

Human identity is not fixed and immutable(Gilbert & Forney, 2013). Within the contemporary dynamics of ‘liquid modernity' (Kasza, 2017), identity changes in response to revolutions and developments of culture and technology. Over the past few years, there has been a significant digitalization and internet-based transformation of human activities and social interactions(Lin & Latoschik, 2022). Tech companies such as Meta, Nvidia and Microsoft are investing heavily in metaverse projects, which indicates an enormous market for digital avatars in the future. As the boundary between reality and virtual continues to blur, it is likely that our bodies will inhabit both worlds in the next generation. Creating and coordinating a system of multiple offline and online identities will increasingly become the norm in human development (Gilbert et al., 2011), as experimenting alternative avatars and different identities will become more accessible and commonplace in the future.

Baudrillard (1976) introduced the concept of hyper-reality. He believes that in contemporary culture overload, the intensive production of information by the general public has been deprived from meaning. Postmodern culture is like a party of excess information, which has resulted in even greater confusion and alienation of personal identity. The diversity and complexity of identities will become something of a spectacle once they exceed a certain limit, leading to self-alienation. Real and virtual identities may continue to influence, conflict and compete with each other. The search for identity should not result in the dominance of one's virtual or real self, as the two are not mutually

exclusive. Amidst the restless technological and cultural revolutions, individuals' self-perception is bound to be constantly challenged, and the pursuit of a harmonious balance between different selves will remain a perpetual task.

3. Related Works

In some artistic practices related to virtual identity, artists deliberately create bodily expressions that differ from reality in order to accommodate media art trends or challenge real-life stereotypes. Multimedia artist Jon Rafman constructs digital ethnographies by archiving facial images. In his work Facials I (2022), he explores individual cultural identities in the chaotic online media environment through uncanny and depersonalised portraits combined from 3D scans of human faces and miscellaneous objects. Rafman suggests that these transformed facial images will be evolved into wearable skins for 3D avatars, and will endow users with a vivid character as their screen time grows. Greek artist Theo Triantafyllidis questions the necessity of maintaining a natural-looking body in virtual spaces. He explores the beauty of body modification in numerous works that speculate on transformative body's alternative materiality, texture, colour, and functionality (Qiang, 2023). In Studio Visit 360 (2018), he embodied an Ork avatar, who used digital tools to create 3D forms in his virtual studio that re-imagined from his offline gallery spaceas a challenge against the expected stereotype of an artistic worker.

Figure 1. Jon Rafman, Facials 1 (2022). [Color video with sound, 3 min]

Some artists have criticized the discrepancy in self-perception caused by digital identities with their straightforward visual disclosures. Parade is a fantasy rainy world created by the Rodina Studio, exploring how we construct our identity in a post-representational digital reality. Parade is a carnival of emojis and selfies, questioning the

endless contemporary self-presentation with a dazzling barrage of messages. Nice To Read You(2020) was about showcasing the duality in personality that many of the contemporary individuals of today have, i.e. the self-design on personal social media accounts. Through the combination of passport photos and captions, the artist reveals this elaborate display of managed personal information.

Figure 2. Pierre Huyghe, (2001). One Million Kingdoms. [Color video installation, with sound, 7 min] The Guggenheim Museums and Foundation. Available at: https://www.guggenheim.org/artwork/10700.

In common with HABITAT, Pierre Huyghe in One Million Kingdoms (2001) uses the coupling of virtual images, virtual scenes and narration to demonstrate the tension between fact and fiction. One Million Kingdoms was part of the No Ghost Just a Shell project (1999-2002) lead by artist Pierre Huyghe and Philippe Parreno. In this project, various artists created more than 30 video and literary artworks based on virtual character Annlee. Annlee has no biography, no superpowers, no attributes, no distinctive features. She is like a container of concepts, adapting to various purposes in the works of different artists. (Castellano, T. 2023) In One Million Kingdoms, Annlee walks alone through the shifting digital lunar landscape, with the narrator reciting passages from Jules Verne's novel Journey to the Center of the Earth in a synthesized form of astronaut Neil Armstrong's voice. Everything in this video is fictional: the digital landscape, the synthesized sound, and even the narration of Journey to the Center of the Earth, which is itself a fictional novel. Annlee appears as a translucent outline, like a symbolic null set being filled with these fictions. Through empathy with Annlee, we can feel the vulnerability and instability brought by the virtual. The audience observes the scene from a third-person perspective, and is observed again and gazed upon by the character. This gaze establishes a subtle connection between the character, scene, and audience, and makes the audience start to examine the relationship between the self and virtuality.

4. HABITAT

Imagine the end of virtual identity editing: when we endlessly self-modify, abandoning everything realistic and natural about us until we are no longer recognizable as human. HABITAT depicts a speculative virtual space . Due to the excessive self discrepancy brought about by inauthentic identities, people gradually alienate themselves from their actual-selves, with their avatars no longer holding a human form - they roam the HABITAT as unnameable digital creatures.

The design of HABITAT creatures is based on the deconstruction of the body and its recombination with inorganic materials. In 1991, Myron Krueger suggested that In the ultimate artificial reality physical appearance will be completely composable. It is not simply about the modifying or the adjusting of existing anatomical features, but an extreme body modification or even perhaps a radical genetic intervention (Stelarc 2003: 03). Katherine Hayles (1996) believes that the body in the posthuman age is an integral part of an 'information/material circuit that includes human and nonhuman components, silicon chips as well as organic tissue, bits of information as well as bits of flesh and bone'. Identifiable human attributes such as facial features, skin and hair are absent in HABITAT creatures, leaving only muscles and bones entwined with liquid metal and ornaments, visually emphasizing their alienation from human identity.

Figure 3. Junya Duan (2023). HABITAT. [video installation with sound] Available at: https://2023.rca.ac.uk/students/junya-duan/.

The video format reproduces the discussion of identity and existence in the No Ghost Just a Shell project. By simulating a realistic uninhabited wetland environment, HABITAT has a vast, serene electronic landscape. The narration is in the voice of a virtual creature, with an existentialist monologue in AI-synthesized BBC radio voice, narrating its reflexive

consciousness, discussing its own origin and perspectives. As the camera moves along a predetermined path through the scene, the perspective is presented in the first person, creating a sense of plain observation.

futures are not a destination or something to be strived for but a medium to aid imaginative thought—to speculate with(Dunne & Raby, 2013). HABITAT makes radical assumptions based on the evolving trends of virtual identities, intending to offer a prefigurative criticism against an uncanny future. Through fiction, this project hopes to compel the audience to set aside common sense and doubts, to actively and boldly imagine uncharted and unrealistic realms, and then measure the present against this possible future as they return to reality..

5. Audience interview

Figure 4. Photo of HABITAT exhibited at Think-1 Gallery in Shanghai, taken in 2024.

HABITAT was first exhibited at the Royal College of Art in London in July 2023, and in March 2024 it participated in the online group exhibition at Spatial, and in December 2024. It was also included in a group exhibition at Think-1 Gallery in Shanghai in December 2024. During the two offline exhibitions, I connected with many visitors and conducted semi-structured interviews with some of them (n=9). The interviewees came from art, media and computer science industries, held a bachelor's or master's degree and were generally interested in media art. They had read the artwork description beforehand and were aware of the concept. During the interview, I asked about their interpretation of the artwork, changes in their self-perception and their watching experience. The interviewees provided enthusiastic discussions on personal identity, emotional response, and the visual effect of the work. The interview results revealed both favorable and unfavorable

factors concerning the conceptual expression of this work.

Seven interviewees said they could feel the uncertainty of personal identity during the watch. One mentioned that the empty landscape of HABITAT reinforced the sense of disorientation, as “an empty grassland makes me think of nomads”. 2 interviewees considered that the indistinct voiceover in the environment gave a sense of “hidden presence”. “The voiceover sounds like a voicemail message. I'm not really listening to what he's saying, but it's comforting to hear a human voice in such a desolate world.” However, some also proposed the idea of interacting with virtual creatures: “I hope to be able to have a conversation with it, rather than just listen to its speech as an audience.” “Watching the video is a bit like taking a sightseeing bus ride. Everything is pre-set, and I just follow the route. “ One interviewee said. The fixed pre-set camera path made him feel less present and more controlled in the virtual space.

During the creation, I have also sought feedback from media art educators. Academic reviews have pointed out that the highlight of this project is worldbuilding as a way to approach the issue, constructing new worlds on top of ideas. It places the audience in an environment that is different from reality, helping to break free from the shackles of imagination imposed by certain real-world conditions and allowing them to focus fully on self-reflection. The background sounds of wind and water add a sensory dimension, enriching the virtual environment and further isolating the audience from the exhibition space. The quiet and lonely atmosphere created by the white noise, the empty ground and sky, all echo the loss of self. Showing an ultra-futuristic world is a powerful response to current issues, forcing the audience to think critically about ethics and morality.

The results of audience interviews show that HABITAT effectively stimulates the audience to question and reflect. The experience of the virtual world made them aware of the instability of identity. However, some audiences also expressed the expectation of stronger interactivity to enhance subjective participation. In future creations, it may be worthwhile to enhance immersion and interactivity as a way to deepen the experience and enhance empathy..

6. Conclusion

With the development of technologies such as artificial intelligence, augmented reality, and deep fakes, the boundaries of digital identity are increasingly blurring. Digital identity is not only playing an increasingly important role in self-perception, it is also having physical implications. Reshaping the digital self is not only about self-expression, but also about privacy, ethics, and social issues. The challenges of identity perception are likely to become more severe in the future, and these challenges will persist over the long term as technology develops.

HABITAT places the issue of self-discrepancy in a virtual world, presenting an extreme variation of future identities. Combining relevant psychological and sociological research, HABITAT's core discussion revolves around digital self-presentation and self-discrepancy theory, and these concepts are visually represented through artistic methods. By creating a virtual world in which avatars have surpassed human form, the work guides the audience to reflect on the authenticity of digital identities while their development is unlimited, and reminds the audience to maintain a stable perception of self and attachment to the real world.

The primary goal of art as research and criticism is to flexibly adopt a variety of media to present vivid criticism and provide a new way of thinking (Thompson, 2012). Confronted with complex identity issues, HABITAT demonstrates how art practice can serve as a form of prior criticism, encouraging the audience to imagine and question the possibilities of future.

* e.berger@strate.design

ABSTRACT | This article builds on the case of a French consortium launched in January 2023 by a consultancy specializing in decarbonization and adaptation to climate change, which gathers 10 multidisciplinary academic and 17 industrial partners. Based on the active involvement of corporate sponsors, it aims at developing a new set of tools to inform companies' strategy-making, in compliance with planetary boundaries.
This complex and multi-stakeholders project requires eliciting its epistemological and methodological foundations, to frame the involvement of each and every contributor. Our team of design researchers was embedded from the outset, but our role and the use of design tools has been evolving. In this reflective analysis, we propose to review the expectations, dynamics and outcomes of the programme so far and in the final phases to come. Our attempt is to assess to which extent the different means deployed effectively help companies overcome competition/cooperation dilemmas, and align with planetary boundaries. The study thus covers the four phases of the project: inspiration (driven by a participatory approach), scenarios (narratives supported by design fictions), quantified model and strategic appropriation. Our method combines insights from longitudinal participant observation and qualitative survey addressed to project holders from the consultancy. The analysis reveals some tensions running through the programme. First, awareness of planetary boundaries doesn't naturally lead to action. Second, the normative ambitions are somewhat offset by neutrality claimed in the process. Third, transition towards more ecosystemic business models is not a linear path for participant companies. Finally, we propose to discuss the agency of design in such complex project environments, according to the different expectations associated with the discipline.

KEYWORDS | PLANETARY BOUNDARIES, MULTI-STAKEHOLDERS PROJECT, FUTURE SCENARIOS, DESIGN FICTIONS, STRATEGIC REDIRECTION

1. Introduction

In the twentieth century, science has established the need to reframe human activities in a "safe and just space", between social foundation and ecological ceiling (Rockström & al., 2009; Raworth, 2017). This requires a radical shift to draw inspiration from living systems, which are autopoietic, interconnected, and rely on cooperation and symbiotic arrangements at all levels (Maturana & Varela, 1980; Capra & Luisi, 2014; Margulis & Sagan, 2002). Yet, most human organisations have been structured with a mechanistic view, in a global paradigm characterised by rationality, linear causality, the culture/nature divide, and the myth of progress (Chandler, 2018). The hiatus between the status quo and the pressing need for change leaves many companies in a state of disorientation or even "strategic vacuum" (Baumard, 2012). A tension is experienced between the broad context of societal change and the situated transition process in which they need to engage (Gaziulusoy & Erdoğan Öztekin, 2019). Despite evidence demonstrating the cost of inaction, many organisations remain trapped in the patterns of the prisoner's dilemma (Tucker, 1983), demonstrating cognitive dissonance between short term self-interests and the necessity to collaborate for achieving a remote positive outcome. Although this situation should foster actors' alignment, the bounded rationality of the human brain tends to favour competition, leading to "free-rider" behaviours (Hardin & Cullity, 2020) and even to the social phenomenon called "tragedy of the Commons" (Hardin, 1968).

Facing the urge of climate change and biodiversity loss, it is no longer time to wait for others to make the effort. To move away from the destructive patterns of the Anthropocene, human organizations need to leave aside short-term interests, embrace complexity, interconnectedness, and develop long-term and systemic perspectives. How to accompany this deeply challenging shift in mindsets and worldviews?

Since 2023, our design research team has been participating in a cross-disciplinary consortium aimed at providing new tools for decision and strategy-making in the Anthropocene era. At the heart of the programme, future scenarios are expected to stimulate corporate actors' ability to see further, wider and in more depth the determinants of change. But strategic redirection is a complex process that cannot be apprehended with determinism (Fry, 1999; Bonnet & al., 2021). Design tools and approaches are called upon to make fuzzy potential futures more tangible, and help (re)create meaning in uncertain situations. These ambitions come with challenges, which we propose to discuss in this reflective analysis based on two years of active involvement and participant observation, confronted with interviews. Our aim is to ponder the role of both the design discipline and a design research team in multi-disciplinary projects aiming at systemic change.

The article is structured as follows. First, the "map" (associated with the "territory" of our research) reviews literature about the challenges faced by big companies in integrating their activities within planetary boundaries. A focus is placed on future scenarios associating foresight and design. Next, the case studied is presented in more detail, with our research question and method. Analysis is then conducted from the angle of three

structuring tensions: between awareness and strategic appropriation of planetary boundaries; between value-neutral and normative perspectives; between global visions and grounded actions. Finally, a discussion on the agency of designers and the design discipline in such a complex project environment is proposed.

2. The "map". Reframing organisations' activities in a safe and just space

This state-of-the-art exposes the determinants of strategic change, before focusing on the roles of foresight and design to build future scenarios and support decision-making.

2.1. Planetary boundaries and strategy-making

A growing field of organisational studies focuses on how embracing paradox enables a dynamic learning process through which human groups increase their ability to anticipate, cope with and rebound from unexpected events. This builds on a set of capacities, starting with that of zooming in and out, exploring persisting contradictions from different viewpoints, integrating interdependencies and unavoidable tensions in any attempt to address a problem (Jarzabkowski & al., 2019). Scholars correlated those attitudes with organisational learning, opening to strategies that interweave planification and emergence (Smith & Lewis, 2011). Improvisation and tinkering are the cornerstones of such collective sensemaking processes (Weick, 1993), which can exceed corporate frontiers.

Different kinds of inter-organisational practices were identified in the literature: from the transfer and translation of insights, the framing of problems or/and solutions, until structural scaffolding. They culminate in the formation of coalitions, when urgent and complex issues require the representation and collaboration of diverse perspectives (Werle & Seidl, 2012). In those cases, the degree of strategic cooperation varies according to the closeness of relationships and the depth of interdependencies; just like the ways of coordinating, ranging from informal to contractual or normative (Astley & Fombrun, 1983). Individual leadership matters in the constitution of strategic coalitions: outside of any structure, cohesive, motivated, and action-oriented groups (even transitory) can develop agency, bring communities together and lead them to evolve (Manzini, 2017). Management studies identify catalysts and inhibitors for building alliances. Some are inherent to the organisations involved (resources and capabilities), some are environmental (external pressure), while others lie in the relationship itself: governance, coordination, trust and fit between partners, and power dynamics (Dzhengiz, 2020). At all scales, fluidity in the decision-making chain is also required for emergent strategizing (Mintzberg, 1990; Morin, 1990).

Eventually, the outcomes of inter-organisational collaborations are to be found both at company- (capabilities, value frames, performance) and system-level (learning, contributions to society). This is in line with the ambitions of the project studied in this article, which aims at integrating ecosystemic levels in business models. We assume that this first and foremost requires transforming the way corporate actors see their role in the future.

2.2. Future scenarios, when foresight meets design

By definition, the future can only be apprehended through projection (and imagination to ensure it is not limited to extrapolating the present). Foresight, design and fiction all participate in a collective capacity to envisage alternative realities and potentialities. This is not self-evident, and requires enabling situations, with supporting mechanisms and artifacts. Future scenarios are one of them, providing decision-makers with occasions to evaluate strategic options and ascertain the possible consequences of action. More than preparing for predictable situations, this is expected to help engage turbulence (Ramirez & Selsky, 2016) and spark discussion on the conditions under which contrasted potential futures might occur. In this line, future scenarios are a means to stimulate strategic conversation, by putting to the test the valuation mechanisms of a group. Besides making normative assumptions explicit, they also provide grounds for challenging the instrumental reasoning embedded in many organisational models (van der Heijden, 2008).

As this is both conceptually and emotionally challenging, descriptive scenarios are to be given a transitional and immersive character (Ramirez & van der Heijden, 2007). This is where the design discipline has a role to play. Starting with "what-if" questions, designers stage cathartic experiences to embody, reveal and discuss the levers and obstacles to change. This can be achieved through experience prototyping (Buchenau & Fulton Suri, 2000), and supported by diegetic objects. Those are considered "world-building artifacts" (Sterling, 2013), which connect their audience to the speculative realities of the system being envisioned through narration and active engagement.

The recent convergence of design research and future studies (Poli, 2019) falls within the scope of "prospective theorising" (Laszlo, 2021). Opposed to positivist empiricism, this epistemological standpoint calls for imaginative and action-orienting research approaches that consciously work to help bring possibilities into existence. The range of what is called "data" expands to narratives, images, metaphors, analogies or "real utopias"... and their analysis can involve speculations or thought experiments, forms acknowledged to be virtually absent in management theorising, despite their scientific legitimacy (Aguinis & al., 2023). This calls for action researchers to adopt a reflexive approach, continuously examining their assumptions as well as the ethical and moral implications of their work. It is also political: power structures, social inequalities, and ideological biases are to be analysed in order to make space for the acknowledgement and expression of different values – including disagreements or tensions (Gümüsay & Reinecke, 2024).

Building on these recommendations, our design research team aims to contribute constituting and animating a shared reflective platform with the stakeholders of the project presented in more details below. The tensions associated with this ambition will be discussed next.

3. The "territory". Case studied, research question and method

3.1. Project configuration and research question

In January 2023, a French consortium gathering 10 multidisciplinary academic and 17 industrial partners was launched, carried by a consultancy specialising in decarbonisation and adaptation to climate change. A four-year programme has been

set up, aiming at creating strategic tools to help decision-makers bridge vision and action, by developing their ability to diagnose complex situations, identify weak signals, and build conditions for coordinated initiatives. One of the goals pursued is thus to foster the constitution of coalitions between participant companies sharing matters of concern. Corporate decision-makers are actively involved, to help overcome the cost of inaction.

At the core of the project is a quantified model connecting human practices with Earth systems, designed to crystallise the transformation of value chains and future conflicts over the use of resources. While this tool is mainly informed by sustainability sciences and strategic foresight, inputs from human and social sciences and design were key to ensure consistency and credibility. In this line, the program started with the co-creation of four qualitative future scenarios, associating technological developments, societal orientations and biophysical constraints. At that time, our design research team was called on to contribute grounding scenarios in human practices, making use cases tangible, and orchestrating the participation of corporate actors. More broadly, our role as contributors and academic advisors has been adaptable, evolving with the different phases of the project through continuous dialogue with partners from the consultancy.

This figure summarises the progress of the project between 2023 and 2026:

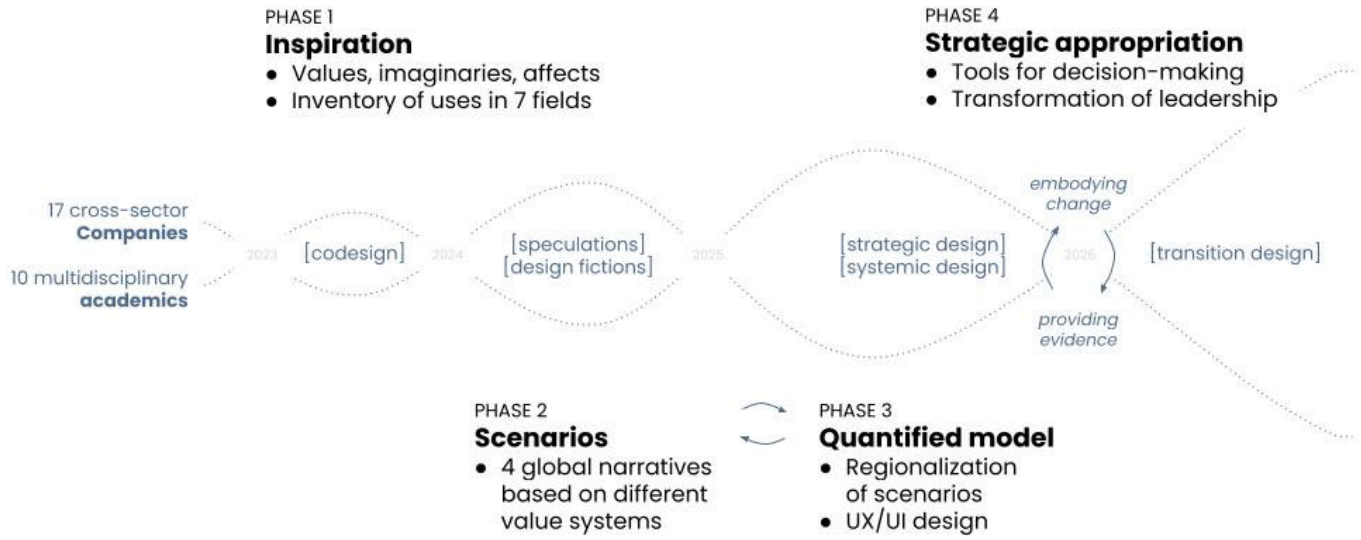

Figure 1. A four-year multi-disciplinary and multi-stakeholders project divided into distinct phases.

- Phase 1. was dedicated to understanding the determinants of human practices and lifestyles: values, worldviews, imaginaries, aspirations.
- Phase 2. integrated these building blocks into four qualitative scenarios, associated with different climate trajectories. In these initial phases, the perspective of design was a natural fit.
- Phase 3. translates scenarios in terms of resources and energy consumption, and pressure on ecosystems. Quantification is carried out on the scale of 11 regions of the world (geopolitical perspective). At this stage, design is mainly used to highlight tensions and illustrate some situations from the scenarios. There is an iterative loop between phase 2. and 3., to ensure narratives respect biophysical projections.
- Upcoming phase 4. will focus on the appropriation of scenarios by companies. During this key period, strategic design methods and tools will be used to engage participants in forward thinking exercises that are both experiential and conducive to strategic conversations.

Throughout the entire programme, our main concern has been for the integration of heterogeneous scales and layers. In a previous article, we identified four ways in which design approaches and tools can contribute to this end (Berger & al., 2024):

- Include multiple, non-hegemonic viewpoints (see Escobar, 2008)
- Connect scales: macro (Earth system), meso (human organisations) and micro (life experiences – see Coops & al., 2022)
- Stimulate discussion on the sustainability and desirability of possible futures, without evacuating dissensus (see Candy, 2010; Boehnert & al., 2018)
- Support transition or redirection paths (see Fry, 1999; Bonnet & al., 2021).

Late 2024, noticing a gap between participants' increased awareness and limits to effective change prompted us to reinvestigate our roles, approaches and postures. In this paper, we focus on the initiatives already taken, with a twofold reflective lens on the place of our external design research team, and that of the design discipline within a complex project environment. Our purpose is to assess to what extent the different means deployed so far effectively help participant companies navigate tensions and dilemmas. We also aim to inform the remaining stages of the programme, and more broadly, to engage in a topical discussion about the agency of design to support the transformation of human organizations towards more sustainable operating models.

3.2. Research protocol

This reflective analysis firstly builds on one and a half years of participant observation (2023-2024), documented through our logbooks. Those report on the briefings, ideas, discussions, and decisions made throughout the project - as well as the questions remaining. They reflect the outlooks of the different stakeholders in the project, from our three unique viewpoints. Together in January 2025, we revisited our field notes and put our experiences into perspective with some hindsight.
This self-analytical dimension is complemented with the results of a qualitative survey addressed to three main project holders from the consultancy, in June 2024. By bringing those materials together, we hope to acknowledge the heterogeneous understandings, as well as the evolutions of a complex programme that is still on-going and evolving. Scientific rigour is expressed through reflexivity and transparency about normative assumption, who participated, and whose voices are considered.

We should hence accept some limitations to this study, that are less due to our involvement as action researchers than to the situation investigated, which involves dynamic ecosystemic relationships. In this line and in a pragmatist vein, our concern is less for generalisation, transferable good practices or methods than for generative potency (Gergen, 1978) and affordances for other contexts (Ansari & al., 2010). We thus hope that the insights of this research contribute to nurturing adaptable ways of thinking, able to transcend reductionism and/or disciplinary silos.

Our analysis is structured around three tensions that we identified as pivotal in the programme: between awareness and strategic appropriation of planetary boundaries; between value-neutral and normative perspectives; between global visions and grounded actions.

4. Analysis of three pivotal tensions

4.1. Awareness / strategic appropriation of planetary boundaries

Bringing together a consortium is expected to help overcome siloed and individualised perspectives for more communal ones, which is a prerequisite to address wicked problems and build resilience in uncertain conditions (Weick, 1993). In this line, the programme is a shared learning journey, a system of its own to design, co-design and re-design. All project holders consider it of prime importance to "*develop processes to question and document the needs or expectations of the various communities that make up our 'clients'*". This is in line with an iterative design perspective, focused on adapting its accompaniment posture according to the evolutions of the situation. For us external design researchers, the consortium is not a field for deploying methods, but a space for conversation and co-construction. Ensuring the active involvement of corporate participants is thus key, but also more importantly supporting their ability to act (to influence the political dimension) and their inner transition (to influence the cultural dimension). This is the aim of our action research approach, but its progression may be questioned as we enter the most strategic phase of the programme [Phase 4 - Figure 1].

According to the project managers, the outcomes produced so far (inspirational material, scenarios, design fictions, quantified model) all effectively raised participants' awareness. The most appreciated contribution seems to be the clarification of potential competition for resources, as this is already an identified strategic issue for corporate actors. Sector-specific indicators and key figures also provide valuable insights: "*Quantification creates credibility and trust: if there are numbers, it's serious, solid. For us, it's a Trojan horse*" assumes a project holder. Yet, a point of vigilance must be placed on the understanding of the forward-looking exercise: several partners tend to perceive it as projection, expecting intermediate milestones to inform a linear trajectory. This is a challenge for the upcoming phase focused on strategic decision-making. Early spring 2025, a workshop is dedicated to reinvestigating companies' business models in light of some building blocks of the scenarios. Transversal support is provided by an ongoing PhD thesis on strategic leadership and the design of coalitions, and a research chair in strategy for the Anthropocene launched by a partner business school.

Our observation so far is that participants feel that space exists to strategize together in novel ways, they do not know where to stand yet. The confrontation to potential disruptions mostly triggers problem-solving approaches and local adaptations. Shifting from a competitive to a cooperative paradigm indeed represents a quantum leap, that the programme has not reached to date. Only the first step towards collective sensemaking is tangible through experience and knowledge sharing among participants, as well as ecosystem building. From our point of view, sharing an explicit theory of change could help promote more communal perspectives to business and strategy making. But this ambition is limited by the desire of the consultancy leading the programme to maintain some distance regarding the decisions made by companies. This leads to another tension, relating to the normative and/or prescriptive ambitions of the project.

4.2. Value-neutral / normative perspectives

In line with critical theory, proponents of prospective theorising call for action researchers to acknowledge that all theory building is inherently based on certain normative

assumptions, even when aimed at value-neutrality (Gümüsay & Reinecke, 2024). In our case, the project assumes a non-prescriptive approach, firstly because it is positioned upstream from the strategic decisions that will be made (or not) by participant companies. But this strategic phase can't ignore social and geopolitical issues. Cautious about tackling these issues, the consultancy assumes a non-political stance. "*We are trying to evaluate the size of the cake to be shared, but it's not our role to decide on the rules of sharing*" illustrates the main project holder. And yet, underlying ideologies must be revealed if we are to discuss them and hope to challenge the dominant paradigms. Otherwise, the extractive and competitive status quo will keep on reproducing itself.

How far does our programme go in setting standards, and how does our design research team participate in arbitration? In 2023, the first phase assumed a value-led perspective. In the workshops devoted to inventorying current and projected human use patterns, we provided inspirational material staging paradoxical tensions, to reveal how values, imaginaries and affects deeply shape human behaviours (see Berger & al., 2024). More importantly, it is from different value systems that the future scenarios were built. In this divergent phase, participants appreciated being immersed in contrasted potential worlds, with an analytical and critical eye. According to the project holders, the analogies and materialisations we provided allowed corporate partners to "*take a different or broader look at the theme they were asked to work on collectively*" and "*reveal links or dimensions they hadn't previously identified*". Preserving this granularity and navigating between the macro and the micro becomes more complicated at the quantification phase [Phase 3 - Figure 1]. This perspective reflects a form of abstraction, in which the multiplicity of viewpoints is difficult to express. Project holders consider final users or citizens "*as archetypes, which don't correspond to anyone in particular*". Obviously, building a model requires an increase of generalization, and thus a simplification of complexity. But local specificities are likely to be lost in this movement above the field. How to maintain a close look to the actors and situations addressed (Hennion & Monnin, 2021)? This echoes the recurring challenge to see and analyse patterns from different angles and scales.

At this stage, deeper interdisciplinary work is required to diffract the narratives with a finer grain than that of geopolitical regions, to make them "land on Earth" and become terrestrial (Latour, 2018). This entails integrating multipolarities, interdependencies, and the messiness of any societal dynamics; as well as opening beyond the homogeneity of perspectives represented by the companies of the consortium – which all represent past, present, or aspiring leaders. Plural voices must be included, with nuances and contradictions responding to temptations for generalisation. In the upcoming strategic phase, there is thus a need to discuss what a "sustainable horizon" means for participants, and what responsibility companies are ready to take on. This can be mediated by design fictions able to prompt debate (hypothetical organisational models, maps, laws or regulations…).

4.3. Global visions / grounded actions

This last tension also relates to the somewhat normative but not prescriptive ambition of the programme, and to the situation of multinational companies which mostly function in a deterritorialized manner. By this we mean not so much their scale and distance from final users/consumers/citizens, as their relationship with the biophysical realities of their operating spaces. Rethink business models in compliance with planetary boundaries requires anchoring and identifying commons around which to organise (Ostrom & al., 1999). This is even more the case when aiming at inter-organisational cooperation.

Our project holders assumed that this goal would naturally be reached by bringing together a learning community engaged in sensemaking: shared knowledge and reflection were expected to drive alignment and progress. Yet, halfway through the programme, a hiatus remains between the efforts made to reach a shared understanding of the situation, and its transformation into concrete actions. To date, corporate partners have been mostly interested in gathering arguments to bring back in their companies. They tend to consider the consortium as an inspirational space rather than one for action. Besides the psychological dimension, this may point to the limits of individual decision-making in big companies.

A working hypothesis to develop collective agency lies in fostering a commons-based approach within and among companies. Indeed, coalitions are defined by shared matters of concerns, around which they organise themselves (Werle & Seidl, 2012). Consequently, to effectively support collective strategy and decision-making, the tools developed in the programme will need to stand against competitive frameworks, such as classical business model canvas. Inspiration can be found in networks of actors engaged in different sorts of coalitions and/or commoning, which function in ecosystems and limit the place of economy within a broader ecological view. Such alternatives might inspire corporate partners new understandings of their roles and responsibilities, until integrating novel stakeholders, patterns and forms of value creation. This will be tested in the upcoming strategic workshops and further developed in the doctoral project associated with the programme.

More than ever, we have become aware of the complexity of articulating different perspectives, and of the time needed for systemic change. Transition is not a process to be decided and managed, but a time of "emotional wilderness" (Bridges, 2004). Space needs to be held for loss, conflict, and backlash, while working through power dynamics (Miller, 2024). Even though our posture of external contributors and advisors is delicate, we consider it an asset to accompany transformative journeys with a design-based approach informed by human and social sciences. We propose to discuss this situation in the following final section.

5. Discussing the agency of design in complex project environments

From the outset, the consultancy leading the programme assumed an iterative and learning process: "*We're on a test & learn basis, continuously gathering feedback on partners' needs (in informal interviews, presentations and workshops), which also change over time and in response to our results. […] As the project is a lengthy one, the phase of gathering these needs is also long and somewhat fuzzy.*" This view expands between action research partners, with our team expected to contribute shaping orientations in a systemic manner. In this respect, our contribution is first and foremost to the project team, and only then to the companies in the consortium. We have a sort of mirror role, to identify and map the playing field, set expectations for the programme and offer means to meet them. Being an outsider naturally enables to see alternatives and multiple perspectives. Here, our frontier position allows and forces hindsight, while participating in transformative action enables ongoing evaluation.

This whole context requires constant adaptation and close communication. A monthly monitoring committee is set up with the consultancy, to review progress, coordinate

action and prepare upcoming milestones. Besides, specific initiatives are discussed along the way, with the concerned stakeholders. Since 2023, the project team has expanded, to meet the consultancy's need for more internal design resources. This prompted re-examination of the expectations associated with "design", "designers" and "design researchers" in the project. On the one hand, they concern the creation and production of outcomes (ranging from participatory workshop materials to data-based model). On the other hand, they represent a disciplinary perspective on the transformative path undertaken by participants. Those two representations imply timeframes, scales and scopes of intervention which can significantly vary. They also entail different relationships with academic partners; for instance, while we all agree on the need for a systemic perspective, there are different scientific standpoints about what this means.

Evolving in such a complex setting, with heterogeneous yet overlapping perspectives, remains a real challenge. In our experience, what has been helping is the time taken to dialogue and better understand each person's skills and aptitudes, in a trusting environment. Time is indeed a key component of designing for systems-level change. Complex and wicked problems are not "solvable" with fast-paced processes whose objectives are clearly predictable. Periods of action and intervention are to be counterbalanced by intervals of observation and reflection "in order to understand how the system is responding" (Irwin, 2018). But this slow approach contrasts both with the current business paradigm and the urgency of change, challenging our concern for transformative impact. This project therefore teaches us patience and methodological inventiveness, demonstrating that inner transition starts with ourselves!

6. Conclusion

In this paper, we attempted to draw a picture of a multi-disciplinary project in which design is embedded both as a set of tools and methods, and as a disciplinary perspective. Obviously, we believe in a holistic approach to navigate the tensions, power dynamics and emotional shifts that are inherent to any transformation. But there is no prewritten protocol to follow, and it is not yet possible to predict the actual impacts of the programme. As we write in 2025, the main concern is for addressing the critical gap between shared understanding and collective action. We hope to succeed in providing tools with a reflective and strategic potential; in fostering corporate actors' motivation to experiment alternative models; and in equipping them with practical means to leave aside the dominant competitive logics for the cooperation that is needed to reintegrate human activities in a safe and just space.

Beyond Aesthetics: Defining Ethical Accountability in Design

Ayushi Jain*[a], Gabriela Karolak[b],

a Independant

b The New School

*ayushi.nyc@gmail.com

ABSTRACT | The evolving role of designers—from product creators to system thinkers—has expanded their influence (Buchanan, 1992). However, ethical considerations are still primarily a personal choice rather than a requirement across the industry. As design now shapes complex social and technological systems, designers must act responsibly and equitably (Costanza-Chock, 2020). Yet, the broadening of design's role often outpaces the development of ethical frameworks guiding designers' work (International Council of Design, n.d.).

Today's designers increasingly work as interdisciplinary generalists, uniquely positioned to question and navigate intricate systems. They bring a "philosophical" lens, uncovering deep-seated values within industries and addressing societal impacts (Nussbaum, 2013). As designers take on leadership roles in fields like healthcare and AI, where the ethical stakes are high, the failure to prioritize conversations about values and ethical decision-making can create significant challenges, especially when designing solutions with far-reaching consequences (Technology Review, 2023).

This workshop aims to critically engage participants in a conversation redefining ethical accountability, focusing on how personal values influence professional decisions. Rather than prescribing a definitive code, we emphasize the power of dialogue and reflection to uncover hidden biases and assumptions that shape actions (Costanza-Chock, 2020). Participants will explore critical questions about design's influence: How do personal values align with professional responsibilities? What unconscious biases affect ethical decision-making? How can designers consciously bridge gaps between their aspirational values and their real-world actions?

Keywords: Ethical Design, Leadership Accountability, Value-Driven Decision Making

1. Introduction

In the dynamic world of design leadership, we often operate under the belief that our decisions are guided by our core values. But what if the values we think we uphold differ from the ones that actually shape our actions? Understanding our values is only the first step in ethical leadership; the real challenge lies in recognizing how hidden pressures and competing priorities can quietly shift our actions away from our core principles (Kegan & Lahey, 2009).

This immersive workshop is designed to uncover the hidden layers of participants' decision-making process, offering profound insights into the alignment—or misalignment—between their aspirational values and real-world behaviors. Through thought-provoking exercises and reflective discussions, participants will explore key questions such as:

- How do the values I believe I hold compare to the values that drive my decisions?
- What unconscious biases or assumptions might be influencing my leadership choices?
- In what ways can I align my actions more authentically with my core values?

2. Facilitating Reflection with Design-Led Research

To facilitate this exploration, the authors will introduce a design-led research tool specifically developed to help leaders reflect on and discuss the explicit and implicit values that shape their design decisions. Inspired by Robert Kegan and Lisa Lahey's Immunity to Change framework, this workshop helps uncover competing priorities that may prevent individuals from acting in alignment with their aspirational/implicit core values (Kegan & Lahey, 2009).

By exploring and reflecting on their values, participants will have the opportunity to step back, gain insight, and develop a clearer understanding of how their values might influence decision-making in leadership roles. This tool serves as a catalyst for reflection, encouraging discussions on value-driven decision-making and accountability in leadership (Nussbaum, 2013).

3. Anticipated Learnings

By engaging with real-world scenarios of ethical design challenges, participants will gain deeper insights into the subconscious factors shaping their decisions, allowing them to bridge the gap between aspiration and action.

- **Self-Realization:** Participants will gain a clearer understanding of the values they believe they hold versus how those values are reflected in their actions.
- **Insight into Competing Priorities:** By contrasting aspirational values with real-world decision-making patterns, individuals will uncover hidden biases and competing priorities that influence their leadership style.

The transformative realization in this workshop comes when participants recognize that the values they declare may not always guide their behavior, especially in high-pressure or instinctive situations. This disconnect can be both surprising and enlightening, offering a powerful opportunity for reflection and growth.

ABSTRACT | Recently, craft has experienced a resurgence reflecting alternative approaches to work, organization, and community in society (E. Bell et al., 2018). Artisans and designers working in the craft sector are increasingly tasked not only with mastering the knowledge and craftsmanship to produce artifacts but also with innovating business models that convert skills and products into brands with new services and experiences (Fjeldstad & Snow, 2018). This transition demands a role shift from hands-on craftsmanship to entrepreneurship, where designers incorporate economic, cultural, and ethical responsibility into their work (Huang & Anderson, 2019). In this context, the artisans' and designers' leadership emerges to foster productive, authentic, and responsible relationships within communities. However, acquiring entrepreneurship skills for artisans might be challenging, ranging from marketing strategy to trust-building with stakeholders (Ivanycheva et al., 2024). We are intrigued by the challenges they face in the craft sector during their transition to entrepreneurs and the leadership that develops in this process.

Therefore, this paper concentrates on practitioners in different kinds of material-based crafts – ceramic, enamel, glass, fabric and jewellery. We view material-based crafts as planetary forms of craftsmanship shared with common knowledge and rooted in the local communities. They also present different manifestations from traditional to industrialized craft, as well as pure, technical, and creative craft in intercultural history (Kroezen et al., 2021). Based on preliminary research, the various roles makers, craftspeople, artisans and designers play in the craft sector are investigated, across different business models --

from non-employer to employer types. We view leadership as an interactive process of influence that happens to achieve common goals within contexts (Silva, 2016). Through in-depth interviews with artisan entrepreneurs making business in China, we investigate the stakeholder relationships, including customers, suppliers, collaborators and peers. Besides, the antecedents, leadership behaviours, and outcomes are also examined. Drawing from an inductive analysis, this research identifies the ethical and responsible leadership developing as artisans'/designers' transition into entrepreneurs, and summarize the qualities and skills essential for craft entrepreneurs. It provides a new perspective on the role of leadership in the craft sector, with implications for fostering entrepreneurship in design education and practice.

KEYWORDS | Artisan Entrepreneurship, Craft Entrepreneurship, Entrepreneurial Leadership, Ethical Leadership, Design and Entrepreneurship

1. Introduction

The craft sector, as a creative and diverse part of the global economy, has gained significant attention over the past decade due to its unique contributions to both cultural heritage and national economic growth (Ratten, 2017). Craft, defined as an activity involving skill in making things by hand, is seen as an alternative approach by contemporary artisans and designers to authentic and autonomous work (Smagina & Ludviga, 2021). Artisans now extend beyond traditional craftsmanship, engaging in craft businesses and lifestyle entrepreneurship across industries like manufacturing, services, and tourism (Ivanycheva et al., 2024). These artisans create functional, artistic handcrafted goods while pursuing entrepreneurship that aligns with their values and demonstrates responsible leadership.

This transformation demands a critical role shift from hands-on craftsmanship to entrepreneurship, where artisans/designers must take economic, cultural, and ethical issues into their consideration (Huang & Anderson, 2019). Artisan entrepreneurship, while a subset of the broader entrepreneurial landscape, demands balance of self-expression and commercial sustainability. Unlike conventional businesses focused on profit and growth, artisan entrepreneurs prioritize authenticity, personal values, and long-term trust with customers and communities (Dana et al., 2022). Despite the growing academic interest in the field of artisan entrepreneurship, there remains a significant gap in understanding the artisans as leaders who have an interactive process of influence that happens to achieve common goals in their communities (Mousa et al., 2024). While much of the research on leadership has focused on large corporations, the specific nuances of entrepreneurial leadership within small, artisanal businesses have yet to be fully explored (Sousa et al., 2021). This paper aims to address this gap by investigating the intersection of leadership and entrepreneurship in the craft sector, particularly focusing on the ethical, responsible, and virtue-driven leadership models employed by artisans. By examining how these entrepreneurs sustain their business, and take social responsibilities, this study seeks to contribute to the broader understanding of leadership in creative industries, with particular emphasis on the craft sector.

Through a quantitative approach with an inductive methodology, this study explores the lived experiences of artisan entrepreneurs in China. By interviewing artisans/designers across diverse material-based craft practices, the research offers valuable insights into how leadership manifests in non-employer and small-scale, craft-based enterprises. It provides a deeper understanding of the entrepreneurial processes that drive these businesses, as well as the ethical and responsible principles that underpin their operations and impact on communities.

2. Business and Entrepreneurship in Craft Sector

2.1. Craft Businesses

Craft businesses form a vital component of today's cultural and tourism market, playing a significant role in both regional and global economic competitiveness (Kapp, 2017). Craftspeople or artisans engage in different types of work across manufacturing, service, and tourism industries .(Ivanycheva et al., 2024) Those who work with materials often engage in the design and production of handicrafts, drawing on creativity to achieve aesthetic excellence. Their craft spans various domains, including textiles, leatherwork, ceramics, glassware, and jewellery. Many artisans working with materials operate as self-employed professionals, allowing them flexibility in setting their work schedules (Valdimarsdóttir, 2024). Depending on their circumstances, Luckman (2015) categorized artisan businesses into seven distinct types, illustrating the diversity of the craft economy based on individuals' engagement levels and business structures. These categories include hobbyists, part-time makers, part-time small business makers, full-time small business makers, part-time design/studio/art/craft makers, professional full-time design/studio/art/craft makers, and named artists (Luckman, 2015). Some of the categories engage in entrepreneurship for diverse reasons, often driven by a serious pull and push factors (Hughes, 2006).

2.2. Artisan Entrepreneurship

Entrepreneurship has been broadly defined as the process through which individuals or groups initiate economic, social, institutional, and cultural change (Rindova et al., 2009). It involves intentional efforts by individuals to leverage their skills in addressing market gaps. Traditionally, economic theories have emphasized the role of entrepreneurs as heroic figures, characterized as innovators and pioneers who exploit market inefficiencies (Harrison et al., 2023; Hoyte, 2018). However, this perspective does not fully capture the realities of small- or medium-sized enterprises in the craft sector.

In the context of craft/artisan entrepreneurship, entrepreneurs primarily focus on creating handmade products, often avoiding automated production techniques (Shane & Venkataraman, 2000). Artisan entrepreneurship is typically defined as the process of establishing and managing a business that relies on human skill and craftsmanship to produce functional goods or services with inherent aesthetic value (Mulholland et al., 2022). It's also categorized under lifestyle entrepreneurship, prioritizing self-expression, and personal fulfillment over rapid business expansion (Ivanycheva et al., 2024).

There has been a growing academic interest in artisan entrepreneurship (Hasanah et al., 2023). Prior studies have explored various aspects of artisan entrepreneurs, including personality traits (Hoyte, 2018), skills(Rashid & Ratten, 2021), and classification (Smagina &

Ludviga, 2023). Unlike conventional entrepreneurs, craft entrepreneurs are often driven by motivations that extend beyond profit maximization and business expansion. Their entrepreneurship is shaped by personal values and individual beliefs (Smagina & Ludviga, 2020). However, despite the increasing academic focus on artisan entrepreneurship, limited research has been conducted on the leadership dynamics within artisan enterprises and how leadership intersects with entrepreneurship in the craft sector.

3. Leadership in Craft Sector

3.1. Artisans Act as Leaders

Leadership, though widely debated, is broadly seen as a dynamic influence process where individuals recognize and accept a leader to achieve shared goals (Silva, 2016). Existing literature highlights that artisans/designers strategically leverage user-centered design methodologies to identify new business opportunities, leading to the creation of innovative products, services, and experiences (Huang & Anderson, 2019). Additionally, research underscores the critical role of in-person interactions and the cultivation of trust-based relationships with customers in small businesses, particularly artisan enterprises (Ratten, 2017). This aligns with the broader concept of moral leadership. Research has identified how artisans act as responsible leaders with autonomy, competence, and relatedness and are motivated by cultural and sustainable factors (Mousa et al., 2024) and the role of ethical market practices in the regional do-it-yourself craft sector (Curtis, 2016).

3.2. Entrepreneurial Leadership

Entrepreneurs are often associated with leadership qualities, given their role in guiding ventures toward success (Pauceanu et al., 2021). Some scholars view entrepreneurship and leadership as distinct concepts, exploring their intersections to identify overlapping characteristics. Fernald et al. (2005) introduce vision, problem-solving, decision-making, risk-taking, and strategic initiates. However, these traits primarily focus on individual capabilities rather than the mutual relationship between leaders and their followers. Instead, Pauceanu et al. (2021) define entrepreneurial leadership as a fusion of leadership and entrepreneurship, not just entrepreneurship alone. Recent studies on entrepreneurial leadership emphasize its contextual nature, offering a more comprehensive perspective without settling on a singular definition (Harrison et al., 2023). Rather than focusing solely on personal traits and business acumen, entrepreneurial leaders also demonstrate a keen awareness of their environment (Pauceanu et al., 2021). They recognize and capitalize on emerging opportunities, adding value not only to their enterprises but also to stakeholders and the broader community.

In the craft sector, entrepreneurial leadership emerges naturally from the interplay between artisans' creativity, their collaboration with stakeholders in supply chain, and the direct engagement with customers. While entrepreneurial leadership in craft sector includes traits such as vision, risk-taking, and strategic decision-making (Fernald et al., 2005; Pauceanu et al., 2021), the craft context reveals deeper relational and community-oriented dimensions. Artisans take on leadership roles that involve more than simply offering products for sale and business management; they collaborate with, influence, and inspire customers, community members and other stakeholders (Curtis, 2016).

3.3. Moral Leadership

Ethical and moral leadership has gained focus following recent corporate scandals (Banks et al., 2021). This shift has fueled academic interest in leadership models that prioritize virtues. Among these, servant, ethical, and authentic leadership have been recognized as key frameworks for fostering morally driven decision-making (Hoch et al., 2018). Such leaders prioritize fairness, transparency, and balanced decisions, aiming to create social, ecological, and economic value through ethical and compassionate actions (Hussain, 2013). Despite the increasing recognition of moral and ethical leadership in organizational studies, research in this area has predominantly focused on large corporations and formal institutions. The ethical leadership practices of lifestyle entrepreneurs and small, non-employer businesses remain relatively underexplored (Mousa et al., 2024).

Artisans' leadership drive extends beyond economic growth to include sustaining traditional techniques, protecting regional identities, and practicing ethical sourcing of materials (Curtis, 2016). These approaches broaden the conventional definitions of entrepreneurial leadership. They lead to co-created initiatives and new business models that meet both personal financial needs and community benefits. Further research is called to explore how ethical leadership shapes smaller enterprises and supports sustainable, responsible business practices (Ratten, 2017; Valdimarsdóttir, 2024).

4. Method

This study adopts a qualitative research method with an inductive approach, which enables us to explore the participants' contextualised entrepreneurial experiences in China. The inductive approach allows for the development of insights directly from the data, making it particularly suited for investigating areas with limited prior research and attention (Creswell & Poth, 2016).

We used snowball and purposive sampling to recruit participants for semi-structured interviews (Mousa et al., 2024), with the key criterion being the ability to sustain a livelihood through their craft, focusing on leadership in artisan entrepreneurship. Preference was given to artisans with a certain level of reputation, recognition, and active engagement in their communities. The study includes seven full-time professional artisan entrepreneurs who work independently or in teams. Participants specialize in ceramics, glass, enamel, fabric, and jewellery, representing a diverse range of material-based craft practices. They were drawn from various regions across China, including Beijing, Shanghai, Jiangxi, and Yunnan, working in different settings such as domestic benches, studios, or shared spaces.

Participants were contacted individually, with interviews conducted online or in-person for accessibility. Following ethical guidelines, they were informed of the study's objectives before their participation. The interviews first established participants' backgrounds, career trajectories, business models and stakeholder networks. Subsequent questions examined their entrepreneurial motivations, visions, risk perceptions, problem-solving strategies and decision-making processes. Finally, participants were asked to share their perspectives and actions concerning moral and responsible leadership within their fields (Lawton & Páez, 2015).

The qualitative data was analyzed inductively using a thematic approach with Atlas.ti software. Initial and focused coding were conducted to identify key themes that emerged from the interviews. The findings derived from this analysis are presented in the subsequent section.

5. Findings

5.1. Navigating Artisan Entrepreneurship

The research confirm that artisans are motivated by pull factors, like authenticity and meaningful work, and push factors, such as health issues, unemployment, or family responsibilities (V. Bell, 2022). Authenticity is a fundamental characteristic of artisan leadership, shaping both the creation process and customer relationships. In the early years of their careers, artisans primarily focus on balancing economic sustainability—ensuring their craft can provide a stable livelihood—and artistic expression, which helps them establish a distinctive identity in the market. They prioritize designing and producing works that are not easily discarded, aspiring for their creations to hold long-term significance for users. Even amid market pressures, artisans remain committed to their craftsmanship principles and personal values.

As highlighted by Mousa et al. (2024), autonomy is another key motive in craft entrepreneurship, as artisans highly value the ability to work on projects that offer a sense of independence and self-fulfillment. Artisans exercise autonomy in selecting their clients, choosing to collaborate only when a project aligns with their artistic and ethical principles. If a request conflicts with their creative philosophy, artisans may decline it or guide customers toward appreciating their values, reinforcing that craft is an intentional, value-driven practice rather than merely reactive to market demands.

Artisan entrepreneurs strategically integrate storytelling, user-centered services, and experiential offerings to differentiate their businesses. Storytelling is a key marketing strategy, allowing artisans to share their design philosophy, values, and craftsmanship through social media and consumer engagement. To sustain their businesses, artisan entrepreneurs use a multi-channel approach, including store agencies, exhibitions for exposure, craft fairs, and creative markets for direct customer engagement. In addition, artisans specializing in custom orders emphasize user-centered services and co-creation, where they engage in extensive consultations—often lasting weeks—to translate customer needs into unique design elements. Some artisans see their work as experience-oriented service rather than a mere product transaction, guiding and collaborating with clients, sometimes involving them in production for a more personal experience. Beyond selling goods, they offer workshops and curriculums, turning expertise into services and diversifying income. This shift from product-based transactions to and experience-driven interactions reflects how artisan entrepreneurship extends beyond craft production into dynamic, relationship-driven, and service-oriented business models.

5.2. Collaborative Leadership and Stakeholder Networks

Unlike traditional hierarchical business structures, leadership in craft enterprises exists beyond employer-employee dynamics. Artisans in craft-based enterprises tend to cultivate partnerships built on shared values and mutual trust. Leadership within these businesses is generally informal and dynamic, favoring collaboration over rigid managerial control. This kind of leadership can be attributed to the competence to develop their own business and at the same time, a broader sense of relatedness to their community.

Throughout the process of starting and expanding their ventures, artisan entrepreneurs continuously engage in vision-setting, problem-solving, decision-making, and risk-taking.

Collaboration emerges organically as they pursue the development of their business trajectories. Collaboration in craft entrepreneurship varies based on factors such as craft type and geographic location. For instance, in ceramic production, artisans engage with multiple partners owning different infrastructure and skills during manufacturing, including raw material suppliers, clay workshop, mold makers and kiln operators. Flexible labor arrangements are a common feature of craft-based businesses, particularly among small-scale entrepreneurs. Artisans manage fluctuating demand by hiring skilled workers as needed, avoiding the financial strain of a permanent workforce. A textile sector case shows artisans flexibly using local resources, outsourcing sewing to a tailor shop and employing local unemployed women for assembly. These hires included both personal acquaintances and individuals recruited through community recommendations. This model underscores the reliance of craft production on social networks.

Beyond collaboration within the production process, artisans establish long-term cooperative and mutually beneficial relationships with other stakeholders, including logistics providers and customers. Some artisans use informal logistics strategies, building relationships with couriers to bypass rigid regulations and enhance flexibility. Their high order volume provides stable work for local couriers, creating a mutually supportive dynamic. Customers in the niche market evolve from strangers into loyal followers and dedicated supporters. Artisans noted that their brands attract a dedicated customer base, valuing engagement and recognition over mass-market appeal. Some customers actively provide unsolicited feedback and suggestions for improvement, demonstrating a high level of involvement. Loyal customers drive organic growth by making repeat purchases and referring friends and family. For some loyal customers, their relationship with the artisans evolves beyond mere consumption, leading to business collaborations. For instance, a customer can become the artisan's part-time employer and facilitate entry into a larger commercial network. Customer relationships sometimes translate into investment opportunities, with supporters funding material and technique experiments and innovation. In some cases, customers who have developed a deep connection with the artisan and brand voluntarily help with workshops or actively promote and sell products at markets, reinforcing the emotional bond between artisan and consumer.

5.3. Artisans' Ethical and Responsible Leadership

With accumulation of experience, resources, capital, and influence, artisans expand their focus beyond personal benefits to ethical practices, social responsibility and environment concerns. Ethical leadership can be found on some artisans which are distinguished by their integrity to ensure transparency and sustainability in their work and efforts to preserve and inherit knowledge and skills in crafts. They are also driven by a virtue of altruism, actively return social favours and contribute to the common good (Mousa et al., 2024).

Integrity defines artisan leadership, running through business practices and public engagement. Artisans prioritize honesty and transparency, avoiding exaggerated claims or unfulfilled promises. They maintain the originality of their work, firmly rejecting plagiarism and resisting the substitution of inferior or inauthentic materials. Integrity fosters long-term trust, essential in high-end custom craft, where clients have discerning judgment. Beyond business

ethics, artisans also recognize the growing need for public education in their field. Short-form social media has fueled misconceptions about craft, as unprofessional creators often stage or manipulate demonstrations, misrepresenting skill, effort, and safety requirements. In response to misinformation, artisans actively engage in public discussions, debunk myths, and provide factual corrections, striving to preserve the integrity of their craft while educating a broader audience.

Altruism is exhibited when returning social favors through various initiatives. Artisans actively engage in outreach programs led by local communities, non-profit organizations, and government bodies, providing hands-on craft experiences to marginalized groups such as the elderly and children, often without monetary compensation. Despite the traditionally closed nature of craft knowledge, experienced artisans now increasingly participate in communities, assisting peers and newcomers while also offering free educational content to the public, customers, and craft enthusiasts. These acts of voluntary sharing are often seen as a natural part of artisan lifestyle.

Artisans practice responsible leadership by prioritizing environmental and emotional sustainability, often critiquing mass production. They emphasize lifecycle sustainability and emotional durability beyond immediate product quality. Environmental concerns are evident in their efforts to address raw-material selection, waste and recycling challenges. For example, artisans emphasize the long-term ecological risks of heavy metals in enamel, which can contaminate soil and water, and the non-degradability of ceramic and glass waste. Despite the lack of formal recycling channels, artisans experiment with repurposing defective or discarded materials to minimize environmental impact. They also contribute to raising industry-wide awareness by exchanging insights with peers, engaging with larger enterprises, and sharing their perspectives on social media. Most artisans resist excessive commercial packaging, rejecting short-lived visual appeal in favor of sustainability, even when this conflicts with consumer expectations. These approaches reflect an underlying anti-consumerist philosophy that challenges conventional marketing norms.

6. Discussion and Conclusion

The findings suggest that artisan entrepreneurship represents a unique leadership style that prioritizes authenticity and integrity, with altruism and sustainable responsibility. Unlike traditional entrepreneurial leadership, artisans adopt a collaborative and moral approach, engaging in business and social activities. Their reliance on communities underscores the importance of social capital in sustaining craft enterprises.

Future research could employ quantitative method to verify the characteristics and behaviours identified as artisan leadership. Another valuable direction would be to investigate leadership dynamics in medium-sized craft enterprises, assessing how leadership structures evolve as businesses scale and engage with broader market forces. Further research is needed to explore how policy frameworks and digital transformation influence artisan design and entrepreneurship.

This study explores the leadership and entrepreneurial dynamics of artisan entrepreneurs in China, revealing the complex interplay between personal vision, business strategies, stakeholder collaboration, and ethical leadership in the craft industry. By adopting an inductive research approach, we reveal how artisans navigate the challenges of sustaining a livelihood while maintaining creative autonomy and ethical integrity. Our findings highlight that artisan entrepreneurs are not solely driven by economic motivations but is deeply rooted in personal values, artistic philosophies, and a broader sense of social responsibility. Artisans balance self-expression with economic sustainability while contributing to communities and society, highlighting ethical leadership in creative industries. Supporting these alternative pathways can help evolve craft practices, measuring success beyond finance to include cultural, social, and ethical contributions.

About the Authors:

Yiwen Cheng earned his master's degrees in Industrial Design from Aalto University and Tongji University. His research interests cover from accessory design, crafts and fashion to discursive and speculative design, design activism and design anthropology.

Ruoan Ren is a Ph.D Candidate from Tongji University in China. His research interests covers fashion apparel design, inclusive design, design for aging, digital-driven innovation strategy, digital transformation and fashion theory.

Siguang Huo has teaching experience in product design for 15 years. Founder and Dean of Product Design Department, Jilin Normal University. Currently is a Ph.D candidate from Tongji University in China. His research interests are related to fashion and design innovation, covering from the product emotional sustainable design method to brand building and transformation practice.

Jie Sun is Dean of the College of Fashion and Art Design at Donghua University and professor in College of Design and Innovation at Tongji University. Focuses on the research, curation, and practice of contemporary fashion.

Acknowledgements: We would like to express my sincere gratitude to the artisans Jiaxi Yu, Pheabe, Mingzhen Zhao, Anyan, Suan, Xiaohan Ren, Miona, and Tina. Their generous participation in the interviews provided valuable insights and essential information that greatly contributed to the development and completion of this study.

ABSTRACT | As sustainability increasingly gains importance, the design industry is now at the forefront of addressing environmental challenges, particularly through the lens of sustainability. As the sector evolves, integrating ethical leadership becomes essential for driving innovation that meets aesthetic standards while achieving broader social and environmental goals. This paper examines the role of ethical leadership in sustainable interior design, particularly in selecting and using materials like sustainable textiles. The research is grounded in two qualitative case studies in the UK showcasing the real-world application of ethical leadership within the interior design industry. The first case focuses on a UK-based design firm specialising in the reuse and resale of surplus textiles. This company emphasises waste reduction through recycling, contributing to a circular economy within interior design. The firm prioritises transparency in the supply chain and fosters collaboration with manufacturers and designers. By incorporating surplus materials into commercial projects, they illustrate how design leadership can promote sustainability without sacrificing quality or visual appeal. The second case explores the work of a residential interior design practice, known for using locally sourced and eco-friendly materials. This practice aims to create interiors that are not only visually appealing but also minimise environmental impact by using organic and biodegradable textiles. This approach reveals the challenges of sourcing sustainable materials and educating clients on the long-term value of environmentally responsible choices. The firm's commitment to ethical design extends to advocating for inclusivity and well-being, ensuring that spaces are healthy for both people and the planet.

Both cases underscore the delicate role of ethical leadership in overcoming interior design industry challenges, like the limited availability of sustainable materials and the demand for greater transparency. They each highlight the importance of collaboration between the interior design and manufacturing sectors to achieve sustainability goals. By focusing on the entire lifecycle of textiles, from sourcing to disposal, these leaders are setting new benchmarks in sustainable interior design, aiming for a future that goes beyond compliance to actively shape a regenerative industry.

The study's findings reveal that ethics in design leadership are not merely guiding philosophies, but strategic tools for transforming industry practices. By embedding ethical considerations into every stage of the design process, leaders in the field of interior design can meet clients' aesthetic expectations while contributing to a more sustainable and resilient design industry. Their work serves as a blueprint for other interior designers interested in incorporating ethics into their design practice, proving that a commitment to sustainability can coexist with creativity and innovation.

This paper advocates for a shift in the interior-design leadership model, placing ethics and sustainability at the core of decision-making. As the industry faces increased pressure to address sustainability concerns, the role of ethical leaders becomes ever more essential. This research lends valuable insights to the ongoing discourse around sustainable design, offering practical guidance on how leaders can navigate the complexities of sourcing, transparency, and client engagement. Ultimately, this invokes a reimagined future for design, where design is driven by responsibility and innovation, led by ethical principles.

KEYWORDS | ETHICAL LEADERSHIP, SUSTAINABLE DESIGN, INTERIOR DESIGN, SUSTAINABILITY, SUSTAINABLE TEXTILES, REGENERATIVE DESIGN, DESIGN ENTREPRENEURSHIP, SUPPLY CHAIN TRANSPARENCY, SUSTAINABILITY INNOVATION.

1. Introduction: Framing Ethical Leadership in Sustainable Interior Design

Interior design has long been associated with an emphasis on aesthetics, luxury, and curated user experiences. Yet, with the escalating climate crisis, this perception is undergoing a profound transformation. The ecological impact of material choices, manufacturing processes, and waste management is no longer a secondary issue—it stands as a critical challenge for contemporary interior designers. Sustainability is no longer an afterthought but an integral responsibility. At the heart of this shift is ethical leadership. Ethical leadership in interior design extends beyond mere adherence to sustainability standards; it involves a proactive engagement with strategies that foster a regenerative and ecologically sound industry.

The urgency of integrating ethical leadership into sustainable interior design stems from several pressing issues. The built environment is responsible for nearly 39% of global carbon emissions, with interior finishes, furniture, and fit-outs contributing significantly to this footprint (United Nations Environment Programme, 2019). Additionally, the fast interiors phenomenon, mirroring fast fashion, exacerbates material waste, shortens product lifespans, and fuels unsustainable consumption patterns. The textile industry, central to interior design, remains one of the largest polluters, with synthetic fabrics releasing microplastics into waterways and natural fibres, often requiring intensive chemical treatments (Shen, Worrell & Patel, 2010).

Beyond environmental concerns, ethical leadership in interior design must also address social equity. Supply chain transparency remains a challenge, with many materials passing through multiple intermediaries before reaching designers. Labour exploitation, lack of fair wages, and unsafe working conditions persist within textile manufacturing, particularly in developing economies (Bocken et al., 2014). Ethical leadership, therefore, requires designers to take a holistic approach, ensuring that sustainability efforts extend beyond material sourcing to encompass fair labour practices, circular economy principles, and consumer awareness.

Historically, interior designers have been positioned as creative professionals rather than industry leaders driving systemic change. However, as sustainability moves to the forefront of global discourse, the role of designers is shifting from passive adopters of sustainable materials to active agents of ethical entrepreneurship. Ethical leadership in design is no longer just about making sustainable choices—it is about reshaping industry norms, challenging unsustainable business models, and influencing consumer behaviour.

Designers, by virtue of their work, operate at the intersection of multiple disciplines—manufacturing, supply chains, policy, and consumer engagement. This positions them uniquely to advocate for systemic change, working beyond individual projects to push for industry-wide improvements. Ethical entrepreneurship, in this context, refers to designers taking ownership of the materials they specify, holding suppliers accountable, and integrating transparency into their decision-making processes (Porter & Kramer, 2011). It also means educating clients, shifting the industry from short-term consumerism to long-term sustainability, and redefining the aesthetics of sustainable interiors.

This study investigates how ethical leadership manifests within sustainable interior design by analysing two UK-based firms that have embedded sustainability into their core operations. The research explores:

- The decision-making processes of ethical design leaders: How do they balance sustainability, aesthetics, and financial constraints?
- Challenges in sourcing and implementing sustainable textiles: What obstacles do firms encounter when integrating ethical materials into their work?
- The broader impact of ethical leadership on the design industry: How do these firms influence suppliers, manufacturers, and client expectations?

Through these inquiries, the paper aims to move beyond theoretical discussions of sustainability and present real-world examples of leadership in action. This research also contributes to the growing discourse on design leadership in sustainability by offering a practical, case-based exploration of how firms are implementing ethical practices. While much of the existing research focuses on sustainable materials and circular economy principles (McDonough & Braungart, 2002), less attention has been given to the role of leadership in transforming industry practices. By framing designers as ethical entrepreneurs, this study shifts the focus from materials alone to the decision-making power of designers to influence suppliers, clients, and broader industry norms.

The findings of this research have implications beyond interior design, contributing to the wider conversation on how leadership in creative industries can drive sustainability. As policymakers and consumers demand greater accountability from the design industry, understanding the role of ethical leadership becomes essential for shaping future design education, business models, and material innovations.

2. Navigating Ethical Challenges in Sustainable Design

Sustainable interior design has evolved from a niche concern to an industry-wide priority, yet the transition from aspiration to execution remains fraught with challenges. Ethical leadership plays a pivotal role in bridging this gap, shaping how designers navigate the complexities of sustainable material sourcing, supply chain accountability, and consumer expectations. This section reviews the theoretical foundations of ethical leadership, the evolution of sustainable practices in interior design, the role of textiles in sustainability, and the challenges that hinder their widespread adoption. Finally, it identifies how this study contributes to existing discourse.

2.1. Theoretical Foundations of Ethical Leadership in Design

Ethical leadership, as conceptualised within business and organisational studies, extends beyond compliance with sustainability regulations to proactive, values-driven decision-making. Brown, Treviño, and Harrison (2005) define ethical leadership as the process by which individuals demonstrate and promote integrity, transparency, and responsibility within their professional domains. This model aligns with Porter and Kramer's (2011) framework of "Creating Shared Value" (CSV), which argues that businesses can generate economic success while addressing societal challenges. Applied to interior design, CSV suggests that sustainable practice need not be a financial burden but an opportunity for long-term industry transformation.

From a design perspective, Manzini's (2015) "Design for Social Innovation" explores how creative professionals, including designers, can function as agents of change, embedding ethics and sustainability into their work. Manzini argues that sustainable design is not merely about using eco-friendly materials but rethinking entire systems—from how materials are sourced to how spaces are used and repurposed. This aligns with McDonough and Braungart's (2002) Cradle-to-Cradle (C2C) model, which advocates for circular material flows where waste is eliminated by ensuring that products are either fully recyclable or biodegradable.

Despite these frameworks, research on ethical leadership specifically within the field of interior design remains sparse. While architects and urban planners have engaged in sustainability-driven leadership models, interior designers are often positioned as specifiers of materials rather than strategic decision-makers (Bocken et al., 2014). This paper seeks to reposition designers as ethical entrepreneurs; illustrating how they can influence material supply chains and consumer perceptions through leadership-driven decision-making.

2.2. The Evolution of Sustainable Practices in Interior Design

Sustainable design has undergone significant shifts over the past few decades. In the 1990s, the focus was primarily on energy-efficient buildings and green certification systems such as LEED (Leadership in Energy and Environmental Design). However, as sustainability discourse expanded beyond energy consumption to encompass materials, waste reduction, and ethical labour practices, interior designers faced increasing pressure to integrate these considerations into their work (Stegall, 2006).
Today, sustainability in interior design encompasses several key principles:

- **Material Transparency** – Ensuring full disclosure of material origins, production impacts, and disposal methods.

- **Circular Economy Thinking** – Moving away from linear consumption models toward closed-loop systems where materials are repurposed rather than discarded (Ellen MacArthur Foundation, 2019).
- **Social Equity in Sourcing** – Addressing ethical labour concerns in textile and furniture manufacturing, particularly in global supply chains.
- **Consumer Awareness & Education** – Shifting client expectations from short-term aesthetics to long-term sustainability investments.

Despite these advancements, widespread adoption remains slow. Research indicates that many firms struggle to align sustainable aspirations with economic realities, leading to greenwashing—where sustainability is marketed but not meaningfully implemented (Jones, Wynn & Hillier, 2020). The question, then, is not whether sustainable design matters, but how designers can operationalise ethical leadership to turn sustainability from an ideal into a functional business model.

Recent scholarship across the creative industries offers additional context for understanding how ethical leadership in interior design aligns with broader sustainability movements. As Väänänen et al. (2022) observe in their cross-disciplinary study on ethics in design practice, many designers now see their roles evolving from service providers to environmental and social responsibility advocates. However, they also emphasise the constraints faced by small firms navigating inconsistent policy frameworks and limited client awareness—challenges echoed in the interior design field. Fischer and Reimers (2020), in a state-of-the-field review, note that while sustainability is a growing research focus in interior design, there is still a lack of integration between design education, professional leadership, and sustainable innovation. These findings parallel those in architecture and fashion, where creative entrepreneurs are increasingly positioned as system changers rather than passive implementers (UNCTAD, 2022). Yet, unlike sectors where large firms often drive sustainability through scale and resources, interior design relies heavily on small studios and individual actors, placing even greater importance on ethical leadership at the micro-level. The relevance of these broader creative-sector dynamics strengthens the case for examining how leadership models in interior design can inform and adapt to evolving sustainability demands.

2.3. The Role of Sustainable Textiles in Ethical Sourcing

Textiles are central to interior design, influencing aesthetic, functional, and environmental outcomes. However, the textile industry remains one of the most environmentally and socially problematic sectors, with high levels of water consumption, chemical processing, and waste generation (Shen, Worrell & Patel, 2010). The transition to sustainable textiles has been slow due to several persistent challenges:

- **Chemical Pollution & Resource Use** – Conventional textile production involves toxic dyeing processes, high water consumption, and significant carbon emissions. Even "natural" fibres like cotton have sustainability concerns due to pesticide use and soil degradation (Fletcher, 2013).
- **Microplastics from Synthetics** – Many synthetic textiles release microplastics into the environment, contributing to ocean pollution.
- **Labour Exploitation in Supply Chains** – A significant portion of textile manufacturing occurs in low-wage economies with poor labour protections (Benyus, 2002).

- **Consumer Misconceptions** – Many consumers and clients equate sustainability with visual simplicity, leading to the misconception that sustainable interiors lack luxury or high-end appeal.

To counter these issues, designers are increasingly turning to ethical sourcing strategies:

- **Upcycling & Surplus Material Reuse** – As seen in Firm-A's business model (discussed later in the case study), the reuse of surplus textiles offers a solution to material waste while lowering costs and carbon footprints.
- **Locally Sourced, Biodegradable Textiles** – As exemplified by Firm-B, locally sourced organic textiles can support regional economies while reducing transportation-related emissions.
- **Cradle-to-Cradle Certifications & Material Transparency** – New frameworks help verify sustainability claims, ensuring accountability across the supply chain (McDonough & Braungart, 2002).

2.4. Challenges in Implementation: Supply Chains, Clients, and Costs

While sustainable practices are gaining traction, designers face significant barriers when attempting to implement ethical sourcing at scale.

- **Supply Chain Transparency** – Many suppliers are reluctant to disclose full material compositions, making it difficult for designers to verify ethical claims (Stegall, 2006).
- **Client Expectations & Market Demand** – Many clients remain price-sensitive, prioritising aesthetics over long-term sustainability benefits. Designers often struggle to convince clients of the value proposition of sustainable interiors (Porter & Kramer, 2011).
- **Economic Feasibility for Small Firms** – Many small-to-mid-sized firms lack the financial resources to source premium sustainable materials, creating a disparity where only large firms can afford to implement high-impact sustainability strategies (Bocken et al., 2014).

These barriers suggest that ethical leadership in sustainable interior design requires more than individual action. It necessitates collective industry shifts, regulatory support, and consumer education to create an ecosystem where sustainability is not a niche but a norm.

2.5. Bridging the Gap: Where This Study Contributes

Existing literature largely focuses on sustainable materials, lifecycle assessments, and regulatory frameworks, but research on how design leaders drive sustainability within firms and supply chains remains limited. This study contributes to the discourse in several ways:

1. It shifts the focus from materials to leadership, examining how interior designers function as ethical entrepreneurs, influencing suppliers, clients, and industry norms.
2. It presents two case studies of firms actively embedding sustainability, providing real-world insights into decision-making challenges and opportunities.

3. It explores the role of collaboration and advocacy in ethical sourcing, demonstrating that sustainable interior design is not just a technical challenge but a leadership challenge.

By examining practical, firm-level strategies rather than abstract sustainability principles, this study aims to bridge the gap between theory and practice, offering a clearer roadmap for ethical leadership in interior design.

3. Examining Ethical Leadership in Action: A Qualitative Approach

Understanding how ethical leadership manifests in sustainable interior design requires more than theoretical exploration—it demands an in-depth look at real-world practices. This study adopts a qualitative case study methodology, focusing on two small UK-based firms that have successfully embedded ethical leadership into their sustainability strategies. Both firms serve as examples of how ethical leadership operates in a small business context. By examining their decision-making frameworks, processes, and operational challenges, this research seeks to uncover how ethical leadership is practiced and what insights can be applied to the broader industry.

Participant Selection and Sampling Criteria: The firms were selected through purposive sampling based on their active engagement with sustainability and visibility within UK design networks. The inclusion criteria required that firms: (1) be UK-based, (2) operate in interior design, and (3) demonstrate a clear commitment to sustainable practices either through public communication, project work, or third-party certifications. Additionally, firms were required to have fewer than 10 employees to focus on small-business dynamics. The selection aimed to reflect different approaches to ethical leadership, Firm-A being systems-driven and Firm-B being client-driven, providing comparative insights into leadership styles within sustainability.

Research Design and Methodological Rationale: The use of a qualitative case study approach allows the complexity of ethical leadership within sustainable interior design to be explored in greater depth. Unlike quantitative methods, which often fail to capture the richness of context-specific practices, case studies offer detailed, real-world insights into how sustainability is operationalized (Yin, 2018). Given that ethical leadership is not a static, easily measurable variable but a dynamic, evolving practice, qualitative methods allow for a more nuanced exploration of how designers navigate moral dilemmas, industry constraints, and leadership responsibilities.

To gain a comprehensive understanding of leadership practices, the study utilized three primary data collection methods: semi-structured interviews, document analysis, and observational insights. These methods were chosen to provide a nuanced view of how ethical leadership is enacted, focusing on the tensions, trade-offs, and strategies involved in sustainable decision-making. By combining multiple data sources, the study enhances its credibility, ensuring that findings are grounded in actual practice rather than abstract ideals.

The two firms selected for this case study represent distinct yet complementary approaches to ethical leadership in sustainability. Firm-A is a design firm specializing in the reuse and resale of surplus textiles, actively engaging with circular economy principles. This firm prioritizes material transparency, supply chain collaboration, and minimizing industry waste. Its leadership model is driven by advocacy and systemic

change, aiming to challenge the disposable culture of the interior design sector. Firm-B, on the other hand, is a design firm that emphasizes local sourcing and the use of biodegradable materials. Its leadership focus is on educating clients about the long-term value of sustainable design choices, shaping consumer perceptions and expectations. Unlike Firm-A, which operates mainly at an industry-wide level, Firm-B's ethical leadership is client-focused, aiming to directly influence sustainability through consumer engagement.

These two firms were selected for their contrasting but complementary approaches to ethical leadership in sustainability —Firm-A, which advocates for industry-wide systemic change, and Firm-B, which fosters sustainability through consumer education and direct practice. Their approaches provide valuable insights into different ways ethical leadership can be enacted within the field.

Interview Protocol and Data Collection Procedures: Data collection consisted of three core strategies: semi-structured interviews, document analysis, and observational insights. Semi-structured interviews were conducted with key decision-makers from each firm, including founders, lead designers, and sustainability coordinators. Each participant received an information sheet and consent form outlining the study's aims and ethical safeguards. Interviews lasted between 45–60 minutes and were conducted via Microsoft Teams.

The semi-structured interview guide was developed iteratively, based on pilot interviews and literature insights, and included open-ended questions on leadership practices, material choices, ethical dilemmas, and client engagement. Questions were intentionally phrased to avoid leading responses and to accommodate varying levels of sustainability expertise. This approach ensured comparability across interviews while allowing participants to freely express their experiences and values.

Alongside semi-structured interviews, firm-related documents (e.g., sustainability policies, client brochures, and supplier correspondence) were reviewed to cross-verify claims made in interviews. Additionally, virtual tours and field notes from site visits were used to observe firm practices and contextualise participant narratives.

Data Analysis Process: The collected data was analysed using thematic analysis, a method particularly suited to identifying underlying patterns and themes in qualitative data (Braun & Clarke, 2006). Themes emerged inductively through a rigorous coding process, focusing on key areas such as decision-making patterns, leadership styles, barriers to sustainability, and stakeholder influence. Thematic analysis provided the study with the depth necessary to uncover the motivations, pressures, and strategies that shape ethical leadership in sustainable interior design.

Ethical Considerations: Ethical considerations were integral throughout the research process. Given the sensitive nature of business decisions and strategies, confidentiality and anonymity were maintained for all participants. Informed consent was obtained from all interviewees, who were briefed on the research aims and their right to withdraw their data at any time. Firm names and other identifying details were anonymized to preserve confidentiality while maintaining the richness of their insights. Throughout the study, the researcher remained reflexive, acknowledging the value-laden nature of sustainability issues. Bias was minimized through triangulation, ensuring that the analysis remained rooted in participants' experiences rather than researcher preconceptions.

Ensuring Credibility and Triangulation: To enhance credibility and reduce bias, triangulation was employed across interview data, documentary sources, and

observational material. Thematic convergence was actively sought by comparing interview narratives with firm-generated materials and visual observations. This methodological triangulation helped verify claims, deepen context, and capture potential inconsistencies. Data were analysed using reflexive thematic analysis (Braun and Clarke, 2006), supported by ATLAS.ti software, which enabled systematic coding, memo writing, and concept mapping. Researcher reflexivity was embedded throughout, with a critical awareness of positionality maintained through journaling and supervision feedback loops.

Summary of Methodological Integrity: Through strict adherence to ethical protocols and rigorous data analysis, this study provides valuable insights into the practice of ethical leadership in sustainable interior design, contributing to a more informed and responsible approach to design in the face of environmental challenges.

4. Insights from the Field: Ethical Leadership in Practice

The notion of ethical leadership in sustainable interior design is often discussed in abstract terms, yet its practical application is far more complex and nuanced. While many firms aspire to sustainability, the realities of supply chain constraints, financial pressures, and client expectations create tensions that test even the most committed leaders. The following case studies provide insight into how two UK-based firms—each with distinct approaches—have embedded ethical leadership into their business practices. One firm has positioned itself as a pioneer in circular design, repurposing surplus materials for commercial interiors, while the other has taken a more localised approach, prioritising ethically sourced, biodegradable textiles. Together, they offer a compelling look at the possibilities and challenges of leading with sustainability.

4.1. Case Study 1: A Circular Approach to Sustainable Interiors

Firm-A has built its reputation around the principles of circularity, focusing on the reuse and resale of surplus textiles. Operating within an interior design context, the firm actively sources discarded high-quality fabrics from manufacturers, fashion houses, and interior projects, ensuring that these materials are reintegrated into new design schemes rather than ending up in landfills. Their business model aligns with the principles of waste reduction, lifecycle extension, and supply chain transparency, positioning them as an ethical leader in an industry still heavily reliant on virgin materials.

Their sustainability strategy is twofold: first, to create an alternative supply chain that values pre-existing materials over newly produced ones; and second, to educate designers and clients on the environmental and aesthetic benefits of circularity. By curating an inventory of premium surplus textiles, the firm not only provides a solution to waste but also challenges the assumption that sustainability compromises quality.

This process is illustrated in Figure 1, which outlines Firm-A's circular workflow—from sourcing surplus textiles to installing them in new interiors and communicating their environmental value to clients.

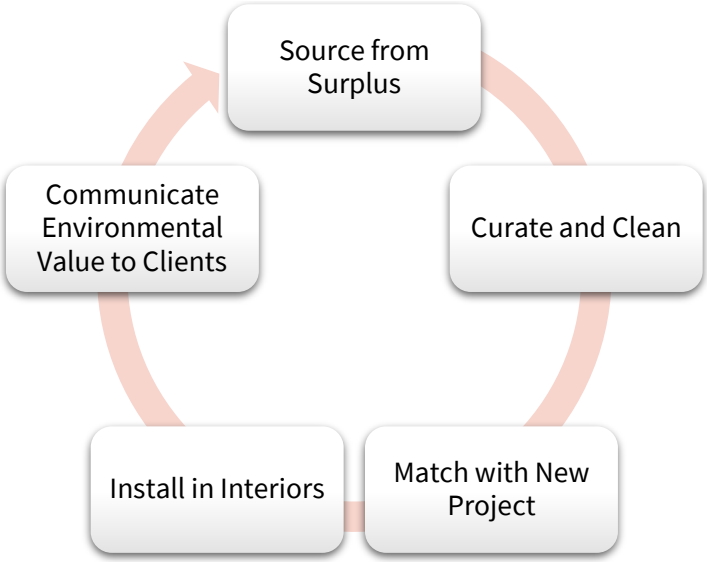

Figure 1. Circular Design Workflow at Firm-A: From surplus sourcing to interior integration and client engagement.

Leadership at Firm-A is highly collaborative, emphasising industry-wide engagement rather than operating in isolation. Their approach involves active partnerships with manufacturers, suppliers, and designers to promote more transparent material flows. Unlike firms that treat sustainability as an internal commitment, Firm-A advocates for systemic change, encouraging competitors and industry peers to reconsider their procurement strategies.

Transparency is a cornerstone of their leadership philosophy. By openly disclosing the origins of their materials and the environmental benefits of reuse, they have cultivated a reputation for trustworthiness in an industry where greenwashing is a persistent issue. Their commitment to educating stakeholders—clients, manufacturers, and fellow designers—reinforces their role as ethical leaders, driving demand for alternative sourcing models.

Despite their success, Firm-A faces several critical challenges. One of the most pressing is the unpredictability of material availability. Because they rely on surplus stock, their inventory fluctuates, making it difficult to guarantee the same textiles for large-scale commercial projects. To mitigate this, they have developed flexible design strategies that integrate diverse materials without compromising coherence or quality.

Cost perception is another challenge. Many clients assume that repurposed textiles should be significantly cheaper than virgin materials, failing to account for the logistical costs of sourcing, curating, and restoring surplus fabrics. To counter this, Firm A has focused on storytelling as a value proposition, framing each textile's journey as part of a larger sustainability narrative.

Firm-A's influence extends beyond its immediate business operations. By proving that a circular economy model is viable within high-end commercial interiors, they have inspired other firms to explore similar strategies. Their leadership is not just about their own ethical choices but about transforming industry norms, making sustainable design more accessible and desirable.

4.2. Case Study 2: Locally Sourced, Ethically Designed Interiors

Firm-B takes a different route to sustainability, prioritising locally sourced, organic, and biodegradable materials for interiors. Their philosophy is rooted in the belief that sustainability should not only be about reducing harm but actively contributing to environmental and social well-being. By sourcing textiles from local artisans, independent weavers, and small-scale producers, they ensure that their supply chain supports ethical labour practices and regional economies.

Unlike Firm-A, which focuses on waste reduction, Firm-B is deeply invested in material purity. Their commitment to organic textiles and non-toxic dyes stems from both an environmental and a health-conscious perspective, as they advocate for interior spaces that are not only sustainable but also beneficial for occupant well-being.

Sourcing high-quality, sustainable textiles remains one of the biggest challenges for Firm-B. The global textile industry is dominated by large-scale, cost-driven production, making it difficult for smaller, ethical suppliers to compete. Additionally, organic and biodegradable materials often come at a higher price point, which can deter cost-sensitive clients.

To navigate these challenges, Firm-B has taken on a dual role as both a design practice and an advocate. They work closely with suppliers to build direct trade relationships, ensuring fair compensation for artisans while securing exclusive materials. Additionally, they actively lobby for greater industry recognition of ethical sourcing, pushing for certifications and policy incentives that support sustainable textile production.

One of Firm-B's most innovative leadership strategies lies in client education. Unlike commercial projects, where sustainability decisions are often made at the corporate level, residential interiors involve deeply personal choices. Many clients are unfamiliar with the impact of conventional textiles, and Firm-B sees education as a critical leadership tool.

Rather than simply presenting eco-friendly options, they integrate storytelling into their design process. Clients are given insights into who made their textiles, where they came from, and what impact their choice has on the environment and local economies. This method fosters a deeper emotional connection between consumers and their interiors, leading to more informed, conscious decision-making. This process is summarised in Figure 2, illustrating how Firm-B combines ethical sourcing with narrative-driven client engagement.

Figure 2. Ethical Sourcing and Storytelling Process at Firm-B: Illustrating the integration of artisan production, material traceability, and consumer education.

Firm-B's leadership extends beyond individual projects. By promoting local production and responsible sourcing, they are helping to shift consumer expectations around sustainability. Their work highlights how leadership in sustainable interior design is not just about material selection but about changing mindsets—both within the industry and among end-users.

4.3. Comparative Insights & Broader Implications

Commonalities in Ethical Leadership Across Both Firms

Despite their differing approaches, both Firm-A and Firm-B demonstrate key commonalities in their leadership strategies:

- Commitment to transparency: Both firms emphasise openness about their processes, materials, and sustainability efforts.
- Education as a leadership tool: Whether targeting clients (Firm-B) or the industry at large (Firm-A), both firms use knowledge dissemination as a driver of change.
- Resilience in overcoming barriers: Both have encountered supply chain difficulties but have adapted through flexible strategies and strong stakeholder relationships.

Differences in Strategy and Execution

While their ethical commitments align, the firms diverge in their execution:

- Firm-A operates within a commercial, industry-focused model, while Firm B engages directly with individual consumers.
- Firm-A's leadership is systemic, influencing supply chains and corporate practices, whereas Firm-B's leadership is experiential, transforming how individuals interact with sustainable interiors.
- Circularity defines Firm-A, while material purity and ethical sourcing define Firm B.

Lessons for the Wider Industry

These case studies highlight a spectrom of approaches to ethical leadership in sustainable interior design, offering valuable lessons for practitioners:

- Ethical leadership is multifaceted—it can manifest in supply chain transformation, direct advocacy, or client education.
- Sustainability is not a one-size-fits-all solution—firms must tailor strategies to their market, values, and operational constraints.
- Leadership is about influence, not just implementation—the ability to shift industry norms, shape client expectations, and advocate for systemic change is just as critical as adopting sustainable practices internally.

Table 1. Two Paths to Ethical Practice: A Comparative Leadership Framework.

DIMENSIONS	Firm-A: Circular Model	Firm-B: Local Ethical Sourcing
Bussiness Model	Reuse/resale of surplus textiles	Locally sourced biodegradable textiles
Leadership Focus	Systemic industry advocacy	Client education and sensory awareness
Key Strategy	Supply chain collaboration	Fair trade and transparent sourcing
Main Barrier	Inventory inconsistency, pricing bias	Limited supply, client misconceptions
Leadership Tool	Storytelling + transparency	Narrative-based material storytelling

Importantly, while these case studies illustrate ethical leadership in small design firms, the principles they demonstrate are not exclusive to niche operations. Scaling such strategies across larger organisations may require additional infrastructure, such as formalised sustainability teams, supplier auditing systems, or policy-based procurement criteria. Nevertheless, the core approaches—such as transparent sourcing, collaborative relationships, and stakeholder education—can inform corporate-level sustainability roadmaps. Larger firms may also be better positioned to influence industry policy by participating in certification initiatives or lobbying for ethical material standards, turning isolated practices into sector-wide norms.

Together, these insights affirm that ethical leadership is not just about doing better design—it is about redesigning the very frameworks within which design operates.

5. Redefining Leadership for a Sustainable Future

As the interior design industry grapples with the growing urgency of sustainability, ethical leadership is emerging not as a mere guiding principle but as a pragmatic necessity. This study has explored how leadership in sustainable interior design extends beyond aesthetic and functional concerns, shaping industry standards, client perceptions, and material supply chains. Through the lens of two distinct case studies, we have seen how firms can integrate ethical leadership in different but equally impactful ways—whether by advancing circular economy models or championing local, ethically sourced materials. The question that remains is not whether ethical leadership matters, but how designers can push the boundaries of sustainability in an industry that often resists change.

At the core of this study was an inquiry into how ethical leadership manifests in sustainable interior design and what challenges and strategies shape its implementation. The findings address several pressing concerns:

- **How do interior design firms integrate ethical leadership into their sustainability strategies?**
  The case studies reveal two primary models: a circular economy approach

that prioritises reuse and waste reduction, and a localised sourcing strategy that focuses on material purity and ethical labor practices.

- **What challenges hinder the adoption of sustainable practices, and how do ethical leaders navigate them?**
  Common challenges include supply chain instability, cost perceptions, and client resistance—each of which was met with strategic responses, such as flexible sourcing, transparent communication, and educational initiatives.

- **How does ethical leadership influence broader industry norms?**
  Leadership in sustainable design extends beyond individual business models; it has the power to reshape industry-wide expectations, fostering greater transparency, client awareness, and long-term commitment to sustainability.

5.1. Key Takeaways: Ethical Leadership in Action

A few crucial themes emerge from this research, offering insights for both academics and practitioners:

- Ethical leadership is adaptive, not prescriptive. There is no single "right" way to integrate sustainability into design practice. Some firms may focus on circularity, while others may emphasise responsible sourcing—but both approaches contribute meaningfully to a regenerative design ecosystem.

- Education is a leadership tool. Whether engaging clients or pushing for industry-wide change, knowledge-sharing is fundamental. Designers who embed education into their practice not only influence decision-making but also reshape sustainability expectations for future projects.

- Transparency builds credibility. Greenwashing remains a persistent issue in the design sector. Firms that prioritise open communication about their materials, processes, and limitations establish trust and set a higher bar for ethical responsibility.

- Sustainability requires resilience. Implementing sustainable strategies is rarely seamless. Both firms examined in this study faced resistance—be it from clients hesitant about costs or from supply chains that lacked consistent ethical options. Ethical leadership, in this context, is about persistence and problem-solving rather than assuming an ideal system already exists.

5.2. Future Directions: Expanding the Conversation

While this study provides valuable insights, it also raises further questions that warrant deeper investigation. The challenges of scaling sustainable models remain largely unresolved—both case study firms succeeded within niche markets, but what happens when sustainability needs to be mainstreamed?

- Future research could explore scalability strategies, examining how firms transitioning from boutique to large-scale operations maintain their ethical commitments.

- Investigating how ethical leadership practices translate within larger commercial

firms, especially those with global supply chains, could reveal both opportunities and structural constraints to industry-wide transformation.

- Another crucial area is policy and regulation—how might government incentives or industry-wide certifications support ethical sourcing and circular design?
- Finally, there is an educational gap in interior design training. How can ethical leadership principles be embedded into design curricula to ensure that future professionals enter the industry with a sustainability-first mindset?

5.3. Final Thoughts: Designing for Responsibility

Ultimately, this research reinforces the idea that interior designers are more than just creators of spaces—they are facilitators of change. Their choices affect not only aesthetics but also material flows, labour conditions, and environmental impact. Ethical leadership in sustainable design is not a luxury; it is an obligation to the future of the industry and the planet.

For sustainability to become the standard rather than the exception, leadership must be proactive, transparent, and unwavering. Designers must continue to challenge norms, educate stakeholders, and innovate within their constraints. The question is not whether ethical leadership can reshape the future of interior design—it is whether designers will rise to meet the challenge.

CULTIVATING ETHICAL LEADERSHIP IN DESIGN START-UPS IN SOUTH AFRICA: AN ENTREPRENEUR'S PERSPECTIVE

Zandisile Mkubukeli
Cape Peninsula University of Technology
Monica Di Ruvo
Cape Peninsula University of Technology
mubukeliz@cput.ac.za

ABSTRACT

Given South Africa's high youth unemployment rate of 60 percent and overall unemployment rate of 34 percent, entrepreneurship has become a critical pathway for design graduates. However, start-up businesses face significant challenges, with many failing within the first five years, often due to leadership and succession planning issues (Adeniran and Johnston, 2011).

Leadership, recognized as a set of qualities vital to business success has been widely discussed in academic literature, particularly in European, North American, and Chinese contexts. While international design companies focus on mitigating design complexities, South African design start-ups face unique challenges. Similarly, ethical leadership, though extensively studied in corporate settings, has been less explored from the perspective of design entrepreneurs in South Africa.

This paper presents exploratory research using data from a focus group discussion with design entrepreneurs to gain insights into ethical leadership in the local context. The authors have drawn upon Spence et al.'s (2001) "four frames" to guide a focus group discussion with fashion, jewellery, product, and visual communication design entrepreneurs about their experiences regarding ethical leadership.

The findings are framed around four key drivers of ethical behavior affecting South African design entrepreneurs: subsistence, enlightened self-interest, profit-maximization, and social priority. Based on these insights, recommendations are made as catalysts for further research on the cultivation of ethical leadership that is both culturally and contextually appropriate.

KEYWORDS | ETHICAL LEADERSHIP, SUCCESSION PLANNING, ENTREPRENEURSHIP, DESIGN

1. Introduction

Leadership is defined by qualities that drive business success and ethical leadership involves aligning business decisions with values and morals increasingly recognised as integral to building trust, fostering sustainability, and navigating complex global and organisational challenges.

South Africa's youth unemployment rate is 45.5% (Stats SA, 2025). Research by Metu et al. (2019) indicates similar youth unemployment in Sub-Saharan Africa, while the African Development Bank (2018) reports that only 3 million formal jobs are created annually, compared to 12 million new job seekers. With a youth unemployment rate much higher than the global average of 10.9% (Baro and Bianchi, 2023) these statistics confirm that the South African education system prepares students for a job market with limited opportunities. In this context, entrepreneurship has become a critical pathway for design graduates.

In South Africa, entrepreneurship is a necessary practical solution for economic survival. Many entrepreneurs start businesses for immediate financial gain rather than calculated risk-taking or innovation reflected in the necessity-driven entrepreneurship model found in developing countries, in which limited career options led to small, informal businesses with low entry barriers but minimal innovation (Reynolds et al., 2005; Shane, 2003; Fairlie and Fossen, 2018).

In South Africa, research on ethical leadership has been explored from a corporate perspective, with limited focus on entrepreneurship. In this paper, the authors examine how South African design entrepreneurs cultivate ethical leadership in start-up businesses.

2. Literature

A published systematic review on ethics and entrepreneurship (Uriarte et. al. 2024) was used as a starting point for this paper in which the authors respond to the identified need for further research in ethical entrepreneurship in diverse social and cultural contexts such as South Africa. Uriarte et. al. Indicate that out of the 516 papers on ethics and entrepreneurship published between 1988 and 2023, only one was connected to South Africa.

2.1 Designers as Entrepreneurs.

Design-based methods including non-linear approaches to problem-solving, organizational culture, and business partnerships, have been identified as key drivers of

innovation and entrepreneurial success (Schuld et al., 2023; Rose et al., 2021). Schuld et al. (2023) propose a conceptual framework for South African entrepreneurs, emphasizing the role of design thinking and bricolage. Bricolage is defined by four competencies: a dynamic approach to resource scarcity, creative resource grouping techniques, the utilization of available resources, and collaboration with external stakeholders (Witell et al., 2017). In resource-constrained environments, entrepreneurial bricolage is essential for creating value by utilizing accessible resources, especially in fostering entrepreneurial opportunities (Welter et al., 2016). Similarly, Simba et al. (2021) argue that bricolage is especially relevant in emerging markets, where firms rely on it to navigate resource scarcity and establish unique relationships. Innovation is influenced by network activation, as the integration of resources and co-creation with stakeholders can enhance the transformation of ideas into practical solutions (Frow et al., 2015).

2.2 Ethics

Carroll's (1979, 1991, 2016) pyramid framework for Corporate social responsibility (CSR) is another key element influencing ethical entrepreneurship and leadership; this framework encompasses four layers: economic, ethical, philanthropic, and legal responsibilities. While legal responsibilities emphasize adhering to laws and regulations, ethical responsibilities involve upholding moral principles beyond legal compliance.

Spence and Rutherford (2001) further expand on CSR with their four-frame model of business ethics for entrepreneurs. This model explores the relationship between profit and social responsibility, illustrating how businesses can align ethical actions with long-term success. The frames include Profit Maximization, where profit and social objectives are seen in opposition; Subsistence, where long-term survival is prioritized over immediate profit; Enlightened Self-Interest, where socially responsible actions are used strategically for marketing or public relations purposes; and Social Priority, where social values are integrated into the business as a long-term strategy.

Some critics argue that ethical business practices can be costly and difficult to implement, especially for small businesses with limited resources (Visser et al, 2010). The challenges of ensuring fair practices, especially in global supply chains, can result in trade-offs between ethics and profitability. Additionally, some businesses may struggle to implement ethical practices consistently due to pressures from competitors and market demands (Dzomonda and Fatoki, 2017, Fisman et al., 2006).

3. Method

A purposive sampling method was used to identify participants for a focus group discussion to obtain representation from the fields of fashion, product, jewellery and visual communication design. After obtaining ethical clearance from our university's research ethics committee, participants were approached for their willingness to take part in a recorded focus discussion.

According to Javis and Barberena (2008) between six to eight participants constitute a

good size for a focus group discussion. For this paper, participants were included if they are practicing designers that have started their own business designing, producing, and selling their products. In total 10 participants were invited to participate; in this paper we include the data from eight of the 10 participants as it was found in the discussion that two of the participants were not in fact design entrepreneurs. Written consent was obtained from the participants as indicated in Table 1 below.

Table 1. List of participants approached for the focus group discussion.

Participant A	Product	Product entrepreneur partnering with manufacturers (excluded based on field)
Participant A1	Product	Purchases and resells clothing and furniture items through social media. (excluded based on field)
Participant B	Fashion	Designs, manufactures, and sells garments directly to clients and online through social media (employs 10 staff).
Participant C	Fashion	Designs, manufactures, and sells garments directly to clients and online through social media (employs 2 staff).
Participant D	Jewellery	Designs Manufactures and sells jewellery directly to clients and online through social media. (works alone)
Participant E	Jewellery	Designs, manufactures, and sells jewellery directly to clients and online through social media. (works alone)
Participant F	Product	Design and production of products for clients.
Participant G	Fashion	Designs, manufactures, and sells garments directly to clients and online through social media (works alone).
Participant H	Jewellery	Designs, manufactures, and sells jewellery directly to clients and online through social media. (employs one intern)
Participant I	Visual communication Design	Freelance designer (works alone)

4. Discussion

Spence and Rutherford's (2001) "four frames" or priorities, were used to draft a discussion instrument with questions as prompts. The participants were encouraged to reflect on their own experiences as design entrepreneurs. The four frames were used as a method for the owner manager to reflect on how they experience what they do in relation to the context. The responses were transcribed and then the data sorted and thematically coded (Naeem et al., 2023) before mapping onto the four frames model.
In this section the findings are presented according to these frames.

4.1 Career choices and entrepreneurial motivations

The participants cited passion, financial stability, external influences, and opportunity gaps when choosing their entrepreneurial paths. This aligns with career development theories,

entrepreneurial motivation models, and opportunity recognition frameworks that explain why individuals transition into entrepreneurship.

> "I just followed my passion, and I love looking good" (Participant B).

> "There's my passion, which is, I think, the main thing" (Participant D)

Many individuals pursue business not solely for financial gain but due to a personal interest in the industry, aligning with Deci & Ryan's (1985) self-determination theory, which links intrinsic motivation to greater engagement and persistence. Cardon et al. (2009) found entrepreneurial passion drives creativity, resilience, and success, while Baum & Locke (2004) argue entrepreneurs driven by intrinsic passion outperform those motivated by financial rewards. Duckworth et al. (2007) link grit (passion and perseverance) to long-term success. Authors caution that obsessive passion can lead to burnout (Dempsey and Sanders, 2010; Chell, 2007.

Our findings suggest some entrepreneurs were influenced by family ties to the fashion industry, while others pursued entrepreneurship out of passion or as a necessity due to South Africa's high unemployment and limited job opportunities. External factors, such as labour market conditions, were also cited as influential. This aligns with Super's Career Development Theory (1969), which suggests career choices evolve from personal interests, societal expectations, and socio-economic factors. Lent et al. (1994) emphasize the role of family role models, as seen in one entrepreneur who initially pursued fashion secretly despite parental expectations.
Hodkinson & Sparkes (1997) argue career choices are shaped by both socio-economic conditions and personal ambition. Gottfredson's Theory (1981) posits that while environmental factors influence career paths, some individuals later pursue their passions. Savickas (2005) suggests individuals actively shape their careers despite external pressures. Kruger (2000) add that entrepreneurship is often chosen as an alternative when dissatisfaction with current roles arises.
While family influence is a common motivator, career aspirations evolve over time, leading individuals to explore new opportunities. For instance, one entrepreneur initially planned a career in human resources but turned to entrepreneurship due to limited job prospects.

> "I started a mobile kitchen where I was selling food around town. This business that I'm currently doing now grew from the mobile food business I had started earlier." (Participant C)

In South Africa, entrepreneurship often becomes a practical solution for economic survival. This reinforces the idea that many survivalist entrepreneurs start businesses primarily for immediate financial gain rather than engaging in calculated risk-taking and innovation. In developing countries, people frequently enter entrepreneurship out of necessity due to a lack of viable career option resulting in small, informal businesses with minimal entry barriers, leading to a saturated market with limited innovation (Reynolds et al. 2005, Fairlie and Fossen, 2018, Shane 2003).

> "For me, I would be honest with you. The reason I started the business is because I was out of job, so I wanted something so that I can earn a living." (Participant B)

While all business owners may be considered entrepreneurs in a broad sense, those who start businesses out of necessity often struggle to scale into small and medium-sized enterprises. Minniti (2008) found that necessity-driven businesses tend to have higher failure rates compared to innovative, growth-oriented startups. Similarly, Shane (2003) asserted that businesses born from opportunity are more likely to achieve long-term success than those established purely for survival.

> "...to combine creativity with economics, offering unique, high quality fashion designs that cater for the niche market. The goal to build a profitable brand that resonates with customers. "(Participant B)

4.2 Profit maximisation for design start-ups

Some business owners expressed confidence in their profitability, while others recognized the need for further growth. Statements like "Yes, most definitely" and "Yeah, I regard my business as a profitable entity" indicate that profitability is a key part of their business models, supporting Shane's (2003) view that niche markets can achieve profitability through effective positioning.

One participant noted, "Yes, but it needs to grow for sustainability," suggesting that while profits exist, growth is necessary for long-term stability. This aligns with Reynolds et al. (2005), who argue that profitability in start-ups requires constant adaptation to market demands.

Another entrepreneur said, "Yeah, I'd say for the moment. I am at least making a profit...certain things are on a slow burner," indicating that scaling profitability takes time and strategy. Fairlie and Fossen (2018) argue that small businesses in developing economies, especially in creative industries, face slow growth due to market saturation and limited resources.

4.3 Strategies used by design entrepreneurs to maximize profit

Design entrepreneurs use social media and e-commerce platforms to boost profitability, along with time management and productivity optimization. These strategies align with marketing literature on product expansion, digital presence, and operational efficiency. Product diversification, including seasonal collections and limited-edition designs, is a common growth tactic in creative industries. Kotler & Keller (2016) argue that diversification captures new customer segments, while limited-edition items create urgency (Cialdini, 2001).

> "Strategies include expanding product lines, leveraging e-commerce platforms, collaborating with influencers, and targeting international markets. Seasonal connection and limited addition designs."

Entrepreneurs' use of digital platforms reflects Chaffey & Smith's (2017) view that digital channels offer cost-effective global reach. Influencer marketing also plays a role, with Kapitan & Silvera (2016) noting that influencers build brand credibility. Social media engagement aligns with relationship marketing theory (Morgan & Hunt, 1994), showing

that direct brand-consumer interactions drive success.

One entrepreneur highlights community engagement beyond commercial activities, which aligns with corporate social responsibility (CSR) literature. Carroll (2016) suggests that businesses benefit from engaging with communities as it builds brand reputation and trust. Authenticity and values-based branding are also important as consumers gravitate toward brands that share their social and ethical values (Holt ,2004).

> "The influencers are the key sector in the industry and trying to utilize more of the ecommerce. Platforms and also going out there in the communities, doing some community engagement so that people, they can also learn about my principles outside my brand. I'm also doing like commentary target your ties and the politicians for the schools" (Participant B).

Another entrepreneur focuses on productivity and resource management, emphasizing the challenges of sole entrepreneurship. Drucker (1999) states that time management and resource optimization are fundamental to business success. Lean management principles (Womack & Jones, 1996) suggest that reducing waste and streamlining operations can significantly improve efficiency and profitability :

> "Strategies. I suppose looking at ways to maximise your productivity. Using / utilising your materials in a careful way, so you don't waste..." (Participant B)
>
> "...you really need to look at time management. " (Participant D)
>
> "Social media a little bit more, strategically" (Participant E).
>
> "Since we are in the age of social media. I would try content marketing and investing in equipment and stay on top of trends" (Participant I).
>
> Diversifying our revenue streams so when one takes a knock due to seasonal or technological changes we can survive" (Participant F).
>
> "Creating a new line of jewellery for my brand and setting up an e-commerce platform where jewellery will be sold" (Participant H).

Drawing from the verbatim responses, design entrepreneurs demonstrate a mix of hands-on experience and growing strategic insight. While some are already utilizing tools like digital marketing, influencer partnerships, and product diversification, others acknowledge the need to enhance areas such as social media strategy and operational effectiveness. Interestingly, although most rely heavily on social media, only a small number mention increasing or diversifying their income streams. Furthermore, it is notable that design entrepreneurs are staying informed about broader macroeconomic trends.

4.4 Profit or Survival driven entrepreneurship

The responses highlight themes of necessity-driven entrepreneurship, social responsibility, sustainability, and scalability, aligning with theories such as necessity vs.

opportunity entrepreneurship (Reynolds et al., 2005), social entrepreneurship (Marti & Marti, 2006), and growth strategies (Porter, 1980). One participant shared that their business was founded out of necessity to create income while pursuing a passion for fashion. This reflects necessity-driven entrepreneurship, where businesses are born out of financial constraints and lack of job opportunities (Reynolds et al., 2005). The GEM Report (2019) notes necessity-driven businesses play a key role in developing countries' informal sectors, contributing to economic resilience (Brixiova et al., 2020; Ndemo & Weiss, 2016).

Another participant emphasized creating opportunities for students and community members while prioritizing asset ownership and profit. This aligns with social entrepreneurship, which aims to create both economic value and social impact (Mair & Marti, 2006). Carroll's (1991) CSR model stresses balancing economic, legal, ethical, and philanthropic duties, while Yunus (2007) advocates reinvesting profits for sustainable impact.

A third participant discussed maintaining a design ethic while adapting to change, acknowledging that success requires iteration, which aligns with design thinking (Brown, 2015) and the circular economy (MacArthur, 2015). Schaltegger et al. (2016) argue businesses driven by sustainability must innovate to stay competitive. Many South African design entrepreneurs, however, have yet to fully integrate sustainability into their models.

One jewelry entrepreneur discussed the challenge of scaling from informal markets to a permanent retail space, reflecting location theory (Hotelling, 1929) and expansion strategies (Porter, 1980). This entrepreneur also mentioned the potential to secure a permanent retail space, which aligns with Kirzner's (1997) emphasis on identifying expansion opportunities and Porter's (1985) view on strategic location for boosting sales and visibility. These responses show that while survival is the immediate focus, some entrepreneurs are thinking strategically about long-term growth.

Entrepreneurs highlighted a lack of separation from their business, a common challenge in small businesses and creative industries. They often become emotionally intertwined with their businesses, affecting brand recognition, growth, and sustainability. These insights align with personal branding and business identity literature.

> "Currently I do not have a separate identity for business" (Participant ABCDEFGHI).

This response suggests the entrepreneur's business lacks a distinct brand identity, with customers associating it more with the individual than as a standalone entity. Keller (1993) emphasizes that strong brand identity is key for customer recognition and differentiation, while Aaker (1997) notes it fosters emotional connections and helps maintain professional boundaries. De Chernatony (2010) argues that businesses without independent branding struggle to scale, as clients link the product/service to the entrepreneur rather than the company. Responses indicate that small businesses often start as personal brands but eventually transition into separate entities. Goffee & Scase (1989) who suggests that small business owners often struggle with the balance between creative freedom and commercial viability, which can affect business growth and clarity.

> "I do believe that other people who are buying or using our services is because

> they know me as their own and not necessarily the business" (Participant D).

Some entrepreneurs noted that a strong personal connection with customers fosters brand loyalty but also limits scalability. As the "face" of their business, entrepreneurs face challenges in delegation and succession planning. Montgomery and Ramus (2011) argue that brand independence is essential for business sustainability, as relying solely on personal reputation can limit expansion.

> "The two became so intertwined, I think that's part of the reason I had to cut and move on" (Participant).

The above response suggests that emotional involvement in the business can lead to burnout and strategic confusion. Many creative entrepreneurs struggle with separating their artistic identity from their business operations, affecting decision-making and long-term sustainability. Cardon et al. (2009) discussed entrepreneurial passion, stating that while passion can drive business success, it can also result in over-identification with the business, leading to emotional strain.

Separating the entrepreneur from the business allows for scalability, delegation, and long-term sustainability. For instance, Kotler & Keller (2012) emphasize that brand differentiation is crucial for businesses to grow beyond individual founders. Gartner (1990) suggests that successful entrepreneurs develop clear operational structures that allow them to separate personal identity from business functions.

The overall finding highlights a lack of separation between personal and business identity, which can limit growth, scalability, and emotional well-being. This issue is well-documented in entrepreneurship and branding literature, emphasizing the importance of establishing a clear brand identity and structured business operations.

4.5 Wealth from an entrepreneur's perspective

Entrepreneurs offer varying perspectives on generating wealth and sustaining growth, focusing on investment-driven growth, asset ownership, value creation through curation, and brand differentiation. These themes align with theories on entrepreneurship, monetary management, and value creation, highlighting the importance of investment, asset accumulation, and unique market positioning.

One entrepreneur said, "It creates its own wealth by reinvesting more," reflecting a self-reliant model in which reinvestment fuels growth. This aligns Ferreira et al., (2013) view that entrepreneurial success depends on continual reinvestment and innovation. Kor (2004) also argued that accumulating resources over time enables self-sustaining expansion, a concept still relevant for small businesses today.

Another entrepreneur emphasized asset accumulation:
"It rests on its own wealth by having assets and funding."
Asset ownership, such as real estate or intellectual property, provides financial security and passive income. Barney (1991) highlights that businesses with unique, valuable resources (VRIO framework) gain a competitive edge. Muharam (2018) argues that financial sustainability depends on balancing equity and operational funding.

One participant noted, "The value of what I do is sourcing and curating pieces… There is the jewellery that has value in itself," emphasizing value creation through exclusivity. Porter (1985) suggests that differentiation through unique products provides a competitive advantage. Kotler and Keller (2012) further argue that brand positioning shapes customer perceptions, especially in markets where uniqueness drives demand.

4.6 Cultivating ethical leadership in a design start-up

The responses from the entrepreneurs demonstrate a deep understanding of ethical leadership, particularly in the context of design entrepreneurship and small businesses. Several core themes emerge from their reflections. One participant highlights the importance of balancing profit with social responsibility, underscoring that ethical leadership should not only drive financial success but also ensure the business upholds sustainable and fair practices. This perspective aligns with the growing emphasis on responsible entrepreneurship that promotes long-term sustainability and fairness (Jones, 2010). Another entrepreneur emphasised the necessity of aligning business values with ethical principles, suggesting that integrity should be embedded in decision-making processes. This reflects the view that ethical leadership requires businesses to act in accordance with moral principles (Ciulla, 2004).

> “I mean fairness in your dealing with people and your employees goes a long way and gets you a lot of respect and it is amazing the difference I've seen in working with people that respect you. Because I really have always tried to”

Fostering a culture of mutual respect enhances workplace relationships and overall business effectiveness. This aligns with research indicating that ethical leadership creates a positive organizational culture that improves employee morale and productivity (Brown & Treviño, 2006).
Jewellery practitioners, potentially faces ethical dilemmas related to the sourcing of materials, and the participants expressed a preference for supporting local and smaller-scale suppliers to mitigate these concerns. This aligns with research suggesting that ethical leaders prioritize responsible sourcing and transparency in supply chains (Crane et al., 2016).
In sum, design entrepreneurs view ethical leadership as a multifaceted concept, encompassing social responsibility, fairness, respect, and sustainable practices in all aspects of business. While some provide clear, structured definitions of ethical leadership, others offer insights based on individual experiences This resonates with theories of servant leadership, which emphasize putting others' needs first and promoting fairness in leadership behaviour (Jamrich & Greenleaf, 1977).
While many entrepreneurs acknowledge the importance of ethical leadership, their ability to practice it effectively depends on the resources available to them and their business context. The responses indicate that ethical leadership is a key value, but practical barriers and the need for profitability can complicate its implementation. However, design entrepreneurs hold ethics on a high regard. For instance, one design entrepreneur had this to say:

> " I guess ethical leadership... Especially like a small-scale sort of approach. It's to do the right thing in every aspect as possible" (Participant D)
>
> "Being trustworthy when dealing with the clients " (Participant F)
>
> "to inspire and cultivate peers and client " (Participant G)

Based on the participant's responses, it is evident that design entrepreneurs understand ethical leadership from their own context. What stood out the most was that entrepreneurs see ethical leadership as trustworthy when dealing with clients and being able to inspire and cultivate peers and customers to do what is morally right.

4.7 Subsistence priority:

Subsistence – profit is not the only driver, but a longer-term survival is prioritised to sustain an income or way of life. This may include Reinvestment, purchasing assets to future proof the business and livelihood. In this model ethics results in long term employment for employees or providing a consistent level of service for clients.
Valencia et al. (2021) identify four mindsets within the Design Mindset Theory (DMT) subprocess: the Artisan, the Configurator, the Opportunity Seeker, and the Design Leader. These mindsets demonstrate a progression from effectual (means-oriented) to causal (goal-oriented) logic. Interestingly, the study finds that designers starting with the Artisan mindset were not always driven by a user-centric approach, instead prioritizing their own interests, beliefs, and venture goals. This contradicts succession planning which speaks to ethical leadership as it ensures passing of institutional knowledge and supports long term sustainability.

4.8 Cultivating succession planning in a design start-up

Succession planning speaks to ethical leadership as it ensures passing on of institutional knowledge and supporting long term sustainability and much needed job creation.
One entrepreneur emphasizes the importance of long-term sustainability through asset acquisition and ownership, especially in terms of land and infrastructure, an approach supported by Venkataraman (1997) and Barney (1991), who suggests that entrepreneurs who focus on owning critical assets often experience greater stability and control over their business.
The emphasis on leadership transitions and nurturing talent within the business also aligns with succession planning, which has been widely recognized as critical for maintaining business continuity. According to a study by Litz (1995), businesses that prioritize succession planning are better positioned for sustained success, as they avoid disruptions during leadership changes. In this case, the fashion entrepreneur's view that:

> "Succession planning is critical for ensuring business longevity. It involves identifying and naturing talent within the organization to ensure a smooth

> transition of leadership when needed."

Suggests a foresight that could help ensure the business thrives even after the current leadership transitions out of the business. In contrast, some entrepreneurs display a more reactive approach, where long-term sustainability and succession planning are not immediate priorities. One jewelry entrepreneur suggests that they have not yet considered succession planning for their business, which could indicate either a lack of awareness or the perception that long-term issues are secondary to establishing the business first:

> "I don't even know what that means. Explain to me..... that's something I should be interested in yeah."

This viewpoint is common in early-stage entrepreneurship, where the immediate need for income and visibility often takes precedence over long-term strategy (Shane, 2003). However, this reactive approach can be risky. Businesses without succession planning may struggle when the founding entrepreneur exists (DeTienne and Chirico, 2013). The jewelry entrepreneur's uncertainty about succession planning highlights a lack of strategic foresight.
Without proactive planning, businesses may face leadership gaps or market shifts. Gardner (2014) notes that failing to address succession early can lead to instability, directionless operations, and financial challenges. A lack of clear strategies for longevity can hinder scaling and navigating market disruptions.
Research shows that proactive strategies like succession planning and asset acquisition are essential for long-term success. Gallo and Vilaseca (1996) found that family-owned businesses with leadership transition plans are more sustainable. In contrast, businesses that delay succession planning may miss growth opportunities. As DeTienne and Chirico (2013) suggest, reactive planning can leave businesses vulnerable and hinder leadership development.

4.9 Enlightened self-interest:

According to Spence and Rutherford (2001), this frame includes motivations or actions that are socially based and will also positively impact the business. These owner-managers are not necessarily motivated by goodwill but employ goodwill and ethics as a form of marketing or public relations.

The findings indicate that design entrepreneurs clearly understand their target audience. However, the key question remains—are they reaching the right customers? For instance, one fashion entrepreneur identified their niche market as fashion enthusiasts aged 20 to 40, while another took a broader approach, stating that their target audience includes individuals aged 8 to 14 and those over 40 who are active on social media. Meanwhile, a jewelry designer described a more refined market, catering to affluent individuals, anthropologists, and seasoned collectors. A common theme among these design entrepreneurs was their reliance on social media as the primary platform for reaching their niche market.

A recent study by McKinsey and Company (2020) discovered that people between the

ages of twenty-five and forty are more likely to be fashion enthusiasts and this guides their purchasing their fashion garments. This statement supports the statement made by one fashion entrepreneur who said:

> "Our niche market focuses on sustainable fashion enthusiasts who prioritize and echo friendly materials and ethical production processes. We target individual or aged 25 to 40 who are conscious about their footprint on the marketing and. Seek unique, stylish yet sustainable clothing options. "(Participant B).

Niinimäki et al. (2020), in their Nature Reviews Earth & Environment publication, highlighted that sustainable fashion enthusiasts are mostly young individuals who rely heavily on social media, which aligns with the study's finding that all design entrepreneurs in the focus group use it as a primary platform for business growth. Kapferer and Bastien (2017) noted that niche markets thrive on social media due to entrepreneurs' personal brand involvement, particularly through storytelling and curated garments that reflect their values. Kim and Ko (2012) also argued that small businesses succeed on social media because they can implement tailored marketing strategies. However, some studies suggest social media alone isn't enough. White et al. (2019) found some customers prioritize sustainability over social media presence. Joy et al. (2012) added that small businesses with strong ethical values attract more affluent consumers. The findings show entrepreneurs do not see older individuals as fashion-conscious. However, ThredUp (2021) found older consumers are increasingly environmentally conscious and buy more sustainable fashion. Mintel (2022) also found individuals aged 40-50 favor sustainable fashion.
A challenge is the excessive cost of sustainable fashion, making it less affordable for younger consumers and potentially threatening the sector's long-term viability. Lundblad and Davies (2016) noted price can be a significant barrier for younger buyers. Therefore, small businesses must reconsider their market positioning and avoid overlooking a sustainability-conscious, ethical customer base. Despite the alignment with sustainable fashion, contradictions exist regarding the target age group and point of differentiation.

4.10 Unique selling point from a design entrepreneur's perspective

This study presents diverse perspectives on gaining a competitive advantage and establishing brand identity within the South African business landscape, particularly in the design sector. The findings and analysis are outlined below.
One fashion entrepreneur emphasized that their business stands out from competitors by sourcing and utilizing unique, high-quality fabrics. This suggests that fabric selection is the foundation of their unique selling proposition and business strategy. This aligns with Goworek (2010), who found that businesses sourcing premium-quality fabrics can distinguish themselves in the market. However, the South African fashion industry faces challenges due to an influx of low-quality fabric imports. Mkhize and Ellis (2020) further support this by arguing that businesses prioritizing premium fabric sourcing gain a strategic edge over competitors who do not.

> "When it comes to competitors, especially in South Africa, not to mention companies, but I mainly deal with fabric" (Participant B).

Sourcing high-quality fabrics is crucial, but businesses must also prioritize branding and their overall business model for profitability. Kapferer and Bastien (2017) argue that brand value and customer resonance are key to long-term success, even when premium materials enhance market prospects. The study shows South African design entrepreneurs focus on fabric quality but often neglect brand development, aligning with Porter (1985), who stresses the need for a comprehensive model to differentiate from competitors.

A common strategy among entrepreneurs is building strong business relationships, helping shape a positive brand perception. While many entrepreneurs reported strong customer relationships, some faced supplier challenges, such as production delays. Nonetheless, most described these relationships as positive, contributing to profitability. This aligns with Kotler and Keller (2016), who found that businesses prioritizing customer service achieve higher retention.

Despite the importance of customer service, small businesses must balance it with scalability and operational efficiency. Reeves and Deimler (2012) emphasize that sustaining long-term growth requires this balance. A key finding was that participants viewed artistic authenticity and unique designs as primary differentiators. Clark (2008) found customers prefer individualized designs over mass-produced styles. However, Hirschman (1986) argued that designs reflecting a designer's personal expression often struggle in the mainstream market, limiting their appeal and posing risks to brand sustainability (Solomon et al., 2018).

4.11 Social priority:

The "social priority" framework refers to a long-term lifestyle or business approach focused on values rather than maximizing profits. Social values and choices are embedded within the business operations. All participants mentioned maintaining strong relationships with their clients and suppliers, but none were involved in community engagement or social entrepreneurship. The consensus was that, as start-ups, they were neither financially nor logistically prepared to focus on these areas.

4.12 Community engagement in design start-ups: an entrepreneur's perspective

The study indicates that while design entrepreneurs are interested in community engagement, it is not an immediate priority, due to financial and mental readiness. As one entrepreneur noted:

> "For now, I haven't done any community engagement, but I have something that is playing on the pipeline."

This statement suggests that while entrepreneurs value community engagement, they are not yet financially positioned to pursue it. Many small businesses, particularly in the initial stages, prioritize profitability over social initiatives, focusing on financial stability before expanding corporate social responsibility efforts. Moorad et al., (2019) supports this, noting that small businesses typically emphasize financial growth initially rather than community-based projects. As a result, for many, community engagement is seen as a

luxury, not a necessity.

However, Harrison et. al. (2015) argues that financial constraints should not prevent small businesses from participating in social initiatives. He suggests that businesses can contribute to their communities in ways that do not heavily strain resources, fostering corporate social responsibility on a smaller scale. Kotler and Lee (2005) reinforce this, finding that such involvement can enhance a business's reputation and attract ethically conscious consumers, contributing to long-term success.

In summary, while financial stability is a primary concern for many design entrepreneurs, there is increasing recognition of the strategic benefits of social engagement. The challenge lies in balancing profitability with community involvement to support growth without compromising financial sustainability.

One jewellery entrepreneur expressed interest in collaborating with undergraduate students, envisioning a platform where aspiring designers could introduce concepts for commercialization. While eager to engage in community initiatives, these entrepreneurs focus more on future projects than immediate action.

This view aligns with Elinger et al., (2011), who emphasized that collaborations foster community engagement. Dahla (2015) also found that involving local communities in design concepts strengthens ties and empowers them. However, Moorad et al., (2019) argue that limited resources—time, money, and space—often constrain the feasibility of such engagement for design entrepreneurs, making it an impractical option for small businesses. This is reflected in the diagram below, where responses were mapped to the four frames, with none aligning with social priorities.

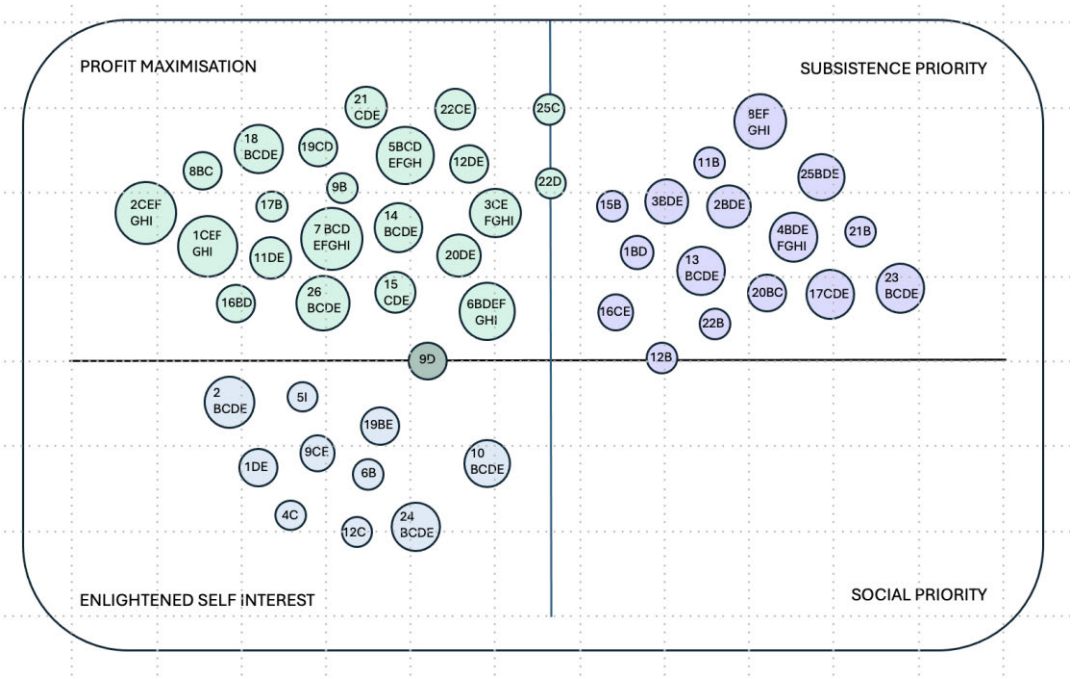

Figure 1. Alignment of participant responses with Spence and Rutherford's (2001) Four Frames.

5. Conclusion and recommendations

In conclusion, this study identifies two entrepreneurial paths: creative entrepreneurship driven by passion and innovation, and survival entrepreneurship motivated by financial necessity. While passion can spark business creation, it does not guarantee profitability, and necessity-driven entrepreneurs often struggle with growth. Design entrepreneurs, in particular, face challenges in integrating entrepreneurial strategies with their creative skills, impacting their success. The findings align with global literature.

South African design entrepreneurs view ethical leadership as encompassing social responsibility, fairness, respect, sustainability and being trustworthy when dealing with stakeholders and inspiring and cultivate peers to do what is always morally right. While some offer structured definitions, others base their insights on subjective experiences. Their ability to practice ethical leadership depends on available resources and business context.

The study underscores the importance of business education in design qualifications, especially in South Africa, where market access and scalability are limited. Profitability is possible but requires strategic planning, economic management, and adaptability.

The research also emphasizes proactive succession planning as crucial for long-term stability and local job creation. It suggests that socially driven entrepreneurship could offer profitable alternatives to a survivalist mindset.

Recommendations for further research to design education, and entrepreneurial practice and policy:

- The development of context relevant pedagogical models that integrate hands-on business simulations to equip graduate designers with ethical entrepreneurial and leadership skills.
- Incorporating business simulation and entrepreneurship into the design-business studies curriculum:
- Policies and government initiatives that support social entrepreneurship as economically viable alternatives for (design) start-ups.
- Alternative models for the incubation of ethical design leadership amongst South African design start-ups.

a new frontier for design

Cultural Heritage and Ethical Design: A Sustainable Approach to the Revival and Innovation of Guangzhou Embroidery

Dantong Zhu
Tsinghua University
zdt24@mails.tsinghua.edu.cn

Yue embroidery is considered to be one of the four major traditional embroidery techniques in China, and is recognised as one of the 'Four Famous Embroideries' in China, alongside Guangzhou embroidery and Chaoshan embroidery. This research project explores the potential for the sustainable development of traditional Guangdong handicrafts through the implementation of ethical design and design leadership principles. It also examines the interactive relationship between traditional craftsmanship and modern design innovation.
The study proposes a cultural innovation framework that emphasises ethical leadership, incorporating design engagement, collaborative innovation, sustainable incubation and dissemination strategies. The objective of this framework is to facilitate the effective integration of Cantonese embroidery with contemporary market demands, while preserving its cultural authenticity. A mixed-methods approach was adopted to explore the coordination of Cantonese embroidery in the contemporary design industry in depth and identify key strategies for its industrial creativity. The results demonstrate that ethical leadership is crucial for balancing cultural authenticity and commercial viability, protecting the integrity of intangible cultural heritage and promoting sustainable design innovation. This study not only identifies key innovation strategies, but also provides a new perspective on craft-based design-driven entrepreneurship that contributes to the protection and sustainable development of global cultural heritage.
Keywords: Guangzhou embroidery, inheritance, cultural sustainability, design leadership, ethical design, design-driven entrepreneurship

Research Objectives

Cultural Analysis: This component of the study will entail an exploration of the historical and cultural significance of Guangzhou Embroidery within the context of China's intangible heritage, with a focus on the principal characteristics of this traditional craft.
Ethical Design Framework: The development of a model of design leadership is imperative in this section, with the transmission of Guangzhou Embroidery prioritising cultural authenticity and the creation of ethical values.
Collaborative Innovation and Sustainable Cultivation: The identification of mechanisms for cooperation among multiple stakeholders (artisans, designers, policymakers) to sustain handicraft practices is a key element of this component.
Sustainable Growth: Propose strategies to avoid excessive commercialisation while enhancing market vitality through design-driven entrepreneurship.

Methodology and Tools

Mixed Methods Approach
Field Research: Conduct semi-structured interviews and site visits with multiple Guangzhou Embroidery intangible heritage masters, designers, and cultural heritage researchers in Guangdong Province (2023-2025).

Case Study (Wang Xinyuan Model): Investigate the complete design and production supply chain of the Wang Xinyuan brand in Guangzhou Embroidery.

Stakeholder Analysis: The roles of government, non-governmental organisations, and businesses in cultural preservation will be mapped out.Design Thinking Workshops: The development of prototypes of modern products rooted in cultural heri-

Key Aspects of Guangzhou Embroidery's Preservation Pathways

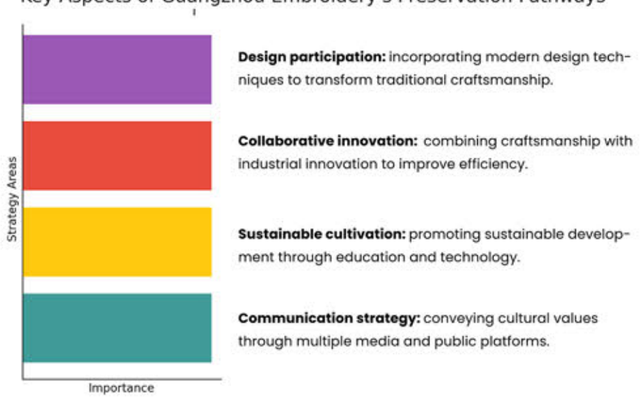

Table 2
Design Leadership and Ethical Design Practice – A Case Study of Wang Xinyuan's Guangzhou Embroidery Master Studio

Dimension	Category	Specific Strategies and Practices
Heritage & Innovation	Core Philosophy	Responsibility for intangible heritage preservation ("Choose one thing for life"), brand commercialization/industrialization integration, innovative industrial development and heritage fusion.
	Heritage System	"One Museum – One Brand": Wang Xinyuan Guangzhou Embroidery Master Studio (Teaching and Demonstration), Cluster Gathering (Commercialized Operation), Wang Xinyuan Embroidery Research Institute (Online Transmission & Public Education).
Talent Cultivation Model	Teaching	Online live-streaming public education, online vocational training (including military veterans), university research collaborations.
	Apprenticeship & Collaboration	Cooperation with 43 vocational schools, collaboration with 200 rural embroiderers for customized orders, structured training for over 100 vocational students.
Product Development	Handicraft Ethics	Purely handmade production, non-industrialized manufacturing (ensuring craft integrity), analysis and innovation of Guangzhou Embroidery (modernized techniques) and traditional embroidery teaching.
	Product Segmentation	High-end customization (collectible embroidery products), daily-use consumer goods (silk scarves, hats, brooches, and other lifestyle-integrated designs).
Business Development	Sales Network	Physical store sales, foreign trade exports, exploration of youth-oriented e-commerce channels.
	Brand Strategy	Cultural IP creation (historical revitalization), cross-sector collaborations, "Guangzhou Embroidery+" scene-based applications (furniture, fashion, cultural and creative products).
Social Impact	Cultural Promotion	High-tech heritage process construction, community-based experience workshops, international cultural exchange projects.
	Economic Empowerment	Rural women's employment revitalization, traditional craft modern transition demonstration projects, veteran re-employment.
Ethical Design Practice	Sustainability	Income and livelihood security plans for artisans, standardization of traditional and innovative embroidery techniques.
	Youth Training	Establishing university embroidery societies, "New Guang Embroidery Revival Plan," digital heritage documentation.

Research Process

The present study follows a four-phase research process to thoroughly examine the modern revival of Guangzhou Embroidery.

Phase One: Historical and Cultural ContextualizationReview of Guangzhou Embroidery archives, museum collections, and scholarly research.Understanding of how Guangzhou Embroidery has evolved over time.

Phase Two: Contemporary Challenges and Industry InsightsIdentification of current limitations, including the decline in artisans and market challenges.Conduct of interviews with industry experts to assess real-world applications.

Phase Three: Ethical Entrepreneurship Case Study – Wang Xinyuan Guangzhou Embroidery-

Obtained Results

1 Cultural & Market Integration: The research successfully demonstrated how ethical leadership and design innovation balance the preservation of Guangzhou Embroidery's cultural authenticity with contemporary market demands.

2 Ethical Design Leadership: Emphasised the importance of ethical leadership in the sustainable development of traditional crafts, creating a complete design-production chain that increases employment while balancing cultural protection and commercial viability.

3 Sustainable Innovation & Stakeholder Collaboration: Through collaboration among artisans, designers, policymakers, and entrepreneurs, the study showed how a multi-stakeholder model, with active participation from educational and cultural institutions, can sustain and expand the Guangzhou Embroidery industry.

4 Cultural & Economic Impact: Highlighted the potential of creative industries to empower local communities economically, with positive effects on rural women, veterans, and other groups. It also demonstrated how intangible cultural heritage can promote the development of local tourism.

5 Craft Entrepreneurship Framework: Provided a novel perspective on design-driven entrepreneurship in the craft industry, offering a practical framework for the adaptation and development of other traditional crafts in the modern economy.

DESIGN AS A TOOL FOR CHANGING THE IMAGERY UNDERLYING LEADERSHIP.

Massimiliano Datti, Francesco Monico

ISIA Roma Design
massimiliano.datti@edu.isiaroma.it; francesco.monico@edu.isiaroma.it

ABSTRACT | Contemporary power is largely based on economic structures, in which financial groups such as BlackRock, Vanguard, State Street, JPMorgan, Microsoft, Berkshire Hathaway and Tesla affect global policies on the economy, energy and consumption patterns (Monico, 2023). These groups, through a network of influential brands, exercise a leadership that shapes not only the economy but also culture and the collective imaginary. Their hegemony is embodied in *Brand Values*, which, through sophisticated design and branding strategies, drive consumption and influence public choice (Grizzanti, 2011). However, recent 'brand activism' is directing the energy of branding towards broader goals, such as sustainability and social responsibility (Kotler, Sarkar, 2021). Tippe Top Design, an innovative approach introduced in 2021 and employed at ISIA Roma Design, promotes a turnaround in the values and imagery of design, moving towards consumption patterns that reduce environmental impact (Damiano, Datti, Monico 2021). This approach, of a democratic speculative decoupling design method, together with art as a tool for change, can create new values that contribute to a sustainable global transformation (Pistoletto, 2023).

KEYWORDS | ECONOMIC POWER, BRAND ACTIVISM, BRAND DESIGN, TIPPE TOP DESIGN, ART & DESIGN

X-Format

Contemporary power is largely based on economic structures, where financial giants like BlackRock, Vanguard, State Street, and JPMorgan shape global policies on the economy, energy, and consumption (Monico, 2023). Through extensive brand networks, they influence both the economy and collective imagination. Their hegemony manifests in 'brand values,' which, through strategic branding, shape consumption and public choices (Grizzanti, 2011).

To enact real change, particularly in the face of the climate crisis, we must rethink consumption. Knowledge fosters awareness, but change requires intention, rooted in desire. To alter global markets, we must reshape collective desires. Since desires are influenced by imagery, transforming the 'imagery of progress' is key to creating lasting change.

We live in an era of crises: climate, geopolitics, and beyond. In times of uncertainty, people seek reassurance. But if "God is dead" what fills the existential void? The answer often lies in consumption: purchasing products to construct identity and role. Brands, as the driving forces of economic logic, wield immense power through sophisticated brand design techniques. "Our mental imagery is presided by brands" (Grizzanti, 2011). However, a shift is emerging through 'brand activism,' which channels branding towards sustainability and social responsibility (Kotler, 2021).

"Tippe Top Design", a methodology of Systemic Design introduced in 2021 and employed in both education and design at Author's Affiliation, promotes a shift towards environmentally responsible consumption patterns (Damiano, Datti, Monico, 2021). The climate crisis is fueled by consumption models, making design a critical discipline, shaping the very processes that sustain this economic system.

Designers interpreting collective imagery, determine the brand values and align products and communication campaigns to them (Datti, Rullo, 2021). The power and seduction of brands cannot be easily replaced, so consumption patterns must be reimagined using large-scale branding logic. A viable global strategy is to evolve brand values, positioning them as guiding coordinates. This would trigger a viral, financially powerful transformation, steering collective imagery toward more sustainable choices. Some brands have already begun this shift through 'Brand Activism,' including Patagonia, Rolex, and Montura.

But how can brand values be altered to spark meaningful change? Brand design, bound by economic forces, is insufficient alone: we need Art! The 20th-century imagery is obsolete for the 21st century; we require an artistic perspective that challenges existing paradigms. Artists adopt divergent viewpoints, stepping outside the conditions that created problems to envision new solutions. Art, as a method of deconstructing and reconstructing imaginaries, uncovers hidden futures. Its freedom allows it to reshape values, catalyzing global change.

Artist Michelangelo Pistoletto, with works like Venus of Rags and the "Cittadellarte" project, sees Art as a means to "inspire and produce responsible societal change." This speculative design approach, where art serves as a transformative tool, has the potential to generate new values and drive sustainable global shifts (Pistoletto, 2023).

Now more than ever, Art and Design must work together to drive change. While they operate at different cognitive, human, and social levels, their synergy is essential for reshaping our future.

The experiment that we intend to hold is inspired on the “exquisite corpse” method. The Distant Early Warning (DEW) card deck is not a traditional game with rigid rules or correct answers, but a real tool for intellectual and creative exploration. Its purpose is to stimulate intuitions, questions and reflections on society, communication, technology and cultural change. The important thing is therefore the questioning, the asking of open questions, stimulating attention towards future changes in society and culture.

The DEW Line Card Deck: Instructions for Use within the Tippe Top Design Framework

Inspired by Ezra Pound’s evocative notion of the artist as "antenna" and Marshall McLuhan’s elaboration of the *Distant Early Warning* (DEW) system—a metaphor drawn from Cold War radar technologies—the DEW Line Card Deck serves as a speculative and anticipatory instrument within the Tippe Top Design (TTD) methodology.

In McLuhan’s vision, the DEW Line was a metaphor for art’s capacity to detect subtle shifts in cultural sensibility before they erupt into overt social transformations. This card deck operates in that same spirit: as a cognitive radar system, enabling designers, educators, and thinkers to perceive the faint tremors of paradigm change before they reach the surface of mainstream discourse.

Instructions for Use:

1. **Activation through Chance**
   Each participant is invited to draw a card at random from the TTP Card Deck. Each card bears a Tippe Top Design’s referred concepts that are deliberately open-ended, generative, and speculative in nature.
2. **Written Response and Reflection**
   Upon receiving their card, participants are asked to compose a brief reflection. This response may take the form of a statement, question, hypothesis, or intuitive insight related to the drawn concept, forming a first layer of interpretation—what we might intend as a “probe” into emerging patterns.
3. **Collective Resonance and Amplification**
   The facilitators, Datti & Monico, will then extract a selection of these written responses, contingent on time constraints, and read them aloud to the gathered audience. These moments will serve as micro-dialogues—occasions for short shared reflection, interpretative blast divergence, and associative thinking. The audience becomes co-sensorial, forming a human feedback loop.

All collected responses will be systematically compiled and analysed by the Tippe Top Design facilitators. Rather than seeking consensus, the goal is to map the aesthetic, cognitive, and methodological terrain revealed through the exercise. These responses constitute an initial corpus for a broader investigation into the epistemic and pedagogical dimensions of the TTD method.

Ultimately, the cumulative findings of this experimental process will inform both future iterations of the DEW Line exercise and scholarly reflection, forming the basis for potential publication and methodological refinement.

DESIGN-BASED CREATIVITY IN GEOGRAPHY: A MODEL FOR TRANSFORMATIVE LEARNING.

Diletta Damiano*[ab], Chiara Rabbiosi[c], Francesca Acetino[c]

a Università degli Studi di Roma Tor Vergata

b ISIA Roma Design

c Università degli Studi di Padova

*diletta.damiano@edu.isiaroma.it

ABSTRACT | Over the past three decades, geographers' interest in visual languages and creative methods has grown significantly (Hawkins, 2013; Von Benzon et al., 2021). While the role of art in these methodologies has been widely studied (Hawkins, 2015), the impact of designers' process-oriented creativity on the transformative learning of young geographers has received less attention. Unlike artists, designers channel creativity into functional outcomes by working within *constraints* (Patti, 2017).

This study explores how incorporating a design-based approach within a transformative learning framework (Brookfield, 2005; Cranton & Taylor, 2012) can foster ethical learning (Goralnik et al., 2012) and critical thinking (DeJaeghere, 2009; Cassim, 2018) among higher education students. The creative turn in qualitative research engages university geography students from multicultural backgrounds and employs educational tools developed by designers to activate creative design processes, guiding students toward tangible outcomes.

Preliminary findings suggest that this approach enriches course content, promotes ethical competencies, and encourages teamwork. It provides a valuable shift in perspective for students in the social sciences, preparing them to address complex issues with creativity and responsibility. This study has contributed to the formulation of a transformative learning model, which will undergo further testing and refinement in future workshops.

KEYWORDS | TRANSDISCIPLINARITY, TRANSFORMATIVE LEARNING, CRITICAL THINKING, CREATIVE METHODS, DESIGN-BASED CREATIVITY

1. Introduction: The Transformative Power of Transdisciplinary Education

Contemporary society is characterized by precariousness and uncertainty regarding the future, which Bauman (2013) described as the "epoch of disengagement." In this context, education aimed at building critical and radical consciousness becomes essential to go beyond disengagement and to involve people in the commitment to transform reality (Freire, 2011; bell hooks, 2003).

The efforts of numerous researchers and educators are currently focused on an education that fosters ethical practices, promotes social justice, and encourages responsible citizenship (Nagda et al., 2003). In this context, the transformative power of transdisciplinary education plays a crucial role, as it manifests through techniques that transcend the boundaries of traditional disciplines, integrating knowledge from diverse fields to create a more holistic and impactful learning experience. This approach enables students to develop critical thinking skills and address problem-solving in creative ways (Massari, 2021; Philipp & Schmohl, 2023). From this perspective, a transdisciplinary approach is crucial to respond to the complexity of contemporary times and to promote the democratization of research and educational practices (Burnard et al., 2022).

The transdisciplinary approach, as described by design education pioneer Aldo Calò (1978), embodies the essence of the designer and is increasingly reflected in design education's engagement with diverse disciplines, including the social sciences (Rowe, 2023). Likewise, anthropologists, ethnographers, sociologists, and geographers have incorporated creative practices into education and research (Giorgi et al., 2021) and also claim for the need of integrating different actors (professionals, the civil society, etc.) in knowledge co-creation. The objective of this paper is to investigate the potential application of design in the context of university-level education, with specific reference to those fields who are interested in digging into space and place dynamics.

In the past thirty years, geographers' growing interest in creative methods has enabled them to engage with knowledge in more dynamic and comprehensive ways (Hawkins, 2015; Von Benzon et al., 2021; Bourlessas & Puttilli, 2024). However, to avoid a superficial or naive application of creativity, careful consideration and critical reflection are essential, as without it, the creative turn in geography risks becoming merely a trend (Hawkins, 2019). Thus, involving creativity professionals is crucial for collaboratively developing critical and participatory processes that foster creative sensibilities and skills in all participants.

While the role of art in these creative methodologies has been widely explored (Hawkins, 2013; Leavy, 2015.), the role of design has received less attention. Unlike artists, designers channel inventive toward functional outcomes, working within *constraints* (Patti, 2017). Sarkar and Chakrabarti (2008), after analyzing over 160 definitions of the term *creativity*, proposed the following definition: "Creativity occurs through a process by which an agent uses its ability to generate ideas, solutions or products that are novel and valuable." Although both forms of creativity share an element of novelty, artistic creativity is more oriented toward a moment of free expression, while design creativity draws its driving force from the constraint, which also integrates logical processes (Patti, 2017).

How, then, can the creative approach typical of design be integrated into geographic education to make a significant contribution to an education that promotes collaborative

skills, ethical leadership, critical thinking, and conscious citizenship? The following text frames the theoretical framework through which a project-based and place-based transformative learning model, incorporating design methodology, has been proposed. This model was developed through the experience of three different workshops with international students enrolled in geography courses.

2. Critical Learning through Experiential Design Practices

Mezirow (2008) suggests that we uncritically absorb values and beliefs from our social and cultural milieux, adopting the dominant ideology as the norm. Transformative learning begins when we recognize these beliefs as oppressive and consider alternative perspectives, challenging previously unexamined views (Cranton & Taylor, 2012). This process involves both individual and social transformation, with critical theory playing a key role in fostering social change (Brookfield, 2005).

The learning moment is crucial for developing awareness and critical thinking (Freire, 2011; Elwood, 2004). University courses that adopt a critical approach through experiential practices are able to connect theoretical learning in the classroom with experiences from the *real world* (Kolb & Kolb, 2017). This type of approach is increasingly recognized for its capacity to stimulate critical analysis of social inequalities while simultaneously promoting responsible citizenship (DeJaeghere, 2009; Cassim, 2018).

In the context of transformative learning and the application of critical theory, design assumes a *doing* dimension capable of bringing theory and reflection *into action* (Swann, 2002). Design can be seen as a concrete process that integrates reflection and action to transform reality through critical analysis. Critical Design, in particular, is a research practice that emphasizes the ethical positioning of the designer, aiming to stimulate reflection, raise awareness, and challenge assumptions, while encouraging actions through democratically participatory practices (Dunne & Raby, 2007; Bardzell & Bardzell, 2013). The proposal is to apply critical and participatory design processes in educational contexts.

Writing from a designers' perspective and discussing large-scale social transformations, Manzini and Rizzo (2011) describe participatory design as "a constellation of design initiatives aiming at the construction of socio-material assemblies where open and participatory processes can take place." In this framework, the concept of the *design device* is central, as they are artifacts specifically designed to initiate conversations and inspire a series of meaningful actions. Graphic resources or visual elements are *cognitive artifacts* that can be used in collaborative research spaces to facilitate teamwork, promote collective reflection, support the creation of shared knowledge, and strategically organize actions within a specific educational context. These tools are described as *Devices for Thinking the Common* (Iconoclasistas, 2021) or *feelthink* machines (Iconoclasistas, 2022), drawing on the *sentipensante* approach coined by Orlando Fals Borda, which emphasizes "thinking with the heart and feeling with the mind" (Fals Borda, 1979).

The designer, in the development of these transformative learning processes, can therefore assume the roles of 1) *trigger*, designing design devices or *feelthink* machines; 2) *facilitator*, supporting discovery, learning, and co-design processes; 3) *design activist*, proposing socially relevant design initiatives (Manzini & Rizzo, 2011). Additionally, the designer can play the role of *visual literacy educator*, introducing new practices and skills

(Hawkins, 2019), particularly with regard to the interpretation and understanding of visual communication. Visual form, in fact, represents a mode of knowledge through which some ideas are expressed more powerfully than through other languages. Like verbal form, visual language requires education and practice (Swann, 2002). Finally, the practical dimension, capable of bridging theory with action to solve real-world problems, can be guided by the designer through the creative and design process.

To leverage the transformative potential of design in higher education, it is essential to address real-world problems through both place-based and project-based approaches. In geography, place-based education (PBE) emphasizes community-centered, contextualized learning, fostering civic identity and community connections (Simm & Marvell, 2015; Schild, 2016; Yemini et al., 2023). Furthermore, place-based experiential approaches, , which facilitate learning that engages both emotional and intellectual experiences, help cultivate a sense of responsibility in tackling problems by fostering an ethic of care (Goralnik et al., 2012). Project-based learning (PBL), which encourages practical and collaborative problem-solving, is particularly valuable for developing transversal skills (Kokotsaki et al., 2016; Guo et al., 2020). Moreover, case studies in urban geography highlight how experiential learning can promote critical reflection, enabling students to engage actively and critically with urban spaces and their meanings (Elwood, 2004; Yemini et al., 2023; Bourlessas & Puttilli, 2024).

3. Case Studies: Educational Experiments in Academic Geography Courses

All of the workshops described below were developed in collaboration with faculty members, researchers, and PhD students from the University of Padua as part of the two-year international Master's programme in Local Development. The programme is a practitioner-oriented curriculum and strongly rooted in the social sciences. All the courses are taught in English, and the student group is overall multicultural and socially diverse, both in terms of social class, ethnicity, gender, sexuality, and disability.

The workshops were conducted as an integral component of two different course units within the same masters: the first, *Geographical Space: Concepts, Tools, and Practices,* adopts critical approaches to the concept of development, challenging Western epistemologies, while the second *Social and Political Tourism Geographies*, provides a broad critical understanding of tourism, privileging a qualitative embodied and emplaced perspective. The inclusion of these activities within the course units was shaped to encourage students to adopt a critical approach to social research (Pepa et al., 2024), enabling them to comprehend abstract concepts by grounding them in the everyday experiences of participants and the places they inhabit. The idea of practical activities within a course is also linked to previous experiences that revealed the students' need to learn to think critically, on one hand, and express a sense of powerlessness in the face of global injustice, on the other hand (Caretta & Pepa, 2023).

3.1 Case Study A – Counter-Cartography Workshop

The first workshop, held over four two-hour sessions between November and December 2023 as part of the *Geographical Space: Concepts, Tools, and Practices* course unit. While

the course unit had a specific instructure among the faculty members, the workshop was led by the kollektiv orangotango, a collective that specialises in collective mapping and counter-mapping and that was invited specifically on this occasion. The workshop included an introductory session followed by three in-class feedback sessions. Students were divided into four groups of 8-10 people and tasked with continuing the mapping process between sessions. Each group was assigned a theme to develop a counter-map, focusing on topics such as housing conditions, decolonial traces, and gender/care issues. Given the limited time frame and the importance of a situated perspective, students were encouraged to map these themes from a personal viewpoint, using their own experiences as the primary data source. The workshop concluded with a feedback session, where the students presented their work to the class, with members of local collectives engaged in the explored topics in attendance (Pepa et al., 2024).

3.2 Case Study B – Bridging Theory and Practice in Critical Tourism Geographies Learning

The second workshop took place over three sessions, each two- hours long, between April and May 2024, as part of the *Social and Political Tourism Geographies* course unit. On the first meeting, the main instructur, who had already lectured traditionally for a few weeks, introduced the designer and the ongoing activity to be taken together; this first meeting was followed by three feedback sessions ending with a *guided tour* in the historical city centre of Venice; the guided tour was organised by the students, with their colleagues and the instructors as an audience. To prepare this final, open air assignment, students were divided into six groups of four people, and were tasked with creating a tour that instead of showing the beauties of Venice, would have shown the problems connected with tourism. If tourism is about learning about a place, here students-cum-tourists would have planned a tour to learn about tourism. To come to this end, students had to choose a topic, explore how it was spatialised and emplaced in Venice, moving from a map that was given at their disposal to its enactment in the city of Venice itself. Students were provided not only with a map (Fig. 1) but also with a booklet titled *Urban Layer Handbook. Design Devices for Field Research. Investigate Geographies of Tourism Bridging Theory and Practice,* a cognitive object created by the designer involved in the course unit to help them interpret the city through different layers (inhabited city, productive city, public city, leisure city…). The experience concluded with a feedback day in Venice, during which the students performed the tours they had designed.

Figure 1. Photo taken during a review session in the *workshop Investigating Geographies of Tourism: Bridging Theory and Practice*.

3.3 Case Study C – Mapping Rione Palestro Workshop

The third workshop took place over four sessions, including two four-hour sessions and two two-hour sessions, totaling 12 hours, between November and December 2024, again as part of the *Geographical Space: Concepts, Tools, and Practices* course. This second edition of the counter-mapping workshop was developed in synergy with the collective *Decolonize Your Eyes*, active in the multicultural Palestro neighborhood. Students were divided into four main thematic groups: history of the neighborhood, the neighborhood today, the neighborhood of the future, and the toponymy of the neighborhood. Each thematic group was divided into one subgroup tasked with creating a word map and another tasked with creating a visual map, resulting in eight groups of around five students each.

As with the previous workshops, this workshop was introduced through exercises and a theoretical lesson by kollektiv orangotango. The designer provided a theoretical introduction to visual language management and supplied students with visual design devices to assist them in the design of their research experience, information selection, and visual mapping (Fig. 2). Following the introductory session, three review sessions were conducted, and students organized themselves to continue the mapping between sessions. The workshop concluded with the presentation of the maps and of the mapping process to the rest of the class.

Figure 2. Students using one of the design devices developed for the workshop *Mapping Rione Palestro*.

4. Learning Model: Proposal for a Transformative Learning Model

From these experiences, a place-based and project-based transformative learning model emerges, realized through a design approach dedicated to the design experience itself. This model consists of the following interconnected phases in an iterative process:

1. **Theoretical Exploration** – Exploring the theory and introducing the topics to be addressed, this phase also incorporates marginalized knowledge, with the professor playing a crucial role.
2. **Generating Shared Knowledge** – Discussing the proposed topic with the workgroup promotes self-awareness and mutual understanding, particularly in intercultural contexts.
3. **Co-design** – The participatory design of an artifact, experience, or service that conveys a counter-narrative of space from a critical perspective. In this phase, the designer plays a key role in facilitating this process.
4. **Connecting with the Place** – Conducting research to gather information and establish relationships within urban spaces. Individuals who navigate or inhabit

these spaces (e.g., local communities, collectives, tourists) act as interlocutors and potential beneficiaries of the project.

5. **Sharing** – The presentation and testing of the design device with the rest of the class, as well as with the local or academic community.

This model involves two types of design devices (Manzini & Rizzo, 2011; Iconoclasistas, 2022): those created by the designer as tools for conversation and those developed by student non-designers as enablers of the experience. The design devices created by the designer, as tools for conversation, are intended to help geography students (non-designers) adopt a design methodology within the group. The second type of design devices, which are conceived as enablers of the experience, represent the project outcomes developed by the student non-designers.

4.1 Analysis and Student Feedback for the Construction of a Transformative Learning Model

The development of this model was made possible through the feedback provided by students who participated in the workshops. Students were asked to provide feedback on the workshops via a questionnaire in case studies A and B, and through both a questionnaire and individual autoethnography (texts, drawings, photos, etc.) for case study C. What emerges from the analysis of the feedback is that, despite initial difficulties with group work, students appreciated the experience and recognized its value, particularly within the multicultural context. Many students from workshops B and C noted that the experience allowed them to apply theoretical concepts practically. One student found the workshop transformative, describing it as the missing piece to overcome feelings of frustration and powerlessness. Additionally, encouraging critical engagement with places proved highly effective, helping students shift their perspectives, connect with the studied locations, and move beyond stereotypes. One student highlighted how the project made them realize that social and political issues are often global in nature, motivating them to foster change and contribute to a more just and humane future.

Nevertheless, each workshop allowed for the improvement of the five phases outlined in the model. Infact, the first workshop revealed chaotic design processes and poorly communicative visual maps. This highlighted the importance of providing students with a clear brief, design constraints, and visual tools to guide them through the creative process, thereby enhancing their skills and ensuring that the design outcomes function as devices that enable the experience. In the second workshop, the introduction of the booklets was a first attempt in this direction. Although some students described the booklet as "very useful to shape the imaginary and reality of a place" or "very helpful not only to help us think about our topic but also to build our own itinerary for touring," its use remained individual, not collective, and it did not fully serve its role as a diary or exploration notebook.

The revised management of the educational structure in the third workshop enabled a more effective design of the five phases of the learning model, particularly with regard to phases 2, 3, and 4. Specifically, design devices were developed to support phase 2 (generating shared knowledge) and phase 3 (co-design). Crucial to the implementation of the co-design phase was the focus on collective mapping methodologies, facilitated by the intervention of the kollektiv orangotango, as well as the facilitation of design

processes (Manzini & Rizzo, 2011) and the development of visual language skills (Swann, 2002) by the designer. Furthermore, it emerges as highly important in phase 3 to give a clear objective and a defined user group to direct the design of the device developed by the students. Finally, phase 4 (connecting with the place) was particularly effective due to the involvement of strategic actors, such as the inhabitant and the Decolonize Your Eyes collective, which plays a politically and socially activating role in the area. These factors have resulted in student's outcames more complex, featuring a more coherent language and a deeper critical reading of the place under examination. (Fig. 3). Visual language acted as an enhancer of the information collected during the research phase and the critical vision presented by the group. One student reported: "Choosing colors, text sizes, and placements became an act of storytelling, where design choices shaped how other people would perceive and interact with the map."

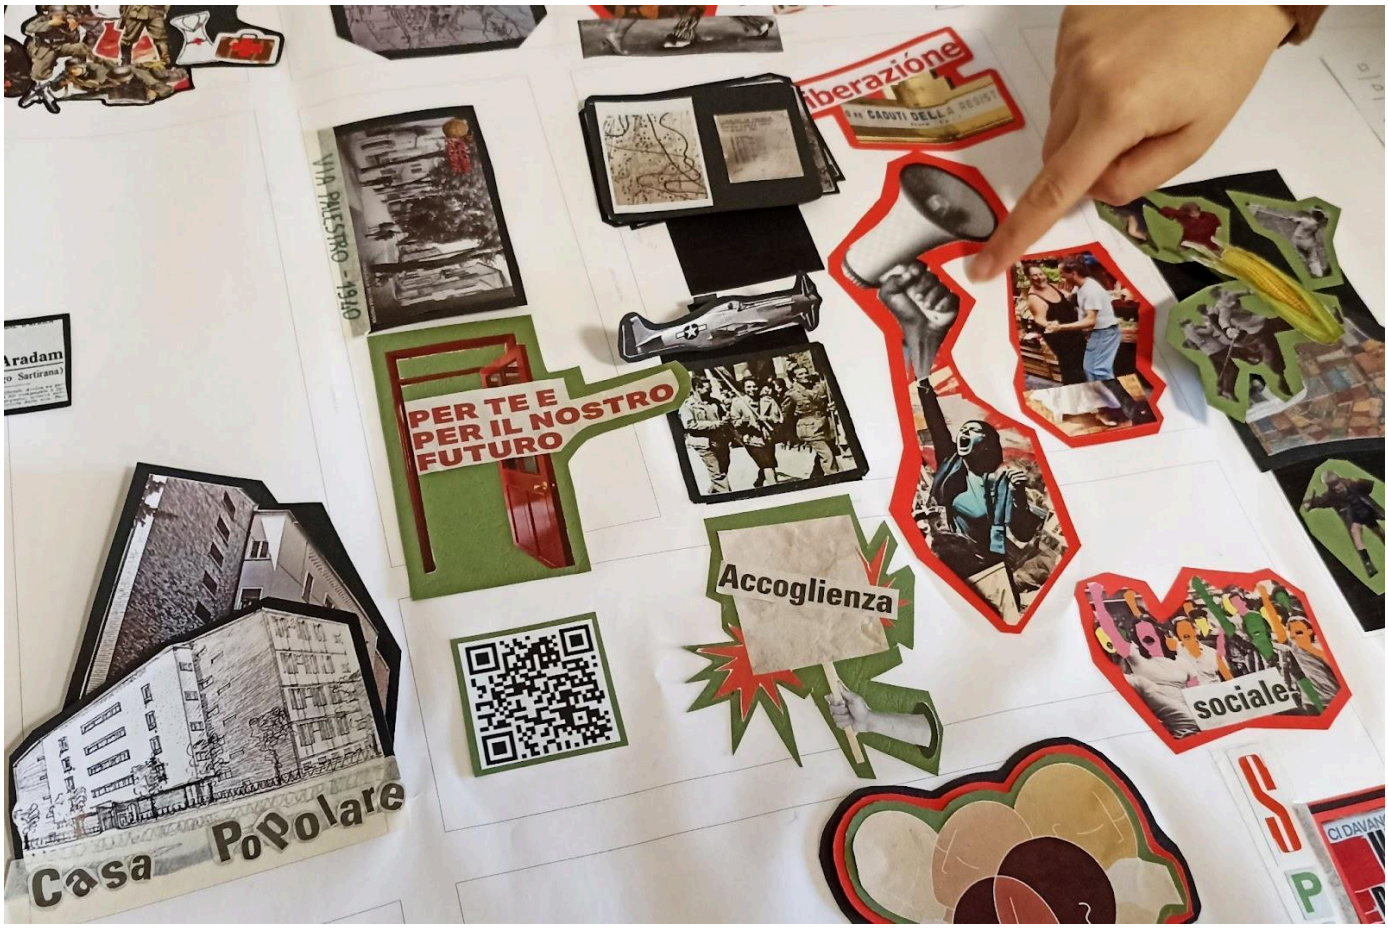

Figure 3. Visual map in progress developed by a group of students during the workshop *Mapping Rione Palestro*.

In conclusion, through research and design, students engage in a place-based and project-based learning process, collaborating to achieve goals through the sharing of knowledge and insights. Transdisciplinary learning is realized not only by involving specific methodologies from diverse disciplines (design, social sciences, geography), but also by integrating practices, collaboration, and knowledge from a wide range of stakeholders (local residents, activists, local and international students, academics) (Massari, 2021; Philipp & Schmohl, 2023). The self-management aspect and the challenges associated with conceptualizing and realizing projects further enhance student engagement, driven by cognitive, emotional, and ethical elements (Goralnik et al., 2012; Kokotsaki et al., 2016). Moreover, the transformative dimension emerges through the critical perspective shift experienced by many students (Cranton & Taylor, 2012),

facilitated by the practice of group work and the analysis of topics related to the places explored.

5. Conclusions

The transdisciplinary approach to education, integrating design, effectively addresses contemporary educational and social challenges by fostering critical, collaborative, and creative skills. The workshops in this study show that using design as a teaching methodology, alongside project-based and place-based learning, enhances student engagement and stimulates critical reflection on global and local issues. The design devices developed by both instructors and students facilitated an educational process that promoted critical thinking and practical skills through hands-on, collaborative design.

These experiences demonstrated how design, especially critical and participatory design, can transform students' connections to places and communities. The combination of theory, practice, and visual tools encouraged new perspectives on these places. Collective design and experiential learning strengthened students' collaboration, sense of belonging, and civic responsibility.

This emerging learning model suggests that design can catalyze transdisciplinary, transformative education, applicable not only to geography but also other fields, including design. The model will continue to be refined in future workshops, aiming to foster informed, responsible citizens who can address future challenges with ethical and creative solutions.

ABSTRACT | To enable sustainable future production systems, waste management is a crucial issue, and designers may assume the role of leadership by negotiating proper material use among various stakeholders that allows resources to be reintegrated into life cycles and establishing new production hierarchies that prioritize waste prevention and capitalize on market opportunities. The presented research investigates ways of stimulating circular material use in the furniture industry, where a transformation has already started, in part due to economic interests and shifting consumer sensibility, but mostly due to a regulatory push towards more sustainable solutions, especially in case of public procurements. While designers have long been experimenting with recycled materials and their distinct visual identity, it is still challenging for them to find locally available circular material options and comprehend their real environmental impact. Due to this difficulty, sustainable and circular design typically requires specialised experts, as well as more time and resources. To mitigate this issue and allow designers to be not only creative leaders, but also agents of sustainable material choices since the initial product conception, this project examines the possibilities of using advanced digital tools for facilitating the design process and, in particular, information flows between three key stakeholders: designers, furniture manufacturers, and waste managers (secondary raw materials). Interviews with these stakeholder categories led to identifying insights organised in three main problematic areas about circular materials: limited awareness

and mistaken perceptions; lack of trust in the environmental impact data; difficulty of choice and supply chain setup. Subsequently, based on the identified requirements, a twofold system of digital tools was designed, comprising an online platform for collecting and exploring circular materials, and a CAD software plugin for channelling circular materials into the design process, allowing designers to quickly confront estimates of environmental impact of different material combinations. AI-driven features have been designed into various workflows, from material uploading to search, recommendations and comparisons in natural language. The developed knowledge and experiments will contribute to a more effective digital toolbox for designers, allowing them to become leaders of circular transformation and proactive professionals who not only do the right design choices, but also help to establish local and circular supply chains.

KEYWORDS | SUPPLY CHAIN, LCA, MATERIALS, DESIGN TOOLS, ARTIFICIAL INTELLIGENCE

1. Introduction

In today's context, the transition toward a sustainable future is imperative and involves all sectors, with design playing a crucial role in this evolution. Designers are no longer just creators of form and function but leaders capable of driving change through design practices promoting sustainability, ethics, and innovation. One of the most urgent aspects, particularly, concerns waste management and the integration of circular production practices, which has become increasingly central in research agendas and industrial policies. The European Commission (2024) highlights how limited access to product sustainability information remains a significant barrier to design-based entrepreneurial initiatives, preventing a genuine transition to circular business models. In this scenario, designers can assume a leadership role by negotiating material use among the various stakeholders involved, creating co-creation networks that facilitate the reintegration of resources into production cycles. However, to effectively address this challenge, designers must have adequate tools and a solid knowledge base to make informed decisions.

This paper presents ongoing research that explores the use of digital tools. Appropriate tools can facilitate the adoption of circular solutions in complex production environments by supporting a more transparent and collaborative decision-making process (Eriksson et al., 2022). The goal is to improve product circularity by making crucial information accessible to various stakeholders and encouraging interaction among all parties involved in design and production. The research project focuses mainly on the Made in Italy furniture sector, which is known for its excellence but is still characterized by limited recycling, reuse, and certification practices (Silvius et al., 2021; Barbitano et al., 2019; Savelli et al., 2019). By using digital platforms for material and data exchange among designers, manufacturers, and other stakeholders, the project aims to develop an organizational model that can be replicated in other sectors, promoting circularity on a global scale. This approach not only helps reduce waste but also creates new market opportunities, focusing on enhancing economic and environmental sustainability.

In this article, the evolving role of the designer will be highlighted, as they not only increasingly assume leadership roles but also take responsibility for their ability to create networks that make strategic decisions with a positive impact on society and the environment. These skills can also be applied in entrepreneurial contexts to develop ethical and sustainable businesses that respond to global challenges. However, this process requires a shared understanding of co-creation dynamics and the ability to navigate different creative cultures while simultaneously changing organizational models

and adopting new digital tools (Cusumano et al., 2019). In this context, ethical leadership through design-driven entrepreneurship becomes central. As leaders, designers should face the dilemma of maintaining their creative essence while taking on new responsibilities. They should be capable of addressing the challenges of adopting circular business models, sustainable practices, and public-private collaborations. This paper will demonstrate how the evolution of design as a tool for building a more sustainable future also involves promoting a cultural shift that encourages dialogue, transparency, and responsibility. Moreover, in order to support these new paradigms, the research develops digital tools to be introduced between the various stakeholders.

2. Circularity in the Italian furniture value chain

The Italian furniture industry, valued at approximately EUR 17.5 billion annually, is a significant part of the EU market, ranking after Germany, the UK, and Poland (EEB, 2017). It is a cornerstone of the "Made in Italy" brand, recognized for its high-quality design and strong export contributions. The sector, largely composed of micro-sized enterprises concentrated in the North, faces growing challenges, including rising energy and raw material costs. To address these challenges, the use of secondary raw materials has gained prominence, positioning Italy as a European leader in circular economy (CE) practices within the wood-furniture sector (Symbola Foundation & Federlegno Arredo, 2016). However, the broader Italian furniture sector lacks full circular economy implementation, with companies mainly focused on activities directly related to business efficiency and immediate economic benefits such reducing raw materials or energy consumption (40%), developing low-resource production processes (36%) and environmental criteria for supplier selection (33%) (Fondazione Symbola & ENEL, 2021).

1.1 Procurements criteria and best practices

In this context, Mandatory Green Public Procurement (GPP) has emerged as a crucial driver for advancing circularity and sustainability within the sector, leveraging public sector purchasing power, which accounts for 14% of EU GDP (EU Commission, 2024). Italy's Minimum Environmental Criteria (MEC), mandatory since 2016, require the use of recycled or renewable materials, modular design, and non-destructive disassembly to facilitate reuse and recycling (EEB, 2017). GPP MEC for urban and indoor furniture, established by the Ministry of the Environment in 2015 and 2017 and updated by Ministerial Decrees (07/02/2023; 23/06/2022), provides a regulatory framework aimed at increasing the use of circular materials. The application of MEC has reached an average of 62% (Legambiente, 2024), contributing to the rapid growth of Environmental Product Declarations (EPDs), which rose from 5 in 2016 to 509 in 2024, demonstrating a clear shift towards transparency and sustainability. MEC criteria specify minimum recycled content requirements - ranging from 100% for wood to 5% for concrete - and address factors such as hazardous substances, energy efficiency, and recyclability. Compliance is verified through certifications such as EPDs based on life cycle assessment (LCA) and mass balance methods, ensuring traceability and credibility.

Also, environmental certifications play a crucial role in promoting circular materials and products. In Italy, certifications such as ReMade in Italy and Plastica Seconda Vita focus on verifying recycled and by-product content, while holistic schemes like Cradle to Cradle (C2C) consider broader circularity aspects, including material health. The research analyzed certification databases, including EU Ecolabel, C2C, ReMade in Italy, Plastica Seconda Vita, and EPDItaly, with a focus on the ReMade in Italy catalogue, which contains the highest number of nationally certified furniture products (ReMade, 2024).

Established in 2013, ReMade in Italy certifies recycled material content in materials, semi-finished, and finished products across various sectors. It requires traceability plans, supplier monitoring, and material classification, ensuring compliance with Green Public Procurement Minimum Environmental Criteria (GPP MEC). Certified products benefit from tax incentives and demonstrate environmental advantages such as reduced energy consumption and lower CO2 emissions. The ReMade in Italy catalogue for indoor furniture has grown to 184 certified products, with school furniture (42%) and seating (34%) as the most represented categories. However, certification adoption remains limited to a few large companies, with 70% of certified products belonging to just five firms. Only 15% of products achieve the highest A+ rating (more than 90% recycled content), such as the Sfera waste sorting container (97% post-consumer ABS). About 50% of certified indoor furniture contains over 60% recycled content, particularly in school tables and seats made of wood, metal, and plastic (MobilFerro). Plastics and wood dominate the certified materials, aligning with MEC criteria for indoor furniture, while coatings and other recyclable materials, such as paper, aluminium, and glass, are underrepresented Despite these advancements, full circularity adoption remains a challenge, as companies still focus primarily on cost efficiency and their numerous challenges in qualifying waste for production processes. Strengthening stakeholder engagement and aligning business strategies with evolving sustainable requirements – as GPP – will be key to further advancing circular practices in the Italian furniture industry (Donatello et al, 2017).

In this sense, the role of the designer can be important in catalysing new conceptual and operational frameworks, acting as an intermediary between the regulatory complexity and the relational complexity of the production and industrial fabric.

3.1 A framework for waste valorisation in the Italian furniture value chain

The research sought to outline a methodological framework, modelling the entire life and design cycle of a furniture product, including the flows of materials and waste, components and materials, and their secondary cycles triggered by the 9 R's (Refuse, Reduce (by design), Reuse, Repair, Refurbish, Remanufacture, Repurpose and Recycle)[1] (Reike, 2018) and introducing at the same time all the different information flows, necessary to make them possible. The close correlation between the material flow related to the product lifecycle and the flow of information that manages and accompanies the different stages that characterize it (figure 1), again emphasizing how the transition to a more circular economy is intertwined with its digital transformation (CENFIM, 2021). Both material and information flow together with the key documents allowing awareness of environmental and circularity profiles of materials and products.

Fitting into this general framework of circular design and production, the present research is introducing two interconnected digital tools (green in figure 1): an Online Platform for circular material (data) exchange and a CAD Plug-in to channel such material data directly into the design process of furniture, thus returning to the designer some of the key information related to the environmental impact of locally available circular materials. Therefore, the project focuses on the phases of material production and component production, where allowing designers and manufacturers to make more informed material choices could have a major overall impact.

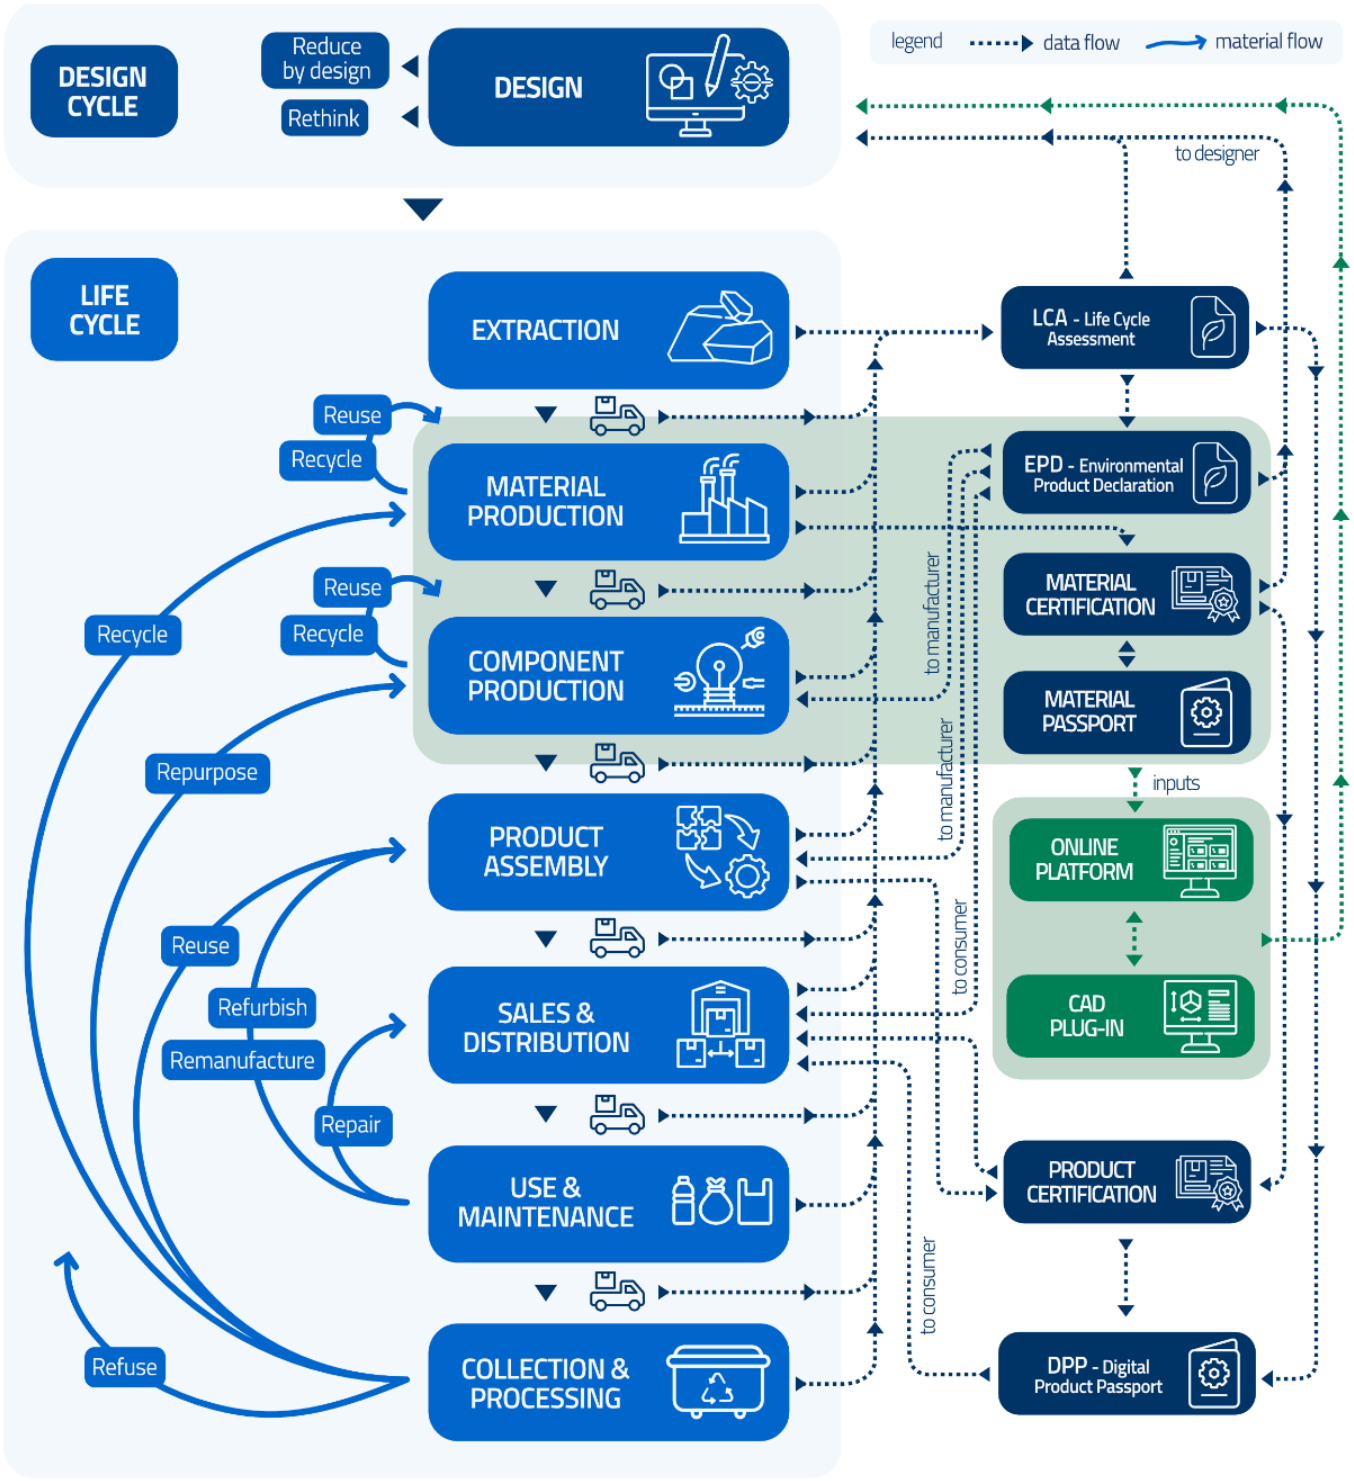

Figure 1. Flow diagram summarizing the methodological framework for circular design and production of furniture, based on enhanced data and information flows and on the implementation of the 9 Rs.

The diagram shows all the steps that contribute to the development of circular material- from the recovery and classification of waste/subproduct to the production and certification of semi-finished and finished products. This complex process requires characterization of waste materials, tracing their path, environmental study and technical/legal framing. For each identified phase, there are many actors involved (the supply chain, the manufacturing company, the reclaimers, the transporters, the laboratories for material testing, the intermediaries for the regulatory and certification part, LCA analysts, etc.), whose needs and any support tools already used must be coordinated with each other, reconciling requirements and resolving any criticalities: in this sense, the designer assumes the role of leader of the entire process, responsible for

effectively coordinating the different becomes professional figures with specific skills.
In this model, designers work by adopting a life cycle-oriented eco-design methodology, which implies their involvement not only strictly in the design cycle but also from a broader perspective in the production process and in consideration of all phases of the life cycle, using smart tools for sourcing secondary materials, for the valorisation of rejected components and parts, for the evaluation of the environmental profile of the designed product, etc. In this scenario, customers, whether businesses or consumers, need more detailed information about products and their sustainability characteristics, including life cycle environmental indicators (LCA Studies, EPDs, Digital Product Passports, and Material Passports). Data collection for each process therefore requires an appropriate digital infrastructure and data collection procedures that ensure transparency, traceability, and security.

Within this framework, rethinking and reducing by design approaches allow for the exploitation and optimization of in-house by-products and reused and recycled waste, end-of-life products reused after repair/remanufacturing/refurbishment actions, post-consumer waste reprocessed by recycling companies, and products that are rejected, i.e., not purchased by consumers. More conscious and informed decisions on behalf of the designers would make it possible to ensure greater material resource efficiency, right from the conception of the product itself, influencing the various stages of the production process and thus the entire product life cycle.

4. Key stakeholders for enhancing circular material use

To encourage conscious furniture design from the outset by giving designers a leadership role, this research is developing a multi-stakeholder system through advanced digital tools, as already anticipated in the previous section. Specifically, the aim is to promote the circular use of materials in the Italian furniture industry by facilitating connections between designers and key stakeholders: waste managers, who provide secondary raw materials or by-products, and furniture manufacturers, who can directly utilize circular materials. The development of these digital tools began with stakeholder mapping, followed by interviews to identify their problems and needs, ensuring their interest in the system participation.

4.1 Stakeholder mapping

The qualitative research phase involves adapting methods to ensure timely and relevant data collection across various disciplinary settings (Vindrola-Padros & Johnson, 2020). This phase includes semi-structured interviews to delve deeper into the information retrieved during the desk research phase (Safdar et al., 2021). Through a qualitative analysis of semi-structured interviews with key stakeholders, valuable insights and perspectives from individuals involved in the system have been retrieved, which has been ultimately clustered and analysed according to the project-grounded methodological approach (Corbin & Strauss, 2008). This analysis provides initial insights into the common knowledge base producers and manufacturers have about waste management within the Made in Italy production chain.
To map the stakeholders, the research analysed regulations and identified waste-generating processes using ATECO codes, which classify economic activities in Italy and define the eligibility for tax benefits and sustainability compliance. The study identified 56 ATECO codes linked to 487 industries relevant to waste management. Specialized consortia play a key role in intermediate recycling activities, aiding designers in creating

sustainable products.
For waste managers, the focus was on ATECO 38.32 ("Collection and sorting of materials"), identifying 113 companies, with 40 selected based on financial stability. Additionally, 45 manufacturing-related codes were analysed, particularly in fashion and furniture, identifying 374 companies, including 141 in Lazio for strategic collaboration.
For designers, the study prioritized professionals integrated into production chains. Eight ATECO codes covering consultancy and research were also identified for potential external collaboration.

4.2 Participant Organizations: roles and positions

After stakeholder mapping, the research conducted interviews with various types of stakeholders involved in the system, including two designers and six stakeholders:

- Designer 1 is an independent designer specializing in Product Design, Packaging, and Strategic Design.
- Designer 2 is an independent designer focusing on Product Design, with a particular emphasis on bathroom furniture design.
- Stakeholder 1 is a producer of indoor rubber floor coverings, which are mainly used in public buildings and private facilities.
- Stakeholder 2 is an intermediary in the environmental services sector that combines operational services with technical and scientific advice to reduce the environmental impact of its clients.
- Stakeholder 3 is a consulting and research company, specializing in the sustainability of materials and products, and in defining metrics for measuring the circular economy.
- Stakeholder 4 is a trade association that represents and defends the interests of inert waste recyclers to create the necessary conditions for the development and growth of the recycled aggregate market.
- Stakeholder 5 is an association reserved for operators in the rubber and elastomer recovery sector, fostering further aggregation potential in the area.
- Stakeholder 6 is a manufacturer engaged in the production of modular shop fittings, accessories, display windows, furnishing elements, and mannequins.

Initially, the roles were defined as designers, waste managers, and furniture manufacturers. However, the interviews revealed that these roles often overlap, making strict classifications challenging. For example, stakeholder 8, identified as manufacturers of furniture, also acts as a waste producer, managing production residues and seeking ways to valorise them. Similarly, some stakeholders take on hybrid roles, such as intermediaries (stakeholder 2 and 3) who provide consulting and technical services, or associations (stakeholder 4 and 5) that represent collective interests while also participating in the waste-material-product chain. This underscores the fluidity of roles within the circular economy, where organizations may shift roles throughout their operations, reflecting the system's interconnected nature.

5. Insights from the ecosystem

Among the various information that emerged during the interviews, problems and needs define a general pattern of topics that have been clustered according to three thematic groups: 1) awareness, communication, and market adoption, 2) quality, availability, and certification of information, and 3) product development, evaluation, and production processes.

5.1 Awareness, Communication, and Market Adoption

A key issue that emerged is the lack of awareness and market acceptance of circular materials, by which stakeholders 4 and 5 emphasized the need for specific marketing channels along with a more strategic engagement of the public to improve product perception, as recycled materials are often undervalued. According to this, stakeholder 1 highlighted the relevance of storytelling in promoting circular economy practices and stakeholder 8 pointed out that materials derived from materials such as MDF powder are often perceived as waste rather than valuable resources, limiting commercialization. Designer 2 emphasized the need for direct dialogue with technical offices that could enable better alignment between design and production constraints, even though the perception that companies are reluctant to adopt sustainable materials due to high costs, limited availability, lack of certification, and aesthetic concerns. In this case, it emerged that many businesses hesitate due to process adaptation challenges and fears of inefficiencies.
As highlighted by the interviewed designers and other stakeholders, the design of the final product plays a key role in creating engaging communication strategies. It serves as a strategic tool to help companies integrate sustainable materials by designing narratives on a multi-stakeholder interface that facilitates the exchange of intelligible and reliable material-related information among manufacturers, suppliers, and users.

5.2 Quality, Availability, and Certification of Information

Another major challenge is the lack of verified and accessible information about traceability, which affects circularity and sustainability. Indeed, stakeholders 2 and 3 emphasized the need for Digital Product Passports to improve transparency, pointing out that manufacturers often codify material information to protect supplier data, creating trust issues in material selection. Stakeholder 6 reported complex and time-consuming certification processes, delaying market entry for sustainable products. Additionally, ESG data collection is still manual and inefficient, lacking structured methodologies for LCA (Life Cycle Assessment) and carbon footprint calculations, highlighting that many companies claim to have no waste, making it difficult to assess material availability and sustainability impact.
To address these gaps, as highlighted by the designers involved, a comparative approach based on sustainability metrics could enhance the adoption of sustainable materials among manufacturers. Cross-referenced data could be integrated throughout the design and production stages, ensuring accessibility and usability for designers. By incorporating objective sustainability assessments, this approach would support informed decision-making and foster more responsible material choices in design processes.

5.3 Product Development, Evaluation, and Production Processes

Stakeholders 1 and 2 identified that managing multiple material attributes (e.g., cost, performance, quantity, aesthetics, environmental impact, logistics) is challenging due to the difficulty of evaluating and visualizing material properties, particularly in clear and intelligible data formats. In this regard, stakeholder 3 suggested that automated material recommendations and improved demand-supply matching could be beneficial. Additionally, stakeholder 6 highlighted challenges in scaling up sustainable innovations, citing high production costs and the need for innovation in the manufacturing chain. This includes integrating digital fabrication processes and adopting more adaptive and modular panels to ensure reliable traceability and regulatory compliance. These

challenges require the integration of a robust tracking system.
In product design and development, both designers emphasized the need for tools that support the assessment of material sustainability, comparison of options, and guidance for assembly with reuse in mind, while also estimating product longevity. They highlighted that digital tool, when enhanced by well-trained AI evaluation systems, could enable designers to make informed choices, ensuring materials align with sustainability goals while optimizing performance, longevity, and recyclability. Additionally, they stressed the importance of establishing direct communication channels between designers and manufacturers to streamline file preparation, prevent misinterpretations, and improve production efficiency.
Based on the results of the interviews, it is possible to outline a hypothetical path of development. Shifting from a linear model to a circular one requires shared responsibility in recycling and a design approach that prioritizes circularity from the outset. This means integrating sustainability data, optimizing supply chains, and ensuring cost-effectiveness to maintain competitiveness in a more sustainable Made in Italy. Key actions include implementing Digital Product Passports for traceability, strengthening legislative support, and launching marketing campaigns to shift perceptions of recycled materials.
Additionally, AI-driven tools for material selection, durability assessment, and assembly guidance can enhance efficiency, while fostering direct collaboration between designers and the diverse stakeholders will streamline sustainable production.

6. Guidelines for better tools

The digital tools proposed by the current research will need to respond to the issues raised by the stakeholders previously described, therefore the interview findings above were used as an input for identifying the system requirements and principles to follow. These will be discussed according to the same threefold division.

(1) The first group of issues revolves around the awareness of available circular materials both for designers, manufacturers and consumers themselves, who perceive quality as inferior. While communication to consumers is out of scope for this project, limited sustainability information may be addressed also with innovative digital tools. Waste exchange platforms are not a new concept, but there is no tool focusing on the territorial peculiarities of Made in Italy furniture. Participants highlighted the need to support various supply chains, with adequate differentiation of roles and functionalities.
(2) Another recurring issue is the lack of trustworthy information and the difficulty of finding the relevant pieces of information, especially in fields that are not (yet) heavily regulated. While software tools for Digital Product Passports are being introduced due to EU legislation, there is a twofold issue: material sources are sensible information for companies, while there is a general mistrust in how strictly companies follow sustainability standards. Better digital tools might help avoid unintentional omission of relevant details, and may proactively invite stakeholders to verify relevant indicators, and perhaps enhance practices.
(3) The final group of issues is about the product development and evaluation process. At the moment, designing with circular materials and setting up a trustworthy supply chain requires specialized expertise, thus making circular product development much slower and more expensive. Digital tools may help to bridge this information and expertise gap by providing sustainability knowledge and up-to-date supply information at the adequate points of the product design and engineering process, also relying on AI processing capabilities that became mainstream recently. Considering various in-house software solutions, a crucial aspect is interoperability: new digital tools should aim at openness and modularity, either through proper open-sourcing, or through public APIs (Application Programming Interfaces) so that any new solution may be quickly integrated

into existing tool chains.

Among these features, the key aspects that enhance designers' leadership capabilities are the expansion of information access and stakeholder collaboration through a seamless workflow. The tool should empower designers with data-driven decision-making by providing access to a national sustainable materials database and an AI assistant for comparative analysis. Simultaneously, it should facilitate direct interaction with other stakeholders, fostering collaboration and serving as a foundation for informed dialogue. To ensure a smooth and efficient workflow, the digital tool will be integrated into CAD software, allowing designers to incorporate sustainable materials seamlessly into their design process.

7. Enhanced workflows through new tools

Based on the previously discussed results of the analytical steps, both regarding current practices of evaluating material sustainability and regarding the mapping of stakeholder needs, the research has outlined practical examples of how the three categories of stakeholders would benefit from the multi-stakeholder system, describing the user journey for each of them. The hypothesized multi-stakeholder system consists of coherent workflows for three main users: designers, waste managers, and furniture manufacturers. Following previously described emerging opportunities, the digital tool integrates conventional CAD software with AI features and a recommendation engine to assist designers and manufacturers in material selection.

7.1 User Journey

On one side, the digital tool incorporates bottom-up processes by collecting data from waste managers through a web interface. Waste managers provide detailed information about their company and the materials they want to sell, including production details, material categories, aesthetic characteristics, and life-cycle parameters. Subsequently, designers and manufacturers can browse the material catalogue via the web interface, using filters to explore options and conduct comparative analyses of materials with AI-driven suggestions. The designer and manufacturer workflow concludes with material selection based on environmental impact and other parameters, leading to a purchase from the waste manager.

At the same time, the digital tool integrates with conventional CAD software, such as Rhinoceros, through plug-in. When the designer has finalized the geometric shape of the furniture, they can use the plug-in for material selection. The designer's workflow begins with the creation of material and shape groups by assigning parts of the geometry. The designer can then set multiple materials from the web interface to these groups. Finally, the designer can assess various material configurations through comparative environmental impact analyses, enhanced by AI suggestions, and apply the selected textures to the geometry for aesthetic evaluation. The system also incorporates top-down processes, involving the evaluation of various international and national environmental indicators. These indicators are narrowed down to two or three for integration as input queries, filters, and the basis for AI recommendations.

7.2 Interfaces

The research developed a set of mockups illustrating the user journeys, which involved

developing initial high-fidelity user interfaces of a website and a plug-in for CAD software. The website supports two main workflows: selling, for waste managers, and buying, for designers and manufacturers of furniture. The plug-in is designed especially for designers and requires basic CAD software skills.

The mockups were developed, to test with stakeholders, then refined, and finally developed into functional prototypes. Considering that this research is part of a larger project, the design system for Italian public digital services was chosen to ensure alignment and integration[2]. The main workflows were illustrated through a selection of mockups, in the following order: setting up material variants within the CAD software through a plugin (figure 3 and 4) and browsing and comparing materials through the web platform (figure 2).
Thus, the digital tool enhances designers' leadership by integrating the national sustainable material database, AI-assist, stakeholder network, and seamless CAD integration, enabling informed and sustainable decision-making in the circular economy.

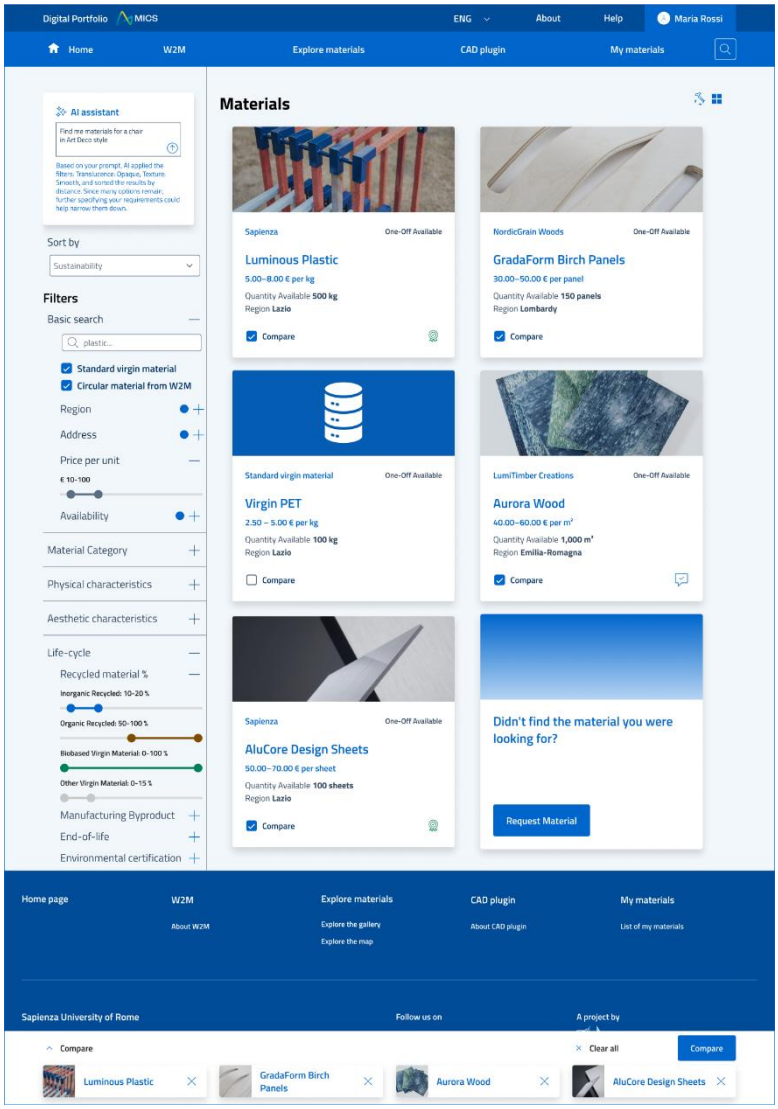

Figure 2. Catalogue of materials with filters for designers and manufacturers of furniture.

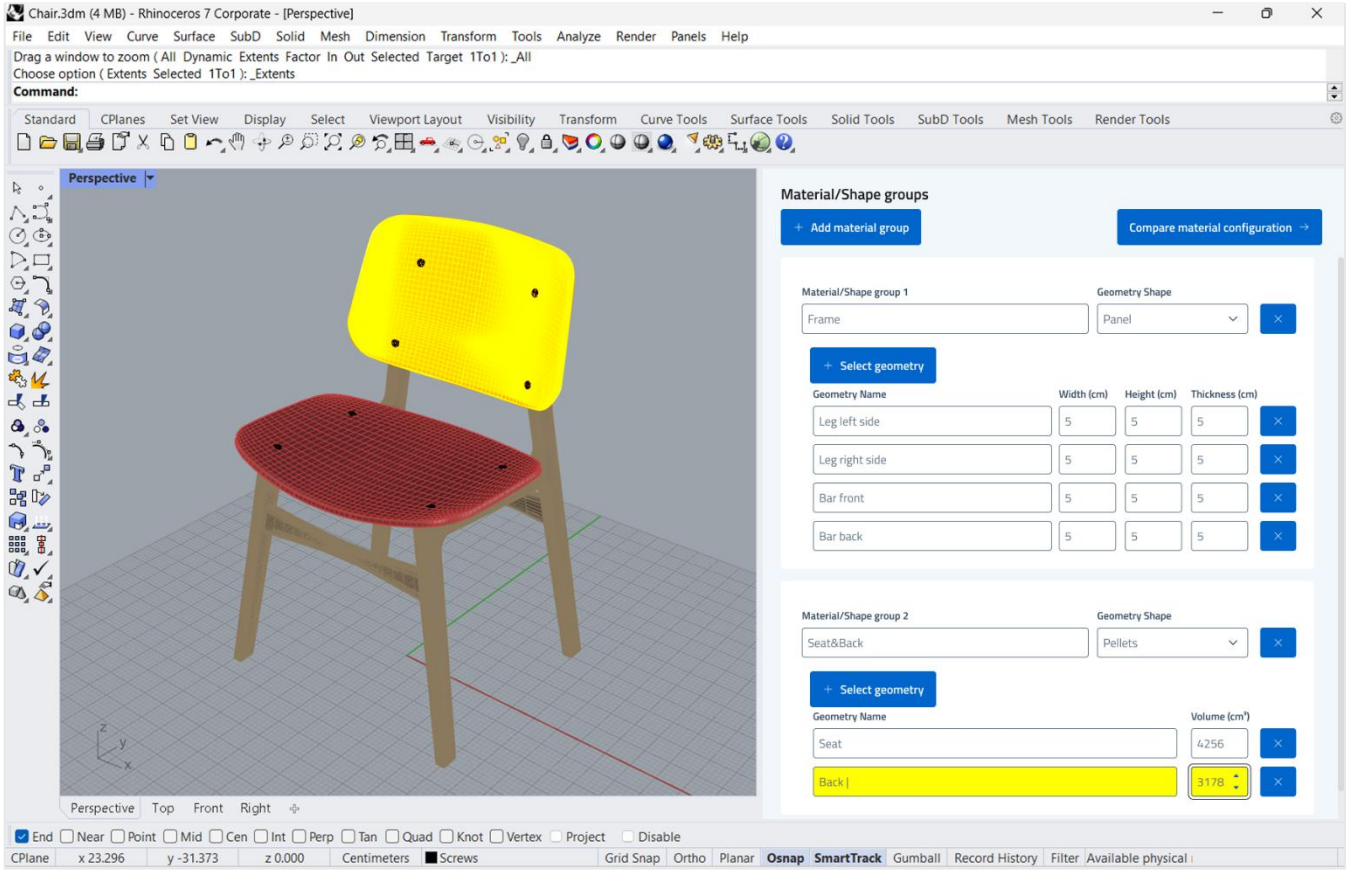

Figure 3. Interface for designers, integrated into the CAD software Rhinoceros 3D, for creating material/shape groups (groups of components that will be manufactured from the same material, with the same starting form, e.g. panels to be cut).

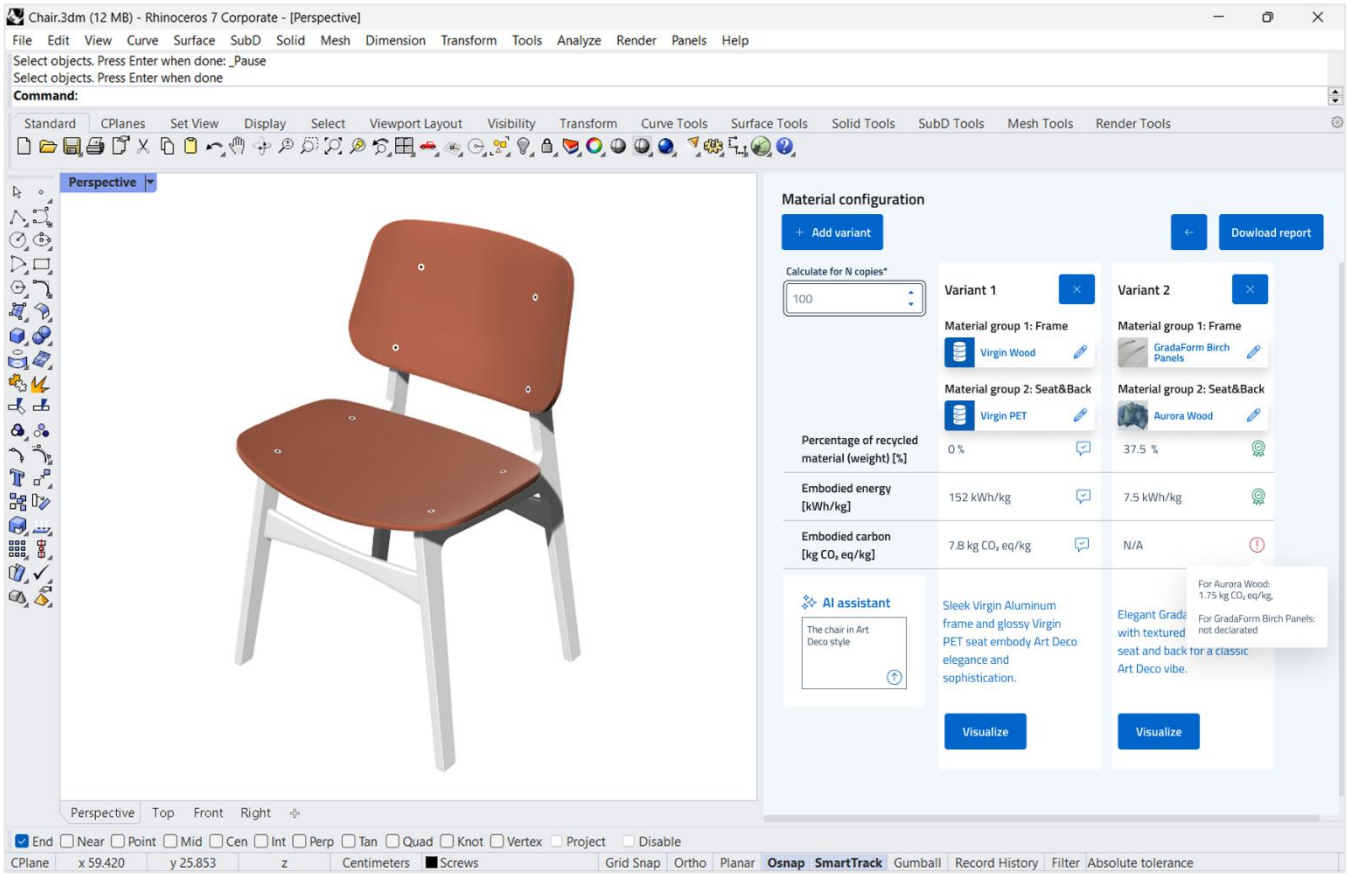

Figure 4. Interface for material variant comparison, once all materials have been associated with the material/shape group, with AI suggestions and a set of key sustainability metrics for comparison.

8. Advanced AI capabilities for the multi-stakeholder system

The proposed project is an innovative web-based platform designed to facilitate circular economic practices by connecting waste managers, designers, and manufacturers. A key technological advancement is the integration of AI-driven capabilities to efficiently manage, retrieve, and correlate unstructured data, optimizing material documentation and discovery.

Most materials-related information exists in unstructured formats, making it difficult to systematically retrieve and correlate relevant data. Traditional data extraction methods have relied on manual curation or rule-based systems, which are not scalable and require domain expertise. Large Language Models (LLMs) present a scalable alternative, enabling structured data extraction from diverse and unstructured sources (Schilling-Wilhelmi et al., 2024), significantly accelerating the discovery and reuse of recycled materials.

Waste managers use the platform to upload detailed information about recycled materials, including textual descriptions, images, and technical files compatible with modelling software. AI-driven structuring minimizes manual effort, ensuring consistency and accessibility. Designers and manufacturers, in turn, leverage advanced search tools powered by LLMs and retrieval-augmented generation techniques to discover suitable materials for their projects (Jiang et al., 2023). By iteratively refining query understanding through AI reasoning, the platform dynamically enhances search results, improving precision and relevance (Jiang et al., 2023).

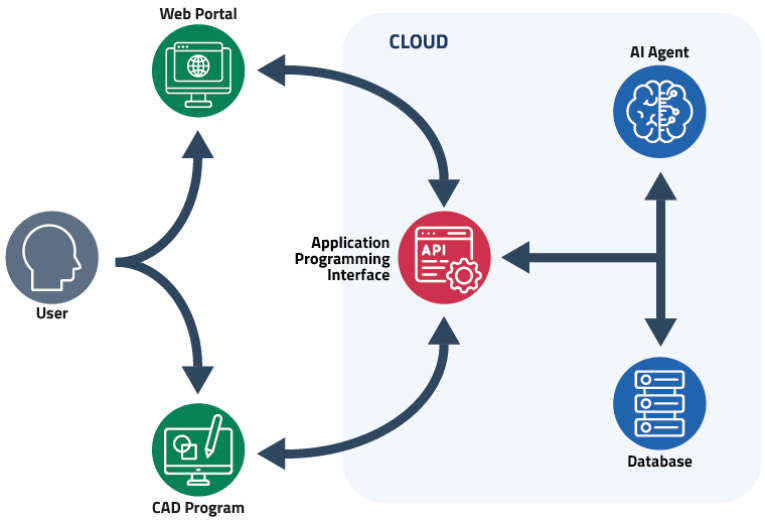

Figure 5. System Architecture Overview: The platform enables users to interact with a web portal or CAD program, which communicates through an API to access cloud-based AI processing and a structured database. The AI agent helps process unstructured data, while the database stores and retrieves material information efficiently, facilitating seamless integration between stakeholders.

At the core of the system lies the transformation of unstructured data into structured JSON outputs, making them easily searchable and integrable within a high-performance, cloud-based database. Research on AI-enhanced data retrieval has demonstrated that users modify their querying strategies over time, necessitating adaptive AI systems capable of learning and evolving with user behaviour (McCamish et al., 2018). This approach ensures that designers and manufacturers can iteratively improve their

material discovery process, shifting from static retrieval models to more intuitive and responsive search paradigms.

The platform architecture includes an intuitive web interface featuring file uploads, AI-powered search, and visual material representation. AI does not only serve a data structuring function but also significantly enhances user experience (UX), ensuring accessibility and ease of use. The relationship between AI and UX is reciprocal, where AI-driven recommendations and interactive assistance optimize decision-making while a well-designed UX increases AI adoption and effectiveness (Virvou, 2023). By leveraging AI-supported UX methodologies, the system dynamically adapts to changing user needs, facilitating seamless navigation and material exploration (Stige et al., 2023).

Additionally, the backend employs state-of-the-art AI models, such as OpenAI and Llama, to refine data structuring and improve search accuracy. Research indicates that AI-driven UX processes can optimize digital design by automating requirement gathering, enhancing solution development, and refining iterative evaluation (Stige et al., 2023). One of the most significant benefits of this AI integration is the drastic reduction in time required for data input and material discovery. Waste managers can populate the database more efficiently, while designers and manufacturers can quickly identify innovative recycled materials, focusing on creative applications. The API integration with Rhinoceros, a CAD software, further streamlines the workflow for designers and manufacturers.

9. Conclusions

This contribution has described the state of development of a research project that aims to enhance circular material use in the furniture industry, with a particular focus on the role of the designers and their information needs while matching consumer needs and desires with material possibilities as well as regulatory issues and sometimes conflicting stakeholder interests.

The paper started by outlining the Italian furniture value chain in relation with circularity, already subject of several studies and reports, which highlight a developing national (and European) system of sustainable furniture production, but also an increasing complexity that requires significant expertise to navigate. Within the long chain of processes in the life cycle of a furniture, the project chose to focus on the phases of material production and component production, and the designer's capacity to optimize these steps through informed decision-making upstream. Beyond designers, other key stakeholders such as furniture manufacturers and waste material transforming companies were interviewed, highlighting the sometimes blurry line between them. The resulting insights included three main problematic areas: limited awareness and mistaken perception of circular materials, lack of trust in the quality of environmental impact data about materials, and the difficulty of designing with circular materials and setting up an effective and reliable supply chain. These issues led firstly to identifying guidelines and features for better digital tools, then to the definition of enhanced workflows including the user journey and interfaces, as well as an outline of advanced AI capabilities, which may act as a well-informed "translator" between various professional figures who otherwise have difficulty with collaborating due to the differences in their professional jargons and mindsets.

Although the initial prototypes are promising, the subsequent in-depth experimentation will be necessary to understand the efficacy of the most advanced functionalities, especially the AI assistant that should be trustworthy and intuitive across various interfaces, and CAD Plug-in that should fit into various personal working styles of

designers. Future research should also examine whether and how much the tool should change to tackle different geographical areas (e.g. different material parameters due to different regulations) or to tackle other industries beyond furniture. While technical development is still in progress, hopefully the developed knowledge and experiments will contribute to a more effective digital toolbox for designers, allowing them to become leaders of circular transformation and proactive actors who not only do the right design choices, but also help to establish local and circular supply chains.

About the Authors:

Viktor Malakuczi PhD, Assistant Professor in Design at Sapienza University of Rome. His research interests that revolve around the contamination of Design with advanced digital know-how. The three main threads of research are design for digital manufacturing, design for cultural experience and design for internet of things.

Luca D'Elia (PhD) is a designer and Researcher at the PDTA

Department of Sapienza University of Rome. His Research activity focuses on digital manufacturing and co-design practices in urban context and within the Makers community.

Carmen Rotondi Product Designer and Ph.D., she conducts research in Industrial Design (ICAR/13) on Biodesign and Biofabrication and, more generally, on the hybridization between design and science, nature and artifice. Her PhD thesis focused on the new concept of "Bio-Augmented Materiality" fostered by bio-digital practices and aimed at innovating through the contemporary eco-entangled context.

Paola Altamura Architect, PhD in Environmental Design, Tenure Track Researcher at Sapienza University, former Research Fellow at ENEA. She conducts research and experimentation on the built environment's sustainable transformation with a life-cycle approach, focusing on material resource efficiency and circular design strategies.

Mariia Ershova PhD student in Service Design for Public Sector at the Sapienza University of Rome. Research Fellow in Made in Italy Circolare e Sostenibile. SID Research Award 2024 for Research ideas. Main interests: Digital twin, and Embodied design methods.

Gabriele Rossini Architect, PhD student in Environmental Design at the PDTA Department of Sapienza University of Rome, Research Fellow on a NPRR project. His research activity concerns material resources circularity in architecture, focusing on the hybridization of biological and technical materials.

Alessandro Aiuti PhD student in Service Design for Public Sector at Sapienza University of Rome. His work investigates how HCI and service design can transform urban mobility and sustainably regenerate public spaces, fostering more accessible and resilient cities.

Sabrina Lucibello Architect and Ph.D., she is Associate Professor at the Department Planning, Design and Technology of Architecture of the Sapienza University of Rome. She is president of the Degree in Design and director of the Saperi&Co. research centre. She carries out research in Industrial Design (ICAR/13) on the subject of product innovation through materials for design.

Serena Baiani Associate Professor of Technological and Environmental Architectural Design at Sapienza, she conducts research on the relationship between existing buildings' design/technological innovation/ecological and energy efficiency in national and European research, focusing on life-cycle approach and

heritage adaptive reuse in fragile contexts.

Emanuele Panizzi Associate Professor in Computer Science at Sapienza University of Rome, Italy. He directs a research team focusing on human-computer interaction, app design, gamification, and context-aware mobile interaction.

Lorenzo Imbesi Full Professor of Design at Sapienza University of Rome, where he is the former Director of the Sapienza Design Research Interdepartmental Centre and the Coordinator of the PhD in Service Design for Public Sector. He is also the President of Cumulus Association, President of the Italian Scientific Society of Design (SID), and member of the Executive Committee of the European Academy of Design (EAD).

ABSTRACT | This article investigates the dynamic and bidirectional relationship between designers and manufacturers within the tanning district of Santa Croce sull'Arno, in the Tuscany region of Italy. Recognized as a paradigmatic example of a "glocal" production ecosystem, the district embodies a complex interplay between deeply rooted local traditions and a far-reaching global impact in terms of both craftsmanship and market distribution. As an integral node within the global value chain, the district must continuously navigate evolving market dynamics, driven by broader socio-economic transitions and transformations. Through an in-depth analysis of this unique industrial landscape, the study highlights how traditional manufacturing entities can sustain their relevance by embracing innovation while preserving their cultural identity and economic viability. Central to this inquiry is the examination of case studies involving national and international design students and graduates who participated in a specialized workshop on vegetable-tanned leather, organized by the Consorzio Vera Pelle al Vegetale. This initiative served as a platform for knowledge exchange, offering a lens through which to assess the reciprocal influences between emerging designers and local manufacturing expertise. By exploring these interactions, the article underscores the potential of design education and collaborative practices to foster sustainable evolution within traditional production contexts.

KEYWORDS | MADE IN ITALY, GLOBAL VALUE CHAIN, CRAFTMANSHIP, CO-DESIGN, KNOWLEDGE EXCANGE

1. Contextualization

1.1 Made in Italy clusters and Global Value Chain

Made in Italy products, the fruit of the union between Italian design culture and manufacturing systems, are characterised by a constant creative relationship between tradition and the search for innovation. They are, therefore, products that share that unique mix of elements that determine their unquestionable recognisability at an international level. This peculiarity involves tangible and intangible elements deriving from its operators' specific know-how and design skills. Therefore, the aspects that characterise Made in Italy are the high specialisation of production techniques, the development context, the conception and realization of district products, and a strong rootedness in territorial specialisations. D'Amato states:

> Italian style owes its shape above all to that 'third productive force', halfway between craftsmanship and industry. [...] This mode of production, although driven by a constant orientation towards seriality, has transformed the concept thanks to the means of processing it uses: machine tools that are more complex than craft tools but less costly and constraining than the machinery of large-scale industry. (D'Amato, 2005).

The incursion of digital technologies has further influenced Italian design culture, both from a productive and creative point of view, accentuating the experimental value of the creative process. The combination of design, high manufacturing, and technologies now allows for the development of new poetics and new approaches to the values of the production system (Micelli, 2011). Significant examples of this evolved operating scenario include CNC machine usage, production planning and control software integrations and many scientific research integrations/implementations into the supply-chain. Thus, Made in Italy's excellence is not a turning point, and it must continue to innovate without renouncing its history and craftsmanship tradition, which are driven by the need for efficiency, sustainability, and competitiveness.

1.2 Italian SMEs and Global Value Chain

Global Value Chains (GVCs) are defined by OECD as the organization of international production, trade, and investments where different stages of the production process are located across different countries. GVC produces winning and losing products and services by the degree of its participants' contribution to new value-through-knowledge. Gereffi et al. (2001) refer to:

> [...] increased cost and importance of activities that deal with intangibles, such as fashion trends, brand identities, design and innovation, over activities that deal with tangibles, the transformation, manipulation, and movement of physical

> goods. As intangibles become more important, tangibles have become increasingly commodified, leading to new divisions of labour and new hurdles for developing country producers to overcome if they wish to enter these chains. (Gereffi, et al., 2001, p. 10)

In other words, tangible activities such as production tend to be outsourced to developing countries, while the intangible activities around branding, design, and innovation remain in more-developed countries. This causes a sort of geographic and cultural split in a product's identity (Goretti, 2017).

Walter Benjamin uses "aura" to denote the intangible spirit embodied in certain objects. Benjamin asserts that the aura [of the work of art] is connected closely with ritual function, explaining:

> The uniqueness of a work of art is inseparable from its being imbedded in the fabric of tradition. This tradition itself is thoroughly alive and extremely changeable. An ancient statue of Venus, for example, stood in a different traditional context with the Greeks, who made it an object of veneration, than with the clerics of the Middle Ages, who viewed it as an ominous idol. Both of them, however, were equally confronted with its uniqueness, that is, its aura. Originally the contextual integration of art in tradition found its expressio in the cult. We know that the earliest art works originated in the service of a ritual –first the magical, then the religious kind. (Benjamin, 1936)

If Benjamin's aura (or spirit) is conferred on the work through its presence in time and space (or place), the temporal and spatial definitions of tradition point toward continuity –rather than disruption or fragmentation– spatially (through place), and temporally (through transmission of information between generations). In contemporary usage, "genius loci" refers to the specific atmosphere of a place, and to the way in which the forms and objects produced in a specific place are adapted to it. Richard Florida claims that genius loci "maintains a proper balance between the natural elements and culture, multiple representations of the intangible values referred to this place" (Florida 2003). Hand-crafted production expresses the phenomenology of intrinsic place identity through such factors as local materials and regional know-how.

2. Designers and artisans in industrial districts: a theoretical framework

While the industrial clusters literature acknowledges that competitive new product development depends on relationship-building activities, from a design perspective, informal social relations enable the development of new products as they can inform new business directions (Bertola & Teixeira, 2003). Therefore, design participates in new product development through "a process of interactive construction that tries to reach the precise scope of shaping a new artifact" (Maffei & Zurlo, 2000). In these terms, design in industrial districts primarily supports new product development by synthesizing and codifying technical and market knowledge. Bertola and Teixeira (2003) define the design capabilities of outsourcing in contexts of informal knowledge circulation as a main competitive advantage for companies participating in industrial districts. Indeed, the codification and synthesis of external users' and network companies' knowledge allowed

companies to define new trajectories for their business that eventually led to collaborative actions in new product development. designers act as mediators or translators, deploying interactional rather than direct contributory expertise.

This form of contribution appears particularly relevant in collaborations between artisans operating in the SMes and designers: the formers physically work with materials, forming them into artefacts; while the latters aim at "articulat[ing…] findings or judgement, and sometimes to translate the expertise of one domain into the language of another" (Collins and Evans, 2019, p. 37)In terms of the T-shaped model of skills, designers would personify the horizontal stroke of the T with their "disposition for collaboration across disciplines"; and artisans the vertical stroke of the T with their "depth of skills" (Brown, 2011).
While design absorbs knowledge embedded in communities and industrial networks, it can mediate between the company's internal scope of shaping a product and the territorial context (Celaschi et al., 2009). As Deserti and Zurlo (2011) emphasize, the main contribution of design capabilities to distributed and interactive dimensions of local production systems concerns the ability to interpret the external users' knowledge and the company's needs. By closely interacting with the companies' entrepreneurs and communicating with heterogeneous stakeholders due to empathy and visual communication skills, design supports the realization of companies' intents in a context of interactive knowledge.

In Italian industrial districts, we highlight on a unique integration of design and manufacturing underpins the enduring success of many of these districts in the global market. Therefore, the SME and its artisans become indispensable to the designer's ability to realize the sample or collection.
The industrial districts' literature widely acknowledges the social dimension of local production systems as the primary enabler of productive interactions for new product development (Becattini, 2002; Morosini, 2004). Therefore, knowledge spillovers, co-located creativity, and the collective development of innovations allowed companies to improve their competitive performance toward the efficiency of the industry they belonged to. Furthermore, as sociological contributions on industrial clusters emphasize (Granovetter, 2018; Uzzi, 1997), the embeddedness of the social structure in local production systems, namely the informal ties and personal relationships, supported the development of superior products as it drawn on tacit knowledge exchange. When tacit knowledge exchange allows for developing products that are hard to replicate, it represents a competitive advantage for companies (Benkler, 2006).
In Made In Italy manufacturing system, the craftsman operating in the SMEs clusters is conserared as a subcontractor for the designers enrolled by the major fashion or design corporations that often acts as a "problem solver" with the ability of implementing the "desires" of designers. In fact, the SMEs it becomes crucial for designers to realize the first sample in the process of development of products for large companies (often part of global financial groups). Even if this process is recognized by brands, the craftsman is not considered part of the design process, but only a producer with a secondary role compared to the designer (Fry et al., 2016)
Thus, we highlight on a dominant position of external designers in this dialectic relationship. According to this perspective, Zhang (2016) critiques the dominant role of external designers calling the artisans as just "workers" to achieve their concepts. Conversely, Bhatt (Vencatachellum, 2005) points out that collaborating with designers only rarely provokes new understanding or open new perspectives for artisans.

2.1 Collaborative Dynamics in Design and SMEs' Craftsmanship: The Role of Co-Creation and Outsourcing Production

The transmission of artisanal knowledge has traditionally been based on apprenticeship systems within guilds and communities of practice (Sennett, 2008). More recently, some artisans have begun to operate within academic contexts, contributing an insider perspective to the analysis of professional practices and studio creation processes (Groth, 2015; Mäkelä, 2016; Niedderer, 2012; Nimkulrat, 2009, 2012). However, the literature on collaborative dynamics within professional artisanal practice, particularly in the context of co-design and co-creation, remains limited.

Pirita Seitamaa-Hakkarainen and her research group have explored co-design in artisanal and design processes, although most of these studies have been conducted in educational settings (Härkki et al., 2016; Lahti et al., 2016). Other significant contributions come from the work of Anne-Louise Bang, who has explored textile design through participatory approaches based on dialogue and play (Bang, 2010; Bang & Christensen, 2013), and from Arild Berg's research, which analyzed collaboration in ceramic art, highlighting how it strengthens not only the artistic integrity but also the personal and professional integrity of the participants (Berg, 2014).
In product design and industrial design, knowledge of materials and production techniques is crucial. However, given the increasing complexity of manufacturing processes, designers cannot always possess specialized knowledge of all production stages. Consequently, outsourcing to artisanal professionals has become a common practice, involving a process of mutual learning: on the one hand, the designer must understand the properties and limits of the materials; on the other, the artisan must assimilate the design intent, including the desired style and atmosphere.

A key element in co-creation processes is the sharing of project authorship. However, as highlighted by Groth and Berg's studies, in some contexts, salaried remuneration can lead to the relinquishment of authorship by the artisan. Designers may exhibit a certain mistrust of the artisans' intrinsic motivation and their responsibility for the project's success. This issue has also been observed in other creative sectors, such as the film industry, where co-authorship between screenwriters and directors develops through an ongoing collaborative process (Pelo, 2010). A similar model could be applied to the relationship between designers and artisans, emphasizing the recognition of each actor's contributions, similar to the credits in a film or academic citations.

Outsourcing production to artisans also raises questions related to professional identity and project authorship, which often remains attributed to the designers. Co-creation relies on a balance of mutual trust and the recognition of each collaborator's contribution. The quality of the final output is subject to negotiations, as there are variable quality standards shared among the different actors involved. For the process to be effective, clear and real-time communication is essential, especially when adjustments are required by design or production constraints. The direct involvement of designers in the manufacturing process is, therefore, a key element in facilitating an understanding of the necessary changes and promoting the sharing of experiential knowledge of the production process.
An interesting boost to the development of this relationship and the roles in this negotiation process can be seen in the growing demand for transparency from consumers in the apparel and food industries. Knowledge of the origin of materials and ethical production standards influences the relationship between consumers and brands,

as well as the perception of the company's social responsibility and that of the individual actors involved (Nguyen et al., 2015).

3. Case Study: The Italian Context and Santa Croce Sull'Arno District

In the production process of the design and fashion system, the Italian leather tanning industry stands out as a sector of absolute significance. Furthermore, this production system offers an interesting insight into the relationships between the design departments of large corporate brands (e.g., LVMH, Kering, Prada, etc.) and the manufacturing districts. According to the 2023 report on the Italian Leather Industry by UNIC (Italian Leather Union), the national tanning industry employs 17,882 people, consists of 1,139 companies, and has an annual average turnover of 4.3 billion euros. Within this productive context, 4.1% of the production is destined for the apparel sector, 33% for footwear, 31.1% for leather goods, 15.7% for automotive applications, 13.7% for furniture, and 2.4% for other productions. The regions most characterized by this production sector include Veneto, with 8,538 employees, Tuscany with 5,956 employees, Campania with 1,937 employees, and Lombardy with 912 employees.

The leadership of the S. Croce sull'Arno Industrial Leather District is summarized by its production capacity (accounting for 30% of Italy's leather production and 98% of the sole leather production), the scope of its export activities (almost 70% of the total turnover comes from foreign sales), and its environmental achievements (over 98% of the total pollution load produced by the companies in the area is treated). This success is attributed to a nearly unique philosophy in the world: district-based management. This concept translates into the centralized management of all tanning-related activities, including organizing trade fairs, promotional initiatives, and addressing the most critical challenge: the environmental impact of industrial production.

The first tanning activities date back to the first half of the 1800s. After World War II, the industry expanded and became integrated into the urban fabric of the municipalities within the district. This area has always been linked to leather tanning, with origins in craftsmanship, where small tanneries initially operated within homes in rural villages. Over time, production expanded, leveraging new technologies and gaining increasing importance in reference markets. The process of relocating production facilities—from urban centers to newly established industrial zones—began in the 1970s, marking the start of industrialization through a strategy developed by local public administrations in close collaboration with businesses, represented institutionally by their trade associations. It was during this period that the concept of district-based operations began to take shape, fostering a unified spirit among entrepreneurs to tackle the most pressing issues in their activities. Trade associations gained operational strength, representing companies at the institutional level and providing the district with specialized knowledge to address emerging challenges (Consorzio Vera Italiana Pelle Conciata al Vegetale report 2023; Vallini, 2013).

3.1 The Sustainability Challenge and Vegetable-Tanned leather

On one hand, the strength of the S. Croce sull'Arno Industrial Leather District can be attributed to the remarkable production capacity of its companies. On the other hand,

the value gained in international markets by Tuscan tanneries lies in the philosophy with which central issues of leather tanning activities have been addressed. The reference here is to the environmental issue, without which it would not have been possible to continue this type of production. Making development sustainable became necessary when the Italian government decided to establish concrete and essential regulations for environmental protection, setting inviolable parameters for pollution produced by companies.
Rather than equipping each company with an individual purification system, the district-based philosophy suggested creating specific solutions for each problem posed by leather production. This is why there are two treatment plants in the area, which receive the wastewater from all tanneries every day, treating them as if they were a single discharge. This is also why in the S. Croce sull'Arno Industrial Leather District, companies are dedicated to the recovery and disposal of the so-called "by-products" of the tanning industry. The creation of this network of companies specializing in decontamination was made possible by the concerted efforts of public institutions and leather entrepreneurs, who, through their trade associations, addressed the situation.
The large and complex initiatives carried out by the sector in this area were entrusted to the following organizations:

- Consorzio Aquarno: Wastewater treatment plant.
- Ecoespanso: Design, construction, and management of a plant for processing the sludge produced by the district's treatment plants.
- Consorzio Cuoiodepur: Management of the purification plant servicing the tanneries.
- Consorzio Recupero Cromo: Collecting chromium-bearing wastewater for the extraction of chromium.
- Hydro SpA: Transforms animal by-products from leather processing (fleshings and trimmings) into hydrolyzed proteins, fertilizers, and technical products for agriculture.
- Polo Tecnologico Conciario (PO.TE.CO): Since 2002, it has been working in research, training, innovation, and technology transfer; thanks to its experience in the sector and the skills and professionalism gained over the years, PO.TE.CO supports companies in the leather industry by providing its human and technological resources (Consorzio Vera Pelle Conciata al Vegetale, 2023 report).

One of the most successful outcomes of this strategy was undoubtedly the recovery and "regeneration" of a traditional tanning practice from the district, which exclusively used vegetable-based leather treatment substances and excluded chemically intensive processes with significant environmental impact. "Vegetable-tanned leather" is the result of an ancient artisanal process, passed down through generations with minimal changes, based on natural materials: hides, tannins, fats, oils, and natural proteins. This innovation, which bridges the past and the future, has achieved significant market success, placing the district at the center of interest for international brands and players in global leather production. As the President of the Consortium, Leonardo Volpi, explains: "Vegetable-tanned leather is a niche product for high-quality, durable goods, with an average annual turnover exceeding 130 million euros, and an export share of 55%."
A centuries-old concept of circularity, that of vegetable tanning, has always been based on natural products, preserved for centuries by Tuscan master tanners. While continuously evolving, without renouncing its origins, today the production process is moving towards zero waste: hides, scraps, and trimmings can be transformed into

agricultural fertilizers with high carbon capture performance. The research conducted by Ars Tinctoria, a chemical research laboratory on tanning techniques established in the S. Croce sull'Arno district, has developed an innovative method for measuring the carbon content derived from biomass and the presence of petroleum derivatives in any type of organic material through SCAR spectrometry, a cutting-edge technique implemented in collaboration with PPQ Sense (a spin-off of the National Institute of Optics). This research has measured the bio-based carbon content and the presence of petroleum derivatives in samples from tanneries in the Tuscan district, comparing them to those in alternative materials. The research confirmed that the analyzed leathers, treated with plant extracts according to the production guidelines of the Consorzio Vera Pelle Italiana Conciata al Vegetale, achieved bio-based carbon content of around 95%, placing them in the highest range (80% - 100%) of contemporary biological materials such as cotton and wool, compared to an average of 25% in so-called sustainable alternative materials made from cactus, pineapple, apple, or other plant-based sources (Consorzio Vera Pelle Italiana Conciata al Vegetale, 2023 report).
The Consorzio Vera Pelle Italiana Conciata al Vegetale, which has been promoting the tradition of vegetable-tanned leather in Tuscany since 1994, has implemented a series of initiatives to address sustainability comprehensively: research, a production code for its members, and a communication campaign. This promotion primarily focuses on the designer-manufacturer relationship, involving large corporations that commission production, associated designers, and SMEs within the district's production cluster.

3.2 The Workshop Program on Vegetable-Tanned leather

Aligned with the mission of the Consorzio Vera Pelle Italiana al Vegetale, since 2014, the Consortium has curated a series of specialized workshops aimed at fostering an in-depth engagement between emerging designers from leading international design and fashion schools and the technical, material, and aesthetic properties of vegetable-tanned leather. These initiatives extend beyond traditional educational frameworks by integrating site visits and immersive design residencies at the Consortium's headquarters, facilitating direct interaction with the distinctive material culture and production expertise of the Santa Croce sull'Arno tanning district.
This program strategically seeks to bridge the existing gap between design education and the technical complexities of vegetable-tanned leather, incorporating the latest advancements in chemical research and production methodologies within the district. The active involvement of companies affiliated with the Consortium further enriches the initiative, as artisans and manufacturers contribute their expertise, providing young designers with direct exposure to the intricacies of craftsmanship.
The overarching objective of these workshops is to cultivate a collaborative paradigm between designers and producers while fostering a deeper understanding of artisanal practices among emerging professionals who will later assume key roles within design and fashion industries. By enabling designers to engage with the often implicit and otherwise challenging-to-grasp nuances of traditional craftsmanship, the initiative not only enhances material literacy but also promotes sustainable design innovation.
From 2014 to 2023, these workshops have yielded significant outcomes, generating collaborative design processes and fostering the co-development of prototypes that reflect both contemporary creative exploration and the enduring value of traditional manufacturing expertise within the district's SMEs.

As part of the 2015 workshop, the work by Maria Sole Ferragamo, representing Central Saint Martins with the collection Cutting Edge, gained significant importance. The designer is also the founder of the project SO-LE STUDIO (https://so-le-studio.com/). The work presents an explorative journey through the materiality of vegetable-tanned

leather, utilizing a jewelry designer's perspective and approach to revisit three traditional women's garments. These garments originally served as shields for protection, now reimagined within the intimate relationship a wearer forms with a product that ages alongside them, telling a personal story.
"Leather remains in its natural state" Ferragamo says "and stretch is achieved through cuts. The process "cut-wet-stretch-mould-dry" serves an aesthetic purpose, opening the cuts to reveal a subtler materiality. The same processes are applied with a structural necessity, as the entire piece is supported solely by the rigidity of the leather strips.

Fig. 1 - Maria Sole Ferragamo, *Cutting Edge Collection*, 2015 (source: Consorzio Vera Pelle Italiana Conciata al Vegetale)

As part of the 2016 workshop, Kira Goodey, representing the Royal College of Art, presented the collection *Orlandi's Opera*. The designer currently provides consultancy services for prominent design brands in the fashion system (https://www.kiragoodey.com/). In 2021, she created leather shoes (made from vegetable-tanned leather) for Iris van Herpen's collection (https://www.kiragoodey.com/archive/iris-van-herpen-ss21-couture-roots-of-rebirth).
As expressed by Kira Goodey:
"Working with veg-tanned leather was a new and deeply rewarding experience for me. Throughout Craft the Leather, we gained an intimate understanding of all aspects of the leather – from material properties and manufacturing to its cultural significance in the Tuscan region and the measures necessary to minimize environmental impacts. Such a profound insight into a material fosters a personal emotional relationship and, with that, a deep respect. Working with the leather was so much more than merely handling the raw materials, although the unique properties of veg-tanned leather – its ability to be sculpted, molded, colored, finished, made hard as wood or soft as velvet – allowed the material itself to shape the design process." (Source: Consorzio Vera Pelle Conciata al Vegetale).

Fig. 2 - Kira Goodey, *Orlandi's Opera*, 2016 (source: Consorzio Vera Pelle Italiana Conciata al Vegetale)

Another interesting example of the relationship between the properties of vegetable-tanned leather and design processes was undoubtedly represented by the work of Balbina Brunell, representing Parsons – The New School, during the 2023 workshop, where she presented the collection *An Analogy of Tarnished Culture*. Indeed, the collection fully expresses the technical properties of vegetable-tanned leather, particularly with a focus on the potential of vegetable-tanned leather in evolving and transforming.

Fig. 3 - Balbina Brunell, *An Analogy Of Tarnished Culture*, 2023 (source: Consorzio Vera Pelle Italiana Conciata al Vegetale)

Another interesting project presented during the 2023 workshop was by designer Shiyu Gong, representing the London College of Fashion, with the collection *Wearing Etiquette*. The fabrication techniques used include wet-moulding and weaving leather in combination with bamboo. The designer focused on how the leather transforms from being moulded and stitched over the form of human hands and seamlessly shifts into an open weave with bamboo tips. Working with leather SMEs has taught the designer the benefit of crafting with quality, where material manipulation is fluid, and the surface remains smooth and delicate.
In the product design sector, another area that significantly involves the production of vegetable-tanned leather, we highlight the work of Korean designer Junsu Kim, who

participated in the second edition of the workshop in 2013. Junsu coils and piles up leather strips of different thicknesses and lengths to form a shape. He then finishes by polishing or lacquering the surface. The designer works with vegetable-tanned leather, so the surface can be smoothed by friction, deformed by water, and tanned and darkened by sunlight. Despite being processed, this material retains vitality. He prefers cowhide because it has a denser and stronger tissue than other leathers (https://www.homofaber.com/en/discover/junsu-kim-leatherworking-korea-republic-of). Junsu presented a leather vessels collection at the Homo Faber exhibition in Venice (Italy) in 2024. He has collaborated with relevant international luxury brands such as Loewe (https://theroom.loewe.com/en/artists/junsu-kim/; https://loewe.craft.prize.staging.makemepulse.com/en/artists/junsu-kim).

4. Discussion: A Systemic and Material Perspective on Innovation in the Santa Croce District

4.1 Dormant Resources and Systemic Innovation in the Vegetable Tanning District of Santa Croce sull'Arno: A Theoretical Interpretation

The concept of dormant resources—understood as latent resources that are not immediately visible or utilized within a productive system—offers a valuable theoretical lens for interpreting innovation dynamics within traditional manufacturing districts (Goretti, 2023). According to a systemic and transformative approach to design (Manzini, 2015), these resources can be activated through co-design practices, intersectoral collaboration, and the valorization of tacit knowledge, thus contributing to the transition toward more sustainable and resilient models.

In the context of the vegetable tanning district of Santa Croce sull'Arno, at least four categories of dormant resources can be identified:

- Leather processing waste, which is currently treated as a disposal material but could be upcycled or transformed into bioproducts for other sectors (e.g., cosmetics, bioenergy, innovative textiles);
- Local artisanal know-how, often informal or non-codified, which could generate high value-added outcomes if integrated with contemporary technologies;
- Intersectoral collaborations, still underexplored, involving designers, agronomists, and biotechnologists in the creation of hybrid materials and circular solutions for the sustainable fashion industry;
- Agricultural residues from the local area, such as chestnut peels or olive leaf extracts, which could serve as sources of natural tannins to enhance the environmental sustainability of tanning processes.

The activation of such dormant resources is not linear; it requires the construction of an open territorial innovation ecosystem grounded in knowledge sharing and co-creation processes. This aligns with the Living Lab approach and the notion of glocal districts (Asheim & Gertler, 2005; Hillgren et al., 2011), in which transformation occurs through the interaction between local actors and global networks.

The Santa Croce sull'Arno district can thus be considered a paradigmatic example of a "glocal" productive ecosystem, capable of maintaining strong territorial embeddedness while responding to global dynamics through open production, distribution, and collaboration models. Within this framework, designers act as "cultural enterprises" (Arquilla et al., 2011), generating new design scenarios and hybrid value propositions.

A further theoretical contribution comes from new materialism, which challenges anthropocentric paradigms in design and recognizes the agency of materials. Bennett (2010) describes materials as "vibrant actants" that exert influence over creative processes, while Coole and Frost (2010) emphasize that the interaction between matter and human intentionality can lead to unpredictable effects. In this light, vegetable-tanned leather should not be seen merely as a passive substrate but as an active design agent whose agency shapes both form and function, as argued by Malafouris (2008) and Bolt (2007, 2013).

This perspective reinforces the notion that innovation in traditional districts is not only technological but also cultural, epistemological, and methodological. The reactivation of dormant resources through systemic design may thus represent a strategic lever for the future of Tuscan craftsmanship—not as a heritage to be preserved, but as a dynamic platform for material and social experimentation.

4.2 Co-creation and Innovation in the Leather Tanning Supply Chain: Insights from the Workshop

The design workshops conducted with students and local leather artisans within the vegetable tanning district of Santa Croce sull'Arno provided an opportunity to investigate the latent potential of dormant resources, through the lens of co-creation. This section draws on a case study approach (Yin, 2017) and connects the empirical findings to the theoretical framework of

new materialism (Bennett, 2010; Bolt, 2007, 2013; Coole & Frost, 2010; Malafouris, 2008), focusing on the interplay between design processes, material agency, and systemic innovation.

First, the workshops foregrounded the role of experiential knowledge exchange. Students engaged directly with vegetable-tanned leather, adapting their design proposals based on the affordances and limitations of the material. This tactile and iterative process encouraged a situated form of learning (Schön, 1983), through which the students developed an embodied understanding of the material's behavior. Importantly, this led to a reconfiguration of the design authorship, where the initial concept was continuously negotiated and reshaped in dialogue with artisans. As Hennessy and Murphy (1999) argue, such collaborative processes—while challenging—enhance the quality and adaptability of design outcomes. The resulting artefacts cannot be attributed to a single author but rather emerge from the entanglement of practices, knowledge, and materials.

Second, the co-creative dynamic between students and artisans revealed critical insights into the activation of dormant resources. The tacit and situated knowledge of local artisans—often excluded from conventional design processes—was brought to the forefront and translated into innovative outputs. This aligns with the view that dormant resources are not merely underutilized but require specific socio-material conditions to be activated (Manzini & Rizzo, 2011). Furthermore, the workshops highlighted how new design perspectives can function as catalysts for reinterpreting traditional practices, generating hybrid solutions that bridge material tradition and contemporary innovation.

Third, the workshop setting acted as a prototype for an open innovation ecosystem, where knowledge circulation and collaborative practices were facilitated across disciplinary boundaries. This resonates with Arquilla et al. (2011), who position the designer as a pivotal figure in the orchestration of new service-product offerings and innovation scenarios within complex production environments. In Santa Croce sull'Arno, the iterative and reflexive character of the workshops fostered resilience, supporting the tanning district’s capacity to navigate contemporary challenges in sustainability and competitiveness.

In sum, the workshops exemplify how co-creation can contribute not only to product innovation but also to a deeper understanding of systemic and cultural transformations. By valorizing latent material and human resources through design, these practices reinforce the notion of design as a mediating and transformative activity, capable of shaping more sustainable and context-sensitive industrial futures.

5. Conclusions

The analysis conducted highlights both challenges and opportunities within the collaborative dynamics between designers and artisans. One key issue is the failure to value the role of artisans by designers, who often appropriate the authorship of the project without acknowledging the decisive contribution of artisanal skills. This situation is widely discussed, but concrete solutions to overcome it remain scarce. Therefore, it is necessary to develop new

business models that go beyond simple outsourcing of production, recognizing the artisan not only as an executor but as an innovator and co-author of the creative process.

Artisanal skills represent a dormant resource, as they are often tacit, intangible, and complex, as well as interdisciplinary. Their valorization requires more effective communication strategies from production districts, similar to those already employed to promote traditional materials, such as vegetable tanning in the Santa Croce sull'Arno district. In this sense, studying artisanal expertise from an interdisciplinary perspective is crucial today (Gibbons, 1994). Analyzing the challenges and potentials of collaboration can help identify new methodologies to enhance the experiential knowledge of the artisan and their material agency.

Recent studies on co-creation confirm that the success of a project heavily depends on the relationships between participants (Greenhalgh et al., 2016). However, while in service co-design, mutual trust and shared responsibility are enabling factors (Pirinen, 2016), it remains to be verified whether these elements are equally effective in the manufacturing context. The case of the Santa Croce sull'Arno leather district, analyzed in this study, highlighted how interactions between designers and artisans are often characterized by a disconnection between design expectations and material realization.

One of the most critical aspects concerns the measurement of reciprocal learning in the co-creation process. The ineffability of tacit knowledge has led researchers to develop strategies for obtaining reliable evidence by analyzing the production environment as a context imbued with intuitive understanding of the phenomenon. A possible methodology involves participatory observation to identify key moments in the collaboration process—those "experiential momentum" moments that allow the project to progress. These moments, often unspoken, constitute implicit awareness and can be analyzed from theoretical, creative, or narrative perspectives, becoming deeply integrated into the design process.

DESIGNING BEYOND SPECIESISM: EMBRACING MULTISPECIES CULTURES IN INSECT BIOREFINERY.

Cecilia Padula*[a], Silvia Barbero[a]

[a]Department of Architecture and Design, Politecnico di Torino, (TO), Italy

*cecilia.padula@polito.it

ABSTRACT | Development is not a neutral phenomenon; thus, an ethics of care framework is essential for addressing complex challenges in sustainable organisations. Insect Biorefinery (IB) for feed and food is often promoted as a sustainable solution to upcycle nutrients from food loss and waste but faces significant challenges. Many existing IB organisations exhibit speciesism—prioritising certain species (mammals primarily) over others (insects)—while relying on one-size-fits-all solutions that overlook diverse ecological and social contexts in which they operate. This approach undermines the principles of democratic practices, which emphasise participation, representation, and respect for all stakeholders, including nonhuman entities.
This research investigates how designers can develop more inclusive business models by co-creating with multispecies agencies to pursue equitable development. The core hypothesis is that applying a speculative capabilities approach to multispecies justice can establish objectives in designing IB organisations.
Our ongoing study focuses on scaling IB within Europe, discussing (1) Black Soldier Fly capabilities in natural and artificial habitats through multispecies storytelling and (2) overlooked human situated knowledge via speculative co-fabulation.
Central contributions are:

1. Identifying multispecies and autobiographical approaches as tools for challenging speciesist narratives;
2. A framework to co-design with multispecies cultures;
3. Synthesis and ranking of competing designs for democratic IB.

KEYWORDS | MORE-THAN-HUMAN DESIGN, MULTISPECIES STORYTELLING, ETHICS OF CARE

1. Introduction

The current ecological crisis and the increased exploitation of nonhumans have generated renewed interest in studying the multiple modes of existence between humans and nonhumans. Concepts such as *Cosmopolitics* (Stengers, 2005; Latour, 2007), the P*arliament of Things* (Latour, 2005; Simons, 2017), *Correspondence* (Ingold, 2017), and *Zoocialisation* (Petitt & Brandt-Off, 2022; Coppola, 2023), among others, contributed to changing understanding of the nonhumans' social and political agency, leading scholars to move from ethical to political frameworks in thinking about the position of nonhuman animals, interspecies relations, and multispecies cultures in organisations (Meijer, 2023).

Following the ontological centering of the nonhumans, designers have increasingly reflected on expanding participation in participatory design to include the voices of nonhumans in the design process (Haldrup et al., 2022). Despite this, few studies have addressed the epistemological challenges associated with the ontological turn (Tironi & Hermansen, 2018). These studies typically follow two main strands: (1) exploring experimental tools that extend the subject condition to nonhumans and (2) examining how nonhumans contribute to the design process. This study aligns with the first research strand.

From existing interdisciplinary literature on ethical leadership, environmental geography, feminist theory and participatory design on multispecies relationality, it is clear that the extent to which non-humans contribute to the design process is related to the space given to negotiate values and goals (Braidotti, 2006; Latour, 2007; Haraway, 2008; de la Bellacasa, 2010; Howard & Melles, 2011; Monahan, 2012; Hartog, 2015; Mitten, 2018; Tironi & Hermansen, 2018; Hansson et al. 2018; Fry et al., 2022; Cusworth, 2023; Mejier, 2023; Stavropoulou et al., 2024). Within the organisation, the dimension of this space has to do with the form of leadership involved in this process and how it affects the self-concept and beliefs of others (humans) (Monahan, 2012; Hartog, 2015; Fry, 2022). Ethical leadership is a value-driven form of leadership that involves the process leader's personal, political, and professional aspects, as it has been perceived as a behavioural style in itself (Hartog, 2015).

Adopting a social influence perspective, this article considers designers' activist and mediator roles (Hansson et al., 2018) in "*speaking for the living*", accessing their knowledge and materialising it in design processes. Cultivating the ability to discern nonhuman vitality (Bennet, 2010) through prototyping (Tironi & Hermansen, 2018) and multispecies storytelling (Westerlaken, 2021), designers as activists can glimpse space of correspondence in which beings respond to one another in gestures of care and attentiveness (Ingold, 2017). Designers, as mediators, can balance human and nonhuman perspectives in their political relations mediated by technology, conceived as media in the *medianaturecultural* continuum (Braidotti, 2016).

As such, this study demonstrates the role of designers in shaping ethical leadership in the *medianaturecultural* continuum of Insect Biorefinery (IB), able to eradicate old ways of practising technological mediation and make room for new ways in which the human-nonhuman relationship is shaped to lower suffering for nonhumans.

In the following, we first reflect on (1) the ontological turn "beyond the human" in sustainability discourse, (2) the role of designers in shaping humans-nonhumans relations in technology use, and (3) the challenges of husbandry dynamics in Western metaphysics.

Next, we present an empirical analysis of ongoing Ph.D. research on establishing interspecies democracies within European IB organisations, which involves prototyping and storytelling practices.

2. Ethics and Politics in Insect Biorefinery

2.1 Sustainability and Ethics in Multispecies Context

Development is not a neutral phenomenon but is deeply intertwined with socio-political dynamics and ethical considerations. Sustainability is a contested issue in science, and it concerns what it entails for organisational and societal practice (Latour, 2004). Sustainability is a matter of creating dialogues that creatively create new practices. This involves grounding sustainability in participatory practices and inter- and intra-multiple context goals (Chabay et al., 2019; Guske et al., 2019).

Sustainability narratives play a pivotal role in shaping decision-making processes within local systems, influencing stakeholder interactions, supporting paradigm shifts, and facilitating the integration of sustainability practices into the cultural fabric of the system (Veland et al., 2018). These practices, in turn, significantly impact the sustainability performance of the local system and its broader contribution to global environmental and social well-being. The fluid and evolving nature of narratives fosters a more comprehensive understanding of sustainability, encompassing multiple perspectives that contribute to effective problem-solving in the face of complex challenges (Veland et al., 2018; Guske et al., 2019).

Indeed, narratives significantly shape human comprehension and our ability to imagine and achieve transformed futures within sustainability. Examining the variation and conflicts between sustainability narratives reveals that they are not necessarily based on evidence and precise categories but can be vague and ambiguous to be acceptable and attractive to different actors (Guske et al., 2019). This emphasises the need to critically analyse and understand the power of narratives in entrenching old ways of thought and practice and making space for new ones (Louder and Wyborn, 2020).

Sustainable Development Goals (World Commission on Environment and Development, 1987), the Triple Bottom Line (Elkington, 1997), the Planetary Boundaries Approach (Rockström et al. 2009), and the Doughnut Economy (Raworth, 2017) are some of the most prominent frameworks of sustainability narratives (Jørgensen, 2024). While these models have driven significant advances in sustainability practice, they remain limited in their ability to challenge speciesist assumptions that prioritize human interests over those of other species.

Speciesism -the discrimination against nonhuman species - poses a significant ethical challenge within sustainable development. It reflects a broader societal tendency to prioritise human interests over those of other species. In this, multispecies conflicts are ontological: they are conflicts over life itself, as they essentially challenge modes of existence (Tassinari et al., 2020; Coppola, 2023).

Addressing speciesism requires a paradigm shift in how we perceive our relationship with nonhuman, advocating for a more inclusive approach that recognises the rights and needs of all species (Otero et al., 2020; Moranta et al., 2022). The changing understanding of nonhuman animals' social and political agency and their increased exploitation have

led scholars to move from ethical to political frameworks in thinking about the position of nonhumans, interspecies relations and multispecies organisations (Mejier, 2023).

Increasing calls to re-conceptualise human relations with nonhuman agencies in the Anthropocene has sparked a range of multispecies studies seeking to de-centre humans to focus on the lives and struggles of nonhumans, outlining an engendering narrative of sustainability (Jørgensen, 2024). However, acknowledging the relationships between humans and nonhumans does not necessarily mean granting equal ethical claims to both. Fry et al. (2022) argue that while an ontological focus on the nonhuman highlights our acknowledgement of interconnectedness, it does not imply political equality. In fact, integrating nonhumans into design processes presents unresolved ethical challenges since existing interspecies design ethics place humans in an exceedingly powerful position (Parker et al., 2022).

Choosing which entities to consider in multispecies relations and how to mediate these relationships is deeply personal and political, and no existing framework can determine it. Instead, it is an ongoing negotiation, reflection, and adaptation process based on the specific modes of existence in which these relations unfold (Fry et al., 2022).

2.2 The Role of Designers as Ethical Leaders in Multispecies Organisations

While technology discourse on morality envelops on defining technologies as media without morals, which mediating roles of human-nonhuman relation depend on how they are used and how they allow unforeseen mediations to emerge; an increasing number of designers and researchers agree that design is not neutral in the world, but rather argue that design is political in shaping relations and interactions in technology use through story-making (Juul Søndergaard, 2018; McIntyre-Mills et al., 2023; Dunne & Raby, 2024).

Various scholars support this notion and argue that design, as deeply connected to designing ways of being (Papanek, 1971), can act as a poietic force, facilitating transitions towards sustainable futures forcing political obsolescence (Rancière, 2010; Dixon, 2020; Coppola, 2023). This layer is where world-making practices like design express their poietic-ability to support democratic relations and interaction in times of planetary challenges (Coppola, 2023).

Akama (2012) emphasises the potential of design to foster democratic engagement and social change, particularly in contexts marked by ecological crises. Similarly, Coulton and Lindley (2017) highlight how design practices can stimulate participatory processes that empower communities to address pressing issues. Manzini and Margolin (2017) elaborate on this by discussing how design can catalyse social innovation, enabling collaborative efforts that transcend traditional boundaries. Rezai and Erlhoff (2021) also contribute to this discourse by illustrating how design can support the development of democratic practices in various societal contexts. Finally, DiSalvo (2022) discusses that designing experimental spaces not only challenge conventional civics, but they embody *"a staging ground that help[s] visions of society take form by activating the civic imagination through making and the use of made things".*

By framing design as a contextual and transformative political act in the *medianaturecultural* continuum (Braidotti, 2016), Hansson et al. (2018) consider designer roles - intervening, interacting, mediator, and activist - as technical functions and political choices that can reinforce or disrupt the status quo. As such, designers can take responsibility for developing experimental spaces for new ways of being in the form of ethical multispecies organisation, leveraging their roles as activists and mediators in a

social influence perspective that focuses on respecting the rights of all affected parties (Gini, 1998; Den Hartog, 2015) and aims to refrain from acts that harm others (Kanungo, 2001).

As we live in a participatory universe, designers as activists and mediators can shape organisational leadership by telling themselves and others multispecies stories (McIntyre-Mills et al., 2023). Storytelling - or story-making as a spatial and material practice (Jørgensen, 2024) - entails the view of being part of nature in such a way that it embodies all the agencies involved, expanding a sense of possibility. In this sense, designers lead others in shaping this human-nonhuman relationship (Mitten, 2018), incorporating diverse worldviews and objectives in synthesising competing designs and ranking them according to a priority ordering of objectives in decision-making (Sen, 2001).

However, it must be acknowledged that *"any practice of relation involves a constitutive violence"* (Ginn, 2014). As such, it must be acknowledged that in multispecies relations, care, harm, exclusion, and hierarchy are objectives with some directions (minimise or maximise) that are possible and can be necessary (Haraway, 2008). In the current animal-industrial system, animals' productive and reproductive labour is always heterodirected, extracted, used and exchanged and has nothing productive for the ecosystem. Haraway (2008), therefore, calls for a sharing of suffering and a responsible way of killing to lower suffering for others (Timeto, 2024).

By creating spaces for negotiating values and goals, designers can shape multispecies organisational leadership - as a relationship in which some people (designers) can persuade others (i.e. humans involved in decision-making) to adopt new values, attitudes and goals (Uhl-Bien, 2006) -, not neglecting inherent relational asymmetry but aiming to lower suffering for, paying attention to, cultivating openesses and sensitivity towards others (i.e. subordinate humans and/or nonhumans) involved, their way of being and bodily experiences.

2.3 Insect Biorefinery Dynamics and Multispecies Organisations

The political considerations surrounding multispecies relations evolve, requiring ongoing dialogue and critical engagement with the diverse realities in which these relations unfold, specifically those involving livestock, farming, hunting, and animal sacrifice (Fry et al., 2022), as animal matter is considered the challenge par excellence of Western metaphysics (Salzani, 2024).

Husbandry dynamics are characterised by power imbalances, where humans exert control over nonhuman animals. Mechanisation and technological advancements in farming have created a disconnect between farmers and livestock, diminishing the traditional bond of earlier practices (Buller et al., 2020). This shift fosters a culture of anthropocentric exploitation prioritising economic efficiency (Rossi & Garner, 2014), often leading to overlooked animal pain in routine husbandry (McLennan, 2018). Furthermore, animal exploitation practices are presented as natural, as if it were normal and inevitable that all animals are treated this way as subordinate and inferior (Filippi and Leghissa, 2024).

These dynamics are no different in the context of emerging breeding technologies. IB represents a niche innovation to upcycle food loss and waste, echoing the environmental salvation narrative (Slater, 2022), presenting several (anthropocentric) advantages over

traditional livestock farming practices, such as:

- Converts feed to animal mass with up to 80% efficiency, compared to traditional livestock, which typically converts only 10% (Peer et al., 2021);
- Emits up to 80% less greenhouse gas emissions per kilogram of protein produced than traditional livestock (cattle) (Pérez-Grisales & Soto, 2022; Oonincx et al., 2010);
- Requires up to 375 times less water than traditional livestock farming, making it significantly more water-efficient (Xie et al., 2024);
- Provides a food source of high-quality protein, essential fatty acids, vitamins and minerals (Zhou et al., 2022).

Moreover, insect-based feeds for livestock and pets have been shown to improve gut health and microbiota diversity (Biasato et al., 2020) and reduce the need for antibiotic growth promoters, thus enhancing their health (Patyra & Kwiatek, 2023).

The multispecies relationship in IB is asymmetrical and hierarchical, interlinked with broader issues of resource access and utilisation (Ghosal et al., 2015; Margulies & Karanth, 2018). IB is often performed as ideological narratives in the form of strategies that provide an opportunity to address resource upcycling and human, pet, and livestock well-being (see Dicke, 2018; Chia et al., 2019; Barragán-Fonseca et al., 2020; Hawkey et al., 2021). In this context, co-producing between humans and nonhumans is predicated on acts of killing. In the IB industry, insects are primarily perceived as entities to be exploited—raised and killed—often without regard for their agency or well-being. This contrasts with earlier practices where the agency of animals—and even insects—was recognised and valued, as exemplified in classical and vernacular Chinese narrative literature on insects (see Idema, 2019).

3. Methodology

This study synthesises and ranks a set of competing designs of interspecies democracies in IB through the notion of capabilities. This notion aims to ensure that living beings have fulfilled lives that account for animals' cognitive and social lives (Nussbaum, 2011). This study applies the capability approach in the context of ongoing Ph.D. research to explore interspecies design scaling opportunities for IB as a niche innovation (Figure 1).

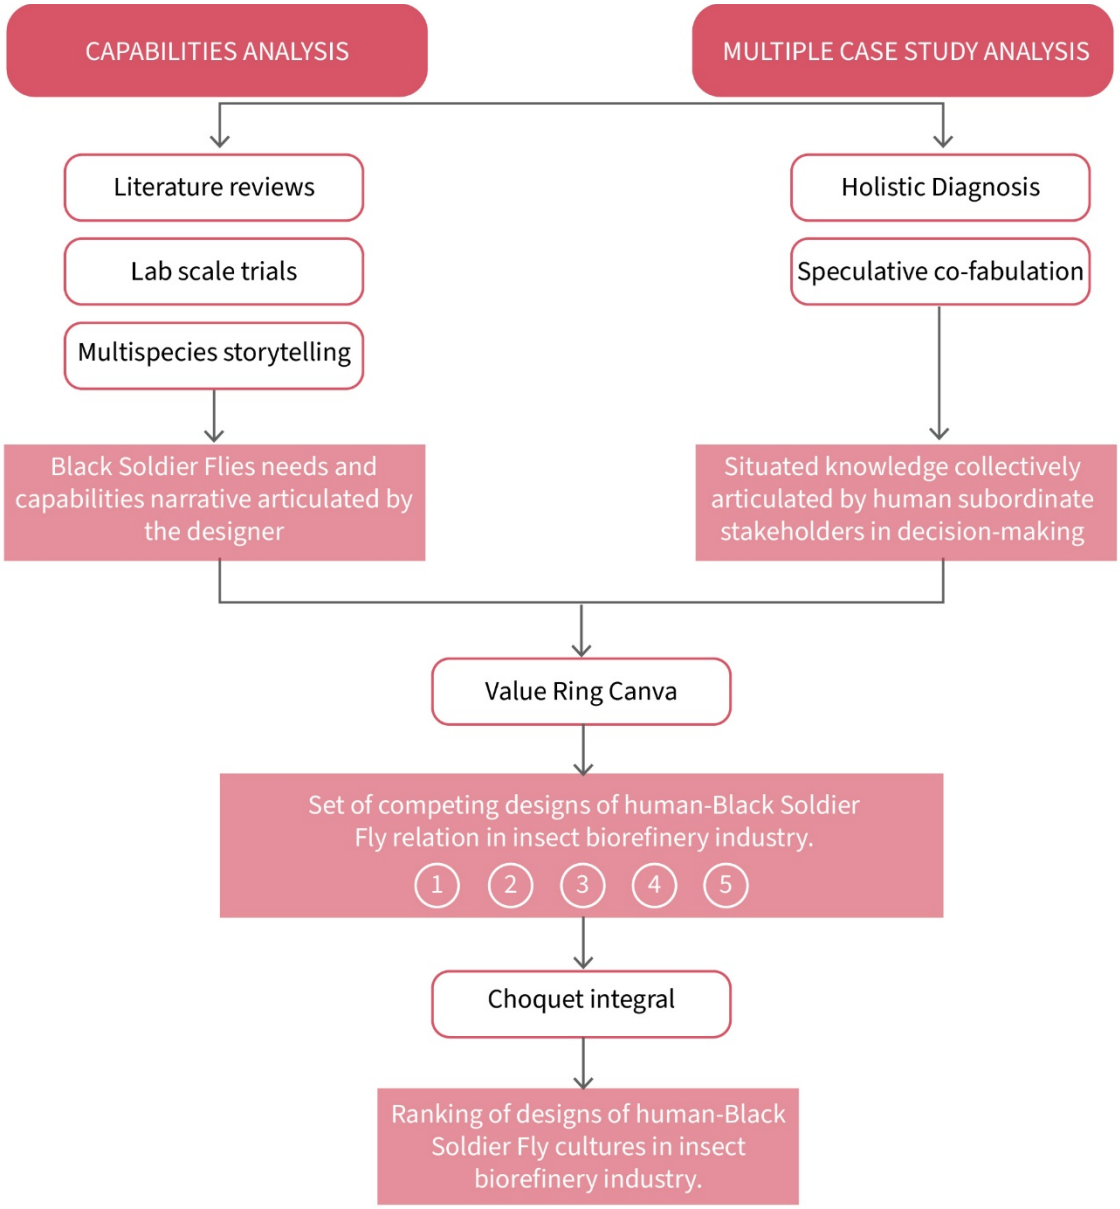

Figure 1. Research design methodology.

A capabilities approach investigates how principles of biomimicry can improve egg production in Black Soldier Flies (BSF) (Hermetia illucens) love-cages. Prototypes of artificial habitats are created in a laboratory environment (see Grosso et al., 2024). Consequently, a multispecies storytelling exercise examines the insects' needs and capacities, transforming this data into practical insights such as:

- Narratives for BSF that designers can advocate for in design projects;
- Requirements, performance metrics, and guidelines for constructing love-cages to allow BSF adults to express their capabilities fully.

The research analyses multiple cases, focusing on the interaction between IB sector and local contexts in Italy and Belgium. The primary aim is to develop a protocol that integrates nonhumans and autobiographical approaches (e.g., multispecies storytelling and speculative co-fabulation; see Padula, 2024) with established systems mapping methods (e.g., Holistic Diagnosis; Pereno & Barbero, 2020). This integration seeks to access and incorporate (human) situated knowledge and nonhuman narratives into the systemic design, advancing its ontological and epistemological commitment to pluralism (Vink, 2023; Meijer, 2023).

The designer employs an updated version of the Value Ring Canvas (Fernandes et al., 2018) as a mediating tool to converge BSF's needs and perspectives with (human) situated knowledge, collectively articulated by local stakeholders during a speculative co-fabulation process (see Padula & Barbero, 2023
), synthesising a set of designs (i.e., value logics) of human-BSF cultures in IB sector.

Finally, according to a decision tree analysis, the Choquet integral analysis (Bottero and Ferretti, 2011) allows for multicriteria assessment and ranking of the value logic from local stakeholders and experts (Figure 2). This method assigns weight to every possible set of criteria - including environmental, entrepreneurial ecosystem, socio-cultural, and economic dimensions - and computes a weighted average of the values of all the subsets. While the framework does not include a specific criterion for animal welfare, this reflects the intent to avoid reinforcing dualisms between human and nonhuman objectives (Latour, 2010).

For the higher level of the hierarchy (the criteria level), the evaluation of the criteria's importance refers to a political sphere and does not reflect strict objective and technical knowledge and thus involves local stakeholders. For the lower levels of the hierarchy (the attributes level), the evaluation has been performed by individual experts in their proper field of expertise. Local stakeholders and experts involved in the multicriteria assessment were informed about the post-anthropocentric approach adopted in the study, clarifying the meaning of each criterion, subcriterion and attribute.

This paper presents the capabilities approach results, focusing on the Italian unit of analysis.

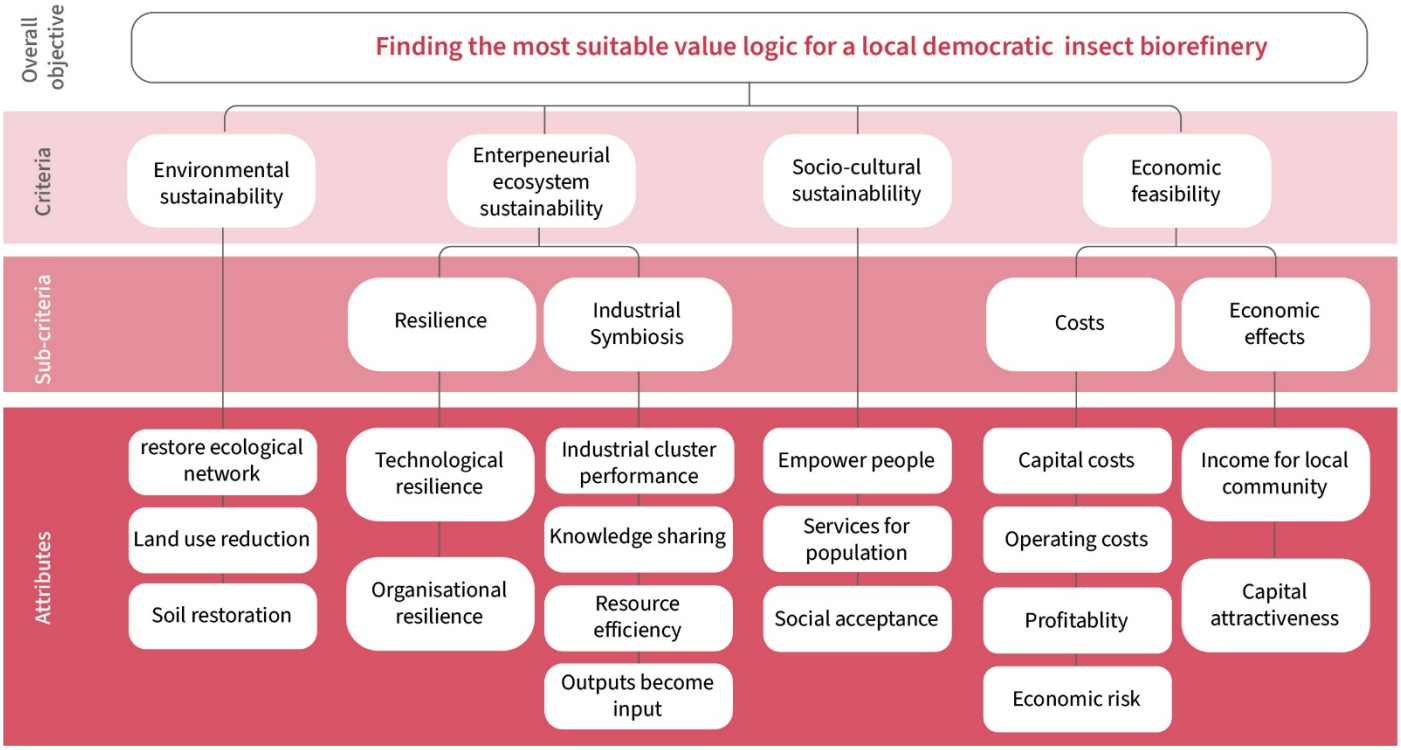

Figure 2. The decision model for the analysis involving 18 indicators clustered in four main criteria: environmental, entrepreneurial ecosystem, socio-cultural and economic aspects. Specific definitions have been assigned to each attribute, sub-criteria and criteria.

4. Results

The results section presents findings in three parts using tables and stories:

- Section 4.1 collects an array of BSF adults' capabilities, offering a baseline for future design in BSF love-cages;
- Section 4.2 presents an excerpt of the multispecies storytelling exercise conducted with BSF adults to prototype a place of correspondence;
- Section 4.3 reports the co-designed value logics as possible human-nonhuman relations in IB beyond current narrative,s and the ranking results from Choquet integral analysis.

4.1 Capabilities of Black Solider Flies: Insights from Multispecies Storytelling

This section describes the capabilities of BSF adults both in natural and artificial habitats as a baseline for future design. Following Parker et al. (2022), Table 1 classifies various capabilities relevant to BSFs and provides definitions and examples for each.

The BSF is a holometabolous insect, so during its life cycle, it performs complete metamorphoses. It passes through larval stages that are very different from the adult form, followed by a quiescent form (pupa), and finally reaches the adult stage. The different forms of the insect show obvious differences, which are not only related to morphology but also to physiology, different feeding habits, and general vital needs (Bonelli et al., 2019). The scope of this study is about the adult stage.

Adult *H. illucens* is about 16 millimetres long, mostly black with metallic blue or green on the thorax and a reddish end of the abdomen, with the second abdominal tergite having translucent zones. *H. illucens* is very similar in size, colour, and appearance to the organ pipe mud dauber wasp and its relatives, making it a mimic fly. The antennae of the fly (Pezzi et al., 2017) are elongated and wasp-like, and its hind tarsi are pale, similar to the wasp's. BSF larvae can be distinguished from those of the blowfly or housefly by a thin grey-black stripe on their posterior ends (ITIS, 2009).

In a natural setting, a female *H. illucens* lays between 500 to 1000 eggs at a time, usually deposited in crevices or on surfaces near decaying matter such as manure or compost (Georgescu et al., 2022). Significant variations are observed between natural and artificial settings: artificial conditions can lead to increased fecundity, with some females laying more than 1,000 eggs (Chia et al., 2018). In addition, traps/egg collectors of different shapes and materials are used in an industrial environment (Booth & Sheppard, 1984; Boaru et al., 2022).

Manipulating breeding environments can impact population dynamics. Several studies have focused on environmental conditions in love-cage as humidity (Holmes et al., 2012), temperature range (Chia et al., 2018), type of light, its photoperiod, and its colour temperature (Liu et al., 2022), and oviposition site preference (Booth & Sheppard, 1984; Julita et al., 2021). Other research reported as BSF reproduction was impacted by adult density and its sex-ratio (Hoc et al., 2019), fly age and size (Jones et al., 2021; Lemke et al., 2024), feeding of adults (Nakamura et al., 2016; Romano et al., 2020), and larval diet (Gobbi et al., 2013; Laursen et al., 2024).

Table 1. Capabilities of Black Soldier Flies (BSFs) adults in natural and artificial habitats.

Capabilities (Design targets)	Definition	Examples

Health	Live a normal length of life, in good health and free from bodily intrusion or violence, with opportunities to develop a full range of senses.	
Rest	Choose favourable resting sites.	Access to perching and resting areas within the enclosure that mimic natural preferences, such as branches or shaded areas.
Feed	Practice typical foraging strategies and choose food.	Access to suitable, diverse food sources such as decaying organic matter or specific substrates that allow for natural foraging behaviors.
Bathe	Access water to drink, clean self, or regulate body temperature.	Access to moisture sources or damp areas for drinking, grooming, and hydration maintenance.
Play	Access sources of pleasure, enjoy recreational activities, or have adequate sensory stimulation.	Providing varied textures and objects within the cage for exploration or sensory engagement.
Autonomy	Make own decisions and have freedom of movement.	
Move	Choose when and where to fly.	Sufficient open space within the enclosure for BSFs to fly freely, take off, and land at will.
Fledge	Access adequate structures to land on and gain independence.	Floating surfaces or landing platforms designed to allow BSFs to hatch after surfacing.
Disperse	Disperse into adequate territories and establish own range.	Large aviary space with minimal overcrowding to allow territorial settlement and space utilisation.
Defend	Defend territory.	Space within the love-cage to engage in behaviors associated with territoriality.
Affiliation	Form rewarding relationships with others and have choice of attachement to others.	
Socialise	Have connections with conspecifics of others.	Group rearing conditions that allow for natural social behaviors, such as aggregation or clustering.
Learn	Develop local knowledge and expertise based on interactions with conspecifics or others.	Situations in which flies can observe and mimic behaviors, especially in resource-locating or environmental navigation.
Mate	Find potential mates, court, and mate.	Availability of both male and female BSFs within the same enclosure to enable courtship and mating behaviors.
Egg deposit	Access potential deposit sites to incubate eggs.	Dedicated, accessible locations such as egg traps or organic substrates for females to lay and incubate eggs.

4.2 Story-making with flies

This section presents an excerpt of the multispecies storytelling exercise.

When discussing possibilities for engaging with animals, Deleuze argues for flies as surface animals, *lesser creatures,* that, through their apparent simplicity, provide a thought-provoking perspective for examining the intersections of human, technological, and non-human agencies (Filippi, 2024).

Our storytelling with BSF adults begins in the fall of 2022. We travel to BEF Biosystems' laboratory plant to commence our storytelling by engaging bodily with BSFs (Figure 3). It continues in the spring and summer of 2023 and 2024 in the pilot plant love-cage of 24 m³ in Casalnoceto, Alessandria, Italy (Figure 4).

Figure 3. The lab scale love-cages (0,3 m³).

> "Entering the aviary room, I am enveloped by a persistent hum, a chorus of wings brushing the air. The four corners of the structure reveal a sterile environment, illuminated by blue lights, and unwholesome (at least for me, a human). The humidity and the heat a heat pump produces make me breathing heavy, compounded by the flies' stench.
>
> I close the door. I sweat, calm my heartbeat, and kneel near a wall. We open the aviaries. BSFs do not naturally swarm, so it takes some time before they exit the cages and spread across the room. Their distribution is not uniform; they cover short distances, arranging themselves mid-air and on resting surfaces. Do they perceive their confinement as I do?

Before long, dozens of individuals land on me. They are small and show no fear of my presence, so much so that I could easily catch them if I wanted to. Do they perceive my warmth, my smell? Do they think I smell bad as I think they do? Do they recognise me as a valid or invalid surface to land on while waiting to mate?

And so, I watch them dance, their circular flights and sudden directional changes transforming the room into a stage—or rather, into a blue-lit courtship arena where all the males' energy is focused on competing for the females' attention." Field diary, November 16, 2022

Figure 4. The industrial-scale love-cage (24 m^3), showcasing the lighting systems and environmental enrichment elements. A researcher inside the cage provides a sense of scale, highlighting the anthropometric relationship. Behind the scenes of the photo-reportage Millenium Bugs by Luigi Avantaggiato, 2024.

This story about BSF adults does not aim to provide definitive answers but rather to raise questions about the relationships among species, technology, and designed environments.

In trials conducted in spring 2023, the environmental enrichment encouraged more significant egg deposition, leading us to believe this was due to a reduction in male competition and, consequently, a greater focus of energy on mating (Grosso et al., 2024) (Figure 4). The design choices, such as increasing resting surface area and creating shaded zones, appear to have encouraged the flies' natural behaviours, shaping a place of correspondence where the designer accesses and engages with the BSF culture.

But what does this mean for the flies in the organisation? What opportunities exist for designers who engage with flies to design responsible human-fly relations?

4.3 Emerging Value Logics for Multispecies Culture in Insect Biorefinery

Table 2 presents a set of competing designs of humans-BSF cultures as value logics in different relationship types, resulting from the Italian unit of analysis. The design process considered captivity and liminal BSF life conditions.

Today, artificial environments are essential to ensure optimal conditions for the survival of BSFs in the European climatic zone throughout the year. Indeed, during the winter, BSFs diapause, which corresponds to the slowing down of their metabolism until the environmental conditions (temperature and humidity) become favourable again (Ferdousi and Sultana, 2021). However, some modelling studies suggest that, following climate change, the suitability of the habitat for BSF would progressively increase in continents with high latitudes, such as North America, Europe and Asia, especially around the 40° N parallel by 2050 (Pazmiño-Palomino et al., 2022). This suggests that, in the near future, human-BSF relationships may develop beyond that of captivity in the European climatic zone.

Results from the Choquet integral (Table 3) report that the most desirable alternative is N°2, followed by N°5, N°1, N°3, and N°4. Hence, there is a reluctance to use alternatives that foresee the use of insect breeding products in the feed and food sector, whether they involve killing insects or not. This finding aligns with studies suggesting that ethical concerns and cultural acceptability significantly influence the perception of insect-based products in both human and animal diets (Delvendahl et al., 2022).

Conversely, the preference for breeding activities focused on soil restoration and recreational or educational initiatives suggests a societal inclination towards applications that align with environmental sustainability and non-intrusive practices respecting insect lifespans. These trends are consistent with emerging literature emphasising the increasing value of biodiversity conservation and non-harmful interactions with nature in agriculture systems (Sultana, 2021; Mejier, 2023; Fry et al., 2022; Nelson et al., 2024).

Finally, the economic feasibility criterion is not relevant. This may be because we are talking about hypothetical scenarios in which the concreteness of economic feasibility fades. This finding resonates with the broader discourse on sustainability transitions, where non-economic values increasingly shape farmers' decision-making processes (Maréchal, 2018; Hayden et al., 2021).

Table 2. Human-Black Soldier Fly (BSF) cultures and their potential impact on BSF capabilities in captivity relationship. Definitions of human-nonhuman relationships are given.

N°	Relationship	Examples of human-BSF cultures (value logic)	Possible impact on capabilities
	Captive	Captive refers to animals that live among, depend on, or are confined by humans. Captivity provides some health benefits but risks diminishing the BSF's ability to exercise autonomy or maintain affiliation with the colony.	
1	Labour	Human urban farming users contribute their by-products and organic waste free of charge to the operators. These are then processed and used as a diet for BSF larvae. The larvae are then raised until they reach optimal size and	BSFs do not live a normal length of life. Enclosure reduces autonomy.

	harvested to be used as high-protein feed for poultry in urban farming systems. Finally, frass is repurposed as high-quality organic fertiliser in the urban farm.	
2 Labour	A temporary BSF greenhouse is set up in contaminated soil to cultivate Black Soldier Flies (BSF). Organic by-products such as agricultural residues, food waste, and plant material are deposited inside the greenhouse. The BSF larvae feed on these waste materials, decomposing them and converting them into nutrients that benefit the soil. This decomposition process enriches the soil with essential nutrients. After a defined period, necessary for the restoration, the service provider dismantles the greenhouse.	Enclosure reduces autonomy. BSFs live a normal length of life. However, the colony has a limited lifespan.
3 Labour	In BSF greenhouses, BSFs are housed in environments replicating their natural habitat by incorporating native plants and vegetation. These settings allow the flies to freely exhibit their natural behaviours, interact with plant species. Egg traps are placed within the environment to collect eggs. The larvae are fed organic food by-products, such as food waste or agricultural residues. Once the larvae are fattened, they are utilised as animal feed. Finally, frass is repurposed as fertiliser.	BSFs experience autonomy interacting with plant species. They do not live a normal length of life. The absence of other animal species may limit the full expression of their ecological roles.
4 Resource	In specially designed aviaries, similar to butterfly greenhouses, BSFs are housed in environments replicating their natural habitat by incorporating native plants and vegetation. These settings allow the flies to freely exhibit their natural behaviours, interact with plant species, and choose their preferred sites for egg deposition. Humans collect BSF exoskeletons (exuviae) to extract chitin and chitosan for several purposes in the food sector, such as improving vegetable product shelf-life and soil properties and inducing plant growth.	Collecting exoskeletons does not involve hunting, so BSFs live autonomous, full-length lives, interacting with plant species. However, enclosure reduces autonomy. The absence of other animal species may limit the full expression of their ecological roles.
Liminal	Liminal refers to animals that live in human settlements but do not necessarily affiliate with or depend on humans. Compared to captive BSF, liminal insects have greater autonomy.	
5 Entertainment	In a natural reserve, humans keep BSFs for entertainment and educational purposes. In a forested area, a netted enclosure is set up. Here, BSFs coexist with various specific other native animal and plant species.	Enclosure reduces autonomy. BSFs live a normal length of life, interacting with plant and animal species.

Table 3. Overall, Choquet integral results. The table indicates the weighted average of the

values of all the subsets (attributes, sub-criteria, criteria) in the decision tree model for each value logic (N°). The detailed attributes for each sub-criteria are shown in Figure 2.

Criteria	Sub-criteria	Attr.	N° 1		N° 2		N° 3		N° 4		N° 5

5. Conclusion

By prioritising speculative methods and feminist critiques, this study contributes to breaking the "ontological blindness" often present in systemic design (Vink, 2023).

By "*becoming fly*", the designer accesses BSFs' lived experiences and cultural needs,

transforming these insights into actionable objectives within IB organisations. This approach extends the subject condition to BSF adults, allowing their perspectives to be heard and translated into objectives within the human-BSF relationship in IB.

This empirical analysis shows us that within the European IB sector, it is possible to create at least a multi-species relationship that reduces the suffering of the nonhuman, albeit characterised by an imbalance of power, typical of the captive condition, aimed at the productive imperative. Integrating multispecies perspectives into the design process offers a pathway toward reimagining IB organisations as more inclusive and democratic entities overcoming the "insects for food and feed" paradigm. However, this experience risks being one of those irrelevant experiences that narrowly escapes the mechanisms of violence, where ethics become entrenched.

In this study, the designer does not "*speak for*" the BSFs in a value logics co-design setting with human stakeholders. Instead, the BSF objectives are systematised alongside human objectives through the updated Value Ring Canvas. This tool enables the designer to prioritise certain objectives based on personal values (Hartog, 2015) and synthesise them into a set of competing designs that strive to challenge the anthropocentrism and asymmetry characterising current IB organisational relationships. Future research could investigate how human participants in co-design workshops perceive and negotiate nonhuman objectives when the designer's leadership advocates for them. This could provide insights into the dynamics of multispecies decision-making and the extent to which human stakeholders are willing to adapt their priorities to accommodate nonhuman objectives.

Moreover, an important factor that may have influenced the successful definition of at least one human-BSF culture that reduces nonhuman suffering is the gender of the designer-leader. The designer author of this study is a woman. Women are often more predisposed to "*becoming other*" and establishing relationships rooted in care and attentiveness (Mitten, 2018). This indicates that further research could explore how designers of different genders contribute to developing multispecies leadership in organisations.

Finally, this research adopts a social influence perspective on leadership. Further research could examine (1) how different approaches to ethical leadership -i.e. social learning, social exchange, purpose-based, and altruism approaches-, (2) or other related forms of leadership- i.e. transformational, transactional, spiritual, authentic and paternalistic- (Hartog, 2015) and (3) or designers behavioural styles shape power dynamics, decision-making, and the integration of nonhuman needs within the design of multispecies organisations.

Nevertheless, achieving truly equitable and sustainable multispecies futures requires fundamentally rethinking the structures and values underpinning IB systems, alongside continuous efforts to navigate the ethical and political tensions inherent in multispecies relationships.

As such, this study reinforces the importance of grounding designers' education in feminist studies and the philosophy of technology (Levick-Parkin et al., 2024). Speculative methods can encourage designers to transcend the ontological blindness in technology mediation of specific industrial contexts, specifically livestock and farming. However, foundational ethics and positionality issues must be equally important in design practice and curricula to realise their transformative potential. It is essential for designers to meaningfully engage with critical questions, such as "what kind" of futures we are designing and "whose futures" are being considered in designing multispecies relations.

About the Authors:

Cecilia Padula is a PhD student in Management, Production and Design at Politecnico di Torino. Her research explores multispecies methodologies and collaborative autoethnography in systemic design for planetary health. She collaborates with university, corporate and public research partners in the EU.

Silvia Barbero is Associate Professor and Vice-Rector for Communication and Promotion at Politecnico di Torino. Her research focuses on systemic design for sustainability, with over 100 scientific publications. She is former Chair of the Systemic Design Association and co-founder of the Sys-Systemic Design Lab.

Acknowledgements: The Italian National Recovery and Resilience Plan co-funded this research under the European NextGenerationEU initiative. C.P. was responsible for the conceptualisation, methodology, data curation, and writing—original draft. S.B. contributed to writing—review and editing.

I want to thank my colleagues at BEF Biosystems, Dr. Marco Meneguz and Francesca Grosso, for their research mentoring and assistance. I also want to thank all the workshop and consultation participants for their trust and active participation.

* promil@uid.edu.in, dean.uid@gdgu.org

ABSTRACT | This study investigates how design functions as a transformative agent for female empowerment, with a focus on initiatives in fashion, craftsmanship, and digital and social entrepreneurship.
Based on a cross-cultural perspective, the research examines how design-oriented projects can address systemic gender-based disparities and facilitate economic and social autonomy for women.
Design is able not only to challenge existing gender inequalities but also to create inclusive environments and job opportunities.
It can allows women access to resources, professional development and a better work-life balance.

The research methodology combines literature review, case study analysis. The conclusions focus on definition of actionable practices based on research-action projects.
The literature review establishes a theoretical framework by synthesizing previous studies on gender equity, design theory, and empowerment.
The aim is to outline how design can influence female agency.
Grounding the study in the field of social design and gendered spaces, the literature review tries to dissect the mechanisms through which design can function as a vehicle for social change.

It identifies recurring themes, such as the economic opportunities related to the access to creative and digital tools, the preservation of cultural heritage through craftsmanship, and the capacity of design to influence policy for gender equality.

The case study analysis centres on specific projects across various cultural contexts that demonstrate how women in different parts of the world use design to reshape their lives and communities.
The selection of case studies, as wide as possible, considered also different design fields from craft-oriented projects to digital platforms.
Additionally, social and creative entrepreneurship examples illustrate how design-led initiatives in underserved areas create new spaces for women's professional growth and leadership within communities.
These cases highlight design's role in creating gender-inclusive spaces, fostering collaborative networks, and enhancing skill development.

To obtain useful indications in the practice of design, the research adopts an action research methodology, aimed at identifying effective formats able to implement projects focused on women's empowerment.
This approach included the analysis of participatory design methodologies that involve women as co-creators and stakeholders.
This practice makes project outcomes consistent with community needs and culturally relevant.
The use of iterative methods include continuous feedback loops, action research. This methodology produce models adaptable to real contexts, aimed to empower women.
This approach considers women not only as beneficiaries of project actions but as active agents in the participation process. It gives them power through participation and development of new models of leadership.

The results highlight the ability of design to influence global development agendas, advancing the Sustainable Development Goals as gender equality, economic empowerment and social inclusion.
Integrating woman-oriented design principles into decision-making processes, the paper highlights that design can go beyond aesthetic and functional aspects and become a strategic tool of social transformation.
This study contributes demonstrates that design can be a driver for inclusion requests and promote empowerment at a socio-economic level.
The findings highlight the transformative potential of design to redefine gender norms and contribute to the creation of a more equitable and inclusive society.

KEYWORDS |
DESIGN, WOMAN EMPOWERMENT, CRAFTMANSHIP, LOCAL DEVELOPMENT

1. Introduction and research context

Design has emerged as a transformative agent in empowering women in recent years. It is an influential tool that enables the shaping of societal values, behaviours, and experiences displayed in products, services, digital solutions and architectural spaces. Design has the potential to foster social change, including the advancement of gender equity.

> Women and girls are half of the world's population and hold half of the world's human potential. The benefits accrue across society when their lives are improved (Beloskar, Haldar and Gupta, 2024).

In recent years Design is garnering interest from scholars, practitioners and activists alike as they recognize the potential of Design as a contributor and promoter of women empowerment. The ability of Design to address the unique challenges that women face—ranging from access to healthcare and education to safety and economic independence—positions it as a critical mechanism in achieving gender justice.

> Women's empowerment remains a core concern globally. It is broadly defined as the ability of "women to control their lives and make decisions that affect their well-being" (Forbes, 2023).

Gender inequality continues to exist notwithstanding the progress in various areas. Design can therefore, provide an alternative in bridging gaps in resources, knowledge, and opportunities, for women to thrive and overcome systemic barriers. This paper explores the intersection of design and women's empowerment by examining theoretical frameworks, key principles, and case studies where Design has been successfully employed to create tangible change for women.

Woman empowerment in Design also refers to the Sustainable Development Goal 5 "Gender Equality". SDG 5: Gender Equality states that gender equality is not only a fundamental human right, but is a necessary requirement for a peaceful, prosperous and sustainable world, although gender inequality, especially for women, persists throughout the world, with the denial of fundamental rights and opportunities.

Design Discipline can support Goal 5 through the creation of products and services based on innovative and cooperative business models, which enhance the specific skills of the participants in their creation both at the design and artisanal level and the enhancement of cultural heritage.

This activity contributes to enhance the opportunities offered by greater social interaction, community engagement, active participation in decision-making processes and emancipation within the reference context.

2. Paper structure

The paper is made up of three macro sections: a bibliographical review of the literature on gender issues and design disciplines, taking into consideration

concepts such as feminism, patriarchy/matriarchy relationship, inequalities and capitalist models, justice and social change, empowerment and female liberation, male and female leadership models, participatory design dynamics, explored by significant authors in the field of design research such as Place, Costanza-Chock, Noel, Manzini, Sanders.
From this investigation emerge some directions of deepening and development of innovative projects that concern the different areas of design ranging from fashion and product design to communication and service design.
In the second section, some case studies are analyzed related to real projects that have seen design as a tool for female emancipation in different contexts both in the global north and in the global south selected both for the quality of the results and for the use of structured methodologies and processes. These cases are related to different design fields, starting from product design and craftmanship to design thinking tools, service design and digital platforms. The case studies choice was made in order to involve diverse design areas that are more relevant in different geographical contexts.
The third section analyzes design tools and methodologies developed with the aim of promoting female empowerment through the creation of innovative and participatory business models capable of enhancing the talents and potential of participants and creating opportunities for training, access to resources, professional development and economic independence. The conclusions show how these projects can contribute to the creation of positive models of female leadership in the field of design, to the creation of replicable project formats that can also inspire public policies capable of redefining gender norms and creating a more inclusive and equal society.

3. Literature review

A systematic and comprehensive literature review of existing scholarship on the intersection of Design and gender equality was conducted. The intersection of design and women's empowerment has gained increasing attention in feminist scholarship, design research, and policy discourse. Traditionally perceived as a technical or aesthetic discipline, design is now recognized and acknowledged as a powerful tool for social transformation, particularly when informed by feminist principles.

> "Feminist design theory, for example, interrogates how traditional design practices have often excluded women's perspectives or reinforced patriarchal structures" (Burgin, 2019).

> "Critical feminist perspectives argue that the design process is inherently gendered and often marginalises women's voices, particularly in industries such as technology and urban planning" (Schneider, 2020).

> "Feminist scholars challenge these exclusions by advocating for inclusive, participatory design practices prioritising the needs and experiences of women at the forefront of the design process to empower them" (Bayat, 2018).

3.1. Feminist Critiques of Traditional Design

> "Traditional design practices often reflect and reproduce male-dominated norms. Design history reveals the voices and experiences of women were largely ignored, relegating them primarily as users and not creators or decision-makers"(Burgin, 2019),.

> "Gendered assumptions are evident and embedded in urban planning, product design, and technological development, where male norms often serve as the default" (Schneider, 2020).

It is these biases that the feminist design theory critiques by foregrounding the structural inequalities that shape the process and outcomes of design.

3.2. Feminist Design Approaches

> "Feminist scholars and practitioners champion participatory, inclusive design methodologies that place women's lived experiences at the centre" (Bayat, 2018).

These approaches challenge hierarchical, top-down models and instead emphasise co-creation, empathy, and local knowledge. Place (2023) introduces the notion of "doing feminism through design," highlighting how feminist values, such as care, inclusivity, and justice, can be embedded into design as both process and product. Feminist design therefore becomes not only a method of activism and creation, but also a core contributor to broader goals of gender equity.

3.3. Design Thinking: A Tool for Empowerment

Design thinking is widely viewed and emerged as a problem-solving methodology identified by its user-centered research, ideation, prototyping, and iterative testing. While it originated in business and engineering, its application in social innovation has proven especially impactful. Brown (2009) and Brown & Wyatt (2010) emphasise empathy as a core component of design thinking, making it a natural ally to feminist practice. When applied with a gender-conscious lens, design thinking can help develop innovative solutions to address systemic barriers women face, such as access to healthcare, mobility, digital inclusion, and economic opportunities.

Case Example:

> "The design of SheSafe, in India is an example of a mobile application co-created with women from urban slums, that allowed users to access emergency services and report incidents of harassment. The app's development followed an iterative design thinking model that centred user feedback, demonstrating how digital design can tangibly improve women's autonomy and safety "(Deshmukh, 2017).

3.4. Empowerment Through Leadership and Systems Design

Empowerment through design extends beyond individual experiences to institutional transformation. As Chamorro-Premuzic (2020) notes, design-led interventions can facilitate the rise of women in leadership, particularly by disrupting traditional male-dominated authority figures and role models. Woman empowerment through design can also drive women to apical positions in organisations, redefining leadership models, shifting from a narcissist male leadership to a feminine transformational leadership paradigm.

> "Transformational leaders excel at translating a vision into a concrete plan for change and serve as strong role models for their subordinates" (Chamorro-Premuzic, T. 2020).

Women in transformational leadership roles, are characterised by vision, empathy, collective decision-making and align with values embedded in inclusive design allowing women empowerment but also contributing to broader organisational effectiveness and social sustainability.

While much of the existing literature emphasises the importance of gender-inclusive design practices, it is the emphasis on the role of implementation that will yield results: the need for action rather than just deliberation. Sampathkumar, (2015, citing Solberg) argues that there are gaps in understanding how these approaches can be systematically implemented in different sectors, from product design to urban planning and digital development.

3.5. Gaps in Practical and Methodological Integration in Current Research

The growing body of literature may be advocating for feminist and gender-inclusive design, however significant gaps persist in practical implementation and methodological integration. Most existing research emphasises conceptual and theoretical frameworks but often lacks:

3.5.1. Transdisciplinary Integration:

Many studies remain confined within disciplinary silos—design, gender studies, urban planning, or policy—without integrating methodologies across fields.

> "There is a lack of hybrid methods that combine qualitative feminist research (e.g., ethnography, narrative inquiry) with design research tools (e.g., prototyping, systems mapping) to generate actionable outcomes" (Sampathkumar, 2015).

3.5.2. Evaluation and Impact Metrics:

The literature rarely provides systematic tools for measuring the impact of design interventions on women's empowerment.

> "Existing studies often stop at the design stage without longitudinal tracking or frameworks to evaluate outcomes at individual, community, and policy levels" (Bayat, 2018).

3.5.3. Contextual Adaptability:

> "Many frameworks are developed in Western contexts and lack adaptation to diverse cultural, socioeconomic, and geopolitical environments, where gender norms and power dynamics differ significantly. There is a need for localised design research that is culturally sensitive and grounded in participatory co-creation" (Schneider, 2020).

3.5.4. Policy Linkages and Institutional Adoption:

> "While design can inform empowerment, few studies explore how feminist design strategies can be institutionalised within governmental, educational, or corporate systems. The disconnect between grassroots participatory design and top-down policy frameworks leaves a major gap in scalability and policy translation" (Place, 2023).

3.5.5. Technology and Digital Inclusion:

> "Although digital tools are increasingly used in empowerment efforts, designing inclusive tech—especially for marginalised women—is underexplored. Issues of algorithmic bias, access, and digital literacy are seldom addressed with integrated feminist design approaches" (Deshmukh, 2017).

This paper brings to focus solutions adopted and applied through design interventions to bridge this gap by providing a comprehensive framework for applying design to women's empowerment by reviewing case studies.
This paper brings to focus solutions adopted and applied through design interventions to bridge this gap by providing a comprehensive framework for applying Design to women's empowerment by reviewing case studies.

4. Theoretical framework: Empowerment through Design

This section will first define the concept of empowerment within the context of this paper to enable a better understanding on how Design can empower women.

> "Empowerment is a multidimensional concept that encompasses psychological, economic, social, and political dimensions" (Narayan, 2005).

Rappaport (1981, 1984) posits that empowerment is a “construct that links individual strengths and competencies…to social policy and social change” (Perkins and Zimmerman 1995, citing Rapapport).

> “Thus suggesting that the basic components of the construct are collaborative participation towards achievement of goals , gaining access to resources and understanding of socio political environment” (Perkins and Zimmerman, 1995).

> “Therefore empowerment-oriented interventions for participants not only improve wellness but also aim to ameliorate problems, enable skill and knowledge building opportunities and engage professionals as collaborators as opposed to “authoritative experts” “(Perkins and Zimmerman, 1995).

In the context of Design, empowerment can be viewed as the process by which design practices facilitate women’s ability to act independently, make informed decisions, and access opportunities previously restricted by societal norms or structural inequalities.

> “Women empowerment and its advancement through design in recent years has been approached through the analytical lens of feminist design theory and critique. It emphasises inclusivity and recognises women as agents of change that should actively participate in the design process” (Margolin, 2010).

The ubiquitous quality of Design permeates much of our realities thus immensely impacting our lived experiences, yet very few of us participate in design processes. Constanza-Chock posits that

> "the people most adversely affected by design decisions pertaining to visual culture, new technologies, the planning of communities, or structure of political and economic systems, tend to have the least influence" on the making of decisions that impact them (Costanza-Chock 2018).

Therefore, assimilating feminist principles into Design, allows practitioners to create solutions that challenge traditional gender roles and dismantle power structures.

> “The concept of participatory Design also plays a central role in this theoretical framework. Participatory Design incorporates user engagement —especially the marginalised or underrepresented groups— in co-creating solutions” (Schuler & Namioka, 1993).

For women’s empowerment, this approach ensures that women’s lived experiences inform the design process, leading to products, services, or environments that genuinely address their needs.

> “A growing field within Social Design is Design justice. It emphasises the importance of centering marginalised communities in design processes through its principles and argues that Design should prioritise equity and social justice by challenging systems of oppression and amplifying voices that have been historically silenced “(Costanza-Chock, 2020).

The framework of Design justice thus not only enables and advocates designs focused on disrupting gendered power dynamics but attempts to promote gender equity. This further promotes social and economic autonomy for women upholding women's empowerment objectives.

> "Social design projects are seen as tools for empowerment, developing creative skills, fostering civic leadership and encouraging wide participation in public life from all society sectors. However, there is still a significant gap in addressing underlying assumptions and biases within design, such as gender norms and power structures, which need explicit discussion to foster a critical perspective of empowerment in design" (Mazé 2019).

> "Emancipation, liberation and abolition can be also used to guide the design process. Sometimes we make progress through incremental change; other times we need to be more radical and abolish systems altogether, and that is where these principles can guide the design process. Reform and incremental change are both an approach to change that is built on tweaking older designs and systems." (Noel, 2023)

5. Case Studies

5.1. Selection methodology

When selecting cases of women empowerment through design, a strategic and multi-dimensional approach ensure the relevance, diversity, and analytical depth of the study.
Cases covering multiple design disciplines, but not just limited to graphic design, product design, fashion design, service design, and digital interaction design is the first criteria. In order to completely understand of how different areas of design can serve as vehicles for empowerment a board coverage is required. The second key criteria is that the geographical diversity is prioritized, it highlights the varied socio-economic, cultural and political contexts which leads to design empowerment. The analysis can be better captured by the influence of local challenges and opportunities on the success of initiatives which incorporates cases from diverse regions.
Third, the focus is on cases of social entrepreneurship with high levels of social impact. This focus on projects that go beyond profit generation to actively address systemic gender inequalities, contribute to community development, and foster long-term social change. A strong emphasis is placed on participatory processes, where women are not merely beneficiaries but leaders: active co-creators and decision-makers.
Additionally, to make sure the structured design methodology is employed which are human-centric design, co-design or design thinking that ensures methodological rigor and replicability. These use of such specific design tools and techniques such as identity cards, stakeholder mapping, and user journey analysis served as a proof of systematic and reflective design process.
By applying these criteria's, the objective of the study is to construct a representative and meaningful narrative of cases that lightened the intersections between design, gender empowerment, and social innovation. These selected cases are an example of both analytical exemplars and sources of transferable knowledge, which in return contributes to a deeper knowledge of how design practices can be utilized to promote gender equity in different global contexts.

5.2. Analysis: Case Studies and Applications

This section presents several case studies from across the world of design solutions that have successfully empowered women across various domains. Thus, this illustrates where Design has been used as a tool for change and the power of Design in advancing women's empowerment.

Fig 1. She for she Pad kit: empowering though product design source: https://www.sheforshepads.com/menstrual-kits/

5.2.1 Product Design: SHE Innovation Kit(https://www.sheforshepads.com/menstrual-kits/)

The SHE Innovation Kit, a set of low-cost, reusable sanitary pads, is an example of how Design can address critical barriers to women's health and economic participation. Designed with input from women in rural regions, the SHE Kit provides an affordable and sustainable solution to menstrual hygiene management, a key factor that limits many women's ability to attend school or work. The design process involved women with a considered and focused view on the cultural and practical constraints they face, the SHE Kit has significantly impacted women's health and economic independence, thus demonstrating the potential for product design to empower women in marginalized communities.

Fig 2. The Anou cooperative, showcasing Amazigh weaving practices source: www.theanou.com

5.2.2 Product Design: Amazigh (Marocco www.theanou.com)

Dina Benbrahim's work with Amazigh women weavers in Morocco is an example of the transformative role of design in processes of female empowerment. These women, often excluded from society due to colonial and patriarchal dynamics, use the practice of weaving to express a feminist narrative and preserve their cultural identity. The carpets they make use ancestral symbols such as the Tanit triangle, a sign of resistance and resilience within a conservative society. Despite systemic exploitation, initiatives like the Anou platform support fair trade and creative freedom. Benbrahim underscores the need for pluralistic design histories that validate marginalized women's contributions, leveraging design as a tool for social justice and inclusive futures.

Fig 3. Design Possível team and women group source: Julia Asche

5.2.3 Product Design: Design Possível (Brazil www.designpossivel.org)

Rede Design Possível, a São Paulo-based non-profit founded in 2004, empowers vulnerable groups, particularly women, through design and solidarity economy initiatives. It provides training, market access, and support to artisans and seamstresses to develop and commercialize accessories, clothes and toys to foster economic independence and sustainability. Design Possível incorporates design with social objectives to allow the network address gender inequality and promote community integration by collaborating with universities to enhance innovation and entrepreneurship. To reinforce women autonomy and socioeconomic impact over 250 beneficiaries have gained skills and income with solidarity economy models and technology expansion plans in the future.

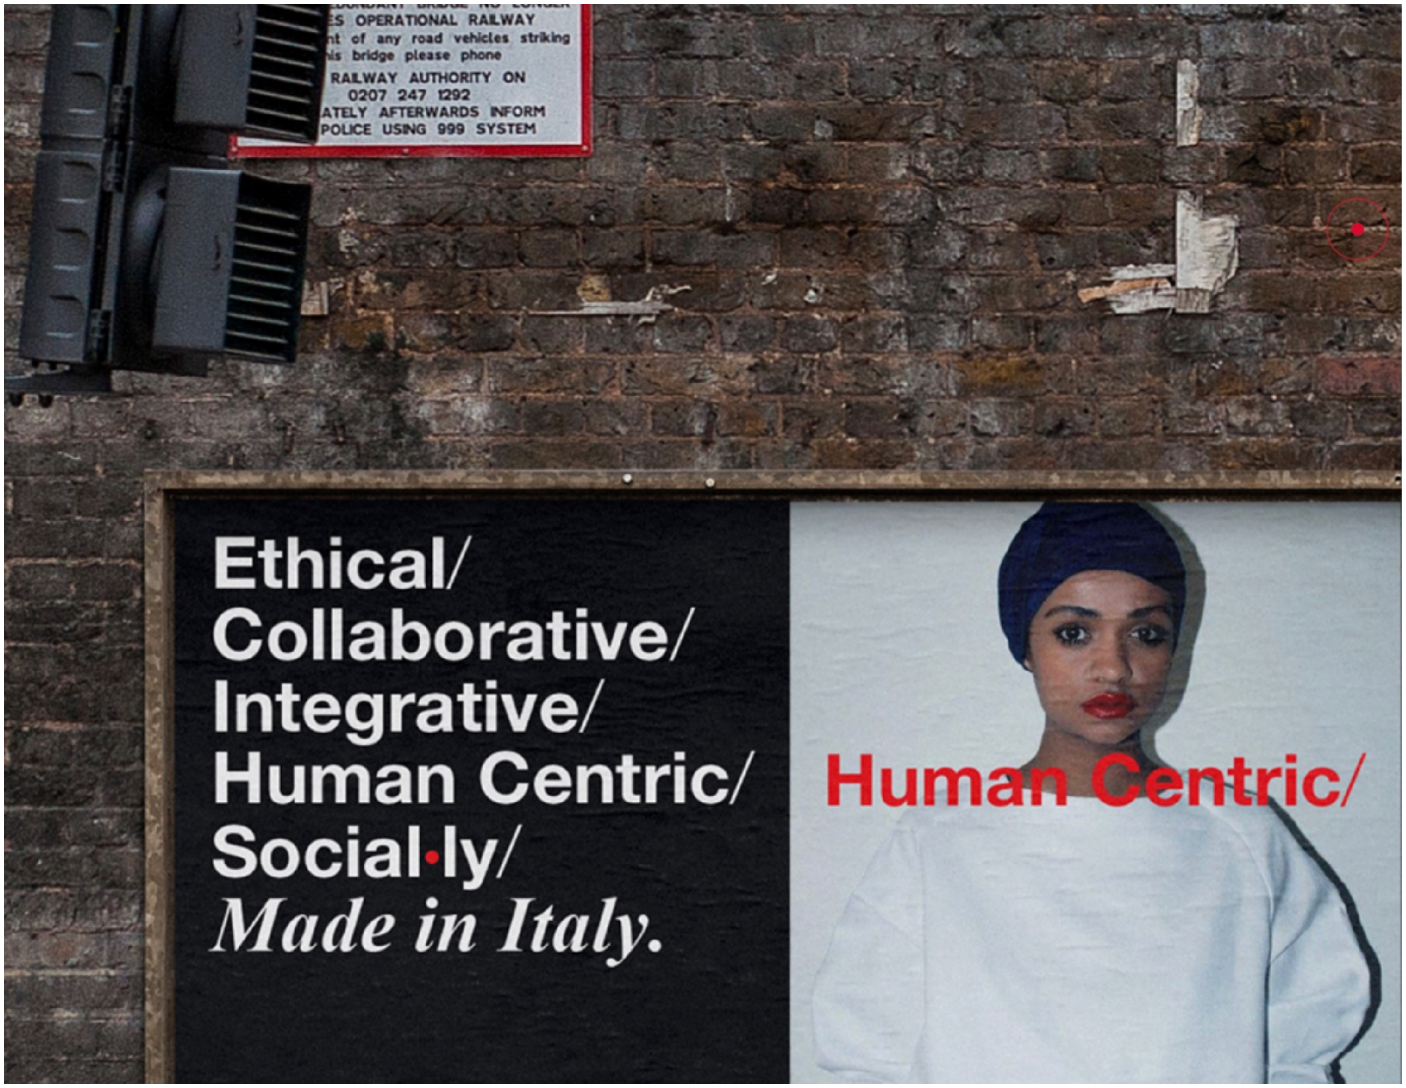

Fig 4.Promotional poster from Cooperativa Alice, an Italian social enterprise combining fashion design with social rehabilitation and ethical craftsmanship.source: www.cooperativalice.it

5.2.4 Fashion Design: Cooperativa Alice (Italy, www.cooperativalice.it)

Cooperativa Alice works with a mission to construct an inclusive society, by supporting sustainable development through craftsmanship and ethical supply chains. Established in 1992, Alice restores centrality of the person, fights prejudice and rehabilitates through fair wages. It is committed to protecting the traditions of "made in Italy" and encourages individuals and companies to develop sustainable lifestyles.

Within the women's sections of the Lombard prisons a trade is taught to help preserve and spread the Italian know-how. This then allows the inmates to return to being active subjects and assume a positive role in the local economy. Alice has enabled achievement of economic independence to more than 450 marginalized women. (https://www.opesfund.eu/restart-italia/cooperativa-alice/)

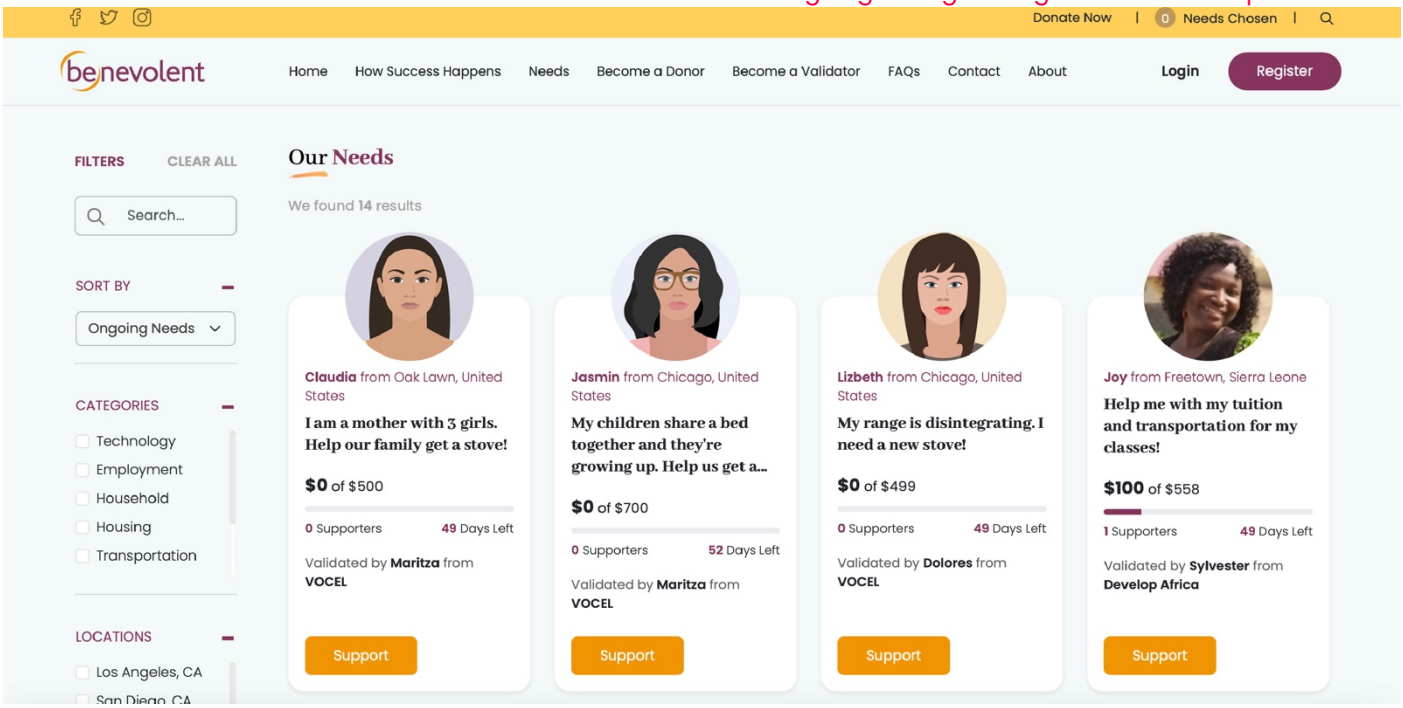

Fig 5. Interface of the Benevolent platform, which facilitates need-based crowdfunding to support women's empowerment through accessible digital design. source: https://portal.benevolent.net/needs/search

5.2.5 Digital Design: Women-Led Digital Platforms (Global, https://benevolent.net/about/our-team/)

Benevolent, is a digital platform founded by a woman that is an example of leveraging design to empower women through micro-donations and crowdfunding. Benevolent allows women (and men) to post specific needs—whether for education, health, or business resources—and receive financial support from donors. Simplicity, accessibility, and security the core design features of the platform make it user friendly for women from diverse backgrounds. Thus, this meets immediate needs and builds a sense of community and self-efficacy, crucial components of empowerment.

Fig 6. Interior view of The Wing, a women-centered co-working space in the USA designed to foster professional collaboration and community. source: https://www.instagram.com/the.wing/

5.2.6 Spatial Design: The Wing (USA)

The Wing, is a co-working space designed for women and represents how when spatial Design provides a safe and supportive environment for professional and personal growth for women it can empower them. Designed with women's needs in mind the Wing offers spaces where women can collaborate, share resources, and network. It offers additional facilities such as childcare and community spaces enabling women to thrive in professional settings that historically have been male-dominated. The Wing, thus fosters both individual and collective empowerment.

Fig 7. Arohan, Aavishkaar Group's microfinance initiative, utilizes mobile technology and design thinking to improve financial inclusion for rural women in India. source: Aavishkaar Social Report

5.2.7 Design Thinking: Aavishkaar (India, https://aavishkaargroup.com/group-companies/arohan/)

Aavishkaar's Arohan is a microfinance initiative that used design thinking to create mobile financial services aimed at helping rural women gain access to credit. By designing an intuitive mobile platform that works in local languages and is tailored to the digital literacy levels of rural women, Aavishkaar has empowered thousands to start businesses, invest in education, and improve their livelihoods.

Fig 8. Gender+ Puzzle Tool by Chroma Collective and IDEO.org, designed to integrate intersectionality into development programs. source: https://www.ideo.org/perspective/a-playful-tool-to-design-more-gender-inclusive-programs

5.2.8 Design Thinking: Chroma Collective and Ideo Gender + Puzzle Tool (Global https://www.ideo.org/perspective/a-playful-tool-to-design-more-gender-inclusive-programs)

Gender+Puzzle is a Design Tool created by the Chroma Collective (a group of gender practitioners) in collaboration with Ideo in order to integrate gender+ intersectionality across multiple levels of a development program. It helps program teams visualize the overlapping identities of those in their target population. The goal is to create a snapshot of a person's life that represents their composite identities and intensity of each identity. The Tool is composed of cubes and cards. Each cube represents a facet of who they are —be it religion, race/ethnicity, class, disability, etc—and practitioners can choose how intense is the presence of that identity in the community interested by the program.

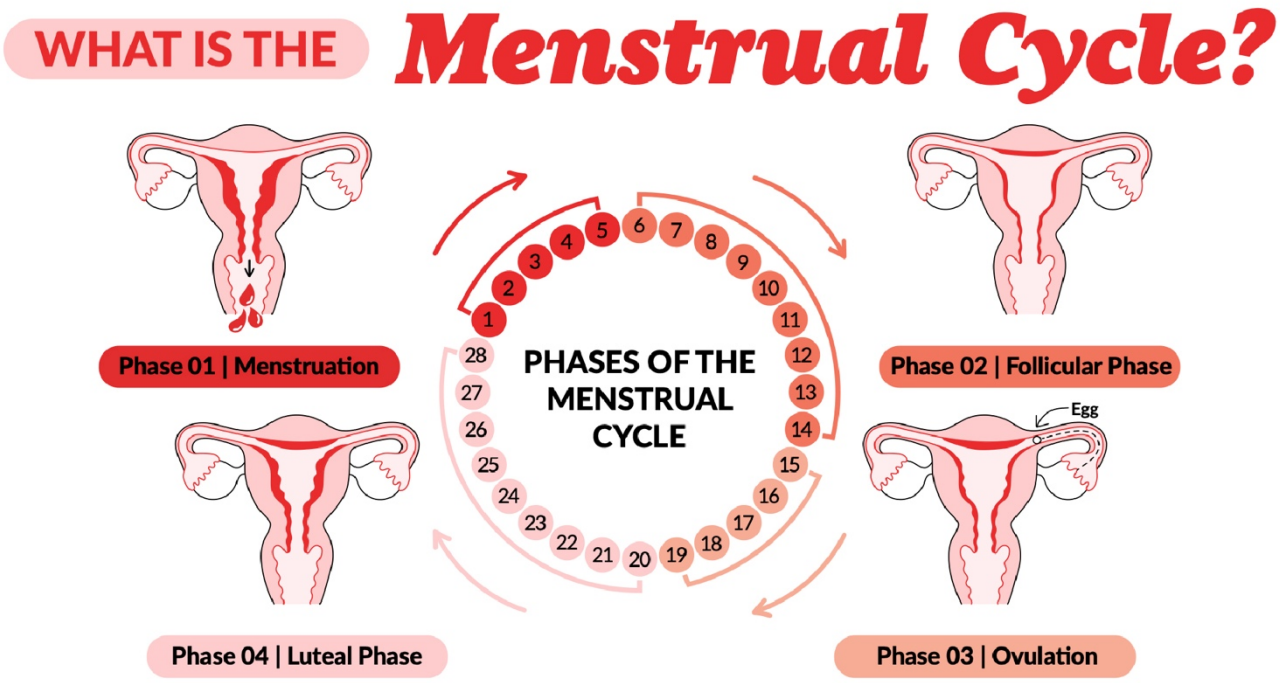

Fig 9. Period menstrual cycle: empowering through communication design source: https://period.org

5.2.9 Communication Design: PERIOD. (USA, https://period.org):

Period, is a nonprofit organization that advocates for systemic change through policy and legislation to remove the stigma around menstruation. They provide educational resources and distribute menstrual products free to communities in need. Design-driven visuals and outreach support their campaigns. PERIOD is a youth-powered movement. It has notably shifted societal attitudes towards menstrual health, recognizing it as a matter of human rights. Thus, sparking systemic and policy changes in local governments and schools. In the state of Uttarakhand, in Northern India, The Sidhast Foundation runs a similar program working on eradicating period stigma in collaboration with local regional organizations (Pandey and Pande 2022).

Fig 10. Women for Women International's programs in Rwanda empower women through economic and social support post-genocide. source: Rwanda, https://www.womenforwomen.org/where-we-work/rwanda

5.2.10 Service Design: Women for Women International (Rwanda, https://www.womenforwomen.org/where-we-work/rwanda)

Designing for women's safety is critical, particularly in refugee camps attempting to provide safe refuge to violated and displaced women. Women for Women International is an organization in Rwanda established to train women to advocate for their rights, in the aftermath of the genocide against the Tutsi in 1994. It enables women to use their economic and social power to change the status quo in their communities (women for women International). Their initiatives have created safety and security designed to provide comfort, economic security and access to resources. They offer diverse services and skills empowering women to rebuild their lives in the face of crisis.

Fig 11. Piano C's initiatives in Milan support female empowerment through coaching, training, and career counseling. source: www.pianoc.it

5.2.11 Service Design: Piano C (Italy, www.pianoc.it)

Piano C is a Milan based organization that promotes female empowerment through coaching, training, career counseling and female entrepreneurship consultancy. It uses the "Work Design" method, based on design thinking practices, aimed at reinventing work spaces and schedules to align them with the needs of participants. Piano C structured an ecosystem to support women with career and care needs, based on the integration of professional coaching and skills development workshops. This approach is based on collaboration, flexibility and creativity and allows women to break down systemic barriers and create paths to economic independence, creating inclusive and sustainable work dynamics.

N°	Project name	Design area	Design method/ tool applied	Female participation or leading role	Empowering effect
1	SHE Innovation Kit	Product Design	Participatory product development,	Participation on the product co-design process	Social inclusion
2	Amazigh	Product Design	Participatory product development, Fair Trade training	Participation on the organizational business structure, participation on the product co-design process	Economic independence, organisational capacity, leadership development
3	Design Possível	Product Design	Design Possível Social Technology:	Participation on the organizational	Economic independence,

			Participatory product development and cooperative production processes organizational training	business structure, participation on the product co-design process development of entrepreneurship mindset	organisational capacity, entrepreneurship, leadership development
4	Cooperativa Alice	Fashion Design	Participatory product development, Fair Trade training, Fashion Design technical training	Participation on the organizational structure of the business, participation on the product co-design process, development of entrepreneurship mindset	Economic independence, organisational capacity, technical skills emprovment
5	Women-Led Digital Platforms	Digital Design	Crowdfounding campaign development	Self promotion	Economic independence, organisational capacity, virtual community building
6	The Wing	Spatial Design	Business model design (BMC)	Development of entrepreneurship mindset, community leadership	Networking, community building
7	Aavishkaar	Design Thinking	Design thinking, digital service development, business model design	Development of entrepreneurship mindset, community leadership	Economic independence, organisational capacity, entrepreneurship
8	Chroma Collective and Ideo Gender + Puzzle Tool	Design Thinking	Chroma Collective cubes and cards	Community leadership	Community engagement, leadership
9	PERIOD	Communication Design	Design-driven visuals and data visualization	Participation on the communication co-design process	Social inclusion,
10	Women for Women International	Service Design	Technical and soft skills empowering methods	Development of entrepreneurship mindset	Economic independence, resilience
11	Piano C	Service Design	“Work Design” method: Coaching, training, career counseling, female entrepreneurship consultancy	Development of entrepreneurship mindset	Organisational capacity, entrepreneurship

5.3. Case analysis, tools and methodologies

Women's empowerment is a transversal theme that can be integrated across all design disciplines, from product design to service design and design thinking. Analysed case studies and projects from both Global North and Global South contexts highlight common themes despite differing socio-economic environments.

5.2.12 Roles and identities

Key aspects that emerged include recognition and valorization of women's identities and multifaceted roles, in the family and in the community. The need to reconcile worker and caregiver role require new organizational models based on an efficient time management and work-life balance.
It is possible to work visually on the feminine identity in product design processes (such as in Amazihg carpet production) valorizing feminist narratives and preserving the cultural identity of an ancestral matriarchal society translating their symbols into contemporary design products.
In the field of communication design the Period association is an example of how communication design can be used to promote campaigns about a complex aspect of feminine life the delicate subject of menstrual poverty.
In the field of design thinking the tool Gender + Puzzle, developed by Ideo and Chroma Collective insert the intersectionality concept and the valorization of multifaced woman identities into the structuration of sustainable development design driven programs.

5.2.13 Economic independence and work-life balance

The creation of new design driven economic activities is addressed to promote economic independence and facilitate work-life balance. This fact can redefine womens role inside families and communities, in an empowerment process. Maternity and caregiving responsibilities are factors that distance women from the possibility of having a fulltime work activity causing economic dependence on the male members of the family and a consequent unbalanced power relation. Economic independence is the main factor of women's emancipation and can be achieved through the creation of cooperatives and startups related to both manufacturing activities and creative jobs in the field of services and communication. These new companies often offer better working conditions in terms of work life balance such as working from home or having a more flexible time management.
Microfinance initiative such as Aavishkaar's Arohan in India and career coaching programs such as Piano C help women to redefine their career paths to structure new businesses with more sustainable conditions.

5.2.14 New business models and leadership approaches

Women and caregivers are driving the creation of sustainable business models and innovative leadership approaches. Many initiatives such as Brazilian solidary economy cooperatives, Italian social cooperatives such as Cooperativa Alice, Fair Trade initiatives such as Anou in Marocco created business with different organizational and leadership models: horizontal, participatory and community oriented.

5.2.15 New funding models

Some of the analysed case studies, such as Benevolent platform and Aavishkaar are representing new funding models, such as crowdfunding and fair trade, to support small-scale and micro-entrepreneurial ventures.
These initiatives represented, women belonging to disadvantaged categories, and allowed the possibility of accessing non-traditional forms of credit, which helped them to create their own business.

5.2.16 Creativity and business

Creativity and craftsmanship emerge as a central topic related to design oriented business innovation, involving on the one side the valorisation of traditional manual and artisanal skills but also new digital and entrepreneurial skills.
Radical creativity allows the generation of new innovative businesses, services and entrepreneurial activities, starting from local materials, a specific artisanal skill or a professional competence that becomes a service.

5.2.17 Skills development

The case studies also revealed that development of hard and soft skills, spanning artisanal expertise to organizational and managerial competencies, is a key point of the initiatives. Programs focus on training, coaching, and education all vital for equipping women with design, managerial, and entrepreneurial skills.

Design thus emerges as a powerful tool for social innovation, supporting women as agents of change and fostering sustainable economic and social ecosystems.

6. Design interventions for Women's Empowerment

6.1. Design methods/design tools, toolkits

Through the comparative analysis we underlined different areas of design methodologies and participatory processes:

- Collaborative Product Design Development

- Business Design, Strategic and Organizational Design
- Design thinking and innovation strategies
- Service Design
- Community design and community engagement
- Technical training related to craft abilities

The comparative table evidence that in most of the case different areas are present and relevant for the project development, mainly the Community Design aspect and the Business, Strategic and Organizational Design.
The main role of design is promoting the development of new community based, collaborative business models.

N°	Project name	Collaborative Product Design Development	Business Design, Strategic and Organizational Design	Design thinking and innovation strategies	Service Design	Community design and community engagement	Technical training related to craft abilities
1	SHE Innovation Kit	x					
2	Amazigh	x	x			x	X
3	Design Possível	x	x			x	x
4	Cooperativa Alice	x	x			x	x
5	Women-Led Digital Platforms				x		
6	The Wing		x				
7	Aavishkaar		x	x	x		
8	Chroma Collective and Ideo Gender + Puzzle Tool			x		x	
9	PERIOD					x	
10	Women for Women International		x	x			x
11	Piano C		x	x		x	

Many of the analyzed cases developed specific tools and toolkits in order to codesign development programs, new businesses, new products aiding in redefining production and income-generation models.

Ideo with the Gender + Puzzle is a structured creative co-design tool that use design thinking methodologies, starting from the personas, in order to consider the multiplicity of social roles and positions that users have in a community.
Design Possível developed a specific approach for working with solidary economy groups and cooperatives that have been patented as social technology. Social technology is defined by Social Technology Institute29 (ITS) as

> "a set of techniques, transformative methodologies, developed and/or applied in interaction with the population and appropriated by it, that allows representation of solutions for social inclusion and improvement of living conditions" (ITS, 2004, p.130).

The goal of this technology is to build up new entrepreneurial activities driven by women in the field of solidary economy, sustainable and social design.
Piano C, in a completely different context, developed the "Work Design" method, in order to promote professional redesign paths, combining design thinking, storytelling and empowerment techniques.
These paths and tools referred to completely different contexts and situations but have a common goal, the empowerment of women, disadvantaged or not, in a working dimension.

6.2. Women's leadership roles in projects

In the analysed cases, women are taking part in the projects as 'beneficiaries' and 'participants', but also in many cases they play a leadership role such as initiating the project, organizing the team, leading the design process and facilitating community change, and analysed how they lead.
In most of the analysed cases one of the most important role of woman leading the projects is the "**community leader**" or the "**community organizer**", regarding local but also virtual communities.
The community dimension in cooperative businesses such as Amazig, Design Possível or Cooperativa Alice is also leading with more horizontal organizational models that have many advantages such as the mutual help dimension and competences exchange.
More innovative business models such as The Wing, Piano C, Aavishkaar, Benevolent are also community based, considering community both in a physical sense but also as virtual networks. Networking, sharing working spaces, facilitating access to financial opportunities are some of the positive aspects of the organization and promotion of community-based projects impacting woman life that are in many cases characterized by the isolation into familiar houses with the role of mother and caregiver.

6.3. Cross-cultural comparative analyses

The article provides a wealth of case studies, coming from different geographical, social, cultural and productive contexts.

With the perspective of a cross-cultural comparative analysis, we can notice that in emerging context, such as India, Brazil, Rwanda, Marocco the woman empowerment initiatives and business are related to the manufacturing/artisanal/productive sector involving specific technical product design competences but also strategical and organizational skills.
In different contexts such as U.S (The Wing) and Italy (Piano C) woman empowerment is more related to career development in more digital and dematerialized activities, related to the field of service design and business strategy.
In both contexts one important aspect is the "peer learning" process and skills development that involve both design, technical and organizational skills.

7. Challenges and Opportunities in Design for Women's Empowerment

Design has immense potential to foster women's empowerment as is revealed in the case studies however much is yet to be done as several challenges still remain. These include systemic biases in the design process, lack of representation of women in design fields, and financial barriers to developing women-focused initiatives. Cultural and societal resistance to empowering women through Design can pose significant hurdles in certain regions. However, these challenges also present opportunities for innovation. Increasing awareness of gender inequity in Design, combined with the rise of women-led design initiatives and organizations, offers a promising path forward. Technological advancements, particularly in the fields of AI and wearable tech, present new avenues for designing solutions that address women's health, safety, and economic empowerment.

8. Conclusions

Women have significantly influenced ethical leadership and decision-making in purpose-led entrepreneurial projects. In the creation of purpose-driven business initiatives women developed a meaningful form of ethical leadership.
Their emphasis on empathy, dignity, inclusivity, integrity, sustainability and commitment to purpose and social impact, fosters ethical decision-making that benefits not only the enterprise but also society at large. Encouraging more women in leadership positions can help shape a more responsible and value-driven entrepreneurial ecosystem.
Design thus holds immense potential for advancing women's empowerment, especially when applied through inclusive, participatory, and socially conscious frameworks. Feminist principles, participatory design methodologies, and design justice into practice collectively can enable designers to create solutions for the unique needs of women and promote gender equity. Using case studies, this paper illustrates ways in which Design can transcend traditional boundaries to provide tangible solutions to challenges faced by women globally. In the future also, it is crucial that designers continue to prioritise women's voices in the design process, ensuring that empowerment remains at the heart of design practices.

Entrepreneurial activities driven by woman to solve women's needs are caring new leadership models that shift from the narcissistic, egoistic male leadership model toward a more empathetic feminine leadership.
Male leaders with a high emotional quotient and the majority of women demonstrate a marked possession of a leadership style that is defined as transformational. The leader who is characterized by this style focuses more on changing the attitudes and beliefs of followers and seeks to engage them on a more emotional level rather than telling them what to do…transformational leaders excel at translating a vision into a concrete plan for change and are strong role models for their subordinates and followers. Good leaders must be equipped with intellectual capital.

> "Much of the research in organizational psychology suggests that individuals who are most effective as leaders have broad and deep connections within and outside the organization" (Chamorro-Premuzic 2020).

Shifting to a feminine transformational empathic leadership model can create woman driven organizations where all the stakeholders can experiment a better participation, work-life balance and vision sharing.
Globally, companies led by women are only 33%, which drops to 15% if we take into account innovative startups founded by women (Gran Thomton Belgium global analysis 2024).
Thus, new design driven entrepreneurial initiatives can represent an inversion of this trend both in the global north and in the global south, changing perspectives, organizational and leadership models.

ABSTRACT | In today's data-driven world, data literacy — the ability to read, analyze, and interpret data — is an essential skill across all sectors. However, the ways in which individuals and communities engage with data are influenced by cultural values and attitudes toward privacy. The project "Designing Data X Cultures", conducted by Köln International School of Design (KISD) and Texas State University (TXST) sought to explore these dynamics from an intercultural perspective by bringing together students to investigate how different cultural contexts shape the use of data.

Through interdisciplinary collaboration, students investigated the data life cycle and developed design concepts to enhance data awareness in their communities. Virtual discussions revealed cultural differences with the aim to not only raise awareness but to generate digital and analogue design interventions promoting greater data transparency and ethical engagement within international communities.
The findings emphasize the role of design in addressing challenges related to data awareness, especially in times of artificial intelligence. This approach not only prepares designers for leadership roles but also fosters a culture of inclusivity and innovation at both local and global scales. We invite conference participants to engage and explore strategies for conducting reflective intercultural learning scenarios in design education.

KEYWORDS | INTERCULTURAL, DATA, INNOVATION, COMMUNITY, LEADERSHIP

1.Introduction

Data literacy, "the ability to collect, manage, evaluate, and apply data, in a critical manner" (Ridsdale et al., 2015) has become a crucial competency, not just for individuals, but also for leaders and entrepreneurs who design, implement, and manage data systems (see Altman et al. 2020). As data increasingly influences decision-making across sectors, the ability to read, interpret, and ethically apply data is no longer a specialized skill — it is a foundational necessity. Ethical leadership in this space is critical to ensuring that data use aligns with societal values, particularly regarding privacy, transparency, and equity. In an age where data is often equated with power, understanding its lifecycle — from collection to analysis and application — is essential for responsible decision-making (see Okorie et al., 2024). Entrepreneurs, especially, face the challenge of balancing innovation with the ethical implications of data use, striving to respect individual rights while fostering social value. As Rhea Alexander argues, entrepreneurs must not only harness the power of data to drive innovation but also use design thinking to ensure that their solutions are ethically sound and aligned with the needs and values of the communities they serve (see Alexander, 2020). Cultural norms and values play a significant role in shaping perceptions of what is considered ethical, particularly regarding data use. Different societies prioritize issues like data privacy, consent, and the moral implications of data analysis and application to varying degrees which have implications for all sectors (see Bakare et al. 2024). For example, in Europe, data privacy and protection are central tenets of the General Data Protection Regulation (GDPR). The GDPR should empower individuals by granting them greater control over their personal data and providing rights such as access, rectification, erasure, and the ability to object to data processing. It has influenced how people interact with data in their daily lives, especially on digital, commercial, and social media platforms (see Strycharz et al. 2020, Schmitt et al. 2024). Moreover, the regulation has heightened awareness of data protection rules and rights among EU citizens, fostering a stronger culture of accountability and transparency in data use (see Marikyan et al., 2024, FRA 2020).

This perspective aligns with the United Nations' *2020 Report on Data Ethics*, which underscores the global imperative to safeguard individual rights in an interconnected world. The report advocates for privacy, security, and transparency as fundamental rights in the digital age, influencing global frameworks that inform the practices of designers as entrepreneurs (see UN, 2020).

Designers in particular work extensively with data in their daily practice. They collect and transform data into information that shapes communication, while designing products and interfaces to manage, organize or generate new data. However, despite the increasing importance of data literacy, these competencies are often only implicitly embedded within

curricula and are rarely addressed explicitly or comprehensively (see Schüller et al, 2021, Ridsdale et al., 2015).

This paper explores how design projects can foster critical and conscious engagement with data literacy in diverse cultural contexts, contributing to the creation of data-aware products and artifacts. In the project “Designing Data X Cultures” students from Köln International School of Design and Texas State University (TXST) deal with the subject of data literacy from an intercultural perspective. This project aims to deepen the understanding of how cultural contexts shape data perceptions and practices. Through an interdisciplinary approach, students engaged with the entire data lifecycle, collecting, and analyzing data on topics of local significance in Cologne and Austin.

Issues such as digital privacy, mental health, and community dynamics were explored, reflecting the unique concerns of these communities. This analysis culminated in the development of both analog and digital prototypes to address ethical challenges posed by data in diverse cultural settings.

2. Project Description and Key Questions

The “Designing Data X Cultures” project took place for the first time in the summer term 2024 and was instructed as a six-week hybrid learning setting. Twelve bachelor and master students with an international background participated from KISD and eighteen bachelor students from TXST. Students from the US and Germany worked together virtually during the project using Zoom for meetings and the Miro digital whiteboard for collaboration. The social learning environment KISDspaces was also used for communication and exchange.

The project was initiated by a first weekend kick-off online meeting between TXST and KISD. At this initial meeting, the students got to know each other, and groups were formed for the entire duration of the project. As the seven-hour time difference meant that it was not always possible for the students from both locations to work together, the groups were divided into local sub-groups. These local sub-groups – of three to four students – worked on their ideas together starting during kick-off. The online meetings between TXST and KISD were used for joint presentations and feedback on the ideas and concepts of each local groups.

Figure 1: Student groups at KISD and TXST and lectures during a virtual meeting at 6 pm CET

During multiple virtual meetings students explored cultural differences between the USA and Europe, focusing on how these differences affect data use and data awareness. Key questions that emerged from the discussions regarding cultural perspectives on data ethics include:

- **How can design contribute to resolving cultural tensions surrounding data privacy while maintaining ethical standards in data collection and usage?**
  The United Nations 2020 report on data ethics emphasizes that ethical data practices must be grounded in universal principles such as privacy, security, and transparency. Designers must create systems that respect these standards while being adaptable to the specific needs and cultural values of the communities they serve. By aligning with global human rights frameworks, design can help bridge cultural divides surrounding data privacy (UN, 2020).

- **What strategies can designers employ to ensure that data practices respect cultural**

differences and promote inclusivity in global contexts?
Manuel Lima, in *The New Designer*, highlights that design must go beyond technical solutions to become a force for cultural sensitivity and inclusivity. Designers can achieve this by embracing cultural diversity in their processes, using empathy to understand the social and ethical implications of data in varying cultural contexts. Lima's view encourages designers to create solutions that are not only effective but also resonate across different global communities (Lima, 2021).

- **How can ethical leadership in design foster trust and promote transparency within communities that may have divergent cultural perspectives on data privacy?**
  Samuel W. Franklin, in *The Cult of Creativity*, critiques the modern "cult" of creativity that often prioritizes innovation over ethical considerations. He argues that ethical leadership in design should counterbalance the sometimes-unchecked drive for novelty by focusing on transparent practices and societal responsibility. For designers working with data across diverse cultural perspectives, Franklin stresses the importance of fostering trust through accountable, transparent leadership that ensures ethical standards are met (Franklin, 2020).

3. Outcomes

Students engaged in collecting and researching data on a wide range of topics that were not only relevant to their local communities but also revealed the varied cultural approaches to data interpretation. These topics spanned diverse areas, including:

- **Payment Methods**: The contrast between cash and digital payment systems, exploring how different societies embrace or resist digital currencies, mobile wallets, and traditional methods like cash, reflecting deeply ingrained cultural trust in institutions and technology.
- **Reading Habits of College Students**: Investigating the impact of digital versus physical reading on college students, this study highlighted cultural preferences for learning and the role of technology in education. It also raised questions around data privacy, particularly regarding how reading data might be used to predict behaviors and preferences.
- **Nutrition Cycles During Sporting Events**: Analyzing how athletes approach nutrition during competitions, this topic underscored regional differences in dietary preferences and health habits, with an emphasis on how cultural backgrounds influence food choices and performance.
- **Mental Health Among College Students**: Focusing on the mental health challenges faced

by college students, particularly during times of high stress, this research uncovered cultural stigma around mental health and varying levels of awareness and resources available to students in different regions.

- **Transparency of Online Interactions**: This topic examined how individuals perceive online interactions and privacy in digital spaces. It addressed issues like data tracking, consent, and the evolving expectations of transparency in online communication across different cultural contexts.
- **Biometric authentication**:. This topic explored how cultural differences affect the use of Biometric authentication and the ethics of using this data for identification and analysis. It concluded into study of how faces are represented in digital environments, particularly in the context of AI and facial recognition technology.

Each of these topics revealed distinct international differences in how data is interpreted and used, underscoring the influence of cultural context on the ethics of data practices. For instance, the approach to data privacy in the USA might prioritize individual rights and freedom, while in Europe, privacy laws like GDPR emphasize collective responsibility and stronger regulatory oversight. Similarly, while some cultures view digital payment methods as a natural extension of modern life, others may see them as a threat to personal autonomy and financial sovereignty.

Prototypes and Community Engagement

After conducting thorough research, students designed and presented prototypes aimed at raising awareness within their local communities about the data collected and its implications. These prototypes ranged from digital tools like mobile apps and websites to analogue designs such as posters, interactive installations, games, and workshops. Each prototype was carefully designed to cater to the cultural nuances of the respective community, ensuring that the messaging and presentation were both culturally relevant and sensitive.

Figure 1: Students and visitors at the presentation playing the Game *Crumbly Connection*

After researching internet cookies and their impact on digital transparency, KISD students created the game *Crumbly Connection* to enhance knowledge and control over cookies in a playful way (see Fig. 1). Their discussions with TXST students highlighted differences in cookie usage and data protection regulations between Europe and the USA, emphasizing privacy laws' influence on interface design and user experience.

Another KISD group looked at FOMO (Fear of Missing Out) in relation to social media and created an interactive analogue polling installation at KISD to visualize this phenomenon. The main aim was to raise awareness of FOMO itself and how social media can trigger this feeling. The exchange with the TXST students allowed them to consider different points of view, especially the connection between FOMO and the long distances in Texas. But the topic seemed to meet with interest on both sides. One quote on the shared Miro board was: "Both cultures have FOMO, digitally and in person".

Also using survey data, a team from the US wanted to study the reading habits of students in the state of Texas. Their question was how designers can use data to influence people's views

on a particular topic. They focused on a common activity in design practice: the visualization of data and its likely outcome in the user's perception. For primary research, they observed on campus and conducted a survey. For secondary research they looked at general statistics on reading habits in university communities.

They designed a series of posters with catchy phrases created from their research and collected data, aimed at engaging the audience and encouraging them to read more. In feedback sessions between the US and European teams, the students discussed about and reflected on the possible impact of such a campaign, but also the differences in reading habits at large, noting that students at universities also read together in book clubs, whereas in Germany reading is more of a private activity as university life is experienced very differently. It was these conversations that led to an overall understanding of the importance of international differences of cultures and their values.

Figure 2: Team “Mind Mosaic” developed an interactive sculpture shown above that uses data to create an awareness of the current mood of students on campus.

The topic of mental health was of importance to the students from Texas. Two project groups examined how to create more awareness and visibility for the sensitive topic through the

careful handling of data. Team “Mind Mosaic” developed an interactive sculpture shown above that uses data to create an awareness of the current mood of students on campus.

Another team visualizing post-pandemic mental health impacts through data on campus.

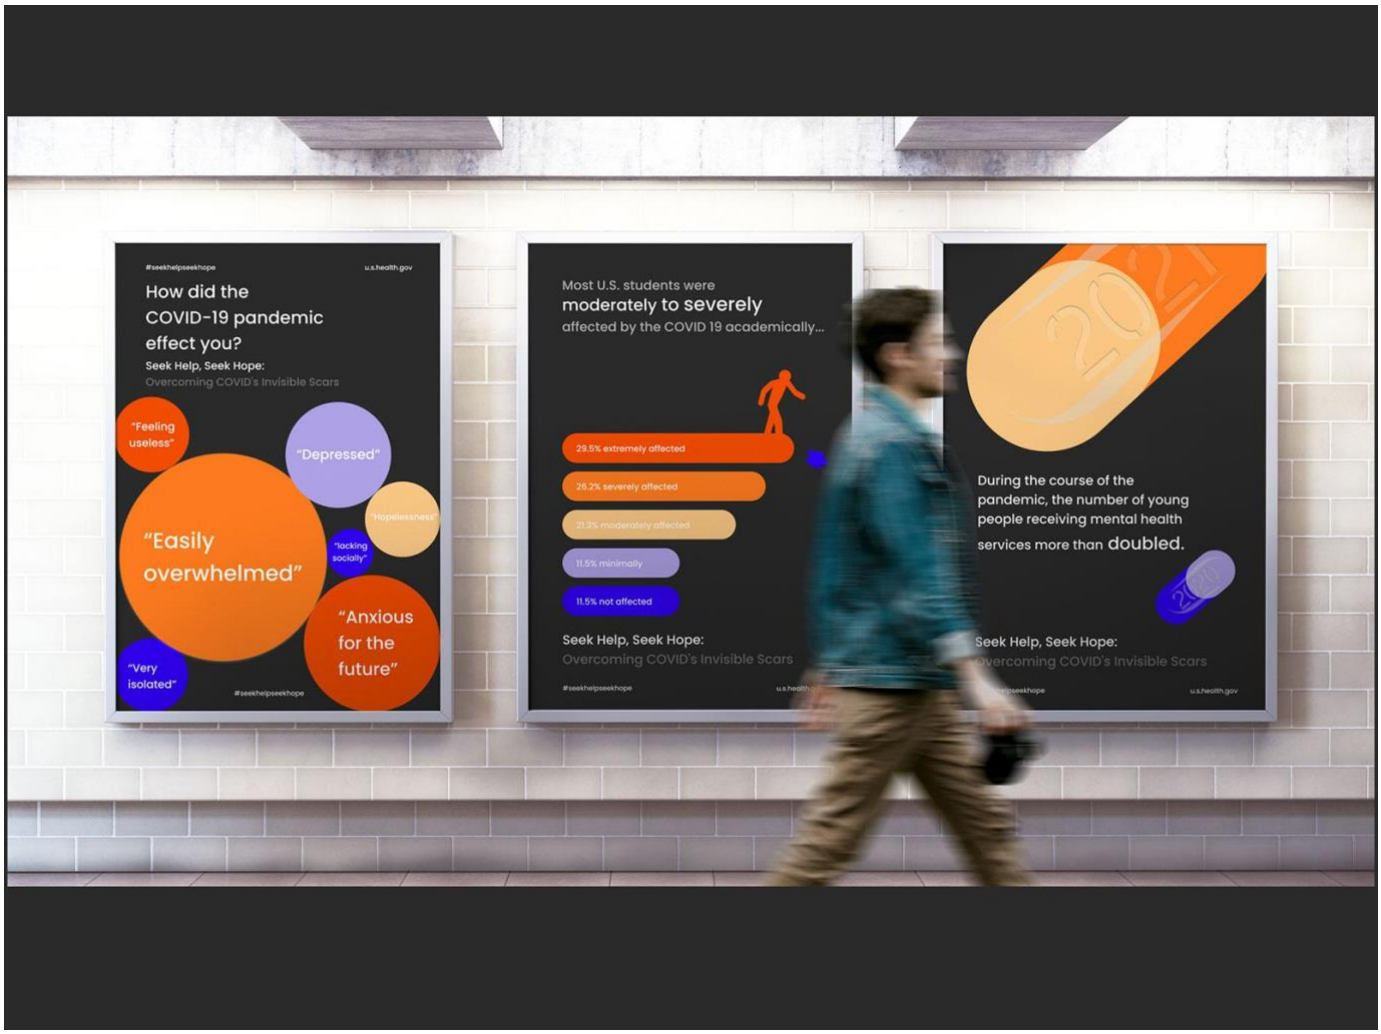

Figure 3: Another group from Texas worked on visualizing data on campus to raise awareness of the impact of COVID on students' mental health in the post-pandemic era.

Figure 3: Exhibition of the project *Payment Issues*. Display of a guide for creating a Badge for the own payment personality.

The interplay between payment methods and cultural attitudes toward privacy inspired KISD's *Payment Issues* team. They designed an analogue badge system to stimulate discussion, drawing on Germany's unique preference for cash, largely due to a lack of trust in digital payment systems and tracking issues with money transactions.

Figure 3: Visitors in the exhibition, trying to solve a puzzle of a face that an AI could build in seconds

With the increasing collection of biometric data and its processing by artificial intelligence in mind, a team from KISD developed a puzzle of a face to provide a haptic confrontation with the question of how algorithms process our data. Biometric data was also the subject of a group of students from Texas. They developed a concept to help runners with their nutrition and hydration during the Austin Marathon by using biometric data in a privacy-compliant way.

These prototypes were designed not only to inform but also to engage communities in meaningful dialogue about data privacy, transparency, and the ethical use of information. Through a design thinking approach, students iteratively refined their prototypes based on feedback from diverse cultural groups, ensuring that each design was both practical and ethically sound. The results were also presented at KISD's so-called Friday presentations. Visitors had the opportunity to try out the prototypes and discuss the topics presented.

4. Conclusion

By addressing these diverse issues through the lens of cultural awareness and ethical data practices, the project empowered students to recognize the importance of culturally sensitive design. The experience developed a deeper understanding of the complex intersection between design, data, and ethics.

The project was evaluated qualitatively using the 4L Method, where students reflected on what they *Liked*, *Learned*, *Lacked*, and *Longed for*. Students liked the cultural exchange to be one of the most enriching aspects of the project, particularly through deep, insightful discussions about the cultural differences and similarities they encountered during the design process. One student wrote "*The casual exchange of cultural differences and similarities was extremely insightful throughout our design process, It was exciting to learn more about Germany from a design perspective!*". The diversity in communication styles and collaborative approaches enhanced their learning experience, with participants feeling both understood and inspired by the feedback from their international peers. As Perttu Pölönen emphasizes in Future Skills, the ability to work across cultures is an increasingly critical skill in the modern workforce, fostering not only innovation but also personal growth through diverse perspectives (Pölönen, 2021). This sense of connection fostered a desire for more collaborative projects and additional interactive sessions that would further deepen engagement across cultural contexts.

From the students' perspective, the course provided invaluable lessons in data collection and usage, the role of cultural differences in design thinking, and the impact of cross-cultural perspectives on the design process. This exposure encouraged students to challenge their assumptions and broaden their thinking, ultimately shaping their views on the ethical dimensions of design and data. One student commented in the evaluation: "this course has made me think differently about design". As Erin Meyer argues in The Culture Map, understanding and navigating cultural differences in communication and decision-making is crucial for effective collaboration in today's globalized world (Meyer, 2014). Students experienced firsthand how cultural awareness could not only improve communication but also enhance the overall design process.

Design thinking played a central role in bridging these cultural differences. Tim Brown, in *Change by Design*, outlines how design thinking can serve as a tool for addressing complex global challenges by promoting empathy, collaboration, and iteration. Brown suggests that by focusing on human-centered design — understanding the needs, challenges, and perspectives of different stakeholders — design thinking allows for more inclusive and thoughtful solutions (Brown, 2009). This was particularly evident in the

project, as students used empathy-driven research to explore how cultural context influences the ethical use of data. By employing iterative problem-solving and collaborative design processes, students created prototypes that not only addressed local concerns but also reflected global considerations of data privacy, transparency, and inclusivity.

The evaluation also identified some constraints: students wanted more collaboration on joint projects with KISD students and more interaction through additional group meetings to deepen engagement. One student suggested: "I would have liked to do a project with the German students, and I HIGHLY HIGHLY want one class to have a studio side option like mixed media and we could showcase our art portfolio for an online show". The “Designing Data X Cultures” project will be offered in summer term 2025, where we will change the design by adding new opportunities for exchange between students in Germany and the US. It is also planned to exhibit the concepts and artefacts designed by the students at the University of the Future Festival in Berlin. The exhibition aims to stimulate dialogue about the sensitive use of data and the potential of intercultural projects at universities.

This project serves as an illustration of how design can facilitate transparent, inclusive dialogue around data practices. By understanding cultural nuances and the varying ethical frameworks that shape data interpretation, we can develop interventions that resonate with diverse communities. In doing so, we not only enhance collective data literacy but also foster a culture of trust and accountability in the use of data across borders. Pölönen’s call for an education system that equips future leaders with multidimensional thinking and cross-cultural adaptability is echoed here, as these skills are essential for navigating the complex ethical landscape of data use (Pölönen, 2021).

In conclusion, the findings from this project underscore the intersection of culture and data, highlighting the critical role design can play in addressing contemporary challenges related to data awareness. As Meyer points out, the ability to adapt one’s communication and decision-making style to fit cultural expectations is a key factor in successful international projects (Meyer, 2014). By integrating cultural sensitivity with ethical data practices, designers can lead the way toward more inclusive and innovative solutions in the digital age. This approach not only prepares designers for leadership roles but also sets the stage for fostering a broader cultural shift in how we understand and apply data. Design thinking, as Brown suggests, is a critical framework for shaping this shift, as it empowers individuals and organizations to approach problems with creativity, empathy, and a focus on human-centered solutions (Brown, 2009).

About the Authors:

Claudia Röschmann Experienced Designer and Educator with a demonstrated history of working in the international communication design world – skilled in innovation + entrepreneurship, brand experiences, typography, and design thinking, with a strong focus on cross-cultural and cross-disciplinary projects.

Elisabeth Kaliva Scientist and University Lecturer, with a focus in social educational design and agile competence oriented learning. Expertise in social learning environments, web-based technologies and user experience design in digital learning and training in higher education.

Lisa Janßen serves as the International Relations Officer at KISD. She supports and fosters the strategic and conceptual advancement of KISD's internationalization, is actively engaged in the exchange across faculties and domestic and international universities, and is also responsible for the acquisition of third-party funds.

Designing Ethical Leadership: Three Shifts For Design Leaders In Complex Times

ABSTRACT | Design leaders are uniquely equipped to drive ethical change in organizations and society, particularly in what Schön (1983) calls "uncertain, unstable, unique" situations. As their influence expands from design outputs to organizational systems and societal outcomes, their ethical development requires new frameworks and approaches.

This working paper, drawing from ethical design leadership workshops (2020-2023), examines design and innovation as an inherently emergent and pluralistic profession. Building on normative definitions of professions (Cooper, 2004), it proposes three pragmatic shifts to strengthen ethical design leadership:

First, expanding positionality discussions beyond personal identity to examine professional plurality, organizational context, and domains of influence, enabling leaders to better understand where and how they can effect and encode ethical change. Second, cultivating robust reflective practice through both individual and collective approaches, drawing on Schön's concepts of reflection-in-action and reflection-on-action to navigate the complexity of pluralistic practice. Third, developing 'ethical muscles'—eight proposed capabilities including perspective-taking, power-sharing, and caring stewardship—that support ethical navigation of everyday challenges.

These working frameworks offer practical tools for structuring cross-disciplinary conversations about ethical leadership in design and innovation, while providing a foundation for further development. Together, these shifts aim to cultivate muscular design leaders who can responsibly steward possibilities in organizations and systems alike.

KEYWORDS | Design Leaders, Ethics, Professional Education

1. Introduction

1.1. Developing the ethical design and innovation leader

> "You can make minor and inexpensive tweaks to the environment, which can produce big increases in ethical behavior....[the question is] how to design institutions in which real human beings, always concerned about their reputations, will behave more ethically." (Haidt, 2012)

Over the past two decades, designers have increasingly been called upon to address society's most pressing challenges, elevating both the stakes and ethical complexity of design practice. Their core capacities—people-centered orientation, interdisciplinary research, pattern synthesis, opportunity framing, and making concepts tangible—uniquely position them to address what Donald Schön (1983) calls "uncertain, unstable, unique" situations. This evolution demands integration across multiple innovation disciplines—design, strategy, product, service, and interaction—to create systemic solutions (Auernhammer, 2024). The field has further evolved through the adoption of co-design and participatory methods that directly engage multicultural communities and complex stakeholder contexts (Sanders, 2008; Cooper, 2004).

As design practice becomes more integrated and proximate to communities, designers face ethical questions that extend beyond their immediate design decisions to encompass processes, organizations, and broader systems. In service design, for example, designers shape the enabling environment around their interventions. As a designer rises in their practice and professional career— they also increasingly design aspects of the organizations in which they work. This evolution from designer to design leader requires a level of maturation and meta-reflection often overlooked in formal education and rarely addressed in day-to-day studio or corporate settings.

Ethical leadership represents a new 'frontier' for designers, as this conference suggests. This working paper, which emerged from a series of 'ethical design leadership' workshops conducted between 2020-2023, identifies key shifts and frameworks to support the development of ethical design leaders. It focuses specifically on leaders within interdisciplinary and strategic design practices, where professional complexity and plurality are inherent challenges. Section Three provides fuller context about these workshops, participants, and limitations. This paper includes excerpts of teaching slides, working frameworks, and interactive whiteboards from these workshops.

Design leaders merit particular attention as they shape not only design outputs but also teams, cultures, processes, and organizational systems. This rise in power has also come with its accompanying gaps in knowledge—about power (Aye, 2017). This expanding sphere of influence calls for a more comprehensive approach to developing well-rounded design leaders. An ethical design leader evolves from a sense of individual ethical responsibility towards collective responsibility; from modeling and navigating dilemmas to advocating and encoding ethical systems; from designing 'tweaks,' as Haidt implies (2012), to encoding more ethical approaches into the way we work.

Figure 1: A series of slides from the introduction of the design workshop to explain the rise from designer to design leader involves an evolution—**modeling** ethical behavior, **navigating** ethical questions and dilemmas, **advocating** for ethical practices, **encoding** and operationalizing ethical interventions and values. An accessible teaching metaphor invites participants to get off the "tweak treadmill"or StairMaster to elevate practice to a new level. (Kahl, 2020-2023)

While robust resources exist for ethics in research processes, emerging technologies, and personal ethical development, there are fewer pragmatic tools for structuring conversations and learning about ethical design leadership. This paper offers initial explorations of frameworks, in the context of a particular training, that support cross-disciplinary conversations about ethical and 'artful competence' that is often difficult to describe and teach (Schön, 1983).

This working paper propose three pragmatic shifts for developing ethical design leaders:

- Shift One: Expand discussions of positionality in professional contexts
- Shift Two: Cultivate robust reflective practitioners through creative, collective approaches
- Shift Three: Articulate & practice 'ethical muscles' everyday

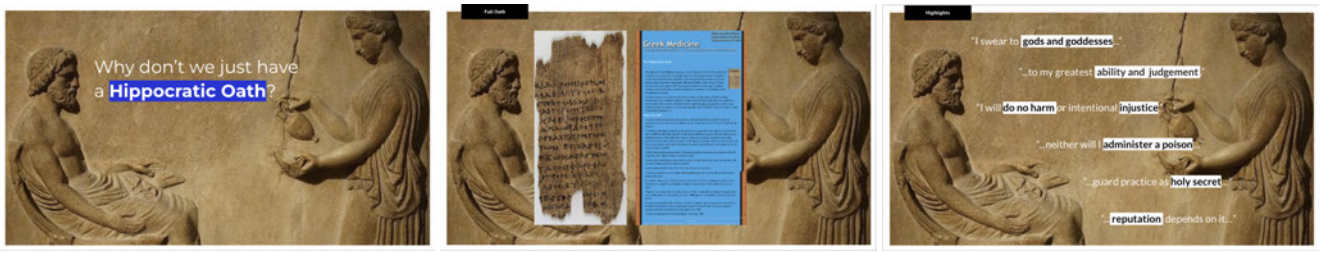
1.2. Recognizing our distinct professional ethics— plural & emergent

"We look to professionals for the definition and solution of our problems,
and it is through them that we strive for social progress.." (Schön, 1983)

"A normative definition [of professions] is useful, since it will make us more sensitive to the differences between moral and immoral professional practice and explicitly explain the vision that ought to inspire people to adopt a professional life" (Cooper, 2004)

What do we mean by "professional ethics"? What is the nature of the design and innovation profession today?

Both this paper and the workshop begin by establishing shared definitions of professions and professional ethics, which sets expectations for what moral professional entails. This framing also acknowledges the inherent challenges of working in emergent, interdisciplinary fields like design and innovation. As Schön notes, "the minor professions suffer from shifting, ambiguous ends and from unstable institutional contexts of practice, and are therefore unable to develop a base of systematic, scientific professional knowledge." This professional instability, when combined with the concept of 'professional pluralism' (explored further in Shift One) and rapid technological development, creates a particularly complex landscape for design leaders to navigate.



Figures 2a and 2b: A series of workshop slides .Top triptic: By reading and dissecting the Hippocratic Oath, participants develop a felt experience of a platonic professional ideal, its historical context, and its code. Bottom Pair: A shared definition of a profession and how design and innovation acts as an emerging and pluralistic form of professional. (Kahl, 2020-2023)

There are five primary components that establish a formal profession: i) esoteric knowledge or technical training, ii) national organization providing oversight and peer accountability, iii) provision of social value for a core human need, iv) strong moral commitment to shared professional values or code, and v) relative autonomy and discernment over decision-making (Cooper, 2004; Hoogland & Jochemsen, 2000). Traditional major professions—medicine, law, and divinity—are anchored by ethical codes that have endured for millennia, including the Hippocratic Oath (400-200 BC, Medicine) and Code of Ur-Nammu (2100-2050 BC, Law). The rapid technological advancement of the 18th-20th centuries sparked an 'explosion' of minor professions, each establishing their own codes—including engineering, architecture, psychology, education, and social work (Cooper, 2004).

Design and innovation fields have experienced their own micro-proliferation of professional and technical associations, each partially fulfilling aspects of formal professional definition (Acaroglu, 2016). While their moral commitments and privileged training varies, sub-disciplines like graphic design and interaction design have established clear professional bodies and codes. Strategic design and innovation practices— inherently interdisciplinary—lack a unified professional home. Contemporary design leaders, who increasingly cultivate multiple professional identities and areas of expertise, embody a 'professional pluralism' that is both sought after and fraught. Fraught, because we are increasingly invited into our era's biggest questions— yet our professional identity and ethical training remains inconsistent.

An ethical frontier, indeed.

2. The Three Shifts

2.1. Shift One: Expand positionality in professional contexts

The first shift is to expand positionality discussions to include a deeper investigation of one's professional pluralism, professional contexts, and domain of influence. This helps design leaders directly reckon with the emergent, pluralistic nature of the profession.

Understanding one's positionality—and regularly revisiting it throughout design research and practice—is a critical step in a designer's ethical development. Positionality involves systematic reflection on how one's social identities, values, and experiences shape both perspective and interpersonal dynamics (Rowe, 2014). These reflexive practices are increasingly integrated into design and engineering research, education, and practice (Noel, 2021; Hampton et al., 2021). While positionality tools are most commonly used by design researchers and social sector designers, they serve any practitioner seeking to understand their biases, critical frames, and relationship to power structures.

The positionality wheel is one such widely-used tool for structured reflection. While variations exist, Dr. Lesley-Ann Noel's framework provides a comprehensive foundation, examining dimensions such as race, ethnicity, class, family background, education level, ability, gender, and sexuality (Noel, 2021). This deeper understanding of identity—wrestling with the fundamental question "Who am I?"—enables designers to build critical foundations for conducting rigorous and responsible research, fostering inclusive teams, and developing equitable solutions. The growing adoption of these tools is particularly promising among design leaders, whose increasing professional authority makes ongoing reflexivity especially valuable to wield power responsibly.

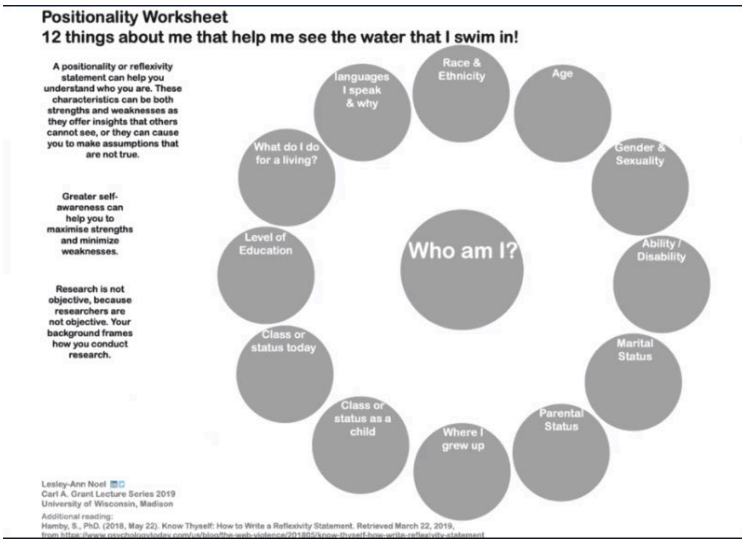


Figure 3: Dr. Lesley Anne Noel's Positionality Wheel Worksheet (2019)

While a design leader's personal positionality and values establish their ethical and moral foundation, an understanding of their professional positionality may help them navigate ethical complexity pragmatically. Increasingly, design leaders carry multiple professional identities, navigate nonlinear

professional pathways, and develop increasingly complex portfolios spanning diverse skills and sectors. This professional complexity mirrors what Donald Schön observed in the 1970s and 1980s as traditional professions faced a crisis in confidence in the face of accelerating technology, uncertainty, and emergent and overlapping professional practices. Schön suggested that the rise of "professional pluralism' called for professionals to develop an 'art of practice' or 'artful competence'— that involved reflecting and devising personal frameworks to synthesize one's multiple perspectives:

> *"In some professions, awareness of uncertainty, complexity, instability, uniqueness, and value conflict has led to the emergence of professional pluralism. Competing views of professional practice-competing images of the professional role, thè central values of the profession, the relevant knowledge and skills—have come into good currency. Leston Havens has written about the "babble of voices" which confuses practitioners in the field of psychotherapy. Social workers have produced multiple, shifting images of the nature of their practice, as have architects and town planners. Each view of professional practice represents a way of functioning in situations of indeterminacy and value conflict, but the multiplicity of conflicting views poses a predicament for the practitioner who must choose among multiple approaches to practice or devise his own way of combining them." (Schön, 1983)*

To grow one's ability to influence as a design leader, one must understand how their professional and organizational contexts shape their opportunities for 'encoding' ethics and what their responsibilities might be.

Shift in Action: Expanding Positionality

In the Ethical Design Leadership workshop, we explored and evolved exercises to navigate professional plurality. A preceding masterclass on positionality or power (given by Lesley-Ann Noel and George Aye respectively) set the foundation. This accompanying workshop dove more deeply into professional ethics. Participants were given a basic overview of ethics in the professions and called to deepen and activate their understanding of their professional positionality.

To activate this shift, we reflected on three professional perspectives:

Provocation	**Illustration**
First, **What is my unique professional plurality?** What are my professional identities? Do they have ethical or moral codes or perspectives? What distinct domain expertise and skills am I responsible for competence, knowledge, and quality? Do these intersect? Are they in tension? How?	***For example:*** *Consider a nurse who has pursued business education and transitions to an innovation role in a healthcare system. They blend multiple valuable perspectives. Their direct patient care experience and commitment to the 'Code of Ethics for Nurses' (ANA, 2025) combines with their managerial training and administrative responsibilities to create a unique professional lens. What tensions are they in? What values do they share?*

Figure 4: Professional Pluralities / The workshop incorporated synthesized case studies of professionals with diverse career paths, using their positionality narratives to deepen participants' reflections.

Second,

What is my professional context and pathway? What type of organization or institution am I operating within currently? What has been my professional context over time? Am I an insider or outsider to the situation? How do these practice contexts shift my perception, offer perspective, expand my stakeholders, or blind me?

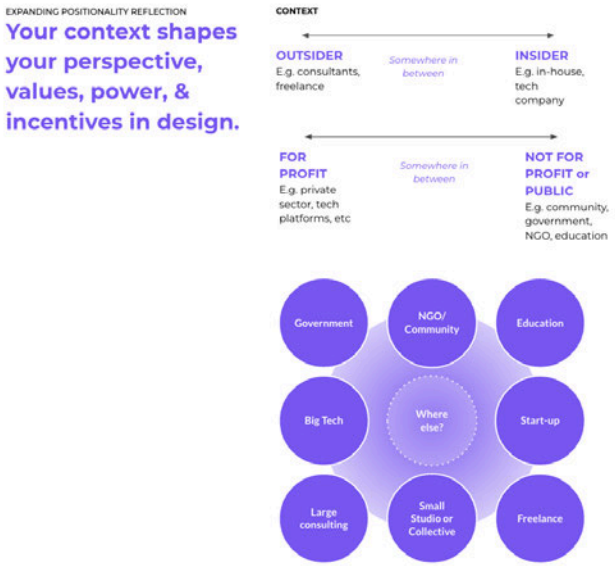

Figure 5: Institutional Context Analysis / The workshop prompted participants to list and reflect on how their professional design settings shaped their positionality.

For example:

One practitioner went from a customer-facing role to a training consultancy to experience and service design role at headquarters. Each afforded a different piece of the knowledge puzzle for designing powerful service and employee experiences. This multifaceted set of perspectives made them extra sensitive to power dynamics and ensuring research was responsible and relational. By owning their own narrative, they could better switch hats to advocate internally and build in protocols to protect and uplift retail-facing teammates.

How does prior experience in one sector influence decision-making in another? What practices or methodologies might successfully transfer between sectors? These considerations ultimately shape how practitioners understand and fulfill their professional obligations within their current role.

Third, **What is my dimension of ethical influence in my organization, institution, or work setting?** **Do I have outsized influence on products, process, studio, and/or business?** Are there common challenges or situations we encounter? Do I have power to shape the underlying processes, culture, or assumptions of that domain? Can we devise a way to encode a more caring, less harmful practice in this organizational system?	***For example:*** *We gave examples of how a range of design professionals can influence practice. For example, a leader or business development associate may have influence over the* ***design business dimension****. In the workshop, we gave the example of Greater Good Studio's "Gut Check" for new business, which acted as an 'ethical intervention' that encoded values into their business pipeline.* *For the* ***design studio dimension****, we looked at people structures. The co-founder of WeUnlockNYC, a company designing fair housing products, shifted their hiring and governance model to create a Leadership Collective of those with lived experience that reviews research, product roadmaps, and internal policies (Figure 8). This is an example of encoding an ethical approach into their studio management.*

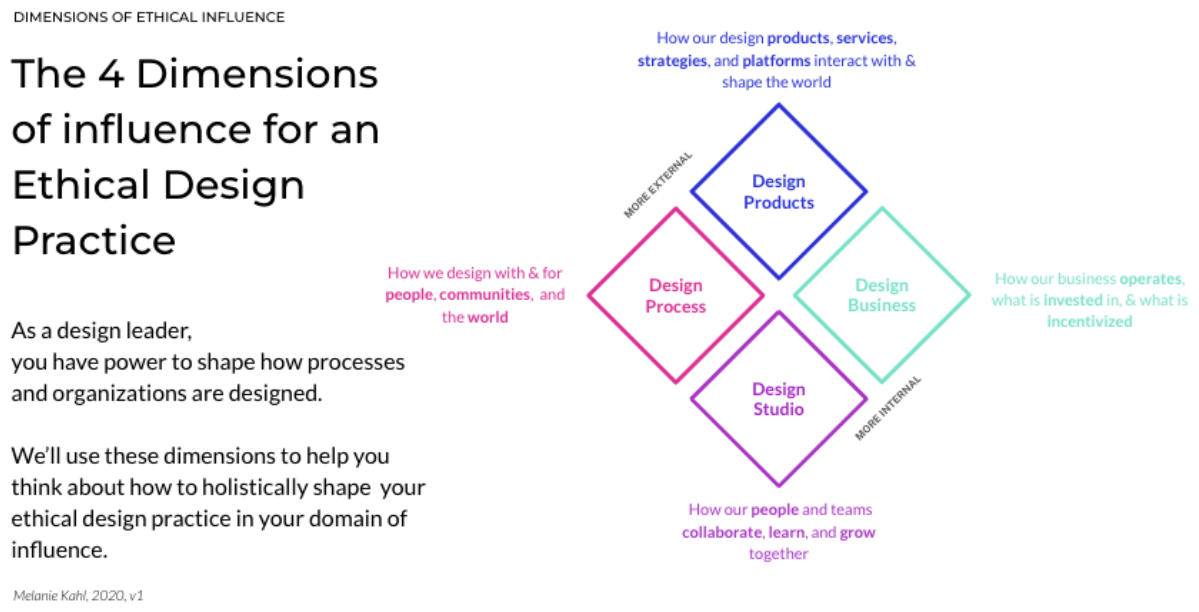

Figure 6: Dimensions of ethical influence— Design Process, Design Products, Design Business, Design Studio
See below for example of a workshop exercise. (Kahl, 2020-2023)

In the workshop setting, we reflected on the positionality prompts through guided individual reflection and paired and group discussion. This built on their foundational positionality identity work, but with new professional practice dimensions. The last positionality prompt, about each design leader's dimensions of influence, was an opportunity to surface common questions and challenges, case studies, inspiration, and concrete situations to workshop with colleagues. The ultimate goal? Defining a domain of power and influence to encode ethics into their design organization. In a diverse group of design and innovation leaders, this common framework facilitated a richer, pragmatic discussion.

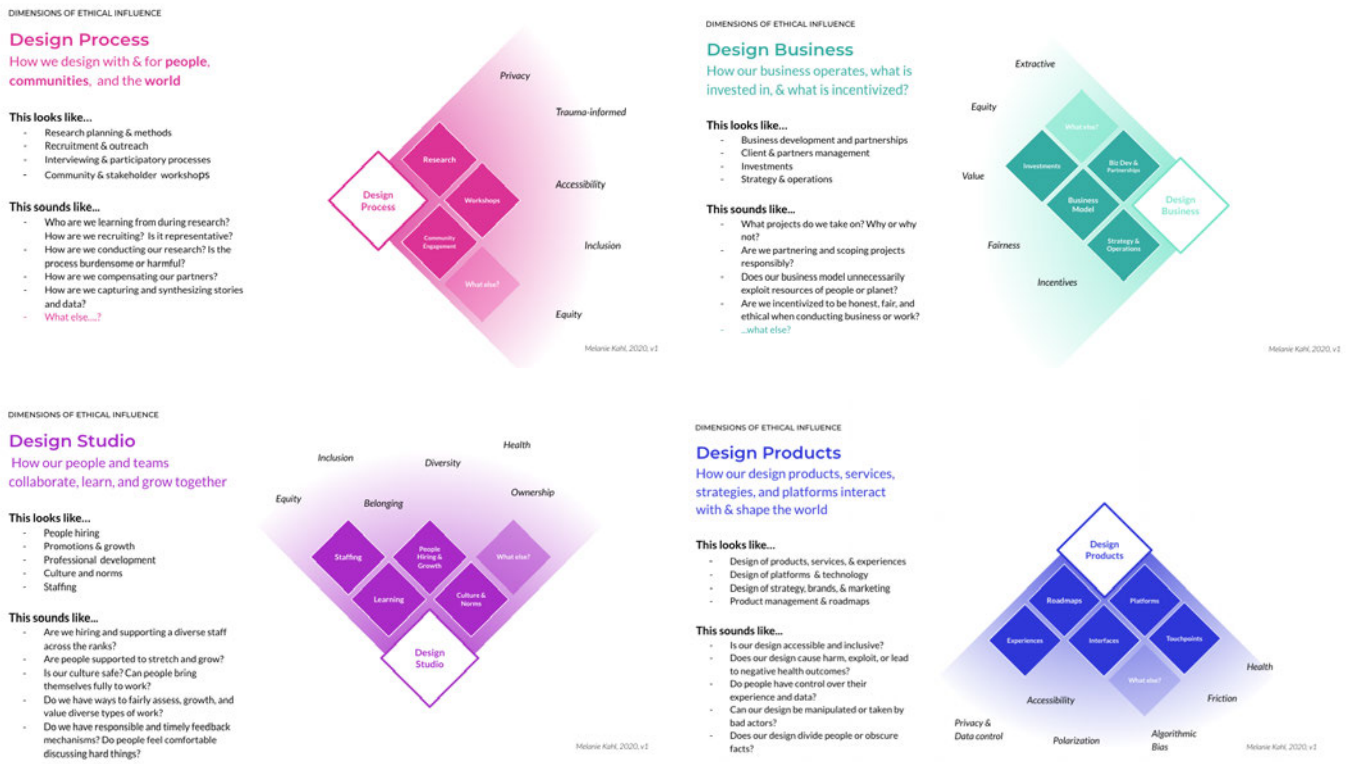

Figure 7: Detailed picture of each dimension of ethical influence— Design Process, Products, Business, Studio. By unpacking what they look and sound like, participants could identify areas where they most felt ethical friction and opportunities for encoding ethics. (Kahl, 2020-2023)

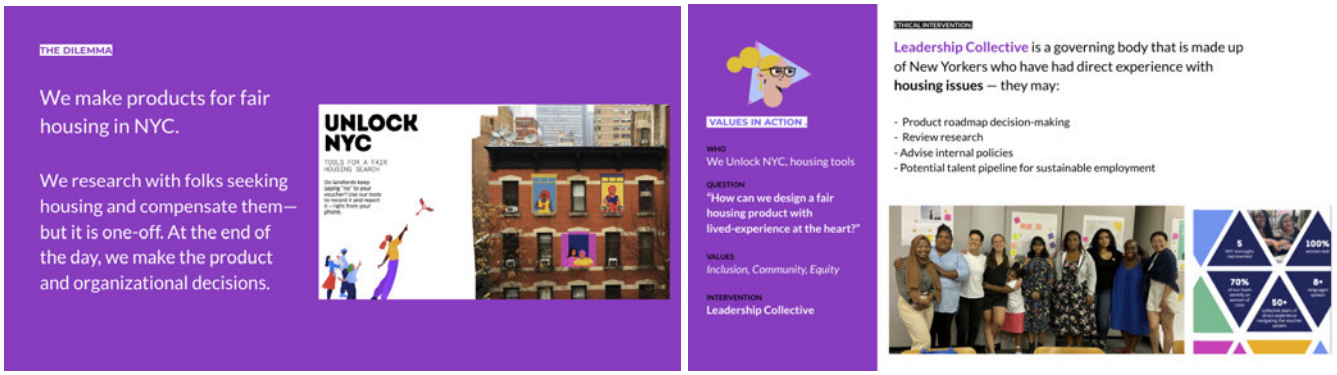

Figure 8: A case study of "We Unlock NYC"— the team 'encoded ethical practice' into their design studio by introducing a leadership collective governance structure. Content shared by Ashley Eberhart.

When design leaders deeply examine their position within their professional discipline, context, and domain, they can better focus their ethical influence. This expanded understanding of positionality enables designers to more effectively engage in practical ethical discussions that arise in daily practice. Strategic design and innovation professionals relatively emergent societally speaking and one are asked to wrestle with increasingly complex social challenges. Schön calls us to more artful navigation of our plurality— these three prompts and frameworks presented here offer innovation professionals across disciplines a shared language for discussing their scope and potential for impact. Moreover, they allow design leaders to assess and shape their design practices for opportunities to encode ethics.

These prompts can be paired with other powerful ethical perspective-building exercises, such as:

- positionality wheels and lens building (Noel, 2019) (Noel, 2024)
- clarifying and articulating values (Klau, 2010) (Barendregt et al., 2021)
- defining a scope of practice (McKercher, 2024)
- ethical stance-crafting (Dietkus, LCSW, 2025)
- power mapping (Aye, 2017)

2.2. Shift Two: Cultivate robust reflective practitioners & approaches

The second shift focuses on diversifying reflective practices—both individual and collective—to help practitioners navigate increasingly complex, ethically nuanced situations.

Both individual and collective reflective practices are central to the development of the ethical design leader—especially in the face of professional and societal pluralism and complexity. Why? It is essential to developing self awareness, negotiating professional plurality and interdisciplinary, and navigating nuanced dilemmas of practice. Schön's studies of various professionals (e.g. architects, urban planners, psychologists) revealed that the most effective and thoughtful professionals demonstrate dual awareness: they think about what they are doing as they are doing it. This ability allows them to problem solve effectively in ambiguous situations. Whether or not they can articulate this tacit knowledge immediately, it is important raw material for reflection that needs special scaffolding to draw out:

> "In real-world practice, problems do not present themselves to practitioners as givens. They must be constructed from the materials of problematic situations that are puzzling, troubling, and uncertain. In order to convert a problematic situation to a problem, a practitioner must do a certain kind of work. He must make sense of an uncertain situation that initially makes no sense." (Schön, 1983)

While it is usually applied to technical problem solving, Schön's frame has been used by other practitioners— like social workers— in an ethical context (Reamer, 2013). Reamer describes social workers heightened 'ethics radar' as they navigate the various situations of their daily practice and cases. Design leaders too can develop heightened 'ethics radar.' Schön offers practitioners multiple ways to think about reflection. First, 'reflection-on-action'— a retrospective look or reconsideration of a situation with an eye towards what could be changed or evolved. This might be a debrief or guided journaling exercises. Second, 'reflection-in-action'— the act of reflecting on something as it is happening, considering the

situation, 'thinking on your feet,' and even experimenting with the situation itself (Schön, 1983).

Both of these types of reflection are critical to the ethical development of individual design leaders. To deepen a leader's skills as well as grow the capacity of a studio— collective reflective practices are critical. And seemingly less written about beyond debriefing tools. Sharing stories in the workshop was a fertile start, but designers need more modes of collective reflective practice.

The case study method is hallmark to almost every professional's responsibility and ethics education—from business to bioethics. In engineering education, cases that reflect on the micro, macro, and extreme situations stretch the ethical dialogue and allow for developing professionals to discern and wrestle with the complexity of a situation (Harris, 2004). However, in pluralistic professions—there is a gap in these cases. Outside of graduate education or bespoke skill development, these critical tools for collective ethical development are hard to come by. What might that look like?

Shift in Action: Reflecting through roleplay and bespoke case development

One example of cultivating robust reflective practitioners comes from personal experience as a leader within Dalberg Design, a design strategy and service design studio working in the global development sector. In 2017, we engaged Consensus Building Institute to craft a bespoke workshop on designing and facilitating with diverse stakeholders. The process began with a mediator (David Fairman) who conducted in-depth interviews of 6-8 team members, from which he created tailored case studies and role-play scenarios. By abstracting real experiences into teaching tools, the workshop enabled a global design team to collectively explore and reflect on their practice in a neutral setting, free from client pressures and with reduced organizational power dynamics. This creative and collective reflection approach created a safe space for discussing ethically complex scenarios and developing shared understanding. It also simulated both reflection-on-action and in-action by crafting a live scenario.

Teams strengthen their ethical practice when they combine ongoing project-based reflection—both individual and collective—with creative experiences that promote deeper processing. To grow the next generation of ethical design leaders, we will need more such creative reflective tools and experiences.

Figure 9: A design team puzzles through a bespoke ethical dilemma case study derived from real stakeholders and diverse contexts. (Picture from Dalberg Design—Senegal, 2017)

2.3. Shift 3: Articulate & practice 'ethical muscles' everyday

> "Nobody is ever going to invent an ethics class that makes people behave ethically after they step out of the classroom [using their rational mind]." (Haidt, 2012)

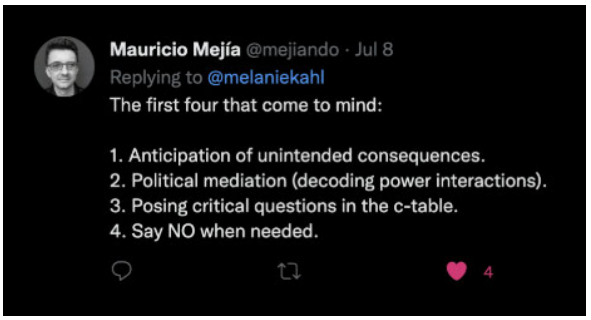
> "In fact, many of the other design industry associations (IDSA, AGDA, IGDA, IDIBC) have ethical codes of conduct that members must abide by; they entail doing no harm, being good to your client, protecting rights such as privacy, etc. These are cornerstones of most industry ethical frameworks…However, they are not good enough. *Cognitively, agreeing to something you didn't decide upon has very little weight in broader decision making contexts….. But no number of ethical guidelines can make the decision for you in the moment.*" (Acaroglu, 2016, author's emphasis)

The third shift is about bringing ethics to life by articulating and practicing 'ethical muscles' to better navigate complexity.

Developing into an ethical professional takes practice. Ethical codes, moral frameworks, nor classroom teaching can completely prepare one to navigate the range of complex dilemmas that arise in the course of design practice. Moreover, identifying and thinking about an ethical dilemma is one piece of the puzzle of navigating it. A design leader may not know what type of situations may arise, so how do they prepare in advance?

Using the language of the body, this paper and workshop series proposes the development of 'ethical muscles'. These are the component skills that are a part of navigating everyday ethical situations, larger dilemmas, and the work of encoding ethics into an institution. This shift to embodied language complements the trend of bringing the whole person into ethical and moral formation—from the importance of emotions in moral cognition (Davis, 2016) to 'felt ethics' as a way to develop ethical sensibilities (Garrett et al., 2023). It also allows for design leaders to intentionally identify areas of strength and growth in their own development.

Through a series of practitioner interviews, queries on social platforms, and three courses of workshops to test and evolve, we developed a provisional set of eight 'ethical muscles' for creative leaders. Each has an active orientation, an accompanying description, and component skills to hone through training or practice. For example, 'Shift & Share Power," aggregates a range of relational and political skills relating to power— from thinking in systems to techniques to shift, share, and cede power. One might pursue meditation training or employ power mapping tools to flex this muscle. All in the service of being able to navigate the everyday ethics of being a design leader in an increasingly complex world.



The eight provisional muscles include:

1. Awareness and discernment
2. Deep listening and perspective taking
3. Creating space and crafting questions
4. Shifting and sharing power
5. Caring and stewarding people
6. Sparking change through stories
7. Prototyping towards progress
8. Envisioning pragmatic possibilities.

Figure 10: Eight ethical muscles for design leaders to develop and hone. (Kahl, 2020-2023)

Shift in Action: Articulating Muscles

Over the course of the workshop, design leaders gathered components of their ethical leadership plan. The last step? Identifying which muscle(s) leaders wanted to practice, how they wanted to grow them, and from whom they wanted to seek support. Leaders were paired to share their plans and exchange ideas for continued development.

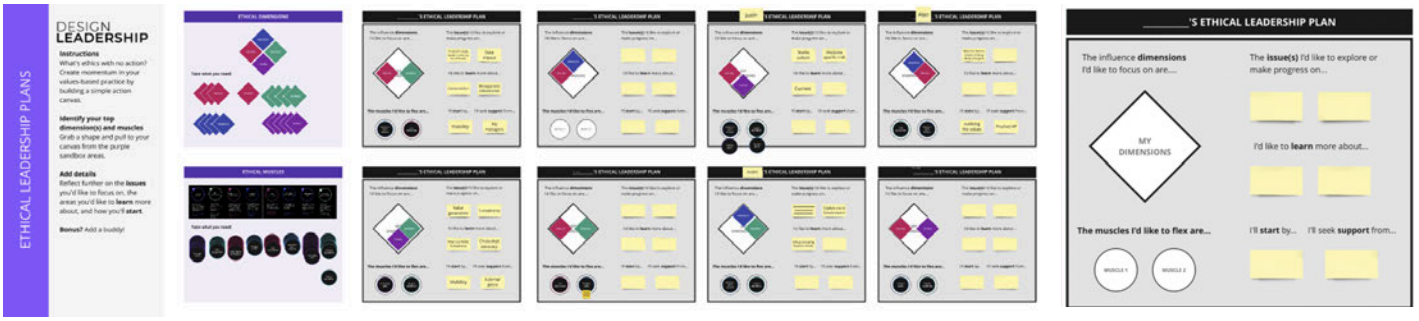


Figure 11: An interactive whiteboard showing the creation of ethical design leadership plans—with extra emphasis on the dimensions of influence and muscles to grow.

3. Looking forward

3.1. Limitations and explorations

This working paper explores pragmatic approaches to expanding ethical practice among design strategy and innovation leaders, complementing existing discourse on ethical design practice across disciplines. The author acknowledges several key limitations and assumptions:

- **Workshop context**: The paper draws from three iterations of a virtual ethics workshop within a 10-week "Design Leadership" course between 2020-2023. Each cohort included 12-16 practitioners, primarily from North American organizations with some participation from Latin America and Europe, spanning technology, consulting, and civic sectors. While this diversity contributed to broader applicability, future iterations would benefit from:
    - More focused participant selection by experience level and geography (to refine and test)
    - Extended duration beyond the half-day format
    - Direct input into participant recruitment
    - Pre and post work to define case studies and activate leadership plans
- **Evidence Base:** Case studies and examples were sourced by the author through:
    - Desk research
    - Personal professional experience
    - Interviews with professional collaborators
    - Participant reflections
    - Crowdsourcing from extended professional networks (LinkedIn, Slack communities)

  Future development requires more systematic data collection methods, including structured surveys and collaborative workshops, to strengthen the frameworks' empirical foundation.
- **Provisional frameworks:** This is a working paper—the proposed frameworks remain provisional, having been tested only in professional development settings. Specific limitations include:

    - The "ethical muscles" framework (Shift Three) could be deepened through a literature review on ethical sensibilities and skills and a broad survey
    - The reflective practitioner section (Shift Two) requires further development. This section was shortened significantly during the workshop setting and originally intended to be an add on session or coaching.
    - All frameworks would benefit from additional testing with collaborators in a range of settings
- **Future exploration:**
    - A survey or workshop to explore and refine “ethical muscles”— to build out examples and refine ways to ‘practice’ and develop muscles
    - An ethical design workshop for studios to redesign different ethical dimensions of their studio practice
    - An organizational audit tool developed out of the “ethical dimensions” or broader curriculum development rooted in “ethical muscles” and "ethical dimensions”

- **Author Expertise & Positionality:** This paper is necessarily informed (and limited) by this author’s expertise, experience, network, teaching, and self and formal study of professional ethics. I am a US-based, design strategy leader and adjunct professor with global professional experience in 17 countries and teaching in the US, Europe, and Central America. A majority of my experience is in the social, education, or civic sectors— with some significant projects with purpose driven brands and social media platforms. The seeds of this professional ethics exploration were planted at Northwestern University in 2008, under the study of the late feminist, care ethicist, Martha Holstein.

3.2. An Invitation

Professional development experiences are a fertile laboratory for blending theory, practice, and hatching new pragmatic frameworks. This working paper, while exploring the 'ethical frontiers' of design leadership, offers both a foundation and an invitation: to develop and test practical approaches for cultivating the next generation of ethical design leaders. These increasingly pluralistic practitioners deserve deep philosophical rooting, reflective scaffolding, and practice to grow their muscles. These containers— to explore, develop, and sensemake— are crucial to developing the skillfulness and discernment to effectively navigate increasingly complex challenges and opportunities for society.

Designing for a post-growth society: Towards a framework for ethical and social impact assessment

Martina Nadal[a], Ariel Guersenzvaig*[b]

A Domestic Data Streamers, Spain

b Elisava Barcelona School of Design and Engineering, University of Vic-UCC, Spain

* aguersenzvaig@elisava.net

ABSTRACT | This paper examines the role of design in navigating the social and environmental challenges of the climate crisis, exploring how design practice might align with post-growth principles. Based on the premise that perpetual economic growth is incompatible with ecological limits, post-growth thinking calls for a fundamental reorientation of design: one that prioritizes well-being, equity, and sustainability over market-driven expansion. While design has long been entangled with capitalist modes of production and consumption, it also possesses the potential to reimagine infrastructures, narratives, and material conditions in ways that support a transition beyond growth. The paper focuses on how designers might critically reassess their professional purpose to foster an ethical, socially responsible practice. Conventional design models often reinforce unsustainable consumption patterns, yet design also carries an inherent normative force, as it does not merely reflect reality but actively shapes it. The need for a more intentional and reflective design practice is thus imperative. We propose a framework for assessing design's ethical and social impact, structured around five key programmatic actions: alignment, revision, awareness, mitigation, and expansion. These categories articulate distinct but interconnected strategies that enable designers to engage with complexity, reconfigure professional priorities, and cultivate a practice attuned to the demands of a post-growth transition. Despite the growing discourse around responsible design, methods for assessing long-term ethical and ecological contributions remain limited. We therefore also tackle the challenge of measuring the impact of design. Drawing on impact assessment methodologies, we explore ways to integrate rigorous, multidimensional evaluation practices into design processes. We conclude by arguing for and supporting calls to a shift in how design is conceived, not as

a neutral, market-serving tool, but as an agent of systemic transformation. The transition toward a post-growth paradigm requires designers to not only rethink their role but to actively construct pathways toward more just and sustainable futures.

KEYWORDS | Post-Growth, Sustainability, Ethics, Design for Systemic Transformation, Impact Assessment in Design

1. Introduction: Ethical Leadership in Design: Towards a Post-Growth Era

This article focuses on the climate crisis from the perspective of design and on how to navigate its social and environmental effects. Drawing from post-growth theories, which propose an alternative socio-economic model, we ask how we might define a new paradigm in the field of design and what indicators we should use to assess whether we are contributing to a transition towards this new model.

In recent years, the concepts of post-growth and degrowth have gathered interest in public debates. We understand degrowth "the planned reduction of energy and resource use designed to bring the economy back into balance with the living world in ways that reduce inequality and improve human well-being" (Hickel, 2020: 25). The notion deals with the tension between economic growth and its limits, based on the premise that on a planet with finite material resources, extractive economies and populations cannot grow indefinitely (Sabini, 2021). Meanwhile, post-growth strategies integrate degrowth goals with those of social justice. We follow Paulson and Büchs (2022) in that a viable transition requires public support to validate political actions; this condition is already met in 34 European countries, where 60.5% of the population supports post-growth (Paulson and Büchs, 2022: p. 6).

Design plays an important role in modern capitalism, influencing the creation, commercialization, and consumption of products, services, and systems. According to various authors (e.g., Monteiro, 2019;, Bohnert, 2018), design is inextricably linked to the climate crisis and social injustice for this reason. Post-growth models reveal the myths we tell ourselves and warn that there is no possible future if economic growth remains tied to resource consumption. We must dismantle the belief that growth is always a sign of progress. Given the expected readership of this article it might not be necessary to argue that design. Besides encompassing notions of form, aesthetics, and functionality, it is strategically connected to the conception and planning of the human-made world. We take, moreover, understand design broadly and primarily as an activity and a discipline concerned with the prefiguration and reconfiguration of the material and immaterial infrastructures that mediate our beings and doings (Author2, 2021: 4–8). Design profoundly affects our everyday lives by transforming our individual and collective cosmovisions (see e.g., Nelson and Stolterman, 2014; Author2, 2021). What's more designers are thus involved from the outset in matters of genuine ethical concern, if only because "designing is 'materializing morality'" (Verbeek, 2011: 90).

With these premises, we ask, How can we rethink the design profession to direct our capabilities towards contributing to a transition towards degrowth while fostering positive environmental and social impacts? What would an alternative design model focus on? How can we redirect our capabilities to generate needs, social dynamics, raise awareness on various issues, and build narratives that are more hospitable to more livable futures? What indicators could we use to analyze the impact of our interventions to assess whether we are contributing to a degrowth transition?

2. Defining Purpose in Design

We understand professions as occupations that aim to promote, ensure, or safeguard some aspects of others' well-being (Bayles 1981; Whitbeck 2011). Merely serving others' wishes is insufficient to count as a profession because a profession must help people "attain certain goods that play a crucial strategic role in living a flourishing life as a human being" (Oakley and Cocking 2001: 79). In this manner, professions can be rightly

considered “moral projects” in themselves (Carr 2000: 28–31). Our understanding of design, which revolves around the conception and planning of the human-made world, plausibly supports considering it a profession, as the discipline can play a pivotal role in people’s lives and flourishing (for a comprehensive discussion, see Author2, 2021: 19–119). However, because it is a new profession and while it already exhibits a strong critical tradition, its ethical foundations *qua* professional practice are still far from being as robust as those of the nursing or teaching professions (Author 2, 2021: 101–103, 123–125).

Design also has a normative and ethical dimension as it proposes, voluntarily or involuntarily, ways of living. This is a central issue in the profession; design is normative as its use or application prescribes norms or standards, explicitly or implicitly. Therefore, design is necessarily concerned with what constitutes "good living" and what is good (more than what is right).In design practice, there is thus a paradox: it is a profession with significant impact and yet it retains great ambiguity about its ultimate purpose. Other professions have a clearer ultimate purpose (medicine and nursing, for instance, are clearly connected to promoting and preserving health and well-being). This indeterminacy has traditionally led us to serve market interests, being either unaware or indulgent of the consequences of our decisions. Indeed, Viktor Papanek famously noted in 1971:

There are professions more harmful than industrial design, but only a very few of them. And possibly only one profession is phonier. Advertising design, in persuading people to buy things they don’t need, with money they don’t have, in order to impress people who don’t care, is probably the phoniest field in existence today (Papanek, 2000, p. ix).

Thus, if we understand, as Herbert Simon said, that "design is concerned with how things ought to be" (Simon, 1996, p. 67), we should be committed as design professionals to the identification and integration of desirable scenarios for the futures we generate. If we understand the ethics and responsibility of the designer as going beyond obligation and duty, as proposed by Author 2 & Ventura, 2024, we can envision a much more viable and rich ethics in our practice. Practicing design more responsibly would be a way to become who we seek to be.

A number of narratives have emerged in recent years that reimagine the role of design in ways particularly relevant to this research, as they more directly acknowledge the social and environmental responsibilities of design practices and propose more conscious and respectful approaches to eco-social systems. Arturo Escobar (2018) is one such figure, contributing to the analysis of the logics that have led the profession to diverge from sustainable orders and equilibriums and proposing new forms of creation connected to the philosophies of "good living." Donna Haraway (2016) also encourages us, with her tentacular thinking, to continue confronting the problem, moving away from perfect, final solutions and understanding that we must collectively and interdependently face the emergencies in which we find ourselves. Haraway highlights the crucial role of communication and storytelling as tools for forging new ways of understanding the world, which can serve as acts of revolt and resistance. Joanna Boehnert (2018) also recognizes the most damaging areas of professional impact when the profession is subordinated to industry, and proposes a theory of change based on counter-power.

We join these calls and believe the design profession must transcend being a tool in service of accelerating the unsustainable consumption system that produces and reproduces global inequalities. Instead, we must center our practice on defining a clear and independent purpose, focusing on positive environmental and social impact anchored in the ambition of professional virtue and the rigor of measurement as an ethical commitment to our purpose. It is necessary to clarify our broader purpose as professionals and accompany it not only with good intentions but also with evidence of our contribution to a greater purpose than serving clients’ wishes in the form of a design brief.

We assume that design can have a significant influence in facilitating the eco-social transition towards post-growth, given its capacity to generate high degrees of social and environmental impact through its interventions. We won't argue in more detail that the purpose of design needs to revolve around conceiving and shaping livable, more just futures and referring the reader to the aforementioned sources. Rather, assuming design can have this significant influence, we want to ask, How can we measure the impact design can have in the transition towards a post-growth context?

3. Designing with Intent: Beyond Mechanicism

To explore ways to expand design capacities to address complex challenges and global urgencies, we sketch five major categories of programmatic actions that design professionals could introduce to transform the sector, contributing to reducing the material demand linked to the growth model.

These actions are:

1. Alignment
2. Revision
3. Awareness
4. Mitigation
5. Expansion

Figure 1 shows the proposed categorization of these actions for a post-growth transition. They are divided into internal activities, referring to the profession's working methods, and external activities, referring to the type of services that can be offered. In the next subsections, we briefly describe these actions and include examples coming from design practice.

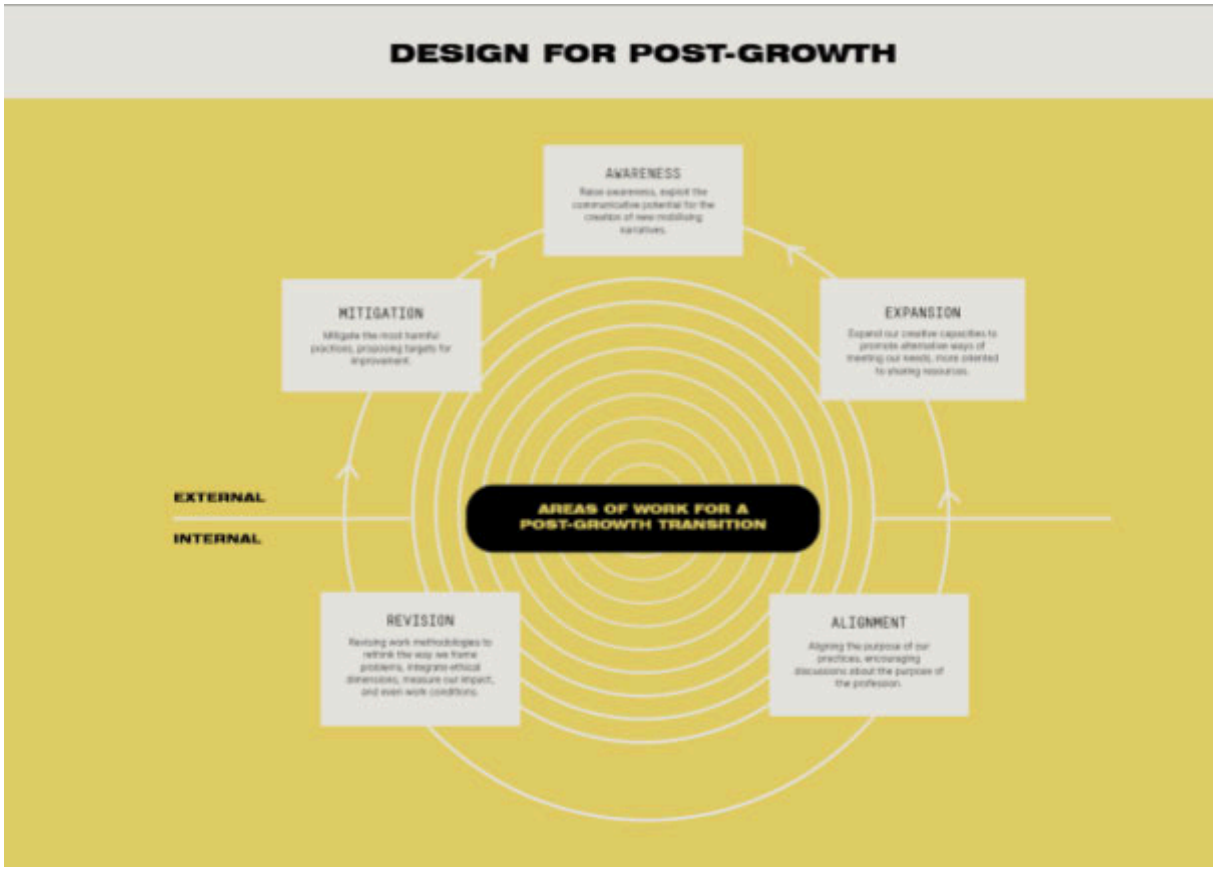

Figure 1: Diagram of internal and external areas of design input to transition (Source: author1, 2024).

3.1. Alignment

Reflecting on the social and environmental implications of professional practice at different levels: individual work, design studios, and the profession as a whole. Prioritise debates on the *what for* of design. What can be the common purpose as a new profession and historically closely linked to a system centred on consumption and growth that is currently in crisis? Aligning then, decisions on the type of employment we generate taking into account the quality and fairness of it, with the ultimate purpose of the sector in a measurable way.

The project *Postgrowth.design* serves to illustrate alignment. Postgrowth.design is an initiative that explores speculative scenarios and concrete practices in order to address the fears, expectations, aesthetic, ethical, political and emotional implications linked to the challenges of degrowth. They argue that design, as a discipline entangled in systems, is also a tool capable of enriching imaginaries, forms of organisation and production, ways of life, and subjectivities that tend towards a society detached from the myths of capitalist growth.

3.2. Revision

It is key to revisit habitual methodologies to incorporate approaches to more complex problems and integrate the dimension of ethics and labor values into work processes. Professional designers ought to initiate and sustain a deeper reflection on the ethical side of their professional practice. This fits what Schön (1983) calls *reflection-on-action*, which is performed outside a design situation. It consists in the ability to scrutinise one's own design processes and one's actions and thoughts. This activity enables the designer to explore the reasons why they acted as they did, in order to evaluate and improve their own process and increase their levels of skill and expertise. The goal of the revisión activity is to internalize guidelines for ethical action *during* design practice (see Author2 and XXX, forthcoming).

The Design Justice Network (DJN) has a mission to harness the collective power and experiences of its members to create safer, fairer, more accessible and sustainable worlds. This exemplifies the revision activity. In their methodological and theoretical work, they champion the idea of design for care, healing, liberation, happiness and deep sustainability. More concrete examples of how design can be led by marginalised communities, dismantle structural inequality and advance collective liberation and ecological survival can be found in *Design Justice. Community Practices for Building the Worlds We Need* (Costanza-Chock, 2000).

3.3. Awareness

Directing design and communication capabilities toward creating and mobilizing new narratives. Generating desirability and credibility for alternative futures that break with the current paradigm. Making current challenges visible and understandable to the general public to facilitate a mindset of transformation in a more conscious way with the global crises. Often information is available, but understanding it in an era of *infoxication* is a challenge for most of us. The role of designers as translators of complex realities could become an unlocker of more coherent decisions between the information we have about the actions that need to be prioritized in order to mitigate some of the most pressing issues in the world.

An example of awareness is *Referente Disnovation.org,* a collective between contemporary art, research and hacking. They develop artistic interventions that seek to empower imaginaries and practices related to post-growth, while challenging dominant "technosolutionary" ideologies. They promote the idea of reconnecting human survival with the living and material qualities of the biosphere, drawing on ecofeminism,

indigenous knowledge, environmental accounting and historical materialism.

3.4. Mitigation

Identifying the practices and decisions made in design exercises that have the most harmful impacts on the environment and people. Learning to measure these, setting goals, and strategies for improvement. Upskilling the professionals to better understand the impact of their choices they make whenever choosing a material, a software, a production method, a colour or a specific user experience technique among individuals and environments to mitigate the most harmful effects that create harmful behaviours in individuals and worsen our environmental conditions.

An interesting example of mitigation activities can be found in the book *Flourish: Design Paradigms for Our Planetary Emergency (Ichioka & Pawlyn, 2021)* . The book proposes an approach to address today's challenges related to climate change and sustainability. In a post-pandemic context, it highlights the need to rethink traditional paradigms in organisations around the world and invites business leaders to adopt regenerative approaches, abandoning unsustainable production and consumption practices. He argues that the current concept of sustainability has fallen short, proposing new ways of thinking and acting to address the planetary emergency by presenting regenerative, reconciliatory, restorative, sustainable, green and conventional systems, from more to less, aligned with a regenerative impact and in relation to the need for energy consumption.

3.5. Expansion

Redirecting creative capacities to design solutions fostering new ways of meeting needs and relating socially that rely less on consumption and more on resource sharing, avoiding material waste, and requiring less energy to live better. This activity presupposes a model to guide a transitioning towards degrowth. One such model could be the so-called *Doughnut Model*, developed by Kate Raworth (2017). This model balances human needs with planetary boundaries and consists of two concentric rings representing the *social foundation* (ensuring basic human needs such as food security, health and education, and an outer ring representing the *ecological ceiling* (preventing environmental degradation such as chemical pollution and biodiversity loss). For Rawort, the space between these rings is the “safe and just space for humanity” to thrive sustainably.

The Post Growth Guide (Feldthus & Haumann, 2025) is an educational platform aimed at professionals who want to learn how to align business with planetary boundaries. It is committed to redesigning businesses to prioritise resilience and sustainability over financial extraction and endless growth.

4. Measuring Ethical Impact & Ethical Practices in Design Processes

Often, impact is argued with weak and unsound assumptions under rigorous investigations (Clift, Phillips & Pritchard, 2021). This section aims to address this deficit by providing practical tools that help us objectively and rigorously understand the impact of our actions. To know how we are contributing to this transition, we must measure our contributions and determine whether our actions produce the desired changes or improvements.

In other words, if our design interventions are intended to raise awareness of an issue, change the behaviour of a citizen, user or consumer, break a taboo on an issue or

reduce the impact of CO2, we must equip ourselves with the necessary tools to be able to understand how, with our design decisions, we impact on these eco-social contexts. Before continuing, we want to point out some substantial limitations in the field of design and the measurement of its impact:

1. *Short-term measurement*: On the one hand, the fact that the design sector works mostly on the basis of specific, time-limited projects, and rarely on a long-term basis, means that the time frame available for measurement is generally too narrow. For example, on their website, the IAB (Interactive Advertising Bureau UK [IAB UK], n.d.), the UK's digital advertising industry body, gives a lot of indicators on how to measure the impact of campaigns digitally, but leaves behind long-term effects.
2. *Measurement of economic bias*: On the other hand, most design impact measurements that are developed over the longer term are biased by the fact that companies collect only or mainly economic impact data. The research team assumes that this bias is justified by the interest in getting more investment in design. Hence the importance of demonstrating its maximum benefit. For example, Sheppard et al. (2018) develop the Design Index Indicator, which looks at the correlation between economic growth of a business and degree of design integration within their business model.
3. *More measurement than evaluation*: Often, the metrics that are collected consist of quantitative data and are not always contrasted with previously established results, nor are learning processes carried out that allow the results to be extrapolated and the knowledge generated to be built upon. For example, In a shallow approach to web advertising and communications, metrics such as page views, click-through rates, and cost per click are heavily relied upon, often without deeper analysis or connection to business goals or communication strategy.

Considering these shortcomings , we want to explore other impact measurement methodologies that might be able to inspire the design sector to broaden its perspectives in this regard. As a case in point, the field of development (development cooperation) is selected. Development is a professional field where designers often intervene whose main purpose is to to improve social and environmental conditions. Therefore, more advanced methodologies for the measurement of long-term socio-environmental changes are desirable.

In related research by one of us, (Author1, 2024), a website (XXXXX) was created with the aim of becoming a dissemination tool for the sector providing a narrative on the importance of impact measurement in the sector and brings together a set of practical resources to guide impact measurement in an accessible and simplified way (Figure 02).

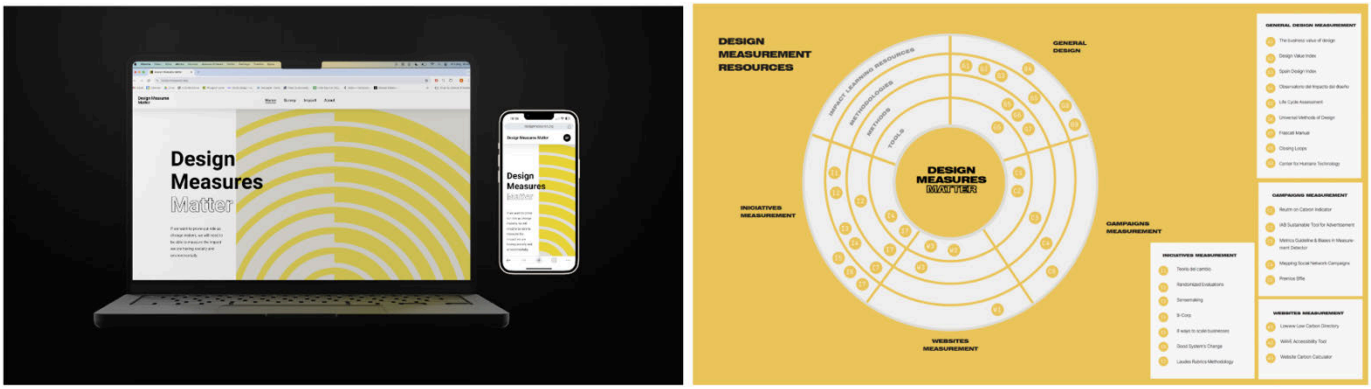

Figure 2: Accompanying website.

Below we offer a selection of examples of initiatives, measurement methodologies and resources for different types of initiatives. Taken together, these tools provide a practical starting point for addressing the challenges of measuring ethical impact in design and promoting more responsible practices in the industry.

B-Corporate
Measurement focus: Environmental and social impacts of business.
Description: The B Impact Assessment is a 360° impact measurement and management tool used by more than 200,000 companies worldwide to improve their social and environmental performance. To embark on the path of impact management, it is necessary for companies to measure their environmental and social impacts with the same rigour with which they manage their financial indicators, from a holistic perspective and considering the impact on all stakeholders. Since 2007, B-Corp has been developing free and open access tools to support companies in this first step.

Laudes Rubrics Methodology
Measurement focus: Systemic change, measurement and learning approach.
Description: A rubric-based methodology created by the Laudes Foundation to support the philanthropy sector to understand its contribution to change, while learning and adapting to new and unforeseen circumstances. They argue that change cannot be captured by numbers alone, because metrics focus on what can be counted, and not always on what matters most. Rubrics are a framework that sets a standard for what is "good" and creates a shared language for describing and assessing it using quantitative and qualitative evidence.

Life Cycle Assessment
Measurement focus: Environmental impact of a product's life-cycle
Description: LCA is a methodology used to assess the environmental impacts of a product, process or service throughout its entire life cycle (ISO 14040:2006). ISO 14040 defines LCA as the collection and evaluation of the inputs, outputs and potential environmental impacts of a product system throughout its life cycle. Along the lines of this standard and with the main objective of helping LCA practitioners to put it into practice, other codes of practice have been developed. In the EU context, the European Commission's Joint Research Centre has published the international reference manual for the life cycle data system. Since 2013, to improve the comparability of LCA applied to products and organisations, the European Commission has launched the Environmental Footprint methods, which calculate the total carbon impact of a product "from cradle to grave", taking into account the collection and processing of raw materials, the manufacture of the product, its distribution, its use by the consumer and its eventual disposal.

Lowww
Measurement focus: CO2 consumption of websites
Description: Lowww is a directory of lightweight websites that has been created to inspire digital industry players to design and build lighter and greener products, using the median web page weight of the HTTP file as the main reference to calculate the impact. They calculate the difference between the weight of a web page and the average weight of a web page and convert it into a percentage. The CO2 calculations use the Sustainable Web Design methodology.

Website Accessibility Evaluation Tool

Measurement focus: Web Accesibility
Description: WAVE is a website that presents a set of evaluation tools that help create more accessible web content for people with disabilities. WAVE can identify many accessibility and Web Content Accessibility Guidelines (WCAG) errors, but also facilitates human evaluation of web content. They focus on issues that affect end users, facilitate human evaluation and educate about web accessibility.

ROCO2
Measurement focus: Climate impact of campaigns.
Description: Purpose Disruptors is a collective of professionals working in the advertising industry. They propose a simple calculation to measure the climate impact of advertising campaigns: "the increase in sales driven by advertising" multiplied by "the carbon footprint per item sold". They also propose to replace or complement the standard business measure of "return on investment" with a "return on carbon" (ROCO²) to maximise profitability while minimising carbon emissions. Ecoeffectiveness is the new metric they propose, "Return on Carbon" (ROCO²), to measure the climate impact of advertising campaigns by multiplying the advertising-driven increase in sales, per carbon footprint, per item sold. The new metric measures "return on CO2e": the additional revenue generated per tonne of CO2 equivalent emitted. If return on investment is about giving a figure for "profitability", ROC can be seen as a measure of "return on burn". The methodology uses Life Cycle Assessments (LCA). Where no LCA exists for a specific product, it is possible to use category level data, which will give a less accurate result. This data is combined with effectiveness data - which shows the increase in sales generated by advertising - to provide a measure of the commercial impact of a campaign in relation to its environmental impact.

IAB Clickhead Booklet
Measurement focus: Advertising
Description: The IAB, uniting the digital advertising sector to promote innovation, set common standards and simplify the complex. The IAB also advocates for the harmonisation and standardisation of digital advertising broadcast measurement, which can help streamline the process and enable comparable analysis. Within their resources they also offer a Measurement Toolkit in which they present six signs that professionals should watch out for to avoid bad habits when it comes to measuring digital advertising, and what you can do to avoid being a #Clickhead (a term they use to name marketers who love click-through rates and reject more sophisticated and nuanced techniques to measure their campaigns). Some of these bad habits and biases are *default bias* and *confirmation bias*, which are cognitive biases that negatively influence decision-making by favoring familiar choices and seeking information that confirms an individual's existing beliefs.

Diverse approaches and tools for measuring ethical impact and design practices have been explored, highlighting both their limitations and opportunities for improvement. From extensive and rigorous methodologies such as B-Corporate's B-Impact Assessment, which covers social and environmental aspects, to the Laudes Foundation's rubrics, which integrate quantitative and qualitative data to assess systemic change, the need for broader perspectives on measurement is evident. Specific tools such as Life Cycle Analysis (LCA) for products and services, or Lowww and WAVE, which address the impact of web design in terms of CO2 and accessibility, respectively, highlight the importance of measuring impacts in specific sectors. Finally, initiatives such as ROCO², focusing on the climate footprint of advertising campaigns, and the IAB's guide to improve measurement in digital advertising, underline the relevance of adopting innovative and more meaningful metrics.

5. Conclusion: Towards a New Design Paradigm

This paper has aimed to contribute elements of reflection on how we can accompany, from the practice of design, the socio-economic transition towards a post-growth model. We explore the narratives and the state of degrowth and post-growth, identifying a necessary paradigm shift. We analyse institutions and scholarly references, mapping their theoretical and practical contributions. We found that post-growth design practices lack robust systems to measure their social and environmental impact, which limits their capacity to evaluate results. We extended the research to impact measurement methodologies, focusing on communication campaigns and proposals such as ROCO2, an environmental impact indicator. However, we found an insufficient scenario, dominated by economic metrics and with few tools to assess long-term impacts. To address these shortcomings, we explored sectors such as cooperation and social innovation, looking for good practices transferable to design, including dynamic and alternative measurement strategies to better parameterise contributions towards eco-social transitions.

We want to offer some considerations to be taken into account when facing the challenges of impact measurement:

- *It is one thing to measure and another to evaluate*: In the first case, data can be collected without further ado; in the second case, it is a matter of comparing it with a target or benchmark, which need to be part of a larger model such as the Doughnut model. Sensemaking and learning processes come later, as the learning phase is not always part of the process, which would lead to measuring without learning. Qualitative KPIs can give very vague or shallow information.
- *Static models for dynamic challenges*: Logic frames and theories of change seem to have limited flexibility in the face of the changing scenarios presented by the wicked problems of our time as defined by the new design approach to transitions defined by Terry Irwin.
- *Short-term measurements for structural challenges*: Often, design projects end up measuring one-off interventions that are confined exclusively to the limits of their time frame, with little or no recourse to broader or more general measurements. Such measurements are often ineffective in capturing longer-term social and environmental effects.
- *Measurements at the design level are often biased by neo-classical economics.* They focus primarily on the bottom line (i.e.., revenue). In the framework of this research we have not found *designerly* longer-term impact measurements to guide an organisation's actions.
- *We measure reach rather than influence*: In campaign design, the use of engagement KPIs and the level of media impact are widespread practices. However, it is less common to find the integration of more qualitative measurements of how campaigns have impacted behaviours and mindsets.

With this work we want to offer a contribution to what is proving to be a growth opportunity for design as a profession. A new space where the knowledge and experiences of this discipline can be agents of change towards more sustainable societies. A reality to which we can contribute, with care and awareness, with all that we know and all that we can learn. With creativity and rigour. If we understand our profession as a dance, we know that there are moments to train and moments to dance. To thrive as a profession we need to be able to shape a new paradigm for ourselves, to glimpse the necessary paths to do so and to provide us with the tools to measure and understand what we do.

Measuring and understanding the impact of our work as designers has often been far from our usual procedures. Perhaps because of this, we are sometimes unaware of some of the most harmful consequences of our practice and, loaded with good intentions, we generate collateral damage and externalities of which we are unaware. "Measure", "count", "understand", "improve" are often verbs that sound to us like examinations, control and lack of freedom, so necessary for creativity. For this reason, they seem like foreign bodies in our field. However, we count the days left to see our loved ones. We remember the birth dates of those we care about. We blow the years we have achieved. Our relationship with metrics is clear, we measure what we value. Measuring can therefore be a way of caring. Caring for what matters to us and, above all, what matters most.

DESIGNING FOR CIRCULARITY: A GRADUATE FRAMEWORK FOR ENTREPRENEURIAL AND INTRAPRENEURIAL LEADERSHIP IN SUSTAINABLE ECONOMIES.

Mary Mc Bride[a], Xue Bai*[b], Richard Green[c]

*xbai4@pratt.edu

ABSTRACT | This working paper will present our research on developing a graduate program that enables designers to evolve into entrepreneurs and intrapreneurs equipped to lead and manage the transition to circular economies worldwide. As circularity gains traction among nation-states, standards for circular practice are expected to influence regulatory frameworks. Circular economy frameworks offer a measurable approach to defining "sustainability" and emphasize the role of design leaders in identifying opportunities that support enterprises, biosystems, and societies. While circularity concepts are emerging in design curricula, the focus remains primarily on materials, methods, and waste management. Although essential, these areas alone do not provide designers with the strategic frameworks needed to lead and manage transitions within economic and enterprise systems. Driving circularity through design will require new mindsets, toolsets, and skillsets, along with a mission to create systems of exchange that not only engage but enrich and enliven. Our research seeks to support this mission by identifying necessary skillsets and toolsets and developing curricula that support design-driven strategies for circularity. This working paper will present our progress, offering a framework for consideration and potential partnership opportunities.

KEYWORDS | ETHICS, LEADERSHIP, DESIGN, ENTREPRENEURSHIP, CIRCULARITY, EDUCATION

1. Introduction

This working paper highlights the importance of educating leaders to design triple-bottom-line strategies that benefit enterprises, communities, and ecosystems (Elkington, 1999). This approach contrasts with both traditional business education and traditional design education. Business education prioritizes profit generation over sustaining living systems. Design education prioritizes the creative and efficient use of materials. Neither business leaders nor design leaders have been well educated to design systems that align human enterprise with the imperatives of ecological and societal well-being.

This paper outlines the research and process of inquiry that informs the design and delivery of a proposed 18-credit "Fellowship," structured as a graduate offering that meets the specifications for an Advanced Graduate Certificate and EU Postgraduate Diploma to be:

- Delivered online in real-time over one year with an optional hybrid residency/practicum
- Inquiry-guided experiential learning in study groups of 8-16 current and emerging leaders
- Team-taught by multidisciplinary faculty
- Designed to be offered through a network of educational partners

The intent of the Fellowship is to provide participants with an understanding of the power and consequences of design leadership at a critical turning point in the Anthropocene. Our goal is to enable entrepreneurs and intrapreneurs to use the strategic power of design to shape circular exchanges based on ethics grounded in:

- The realities of systems dynamics and interdependence
- The material and non-material needs of humankind
- The survival imperative of our genes

2. Context and Contribution

This paper presents our initial findings on the current context of leadership education. Its contribution to that context is its emphasis on examining the ethical responsibility of the leader to design strategies that enable a transition to systems of circularity.

Our methodology includes an extensive literature review on leadership, design, design leadership, sustainability studies, circularity, ethics and economics. Our ethnographic research includes informal and ongoing conversations with industry partners, designers, leaders, professional associations, program participants and alumni.

We have focused our research on circularity as an emerging discipline of study, not yet fully woven into the curriculum of leadership, design, or sustainability studies. We can see potential for educational offerings that can leverage the focus on circularity in national initiatives. It is our research intention to explore how best to educate leaders able to discover, define, design, and deliver (4D) systems of exchange focused on circular flows.

3. The Ethical Challenge in Leadership Education

Traditional business schools and MBA curriculum often fail to elevate ethical considerations (Bennis & O'Toole, 2005), which are integral to the value of life or living systems. Instead, they prioritize providing leadership mindsets, toolsets, and skillsets that enable leaders to efficiently produce profit within economies of exchange organized around consumption. Design leaders trained in traditional business schools are taught to focus on quantitative measures of success, sidelining creativity, ethics, and sustainability.

Leaders are trained in the "ethics" of free enterprise systems, which prioritize efficient production and optimal return on investment. The core mission is to create and grow economic value. As a result, leaders focus less on moral values or principles that guide ethical behavior, and more on compliance with legal norms and mitigating reputational risks. Resource utility replaces reverence as the dominant view of the natural world. The future is measured in quarters. What cannot be measured matters little; what cannot be monetized matters even less (Rushkoff, 2011).

According to Sumner (1907), “The word ‘moral’ means what belongs to or appertains to the mores... The morality of a group at a time is the sum of the taboos and prescriptions in the folkways by which right conduct is defined. Therefore, morals can never be intuitive. They are historical, institutional, and empirical” (pp. 29, 37). Sedlacek (2013) argues that economics and ethics are intertwined and the moral dimensions of economic decisions must be actively considered.

Building on this, we believe that ethics, when detached from the ethos of people, risks becoming an abstract system that seeks to impose universal doctrines of right and wrong, weakening its practical application in leadership. Leadership education must integrate ethical thinking that is deeply rooted in social and cultural contexts. But to some degree, business has become its own social and cultural context (Coolidge, 1925; Susskind, 2024). A transition to circularity will require an examination of the overreach of business as a social and cultural framework. It will also require the emergence of other frameworks that orient leaders to design for a wider wellbeing.

Emerging frameworks like Australian Government (2023)’s first National Wellbeing Framework demonstrate how nations can redefine leadership priorities. By centering equity, sustainability, and resilience, these frameworks provide a roadmap for future leaders to balance economic and ecological goals effectively.

4. From Sustainability to Viability

Leadership behaviors that set human enterprise against the collective wellbeing and the aims of life are not just unethical but also unsustainable. Yet they are common, supported by social norms and educational practices that encourage leaders to adopt an amoral approach to decision-making. Sustaining life is a genetic imperative. Every species must secure its niche and safeguard the affordances offered by its environment. All species must organize social relations and economies of exchange toward this shared aim. When aims of material well-being and economic development jeopardize society or the environment, we undermine our own survival (Wright, 1994).

Sustainability is not optional. It is a prerequisite for survival and viability.

> "The decision-maker's attention should be focused on the context in which the organization operates, in which it dynamically becomes a component of a variety of viable systems in which it realizes its own role. In other words, the survival of the organization depends on the survival of the context in which it operates" (Formisano et al., 2018, p. 10)

Author (2011)'s "Triple Bottom Line by Design" emphasizes that sustainability is an ethical mandate grounded in principles of stewardship and reciprocity. According to the author, "Sustainability is not about eco-efficiency or even eco-effectiveness, it is about an eco-ethic—a value that speaks to the character of the organization and its compact with its community of customers and with life".

We believe that the emerging discipline of circularity can deepen our understanding of systems thinking and the ethical responsibilities of stewardship. By designing systems that minimize waste and pollution, circulate products, services, and materials, and maximize resource regeneration, leaders can ensure economic viability and ecological health (Ellen MacArthur Foundation, n.d.).

5. The Business Case for Circularity

Traditional business education often views the world as a resource to exploit rather than a system to sustain. Leaders are trained to maximize productivity and profits, often ignoring the interconnectedness of human and ecological systems. This reductionist approach fails to prepare leaders for the complexities of real-world challenges, where adaptability and systems thinking are crucial (Rutherford, 2021; Winston, 2014).

The concept of homo economicus (Papadogiannis, 2014), a rational and self-interested economic agent, has dominated leadership education. However, this model is disconnected from the realities of human interdependence and ecological limits. Markets must be redesigned to serve societies, not the other way around. This mindset shift requires entrepreneurial and intrapreneurial leaders to recognize the interdependence of human and ecological systems, fostering long-term viability while focusing on economic goals.

Circularity offers a measurable approach to defining "sustainability" and a new model for entrepreneurial and intrapreneurial leaders (Pilipenets et al., 2024). Geissdoerfe et al. (2016) argue while "sustainability" aims at benefiting the environment, the economy, and society at large, the main beneficiaries of the Circular Economy appear to be the economic actors that implement the system. Positioning economic actors as beneficiaries rather than antagonists can help move change.

Business that promotes "robust circulatory flow" (Fullerton, 2015) aims to utilize "waste" from one process as "resources" for another. By adopting this approach, businesses reduce waste disposal costs and raw material expenses, and create more competitive advantage and economic value through circular innovation. Intrapreneurs and innovation are critical to this internal process.

Entrepreneurial leadership in the circular economy means to "create value for the broader system an organization is part of. Rashid et al. (2013) describe circularity in business models and supply chains as a precondition for sustainable manufacturing and that closed-loop manufacturing systems as economically and ecologically viable.

(Suchek et al., 2022) observed that circular entrepreneurship, conceptualized as the processes of exploration and exploitation of opportunities in the circular economy domain (Zucchella & Urban, 2019), contributes to sustainable development through value proposition, value creation and delivery and value capture (Cullen & De Angelis, 2021; Ünal et al., 2019). Designing value capture based on the values that support and sustain life is the work of the 21st century leader.

We propose that this work will require a reexamination of consumption-driven, debt-fueled economic growth that cannot be supported. The design and leadership of circular exchanges can enable the growth of resilient communities and biosystems, and create and grow economic value (Hart, 2024).

6. The Moral Case for Circularity

What is a circular flow? And why do they morally matter? In sum, "what goes around comes around." "The unequal distribution of wealth and materials greatly destabilizes society and strains Earth's life support systems" (Circle Economy Foundation, 2024). Circular flows represent systems where materials, financial resources, and investments return to their origins to nourish and sustain life. Investments that sustain firms must also sustain the communities they rely on—not only during prosperity but also during crises. Abandoning communities in times of need is a common business practice, but it contradicts moral principles such as "love-thy-neighbor". It is more like "beggar-thy neighbor".

Unguided by moral precepts, leaders often prioritize shareholder interests and the enterprise's immediate financial well-being. In practice, this has led to captains of industry exiting markets, abandoning communities whose value they've consumed, and steering resources toward safer investments. Such behavior aligns with traditional "good" business practice but is grounded, in part, in 19th-century utilitarian ethics that view economic development as a universal moral good (Bentham, 1789; Mill, 1879).

However, the ethical appeal of this utilitarian perspective is diminishing, particularly for customers and communities who fund enterprise resilience only to be left without support when they need to rebuild. Circular flows matter because they ensure that resources—financial or otherwise—flow within ecosystems. When funds move from local communities to global markets controlled by shareholders, those shareholders can easily divest. In contrast, communities, businesses, and individuals tied to a specific place cannot simply abandon their homes, jobs, or networks. Regenerative economies sustain long-term vitality by continuously reinvesting money, information, energy, and resources back into developing internal capacities, particularly human kind. The rate at which money circulates at local and regional levels may be the most crucial metrics of economic health replacing GDP growth (Georner, 2015; Fullerton, 2015).

A moral business case can be made for aligning strategies with the emerging conditions of an earthbound world. Our ability to adapt—not merely to compete—will ultimately determine our viability. Leaders need to value life rather than attempt to put a value on every living thing (Rushkoff, 2011; Martin, 2000). Enterprise leaders need values in practice that design and deliver on viability. Values that help define the problems we tackle.

> "Almost all real problems are incompletely and imperfectly specified, and to tackle them, we have to close them in some way. Closure means deciding what to bring in and what to leave out. Even when faced with what appear to be

> simple choices, we have to create our own description of the problems we try to solve." (Kay, 2012)

Ethical leadership is indeed a new frontier for design. Design is at its best when challenges are imperfectly specified, requiring intentional ethical choices about how to "close" the problem. Unfortunately, design leaders are often educated to adapt themselves to pre-determined strategic intentions, with little input into specifying or framing those strategies. They are trained to view societies as nested within markets rather than acknowledging that markets are nested within societies and living systems.

7. The Need for Strategic Design of Circularity

Exceptional design educators—like William McDonough (2002), Allan Chochinov (2007), and Emily Pilloton (2009)—have advanced the power of design to change mindsets, innovate toolsets, and apply skillsets to create life-serving solutions. However, the standard design curriculum remains just that: standard. Leaders and designers are insufficiently educated to analyze systems dynamics or account for the full consequences of their decisions on social and natural ecologies. The focus on a user is useful, even necessary, but not sufficient.

If leadership and design continue to prioritize those who can pay, the collective cost will be staggering. Societies will be reduced to transactional markets, and living systems will be further degraded into mere resources. Consider the coffee shops that have replaced public spaces: they offer no access to non-paying individuals, no facilities, and no opportunity for broader social engagement.

7.1. The Consequences of Linear Flows: A Case Study in California's Wildfires

As we write, wildfires are ravaging Los Angeles, presenting significant challenges to the insurance and financial industries but even more so to those who rely on these services. Home insurers such as State Farm, are rapidly withdrawing from California and Florida at alarming rates (Botros, 2023).

Figure 1. An estimated 7,000 structures have been damaged or destroyed by the Eaton Fire in Altadena, California. Justin Sullivan—Getty Images

JPMorgan Chase projects economic damages from the fires to reach $50 billion, and costs continue to rise (Lee, 2025). Insurance companies are pricing risk, exiting volatile markets, and leaving states to absorb financial burdens. Without insurance, the housing market itself becomes unsustainable. Mortgages require insurance, and homes cannot be rebuilt, purchased, or sold without it.

The impact of climate chaos threatens corporate viability, destabilizes markets, burdens governments, and exacerbates inequality between those who can pay for private safety measures and those who cannot. For example: Private firefighting services cost between $3,000 and $10,000 a day. And despite the high cost, these private groups are often seen as a liability rather than an asset due to different training backgrounds (Arango & Kamin, 2025).

Putting a price on human life and essential life-saving services can erode trust and social cohesion. Wealthy individuals can pay for protection, but communities at large are left vulnerable. Sandel (2013) raised questions about the moral limits of markets, we can see this in the privatization of public services.

7.2. Strategic Context-Sensitive Learning

Circular Economy curricula often adopt a one-size-fits-all approach, neglecting the unique cultural, social, and economic contexts in which circular strategies are implemented (Murray et al., 2015). For example, the challenges and opportunities for

circularity in resource-scarce regions differ markedly from those in affluent economies. In resource-scarce regions, limited access to advanced recycling technologies and infrastructure often necessitates reliance on informal systems of material recovery. Community-led waste management programs in Sub-Saharan Africa have demonstrated how localized, low-tech solutions can address resource constraints effectively while fostering community engagement (Murray et al., 2017). However, these solutions often lack the scalability and regulatory support seen in more affluent economies.

Conversely, in affluent economies, the focus tends to be on high-tech innovations such as automated recycling plants or sophisticated lifecycle tracking systems. While these technologies drive efficiency, they can also exacerbate inequalities by marginalizing small-scale recyclers and ignoring the social dimensions of sustainability. For example, in Europe, the implementation of extended producer responsibility (EPR) schemes has improved recycling rates but has also led to complex regulatory environments that exclude informal or community-based actors (Kirchherr et al., 2018). These disparities highlight the importance of designing circular economy strategies to the unique socio-economic and cultural contexts of each region to ensure both environmental and social equity. By failing to address these nuances, current programs risk promoting strategies that are ineffective or culturally insensitive.

We propose a strategic context-sensitive approach to enhance the relevance and applicability of Circular Economy education. This includes designing curricula to address the unique challenges of specific industries, regions, and cultures. Collaborative partnerships with local stakeholders can provide students with experiential learning opportunities, fostering a deeper understanding of place-based circular strategies. For example, Circular Economy Portugal (2022) engages in several place-based innovations that address local environmental and social challenges through circular economy principles.

8. A Design Intervention: Designing for Circularity

Our mission is to develop an educational experience that can enable leaders to design circular economies of exchange for products, services, and experiences engaging in systems thinking within cultural context.

Our ongoing research explores “life-serving leadership”. We educate leaders and designers to design triple bottom line strategies that benefit enterprises, human communities, and biosystems. We specifically investigate 7Ms:

1. What **mores** can support the **mission** to align economic growth goals with the thriving of human and biosystems?
2. What **mindsets**, **models**, and practice examples demonstrate that life-serving growth can also be profitable?
3. How can we develop **measures** frameworks that lead and manage material and non-material circular flows and assess what truly matters?
4. What **materials**, **methods,** and **media** are available to design for returns on investments that sustain human enterprises?

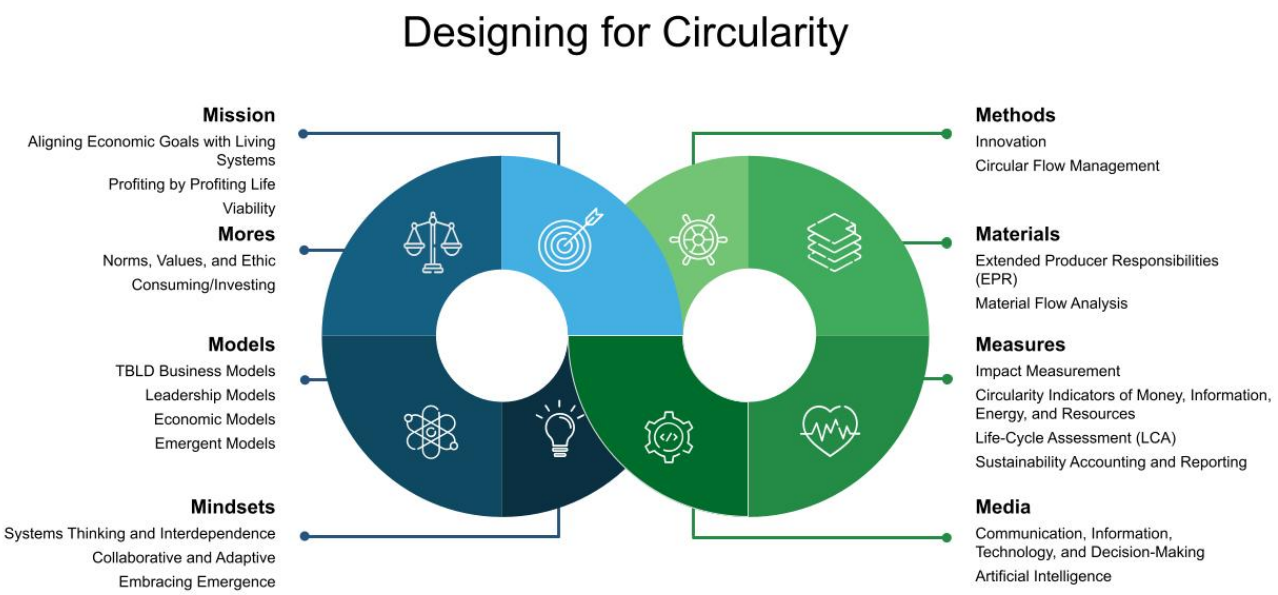

Figure 2. An illustration of the proposed framework on Designing for Circularity (Author, 2021).

10. Conclusions and Next Steps

We have entered the Age of the Anthropocene—a time when humanity can clearly see that the world around us has been shaped by our own ideas and designs. Now leaders must focus on creating conditions that sustain life rather than depleting resources for a short-term growth that shrinks the possibility of enterprise and species viability. Our ideas matter. Our designs matter. Our world is at stake. Having come full circle from devaluing design to depending on it, the time has come for ethical leadership by design.

Future versions of this study will integrate broader datasets and analysis to strengthen its conclusions. To be more specific, we will:

- Compare established programs and conduct case studies
- Form physical and digital study circles of facilitators and fellows through a 4D process guided by facilitated inquiry (See Appendix Table 1)
- Refine proposed mindsets, toolsets, skillsets (See Appendix Table 2)
- Outline plans for assessing the effectiveness of the program
- Launch pilot programs and collect feedback (Program Overview See Appendix Table 3)
- Discuss funding opportunities and potential collaborations with industry, government, corporations, and other educational partners

Empathy in Design | Physical Visualization as a creative approach to improve intercultural understanding.

Pauline Hoogweg*, Martha Lauría Baca**

Amsterdam University of Applied Sciences
* p.m.hoogweg@hva.nl, ** m.a.lauria.baca@hva.nl

ABSTRACT | Empathy is essential in design, especially in intercultural contexts where misunderstandings can arise. At the Amsterdam University of Applied Sciences' CMD program, we developed a three-part workshop to foster empathy through physical visualization. By creating and exchanging tangible conversation objects, participants engage in active listening and meaningful dialogue. This approach enhances understanding by moving beyond verbal communication. Ultimately, it promotes respectful interactions and ethical thinking in design.

KEYWORDS | Foster empathy, Ethical approach in co-creation process, intercultural understanding, learning by making

1. Empathy in Design | Physical Visualization as a creative approach to improve intercultural understanding.

Communication and Multimedia Design (CMD) is a bachelor-level design program at the Amsterdam University of Applied Sciences (AUAS). In our learning community, we aim to develop a critical attitude toward the complex society we live in. Additionally, it is essential that we train our ethical thinking skills to navigate the challenges that arise from engaging with diverse socio-cultural backgrounds as designers.
We propose that ethical thinking starts with empathy – specifically, with understanding one another. We've noticed that in a design or co-creation process, misconceptions can easily arise. Often, we interpret things differently due to our varied backgrounds and

contexts.

This led us to our research question: How can you create a space for connecting and empathizing with the people involved in a design or co-creation process? Ideally, this would happen at the very beginning of the process.

To address this question, we developed an empathy-building approach structured as a three-part workshop:

- Part 1: Listening & Connecting
- Part 2: Making a Conversational Object
- Part 3: Exchanging and Reflecting

What stands out in this approach is its ability to foster empathy through the creation of a physical object. This tangible visualization facilitates conversation and encourages participants to share interpretations more openly. By using a conversation object rather than relying solely on words, the approach opens new pathways for active listening and meaningful exchange.

This creative method encourages exploration of interpretations, aiming to deepen understanding and appreciation of diverse perspectives. Ultimately, we hope this practice cultivates respectful interactions.

ABSTRACT | How can we redesign our dominant artificial global systems to align with our ecological ceiling and social foundation? This paper examines the entanglement of three dominant global systems—economics, corporate leadership, and industrial infrastructure—each driven by distinct but interconnected paradigms. These paradigms collectively strain the biosphere's regenerative capacity. In response, the paper proposes a strategic redesign of these artificial systems using Donella Meadows' 12 leverage points, specifically through entrepreneurial innovation by fostering physical, metaphysical, and metaphorical "synergistic islands" (syntopia) of regenerative economic, corporate, and industrial systemic structures. These synergistic islands, ethically connected by common biocentric outlook principles, seek to transcend or reduce considerably the corposphere's systemic dominance while influencing the econosphere and the technosphere to respect and operate within the means of our planet's ecological boundaries.

KEYWORDS | systemic design, co-design, entrepreneurial synergy, experiential foresight, biocentric ethos

1. Introduction

Human civilization faces a critical moment, dominated by three artificial systems—economics (the econosphere), corporate leadership (the corposphere), and industrial infrastructure (the technosphere)—which strain the biosphere's regenerative capacity.

Donella Meadows observed, "Systems cannot be controlled, but they can be designed and redesigned" (2001). Despite efforts to reform these systems since Limits to Growth's publication (1972), entrenched paradigms rooted in colonization, industrialization, and neoliberalism remain resistant to change.

Inspired by Buckminster Fuller's advice: "You never change things by fighting the existing reality. To change something, build a new model that makes the existing model obsolete," and John P. Allen's entrepreneurial ethos, this paper introduces the concept of 'syntopia': synergistic, semi-autonomous entrepreneurial societies prioritizing biocentric ethics. Syntopias serve as experimental 'islands,' providing an actionable, alternative strategy to redesign dominant human systems.

2. Historical Systemic Context

The entanglement of human civilization with the econosphere, the corposphere, and the technosphere, has deep historical roots shaped by ideological, technological, and geopolitical forces. These systems evolved through colonialism, industrialization, and neoliberalism, reorienting humanity's relationship with the biosphere.

2.1 From Colonialism to Consumerism

By aligning with emerging maritime empires like Portugal and Spain, the Catholic Church's missionary works (propaganda fide, 1622) laid the ideological groundwork for colonization. Figures like Vasco da Gama and Christopher Columbus contributed to transform spiritual conquest into territorial control.

The British and Dutch East India Companies (founded in 1600 and 1602) exemplified colonial prototypes of what became the corposphere. Colonized regions supplied raw materials, supported by infrastructures like ports and railways, which became the technosphere's foundations. Colonial wealth acquire through land spoliation of native populations, fueled the Industrial Revolution, embedding fossil-fueled mechanization enabling unprecedented production and resource extraction (Wallerstein, 1974; Pomeranz, 2000).

The introduction of electricity in the late 19th century transformed industry, urban life, and global communication. While Buckminster Fuller described electricity as a unifying force, creating efficiencies to "do more with less", it tied humanity to fossil-based energy systems entrenching industrial infrastructures in systemic dependencies on non-renewable resources that now strain the biosphere's limits.

The industrial economy required perpetual production and consumption, giving rise to consumerism. Strategies such as planned obsolescence ensured continuous demand.

Figures like Edward Bernays (1928), used psychological manipulation to stimulate consumer desires, reframing consumption as self-expression (Lebow 1955; Packard, 1957), embedding it within modern culture.

Simultaneously, industrial designer Raymond Loewy shaped consumer products to appeal emotionally beyond their functionalities, declaring, "The most beautiful curve is a rising sales graph," highlighting the link between aesthetics, and profits.

Neoliberal economists Friedrich Hayek and Milton Friedman aligned their economic theories with consumerism by "placing the market at the center of our social, political, and economic life" (Raworth, 2017), driving global adoption through think tanks and policies that reshaped governance while sidelining ecological and social concerns.

2.2 The Emergence of Ecological Limits' Awareness

As industrialization surged, concerns about humanity's impact on natural systems grew. In The Biosphere (1926), Vladimir Vernadsky presented Earth as a self-regulating, interconnected system shaped by life itself, challenging the anthropocentric views of Bacon's Novum Organum (1620) and Descartes' mechanical worldview (1637), which saw nature as inert and exploitable.

Buckminster Fuller's Operating Manual for Spaceship Earth (1969) further expanded Vernadsky's vision, emphasizing the Earth's delicate balance.

Humanity's evolving understanding of the Earth, shaped by events like the environmental movements of the 1960s, the rise of ecological science, and the space-age perspective of Earth from orbit, led to a profound shift in how we view our planet.

This culminated in Limits to Growth (1972), commissioned by the Club of Rome. Donella Meadows and her team used system dynamics to reveal the unsustainable trajectory of industrialization, highlighting the interconnected threats of resource depletion, pollution, and population growth.

3. Systemic Interdependence

Using Donella Meadows' systems-thinking framework, we examine how the interdependence of the econosphere, corposphere, and technosphere perpetuates unsustainable practices, shaping the sociosphere and straining the biosphere.

3.1 Econosphere:

Paradigm: The econosphere is driven by the belief in infinite growth, assuming Earth's resources are

inexhaustible
(Raworth, 2017).

Goals: Economic success is measured by GDP growth, which prioritizes market expansion over sustainability.

System Structure: Trade laws, taxation systems, and incentives favor efficiency and profit, often disregarding ecological limits.

Feedback Loops: Positive feedback in investment and consumption cycles reinforces resource extraction and economic dependence on growth.

Stocks and Flows: The econosphere controls capital, labor, and natural resources' trade, valuing their availability and movement, thereby dictating behaviors across systems. Within the sociosphere, the paradigm of 'infinite growth' morphs into 'infinite greed'.

3.2 Technosphere:

Paradigm: Assumption that industrial science can solve any ecological challenges (Merchant, 1980).

Goals: Efficiency aligns with economic productivity, heavily relying on finite energy sources.

System Structure: Fossil fuel-based infrastructures resist change due to prohibitive costs and coordination challenges.

Feedback Loops: Urbanization intensifies demand for construction materials such as steel and concrete, creating reinforcing feedback loops that escalate resource extraction, energy consumption, and associated environmental degradation.

Stocks and Flows: Energy and food systems rely on centralized, resource-intensive operations.

3.3 Corposphere:

Paradigm: Profit maximization dominates corporate decision-making (Friedman, 1970).

Goals: Corporations prioritize shareholder returns, often at the expense of social equity and ecology.

System Structure: Hierarchical corporate systems, driven by competition, influence policies and shape technological innovation.

Feedback Loops: Artificially created consumer demand sustains production, exacerbating resource consumption.

Together, these systems form an entrenched triad that perpetuates ecological degradation, requiring systemic redesign at their foundational leverage points.

4. The Paradigm Trap

Despite well-intentioned attempts to promote sustainability, entrenched paradigms resist significant change.

4.1 The Econosphere Paradigm

Kate Raworth's Doughnut Economics (2017) challenges the outdated growth model, proposing an economy that operates within ecological boundaries and ensures social equity. Raworth's "doughnut" visualizes prosperity as a space between social foundations and ecological ceilings.

In Design for a Better World (2023), Don Norman extends Raworth's model, using it as a "dashboard" to guide systems-level design thinking and encourage "humanity centered" designers to operate significantly closer to leadership positions in key fields such as economics and policy.

4.2 The Technosphere Paradigm

The Cradle to Cradle (C2C) framework, developed by Michael Braungart and William McDonough (2002), promotes designs where materials are endlessly reusable, distinguishing between "biological nutrients" (regenerative) and "technical nutrients" (restorative or recyclable). The framework has inspired related movements, such as the Ellen MacArthur Foundation's advocacy for the circular economy.

Despite the rise of disciplines like design for sustainability, transition design, and design beyond human, the technosphere's reliance on fossil fuels, extensive infrastructure, and deeply ingrained corpo-cultural habits remains a major obstacle to fully implementing these practices.

4.3 The Corposphere Paradigm

Corporate Social Responsibility (CSR) initially sought to balance profit with social and environmental accountability, often devolved into greenwashing. Peter Drucker's idea that "management is doing things right, but leadership is doing the right things" (1967) remains difficult to implement within profit-maximizing corporate models.

Otto Von Busch and Karl Palmas, in The Corruption of Co-Design (2023), critique the co-optation of participatory design principles by corporate agendas. They argue that such processes, while

appearing inclusive, are often instrumentalized to align stakeholder collaboration with profit motives rather than genuine systemic transformation.

The corposphere's required alignment with the econosphere perpetuates a paradigm in which sustainability is subordinated to profitability, complicating efforts to advance ethically meaningful, and sustainably impactful leadership.

These frameworks, though conceptually strong, often remain aspirational, hindered by entrenched structures and resistance from powerful interests. The challenge is not just about developing alternatives, but also creating the socio-cultural momentum to replace and redesign these global systems.

5. Syntopia: the Seed of a New Paradigm

This approach combines ethical leadership with sustainable world-building, rooted in biospheric science, guided by systemic design methodologies to develop a network of co-creative, interdependent communities aligned with a common ethos, aiming to eventually render the corposphere obsolete.

The concept of syntopia, "places that work together", coined by John Allen (2016) in response to Hans Ulrich Obrist's question about utopia, represents interconnected, synergistic spaces. It reflects Allen's lifelong understanding of 'synergy,' rooted in his background as an engineer and metallurgist, where the integration, and combination of forces, elements, or individuals generates outcomes that exceed the sum of their individual contributions.

Allen's most ambitious project, Biosphere 2, aimed to replicate Earth's biosphere as a self-sustaining ecological system. This groundbreaking experiment was also a masterclass in system design. Drawing from Ralph Abraham's Chaos Theory, Allen developed a unique management structure, dividing leadership into four "attractors" to foster cross-disciplinary collaboration between finance, design, architecture, and science. Positioned as a metaphorical "watchtower," he had access to all information without direct control over the system's feedback loops, reflecting his belief in synergistic teamwork where every individual's input contributed to the success of the whole.

By tracing its origins to Allen's interdisciplinary legacy, syntopia emerges as an inspirational seed for a potentially new paradigm merging ethical collaborative leadership with systemic design.

6. Syntopia: an Entrepreneurial Strategy

Entrepreneurship is traditionally viewed as identifying opportunities, mobilizing resources, and creating value to drive profit and economic growth (Schumpeter, 1934). Syntopias, in contrast, redefine entrepreneurship as a process of collaborative world-building and systemic design, where the aim is to create regenerative, self-sustaining systems in harmony with the planet. When

reframed through a sustainability lens, entrepreneurship emphasizes resilience, social equity, and ecological balance prioritizing the well-being of both human and non-human systems.

6.1 Conditions to Establish a Syntopia

To establish a syntopia, three conditions must be met: geographic autonomy, full self-sufficiency, and adherence to a biocentric ethical outlook. Remote locations such as floating platforms or deserts are ideal for testing these systems. Syntopias must operate independently from external systems, generating their own energy, water, and food. These communities can connect minimally with the econosphere and technosphere, to facilitate a transition to full autonomy.

6.2 Syntopias as 'Islands' of Sustainable Practices

Syntopias function as islands—physically or conceptually isolated from dominant systems. They emphasize regeneration, decentralization, and interdependence, differing drastically with colonial systems that exploit and control. Syntopias, in contrast, prioritize sustainability and equity, fostering long-term autonomy.

6.3 Energy Self-Sufficiency

Energy independence is key to syntopian autonomy. Renewable technologies like solar, wind, and wave energy are used to power these communities. Water is sourced from rainwater collection or micro-desalination, while food is produced locally through systems like aquaponics and permaculture.

6.4 Biocentrism: A Moral Framework

Syntopias operate under a biocentric ethos, emphasizing respect for biodiversity, interdependence, and finite resources (Watson, 2019). This framework guides every aspect of design, from resource management to community practices, ensuring sustainability and ethical leadership. This ethical framework, rooted in moral agent/moral subject principles, a concept articulated by ethicist Paul Taylor (1986), positions non-human life as having intrinsic value.

While syntopias are not isolated in the conventional sense, they are deeply embedded in the principles of sustainability and ethical leadership, ensuring that each system, material, and community is aligned with the larger vision of interdependence and resilience.

Should a syntopia fail, it can be absorbed by other successful syntopias, thus contributing to the network's diversity and growth. The experimental nature of entrepreneurial syntopias means that each one represents a unique initiative, and the lessons learned from one can be used to improve others.

7. Entrepreneurship for Sustainability & Resilience

Donella Meadows, in her 1999 lecture on sustainability, cited Herman Daly's Laws to design systems within Earth's ecological limits:

- Every RENEWABLE RESOURCE must be used at or before the rate at which it can regenerate itself.
- Every NONRENEWABLE RESOURCE must be used at or below the rate at which a renewable substitute can be developed.
- Every POLLUTION STREAM must be remitted at or below the rate at which it can be absorbed or made harmless.

She then added a fourth law, we can now call Meadows' Law:

- To be SOCIALLY SUSTAINABLE, capital stocks and resources flow must be EQUITABLY DISTRIBUTED and SUFFICIENT to provide a good life for everyone.

Meadows' fourth law echoes Buckminster Fuller's advocacy for equitable resource distribution (Fuller, 1969), emphasizing fairness as a guiding principle for true sustainability.

The ecological law of finite resources (Watson, 2019) emphasizes that ecosystems, and the entire biosphere, are constrained by limited resources, defining their carrying capacity. When any species overconsumes—whether due to population growth, greed, or inefficiency—it diminishes the capacity of other species to survive. This principle calls for a profound shift in how humanity manages both renewable and nonrenewable resources.

Building on this understanding of sustainability, let us examine real-world examples of communities and technologies that embody this redefined approach to entrepreneurship.

In 1969, John Allen established Synergia Ranch, which became an incubator for several entrepreneurial ventures that later informed projects such as Biosphere 2, and the research vessel Heraclitus, and led to the formation of the Institute of Ecotechnics.

In the 1970s, architect Michael Reynolds pioneered the Earthship community, creating autonomous homes made from recycled materials like tires and bottles. Designed for self-sufficiency in energy, water, and food, Earthships demonstrated the feasibility of off-grid living (Prinz, 2015). Despite facing regulatory hurdles, they showed the potential of innovative entrepreneurship to push the boundaries of sustainability.

Looking at indigenous communities provides valuable insights into self-reliance and ecological stewardship. One such example is the Sentinelese, one of the most isolated tribes in the world, who have maintained their way of life on North Sentinel Island in the Andaman archipelago, living without contact with modern society and relying on fishing and foraging.

Similarly, the people of Ganvié, a village in Benin built entirely on stilts, adapted to their environment when they moved onto the lake to escape slave raids in the 16th and 17th centuries.

The Mad'an people, who once thrived in the Mesopotamian marshlands, sustained themselves

through floating reed house construction, fishing, and date palm cultivation.

However, these communities are now facing increasing threats from climate change and resource exploitation, highlighting the importance of resilience, autonomy, and the need for strategic adaptation in the face of external pressures.

Designer and academic Julia Watson, in her book Lo-Tek: Design by Radical Indigenism (2019), argues for the incorporation of indigenous knowledge systems into modern design practices to address sustainability challenges. Her work emphasizes how traditional ecological wisdom can offer scalable solutions to contemporary environmental issues.

The Biosphere Experience, a Parisian experiment in low-tech self-sufficiency led by Caroline Pultz and Corentin de Chatelperron (2023), demonstrates that the core tenets of syntopian entrepreneurship—full autonomy in energy, water, food, and even garments production—can be successfully integrated into the heart of the technosphere.

Creating sustainable, autonomous systems is both complex and difficult. As seen with these examples, ideological, economic, and geopolitical forces often shape outcomes. Geographic isolation, resource independence, and strategic interdependence become crucial principles to design a Syntopia. Floating syntopias in international waters, for instance, provide a buffer from global pressures, while their interdependence enhances resilience, fosters innovation, and ensures long-term sustainability.

8. Designing a Syntopia

Designing a syntopia is greatly enhanced by using scenarios, which concretely illustrate abstract concepts and demonstrate how principles can be applied in specific contexts.

8.1 The Bajau People

The Bajau, known as "sea nomads," are an Indigenous maritime community in Southeast Asia. Traditionally living on boats or stilt houses, their survival relies on sustainable fishing and marine foraging. However, modern challenges, including statelessness, marginalization, and environmental degradation, threaten their way of life. Despite these issues, the Bajau possess invaluable cultural and ecological knowledge, making them an ideal community for piloting an oceanic syntopia.

8.2 Establishing Co-Design Conditions

By building trust through NGOs already assisting the Bajau, co-designing conditions would be established using humanitarian designer Georg Hoehne's methodology:

Thinking Locally: Solutions must align with Bajau traditions and environmental realities, focusing on marine resources and autonomy.

Transfer of Ownership: Ensuring Bajau-led governance fosters independence and resilience.

Leveraging Local Creativity: Repurposing ocean plastics and coastal waste into infrastructure engages local artisans and promotes sustainable innovation.

Community-Led Problem Definition: Participatory workshops identify priorities like clean water, sustainable fishing, and renewable energy.

This approach ensures the syntopia evolves organically, rooted in the Bajau's lived experiences and aspirations.

8.3 Phase 1: Experiencing Foresight

Experiential foresight connects communities to potential futures, fostering ownership and agency (Press et al., 2024). For the Bajau, tools like cognitive sandboxes and participatory games can facilitate this process.

Drawing inspiration from the Machi Wachi board game, created by designers Taqi Shaheen and Sara Khan Pathan to support the Bhit Island communities in Pakistan, a similar approach could be used to engage the Bajau in envisioning their syntopia. A floating school could serve as the foundational hub, integrating education with sustainable innovation. Through collaborative games and creative exploration, the community could actively identify and prioritize sustainable practices tailored to their needs.

8.4 Phase 2: Real World Building

With the successful establishment of the floating school, the Bajau community begins to coalesce around it evolving into a floating village, incorporating ethical experiments and sustainable technologies. Each new floating island becomes an extension of this system, fostering resilience and interdependence.

To guide the expansion of this community, various ideation techniques like ‘reversing assumptions’ challenging conventional thinking, metaphorical exercises, such as likening the floating school to a coral reef, emphasize interconnectedness and sustainability. Tools like Jet Gispen’s Moral Agent card game can help establish ethical governance, ensuring decisions reflect community values.

The floating school becomes the center of a fractal evolution, with each new floating island representing a branch of the original idea, continuously expanding and improving upon its design

8.5 Phase 3: Scaling Resilience

As the syntopia expands, managing complexity becomes critical. Simulation tools like digital twins allow communities to model and optimize systems. The Virtual Singapore project, supported by Bentley Systems, demonstrates how digital twins integrate urban planning, environmental simulations, and real-time data for sustainable governance.

For the Bajau syntopia, digital twins could manage energy, food, and water systems while monitoring marine biodiversity and underwater vertical farming. Upcycling discarded electronics fosters innovation while maintaining self-reliance, blending advanced technology, simulations and management games with local creativity.

This iterative approach ensures the syntopia evolves thoughtfully, balancing ecological harmony and community resilience.

9. Conclusion

The Bajau syntopia scenario demonstrates how self-sustaining communities can redefine humanity's relationship with the planet. Rooted in biocentric ethics and systemic design, syntopias bypass entrenched global systems, prioritizing regeneration and autonomy. Through collaborative planning, ethical innovation, and advanced tools, they offer a blueprint for sustainable futures. While challenges from external systems and internal conflicts persist, defense mechanisms like geographic isolation and interdependent networks strengthen resilience.

Looking ahead, syntopias could flourish as sanctuaries of sustainable innovation hubs, paving the way for future land-based initiatives aligning with the biosphere's limits.

ETHICAL LEADERSHIP IN DESIGN-LED ENTREPRENEURSHIP: A SCENARIO-BASED STUDY OF THE CHIEF DESIGN OFFICER COMPETENCY MODEL

Yin Li[a], Lin Zhu*[b],

Tsinghua University
*zhu-l20@tsinghua.org.cn

ABSTRACT | With the rise of design-led entrepreneurship, Chief Design Officers (CDOs) play a key role in bridging design and business, driving organizational innovation, and implementing ethical leadership. Despite the significance of CDOs, their capabilities and unique value in this context remain underexplored. This study examines the capability development of CDOs in the process of transformation from designer to entrepreneurial leader. Based on the mixed research involving 21 Chinese design entrepreneurs, we developed a competency model containing eight core dimensions, in which ethical leadership emerges as a strategic capability founded on aesthetic, empathy, coopetition, and collaboration capabilities. This strategic capability effectively links creative, foresight and insight. Research reveals that design entrepreneurs prioritize the practice of ethical values and consistently operationalizes ethical leadership to achieve business success. CDOs address leadership challenges through ethical practices, fair value-negotiation and sustainable strategies that balance business and social values. The scenario-based architecture presented in this study provides a new perspective on the capability requirements and cultivation of CDOs, guiding and providing foresight for future design entrepreneurial practices. They illuminate actionable pathways for developing ethical leadership and promoting sustainable development through design-led entrepreneurship. By fostering a deeper understanding of the capabilities and ethical considerations crucial to the success of CDOs, this research contributes to the advancement of design-led entrepreneurship and its potential to drive positive change in organizations and society at large.

KEYWORDS | DESIGN-DRIVEN ENTREPRENEURSHIP, ETHICAL LEADERSHIP, CHIEF DESIGN OFFICER, COMPETENCY MODEL, INTERCULTURAL DESIGN

1. Introduction

The human-centric paradigm in contemporary design entrepreneurship is catalyzing tectonic shifts across industries in consumer technology, advanced manufacturing and other fields (Buchanan,2019). In this context, the chief design officer (CDO), as the core of strategic decision-making, has become a key role in balancing business objectives and social responsibility by driving product service system construction and brand value building by design. In the future, as the influence of design in business and society continues to expand, the strategic position and role of chief design officers will become more and more important, and their ethical leadership will directly have a profound impact on the design decisions of organizations, team management and corporate social responsibility (d'Anjou, 2010).

In the process of deep transformation of designers to chief design officers and entrepreneurial leaders, they need to overcome the ability gaps in strategic thinking, commercial convergence, team collaboration management, decision risk management, brand and market operation (Kolko,2018). This transformation is not only the expansion of professional skills, but also the reshaping of the way of thinking. The current research on chief design officer's ability has achieved important results in the aspects of design and business integration, user insight, team management, but there are still shortcomings in the aspects of systematic construction, meta-cognitive awareness, regional cultural differences (Borja, 2006). At the same time, we can see that the practice of ethical leadership in design entrepreneurship faces multiple challenges, including conflict of interest, rapid decision-making pressure, team culture conflict and the balance of social responsibility (Chan, 2018). These challenges are particularly acute in the Chinese context, where the unique nature of social values and technological ecology require the CDO competency framework to be culturally sensitive and dynamically modified.

Our mixed-methods inquiry addresses the lacunae through two-phase investigation (qualitative interview + scenario foresight workshop), a three-level coding analysis is conducted on 21 entrepreneurs, and an eight-dimensional competence model including ethical leadership is extracted. MLP (multi-level perspective) and CLA (causal stratification analysis) tools are used to verify their adaptability in scenarios such as technology ethics and policy abrupt changes. This study contributes to design leadership discourse by proposing practical framework for the cultivation of local CDO and promoting the evolution of design leadership theory to the symbiotic paradigm of "ethic-business-culture".

2. Related work

2.1. Design-driven entrepreneurship and ethical turn

The evolution of design-driven Innovation theory, pioneered by Verganti (2009) and advanced through institutional practices like IDEO's design thinking methodology, has progressively shifted from product-centric aesthetics to strategic-level foresight. This paradigm positions design not merely as responsive to user needs but as actively shaping future market trajectories–a transition exemplified by Apple's ecosystem architecture and Airbnb's service model reinvention. The Sustainable Development Goals (SDGs) have further catalyzed an ethical inflection point, compelling CDOs to evolve from creative executors to strategic integrators who reconcile commercial objectives with socio-environmental imperatives. This role balances knowledge ecosystem integration with insight into future needs. Although the "design-oriented scenario" proposed by Manzini (2015) introduces scenario planning tools into the field of social innovation, its macro perspective is difficult to adapt to the resource constraints of start-ups.

The conflict between design ethics and business objectives is particularly significant in rapid iteration scenarios, for example, the conflict between data privacy and business model innovation has not been systematically resolved. Ethical leadership, defined as "demonstrating normative and appropriate behavior through personal behavior and interpersonal relationships" (Brown et al., 2005), is critical in design-led businesses because decisions often

involve trade-offs between profit, user needs, and social impact. In an entrepreneurial setting, CDOs must simultaneously act as innovators, negotiators, and ethical managers - a multidimensional role that requires capabilities beyond traditional design management (Kimbell, 2011).

2.2. Interdisciplinary dilemmas of situational tools and ethical decision-making

As a shared tool of management and design, scenario planning plays a bridging role between macro trends and micro practices. The Design Council's leadership framework (2018), despite advancing visionary thinking metrics, overlooks individual-level ethical foresight cultivation. Its mature organizational orientation ignores the multi-dimensional challenges of start-ups - CDOs need to simultaneously act as innovators, negotiators and ethical managers. The study of ethical leadership also faces interdisciplinary fault. Brown et al.'s ethical leadership model (2005) emphasizes normative behavior and social responsibility, but does not resolve the unique contradictions in the design scenario. The limitations of the existing framework are threefold: (1) It treats ethics as a separate domain rather than an endogenous element of design leadership; (2) Ignoring the ability to predict ethical-business conflicts at the individual level; (3) Lack of dynamic responses to technological changes and cultural differences.

2.3. Iterative demands on competency model

Contemporary competency frameworks require radical reconfiguration to address design leadership's evolving demands. The founders of environmental brand Patagonia (Patagonia, 2022), for example, design products that promote sustainability with ethics at their core. The concept of ethical leadership and its training path, in the current background of design-driven entrepreneurship, are an interdisciplinary integration opportunity for the development of design ethics (Hamington,2019). Boyatzis' (1982) Iceberg competency model, which distinguishes between surface skills and deeper traits, provides a foundational framework for analyzing leadership development. Recent research on entrepreneurship has highlighted the need for future-oriented skills, such as adaptability to technological change and to "weak signals" of emerging trends (Kononiuk et al., 2017). The European Commission (2006) of Reference for Key Competencies further identifies "initiative and entrepreneurship" as essential to managing uncertainty. However, these models lack specificity for design leaders, especially when it comes to combining ethical reasoning with entrepreneurial agility.

3. Method

3.1. Data acquisition and coding process

This study employed a three-stage thematic coding analysis targeting design entrepreneurs in China's consumer goods (38%), advanced manufacturing (33%), and information technology (24%) sectors. The sample comprised 21 decision-makers from startups valued between RMB 25-200 million, all undergoing second-generation product iteration cycles. Participants included C-suite executives and senior managers, with data collected through semi-structured interviews (mean duration: 90 minutes) and scenario-based workshops.

The interview focuses on the impact of design background on decision-making and the dilemma of ethical leadership practice. The interview outline is in Appendix I, and the basic information of the interviewees is in Appendix II. To ensure coding rigor, two researchers independently conducted line-by-line text analysis. Initial codebook calibration occurred after six interviews text, establishing consensus on the code definitions and application criteria. Subsequent coordination sessions followed each new thematic emergence. Discrepancies in coded segments were resolved through iterative discussions until unanimous agreement was reached. Inter-coder reliability, measured by percentage agreement across all coded units,

achieved 92.4% consistency. 157 initial concepts were extracted and summarized into 31 core themes. Based on topic saturation test (when sample size ≥16, new themes tend to zero. Over 80% coverage) to ensure data adequacy (Guest et al., 2006), see Appendix III.
Axial coding revealed three constitutive dimensions governing design leadership efficacy (see Table 1). Six subordinate clusters emerged through constant comparison.

Table 1. Codebook

First level	Second level	Third level	No. of material sources	No. of reference points
Impact of design background	Effective communication and collaboration	Empathy	10	18
		Collecting and sorting out information	6	8
		Strong communication skills	5	8
		Create good creative space	7	10
	Human-centered design thinking	Logic and construction	2	3
		Rich user perspective	8	16
		Creative problem solving	5	7
		Unique way of thinking	3	6
		The ability to identify and solve problems	5	7
		User Thinking	8	14
Advantages of design entrepreneurs	Aesthetic Conviction	Professional background	2	2
		Individual expression	6	17
		Sensitivity to design	2	3
	Cross-field experience integration	Accurate analysis of industry situation	4	7
		Integration of resources	9	13
		Flexible in optimizing products and business	9	25
		Flat Managed creative space	2	3

	Corporate Vision and Mission	8	17

Through systematic coding analysis, six distinctive competitive advantages emerged as defining characteristics of design-driven entrepreneurial leadership.

First, design entrepreneurs demonstrate effective communication and collaboration throughout the product design and requirements delivery process. They place rigorous emphasis on internal communication, ensuring team members have a comprehensive understanding of design concepts and schemes. They value team members' opinions and respect designers' commitment to the integrity and originality of design concepts. Design entrepreneurs exhibit empathy-oriented design thinking, anticipating latent user needs and product application scenarios from the user's perspective. They engage in forward-looking thinking about profound user needs and the interaction between people, society, and ecology. Aesthetic sensibility permeates the entire innovation and creation process for entrepreneurs with design backgrounds. They prioritize product design, attention to detail, and the pursuit of beauty. They consciously cultivate an aesthetic sensibility within themselves and their teams to sustain the vitality of design and creativity. Design entrepreneurs also possess cross-disciplinary integration capabilities, often drawing from multi-disciplinary backgrounds and knowledge reserves. This enables them to engage in effective coopetition - simultaneously cooperating and competing with others. They master the professional knowledge required for the product's core processes while demonstrating strong humanistic and artistic literacy. They continuously understand and integrate knowledge from diverse fields, leveraging the complementarity of team members' disciplinary expertise.

In terms of innovation and creation, design entrepreneurs are not only limited to introducing new forms of presentation into emerging industries but also pay more attention to thinking about underlying issues such as product demand and use scenarios. This allows them to logically determine the direction of product innovation, differentiating the enterprises they create from others through creativity. Design entrepreneurs exhibit outstanding strategic reflection and foresight, particularly in risk identification and response. Their composure and long-term perspective are crucial for navigating the strategic adjustments enterprises face from inception to maturity.

3.2. Scenario-based insights

In the dynamic market driven by capital flow, insight into market trends and accurate identification of customer pain points are crucial for start-ups to withstand market challenges. Only 9.5% of respondents self-rated as having "industry situation research ability," indicating a stronger capacity to discover new opportunities and a heightened sensitivity to shifting social trends. Design entrepreneurs often lack the tools to link trend analysis with product design, making it difficult to gain market insights through data collection, personal reflection, and other methods to conduct accurate industry research and judgment.

Survey data reveals that design entrepreneurs generally struggle to integrate innovative design with business strategy. They lack conscious consideration of the design-business relationship from a top-level perspective and fail to align product innovation with the company's overall business plan. While design entrepreneurs recognize that product design and innovation require the support of a reliable business model, fundamentally a matter of holistic enterprise resource integration and allocation, they often lack awareness that organizational leaders must transform innovative ideas into sustainable production and operation modes, striking a balance between innovation and business in product design. However, the survey also indicates that entrepreneurs with a stronger sense of social responsibility tend to be more pragmatic and comprehensive in assessing the risks and feasibility of design schemes.

Respondents acknowledged a "lack of connection between innovative design and business operations". Initially, "gaps in business logic" and "inefficient resource allocation" were classified as capability gaps, manifesting as an excessive focus on product innovation, neglect of cost control and profit model design, and a lack of understanding of fundamental business modules such as supply chain management and financial risk. Although ethical leadership was identified as a strategic capability, interviews revealed a "lack of an actionable framework for ethical decision-making". Only 24% of respondents mentioned "data ethics" or "transparent oversight mechanisms."

Building upon the six strengths and two weaknesses identified above and informed by scenario foresight interventions, this paper argues that the CDO capability model must emphasize ethical leadership, not merely as a conceptual extension of design leadership but as an explicit capability characterization. As a core decision-maker, the CDO's conceived product service system requires not only usable products based on user experience and technology roadmap development but also market brand alignment with the organization's vision, social responsibility, and medium- to long-term development goals. Consequently, this paper proposes eight core capabilities: aesthetic, empathy, competitive force, collaboration, innovation, foresight, insight, and ethical leadership, forming the foundation of an initial CDO capability model.

3.3. Scenario workshop verification

This study organized an online scenario workshop with the theme of "Future Vision and Service Experience in the Automotive metaverse" to verify the practical value and dynamic adaptability of the Chief Design Officer (CDO) competency model. Participants included 5 design entrepreneurs in the field of transportation (all from the previous in-depth interview respondents) and 15 graduate students in design, and simulated multiple decision-making roles in real business scenarios through mixed grouping across experience and academic background. Using Scenario Foresight and foresight tools such as MLP and CLA, the workshop focuses on the synergy of ethical leadership, collaboration and foresight to validate the adaptability of models in complex business environments.

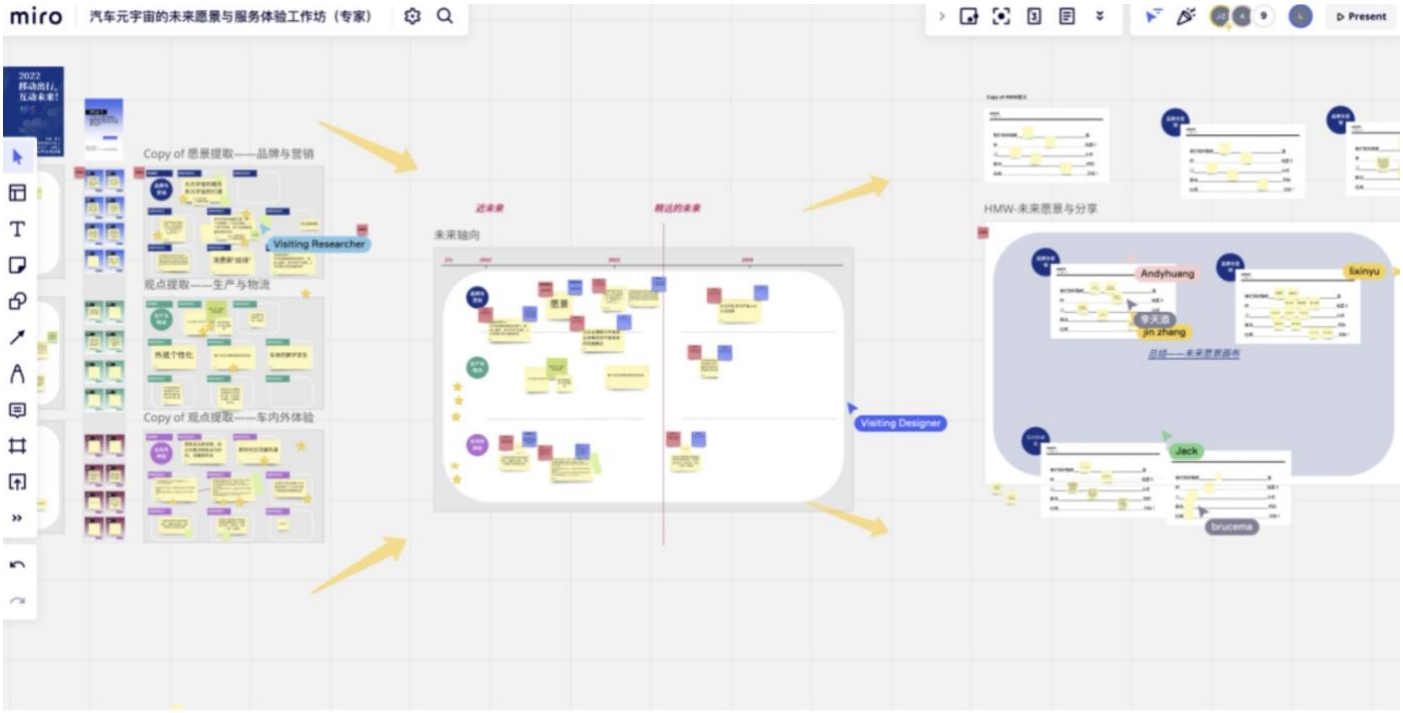

Fig 1. Workshop online co-creation board

The workshop was divided into 3 sessions and lasted 4 hours:

Scenario construction (1.5 hours) Based on the MLP framework, participants from the macro (social trends, policies and regulations), medium (industry ecology, technological innovation), micro (user behavior, product services) three levels, jointly build the 2030 "automotive metaverse" four potential scenarios, each group through the Miro whiteboard visualization of the scene map. Note key drivers (e.g., AI ethics, privacy awareness) and their interactions.

Capability Mapping and Decision Simulation (2 hours) For each scenario, participants role-play based on the CDO capability model. Each team is required to submit specific decision plans (such as ethical review process, technical roadmap adjustments) and undergo cross-questioning to simulate real business negotiation scenarios.

Feedback and model iteration (0.5 hour) 20 participants evaluated the validity of the competency model through an anonymous questionnaire (Likert 5 subscale) and focus group discussion. The core indicators of the questionnaire include: the coverage of the competence dimension to the decision demand (mean 4.2/5); The synergy of ethical leadership with other competencies (mean 4.5/5); The model's fitness to dynamic challenges (mean 3.8/5).

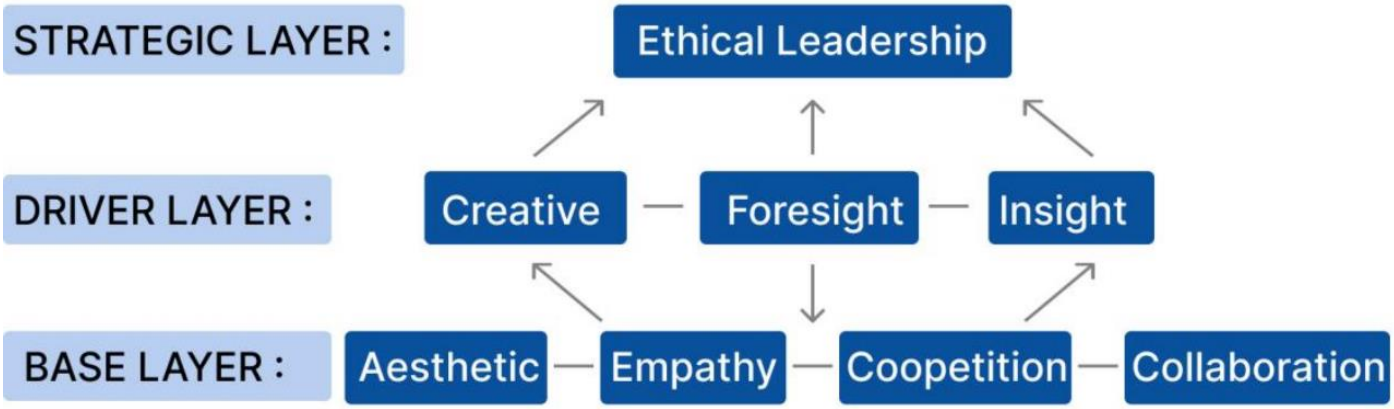

Fig 2. Competency linkage model

Based on the capability linkage diagram (Figure 2) extracted from the scenario workshop, the arrow represents the linkage relationship between capabilities, and intuitively presents the collaborative mechanism of ethical leadership as the core of strategy, driving innovation, foresight and collaboration capabilities. The results show that the CDO needs to achieve the

bidirectional fit of ethics and business objectives by dynamically balancing the base layer ability (Aesthetic, Empathy, Coopetition and Collaboration) and the driver layer ability (Creative, Foresight and Insight). This verification provides a simplified framework for the practical application of the model, and the subsequent research can further expand the scenario types to enhance the universality.

4. Discussion

4.1. Adaptability of capability model in dynamic scenarios

Situational workshop validation reveals significant limitations in existing competence models when addressing ethical conflicts in technology, such as data monopoly scenarios. Despite the positioning of ethical leadership as a strategic core, respondents generally lack actionable ethical decision-making tools (e.g., data ethics assessment matrices, stakeholder value maps). For example, in automotive metaverse simulation decisions, design entrepreneurs tend to rely more on personal intuition than on a systemic framework, resulting in an imbalance between commercial feasibility and social responsibility. This contradiction highlights the disconnect between ethical leadership and business insight in current models, which do not yet have a quantifiable linkage.

4.2. The differentiated shaping of ethical leadership by situations

In-depth interviews show that Chinese mainland design entrepreneurs exhibit a significant policy-oriented and localization tendency in their cognition of ethical issues. For example, 57% of respondents included a "dual-carbon goal" in their product design ethics framework, while only 9% mentioned globalization issues. Respondents from non-founder backgrounds are limited by their job responsibilities and lack awareness of the process of integrating design into corporate strategy to create long-term value. Moreover, this reflects respondents' one-sided understanding of the nature of their cultural situation, leading to a lack of confidence in design leadership's ability to promote team collaboration and cultural shaping, and diminishes the expected role and value of ethical leadership in their capability-building process. As a strategic core, ethical leadership needs to enhance its synergy with other capabilities through an instrumental framework.

4.3. Interdisciplinary education breakdown and ability training path reconstruction

Design entrepreneurs in the survey group, particularly start-up founders with design backgrounds, constitute a predictable research group. Overall, respondents are facing a serious disconnection between practice and theory, lacking essential understanding of academic terms and cognition of literature achievements. The structural defects of design education are exposed. Currently, design courses still focus on the one-way link between creative output and user verification. Design schools rarely offer interdisciplinary courses such as business ethics and philosophy of technology, making it difficult for entrepreneurs to identify emerging ethical risks such as algorithm bias and data colonialism. And the lack of training scenarios of business-ethical-technology triangle coupling.

5. Conclusion

Through subject analysis, this study conducted semi-structured interviews with 21 founders and middle and senior managers from different industries. Open coding, axial coding and selective coding were adopted to identify six core advantages and two capability gaps of design entrepreneurs. On this basis, combined with the scenario prediction method, a capability model for the CDO is proposed, which includes eight abilities: Aesthetic, Empathy, Coopetition, Collaboration, Creative, Foresight, Insight, and Ethical leadership. Previous design leadership models emphasized organizational culture shaping, product process sustainability, organizational change. By introducing ethical leadership, the CDO competency model of

constructed in this research aims to balance short-term interests and long-term value, promote transparency and data supervision based on strategic management and ethical decision-making framework emphasized by the ethical leadership model. Greater emphasis is placed on cultivating an ethical culture and team consensus, combining data ethics and technological innovation, and establishing a multi-party collaboration platform. Scenario prediction and other methods can more effectively support the academic intersection between management and design, which is one of the important aspects of training designers, particularly design entrepreneurs, to develop their ability for the future.

The research finds that entrepreneurs with design background face the challenge of disconnection between theory and practice. Influenced by differences in educational background, practical experience and cultural cognition, they have a partial understanding of design management and design strategy, and lack the cognition of integrating design into corporate strategy to create long-term value. The CDO competency model in this study attempts to bridge the limitations of design leadership in different dimensions, and emphasizes the important role of ethical leadership in balancing business interests and social values. With increasing attention being paid to design thinking and corporate social responsibility, taking ethical leadership as the entry point of the cross-integration of management science and design science has important theoretical significance for cultivating future-oriented design entrepreneurs. Future research can be further deepened and improved in expanding sample size, developing quantitative assessment tools and expanding research objects.

Appendix

1. The Chief Design Officer competency standard model constructs the project in-depth interview outline

Part I: Basic situation
1. Why did you choose to start or work in the field of digital innovation?
2. What is the field and content of your business?
3. What kind of person do you think you are? As the promoter/founder of the company
Part II: entrepreneurial motivation
one Why did you choose to start your own business or work in design? 【Internal factors, driven by external forces 】
[Internal factors] Personal ideal, income, character quality (willingness to take risks, courage to take risks, innovation drive, creativity, confidence, ability to withstand pressure, emphasis on logic/intuition, vision pattern, courage to face competition, acumen to find business opportunities, etc.), learning background, working experience (relevant job experience, cross-field working experience, founder, co-founder), Family experience, etc.
[Driven by external forces] capital, contacts, environment (campus, society), policies, business opportunities, entrepreneurial guidance, etc.
3. How many times have you started your own business? Or what previous occupations did you have?
4. What is the most critical factor that will ultimately determine your choice to start a business or pursue a career in design?
Part III: Company Development (Corporate vision, business growth, evolution process)
1. What is the corporate vision of your company?
2. What is the main business scope of your company? Which direction will the future take? What are the drivers of business development (e.g., innovation-driven, market-driven, entrepreneurial capability driven)?
3. What is the market competitiveness of your product/service? What are the main problems facing us now? What is the team responsible for solving the problem?
4. How do members of the design background influence team decisions when resolving issues involving ethical conflicts, such as user privacy versus business interests? Give an example of its ethical considerations.
Part IV: Advantages and abilities of design entrepreneurs or practitioners
1. How do you balance business goals with social responsibility (e.g., sustainability, fairness) through design thinking? Please refer to specific decision cases.
2. What qualities and abilities do you think future design entrepreneurs or practitioners should possess?
What positive impact do you think design thinking has had on individuals, companies, and society after you have started or worked successfully?
[Personal impact] How has design thinking impacted you personally while working in the field of digital innovation? In [value concept (consumption concept, family concept, marriage concept, financial concept, friend choice concept), professional ability, life status (personal charm, interpersonal relationship, heterosexual relationship), comprehensive quality] performance? 【Separate questioning 】· 【Interpersonal relationship 】Compared with your classmates and friends at the same time, what differences do you think you have? (Focusing on the changes in quantity, quality, and type of interpersonal relationships.)
What impact has design thinking had on your company? What is your performance in [strategic decision-making, organizational structure, employee relations, product

development, capital financing, etc.]?
[Business impact on society] What impact do you think companies in the field of digital innovation have on society? [Promoting industry development, promoting green, low-carbon, sustainable development, building a harmonious society, etc.] What performance?
Part V: Typical portrait of chief design officer, ability standard and relevant suggestions
1. According to your knowledge, what areas do you think are the areas that future design entrepreneurs or entrepreneurs can deeply cultivate?
2. As far as you know, you think that the current promoters or founders of companies in the digital field or design positions are familiar to executives
What typical traits do you often have?
3. In a rapidly changing market environment, how should CDOs address the dual ethical and business challenges through scenario foresight methods (such as constructing future business scenarios)?
4. How do you evaluate the current startup environment? What is your attitude toward the future startup environment?

2. Basic information of interviewees

P	Position	Industry
1	Founder	Mass consumption
2	Founder	Information technology
3	Founder	Advanced manufacturing
4	Design director	Advanced manufacturing

Ethical Leadership in Design: Building Collaborative and Caring Frameworks for Challenging Academic Times.

Marty Maxwell Lane

University of Arkansas

ABSTRACT | This X-format session examines the preparedness of academic leaders in design to navigate and lead within unstable and disruptive contexts and proposes leadership frameworks that center collaboration and care. Scarcity of resources, hostile state politics, the approaching enrollment cliff, and the post-pandemic era of loneliness contribute to the current challenging academic culture, particularly within the United States. (O'Connell-Domenech, 2024; Essential Partners, 2023)

Drawing on research in management and organization, we note a call to shift from traditional hierarchical models to frameworks emphasizing self-organization, trust, and robust team dynamics (Rutkowska and Kaminska, 2020). However, many of the world's oldest organizations, including academia, remain bound to traditional, conformist, machine-like hierarchies (Hormess and Lawrence, 2020), fostering cultures that conflict with the methodologies needed for contemporary leadership.

Service designers work to anticipate and manage disruption and call attention to the emotional side of user experience (Beckers, 2020) through relational, empathetic, and systems thinking. Rooted in co-creation, service design aligns closely with the four core features of creating caring communities outlined in *The Care Manifesto*: mutual support, public space, shared resources, and local democracy (The Care Collective, 2020). By applying these four pillars to academic environments and using service design methods and core values, leaders can create transferable frameworks and strategies for care-centered leadership. This X-format session aims to discuss how we might co-create the conditions for caring, connected, and ethical communities prepared to meet today's challenges.

KEYWORDS | COLLABORATION, CARE, LEADERSHIP, FRAMEWORKS

1. An Uncertain Landscape

The landscape of higher education is increasingly defined by uncertainty as institutions are under immense pressure from external forces. Particularly within the United States, institutions are facing funding insecurities, shifting political landscapes, and inadequate support for faculty, creating an environment of disconnection and loneliness. (Berg and Seeber, 2016) As a result, institutions often resort to risk-averse administrative strategies that stifle innovation and trust. At the same time, faculty experience isolation, diminished agency, and a lack of institutional belonging.

2. Systemic Barriers to Collaboration and Care

This uncertain landscape perpetuates and amplifies already existing systemic barriers to collaboration and care within the academy. By identifying six primary pain points, we are able to see opportunities for potential interventions and a reimagining of how we create culture at work.

1. Faculty Isolation
   Faculty members experience increasing loneliness, which leads to a pervasive lack of trust in each other and our institutions.
2. Confusing and Shifting policy
   Frequent changes and ambiguity in federal, state, local, and institutional policies create distrust and confusion, particularly among new faculty.
3. Lack of Sense of Belonging
   Faculty are rarely acknowledged as whole people with unique identities, needs, and goals. As many faculty move away from well-established communities for new academic jobs, the time to nurture relationships outside of work is critical, yet often not supported through poor work boundaries.
4. Ineffective Onboarding
   High turnover rates lead to continuous onboarding processes that feel mechanical and task-oriented rather than fostering faculty empowerment and fresh perspectives.
5. Resistance to New Ideas
   A burnout-driven culture often prioritizes efficiency over innovation, and traditional ways of working may be presented as the expectation, all leading to resistance to new ideas and stifling creativity.
6. Lack of Collaborative Models
   Even when faculty are interested in new ways of working, they face a lack of clear collaborative structures that balance governance with non-hierarchical approaches.

These systemic barriers collectively undermine efforts to build a supportive and innovative academic environment, limiting opportunities for meaningful collaboration and sustainable care within academic communities.

3. Frameworks for Collaboration and Care

These systemic academic challenges require a shift from traditional models to frameworks that prioritize self-organization, trust, and robust team dynamics (Rutkowska and Kaminska, 2020), but few models exist. Service design offers us a pathway to address the emotional aspects of user needs through relational, empathetic, and systems thinking and leads to fostering collaboration and trust, but is dependent on identifying a framework appropriate to the problem at hand. Using *The Care Manifesto*'s four core features of creating caring communities—mutual support, public space, shared resources, and local democracy—as a framework while using service design methodologies, we can begin to reimagine our leadership decisions to prioritize collaboration and care within the academy. (The Care Collective, 2020). We can address many of the current academic challenges, as outlined in section one, through the four pillars of mutual support, public space, shared resources, and local democracy. In the session, we will discuss how one institution has applied the care-centered leadership in the following examples:

Mutual Support
Peer mentorship teams provide guidance and encouragement among colleagues while prioritizing transparency in sharing knowledge. This fosters a culture of openness and collective growth.

Public Space
Sharing research tools and spaces increases accessibility and collaboration across disciplines. Establishing third spaces within the workplace, such as cafes, encourages informal discussions and relationship-building.

Shared Resources
Providing access to tenure and promotion materials, as well as effective approaches to research, reduces stress for faculty on the tenure track. Sharing pedagogical resources strengthens teaching practices and innovation. Committing to anti-resource hoarding promotes a culture of generosity and ensures a community of collective success among faculty.

Local Democracy
Encouraging junior faculty in leadership roles, with support from senior administration, amplifies new voices and perspectives. Co-creating agendas and goals and flattening hierarchies in working groups fosters inclusivity and shared decision-making. Cultivating a culture of humility and shared governance strengthens trust and mutual respect within institutions.

It is imperative that leaders understand the significance of every decision they make and that they are all parts of a larger system. If we use a framework for each decision, it can ensure that we are working towards the culture we aim to create. Strategic decisions that anticipate how various users will be impacted by an outcome accumulate and lead to sustained collaborative and caring communities.

3. Reimagining Futures

During the X-format session, participants will examine the affordances of the *Care Manifesto* as a tool to reimagine academic leadership and the potential of this framework to improve leadership conditions for caring, connected, and ethical academic

communities. Focusing on mentorship, onboarding, and leadership training, participants will consider how each one may shift if viewed through the lens of the four pillars of caring communities: mutual support, public space, shared resources, and local democracy. (Care Collective, 2020). By applying these four pillars to academic environments and using service design methods and core values, leaders can create transferable frameworks and strategies for collaborative care-centered leadership.

ABSTRACT | Nowadays, when the concepts of global sustainable development and circular economy are becoming more and more prominent, cultural and creative products, as an important carrier of cultural inheritance and innovation, have far-reaching impacts on society, the environment and cultural inheritance through their design and production modes. In the fashion sector, fashion brands face a dominant pressure for ethical behavior (Lundblad and Davies, 2016); this pressure not only influences companies to cope with the social impacts of their operations, but also influences consumers to adhere to sustainable behaviors. Consumers are more inclined to adopt these behaviors when they believe that significant others support ethical fashion (King, 2011). However, many fashion brand product design companies in the current market that are driven by cultural and creative design are clearly under-driven by design, failing to result in market-driven product design instead failing to gain long-lasting emotional attachment with users. As a result, the product is quickly discarded and the brand cannot continue to grow. This paper uses a case study approach to select three Chinese long-termism fashion brands: "UOOSEE", "Related", and "MADE IN NATURE", to explore the role of ethical leadership in designing cultural and creative products and establishing a brand image and its impact on the product's cultural depth and emotional durability in the context of the circular economy and the heritage of traditional oriental culture. The study finds that Chinese people's

fixation on traditional morality and new-age symbolic translation can effectively construct

emotional links between products and users, which is conducive to the construction of a positive

brand image and effectively promotes the emotional durability of products for sustainable

development. The study suggests that cultural and creative product design should strengthen

the construction of ethical leadership, which, in addition to its great role in shaping the team

thought it also has a huge role in generating useful creative ideas. Future research could expand

the sample to further validate the generalizability of the hypotheses and explore the interaction

mechanisms between ethical leadership and other factors.

KEYWORDS | EHICAL LEADERSHIP; FASHION BRANDS; EASTERN CONTEXT; EMOTIONALLY DURABLE DESIGN

1. Introduction

The value attributes of products are often included in the development of product narrative design. People use objects to differentiate themselves from others, and designing for the emotional added value of products has become crucial in this current era. With the emergence of AI-assisted design, the reliance on fragmented information, and the global trend towards sustainability and circular economy concepts, collective action by all stakeholders to reshape our education system, remove barriers to sustainable consumption and facilitate sustainable business models is needed. consumption and facilitate sustainable business models is needed for lasting change. (Amira Mukendi, et al, 2020, p.41) Fashion brands' moral transgressions often lead to a lack of awareness of the need for sustainable development. moral transgressions often lead to unfavorable brand evaluations (e.g., negative perceptions of brand ethics), social media backlash, and even purchase boycotts (e.g., the use of “moral” or “moral” in a brand name). purchase boycotts (e.g., #toodirtytowear campaign against Levi's; Forbes, 2018) for consumers leading from the thinking, cognitive level to the emotional, perceptual level. Long-lasting emotions cannot be separated from the design of values and ethically relevant elements such as trust and respect. At the same time, people are influenced by fashion trends and tend to pursue new fashions, which is contrary to the durability of emotions. Therefore, to balance the relationship between the two, and how to realize the needs of both at the same time is the opportunity to carry out research in this paper. As an important carrier of cultural inheritance and innovation, the design and production of cultural creative products have a significant impact on society, the environment and cultural heritage. Chinese morality originates from people's traditional beliefs, which can be briefly summarized as the pursuit of “真” (true), “善” (kind) and “美” (beauty), and it is the criterion for being and doing things It is the criterion for doing things and the standard for measuring the quality of things. The so-called “ethical leadership” is “design for truth, design for goodness, design for beauty”. Many Chinese startups are trying to tap into traditional Chinese culture and incorporate it into modern product design, aiming to create innovative fashion and lifestyle brands that are culturally rich and sustainable. However, after all, the commercial marketing laws of the modern consumer context can lead to a practice that often

the existing research gap.

2. Theoretical basis and research hypotheses

2.1 Moral Leadership and Cultural and Creative Product Design

The four essential normative principles of ethical leader-ship, the so-called central ethical orientations: (1) humane orientation, (2) justice orientation, (3) responsibility and sustainability. All four central ethical orientations present established leadership attributes in general leadership. All four central ethical orientations present established leadership attributes in general leadership literature in the social sciences as well as in the social sciences. literature in the social sciences as well (e.g., Brown et al., 2005; Ferdig, 2007; Johnson, 2009; Kalshoven, Den Hartog, & De Hoogh, 2011). Contemporary leadership research focuses on theoretical discourse and neglects practical research in solving intractable problems in reality. Appropriate behavioral interpersonal relationships that demonstrate norms through personal demeanor and behavior and promote this behavior to followers through two-way communication. communication, reinforcement, and decision-making.Despite the importance of this issue, the body of social scientific research on ethical leadership still is rather small (see Brown & Treviño, 2006; Den Hartog & De Hoogh, 2009; Toor & Ofori, 2009; Treviño, Weaver, & Reynolds, 2006) and even less interdisciplinary research has been conducted on the role of ethical leadership in management in brand and product design. In the cultural and creative fields of product design, ethical leadership is reflected not only in the leader's personal moral character, but also in his or her guidance of team members and control over the direction of the product. From the design of symbols, products, services, and systems. This leadership can guide the designer to dig deeper into the moral elements and traditional culture in the design and integrate them into the product design, so as to improve the narrative ability of the product, and to realize the power of the product and the brand with a constant traditional moral kernel, and to achieve the The realm of everlasting emotion. Culture includes the customs, beliefs and social behaviors of a group, as well as their intellectual and artistic achievements, reflecting human nature and social practices. In the context of Chinese fashion, which emphasizes the unity of man and nature, and under the current conditions of material abundance, users need more emotional satisfaction beyond function. The driving force of design is the need to synchronize the construction of product narrative and brand influence. Startup product design companies, with their founders' cultural cultivation and ethical influence, can test the ethical impact of the Universal Declaration of Human Rights by building team trust, increasing team creativity, and

shaping the organization's morals and values, standards and cultural consensus are the key foundations for ethical impact, and the underpinning of all of this is ethical leadership.

2.2 Moral Leadership and Sustainable Brand Development

Users do not require or demand sustainable products (Yan, Hyllegard and Blaesi, 2012; Brewer, 2019a; Soto-Acosta, 2020, 2024; V at am anescu et al.,2022) . To apply ethical leadership in the design of cultural and creative products is to deepen the further spirituality of the product's cultural connotations while promoting sustainable development. Trevino, Brown, and Hartman found that ethical leadership is not only related to leader traits (honesty, integrity, and trustworthiness) and ethical behaviors (openness, caring, fairness, and ethical decision making), but also the importance of values. Values-based management (setting ethical standards rewards through communication and communication). Ethical leadership requires communication, principles and role modeling through the following effects to drive better understanding and application of sustainable design concepts in design teams. Critical to building public relations and gaining consumer trust, establishing some form of causality engages consumers, giving them more confidence in the value of the product and sustaining a long-term brand relationship. From the initial research phase to the selection and design of the media, it all depends on how well the market developer understands the values of the people they are targeting. The product is realized through styling, symbolism, and form, using semantics and semiotics as a guide to the product's symbolic system. The concept of branding is a modern construct of a negotiated relationship that is transaction-oriented and at the center of all business and marketing interactions. From a functional point of view, a brand is a name, design, logo or a feature of a service that distinguishes the goods and services of a merchant or group from its competitors. By generating a value

proposition, it encompasses functional, emotional, and self-symbolic meanings. Branding can be used as a political vehicle for a company to dispel a negative image or to express public goodwill. Brands are differentiated by differences in consumers' understanding and perception of the branded product and its utility; brands are ultimately psychological creations of the consumer. Brand symbols include six levels of meaning: brand characteristics, brand advantages, brand value, brand culture, brand personality, user feedback. The difficulty of branding lies in the driving force with which the relationship between culture, society and economy is linked. Ethical leadership, as a brand driver, gains meaning through style, image, and the transactions, interactions, revisions, adjustments, and disputes between the parties involved. While the value of a brand in business is created through constant change, the constant cornerstone is ethical leadership. That is, ethical leadership brings together actors on the corporate side, the design side and the consumer side. A brand is not a physical thing, it is a dynamic space that represents a strategic interaction.

2.3 Moral Leadership and Emotionally Sustainable Design

In recent years, brands have been widely and harshly criticized for exploiting political, environmental and social responsibility deficits for profit. Brands have in fact become powerful social practices, and their creators and owners should be aware of this and act responsibly. From a collective perspective, ethical leadership generates relational recognition that evokes positive psychological cues for the group. From an individual state, ethical leadership helps to generate moral self-resonance. Designers infuse this nobler emotion into their product design approach. This logical correlation allows the user to always feel the moral voice in the use of the product, which is where the value lies and the significance of ethical leadership as an enabler. This emotionally sustainable design not only strengthens the emotional bond between the user and the product, but also enhances the cultural depth and emotional longevity of the product, thus promoting its sustainability.

The brand characteristics of a product are developed and defined, and these characteristics become the basis for communicating its value to consumers, which in turn has an impact on all aspects of the product's appearance, packaging, and sales.In this sense, emotional sustainability capacity, which involves recognizing and In this sense, emotional sustainable capacity, which involves recognizing and managing emotions, could mediate the relationship between sustainable fashion knowledge and individual sustainable responsibility. paramount importance in translating knowledge into responsible behavior (Betzler et al., 2022). Sustainable fashion knowledge may lead to emotional responses such as guilt or satisfaction, which can influence subsequent purchasing. satisfaction, which can influence subsequent purchasing behaviors (Castagna et al., 2022). Emotionally durable design (EDD) is a design philosophy that aims to extend the life of a product. It enhances the appeal of a product by strengthening the emotional connection between the user and the product. Jonathan Chapman proposed a six-point empirical framework for Emotionally Durable Design (EDD) which includes narrative, detachment, surface, attachment, fiction, and consciousness, which are seen as key areas for extending the emotional durability of products. In addition, research by B., Van, P., Dzmitry, A., and Jon, M. reveals the product qualities needed to extend the emotional endurance of products in areas such as engagement, adaptation to user identity, spirituality, evocative memory, and reward. These theoretical tools provide the basis for ethical education. Designers create the 'right' product differentiation, which is their most important business capability. The future of the industry is concerned with the shift in roles between the traditional designer, the company and the consumer, and the axis of this shift is the most critical element.

3 Moral Leadership and Emotionally Sustainable Design

3.1 Research Methodology

The data for this study comes from field research conducted in Shanghai. Conduct research and cooperation through the research institutions of universities. This partnership allowed the focus of the study to be refined and additional information to be collected. The theoretical basis also includes the author's doctoral research.

The research methodology consisted of four main phases. The initial desk research phase was followed by a case study phase. This methodology was adopted in order to narrow down the scope of the study. The objectivity and representativeness of the research is guaranteed, as the topic and its applicability to analyze multiple variables in the original context as connecting case study methodology supports the generation of inductive theory.

Given that emotional permanence has not been fully explored in the design of fashion branded products in start-ups, this approach provides practical insights and encourages interpretive analysis.

3.2 Case study analysis

The research began with a desk study to map the sustainable design and production practices of companies related to the fashion industry in Shanghai, China. The study identified around 20 sustainable fashion brands covering the cultural and creative products and daily-use products sectors. Most of these brands are micro-enterprises or small and medium-sized enterprises (SMEs), focusing on cultural creativity and emotional design of products, including services and experiences. Four macro dimensions were derived from the organizational practices of these brands, highlighting an emotional sustainability strategy led by ethical leadership. Three brands were selected for in-depth case studies to examine how ethical leadership guides brand development. Data were collected through participant observation, offline interviews, and digital ethnography research methods. These case studies were used to systematically analyze and generalize the findings. These case studies reveal how ethical leadership distills cultural and ethical values into design concepts, embeds an emotional sustainability approach, and designs products through narrative, attachment, and other means based on sustainable design's low-impact resource use, low-waste design, and management of product lifespan and recycling resources. These strategies not only enhance sustainability but also support business growth. The research takes brand narratives as its object and the results can bring learnable implications for product form, aesthetics, construction, and semantics. The results of the study

contribute to the production practices of the fashion industry towards sustainable excess.

3.3 Case Study 1

The brand “UOOSEE”: contemporary reinvention of traditional materials

The use of nostalgic elements is common in advertising and fashion, and bicycle inner tubes are one such nostalgic element. Founded in 2022, “UOOSEE” is a brand that specializes in sustainable fashion and has pioneered the concept of “sustainability”. Using discarded bicycle inner tubes as raw materials, it creates hard-wearing, waterproof and cool bicycle inner tube backpacks. The brand's core philosophy of “Game of Life” encourages users to be bold players in their lives.

The embodiment of ethical leadership: “UOOSEE” practices sustainability through ethical leadership to unite teams and artisans. Initially inspired by Patagonia, an American outdoor brand, and inspired by its ethical leadership, Anita, the brand founder, decided to create a brand with an environmental theme. The brand demonstrates ethical leadership through: fair cooperation: establishing long-term partnerships with artisans to ensure their rights and interests; interest, providing consumers with skills training and marketing support; environmental philosophy: insisting on the use of sustainable recycled and discarded bicycle inner tubes to reduce the waste of resources; community building: building a vibrant community through the organization of offline events and an online podcast, “The Cliff” , spreading the spirit of “The Game of Life”; Emotional Sustainable Design: UOOSEE focuses on the background story of its products, introducing the products along with the production process so that consumers can feel the uniqueness and environmental value of the products. Through creative design and handmade production, it gives new life to discarded materials and conveys respect for human beings. Through this case, we can develop the revelation of the knowledge of germinating ideas, constructing and shaping communication, rhetorical patterns, memory points, and artistry. It is possible to make a transfer from cognitive rhetoric or directly refer to rhetorical models in the form of a three-step process of abstraction, contextualization, and continuity.

Figure 1. The "UOOSEE "brand uses recycled inner tubes from bicycles to make backpacks, which are produced by an entrepreneurial team formed through ethical leadership

3.4 Case studies 2

The " related" brand: a contemporary reconstruction of traditional relationships

From the view of sustainable fashion, feelings, emotions and beliefs change daily and sometimes more often (Todeschini et al., 2020; Buzzo and Abreu, 2019; McNeill and Moore, 2015). Founded by the mother of Chinese supermodel Chen Biege, "related" focuses on designing apparel products with emotional value and moral significance. The brand takes "related" as its core concept, emphasizing the connection between people and people, and between people and nature. Embodying a sense of moral value. The brand is mainly known and accepted by the public is the brand to save water resources with the characteristics of the new process and the story of 70-year-old women's entrepreneurship, from different dimensions to reflect the charm of moral leadership, physically guiding the public to reflect on fashion, attention to social and moral issues. The brand's design strategy of emotional durability is based on building long-term partnerships with artists and artisans in order to ensure their rights and interests in the creative process. This is a natural fit with the brand's philosophy of using eco-friendly materials in product design to minimize environmental impact and not burden the environment. Through environmental initiatives and public service activities, the brand develops a unique ethical image and wins the trust of consumers. The brand's multifaceted narrative and cross-border linkages with various events have become a powerful strategy to enhance users' emotional connection, especially when focusing on respecting elders and women's independence, and even including many redefinitions of concepts such as age.

Figure 2 The "related" brand, the re-entrepreneurship of three retired mothers, is "related" to sustainable courage and responsibility

3.5 Case Studies 3

“MADE IN NATURE brand: contemporary regeneration of traditional elements

Founded in 2015, “MADE IN NATURE” is an ethnic fashion brand that focuses on fusing local culture, traditional crafts and modern design. With “nature, humanity and handicraft” as its core elements, the brand is committed to integrating traditional Chinese handicrafts into modern life. By thinking in a fashionable way about the current people's retrospective thoughts about traditional nostalgia, it innovates, recreates and regenerates traditional products.” MADE IN NATURE” demonstrates ethical leadership by Taking Chinese calligraphy as the brand communication symbol, through the modern re-creation of traditional calligraphy, its expression of strong emotional tension shapes a distinctive brand image; Empowerment for craftsmen: the brand cooperates with craftsmen in depth, provides marketing channels and design support, helps them transform traditional skills into commercial value and increase income, embodies social responsibility for inheriting traditions, and wins moral reputation; Cultural Inheritance: By shooting documentaries and holding exhibitions, the brand records and spreads traditional handicrafts, letting more people understand traditional culture and the values behind it, shaping the brand's ethical image and reflecting the quality assurance of the brand's products; Public Welfare and Sustainable Development: The brand actively participates in public welfare activities, promotes the revitalization of rural culture, revitalizes the regional economy, and enhances the well-being of the people in the region with its design, expanding the moral influence of design in terms of mode. mode of expanding the moral influence of design.

Fig. 3. “MADE IN NATURE” leads the regeneration of Chinese folk crafts with morality and becomes the front wave of the “National Wave”.

4. Conclusions and Recommendations

This study confirms that there are successful cases of combining pop culture and emotional sustainability in contemporary Chinese fashion brand products represented by accessories, clothing, and cultural and creative products. It also confirms the key driving role of ethical leadership as the underlying logic in this linking relationship. It is further found that emerging fashion brand startups driven by design thinking can, through cross-media narrative design methods such as contemporary reconstruction of traditional materials, contemporary reconstruction of traditional relationships, and contemporary regeneration of traditional elements, translate the good culture of thrift, care, tolerance, support, and sustainability embedded in traditional morality, emotion, and cultural elements into symbols that resonate with contemporary people, and integrate them into the fashion industry, with the driving force of moral leadership. in the fashion industry. Driven by ethical leadership, product design can enhance cultural depth and emotional connotation, strengthen emotional durability, and promote sustainable development. Ethical leadership can effectively guide startup brand teams to work together as one, positively reflect traditional moral values, effectively inspire emotional resonance in users, and reduce product obsolescence and environmental impact.

Recommendations

To strengthen the cultivation of ethical leadership, especially the start-up fashion company design company is in the image building period, should be through training to develop ethical leadership and education, to guide the design lead to set up the correct values, to improve their moral influence. To deepen cultural exploration, the design process should explore the

relationship between local fashion trends and lifestyles, and combine traditional ethical and moral elements with modern design concepts to create classicized products with greater cultural depth and emotional durability, shaping them into classic brands. The company should adopt a sustainable development mindset that combines the above aspects and incorporates environmental protection and resource conservation throughout the product life cycle.

Future Research

In emerging economies, design is recognized as an important way to promote economic development in order to change the current status quo of being a source of cheap goods and a processing site for products designed by foreign design firms, and to develop local brands that are competitive in global fashion. Future research could be useful in revitalizing the manufacturing sector as a contributing factor to the new post-industrial economy. Future research should expand the sample size and explore the interaction between ethics and other factors. leadership and other factors, such as corporate culture and employee innovation, to provide a more comprehensive theoretical framework for sustainable design that can fully serve the innovative capacity of a firm and even a nation.

ETHICAL LEADERSHIP OF ENGOS FROM A SYSTEMIC DESIGN PERSPECTIVE: A CASE STUDY OF THE YANGTZE RIVER IN CHINA AS A METAPHORICAL BOUNDARY FOR RIVER SUSTAINABLE DEVELOPMENT

Wen Lu*[a], Silvia Barbero[b], Amina Pereno[b], Xin Yang[c]

a Tongji University
b Politecnico di Torino
c Sichuan Green River Environmental Conservation Promotion Association
*Wen.lu@polito.it

ABSTRACT | China's rapid economic growth has led to prominent environmental issues, including pollution, ecological imbalance, and biodiversity loss. Among them, the environmental impacts on the Yangtze River raise concerns. The Yangtze River, known as the 'Mother River of China', originates in the Qinghai-Tibet Plateau's hinterland and is the world's third-longest river. During significant historical evolution, especially in response to national policies and global environmental challenges, environmental non-governmental organisations (ENGOs) have transformed from peripheral players in environmental governance to influential participants and have adopted various strategies to collaborate with governments to formulate policies. Among the key ENGOs in China that have sprung up around the conservation of the Yangtze River, the Sichuan Green River Environmental Conservation Promotion Association (Green River), founded in 1995, is a prominent representative. The organisation's founder, Yang Xin, has a deep connection with the Yangtze River that began in 1986, when he was part of the first human expedition to raft the Yangtze. He has used his life to engage in dialogue with the Yangtze, which has existed for hundreds of millions of years (Li, 2006). Subsequently, after many in-depth investigations at the source of the Yangtze, he observed the fragility of the Yangtze River basin ecosystem and the severity of the pollution problem and established China's first non-governmental nature conservation station. Over the next 30 years, through his unique moral leadership, he rallied nearly 3,000 volunteers from cities across China to engage in environmental conservation actions at 15 conservation stations along the Yangtze River. The leadership principles of 'leading by example' and 'public participation' (S. Quick et al., 2022), which he advocated, have become critical forces in promoting

sustainable development in the Yangtze River Basin. This paper aims to explore the contribution of ethical leadership to transforming ENGOs from a multidisciplinary perspective, drawing on concepts from systemic design theory, ethical leadership, and metaphorical boundaries. The Yangtze River is a metaphorical boundary here, symbolising separation and connection. In a socio-cultural context, it delineates the boundaries of different experiences and provides new opportunities to cross boundaries and explore (Gara, 2022). This paper adopts a mixed-methods approach, combining systems thinking with design tools to conduct a multidimensional, multi-stakeholder analysis. Key data for the case study were obtained through semi-structured interviews and field research. The Yangtze River as a metaphorical boundary shows how to integrate the resources of the government, businesses, NGOs, and citizens to jointly address the complex challenges of Yangtze River ecological protection in the Chinese context, thus providing a new perspective on the development of ethical leadership for ENGOs and exploring the definition of a systemic design-led roadmap for desirable future trends in ecological conservation.

KEYWORDS | ETHICAL LEADERSHIP, ENGOS, GREEN RIVERS, SYSTEMIC DESIGN, YANGTZE RIVER, METAPHORS

1. Introduction

As Liu (2018) states, “Some studies have found that 90% of the global plastic waste entering the sea is concentrated in ten rivers, including China's Yangtze River.” The Yangtze is the longest river in China and the third longest in the world. Its source is in the Tanggula Mountains in Qinghai Province, where it collects the Chumar River system in the north, the Ulan Moron River system in the west and the Dangqu River system in the south. The Yangtze River is 6,397 kilometres long and has an annual runoff of 951.3 billion cubic metres (Guo et al., 2021). The Yangtze River and its tributaries run through 19 provinces (autonomous regions, municipalities directly under the central government) in China and finally converge in Shanghai into the Yellow and East China Sea. The total industrial and agricultural output value of the areas along the river accounts for about 40% of China's total economic output, and 40% of China's 1.4 billion people live in the Yangtze River basin.

Against China's complex political, social, and cultural context, the government is more concerned with livelihood issues while promoting economic development. However, the Yangtze River Basin faces multiple environmental challenges, including plastic pollution, water pollution, ecological degradation, biodiversity loss, overexploitation, and climate change. These challenges urgently require a multi-party response. Since the 1980s, various civil entities have flourished in China as civil society organisations have gained increasing global influence (Kahn et al., 2024, p. 8). Types of NGOs in China include international NGOs (INGOs), government-led NGOs (GONGOs) and bottom-up NGOs (NGOs). The development of ENGOs in China began in the mid-1990s and has since grown rapidly. Unlike in other parts of the world, Chinese NGOs promote their agendas by avoiding confrontational approaches and encouraging cooperation with the government (Kahn et al., 2024, p. 6). As times have changed, China's NGOs have gradually transformed from being peripheral participants to influential partners. One outstanding representative is the Green River, a grassroots Chinese ENGOs established in the 1990s, promotes and organises activities to protect the natural ecological environment in the upper reaches of rivers, promotes the development of civil society efforts to protect the natural ecological environment in China, raises environmental awareness and environmental ethics in society as a whole, and strives to achieve sustainable socio-economic development in the basin (Green River, n.d.).

ENGOs now have substantial impacts on people and their environments, both on the ground through project implementation (Brockington, 2002; West, 2006; Beymer-Farris & Bassett, 2012; Steenbergen & Visser, 2016; Watanabe, 2019; Partelow, Winkler, & Thaler, 2020) and through influence on policy from the local to international levels(Allan & Hadden, 2017; Keck & Sikkink, 1998; Larsen & Brockington, 2018; Partelow, Winkler, & Thaler, 2020; Princen & Finger, 1994; Thaler, Viana, & Toni, 2019). Throughout ENGOs worldwide, a few organisations have relied on their national resources to implement differentiated environmental protection actions by establishing conservation stations. However, some INGOs have taken a different path. For example, Greenpeace has established branches worldwide to promote local environmental initiatives. At the same time, among the first scientific explorers to complete the entire journey of the world's major rivers, only a few have continued this feat as a lifelong career in ecological and environmental protection. Some explorers were killed during their expeditions, such as Naomi Uemura, who completed the Amazon River in 1970. According to the available data, Yang Xin has been working on ecological and environmental protection for a long time.

Rivers have always been seen as metaphors for physical and symbolic boundaries. As dynamic entities, they break the static concept of traditional territorial boundaries and provide a wealth of symbolic meaning for culture, society and the environment. In the conservation practices of ENGOs, the image of the Yangtze River as a metaphorical boundary inspires unique emotions among people living along the river toward river conservation. Historically, the Yangtze River region relied on cruise ships and passenger terminals to connect the region. In today's practice of joint ecological protection of the Yangtze River, the Chinese government has put forward a development strategy along the Yangtze River centred on the 'Yangtze River Conservation' (Zheng et al., 2020), and through the enactment of the Yangtze River Conservation Law (Xinhua News Agency, 2021), the Yangtze River is being protected from the cultural metaphor of the Yangtze River as China's 'Mother River', calling for the active participation of various institutions and citizens in the cities along the river.

Brown et al. (2005) define ethical leadership as the "demonstration of normatively appropriate conduct through personal actions and interpersonal relationships, and the promotion of such conduct to followers through two-way communication, reinforcement, and decision-making" (p.120). Ethical leadership is not only reflected in individual behaviour but also in the actions of the entire organisation. The systemic design approach provides structured support for ethical leadership by focusing on multi-stakeholder, multi-level collaboration in complex systems such as environmental conservation, especially in cross-regional ENGOs. This paper explores how to promote sustainable development practices in ENGOs in the Yangtze River Basin by combining systemic design theory, an ethical leadership framework and the concept of 'metaphorical boundaries.

2. Methodology

This research adopts a mixed-methods approach that integrates the perspectives of systemic design, ethical leadership, and metaphorical boundaries. It aims to explore how the ethical leadership of ENGOs plays a key role in ecological and environmental conservation in the Chinese context, and how strategies in the Yangtze River Basin can inform the future development of a design-led, systemic roadmap. The research combines quantitative and qualitative methods to analyse data on Green Rivers' achievements and development milestones in environmental conservation. Semi-structured interviews and field observations are used to analyse the experiences and strategies of ENGO leaders in ecological conservation practices.

The semi-structured interviewees were selected from among the leadership representatives of Green Rivers, an environmental NGO. A consistent interview framework was used across all participants, covering topics such as their motivations for participating in ecological activities, the role of the Yangtze River in China's environmental conservation efforts, and the organisation's management structure and leadership style.

First, the research centres on the symbolic 'mother river' Yangtze, a metaphorical boundary in the Green River environmental conservation case study. This metaphor not only reflects the unique position of the Yangtze River in ecological and environmental conservation but also inspires the possibility of exploring new environmental governance and leadership models in regions with similar geographical and cultural backgrounds. Ethics, as a "tool for guiding personal behaviour, attitudes and manners" (Sharma et al., 2019, p. 714), is critical in the practice of ENGOs. As Naeem and Syed (2024) point out, "Ethical leaders' traits not only influence behaviours and decisions within the organisation but also play an important role in shaping the broader organisational context leading to the creation of an environment where ethical practices thrive and evolve" (Naeem & Syed, 2024, p. 1168). Based on this, this study aims to analyse how ENGO leaders in the Chinese context can use their ethical leadership to call on large-scale communities and volunteers to protect the Yangtze River ecosystem, thereby providing lessons for similar environmental governance.

Since grassroots ENGOs in the Chinese context inevitably need to address highly complex system issues when tackling ecological and environmental challenges, including the impacts of material, information, ecological, and economic flows, as well as the complex relationships among numerous direct, indirect, and potential stakeholders, this study focuses on the following two aspects. First, a qualitative study was conducted through semi-structured interviews with multiple ENGO leaders involved in conserving the Yangtze River's ecological environment. The interviewees received personalised questions based on a unified question framework before the interview, covering the Yangtze River's role in ecological and environmental conservation, motivation for participation, leadership style, organisational management and decision-making mechanisms, and the main challenges faced. Each interview lasted about an hour. The interview texts were coded using content analysis to identify and organise recurring concepts and key insights (As shown in Table 1). Secondly, the quantitative study collected and analysed data on the Green River Project's results and development milestones to quantitatively evaluate the results achieved by ENGOs in promoting ecological conservation practices, providing data support and verification for the qualitative study.

In addition, systemic design, as an important theoretical approach in this study, originated from the Politecnico di Torino in Italy at the beginning of the 21st century. Its core concept is to promote the sustainable development of the environment, society and economy through interdisciplinary methods and systems thinking. In the case of the Green River, a systemic design complexity map is used to analyse how various stakeholders collaborate and participate in environmental protection projects.

In the Yangtze River ecological conservation practice, ethical leadership is demonstrated by leaders and environmental NGOs who actively advocate ecological responsibility and promote public participation in conservation actions. Meanwhile, the systemic design provides a holistic understanding of the system, clarifying the various stakeholders and helping coordinate the multiple forces of government, business, and civil society organisations to work together within the complex ecosystem of the Yangtze River basin. At the same time, the metaphorical boundary of the Yangtze River as the 'Mother River' breaks down administrative and geographical constraints at the emotional and cultural

levels, fostering a sense of identity and belonging across boundaries and providing an effective platform for collective action. According to Lakoff and Johnson's (1980) theory of metaphor, metaphorical boundaries not only cognitively simplify complex information but also emotionally facilitate the mobilisation of collective action, thereby providing ethical leaders with a powerful tool for systemic design in real-life scenarios.

Finally, the study explores an effective model for multi-sector collaboration in ecological conservation involving government, businesses, NGOs and the public by mapping out a 'green river development path and stakeholder map' led by systemic design, providing theoretical and practical references for the policy framework and practical path for plateau ecological conservation, and apply holistic analyses of systemic design to support ethical leadership in environmental governance.

Table 1. Table of list of semi-structured interviews.

Name	Time involved (years)	Role	Affiliation
Yang Xin	32	Explorer, photographer, environmentalist	Founder/President of Green Rivers, Director of the Yangtze River Estuary Green Development Promotion Centre
Han Mei	24	Director physician at Golmud People's Hospital, classmate of environmental conservation defender Jiesang Suonandajie	Former Director of the Yangtze River Source Eco-Environmental Conservation Centre
Gejiaer Tudan Damba	14	Pastoralist of the Yangtze source	Director of the Yangtze River Source Eco-Environmental Conservation Centre, Yangtze River No. 1 Theme Postmaster
Shi Shile	5	British international accountant, account manager of the project finance department and credit department of the Shanghai branch of Société Générale, general manager of the internal control audit and risk management department of Huabao Xingye Fund Management Co., Ltd., general manager of Vanda Private Equity (Shanghai), partner of Shanghai Xinren Culture, Beijing Entrepreneur Environmental Conservation Foundation	Secretary general of the Yangtze River Estuary Green Development Promotion Centre
Zhong Peijian	3	China Changdian 606, 908 Captain (Yangtze River Route)	The postmaster of Changjiang 11 Theme Post Office

3. Results

After cross-analyzing quantitative and qualitative data, analyzing interview results, and using deductive methods combined with visualization tools to draw the Green River development milestones, full map of the Yangtze River basin and a map of the Green River conservation station and Green River development path and stakeholder map, and through comparative analysis of charts and graphs ten key ten comparisons between China's Green River, the results of 30 years of Green River conservation are displayed to evaluate the effectiveness of Green River in ecological and environmental conservation practices.

3.1. Results of the interviews

- Motivation to participate in eco-related activities

All interviewees described their initial motivation for getting involved in the Green River environmental conservation effort, and each shared unique and fascinating experiences. A recurring theme was the memory of specific historical events: four interviewees mentioned the 1986 Yangtze River rafting expedition that caused a national sensation, and three mentioned the tragic death of Jiesang Suonandajie, deputy secretary of the Zhiduo County Committee in Yushu, Qinghai Province, in January 1994, when 18 Tibetan antelope poachers shot him in the uninhabited area of Kekexili at minus 40 degrees Celsius. In addition, three interviewees recounted their experiences witnessing environmental changes at the source of the Yangtze River, and three said that Yang Xin's influence prompted them to participate in the Green Rivers project.

For example, interviewee Yang is an explorer, photographer and staunch environmentalist. Not only did he complete a rafting expedition down the entire Yangtze River in 1986, but he also made five expeditions to the source of the Yangtze, where he documented, through his camera, the profound impact of climate change and glacial retreat on the ecology and the lives of local people. Interviewee Han recalled:

> “After my classmate died, I began to feel strongly about the severity of environmental conservation issues in the highlands, and a sense of responsibility welled up inside me. It was not until Yang established the Suonandajie Nature conservation station that I started to pay attention to ecological environmental conservation.”

Another interviewee, Ge recounted:

> “In 1986, when I was in primary school, the school organised a celebration for the heroes of the Yangtze River rafting team, with all the teachers and students beating drums and gongs. It was not until 2011, when Green River set up a conservation station in Tangula Town, where I was born and grew up, and needed to recruit local managers, that I had the opportunity to get involved directly.”

In addition, interviewee Shi described the experience of conducting due diligence to identify an unqualified investment donation target and confirm Green River as the donation target while serving as the organisation's head.

- The role played by the Yangtze River in China's ecological and environmental conservation work

All five interviewees mentioned the close connection between their upbringing and the Yangtze River. Two came from the Source of the Yangtze, one from the Upper Yangtze and two from the Lower Yangtze. Han, who grew up at the Source of the Yangtze, recalled:

> "I noticed that the snow-capped mountains and the river changed significantly yearly during my upbringing. If the snow-capped mountains melt, it will seriously impact human health and the survival of all life, including wildlife and plants. The most direct consequences will be water shortages and the spread of various infectious diseases."

Another resident of Ge, which is located on the banks of the Ulan Moron, said: "The source of the Yangtze is not only where I grew up, but it also nurtured me. I have a deep affection for my mother river, and I can observe the changes in the Yangtze and its source grasslands and ecosystems." Yang, who comes from the Upper Yangtze, said with emotion: "With the Yangtze as your backdrop, you have to be strong; in the process of exploring and protecting the Yangtze, there have been many victims." Captain Zhong, who has been navigating the Yangtze said: "I have worked on the Yangtze for 40 years, and the Yangtze has accompanied me for half a century." In addition, interviewee Shi, starting from the point that "the Yangtze carries a rich historical and cultural heritage," explained the important role of the Yangtze in multiple dimensions such as geography, economy, culture and the environment.

- Management structure and leadership style

In terms of management structure and leadership style, all four interviewees emphasised Yang's unique personal charm, leading by example, perseverance and a strong sense of social responsibility. These qualities are key factors that attract other managers to continue to participate in the Green River Project. Green River has two centres, the Yangtze River Source Eco-Environmental Conservation Centre and the Yangtze River Estuary Green Development Promotion Centre. There are 15 conservation stations across most of China, as shown in Figure 2. Han, Ge, Shi and Zhong mentioned in the interviews:

> "Yang has been a committed leader in ecological and environmental protection for 30 years, particularly at the high-altitude Source of the Yangtze River. With his firm belief in environmental protection, charisma, credibility and heroic spirit, he has inspired volunteers, pastoralists, businesses, NGOs and governments from all over China to work together for the environment. He is rigorous and pragmatic, ensuring projects get off the ground, promoting cost-effective operations for NGOs, and demonstrating an entrepreneurial spirit to enhance sustainability. His moral leadership influences his team and inspires more people to devote themselves to environmental protection and promote the organisation's development through collaboration and a shared vision."

The key to Green River's success in ecological conservation in China and in rallying nearly 3,000 volunteers to carry it out lies in the organisation's credibility, product-driven approach, and transparent and fair project implementation. It is precisely through practical actions in exchange for public recognition that Green River has always adhered to the principles of fairness and transparency in project implementation and has used the power of example to rally people from all walks of life to work together towards a common goal.

3.2. Results of the analysis of complex mapping tools in systemic design

As shown in Figure 1, the distance between the protected stations along the Green River exceeds 6,397 kilometres. The operation of these stations requires cross-regional and cross-departmental collaboration. The similarity among these stations is that they are all located near rivers, reflecting the Green River's holistic strategy for protecting the river basin ecosystem. When recalling their most difficult decisions, each interviewee mentioned how these choices have further strengthened their commitment to environmental sustainability. For example, when faced with development difficulties, Yang Xin still firmly refused to accept donations from tobacco and fur companies that ran counter to environmental conservation concepts.

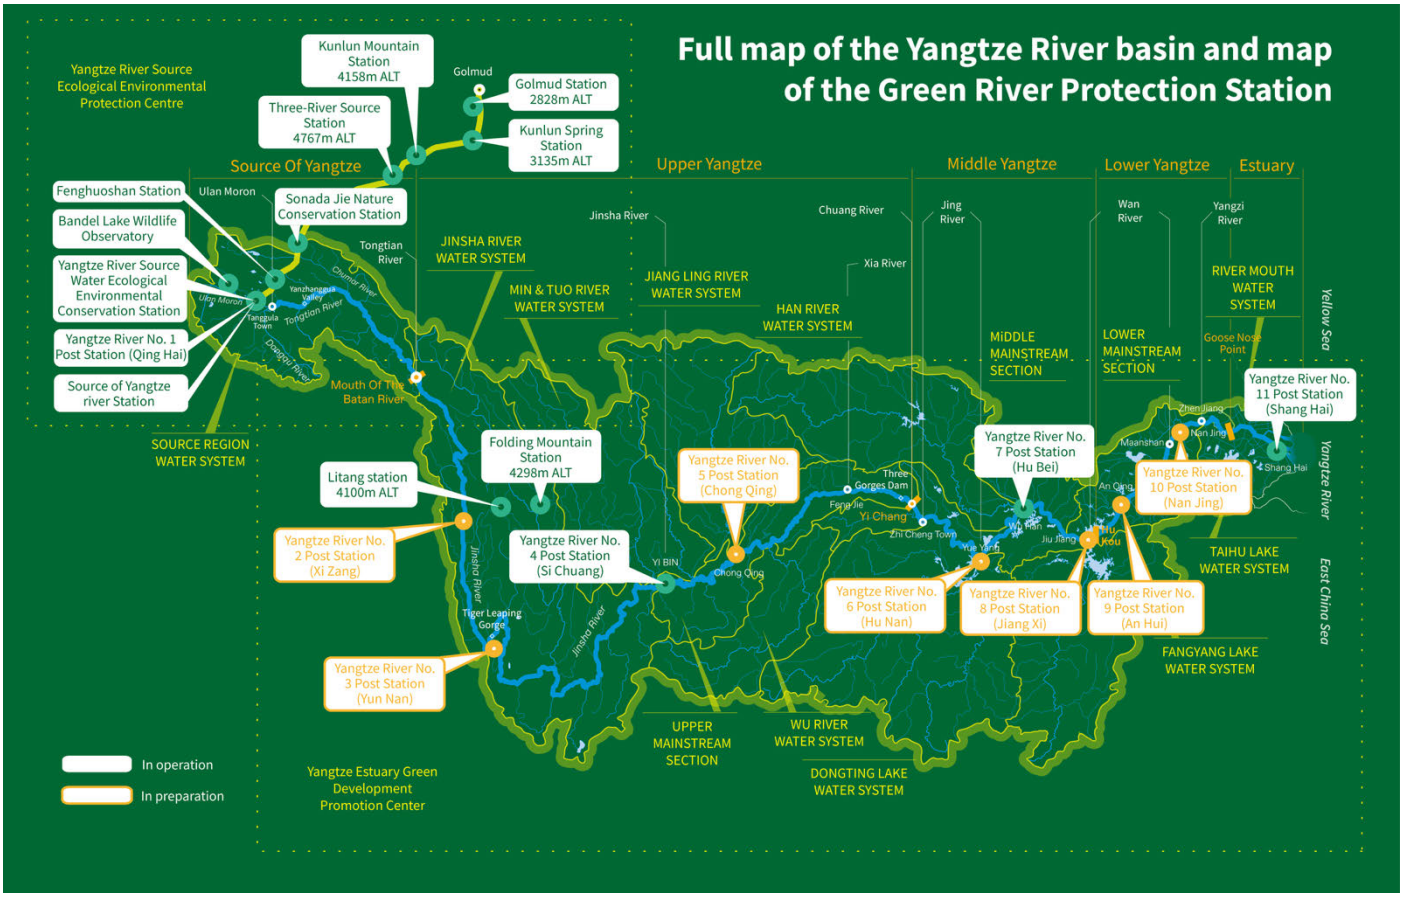

Figure 1. Full map of the Yangtze River basin and map of the Green River Conservation Station.

Figures 2 and 3 show that most conservation stations are in the Source region of the Yangtze. Their ecological conservation work mainly focuses on climate change and glacier retreat in the Source of the Yangtze, biodiversity and wildlife conservation, and packaging waste on the Qinghai-Tibet Plateau. From a systemic design perspective, ecological conservation does not focus on a single stakeholder but also requires a holistic understanding of all living things in the ecological conservation system and all material, energy, information, ecological, and economic flows that exist in direct, indirect and potential relationships with them, to achieve a comprehensive understanding and optimisation of the complex plateau ecological environment system. This comprehensive perspective ensures the project's long-term sustainability across environmental, social, and economic domains. Green Rivers follows a volunteer operation model of 'local government leadership, civil society mobilisation and participation, and social enterprise

supplement'. As shown in Figure 3, ecological and environmental conservation is not an isolated action but constitutes a complex ecological network in which every animal, every wetland, and participant plays an indispensable role. This approach transcends the limitations of traditional solutions and offers a new perspective and practical path for ENGOs to tackle complex ecosystem issues.

Figure 2. Green River development milestones.

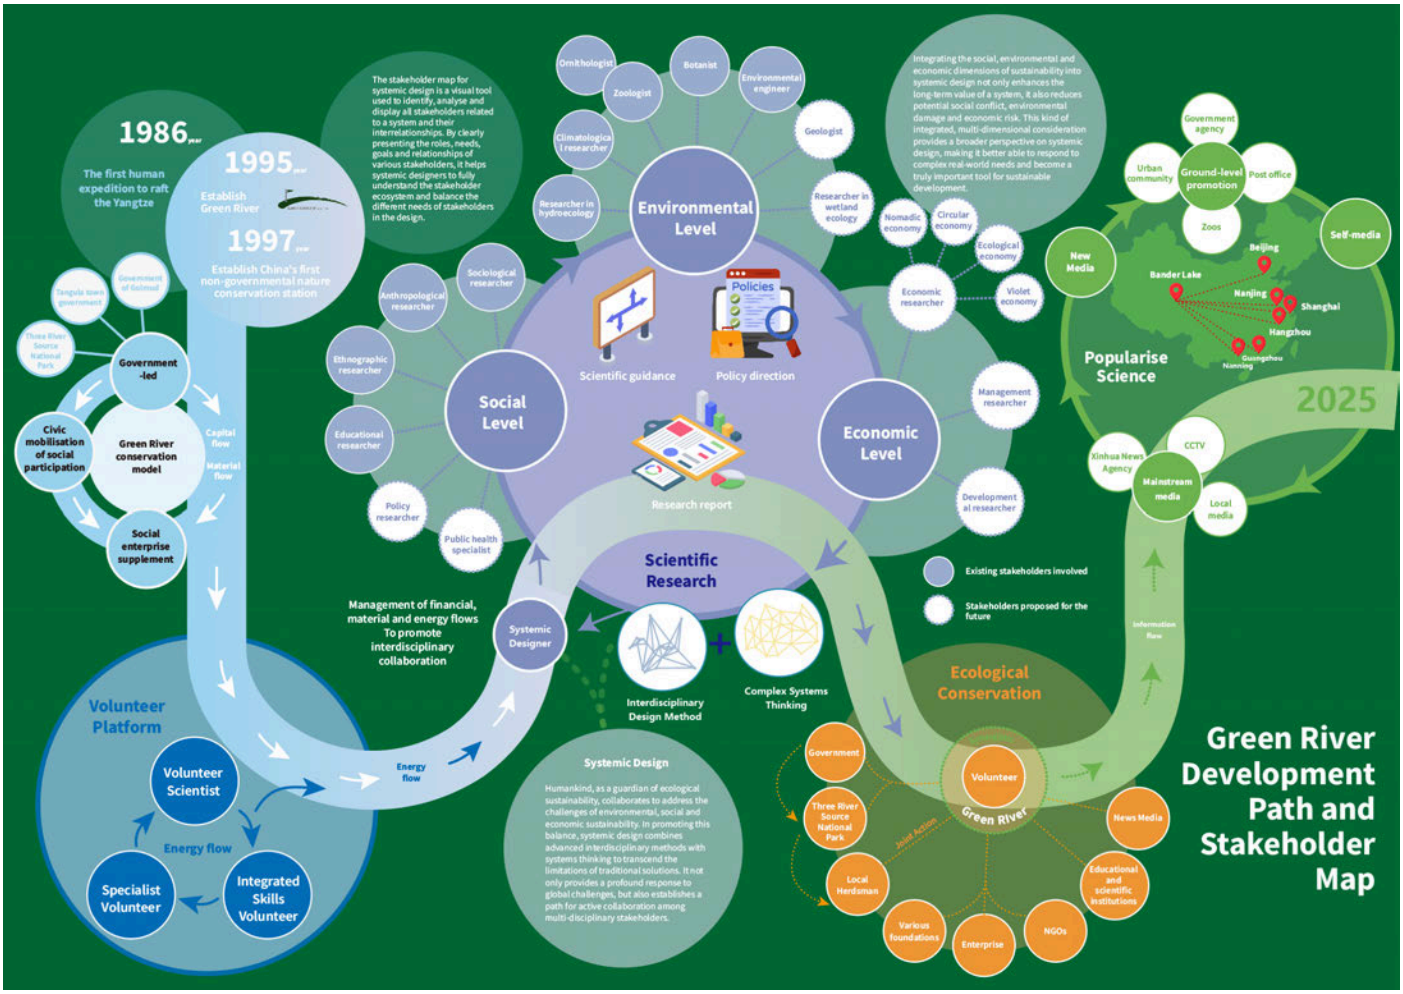

Figure 3. Green River Development Path and Stakeholder Map.

Table 2. Results of 30 years of Green River conservation.

Duration(years)	Project content	Results
2002 -2024	Recycling of waste on the plateau	1.65 million waste items (Green River, n.d.)
2005 -2010	Yangtze River Source Glacier Change Monitoring Project	Released 'Yangtze River Glacier Retreats 4,000 Metres in 40 Years' at the side event of the 2010 Climate Conference and became an observer organisation at the World Climate Conference (Xinhua News Agency, 2010; Yang, 2025, p92),
2012 -2024	Tourists participate in the 'Take a bag of trash away' project	About 60 000 people (Green River, n.d.; *Yang, 2025*)
2012 -2024	Anser indicus conservation project at the Bander Lake Wildlife Observatory	The maximum number of Anser indicus observed in a single day has increased from 1,172 in 2012 to 7,742 in 2023, showing a 6.6-fold growth trend (Lu., 2025, p. 102;)
2012 -2024	Biodiversity population survey of Lake Bande	Using a combination of volunteer and herder patrols, as well as methods such as drone surveys and camera monitoring, a total of 68 species of wild birds and animals were discovered in the 4.66 square kilometre Lake Bende wetland, including 47 species of wild birds and 21 species of wild animals (Chen, 2021). There are also 9 species of special plateau plants and 2 species of plateau fish populations (Xiong et al., 2022)
03/2024 -01/2025	Research action on tidal garbage along the coastline of two 50-metre sample areas in the Yangtze Estuary, Shanghai	The total weight of the waste is 591.5 kg, and the total weight of the plastic is 194.9 kg. This project involved 14 activities, with a total of more than 360 participants and 35 government units, enterprises, and organisations (Green River, n.d.)

4. Discussion and Conclusion

Green River's conservation stations operate with a combination of permanent staff and monthly volunteers. Recruiting high-quality management, fundraising, and project implementation talent is challenging in a low-cost operating model. However, Green River's nearly 30-year-old volunteer platform has created a situation where diverse resources complement each other: 'Some provide resources, some provide funding, and some provide technology or knowledge to work together to solve problems.' Much information shows that Yang Xin has won almost all the major environmental awards over the past 30 years and has had a decisive influence on the environmental movement in China. He has also 'used his network and adopted various strategies to initiate environmental campaigns' (Kahn et al., 2024, p. 7). "Green Rivers has used its charismatic founder and aligned itself with broader environmental values and messages in Chinese society to inspire broad and committed support for its goals" (Kahn et al., 2024, p. 5). "Despite regulatory and financial challenges, Green Rivers has been able to leverage its limited resources to significantly contribute to protecting the environment and rich biodiversity of the Yangtze River Basin" (Kahn et al., 2024, p. 2).

Green Rivers has built a sustainable ecological protection model in the Yangtze River Basin through cross-regional collaboration, systemic design methods, and ethical leadership. It has achieved remarkable results in plateau waste recycling, biodiversity monitoring, environmental education and public participation, providing innovative practices and important references for developing ENGOs in China and the ecological governance of the Yangtze River Basin.

The path of protecting the Green River fully reflects the unique geographical environment of the Qinghai-Tibet Plateau, as well as the innovative, sustainable and replicable nature of the conservation work carried out by scientists and local herders. This model provides a forward-looking management framework for ecological conservation in other areas of the Sanjiangyuan region and serves as an inclusive optimisation model by constructing a system that meets the basic needs of multiple species. This model can expand the scale of biodiversity resources and public welfare pools, promote broader social participation and commitment, and promote common development among all parties with a 'win-win-win' logic. The transparency of the method has led to open dialogue, a model of participatory governance that has become a successful case that can be replicated and promoted in ecological conservation. The collaborative cooperation model involving the government, NGOs, social enterprises, and the public has enhanced the efficiency and depth of ecological conservation and provided valuable experience for future ecological conservation practices in China and around the world.

One thing to note in terms of research transferability is that the Chinese government conducts a certain degree of regulation and review procedures for EGNOs' registration, approval of activities, fundraising, and international cooperation, which requires EGNOs to pay attention to changes in government policies to adjust their strategies and operational models to ensure compliance. This institutional context may limit the direct transferability of the research findings across different political and governance environments. The portability of future research also requires attention to local government policy orientations to clarify further the model's applicability in other countries or regions.

EXPLORING SYSTEMIC DESIGN FOR POST-DISASTER RECOVERY: A CASE STUDY IN TURKIYE.

Yagmur Gizem Avci*[a], Cigdem Kaya[a],

a Istanbul Technical University, Department of Industrial Design
*ciplaky@itu.edu.tr

ABSTRACT | The Systemic Design is an effective approach in complex social situations but has rarely been applied in post-disaster contexts. This study, conducted as part of an ongoing doctoral thesis in the Department of Industrial Design at Istanbul Technical University, aims to support the post-disaster recovery process by utilizing the Systemic Design approach in a region affected by the February 6, 2023 earthquakes in Türkiye. The research focuses on the local producers with traditional knowledge, who are key actors in the regional economy and cultural heritage. With this motivation, existing toolkits and studies in the Systemic Design field that can aid post-disaster context were examined and strategically framed to experience the approach in the region. Through the case, proposals and strategies for local producers were formulated based on data obtained from field research, observations, surveys, and interviews with local producers and all relevant stakeholders. Expert interviews and surveys will be conducted with designers, sociologists, and strategists using Delphi Method to understand the impact and contribution of the proposals and the Systemic Design approach. Throughout the study, it has been observed that the methods and tools from the Systemic Design literature have been valuable in analyzing the region's challenging conditions, making informed decisions, and managing complexity. The findings confirm that, as demonstrated in the literature for various social contexts, the Systemic Design approach is also a highly effective tool in post-disaster recovery. Sharing and highlighting the potential role of the approach in the post-disaster recovery process can serve as a starting point for practitioners conducting research in similar complex situations and indicate the different leadership alternatives of designers.

KEYWORDS | SYSTEMIC DESIGN, POST-DISASTER RECOVERY, DESIGN EXPERTISE, SOCIAL WELL-BEING, LOCAL PRODUCTION

1. Introduction

In recent years, the increase in global crises and the growing pressure on social systems have create interest in combining systems thinking and design practices to leverage their strengths. While systems thinking offers strong analytical capabilities, design brings action-oriented solutions (Buchanan, 2019). As the roles and responsibilities of designers evolve and the complexity of problems continues to increase, understanding and applying the principles, methods, and theories of the Systemic Design approach is becoming increasingly valuable in the field of design (Jones, 2014b; Peng et al., 2022). Systemic Design, an interdisciplinary field that combines systems thinking and human-centered design, offers a holistic approach to complex, multi-stakeholder situations. This approach has been applied in various contexts, such as industrial networks, transportation, medicine, and healthcare, integrating systemic approaches to enrich design methodologies and practices (Jones, 2014a). By utilizing Systemic Design principles such as idealization, appreciating complexity, purpose finding, boundary framing, requisite variety, feedback coordination, system ordering, generative emergence, continuous adaptation, and self-organizing, as outlined by Jones and Kijima (2018), Systemic Design aims to propose connected solutions that are sensitive to the dynamic nature of the systems they address. Despite its wide range of applications, there is a notable gap in the literature regarding the use of systemic design in post-disaster recovery and development processes. Previous research and Systemic Design applications have generally focused on public and social innovation, education, architecture, and healthcare. However, the potential of Systemic Design to contribute to disaster recovery, particularly in empowering communities in earthquake-affected areas, has not been sufficiently explored.

This study aims to explore how the Systemic Design approach can serve as an effective tool in the post-earthquake recovery process. Based on the Systemic Design framework provided by the Design Council (2021) and the practical tools presented in the Systemic Design Toolkit by Jones and Ael (2022), this study explores the problems, needs, and current conditions of local producers in the earthquake-affected region. By applying Systemic Design tools, the research aims to reach innovative and sustainable solutions that will facilitate recovery and enhance resilience in these communities and to experience the contributions that systemic design can offer.

2. Background and Motivation

The earthquakes that occurred in Türkiye on February 6, 2023, negatively affected the social and economic structure and had negative impact on local communities, relatively the livelihoods of local producers. The urgent need for sustainable development strategies after such disasters reveals the necessity of searching for guiding approaches. This study aims to examine and demonstrate how the Systemic Design approach can be applied in this context and how it can offer strategic solutions to the problems faced by local producers. Systemic Design is an approach that has the potential to provide integrated and sustainable solutions to complex and multidimensional problems. Although there are various studies in the literature on the use of Systemic Design in social issues, there is a limited number of studies on how this approach can be applied in post-disaster development processes. By focusing on local producers in earthquake-affected areas, it promotes a Systemic Design approach to develop strategic recommendations that not only support recovery and long-term resilience but also serve as a sample for similar post-disaster contexts.

The study, began with the aim of developing traditional knowledge in Hatay, a region rich in local, sustainable, and traditional products that were previously underrecognized and at risk of disappearing. Using a social innovation approach, specifically Ezio Manzini's SLOC (Small, Local, Open, Connected) model, the research focused on identifying unique regional products that needed promotion. System proposals were developed based on interviews with local producers and shared at scientific conferences to support their sustainability and visibility. However, with the earthquake of February 6, 2023, it has unfortunately become impossible or very difficult for local producers who survived the disaster to make their production to sustain their lives. In addition, the danger of the traditional knowledge of local producers disappearing has emerged as another important issue. According to the Presidency of Strategy and Budget of Türkiye (2023), the disaster threatens progress on Sustainable Development Goals (SDGs), including poverty reduction, food security, gender equality, education, and healthcare, highlighting the need for collaboration among public institutions, NGOs, universities, and the private sector to reduce its impact. As a result, the study placed greater importance on preserving traditional knowledge and aimed to better understand the challenges, disruptions, and needs of local producers in the post-disaster period.

In search of an alternative guiding approach, the literature was examined for methods, approaches, and strategies that facilitate inclusive, systematic, and rapid action on social issues. The findings indicate that the Systemic Design approach, which has been present in the literature since the 2010s and integrates systems thinking with design methods, was considered to play a significant role in post-earthquake recovery and sustainable development processes.

3. Systemic Design Approach

Systemic Design has emerged as an approach that encompasses economic, environmental, and social conditions, offering systemic and interconnected solutions to the complexity of the current situation (Battistoni et al., 2019). In the article "Design Research Methods for Systemic Design: Perspectives from Design Education and Practice," Jones, a pioneer researcher in the field, emphasizes that the integration of systemic approaches has become inevitable to enrich design methodologies and practices (2014a). According to Jones and Kijima (2018), Systemic Design creates an integrative interdisciplinary field by bringing technical knowledge, aesthetic skills, and creative practice to collective actions. In another article on the principles of Systemic Design, "Systemic Design Principles for Complex Social Systems," Jones (2014b) argues that Systemic Design combines systems thinking and methods with human-centered design to address complex, multi-stakeholder situations such as those found in industrial networks, transportation, medicine, and healthcare services. He suggests using a combination of known design capabilities such as idea development, designing, process management, research methods, and visualization to identify and restructure complex services and systems through a systems thinking approach. He states that Systemic Design is not a design discipline but an approach, and its ultimate goal as a strong design practice is to co-design better policies, programs, and service systems with the involved stakeholders. The Systemic Design approach integrates skills and domain knowledge at the levels of social organization and enables the identification of outputs such as new products or services that adapt to the ecosystem and the addressed situation. To achieve this, Jones (2014a) has defined principles for the Systemic Design approach, arguing that these principles provide guidelines and a foundation for practitioners to increase participation and develop better practices. These principles are defined as follows:

- Idealization
- Appreciating complexity
- Purpose finding
- Boundary framing
- Requisite variety
- Feedback coordination
- System ordering
- Generative emergence
- Continuous adaptation
- Self-organizing.

As a different framework, Ryan (2014) addresses Systemic Design through the following stages:

- Inquiring
- Framing
- Formulation
- Generating
- Facilitation
- Reflecting.

Ryan (2014) emphasizes that these approaches are useful tools to encourage participants when design projects involve stakeholders unfamiliar with the principles of systems thinking or design, and also important for the trial and sharing of best practices among Systemic Design practitioners. The Design Council (2021) defines a contemporary Systemic Design approach to bridge technological research, innovation goals, and social applications, creating a framework that raises awareness and enables designers from various disciplines to collaborate with other professionals and communities. The council defines the approach phases, as shown in Figure 1, based on their existing Double Diamond model, by acknowledging the complex nature of the challenges addressed and prioritizing both the planet and people. These phases are framed as Explore, Reframe, Create, and Catalyse. They emphasize that this approach considers not only the individual elements involved in a project but also how these elements are interconnected, how the system changes/can change over time, and how it relates to the broader environment.

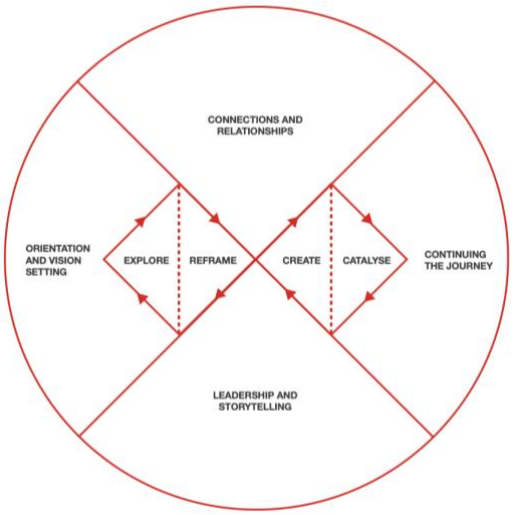

Figure 1. Systemic Design framework, Design Council (2021)

According to the council, researchers or practitioners who want to follow these phases should also adopt six fundamental principles. These principles are defined as being human and planet-focused, converging or diverging according to the current state of the process, testing and idea development, embracing inclusivity and diversity, establishing collaboration and creating connections, and being cyclical and regenerative.
In addition to the three different process approaches discussed above, Jones and Ael (2022) have created the "Systemic Design Toolkit" to guide designers and academics who want to apply the Systemic Design approach in understanding systemic problems and developing suggestions in their processes. This toolkit includes method templates for each phase under the main stages of Framing the System, Listening to the System, Understanding the System, Envisioning Desired Futures, Exploring the Possibility Space, Planning the Change Process, and Fostering the Transition, to be selected and used according to the situation.

3.1 Potential Contributions of the Systemic Design Approach

The increasing global crises and the growing pressure on social systems in recent years have rekindled interest in integrating systems thinking and design practices to build on the analytical strengths of systems thinking and the action-oriented strengths of design (Buchanan, 2019). Therefore, as the roles and responsibilities of designers change and the complexity of problems continues to increase, understanding and applying the principles, methods, and theory of Systemic Design is becoming increasingly valuable in design (Jones, 2014b; Peng et al., 2022). According to Ryan (2014), the Systemic Design approach allows for evaluating situations from multiple perspectives, collaborating with stakeholders to understand and shape the context, and developing deep empathy with them. Systemic Design helps groups quickly translate new insights into actions, provide alternatives to existing paradigms, and organize solutions to improve complex situations. Bijl-Brouwer and Malcolm (2020), who researched to understand how expert practitioners carry out Systemic Design studies in the context of public and social innovation, emphasize that designers have a rich set of methods and tools they can utilize, such as qualitative design research methods, collaborative and participatory design methods, and scenario creation. They highlight that designers can contribute to system change by framing problems to develop a systemic perspective, iteratively co-developing problems and solutions to address complexity, and shifting from individual user needs to a human-centered approach that explores relationships and designs new interventions (Bijl-Brouwer and Malcolm, 2020). This approach helps to manage resources, improve production processes through continuous transformation, and foster new relationships among individuals, leading to overall well-being (Bistagnino, 2011). Today's societal challenges require holistic approaches that can interpret and deliver innovative and sustainable solutions. Approaches like Systemic Design provide specialized tools to design new relationships among the units of a system, uncover their hidden relationships and potentials, and facilitate proactive collaboration among actors (Battistoni et al., 2019). Therefore, the Systemic Design approach requires the continuous and mutual learning process of all involved actors and a constant need for education through learning communities involving academics or practitioners from various disciplines (Bijl-Brouwer and Malcolm, 2020). In addition to these findings, a review of the Systemic Design literature shows that, while it has been applied in various fields like education, architecture, and health, its use in post-disaster recovery remains limited. The literature clearly demonstrates that Systemic Design, with its ability to foster innovation, adaptability, and collaboration, can be a powerful tool for addressing such complex social situations.

4. Experiencing The Approach as a Tool in The Post-Disaster Process

This research adopts the Design Council's Systemic Design Framework as its primary approach, based on various Systemic Design processes and approaches discussed in the literature. For the key stages defined by the council, appropriate methods from Jones and Ael's toolkit were selected to guide the necessary sub-activities.

In the explore phase, it is aimed to analyze the current situation or circumstances in line with the methods selected from the Systemic Design Toolkit. Based on interviews with 56 producers in Hatay, field research, and desktop research using Systemic Design methods; it has been seen that the need in the region is not only the difficulties experienced in the production phase (raw material supply, production area, or equipment supply, etc.) but also the uncertainty about which products should be produced, difficulties in finding sales channels and selling products, need for analyzing the market/customer needs or the reasons to not buying products from the region, lack of a sustainable and standardized operation and lack of a sustainable revenue model have emerged as major problems. In this context, from a designer's perspective, the most important need has been identified as understanding consumer preferences that enable sales. To address this, consumer preferences were researched and integrated into the system, based on a survey conducted with 301 participants across 11 countries.

The main purpose of the Reframe and Create stage is to create many different actions and ideas that will move the system towards a larger goal, by reframing the problem and getting rid of our current way of thinking, in the light of the data and observations obtained in the first stage (Design Council, 2021). So, according to identified problems, situations, and requirements, in the Reframe and Create phase the following details emerged and were framed as important findings for local producers who continue to produce and sell in the region:

- Need for creating the value proposition in the clearest way possible under current conditions.
- Need for a realistic, comprehensive, and detailed time plan and business model.
- Need for considering the possible risks that may arise specific to the project, taking precautions from the beginning of the process, and creating an alternative plan.
- Need for correct planning of sponsors/capital/financial resources and integration into the process at the right stage.
- Need for analyzing the end users' needs and feeding into the process continuously.
- Demonstrating to people outside the region that the rate of purchasing products from the region is quite low, and therefore the need for development and recovery in the region continues.
- Prioritizing online platforms to reach the consumer group to increase sales potential.
- The promotion of region-specific products on these platforms should be presented comprehensively, including the contents of the products, all their features, and production conditions.
- Clean content, health, hygiene, and safety criteria must be met in the products to be produced, and these criteria must be documented by the relevant institutions and displayed transparently (especially for food products, proving the use of raw

materials that are not affected by asbestos)
- Providing the entire product purchasing experience through an online platform where it will be safe will increase recognition and the possibility of selling products for manufacturers in the short term, and will provide easy access to products for consumers.

It is seen that the details are important issues and producers should consider them and continue their production, if production is made in this direction, the development processes will accelerate and be sustainable. The main aim of the Catalyse phase is to accelerate change by showing what a new vision looks and feels like and to reflect and share knowledge with the wider system (Design Council, 2021). So, sharing the findings with the producers and relevant actors in the region and ensuring that the producers produce in line with these recommendations will be a trigger for change. In line with this purpose, all findings and suggestions for change have been shared with such as local municipalities, cooperatives, non-governmental organizations, and potential consumers that the researchers can reach, and most importantly with the producers interviewed during the Explore phase, and will continue to be shared to increase the impact.

5. Discussion And Conclusion

This study aimed to explore the potential of the Systemic Design approach in understanding the needs and challenges of local producers in earthquake-affected regions and developing strategic solutions. It also tried to highlight a gap in the literature, as this approach has not been widely applied to post-disaster recovery. Systemic Design offers a novel and holistic methodology for addressing these complex challenges. In such a difficult post-disaster context with multiple sub-problems, its structured framework and methodological tools have played a crucial role in guiding and sustaining the process. Applying the Systemic Design approach in the context of the disaster-affected regions offered and can offers for similar context several potential contributions:

- Systemic Design approach allows for a holistic problem framing, comprehensive understanding of the interconnected issues for the focused area, enabling the development of more effective and sustainable solutions.
- The emphasis on understanding the needs and experiences of the people (local producers in this case) ensures that the proposed solutions are not only effective but also help to aligned with the community's values and aspirations. It can be said that it brings empathy and human-centered solutions to the complex process.
- Systemic Design promotes the exploration of innovative practices that can enhance the resilience of local production systems, contributing to economic recovery and long-term sustainability in this case. Based on this, it can be said that it can offer innovative solutions in similar situations.
- It improves the capacity to better respond to future challenges by developing strategic recommendations based on Systemic Design principles, increasing overall resilience so that the approach actually creates a foundation for similar situations in the future.
- For the realization of proposals in the future, by involving different stakeholders, including local producers, community leaders, consumers and governmental actors, can encourage collaboration and ensure that different perspectives are taken into account in the development process.

In conclusion, the findings of this research demonstrate the potential of Systemic Design to contribute to the recovery and long-term resilience of earthquake-affected communities. Moreover, this approach can serve as a sample case for addressing similar challenges in other regions impacted by natural disasters, conflict, or other crises, supporting the dissemination of knowledge and best practices. The effectiveness of applying the Systemic Design approach in this context will first be evaluated through expert feedback. Based on these insights, future research should further explore its use in diverse settings. This study contributes to the Systemic Design literature by demonstrating its application in post-disaster recovery, a context that remains underexplored. The structured yet adaptable nature of the approach proved effective in managing complexity and uncertainty. Using Systemic Design in future research on similar social issues can support the development of context-specific solutions and foster knowledge-sharing, helping to advance the field and address complex social problems effectively.

FOSTERING A DESIGN-DRIVEN MANAGEMENT CULTURE: INTANGIBLE INDUSTRIAL HERITAGE AS A DRIVER FOR AN ETHICAL BUSINESS LANDSCAPE

Alberto Bassi, Giulia Ciliberto, Maria Cristina Addis, Jacopo William De Denaro, Marco Scotti (Università Iuav di Venezia)

ABSTRACT | This paper presents the outcomes of an interdisciplinary collaboration aimed at formalizing a design-based framework for mapping the Italian North-Eastern entrepreneurial ecosystem, starting from the intangible body of knowledge expressed by local companies in their interactions with design culture. In particular, our contribution focuses on the ethical role that a design-driven management culture can play in establishing a smart, fair and sustainable economic growth, able to face the challenges represented by globalisation, social polarisation, climate warming, and increasingly critical and uncertain geopolitical scenarios.

While it is becoming increasingly clear that expanding knowledge management is crucial to enable a critical evaluation of companies' organisational base, our framework interprets design as a major carrier of encoded knowledge, in order to unveil an underlying intangible industrial heritage able to activate virtuous interactions. Aim of the proposed framework is to synthesize and systematize an exchange of knowledge oriented not to consumption for its own sake, but capable of addressing all phases of products' and services' life cycle management (idea, project, production, distribution, usage, disposal). Such a perspective appears particularly significant at the time when the whole system of Made in Italy needs to reinvent itself relocating beyond financial capitalism, bringing into play the relevance of intangible assets and capabilities in enhancing companies' economic and cultural value.

Supported by field surveying activities such as interviews and workshops, our investigation has led to compiling a glossary of design-based indicators, which serves as a foundation for measuring intangible industrial heritage within local corporate entities through both qualitative and quantitative methods. By quantifying the presence of design in relation to a company's intangible industrial heritage, our framework outlines an interpretive paradigm that stands as an alternative toward those of traditional financial accounting and reporting, offering a more holistic perspective on corporate value.

Collected data and information will converge into a digital platform functioning as a collaborative ecosystem, in order to enhance the accessibility of intangible industrial heritage, reflecting its evolving and dynamic nature, as well as its connections with design practices. Leveraging the principles of service design, we aim to foster a multi-layered narrative about intangible industrial heritage within the Italian North-Eastern entrepreneurial ecosystem, strengthening the relationships between economy, culture, and society, thereby contributing to a more ethical business landscape.
This research has been developed in the framework of iNEST – Interconnected North-East Innovation Ecosystem – project. iNEST is a network of Universities, Public Research Institutions, Territorial Institutions and Companies active in technology specialization areas which are coherent with territorial industrial & research missions, and promote and strengthen cooperation among Research, Economic players and Institutions. Main objectives of iNEST are to facilitate technology transfer and digital transformation of companies and related processes, taking care of economic and environmental sustainability and of social impacts. iNEST is founded by the European Union – NextGeneration.eu.

KEYWORDS | DESIGN CULTURE, ENTREPRENEURIAL ECOSYSTEMS, INTANGIBLE ASSETS, DESIGN-DRIVEN MANAGEMENT CULTURE, SUSTAINABLE GROWTH

1. Introduction

The project for which we present these preliminary results aims to reinvigorate research and experimentation toward new business models driven by emergent value systems – values that have taken firm root in collective consciousness and sensitivity – yet for which innovative offerings of material and immaterial products, systems, and services remain largely absent.
Sustainability serves as a paradigmatic example in this context. Although the concept is widely invoked and appears in numerous advertising and communicative slogans, a closer look at the Italian landscape – and particularly at the entrepreneurial fabric of the North-East, the focus of our research project – reveals that few companies and designers adequately explain how they are operationalizing a holistic, integrated system and process that must be reorganized in line with this new value horizon (Bassi 2017).
In general, it is challenging to discuss sustainability – and corporate ethics more broadly – without at least partially questioning, from a reformist perspective, the very foundations of capitalism and the market driven by the intensive and seemingly infinite consumption of goods, natural resources, and human beings.
A question that had long remained unresolved in these difficult years has resurfaced with renewed intensity: do we resume from where we left off (recognizing that the recurring and perpetual crises of this millennium are the “natural” consequence of the current system), or do we embark on a new path grounded in sustainability and a renewed commitment to human, social, and environmental care, along with corporate and design social responsibility?
Our project embraces the latter option through a research and dissemination approach aimed at identifying and mapping those enterprises capable not only of mediating between individual and collective interests, private profit and the common good, economy and culture, but also of integrating these dimensions synergistically – thereby enriching the local knowledge capital with strategies and virtuous practices that have yet to be captured by existing systems for measuring corporate intangible assets.
In this framework, design assumes a central and cross-cutting role relative to other

intangible corporate values (Bulegato & Dalla Mura 2014, Ramírez Martín & Portela Filgueiras 2022). Whereas a company's ethical stance is demonstrated by its responses to shifting national and international scenarios and contemporary challenges (ranging from globalization and the ongoing financial market crisis, to climate change, political uncertainty, and humanitarian crises exacerbated by conflicts increasingly near our territory and linked to Italy – as well as the economic and socio-cultural disruptions introduced by digital media, unemployment, and the precariousness of human resources), design is tasked with diagnosing the existing complexity and conceiving solutions that facilitate connection and mediation among all the stakeholders and interests involved.
Building on an examination of the interrelations between design and entrepreneurship, we intend to investigate the presence and impact of corporate intangible values – including, and especially, those excluded from WIPO (World Intellectual Property Organization) lists or assessed solely on the basis of a company's economic success – without accounting for the social and cultural functions performed by the related assets (such as research & development, communication, organizational structure, and relationships) within the myriad communities an enterprise engages, from suppliers to distributors, employees to consumers, and from local territories to global arenas.

2. Beyond the Concept of Capital: On Intangible Industrial Heritage

This research aims to formalise a design-based framework for mapping territorial entrepreneurial ecosystems starting from the intangible body of knowledge expressed by local companies in their interactions with design culture. The final objective of the project is to collect, disseminate and foster the reuse of knowledge, capabilities and good practices which are still largely unstudied and often unperceived.
Focusing on design and its connections with other crucial intangible assets (Bassi & Bulegato 2018, Bassi, Bonini Lessing & Bulegato 2018, Corà, Fazio & Collura, 2023), our study addresses the grey zone in-between industrial heritage and intangible capital, that is, between the study of our industrial past and the recognition of its contemporary forms (Volpe, 2018), as well as between theoretical studies and business strategies, between economy and culture, between politics and aesthetics (Bassi, Pantano, & Ranzo, 2023).
On the one hand, the recognition of industrial heritage has typically been focused on its more material sides such as products, machines, buildings, landscapes, and artefacts (Lores, 2008, Rojas Sola, 2022), while in contrast very little attention has been paid to knowledge, memories and identities that they embody and express. On the other hand, studies (mostly in the area of economics and marketing) on intangible capital tend to focus on values from which the company derives a direct economic benefit (Seyr & Hoffer, 2021, Calzada-Prado, 2022, Beliaeva, Bounfour & Nonnis, 2023), while design cultures and practices are rarely studied as such and in their broader connections with society and culture.
In fact, to date the most significant advances in the study of corporate intangible assets have been achieved within the economic and financial domains, where they define what is known as corporate intangible capital. Corporate intangible capital comprises the set of non-material resources that determine a company's value (Haskel & Westlake, 2018). It is not a fixed or static parameter, but rather depends on a wide range of factors characterizing individual production systems.
As specified by the International Financial Reporting Standards (2024), the main indicators of corporate intangible capital are:

- Relationships
- Proprietary technologies
- Industrial and intellectual property
- Codified knowledge
- Industrial and corporate trade secrets
- Rights
- Organizational architecture

According to the annual report of the Brand Finance Global Intangible Finance Tracker (GIFT), in 2023 the global corporate intangible value increased by 8%. The economies with the highest intensity of intangible assets are the United States, Ireland, Denmark, the United Kingdom, and France. The industrial sectors with the highest degree of intangible value include:

- ICT
- Banks and financial institutions
- The mining and automotive industries
- The pharmaceutical industry

While intangible assets have an increasingly significant impact on global financial markets, this trend appears to affect Italy and its manufacturing industry only marginally. In our view, this gap reveals that the national entrepreneurial fabric – and particularly that of the North-East (Roverato, 1996, Brunetti, 2015) – embodies intangible assets that escape the measurement systems developed within the economic and financial sectors. In other words, the local entrepreneurial culture expresses an added value that is difficult to fully capture using the current conception of intangible capital.
Indeed, our framework accounts for seemingly marginal and unsystematic aspects that are, in reality, crucial and determinant for a company's identity and success, such as:

- Design and project culture
- Visual identity, advertising, and communication
- Relationships with the territory and the community
- The density of the industrial ecosystems in which the company operates
- Membership in industrial districts
- The presence of, or initiatives related to, archives, museums, libraries, institutions, foundations, as well as exhibit and visual design practices

For this reason, it is necessary to move beyond the concept of intangible capital in favor of that of heritage (UNESCO, 2003). Corporate intangible heritage consists of valorizing the cultural potential of a company's intangible assets. An asset with cultural potential is one in which the "value for the company" (in terms of competitiveness, responsiveness to market and socio-cultural contexts, reputation, visibility, prestige, and sustainability) is inseparable from the value that the asset holds for the industrial ecosystem, various stakeholder clusters, the local community, the well-being of individuals and communities, the identity and memory of the territory, environmental impact, the history of material culture.
In fact, investments in design often include expenditures targeted to knowledge management (Norman, 2023), taking forms such as education and training, product research and development, communication and brand identity, quality of working and production spaces, provision of cultural activities and facilities (Cross, 2007). These kinds of assets and capabilities, which are increasingly shaping the distribution of income in global value chains, are crucial to develop a resilient and sustainable management

culture; however, they are generally difficult to measure and assess, involving a variety of features that are not recognizable in merely quantitative terms.
A greater understanding and awareness of the value and potential of design and project cultures – and of the other intangible assets we have identified, we contend – can provide companies with the opportunity to steer their economic actions also on ethical grounds. This entails finding solutions to contemporary challenges that most effectively connect and mediate between individual interests and the common good, thereby triggering virtuous cycles between a company's market value and the social and cultural value it creates for communities, for the territory, and for the history of material culture.
Given these premises, our research is geared toward identifying strategic design-based modes of business-making in the target area, through a cross-sectoral approach intercepting different fields, from design theory and history to territorial studies, economics, semiotics, and cultural heritage.
Our approach delves into the study of traditional intangible assets while introducing new ones, with the aim of appreciating and measuring their cultural and economic potential, deepening our understanding of those that are less studied or recognized, and disseminating knowledge, tools, and best practices for ethical leadership.

3. Mapping intangible industrial heritage

In order to map industrial intangible heritage in the North-East area, the research team carried out a range of activities accordingly to some closely related macro-areas:

- reconstruction of a critical debate starting from a multidisciplinary context;
- definition of a network of partners, companies, and scientific advisors;
-
- desk and field research activities aimed at improving the methodology for mapping the corporate intangible heritage expressed by the companies which operate in the North-East region;
- development of digital tools for mapping corporate intangible heritage and for making it accessible to stakeholders and the broad public;
- dissemination activities of the research results.

In order to define and quantify intangible assets, we adopted a multidisciplinary approach that enabled the development of a methodology based on ongoing debates within various disciplines. Reference bibliographies were created, with a focus on the history and criticism of design, which is part of the broader transformation that has been underway for decades in the humanities and social sciences.
Concomitantly, thanks to the mediation of the Iuav Foundation, we established an initial pilot group of companies to test the indicators for quantifying the intangible assets of a business: Arper (furniture), Lanificio Bottoli (textile), Campagnolo CMP (Tech Wear), Magis (furniture, lumen), Riso Melotti (food).
In light of studies on intangible capital, intangible industrial heritage, and the history and criticism of design, we developed a provisional list of assets to be measured (Figure 1):

- Design
- Research & Development
- Identity and Communication
- Cultural Heritage
- Territorial context
- Work organization

- Company spaces
- Welfare
- Relationships
- Education

The measurement tested during the first research phase proved to be extensive and horizontal, causing dispersion and, in some cases, ambiguous, irrelevant, or overly simplified data. Furthermore, the concept of industrial intangible heritage turned out to be unclear for some of the interviewees. From this preliminary data processing come the corrective actions described in the following paragraphs.

3.1. Enhancement of the indicators system aimed at quantifying the company's intangible assets

To address the issues mentioned in the previous paragraph, the following modifications were made:

1.4 Hierarchy of indicators, with a focus on design and project culture:

- Design
- Research & Development, Identity and Communication, Cultural Heritage
- Territorial context, Work organization, Company spaces, Welfare, Relationships, Education.

2.4 Introduction of meta-indicators to measure the impact of the asset on the company in more detail:

- Degree of presence of the asset (Table 1)
- Role played by the asset within the company (Table 2)
- Degree of connection of each asset with all others (Table 3)
- Degree of awareness of the company regarding the asset (Table 4)

Design is the most relevant asset, defining the intellectual and cultural infrastructures underlying the processes of conception, creation and iteration of new products or services. The assets *Research & Development, Identity and Communication, Cultural Heritage* are the most related to design. The *Research & Development* asset consists of the total value of knowledge, skills and experience that can give a company a competitive advantage. The asset *Identity and Communication* expresses the brand identity through different communication channels, according to a strategy consistent with the corporate philosophy. The asset *Cultural Heritage* encompasses the set of institutions, offices, initiatives and projects dedicated to the enhancement of the cultural heritage expressed by the company and/or the reference territory and community.

Figure 1. Representation of the proposed design-based framework

The assets at the third level define the domains that could mainly benefit from design-driven strategies aimed at implementing the ethical management approach. *Territorial context* comprises the set of environmental resources capable of providing goods or services that are crucial to sustaining a company's past, present or future prosperity and resilience. *Work organization* covers the working practices of managers, employees and co-workers within individual departments and divisions, recruitment and personnel management policies and work-life balance measures. *Company spaces* defines the design of work and production spaces and other areas reserved for employees in terms of healthiness, comfort, accessibility, aesthetics, sustainability. *Welfare* focuses on the conditions that determine the quality of employees' work, taking into account their specific needs, constraints, backgrounds, behaviours and desires. *Relationships* includes the set of relational structures that the company establishes towards its network of primary and secondary stakeholders, and the impact of these relationships on production. *Education* includes all training measures and programmes for employees, directly related to the tasks and work activities of the concerned human resources or relating to transversal skills (such as second or third language or updates on safety, legality or sustainability).

Table 1. Meta-indicator 1: presence of the asset

Value	Label	Description
0	absence	The asset is not present
2	implicit presence	The company expresses the asset but in an implicit form; activities or tasks such as design, communication, human resources management are carried out transversally by other departments or directly by the CEO.
4	explicit presence - collaborations on projects	The activities or tasks envisaged by the asset are carried out sporadically through collaborative projects with third parties such as cultural institutions, universities and research bodies, NGOs and the third sector, other companies
6	explicit presence - external collaborators	The activities or tasks covered by the asset are carried out by ad hoc personnel but external to the company, who acquire the service from third parties.
8	explicit presence - internalised	The company has a department or office dedicated to the asset.

Table 2. Meta-indicator 2: role of the asset

Value	Label	Description
0	capability	The company has a department and/or space and/or office and/or human resources dedicated to the asset, but this capital is not converted into specific activities or actions.
4	tool - brand identity	The asset has an active function in the construction of the company's image to the outside world and of the company brand.
6	tool - production and marketing	The asset has an active function in optimising the company's performance in the market.
8	tool - integrated functions	Consistency between the two main functions of external communication tool and internal design and innovation tool

Table 3. Meta-indicator 3: connections between assets[1]

Value	Connected asset(s)
n x 8	Design
n x 4	Research & Development, Identity & Communication, Cultural Heritage
n x 2	Territorial context, Work organization, Company work spaces, Welfare, Relationships, Education

[1] The *n* value n is determined by the sum of the value assigned to the presence of the asset and the value assigned to its role.

Table 4. Meta-indicator 4: awareness of the company

Value	Label	Description
0	absence	The company does not assign particular value to the asset
2	passive isolated awareness	Awareness expressed by one or more managers/departments, who recognise its potential but do not translate it into concrete actions to enhance, promote and implement the asset.
4	passive widespread awareness	Awareness integrated with the corporate vision and mission.
6	active sporadic awareness	Awareness expressed by one or more managers / departments that lead to actions to valorise, promote and implement the asset.
8	active widespread awareness	Awareness integrated to the company's strategies and economic action

3.2. Redesign of the interview format

Corrective actions also included a redesign of interview format. In order to build a trust-based relationship with the interviewee and facilitate the acquisition of relevant but implicit information, we designed a conceptual map representing the assets and a set of cards dedicated to each asset.
To begin the interview, the research team presents the map to the interviewee and asks them to choose the indicator they most identify with, while also showing them the corresponding card. As to avoid dispersing the interviewee's attention and to obtain more accurate data, we also created a semi-structured questionnaire that follows the hierarchy of the assets presented above.
We tested the new interview format on companies in the first pilot group, in order to gather the missing data and complete the partial ones. Although the new method proved effective, we encountered additional challenges:

- Lack of transparency regarding the objectives of the questionnaire
- Excessive amount of information requested
- Lack of immediacy in the content of the questions

The most motivated companies were involved in further exchanges via email and video-conference during October and November 2024, with the aim of increasing the knowledge of the company's intangible assets and assessing the effectiveness of the interview.

The main outcomes of these exchanges were:

- Refinement of the definition of intangible business assets, with a more precise distinction between intangible capital and intangible heritage;
- Expansion of the state of the art to include studies on both tangible and intangible industrial heritage;
- Simplification of the structure, content, and language of the questionnaire.

In line with the results of the testing actions, we integrated the map/cards system with the semi-structured questionnaire (mixed approach).

The most effective solution proved to be the mixed approach; exposure to the map and cards stimulates the acquisition of particularly relevant information for the company, allowing for the establishment of a trust-based rapport with the interviewee and facilitating the explicit expression of implicit knowledge and skills, which the company is often not fully aware of. The questionnaire, restructured in terms of transparency, simplicity, and focus on design and project cultures, helps optimize the acquisition of relevant information and the accuracy of the value assigned to each asset.

3.3. Creation of a second pilot group of companies on which testing the improved mapping methodology

In parallel with the development of the methodology for measuring intangible capital, we optimized the criteria for selecting the case studies:

- Thematic balance, aimed at ensuring representation of the main industrial sectors covered by the local manufacturing industry;
- Focus on company museums.

In light of the new criteria, we established a second pilot group of companies: Battistella Spa (furniture), De Longhi (food machineries), Formest (metal carpentry), Luxardo (food), Manifattura Valcismon (Tech Wear), Salco (packaging), Selle Royal (cycling).

Interviews with the second pilot group have been scheduled by January 2025 and will be completed by March 15, 2025.
The research team is planning a roundtable with all the companies involved in the project in order to share the research findings and collect feedback and suggestions. The event will take place no later than April 15, 2025.

3.4 Development of digital working tools to support the team in the mapping of intangible assets

The development of digital tools focuses on creating a comprehensive system-conscious approach that supports the research team in mapping intangible assets. These tools need to reflect the complex nature of company systems and their various actors, including employees, stakeholders, and the broader community.
The key features of these digital tools encompass data collection mechanisms that capture both quantitative and qualitative aspects of intangible assets, alongside analysis frameworks that consider the interconnected nature of primary indicators such as Design, Identity and Communication, Research & Development, and Cultural Heritage, as well as secondary indicators. The tools include sophisticated visualization capabilities that represent the relationships between different company actors and intangible assets, while offering seamless integration capabilities with existing company systems and databases. Furthermore, collaborative features enable multiple team members to work simultaneously on data collection and analysis.
These tools are designed to support a holistic view of the enterprise, encouraging system-conscious awareness of company complexity, recognition of relationships between different intangible assets, and understanding of how various actors interact within the company ecosystem.

3.5 Interactive questionnaire design and development

The interactive questionnaire represents a crucial component in data collection, designed to overcome the challenges identified during initial research phases. Based on feedback from companies, the questionnaire needs to balance comprehensive data collection with user-friendly implementation. The design incorporates adaptive questioning paths based on company size and sector, while integrating both structured and semi-structured interview elements to support spontaneous dialogue about intangible heritage.
The questionnaire system features a simplified interface to address complexity concerns raised by companies, complemented by built-in guidance and explanatory materials. From a technical perspective, it includes real-time data validation and verification, comprehensive progress tracking, and save functionality. The system supports multi-user access for different company stakeholders, provides automated preliminary analysis of responses, and seamlessly integrates with the main platform database.

3.6 Platform design and development

The platform development focuses on creating two distinct but interconnected areas: a public space for general mapping and a personal area for detailed company analysis. The public area provides surface-level mapping of participating companies in North-Eastern Italy, educational content about intangible heritage research, interactive visualization of regional business ecosystems, case studies, success stories, and detailed information about the research methodology and objectives.
The personal area offers detailed company-specific intangible asset visualization, continuous data collection tools and interfaces, custom reporting and analysis functions, collaborative spaces for internal company stakeholders, and tools for tracking changes in intangible assets over time.
The platform's design principles emphasize promoting cooperative competition ("coopetition") rather than pure competition, while supporting system-conscious and system-shifting objectives. It integrates all identified company actors including employees, management, stakeholders, and community members, with an emphasis on holistic business views beyond financial metrics and tools for measuring and promoting virtuous entrepreneurial practices.

3.7 Dissemination activities

First research findings have been disseminated by participation to national and international design conferences and articles on scientific international design and cultural heritage journals.

4. Conclusions

In order to stimulate virtuous entrepreneurship, we must first be capable of mapping and implementing the virtuous management practices already in place within the territory. In this regard, despite the growing need and demand for design – that is, a method of planning and action aimed at identifying solutions to novel problems and at examining and diagnosing existing conditions in their complexity and in relation to people, markets, society, and culture – design and project cultures are never systematically studied as such, either in isolation or in their broader connections with social and geopolitical transformations.
This observation served as the starting point for our work, the primary outcome of which is the development of an interactive platform for the dissemination of intangible heritage, aimed at stimulating an entrepreneurial ethic guided by design culture. The design of this platform adopts a “system conscious” approach: through a user-centered perspective, our method

conceives the enterprise as a complex organism – composed of clients, employees, management, suppliers, investors, local communities, and regulators – thereby helping it to comprehend its systemic dimension through the indicators of intangible heritage. This approach enables us to enhance the interconnections among the various actors and to underscore how every business decision reverberates throughout the entire ecosystem.
Moreover, the platform functions as a tool for "system shifting", stimulating entrepreneurial behaviors that focus on cultivating intangible heritage and are guided by design culture, thereby shifting the corporate perspective from mere profit towards a holistic vision grounded in intangible assets. This paradigm shift is fundamental to constructing a more sustainable and responsible form of entrepreneurship, one that is capable of generating not only economic value but also social and cultural benefits.

About the Authors:

Alberto Bassi (Università Iuav di Venezia, full professor) deals with design history and criticism and is full professor at Iuav University of Venice and Dean's Delegate for Communication. He coordinates the Master in Product, Visual and Interior Design. He collaborates with magazines – such as "Casabella", "Abitare" and "Auto & Design" – and newspapers. He wrote numerous books, including: *La luce italiana, Design anonimo in Italia. Oggetti comuni e progetto incognito*; *Food design in Italia. Il progetto del prodotto alimentare*, awarded with Compasso d'Oro ADI; *Design contemporaneo. Istruzioni per l'uso*. He is Chairman of the Scientific Committee of the national technology cluster MinIt-Made in Italy and founder of the Veneto Regional Innovative Network Face-Design. He coordinates the presence of the Iuav design area within the iNEST – Interconnected Northeast Innovation Ecosystem.

Giulia Ciliberto (Iuav University of Venice, researcher) has taught at Academy of Fine Arts of Verona and Ca' Foscari School for

International Education. She is author of books, essays and articles on the topic of visual design and its role in education, innovation, and territorial enhancement. She worked as a visual designer for researches projects held by Iuav and Ca' Foscari Universities of Venice, University of Padua, Italian Mathematical Union, Italian Association of Design Historians, Italian Society of Urban Planners, Institute of Network Cultures (Amsterdam), and Societat Catalana d'Història de la Ciència i de la Tècnica (Barcelona).

Maria Cristina Addis (Iuav University of Venice, post-doctoral fellow) is a member of the interdisciplinary team involved in the iNEST (Interconnected Northeast Innovation Ecosystem) project and lecturer of Semiotics & Visual Theory at Iuav University of Venice, Department of Design Cultures. PhD in Semiotics. She is author of books, essays and articles on the topic of semiotics and aesthetics. Her main research interests are design, visual and living arts, and public spaces. The methodology to analyse such objects interweave the semiotic approach with studies of aesthetics and critical philosophy.

Jacopo William de Denaro (Iuav University of Venice, research fellow) specializes in digital interaction and visual communication design. Born in Trieste in 1997, he studied at Polytechnic University of Milan, earning degrees in Communication Design and Digital and Interaction Design. He also completed a double degree program with Tongji University in Shanghai, focusing on Interaction Design. Since 2017, Jacopo has worked as a freelancer for clients including Gallerie d'Italia and Bakken&Baeck. In 2023, he co-founded InTra, an association applying design methodologies to rural and neighborhood regeneration, collaborating with institutions like the Polytechnic University of Milan and ICEI.

Marco Scotti (Iuav University of Venice, post-doctoral fellow) has been a Research Fellow and Post-graduate researcher at CSAC, University of Parma. ice. PhD in History of Art. He currently teaches History of Design at Università Iuav di Venezia. His research has recently focused on the figure of Ettore Sottsass, on interweaving of art, architecture and design culture, on specific aspects connected to exhibitions and archives in avant-garde artistic practices in the second half of the twentieth century and on design archives. He worked as a curator for several institutions, galleries, prizes and events, as well as several independent projects, and he is part of the editorial staff for the on-line journals “Venezia Arti” and “Ricerche di S/Confine”.

Fostering Ethical Design Entrepreneurs in China: The Implications of the Design Leadership Competency Model

Xuan Gao*[a], Yekta Bakırlıoğlu[a],

a Lancaster Institute for the Contemporary Arts (LICA), Lancaster University
* Corresponding author: x.gao16@lancaster.ac.uk

ABSTRACT | As the design field evolves, design leadership is increasingly recognised as pivotal in guiding organisations toward innovation. High-profile companies led by designers in their founding teams, illustrate the growing impact of design leadership on business success. In China, design entrepreneurs are playing an increasingly critical role in driving industries forward. With rising societal expectations such as sustainability, inclusivity, and social responsibility, there is an increasing need to understand the competencies required for effective design leadership—particularly regarding the ethical aspects. Although many studies highlight the importance of ethics for designers and entrepreneurs, the ethical aspects of design leadership have received limited attention, let alone how it can be fostered in design education.

This paper introduces a design leadership competency model, developed with a particular focus on China, and presents its implications for ethical leadership. The model was developed with a qualitative methodology using a triangulation of three data sources: analysis of 50 job descriptions for senior design-related roles to identify required competencies; a review of 12 case studies from grey literature focused on design entrepreneurs; and semi-structured interviews with 26 design leaders who have transitioned into leadership roles. The resultant model consists of 16 core design leadership competencies such as creative problem-solving, design communication, and design sensitivity. The model was then validated through 14 interviews with educators, students and alumni in design management, as part of a case study of Shandong University of Art & Design, to assess the model's relevance and completeness. In addition to getting feedback on the model, participants were specifically asked about the ethical competencies within both design education and design entrepreneurship contexts. This

inquiry explored the link between ethical aspects and competencies in design-driven entrepreneurship as perceived by design management experts and students in China and their implications for Chinese design education, which plays a crucial role in shaping future leaders. While the study specifically focused on design management in China, the findings provide actionable insights for design education in different contexts, ensuring that future design leaders are equipped to address both creative and ethical challenges in their leadership roles.

KEYWORDS | Design Leadership, Ethical Leadership, Design Education, Design Entrepreneur, Design Management, China

1. Introduction

With the growing recognition of design as a critical factor in driving innovation and business success (Budd, 2016; Gloppen, 2009), real-world examples such as Pinterest and Airbnb illustrate the tangible impact of design leadership. Such companies extend the influence of design to the executive level, stimulating creativity and innovation (Gemser et al., 2023; Hsieh et al., 2021), and can contribute to business success (Eikhaug, 2019). In many successful companies, leaders with a design education background or those who began their careers as designers drive significant value. There is also an increase in design entrepreneurs in China, with many design-led businesses emerging (Huang, 2022; Tong, 2023; You, 2023). In parallel, societal challenges, such as environmental sustainability (Liu, 2023; Xi, 2019), rural revitalisation and inclusivity (Liu and Li, 2023), are increasingly targeted via various policies in China, influencing business strategies and design practices. However, research on design leadership and its impact on societal challenges remains limited. Specifically, it becomes important to understand the competencies of design leaders that embody and facilitate ethical design and business practices capably addressing these societal challenges.

This paper introduces the ethical dimensions embedded in a design leadership model developed through document analysis and interviews with design leaders and validated through semi-structured interviews with academic staff, students, and alumni of Design Management programmes at Shandong University of Art and Design. The study sheds light onto the design leadership competencies that foster ethical design practices, as well as their shortcomings in capably addressing the societal challenges of our time.

2. Ethical Leadership in Design

Design is inherently tied to social responsibility because designers create products and services that shape people's lives (Eggink et al., 2022). Design ethics often focuses on professional behaviour guided by moral duty, goals, and virtues (Anjou, 2010a), especially when designers and design leaders are faced with complex decisions, like balancing aesthetics, market demands, and societal needs (Anjou, 2010b). Design thinking emphasises collaborative, socially responsible approaches that prioritise innovation and ethics over pure profit (Hussain, 2013), suggesting that designers or individuals with a design-thinking mindset may have an inherent advantage in addressing ethical aspects.

There are various tools and models for ethical design practice. For example, tools like Value Sensitive Design and responsibility analysis help designers tackle ethical dilemmas (Lindberg et al., 2020). Anjou's (2011) five-phase model provides a practical framework for ethical decision-making in design, primarily focusing on design awareness and reflection while promoting thoughtful decision-making that integrates ethical awareness at every stage of the design process. As an important role at the strategic level in the company, design leaders hold a huge responsibility in creating ethical systems aligning design with the organisation's mission and long-term sustainability (Eisenbeiss, 2012; Epley and Tannenbaum, 2017), making fair decisions (Eisenbeiss, 2012), and fostering a culture of respect, diversity and ethical awareness throughout the organisation (Eisenbeiss, 2012), by utilising actively reflecting, debating, and challenging the status quo (Lindberg et al., 2020).

While design leadership and ethical leadership emerge from different scholarship on leadership, they share several overlaps. Both design leaders and ethical leaders have

similar competencies, particularly in areas such as vision, empathy, and collaboration.

1. *Vision and Strategic Thinking*: Design leaders envision desired futures, define strategic goals, and create pathways to achieve them (Turner & Topalian, 2002). Similarly, ethical leaders inspire trust by aligning their decisions with long-term benefits for society and their organisations, often challenging existing norms to promote progress (Eisenbeiss, 2012; Lindberg et al., 2020).
2. *Empathy:* Ethical leaders demonstrate empathy, imagination, and sensitivity, fostering environments where respect and collaboration thrive (Greenleaf, 1977; Brown & Trevino, 2005). Similarly, design leaders employ user-centred approaches, understanding the needs and experiences of diverse stakeholders to create meaningful and inclusive solutions (Hargadon, 2010).
3. *Collaboration*: Ethical leaders focus on building a sense of community and promoting fairness and inclusion in their teams (Northouse, 2007). Similarly, design leaders advocate for cross-disciplinary collaboration, aligning design expertise with organisational goals and stakeholder needs (Tan & Chapman, 2017).

This overlap between design and ethical leadership shows the potential for ethical design leadership practices and constitutes a starting point to explore the ethical dimensions more explicitly within design leadership models.

3. Methodology

The previous study developed a design leadership model consisting of 16 main competencies through the triangulation of three primary data sources: semi-structured interviews with 26 design leaders in China, 50 job descriptions for design leadership or related roles collected from job-seeker websites, and 12 case studies of design leaders sourced from grey literature. This diverse dataset provided real-world insights, particularly within the Chinese business context, offering a comprehensive perspective on the overall scope of design leadership. This paper presents the validation of this design leadership model through 14 semi-structured interviews of academic staff (n=3), students (n=8), and alumni currently working as design leaders (n=3) from design management programmes at Shandong University of Art and Design.

Shandong University of Art and Design (SDAD) was selected as a case study considering its relevance and historical significance to design management education. SDAD is among the first universities in China to establish a design management program in 2003. Its undergraduate and postgraduate design management programs focus on integrating design with entrepreneurship and leadership, aligning closely with this study's aim of fostering design-driven entrepreneurship and leadership competencies. The comprehensive curriculum at both levels allows for a broader understanding and valuable insights about the development of ethical competencies.

The interview questions were structured into two sections. The first section aimed to explore participants' perceptions of ethical aspects of the program, including the ethical responsibilities and abilities of design leaders, as well as their views on how ethics is reflected in the design leadership model. The second section sought general feedback on the design leadership model, specifically identifying missing competencies, highlighting important ones, and suggesting competencies that could be removed.

4. Findings

4.1 Key Ethical Competencies in the Design Leadership Model

While ethical aspects are embedded across all 16 competencies of the design leadership competency model (Figure 1), the interviews revealed the following as more prominent in significantly influencing a design leader's behaviour.

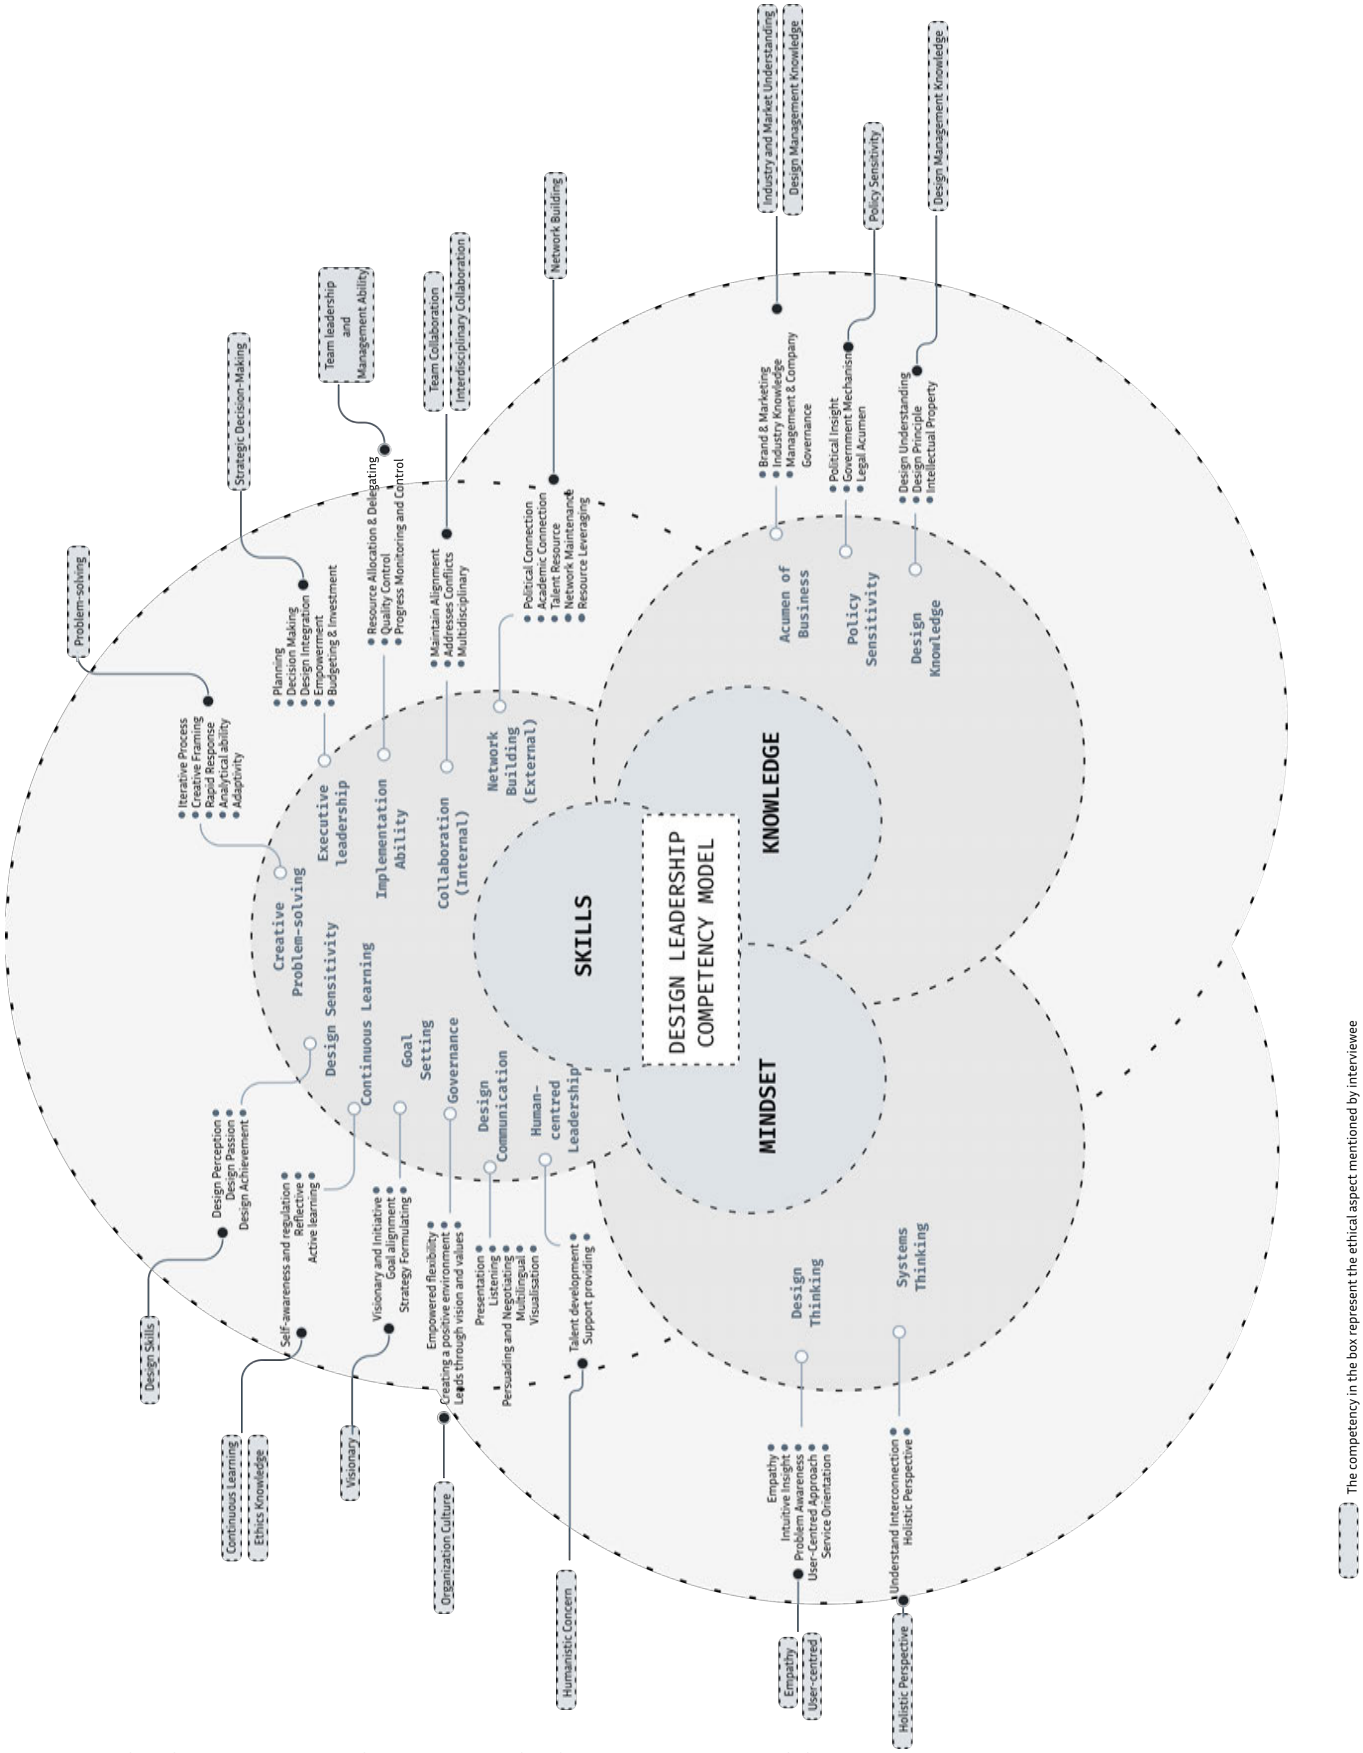

Figure 1: Ethical Competency in the Design Leadership Competency Model

Design Sensitivity refers to a design leader's ability to perceive and interact with the world and to create impactful design work. According to the interviewees, design sensitivity is not only essential for achieving aesthetic and functional excellence but also plays a critical role in integrating ethical considerations into both the design processes and outcomes.

Continuous learning empowers design leaders to reflect on their capabilities, identify learning needs, and acquire new knowledge. This competency is essential for staying informed about emerging ethical challenges and their everchanging nature, including sustainable practices and evolving societal expectations (Bagnall et al., 2022). A design leader must demonstrate the ability to anticipate future trends, particularly those involving ethical considerations, by analysing past and current events while maintaining a broad, clear vision for the future. This competency enables design leaders to identify emerging challenges and opportunities in areas such as sustainability, inclusivity, and social responsibility. By aligning their strategies with evolving societal expectations, visionary leaders ensure their work remains relevant and impactful.

Visionary leaders possess a keen ability to detect potential ethical risks and opportunities early, providing valuable insights that guide long-term strategic directions. By integrating ethical foresight into their vision, these leaders not only inspire their teams to innovate responsibly but also shape design solutions that positively impact both business success and societal well-being. Interviewees highlighted the importance of long-term thinking in ethical leadership:

> "Moral responsibility requires a long-term perspective. Leaders must focus on long-term benefits, ensuring that their decisions genuinely help those they serve." – Int8 DM Student

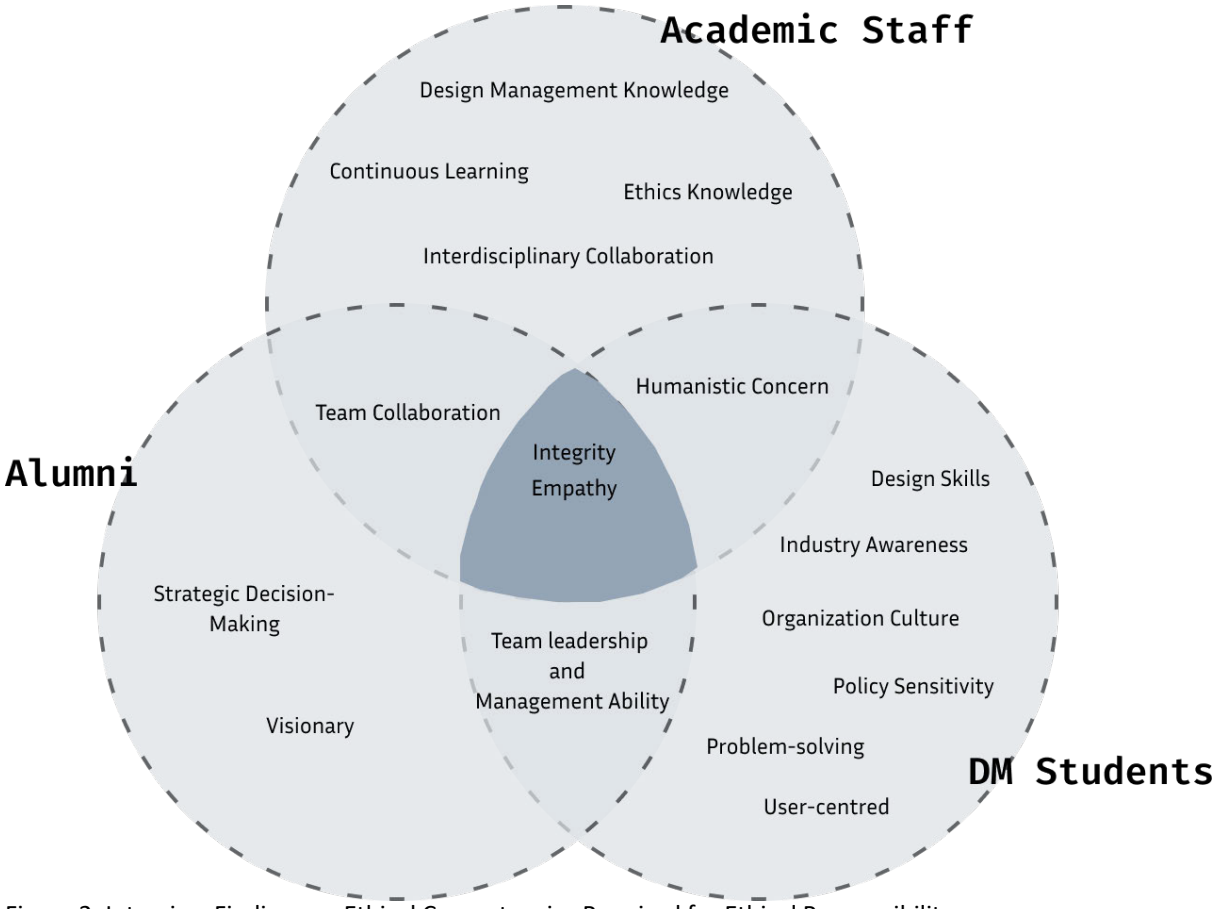

Figure 2: Interview Findings on Ethical Competencies Required for Ethical Responsibility

A design leader demonstrates **humanistic concern** by offering guidance and assistance to enhance the skills and potential of their team members while supporting them through

challenges. This competency reflects a deep ethical commitment to prioritising the well-being and development of individuals within the organisation.

> "A design leader must have a mindset dedicated to serving others and reflecting personal values aligned with helping people." – Int2 DM Student

Empathy is a critical competency for design leaders, enabling them to understand the perspectives and emotions of others. Empathy is the foundation for a **user-centred** approach, allowing design leaders to prioritise the needs and experiences of diverse stakeholders, particularly those from marginalised or minority groups. Empathy enables design leaders to not only connect with stakeholders but also create thoughtful and inclusive solutions that reflect ethical considerations. Interviewees across three groups all underscored the importance of empathy in ethical leadership:

> "First of all, they need to have empathy—a certain ability to empathise with others. They need to first establish an awareness of their societal responsibilities before they can take the next step." – In10 Alumni

Integrity emerged as a highly emphasised personality trait across all interviewee groups in the interviews, underscoring its importance within the ethical dimension of design leadership. They believe that design leaders must possess honesty, strong moral values, and a commitment to ethical behaviour.

> "Human nature is inherently good, and this is something that will never change. This is extremely important for ethical design leadership." – Int12 Academic staff

Although integrity is not explicitly included in the design leadership competency model due to its inherent nature as a personality trait rather than a teachable skill, it remains crucial for promoting the ethical dimension of design leadership. While it is challenging to teach integrity within the framework of design education, understanding its importance helps highlight its function in reinforcing ethical behaviour and guiding leaders toward responsible and impactful practices.

4.2 Insights on Ethical Responsibility in DM Education

The understanding of ethical responsibility varied across different participant groups (academic staff, students, alumni), with some emphasising its importance less or more than others. The academic staff appeared to demonstrate the most comprehensive understanding of ethical responsibility, followed by design management students, while alumni seemed less knowledgeable. This suggests that the curriculum may have been updated to better incorporate ethical aspects over time. Furthermore. Ethical considerations are usually viewed as an extension and complementary part of design management curriculum, rather than a core learning outcome in the first place.

Academic staff identified 11 distinct aspects of ethical responsibility, spanning environmental, societal, and organisational concerns:

- *Environmental Issues*, such as addressing consumerism's impact on the environment (e.g., fast fashion), tackling ocean pollution, and promoting sustainability;
- *Societal Issues*, such as solving community challenges, creating jobs to reduce unemployment, addressing mental health concerns among the younger

generation, developing inclusive design, and safeguarding user privacy;
- *Organisational Context*, such as cultivating holistic perspectives, raising employees' ethical awareness, promoting inclusive design, increasing intellectual property (IP) awareness, and improving IP protection.

Design management students shared some overlaps with academic staff, particularly on societal issues, but placed greater emphasis on:

- Preserving Cultural Values and ensuring cultural heritage is reflected in design;
- Inclusive Design and developing designs that serve diverse user groups;
- Environmental Responsibility and taking steps toward sustainability.

Additionally, students highlighted the need for equitable distribution of design resources, criticising the concentration of resources among higher-ranking individuals while neglecting those at the middle and lower levels.

Alumni demonstrated a narrower understanding of ethical responsibility, focusing primarily on organisational contexts, such as:

- Ensuring fair employee benefits,
- Promoting ethical decision-making,
- Fostering an inclusive and equal workplace atmosphere.

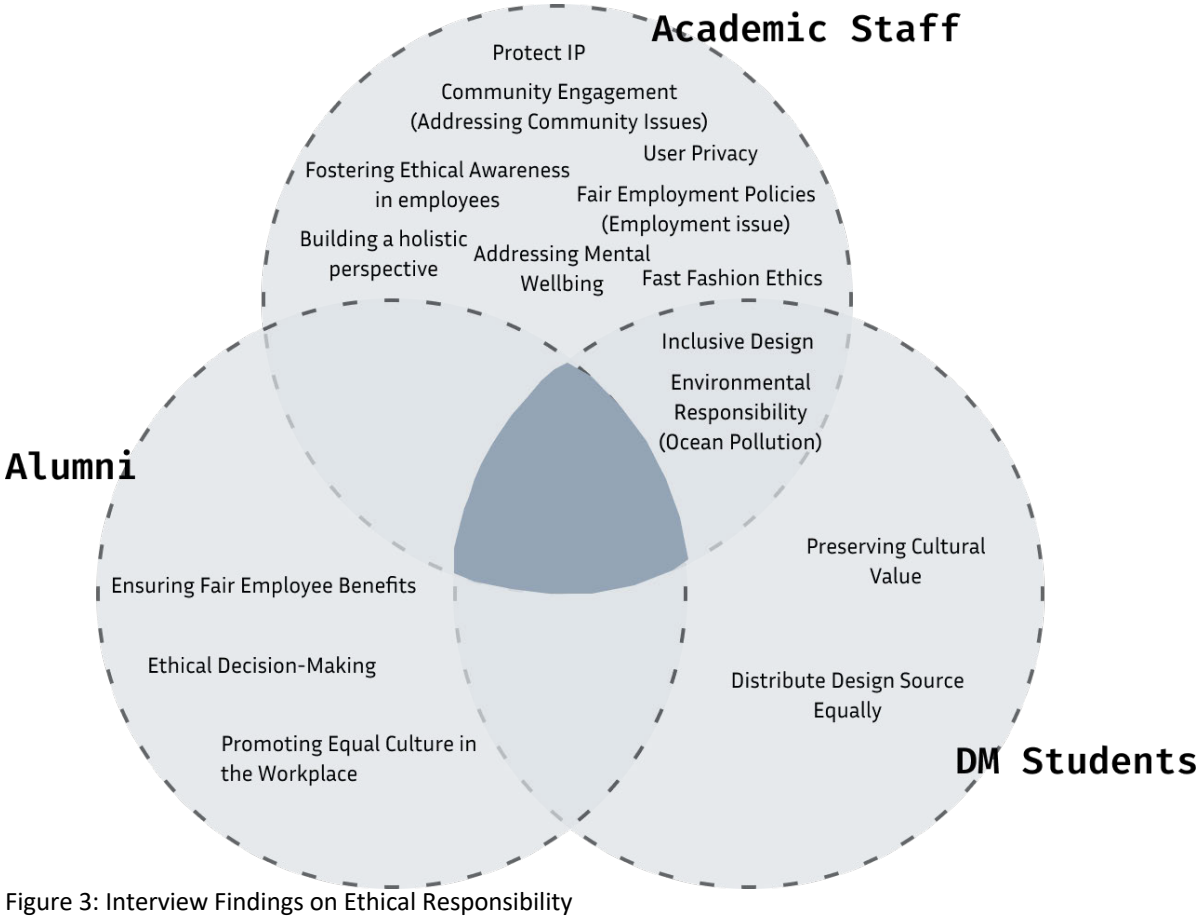

Figure 3: Interview Findings on Ethical Responsibility

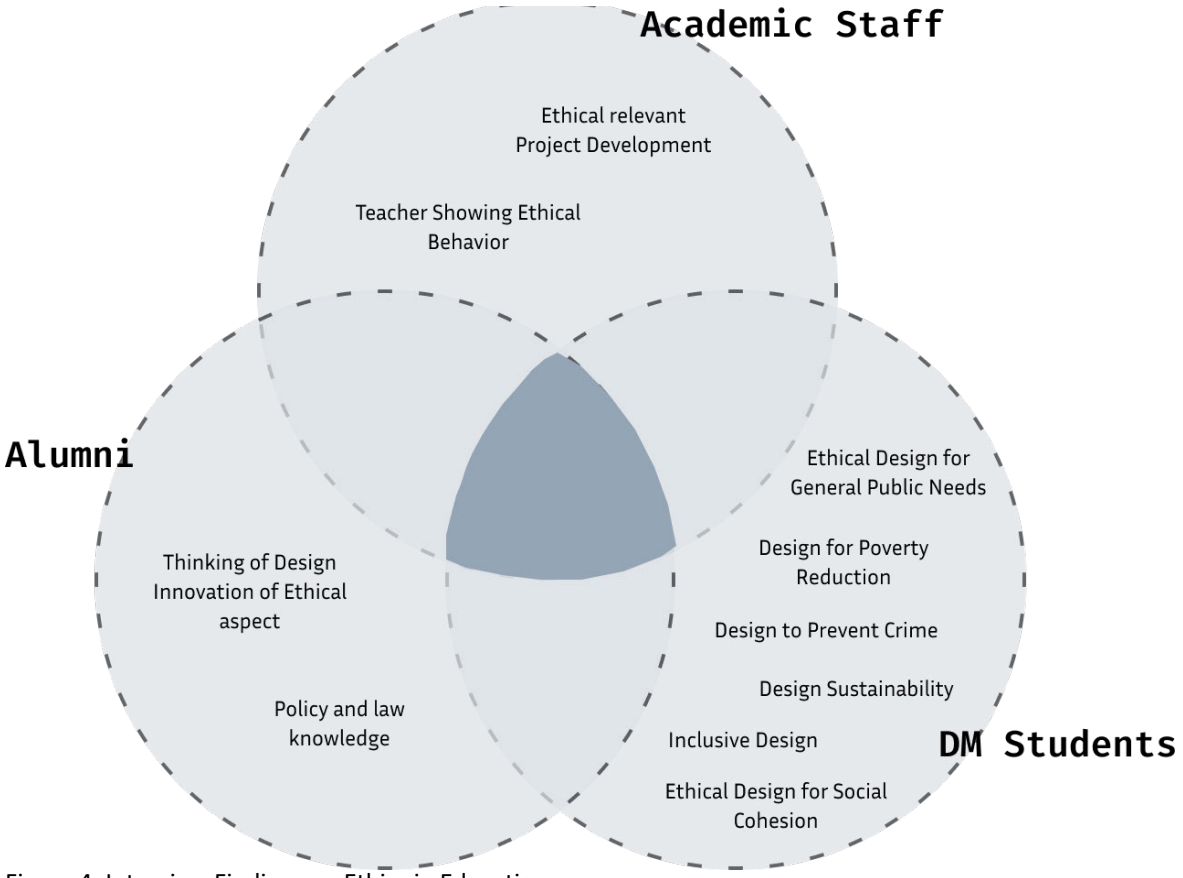

Figure 4: Interview Findings on Ethics in Education

Academic staff explained how ethical aspects are integrated into the design management program, primarily through project-based learning. Teachers prepare assignments with ethical themes, such as sustainability or social inclusion, and guide students in exploring these themes in their projects. However, there are difficulties in accessing public resources now, such as a lack of sustained industry involvement: guest lecturers from the industry often deliver one-off lectures rather than providing continuous engagement throughout an entire term, which could foster more consistent skill development.

Without sufficient support, most project themes or topics are selected based on the teacher's own understanding and experience or perspectives. This can ensure a certain level of quality and effectiveness in shaping students' perceptions and understanding through the project. However, this also highlights a potential limitation: without external, especially industry, involvement or validation, these topics or ideas may lack alignment with current industry practices, resulting in project outcomes that are idealistic and hard to implement in real-world scenarios.

Academic staff also emphasised the importance and challenge of role-modelling ethical behaviour. They believe that cultivating ethical awareness is a lifelong process and goes beyond classroom learning. Teachers aim to inspire students by demonstrating ethical behaviour in daily interactions, providing a practical complement to theoretical knowledge.

From students' insights, when asked about their ethical learnings in class, most students were impressed by contents and cases of addressing public needs, such as:

- Design for addressing poverty,
- Inclusive design for diverse user groups,
- Design in improving community and societal engagement,

- Design against crime, and
- Sustainable design.

From Alumni's perspective, they recalled learning about ethical aspects through discussions on design innovation and exposure to policies and laws relevant to ethical practices. However, one alumnus shared that knowledge can provide valuable foundational frameworks, but the ethical aspects were not often learned or emphasised in their education. This raises a question about ethical cultivation: can ethics be "learned" or "taught" in design education? About the teaching of ethics, it is now has been reached a consensus that ethics can be taught (Avci, 2017).

Ethics as foundational knowledge can be taught through methods often implemented by lectures, case-based teaching and group discussions (Avci, 2017; Bruns et al. 2015; Laabs 2015), and should be emphasised in education (Avci, 2017; Vynckier et al. 2015). However, the cultivation of ethics should extend beyond knowledge transfer. Cultivating ethical design leadership, is not just about understanding rules or frameworks but also about developing the capacity for ethical leading and decision-making in complex situations (Brown et al. 2005; Kaptein, 2019).

As one academic staff emphasised in the interviews, role modelling plays a vital role in fostering ethical awareness and shaping ethical behaviour (Grande et al., 2024) and motivation (Gladstone and Cimpian, 2021), to influence the process or work in design project (Donia and Shaw, 2021; Grunwald, 2001; Timmermans, 2017). While foundational ethics knowledge can be taught and learned, cultivating an ethical mindset among students may be more important, and requires an experiential (Goralnik et al., 2012) and comprehensive approach. This includes combining classroom learning with a real-world application lens, and incorporating reflective practice outside the classroom. This approach can create a holistic approach to cultivating an ethical mindset.

5. Discussion

5.1. Ethics in 'Neutral' Competencies

Some competencies do not inherently possess an ethical dimension but can make an ethical impact depending on the context in which they are applied. For instance, **strategic decision-making** can be ethical, but this sometimes depends on the values of the individual or organisation (Haralick, 1983; Papadakis et al., 1998; Shepherd and Rudd, 2014). If a person or organisation prioritises profit and financial success—particularly in situations where the organisation is in its early stages and focused on survival—they may decrease some considerations such as environmental sustainability. This can result in unethical outcomes, such as pollution or resource depletion, due to a lack of emphasis on sustainable practices.

Similarly, **network building**, as a competency, is neutral and does not inherently carry a moral aspect. However, ethical issues can arise in certain contexts (Melé, 2009). For example, collaborating with companies or organisations that have low ethical standards or awareness can lead to unintended consequences, such as supporting exploitative practices. Additionally, network building may marginalise certain individuals or groups and cause inequality by excluding those who lack access to influential networks or resources.

5.2. Potential Ethical Conflict Between Competencies

There are also conflicts between certain competencies, particularly when they are applied in ethical practices. For example, the **industry and market understanding** competency, which often prioritises profitability and market demands, may conflict with **humanistic concern** when those demands result in products or practices that negatively impact individuals or society.

One example is **addictive technologies**, which are designed to satisfy users' needs and engagement, meeting market demands and boosting profitability. However, such technologies can harm users by fostering addiction, reducing productivity, and negatively impacting mental health. Similarly, **fast fashion** sell producing low-cost, high-turnover products that fit with fashion trends. While this aligns with market demands and drives profitability, it directly contradicts humanistic concerns, as it often compromises fair labour conditions (Tandon et al., 2025; Turker & Altuntas, 2014) and sustainability.

5.3. Uncovering Bias in Ethically Relevant Competencies

As a competency, it is essential to consider the **cultural** or **contextual biases** (Banuri et al., 2019; Pope et al., 2018) that may influence its application. For example, **policy sensitivity** assumes that existing policies are inherently ethical. However, what happens when certain policies may include inequality or harm? One alumnus shared a workplace case concerning compensation for employees who experienced workplace accidents. She noted that, while she empathised with the affected employees' situations and wished to provide greater compensation, regulations limited the amount she could offer. She realised that policies and regulations sometimes prioritise institutional compliance over individual rights, creating an ethical dilemma. This situation underscores the challenges design managers face in balancing adherence to policy frameworks with addressing ethical considerations from a human-centred perspective.

6. Conclusion

This paper focuses on the ethical dimension and validation of the design leadership competency model. Through the validation process, ethical aspects were identified across all 16 competencies, such as design thinking, continuous learning, and visionary. The findings reveal the impacts of ethical leadership in design education. Furthermore, traits like integrity, while not directly teachable, were emphasised in the interviews as a vital role in ethical leadership and impacting design leaders.

This paper also highlights the relevant ethical leadership competencies required in design-driven entrepreneurship in the Chinese context, providing a direction for cultivating ethical design leaders in future design education programs.

ABSTRACT | This paper studies how design thinking has transformed an outdoor tourist business (X-Company) to an educational platform. Throughout its development, sustainability functions as a key principle of the business and leads to inspiration of ethical practices. The story is a vividly illustration of how design thinking can play an effective role in navigating dilemmas of decision making caused by conflicting values.

The case study starts from introducing the background of X-Company and how design is brought into the business decisions. It is an ongoing story started over seven years ago, when a designer was asked to explore opportunities to extend marketing potentials of a newly developed outdoor business through improvement of user experiences. Whereas the designer realized the potential negative environmental impact by bringing mass tourists to the precious nature beauties. Followed by explaining how design functions in X-Company, which includes organizational structure of design capability, responsibility of design, methods and tools used. The main part of the observation focused on how X-Company has redefined its mission statement, changed its product offerings, and made the transformation from a heavily natural resource dependent outdoor tourist to an educational platform on sustainability through controlled access to carefully selected outdoor locations. And later the business was brought into metropolitan areas to revitalizing abandoned factory facilities, and became partners of well-developed large businesses and organizations.

Winterhouse Pathways, a strategic framework developed by Winterhouse Institute, used by the design team during its effort of transforming X-Company will be explained. It is a matrix tool to help business map and visualize key milestones during its development. In this case, the method is used as modification and exploration to understand personal growth as designer to cultivate leadership in aligning with entrepreneurship of long-term strategic, social transformation and sustainability pathways.

In conclusion, this paper offers a comprehensive exploration of how design thinking serves as a transformative force in both leadership and entrepreneurship. By bridging the gap between creative problem-solving and ethical leadership, design thinking provides a blueprint for building businesses that are not only economically viable but also socially responsible and environmentally sustainable. Through the analysis of case study, we aim to contribute to the ongoing dialogue on the role of designers as ethical leaders in the global business landscape.

KEYWORDS | Design Thinking, Design-driven Leadership, Creation of Values

1. A Business Opportunity that Resonates Future Generation

1.1 X-Company and its Outdoor Climbing

X-Company, established in 2017 in Zunyi, Guizhou Province, China. It operates as a specialized outdoor tourism enterprise focused on rope climbing. Its flagship facility, the Top-rope Climber Rope Climbing Base (see Figure 1), representing a RMB 40 million investment and adheres to IRATA ICOP European industrial safety standards. The company's core operations center on vertical rope climbing, a discipline that enables three-dimensional exploration of natural environments. This specialization has driven diversification into complementary sectors, including customized adventure tourism, extreme sports programming, and technical training for high-altitude professions. By integrating rope climbing with nature-based tourism, X-Company provides urban populations with structured access to remote natural landscapes, promoting human-nature interaction. Its operational framework combines certified rope techniques, standardized instructional protocols, and purpose-built infrastructure, positioning it as a pioneer in China's evolving outdoor tourism sector. The company's model demonstrates how niche adventure activities can catalyze market expansion while addressing growing consumer demand for experiential, environmentally engaged tourism.

Figure 1. X-Company Rope Climbing Base

This study has been authorized by X-Company to use data and content from interviews, workshops, photographs, and other sources; however, the company name cannot be disclosed. It investigates the application of design-driven leadership in shaping the business strategy of X-Company, with a focus on sustainable business model innovation.

1.2 Conflicting Values in Sustainable Tourism

The contemporary tourism sector, recognized as a multi-dimensional industry encompassing strategic economic development, well-being enhancement, and livelihood sustainability, has witnessed intensified scholarly discourse on the design of sustainable tourism paradigms. Rising disposable incomes and consumption have substantially expanded tourism markets, driving demand for experiential offerings and premium services. Paradoxically, this growth trajectory has been juxtaposed with unprecedented sectoral disruptions, as recurrent COVID-19 outbreaks act as transformative catalysts—accelerating digital adoption, safety protocol integration, and destination hyper-localization. While these dual forces demonstrate tourism's adaptive capacities, their enduring implications for industry structures, labor ecosystems, and sustainability commitments remain indeterminate.

Green tourism development confronts critical challenges that impede its values and long-term viability (see Figure 2). A central issue is the misalignment between theoretical environmental standards and practical implementation. Despite claims of sustainability, projects frequently lack rigorous enforcement mechanisms, resulting in superficial ecological safeguards and diminished outcomes. A persistent tension exists between economic imperatives and environmental preservation. Commercial entities often prioritize short-term profitability, adopting practices such as infrastructure overdevelopment and unsustainable operational models. This prioritization is particularly evident during initial project phases, where immediate financial returns supersede commitments to ecological stewardship, undermining the foundational principles of sustainability. Tourist engagement presents another barrier. The success of green tourism hinges on visitor participation in sustainable behaviors, yet many initiatives inadequately cultivate environmental awareness or incentivize responsible practices, reducing their transformative potential. Concurrently, fragmented collaboration among stakeholders—governments, private enterprises, tourists, and local communities—exacerbates inequitable resource distribution and obstructs cohesive governance, further compromising project continuity. Addressing these challenges necessitates systemic integration of ethical principles into project frameworks.

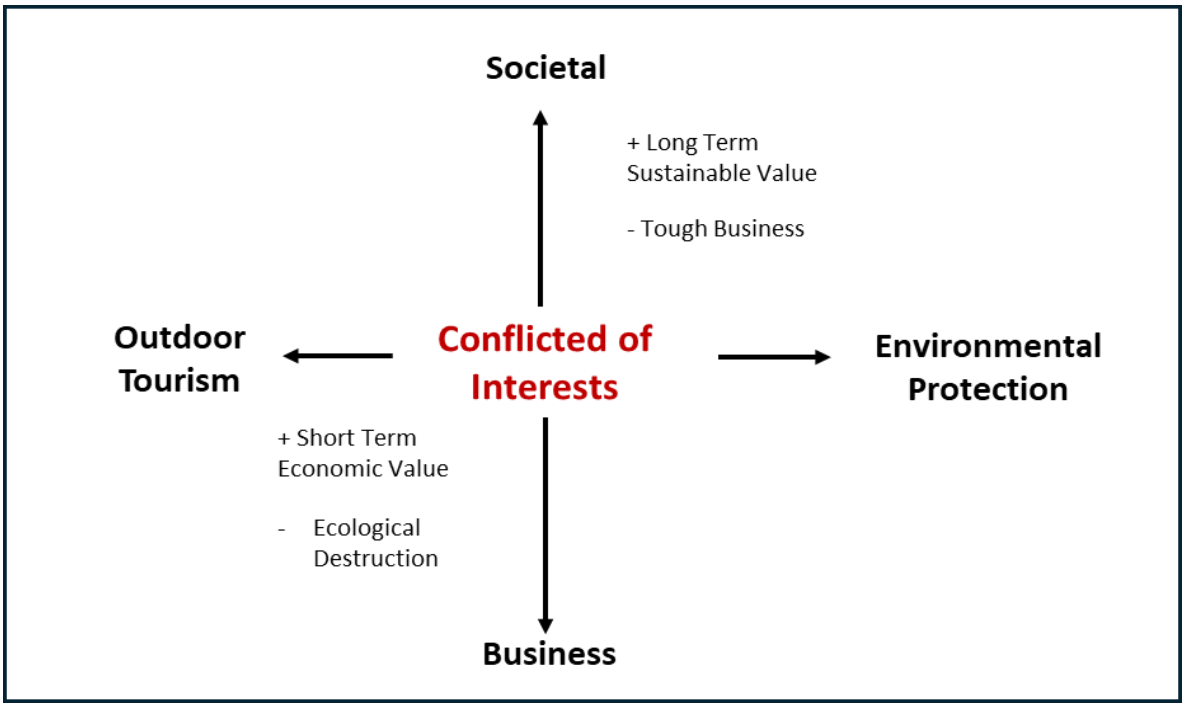

Figure 2. Conflicting Values in Sustainable Tourism

2. Integration of Design Thinking into Company-X

2.1 Designers Act as External Agencies

Following the disruption caused by the COVID-19 pandemic, the global tourism and outdoor sports sectors experienced profound challenges, with X Company confronting significant operational pressures by 2022. The company faced stagnation in acquiring new customers, alongside a marked decline in retention rates. Simultaneously, tensions emerged within the organization, particularly between the profit-driven strategies of management and the professional staff's advocacy for sustainable practices and improved customer engagement. This divergence in priorities generated strategic ambiguity, complicating decision-making and impeding effective crisis management.

In light of these difficulties, the founder—despite not possessing a formal background in design—recognized the urgent need for leadership capable of bridging these competing priorities, fostering innovation, and aligning organizational practices with evolving market demands. The founder's approach was shaped by an academic conference at which a keynote on design-driven organizational leadership profoundly influenced their perspective. The speaker's discussion emphasized the importance of integrating design thinking into leadership to resolve internal conflicts, enhance organizational coherence, and better meet the needs of a rapidly shifting market.

Inspired by this insight, the founder extended an invitation to the keynote speaker and their team to engage with X Company, with the aim of embedding design thinking principles into the company's leadership framework. This initiative marked a strategic effort to address the internal tensions and external challenges facing the company, with the goal of developing a more sustainable, customer-centric approach to business operations in the post-pandemic context. The integration of design-driven leadership was thus seen as essential for aligning organizational strategies, fostering innovation, and effectively navigating the complexities of the new market environment.

2.2 Design Thinking as A Strategy for Navigating Complex Decisions

Design thinking offers a pathway to reconcile competing priorities by fostering innovation through stakeholder-centric problem-solving. This approach emphasizes iterative, interdisciplinary strategies to harmonize economic objectives with ecological integrity, ensuring scalable and equitable sustainability outcomes.

These challenges highlight the necessity of applying design thinking to reframe sustainability as a mechanism for value creation rather than mere regulatory compliance. Winterhouse Social Design Pathways (The following text will refer to "WSDP"). illustrates this approach through iterative prototyping of socio-technical systems, such as waste management networks and community benefit-sharing models, demonstrating how ethical leadership can convert risks of greenwashing into regenerative strategies for placemaking (Nelson & Stolterman, 2012). This method emphasizes the systematic integration of systems thinking and participatory co-design to align economic feasibility with the preservation of biocultural heritage, ensuring mutually reinforcing ecological and social outcomes.

Sustainable business development inherently involves addressing "wicked problems," characterized by tensions between economic costs and ethical values, misaligned

stakeholder expectations, and challenges in fostering sustained engagement among target groups. For X-Company, the priority in its early stages lies in cultural transformation and sustainable community development, rather than product innovation. Design thinking, a co-creative methodology for resolving complex, conflicting challenges, has gained prominence in corporate and entrepreneurial contexts. Rooted in Herbert A. Simon's conceptualization of design as a process of "creating ideas" rather than merely deconstructing them (The Sciences of the Artificial, 1969), the approach evolved through Horst Rittel's exploration of planning dilemmas (Dilemmas in a General Theory of Planning, 1973). Richard Buchanan later formalized its application to "wicked problems" in design contexts (Wicked Problems in Design Thinking, 1992), highlighting irreconcilable conflicts between competing priorities: economic and business objectives versus socio-cultural values, and short-term micro-level gains versus long-term macro-strategic imperatives. These tensions underscore the necessity of integrating systems thinking and participatory co-design to balance competing demands while advancing ethical and sustainable outcomes.

Design thinking lacks a universally agreed definition but is broadly recognized as a multidisciplinary problem-solving approach integrating human-centered innovation, technical feasibility, and business viability. Tim Brown (2008) characterizes it as a human-centric methodology that aligns market opportunities with customer needs through creative business strategies. Similarly, Johansson-Sköldberg (2013) emphasizes its role in bridging diverse disciplines, cognitive frameworks, and mindset integration. Scholar Li Yinan (2017) extends this perspective, framing it as a collaborative process that leverages cross-domain expertise to systematically address user needs through culturally informed creative practices. Despite definitional ambiguities, design thinking has gained traction across academia and industry for its capacity to address complex challenges. Its practical impact is evident in cases such as Apple, where iterative design processes drove innovations like the iPhone and strategic business models. IDEO further institutionalized the approach, embedding it into organizational culture to guide project development and strategic decision-making. Industry leaders like Juan Carlos Baumgartner advocate its future role in solving unpredictable societal and organizational challenges (Lingyan, 2015). These applications underscore design thinking's potential to transcend traditional boundaries, offering a framework for addressing systemic issues such as ethical business strategy formulation, socio-technical innovation, and adaptive responses to global uncertainties. By prioritizing empathy, experimentation, and interdisciplinary collaboration, it positions itself as a critical tool for fostering sustainable, value-driven solutions in both entrepreneurial and societal contexts.

2.3 Design Thinking Became Driving Force of Transformation

The design team's brought design thinking into X-Company played a crucial role in its business transformation, operating both externally as consultants and internally as strategic decision-makers. Externally, the design team brought specialized expertise in design thinking, providing objective insights and innovative methodologies to address the company's operational and strategic challenges. This consultancy role allowed X Company to reassess its practices and adopt a user-centered approach to problem-solving, fostering a more adaptive and innovative mindset within the organization.

Internally, the design team worked closely with X Company's leadership, directly influencing key decision-making processes. By embedding design thinking into the company's strategy development, the team ensured that business decisions were more customer-centric and aligned with emerging market trends. The team's involvement helped

streamline internal operations, resolve conflicts between management and staff, and promote a culture of collaboration and innovation.

This dual involvement, both as external consultants and internal collaborators, was instrumental in driving X Company's business transformation. Through this approach, the company was able to reorient its strategies, improve its customer engagement, and position itself more effectively in the market, ensuring long-term sustainability and adaptability in a rapidly evolving business environment.

A. Defining Brand Culture of X Company

Slogan: With ropes, we connect people to nature; from above, we see the world differently.

Mission: To enable individuals to experience joy, rediscover themselves, and become responsible global citizens through exploring nature and overcoming challenges.
Vision

Vison: To become the most trusted professional training center for rope operations and to establish Guizhou as a global destination for high-altitude adventure tourism.

B. Finding Key Opinion Customer

The acceptance and adoption of new products or innovations by the general public typically follow a sequential process, necessitating a phased market development strategy. This approach begins by targeting an early adopter segment, whose influence can facilitate the expansion of the market to a broader audience. Over time, through product diversification, the strategy aims to penetrate and influence the laggard market. Consumers characterized by an open mindset and substantial resources are particularly drawn to X-company's distinctive products. These individuals not only exhibit a strong affinity for innovation but also possess the capacity to generate significant publicity and market influence for the company. Based on an analysis of user segmentation and dynamic user profiles, the authors recommend prioritizing innovators, adapters, and experiencers as the initial target groups for market entry.

According to Everett M. Rogers' Diffusion of Innovation Theory (Rogers, 1962), the widespread acceptance of innovative products is typically driven by early adopters. Innovators, trendy achievers, and experiencers, as key social groups, are often at the forefront of societal development and play a critical role in driving innovation. These individuals are predisposed to leading trends, embracing novel ideas, and serving as influential opinion leaders within public discourse. As such, these three groups are instrumental in introducing X-company’s brand and the concept of "rope climbing" to the broader public, ensuring that early investments in product development, services, and promotional activities yield maximal returns. Moreover, these groups can be further refined and segmented based on factors such as profession and social role, enabling the strategic targeting of specific subgroups for product promotion. Examples of such subgroups include EMBA followers, university organizations, executives in internet companies, executives in start-ups, middle-class families, and outdoor enthusiasts. This targeted approach enhances the precision and effectiveness of market entry strategies.

C. Repositioning of X Company

X Company’s brand development and business planning are based on a thorough analysis of global and domestic trends in the outdoor tourism industry. Drawing from market data and an evaluation of the company's existing strengths, technological capabilities, and resource reserves, the team has identified six core business lines to drive its future growth. These business lines align with X Company’s mission, vision, and values

and serve as the strategic foundation for the company's expansion. Initially, X Company's business model was relatively narrow, focusing mainly on a single aspect of outdoor tourism. However, with the involvement of designers, the company was able to break out of this limited framework. The design thinking process helped identify opportunities for innovation and business diversification. Designers worked closely with key decision-makers to explore new business avenues, helping the company shift from a singular focus to a more expansive and integrated strategy. As a result, the six business lines (see Figure 3) now form a comprehensive, interconnected model that allows X Company to reach a broader audience and achieve greater market impact.

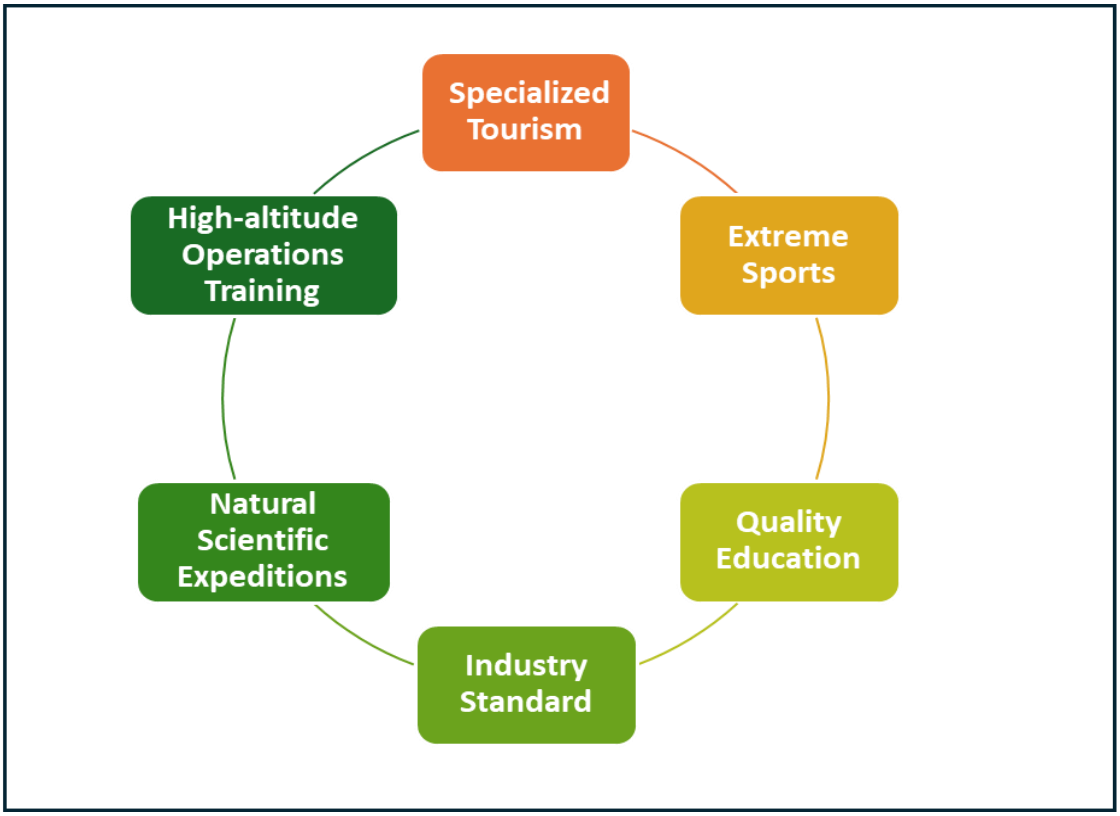

Figure 3. Six Business Lines

1. Specialized Tourism:
The tourism business line targets both domestic and international markets. By leveraging Zunyi's Red Tourism as a major attraction, X Company draws large numbers of visitors from across China. Furthermore, the company utilizes the unique Karst and Danxia landforms in its surrounding areas to create outdoor adventure tourism products, particularly rope-based activities, that cater to a wide range of consumer groups.

2. Extreme Sports:
The extreme sports line focuses on the development and sponsorship of rope-climbing events. This strategy not only promotes the sport but also enhances X Company's brand visibility in both public and industry sectors. Through collaborations with government agencies, private organizations, and media platforms, the company aims to establish itself as a key player in the event-driven tourism market.

3. High-Altitude Operation Training:
This business line capitalizes on the company's technical expertise by providing specialized high-altitude rope access training and certification for industries such as law

enforcement, firefighting, construction, and industrial operations. Additional services include safety assessments and high-altitude rescue training, positioning X Company as an industry leader in safety and technical education.

4. Quality Education:
Quality education represents a strategic cross-sector development for X Company. By utilizing its natural resources, the company offers educational programs that help build a positive public image and foster long-term relationships with family-oriented consumers. Entering the educational sector early gives X Company a competitive edge in the growing market for adventure-based and sustainable education.

5. Scientific Research and Exploration:
X Company's commitment to social responsibility is exemplified in its scientific research and exploration initiatives. The company plans to build an internal research team and collaborate with external experts in environmental and ecological fields, furthering scientific progress and enhancing the company's role in societal development.

6. Industry Standards Development:
The establishment of industry standards is essential for X Company's long-term sustainability and its goal of becoming an industry leader. By contributing to the development of operational and safety standards, the company can strengthen its position in the market and build trust with both consumers and industry stakeholders.

D. Introduction on WSDP: A Pragmatic Tool to co-organize Fragmented Activities

WSDP, launched in 2013 by the Winterhouse Institute in collaboration with international designers and educators, offers a structured framework for social impact design. Designed for educators and practitioners, it provides tools to identify and mobilize resources and expertise needed to address complex social challenges across different scales. The framework operates as a matrix tool, helping businesses and organizations visualize key development milestones to achieve meaningful social impact.

In the context of X-Company, the horizontal axis of the Pathways matrix defines its organizational evolution. The "individual or independent team" represents the startup-phase professionals, often skilled in rope climbing and handling multiple roles. The "interdisciplinary team" reflects its growth phase, incorporating expertise from fields like marketing, business management, education, and design. The "cross-functional organizational team" signifies its mature phase, collaborating with entities such as government, media, real estate, and educational institutions to form a shared-interest community. On the vertical axis, "individual products or services" denote specific offerings like outdoor tourism routes. "Systemic innovation" refers to resource integration, such as a rope technology system combining training, certification, and safety testing. "Cultural transformation" captures broader societal impacts, like rope climbing becoming a mainstream activity influenced by celebrity endorsements or replacing golf as a preferred high-end sport. This framework illustrates X-Company's strategic development and cultural influence.

The adjustment of user profiles, integrated with WSDP tool, providing a macro-level framework for the development trajectory of X-Company, shifting from specific tourism products to a broader cultural impact across various societal domains. The user profiles are aligned with the company's product planning by employing a segmentation model that includes early adopters, mainstream users, and laggards. The early adopters are classified as innovators, trendy achievers, and experiencers; mainstream users consist of

traditional achievers, strivers, and adapters; and laggards include preservers, sustainers and strugglers. These user segments were developed based on the VALS model. Through this persona analysis, three distinct product development pathways were identified, providing strategic guidance for X Company's growth.

In the extreme tourism business line for Case A, X-Company should follow a structured development path (see Figure 4): (1,1) -(1,2) –(1.3) -(2,3) -(3,3) -(3,2).

Figure 4. WSDP for "Extreme Tourism Business"

The focus point is high-end outdoor tourism products aimed at individuals such as EMBA graduates, senior corporate executives, and specialized groups, including photographers and seasoned outdoor enthusiasts. The company emphasizes value-added services and collaborates with partners to offer a variety of thematic experiences, such as "Exclusive Outdoor," "Extreme Photography," and "Geographic Exploration." These offerings primarily include skill development, outdoor activities, and knowledge-sharing events, designed to provide a holistic tourism experience that integrates travel, social interaction, and intellectual engagement. This approach targets high-end and niche markets with specific needs. Through user research, it was found that this target demographic does not prioritize the inherent playfulness or enjoyment of the activities themselves. Instead, their focus lies on the added value these experiences provide. For this group, a

pleasurable tourism experience serves as a fundamental component, while the meaningfulness and high added value of the experience take precedence. Consequently, X Company's product offerings are designed to meet these higher expectations, ensuring that the experiences deliver both intrinsic satisfaction and significant external value.

The value proposition for this user group lies in the opportunity to engage with individuals outside their usual professional and social circles, whom they would not typically encounter in their everyday lives. This expands their social networks and enhances their access to valuable resources. High-end tourism activities, in this context, serve as intermediaries, creating opportunities for meaningful connections. Rope climbing, with its cultural significance and high entry barriers, is well-suited to act as such a social mediator. By collaborating with media outlets that engage regularly with this target demographic, X Company can effectively position its offerings as premium products that appeal to high-end consumers, ultimately establishing rope climbing as a socially enriching experience within the luxury tourism sector.

Therefore, “Infinity X” is created through collaborations with international media and cross-industry brands. The offering includes X Company's core activities, such as venue-based programs, outdoor adventures, and leisure activities, alongside value-added events provided by strategic partners. These events include cultural salons, exhibition speeches, and entertainment competitions, enhancing the overall experience for the target audience.

3. Business Model Verified as Fruitful Outcomes

3.1 Adapting to Shifting Target Markets

Following post-pandemic policy relaxation, the authors applied design thinking at X-Company, initiating a transformative project in October 2023. Over 15 months, X-Company overcame its most challenging phase, achieving a 12% growth in revenues and a 32% increase in registered users compared to the pre-project phase. The design-driven solutions, implemented in phases across multiple dimensions, demonstrated significant success. This case highlights the potential of design thinking to foster organizational resilience and growth in complex environments. By integrating innovative, stakeholder-inclusive approaches, the project underscores the value of design principles in strategic decision-making, offering a model for sustainable development in dynamic business contexts.

3.2 Business Expanding from Mountainous Regions to Urban Markets

In early 2024, X-Company introduced the X Lighthouse Camp, an innovative tourism product themed as” The Great Voyage and Climbing to the Starry Sky”. The camp features six sections, including Voyage Adventure, where visitors engage in rope climbing and descent activities on a 4-meter wooden sailing vessel, complemented by themed photo opportunities. Additionally, X-Company collaborated with the Guangzhou Rainforest Ecological Botanical Garden (see Figure 5) to develop Rainforest Escape, a simulation of a primitive forest environment. This project allows visitors to apply rope skills and escape techniques to navigate simulated hazards, fostering both adventure and experiential learning. These initiatives highlight X-Company’s commitment to enhancing tourism through innovative, skill-based, and immersive experiences.

Figure 5. Urban Rope Climbing Base

3.3 Enhancing Influence through Recognition and Honors

The Summer Rope School (see Figure 6), designed for students, consisting of two components: the “Rope Climbing Class” and the “All-Round Summer Camp”. The Rope Climbing Class includes three sections: Rope Knowledge Learning, where students engage in hands-on activities like knot-tying; Outdoor Emergency Response Methods, teaching CPR and wound care using mannequins and medical tools; and Rope Rescue Demonstration, involving simulated rescues with rope systems. The All-Round Summer Camp extends learning to advanced challenges, such as outdoor cliff climbing, while promoting parent-child collaboration. Participants receive a completion certificate, recognizing their achievements. This program combines skill development, emergency preparedness, and family bonding, offering a holistic educational experience.

Figure 6. Summer Rope School

Furthermore, X-Company is dedicated to environmental sustainability and fostering responsible global citizenship. Having established 12 industry standards across training, safety, and ecological protection, the company keeps innovations constantly. In August 2024, it collaborated with experts, including Dr. Chen from the China Academy of Geological Sciences to develop the Guidelines for the Protection of Ecological and Landscape Resources in Karst Mountain Adventure Tourism in Guizhou Province. This initiative highlights X-Company’s commitment to preserving natural resources and

advancing sustainable tourism practices, setting a benchmark for environmental stewardship in the industry.

X-Company has partnered with Guangzhou's creative arts district to merge outdoor rope climbing with the artistic ambiance of its industrial heritage, creating a "Rope Culture" arts park. This initiative combines the historical significance of rope—a symbol of human progress—with the industrial heritage representing technological advancement, fostering a dynamic synergy. The project revitalizes the industrial site while promoting rope climbing as a culturally enriching activity, bridging sport, art, and heritage in a unique and innovative space.

4. Reflections and Value

Follow-up interviews with highly engaged customers underscored enhanced experiential immersion and strengthened connections to nature. Participants emphasized educational outcomes in skill-based and cultural activities, with increased propensity for organic promotion and expertise refinement. Many reported external recognitions, reflecting broader societal influence.

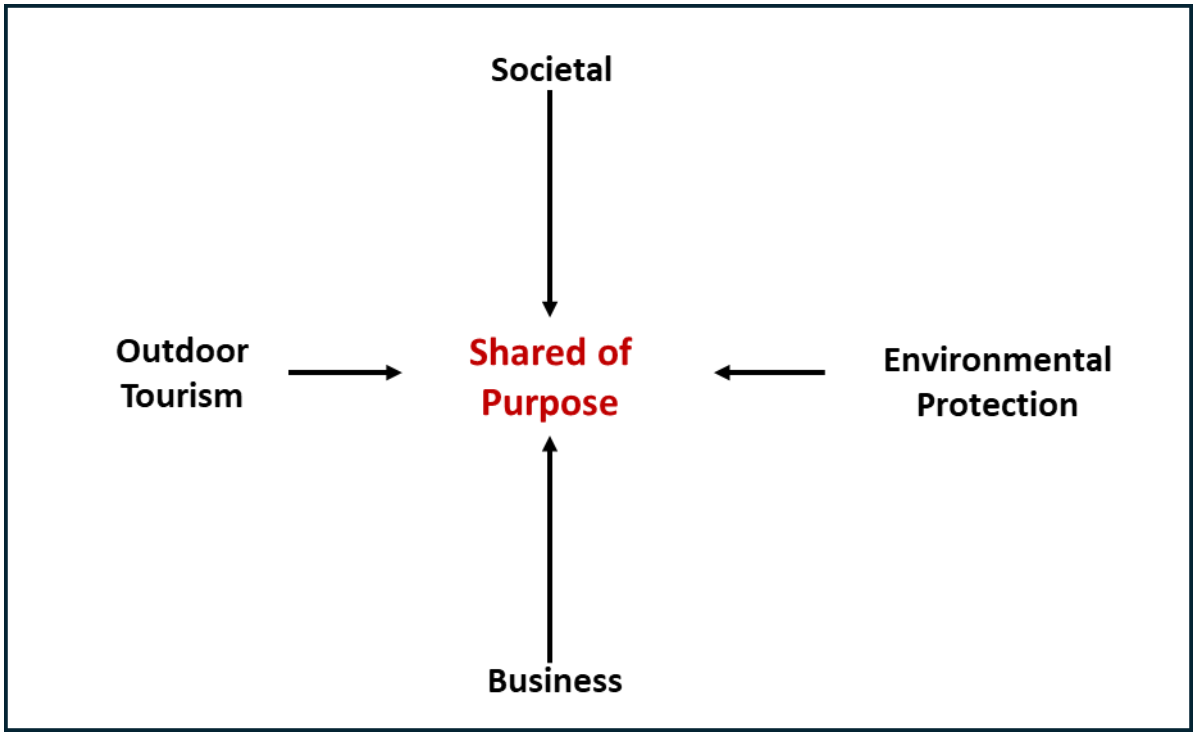

Figure 7. Shared of Purpose

X-Company's slogan, "With ropes, connect people to nature; from the heights, see a different world," metaphorically aligns with its strategic elevation through design thinking. The "heights" signify organizational transformation, while the "world" reflects a vision of sustainable business success (see Figure 7). This shift from "ropes" to "rope culture" exemplifies design thinking's role in reframing business development, offering insights into integrating cultural and innovative practices. The transition also addresses urbanization challenges by promoting a "future-oriented" lifestyle that harmonizes sustainability with human-nature connectivity, positioning X-Company as a model for interdisciplinary innovation.

The case study of X-Company's organizational transformation underscores the adaptability and value beyond its traditional applications. By implementing WSDP, which was historically confined to design practice, the project achieved three critical innovations. Firstly, it expanded the framework's theoretical scope by systematically integrating all stakeholders (e.g., employees, management, external partners) into the co-creation process, rather than limiting participation to designers. This inclusive approach fostered collaborative problem-solving and aligned organizational goals with diverse perspectives, demonstrating the potential of WSDP as a cross-functional tool for systemic change. Secondly, the project operationalized design thinking as a catalyst for self-reflection, enabling participants to critically re-examine their roles and responsibilities within evolving organizational structures—a dimension previously underexplored in WSDP literature. Thirdly, WSDP has catalyzed the emergence of previously absent ethical leadership mechanisms, fostering meaningful dialogue and creative ideation. Nevertheless, the focus of X-Company is relatively niche audience (e.g., a specialized rope-climbing initiative) which might raise questions about WSDP's scalability. To broaden its impact, future research should extend WSDP into contexts involving heterogeneous populations.

Ethical leadership represents not only an ideal but also an actionable framework through initiatives like WSDP. This study outlines a transformative pathway where design-driven entrepreneurship breaks traditional boundaries, cultivating ethical leadership through participatory methodologies that shift power dynamics in organizational governance. By integrating human-centered co-creation with strategic business transformation, WSDP pioneers a replicable model for embedding ethical imperatives into corporate practices.

Looking ahead, the fusion of design thinking and leadership development marks a new era, where creative professionals become architects of equitable systems and stewards of accountability. The capacity should be transformed from conflicted traditional decision-making hierarchies into interconnected ecosystems grounded in shared ethical responsibility. In an age of complexity, design-driven ethical leadership is not optional—it is the foundation for sustainable innovation, urging a renaissance in how we educate, practice, and create value. Through this, designers evolve into visionary leaders, with ethical frameworks guiding strategic progress.

*adriano.magliocco@unige.it

ABSTRACT | This contribution examines the role of the designer in relation to traditional applied arts and the local culture within the contemporary Italian context, intertwining theory, and practice. In recent years, the association between the advancement of design disciplines and highly specialized figures has shown signs of change, highlighting new boundaries as potential nodes of innovation (Da Empoli, 2013). There is indeed an increasing crossover between design and other disciplines, sciences, and techniques, based on the centrality of the product in its multiple expressions. The focus of this work is on the analysis of strategic and project outputs developed within the Art Lab partnership (Art Lab Net, Art Lab Experiences, Art Lab Services), supported by the Interreg Maritime Italy France programme, from 2017 to the present. These initiatives have aimed to support businesses in the manufacturing sector, addressing the challenges of global competitiveness and proposing new opportunities for growth and innovation. By recognizing the value of the technical skills within workshops and enhancing the competitiveness of national production, it is possible to contribute to the achievement of the Sustainable Development Goals (SDGs), particularly SDG 5 - Gender Equality and SDG 8 - Decent Work and Economic Growth. In recent years, the field of applied arts and local culture has experienced a significant rediscovery, fueled by a growing ethical and aesthetic

awareness. This has prompted new generations of designers to reconsider their role in response to the changing market conditions (Antonelli, 2012). The contribution analyses the importance of the manufacturing sector in the realm of Made in Italy furniture and accessories, characterized by a high number of companies that occupy the space between industrial and artisanal models (Vercelloni, 2008). However, this situation has contributed to marginalizing small artisans in the arts sector, who struggle to maintain competitiveness due to their size and marketing capabilities. In this context, the paper explores collaborative practices and experiences among universities, businesses, and local organizations, through which young designers have proposed innovative interpretations of the design system. This approach has highlighted hybrid aspects of the discipline, sensitive to territorial peculiarities and not relocatable characteristics (Gambardella, 2020), while simultaneously fostering processes of curation and leadership within a conscious and dynamic interdisciplinary framework.

KEYWORDS | LEADERSHIP, ENTREPRENEURSHIP, MULTIDISCIPLINARITY, MADE IN ITALY, CULTURAL HERITAGE

1. Context and relevance of Local Production: the role of Curatorial Leadership

Local production, particularly that associated with *Made in Italy*, has long been recognized as both a cultural and economic phenomenon of great significance, not only on a national scale but also globally. In an era of ongoing globalization, the challenges associated with sustainability and authenticity have become crucial in the enhancement of local traditions and regional productions. While globalization has broadened opportunities for exchange and growth, it has also raised new concerns regarding the protection of cultural identity and the risk of homogenization of products, leading to a potential loss of uniqueness and distinctiveness. In this context, Italy, with its invaluable heritage of knowledge and craftsmanship, has a unique opportunity to promote an alternative vision of production, one that focuses on quality, authenticity, and ecological responsibility. These values, which have always characterized *Made in Italy*, can serve as a model for sustainable development, capable of addressing contemporary demands without compromising cultural identity or tradition.

Within this framework, curatorial leadership emerges as a strategic response, enabling the connection between the past and the future, between the traditional and the innovative, through careful and mindful management of cultural heritage and local resources. Curatorial leadership functions as a guiding force, preserving the authenticity of craftsmanship and production while steering tradition towards sustainable and innovative practices. This approach becomes crucial in the contemporary landscape, where the challenge lies in aligning the aesthetic and cultural value of products with environmental and social needs.

The concept of leadership, in fact, has increasingly been linked to design, especially in the context of ethical and sustainable design. According to the traditional definition, the term leadership refers to the ability to guide and influence a group towards common objectives (Treccani). However, a deeper analysis, such as that proposed by Peter G. Northouse in his work *Leadership: Theory and Practice* (1997), reveals leadership as a dynamic, interactive, and contextual process, profoundly influenced by cultural, organizational, and social factors. Northouse explores how leadership can be applied in various contexts, including intercultural leadership and team leadership, emphasizing

personal qualities such as intelligence, trust, determination, and integrity, all of which are essential in guiding innovative and collaborative processes.
In parallel, Richard Sennett's *The Craftsman* (2008) plays a crucial role in defining the role of contemporary craftsmanship. Sennett delves into the concept of the "craftsman," focusing on the importance of competence, care, and dedication in manual work, qualities that have traditionally been integral to Italian production practices. Designers and curatorial leaders, therefore, are figures capable of integrating technological innovation with the value of traditions, driving a rethinking of design practices through a greater awareness of their social and ecological implications.
This evolution in design today manifests itself in a reconsideration of the paradigms inherited from the German Bauhaus school, which dominated the design landscape for much of the last century. Today, design culture is increasingly oriented towards a sustainable future, where the overcoming of traditional models is not seen as a threat, but rather as an opportunity to innovate, offering alternative visions that can address environmental, ethical, and social challenges. The growing interdisciplinarity and adoption of hybrid approaches in design highlight the need for a paradigm shift, where sustainability becomes key to integrating artisanal quality with modern market and eco-sustainability demands (Germak, 2015).
Curatorial leadership in design implies a holistic vision that goes beyond the product's aesthetics, considering the social, economic, and environmental impacts of design choices. In this context, design emerges as a fundamental tool not only for aesthetic innovation but also for promoting a responsible business model. As Ezio Manzini (2015) asserts, design is no longer simply a process limited to creating functional and beautiful objects but must respond to the social and ecological needs of a community, generating shared value through practices that are both responsible and inclusive.
In Italy, *Made in Italy* is synonymous with excellence and uniqueness. Its strength lies in the ability to blend tradition and innovation – qualities that are valued through a production system now required to face the challenges of globalization, sustainability, and digitization. Local artisanal practices, combining manual expertise with technological innovation, must now respond to the need for a strategic vision that makes them competitive on a global scale, without sacrificing cultural identity and environmental respect.
In this context, curatorial leadership emerges as one of the most powerful tools for addressing contemporary challenges. This form of leadership not only guides the design process but enriches it with strong cultural and territorial value, bringing to the fore a new type of designer who not only manages but actively curates the relationship between cultural heritage and the innovations needed for the future. Through the enhancement of local resources and artisanal traditions, curatorial leadership enables responses to the growing demand for sustainability and social responsibility, integrating these principles at every stage of the production process.
Within the landscape of Italian businesses, curatorial leadership plays a fundamental role in steering companies toward a more responsible and sustainable business model. Businesses are no longer merely places of production; they are cultural and economic actors that must respond to global challenges, including the demand for products that are ethical, ecological, and people centred. Design, therefore, becomes the engine for a transformation that affects every phase of production, from design to realization, promoting the creation of value that goes beyond the aesthetic and functional aspects of the product. The designer, as a curatorial leader, must integrate creativity, technique, and strategy into a process that meets sustainability requirements without compromising the quality and authenticity that define *Made in Italy*.
This vision aligns perfectly with the United Nations' Sustainable Development Goals (SDGs), particularly SDG 12 (Responsible Production and Consumption) and SDG 8 (Decent Work and Economic Growth). The adoption of ethical and sustainable practices in manufacturing not only contributes to competitiveness but also creates a positive

impact on local communities and the environment, promoting a culture of design that is genuinely transformative.
In light of these reflections, this contribution aims to investigate how curatorial leadership can serve as a strategic design approach to revitalize local production ecosystems in Italy, particularly in the context of hybrid practices that connect artisanal knowledge with contemporary design methods. The research focuses on identifying models of collaboration that integrate cultural heritage, sustainability, and entrepreneurship, highlighting the transformative role of designers as mediators and facilitators of innovation within local communities.
The study adopts an interdisciplinary framework that draws from design theory, cultural studies, and leadership practices. It engages with the work of Northouse (1997) and Manzini (2015), among others, to conceptualize leadership not merely as a managerial function but as a curatorial act – one that balances strategic vision with local specificity and ethical responsibility. This approach also considers the socio-technical dimensions outlined by Sennett (2008), positioning the craftsman not as a nostalgic figure, but as a potential agent of innovation.
Within this framework, the paper analyses design-driven entrepreneurial initiatives developed through the Art Lab partnership – a cross-border cooperation programme supported by Interreg Maritime Italy-France – as a case study to explore how young designers can act as leaders in developing sustainable and inclusive value chains. By examining these initiatives, the research seeks to contribute to ongoing discussions on how design can generate actionable strategies aligned with the SDGs, particularly SDG 8 and SDG 12, while reinforcing the cultural and economic identity of local territories.

2. An Interreg Program Studies the Interconnections Between Design, Leadership, and Local Production

In recent years, Italian design has witnessed a significant expansion in its field of application, embarking on numerous new and uncharted trajectories. Among these, the renewed focus on craftsmanship stands out as particularly noteworthy. This rediscovery and re-evaluation of traditional artisanal expertise, merging historical heritage with contemporary innovation, generates a dialogue capable of redefining the landscape of contemporary design. Far from being a homogeneous phenomenon, this process encompasses a multiplicity of approaches, as documented in publications, projects, and exhibitions. It ultimately contributes to shaping new paradigms for the intersection of design and craftsmanship. Against the backdrop of the legacies left by the masters of Italian design and the generation that has inherited their values, an intricate investigation emerges regarding how craftsmanship has not only been reappraised but also reinterpreted as a virtuous foundation for the future of Made in Italy.
Contemporary cultural production, while not confined to a singular school of thought, demonstrates how design is shaping a parallel reality alongside industrial production. The latter is increasingly marked by an emphasis on authenticity, sustainability, and customization—qualities inherently embedded in the artisanal domain. Through diverse creative strategies, designers not only reinterpret traditional techniques but also integrate them with advanced technologies, proposing production models that respond ethically and innovatively to global challenges. This interplay between design and craftsmanship provides an analytical framework through which the transformation of design practices can be observed, prioritizing sustainability, social responsibility, and technological innovation.
Several significant projects illustrate this symbiotic relationship. Internoitaliano, founded

in 2012 by designer Giulio Iacchetti, exemplifies an innovative approach to contemporary craftsmanship. The initiative envisions a decentralized manufacturing network involving artisanal workshops spread across the Italian territory. By collaborating with these local artisans, the project designs and produces furniture and accessories inspired by Italian cultural heritage. The mission of Internoitaliano is to narrate—through objects—the Italian way of life, which has long been admired and globally recognized. Each product, crafted entirely in Italy, embodies an authentic mode of living, one that is attentive to people, traditions, artisanal skills, and the geographical specificity of materials. A distinctive feature of this project is the signature of each piece: both the artisan and the designer personally sign the finished product, reinforcing the notion of co-authorship and shared creative responsibility.

Similarly, the 2016 DoppiaFirma initiative, promoted by the Fondazione Cologni dei Mestieri d'Arte in collaboration with *Living* – the interior, design, and lifestyle magazine of *Corriere della Sera* – offers another compelling model. Launched during the Fuorisalone of Milan Design Week, the project seeks to enhance the dialogue between contemporary design and traditional craftsmanship, fostering innovative collaborations between designers and master artisans. The resulting works, emerging from this intersection of creative disciplines, serve as tangible expressions of regional identities, demonstrating the capacity of design to revitalize and reinterpret artisanal expertise within a modern framework.

Beyond these initiatives, broader systemic methodologies within contemporary design integrate multidisciplinary knowledge to develop production models that reconcile tradition with technological innovation. The growing constellation of designers engaging with craftsmanship signals a profound shift within Italian design culture, wherein craftsmanship is no longer perceived as a vestige of the past but rather as a dynamic resource for envisioning the future. As Germak (2015) notes, the collaboration between designers and artisans fosters a process of mutual contamination, elevating design quality while establishing new modes of consumption and production. The Italian manufacturing context distinguishes itself by its ability to merge local artisanal traditions and specialized expertise with the opportunities afforded by digital technology. Movements such as the Makers and FabLab, alongside academic and cross-border initiatives, underscore the role of design as a catalyst for innovation and sustainability.

A flagship case study that exemplifies this phenomenon is the Art Lab Net project, promoted by the Department of Architecture and Design (DAD) at the University of Genoa. This initiative integrates the principles of the UN Agenda 2030, fostering regional cooperation and supporting micro-enterprises, often led by female artisans. Through digital platforms and storytelling strategies, Art Lab Net not only enhances the value of artisanal products but also creates meaningful connections between past and future, safeguarding cultural roots while promoting the fusion of tradition and contemporary innovation.

To identify effective strategies for communication and commercial positioning of artisanal products, the research methodology incorporated an in-depth analysis of key projects, field observations, case studies, and expert interviews. Within the Art Lab Net initiative, qualitative interviews were conducted with over a hundred artisans from the Italy-France Maritime regions, exploring their specific needs and expectations concerning the preservation and evolution of their craft. These interviews provided crucial insights into production techniques, daily challenges, and perceived opportunities regarding the integration of new technologies and design strategies. The findings revealed a critical need for mentoring systems that could facilitate the transition towards contemporary market demands without eroding the authenticity of traditional craftsmanship.

An essential outcome of this research was the identification of strategies to enhance the visibility and competitiveness of artisans within an increasingly digitalized and globalized market. Despite their expertise and deep-rooted traditions, many artisans face significant obstacles in adapting to the contemporary commercial landscape, particularly in

effectively communicating the cultural and social value of their products. To address this issue, the study developed a strategic storytelling model, designed to convey not only the intrinsic quality of artisanal pieces but also the rich narratives embedded within them. This approach strengthens the territorial and cultural identity of the products, enhancing their appeal to discerning consumers who seek authenticity and sustainability.
The research further examined emerging market trends, revealing a dual trajectory: while industrial production continues to appeal to cost-conscious consumers, a growing segment of the market actively seeks unique, handcrafted, and ethically produced objects. However, the dominance of mass-produced goods within digital marketplaces poses new challenges, necessitating sophisticated presentation techniques. Augmented reality, 3D modelling, and immersive digital experiences have emerged as viable solutions, allowing consumers to engage more deeply with the materiality and authenticity of artisanal products.
The Art Lab Net project also functioned as a natural laboratory for experimenting with sustainable design solutions. Collaborations between designers and artisans resulted in product prototypes that employed locally sourced and sustainable materials while leveraging advanced technologies to optimize production processes. These efforts exemplify how curatorial leadership extends beyond strategic orientation to encompass an ethical and cultural vision—one that actively steers projects towards responsible business models capable of addressing contemporary global challenges.
The ultimate impact of this strategic mentoring model was the creation of a collaborative framework that granted artisans access to new markets and opportunities while preserving their cultural identity and artisanal values. The role of contemporary designers, acting as facilitators and mentors, proved instrumental in bridging craftsmanship with innovation, ensuring the intergenerational transmission of artisanal knowledge in a manner that is both sustainable and forward-looking. The initiative demonstrated how curatorial leadership can serve as a foundational pillar in supporting local production within an increasingly globalized economy, forging novel connections between past and future while shaping a developmental paradigm grounded in authenticity, ethics, and sustainability.
This trajectory underscores a broader transformation within contemporary Italian design: designers are no longer mere creators of objects but emerge as ethical leaders, actively redefining organizational and production models to align with sustainable and socially responsible imperatives. Their leadership manifests through intercultural design practices, support for design-driven entrepreneurship, and a commitment to fostering ethical consumption models. As Manzini (2015) argues, the designer of the future is a strategic facilitator, capable of synthesizing ethical imperatives with entrepreneurial objectives, thus creating synergies between local and global actors. Within this evolving framework, contemporary design becomes not only a discipline of aesthetic and functional innovation but also a platform for ethical leadership – one that reconfigures sustainability, craftsmanship, and digital innovation into a cohesive and transformative vision for the future.
The methodology adopted in this study is qualitative and exploratory, rooted in design research practices and enriched by interdisciplinary contributions from the fields of cultural studies, economics, and sustainability science. By combining fieldwork, semi-structured interviews, and case analysis, the research provides an in-depth understanding of the dynamics between designers and artisans within local production ecosystems. The insights generated through the Art Lab Net initiative serve not only as empirical evidence but also as a basis for developing scalable strategies that support design-led innovation in local contexts. These findings highlight the relevance of curatorial leadership as a conceptual and practical framework capable of guiding the transformation of local production models in alignment with the UN Sustainable Development Goals. Building on these results, the next chapter will explore how collaborative design processes can be formalized into operational strategies that

strengthen both cultural identity and economic viability, particularly in marginal or underserved territories.

3. From Theory to Practice: Designer-Entrepreneurs rediscover (and improve) Local Crafts

Integrating artisans into the historic centers of lesser-known or smaller villages represents a crucial opportunity to stimulate the development of these areas' tourist appeal. This process not only contributes to the revitalization and valorization of cultural heritage but also promotes sustainability, enhancing the competitiveness of local tourism activities (Sau, 2020). In recent years, there has been a growing "search for authenticity" (Ferrari & Adamo, 2005), which has directed tourist flows toward secondary destinations, largely due to the saturation of traditional tourist hotspots. Despite the challenges posed by the pandemic and economic crises, this phenomenon has led to the rediscovery of lesser-known places, where tradition and craftsmanship can play a vital role in creating more authentic and original tourist offerings.

The "Art Lab" projects, which developed in several phases, are concrete examples of how design can support and innovate the artistic craftsmanship sector, highlighting both its challenges and its potential for growth. The three projects—Art Lab Net, Art Lab Experiences, and Art Lab Services—allowed for a deep dive into the artisanal context, promoting activities that supported the sector in various areas, including sustainability, process innovation, and strengthening networks between designers and artisans.

Thanks to the Interreg Programme, it was possible to encourage a distributed production model across different territories, intertwining design and craftsmanship while enhancing cultural and territorial resources. Particularly noteworthy was the involvement of local associations, which played a fundamental role in promoting artisanal production within their communities. During the Genoa BeDesign Week, for example, a collaboration with the Design District enabled the realization of an exhibition that showcased the work of artisans. Unique and previously unseen products were displayed in the historic centre of the city, allowing many visitors to discover the fascinating knowledge hidden within the workshops. This initiative provided artisans with a direct channel to interact with the public, offering insights into production techniques, engaging in discussions with fellow artisans, and experimenting alongside university design students. Such moments demonstrate how small-scale interventions can foster greater awareness of the artisanal system, laying the groundwork for broader and more structured future projects.

By bringing together students, artisans, and researchers, more conscious and coherent projects can emerge, attuned to contemporary needs while remaining open to future developments. The designer, in this context, asserts himself as "the artist of our time," ready to respond to societal needs by solving problems without stylistic prejudices or artistic pretensions (Munari, 1997). The role of innovation within design can thus be seen as that of an orchestra conductor, capable of weaving connections between different disciplines and charting new horizons that enable the formal recognition and educational codification of the designer-artisan role. Today, the act of thinking is as crucial as the act of making, and meaning surpasses mere physical production of objects, systems, and services (Bassi, 2017).

The Art Lab Net project was the first pivotal step toward synergy among the partners, facilitating the creation of structured collaborations based on each actor's unique skills and expertise. It involved the organization of numerous seminars and workshops, many of which focused on environmental sustainability, aiming to raise artisans' awareness about adopting low-impact materials. Topics such as eco-design, the use of recycled materials for packaging, and the recovery of fabrics for tableware items, all aimed at reducing

ecological impact, were discussed. Additionally, participants had the chance to explore areas such as ethical fashion (in collaboration with Sara Conforti Hòfer), urban gardening (with David Zonta), and restoration techniques (with Antonio Rava and the School of Specialisation in Architectural and Landscape Heritage at the University of Genoa). The historic centres of the cities involved, including Genoa, became a stage for fascinating tours that led visitors through artisan workshops, such as the rickshaw tours organised by Treecycle in Genoa's historic centre.

The second phase of the project, Art Lab Experiences, focused on connecting young graduates in design, art, and architecture with artisanal workshops, fostering the transfer of creative skills into the production context. In this project, young designers proposed innovative solutions such as the use of "non-cruel" silk for jewelers making, the use of natural dyes for textiles, and the adoption of biopolymers for 3D printing jewelers. Beyond creativity, the project also emphasized the importance of roles such as social media managers, marketing experts, and web designers, which can be crucial for enhancing the visibility of artisanal products and increasing competitiveness in the global market.

The third project, Art Lab Services, was particularly significant in addressing the needs of artisans who had recently started their businesses, identifying necessary support services to navigate the challenges of the early stages of professional life. These artisans, often struggling to stabilize their position in the market, benefited from targeted consultations to address transitional moments, where the lack of experience and economic stability can threaten the survival of small enterprises. The program had a significant impact, not only from a technical and operational perspective but also by helping to build a support network that, through an integrated approach to design, marketing, and strategy, fostered the resilience of local businesses.

The results and studies described here are part of the findings obtained from the Art Lab project, supported by the Interreg Maritime Italy-France program, from 2017 to today, in synergy with all the valuable partners of the initiative. It is crucial to acknowledge the contributions of all those involved in the project, without whom this research would not have been possible. If, in the Italian tradition, the entrepreneurial spirit is tied to the "magic of the impossible," linked to an initiatory, symbolic, and alchemical culture (Morace & Lanzone), we must recognize the determination of many individuals. Without a virtuous team effort, the achievements described here would not have been realised. The project team consisted of people from diverse backgrounds, each of whom contributed their expertise and dedication to the initiative. It is therefore important to extend gratitude to all project partners, not only those who worked in the Liguria Region but also the teams from Corsica, Sardinia, and the French Riviera, whose support and insights played a fundamental role in shaping the project's evolution.

Studying contemporary design and cultural trends while participating in initiatives that support craftsmanship has led to key reflections. Italian universities, building upon these newfound insights, have an opportunity to invest further in distributed production models that integrate design and craftsmanship, enhancing cultural and territorial resources without necessarily excluding industry. Academic curricula can incorporate local artisans and foster hybrid experiences, where artisans collaborate with different professionals to develop new educational pathways. By preserving and transmitting traditional techniques to Generation Z, universities can ensure the continuity of artisanal knowledge while adapting it to contemporary technological advancements.

The collaboration among various partners and institutions has laid the foundation for developing synergistic relationships between making, research, and culture. As the world changes rapidly and international dynamics evolve within an increasingly fluid and globalized landscape, the ability to navigate in a different direction becomes an invaluable strength. The fusion of design, craftsmanship, and sustainability within a framework of ethical leadership provides a viable pathway for shaping the future of cultural production, reinforcing the role of artisans and designers as key players in an ever-changing global economy.

These pilot initiatives offer valuable insights into how design-driven innovation can empower local craftsmanship to thrive within contemporary economic and cultural ecosystems. The intersection of tradition and innovation, as demonstrated by the Art Lab projects, outlines a reproducible methodology that can be adapted and scaled in other regions. This approach leverages design not only as a tool for aesthetic or functional improvement, but as a strategic asset for sustainable development, territorial regeneration, and community empowerment.
Ultimately, the rediscovery of craftsmanship through the lens of design and curatorial leadership reaffirms the potential of small-scale, ethically grounded innovation. In a world dominated by globalized production and digital consumption, these practices illuminate a different path – one that values slowness, care, cultural depth, and ecological responsibility.

ABSTRACT | This article examines systemic leadership pedagogy, and the educational evaluation and planning processes designed to guide the developing, adjusting, and teaching of systemic design courses on an international collaborative level.

Contexts: When operating as a systemic designer, systemic design educator, or systemic leader in public and private sectors, one inevitably operates in and with uncertainty due to the exceedingly complexity of the system context that is to be transformed through design, pedagogy, and facilitation. Developing the skills to navigate uncertainty can lead to greater confidence, or certainty, in addressing complex systems holistically. Certainty in systemic leadership then concerns acknowledging the situation that is to be studied as complex and thus connected to uncertainty and the ability to operate in it. To examine this situation, we explored how conversation theory can facilitate discussions and possibly skills in supervising holistic approaches. In particular, we highlight the role of exercising capacities of uncertainty through conversations, demonstrating how structured dialogue can help individuals and teams develop resilience and adaptability in uncertain contexts.

Empirical data gathered from organizing an international course in systemic design within the Erasmus+ program over some years makes a perspective for a theoretical discussion that origins in systemic leadership and pedagogy and on theory on systemic design, conversations, systemic leadership, systems thinking, and pedagogy. In extension we discuss the concept of

systemic leadership and education in relation to UNESCO´s key competences and approaches to teaching necessary to fight the Poly-crisis and the climate change.

KEYWORDS | systemic design pedagogy, conversation theory, Erasmus+ collaboration

1. Introduction

This article emerges out of an Erasmus + collaboration within our network European Systemic Design Lab (ESDL) which is an international collaboration between L'École de design Nantes Atlantique (EDNA), the University of Applied Sciences (HTW) Berlin and the Oslo Metropolitan University (OsloMet) and our interest in reflecting about our pedagogy in relation to theory on systemic leadership and systemic design. This involves the considering of how we lead our own work, how we facilitate for students to lead their own work, how students critically reflect on their own thinking, and how we support students learning to learn- all to be able to operate in complexity and thus uncertainty- and systemic thinking in design.

The overall goal with our Erasmus+ initiative is to contribute to Education for Sustainable Development (ESD) initiated by United Nations Educational, Scientific and Cultural Organization (UNESCO, 2018) aiming to reach the global Sustainable Development Goals (SDG's). Briefly introduced, (ESD) presented eight specific key competencies necessary to fight climate change and the poly-crisis that need implemented in pedagogy and educational planning. The competencies are angled towards action-oriented approaches and transgressive learning in which Lotz-Sisitka et al., (2015) suggests as means to overcome the status quo and prepare the learner for disruptive thinking and the co-creation of new knowledge." (UNESCO 2018) Systems thinking is enumerated first in this list of competencies that can facilitate the change from the status quo.

In our Erasmus+ collaboration, systemic design which can be understood as the combination of design practice and systems theory, is explored in a diverse environment for learning the dynamics and processes this implies, and is thus aligned with UNESCOs understanding of that:
"...to create diverse and cross-boundary learning settings and draw holistic, comprehensive pictures of global sustainability challenges (including the SDGs), educational institutions and educators should foster partnerships at the local, national and international level." (p51, 2018)

2. Methods

Our research is oriented about generating knowledge about status quo in today's educational planning and how this can be transformed by perspectives of systemic leadership and conversation theory.

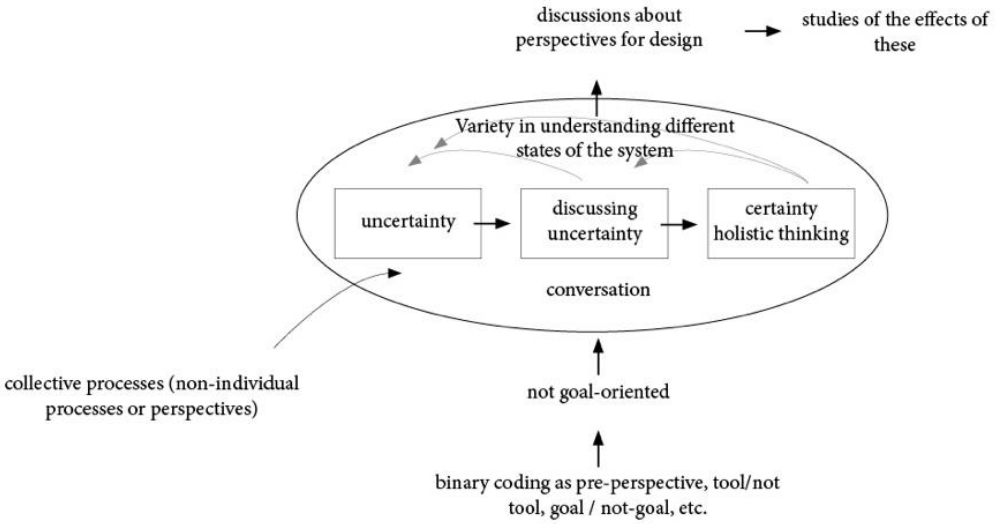

Figure 1. A setup of our research design which describes the status quo by ways of communication and goal oriented processes that do not consider the whole picture for interventions and how collective processes that involve learning to learn by conversation that facilitate students of handling uncertainty and thus the ability to handle and change exceedingly complex systems.

Our examination involves analyzing student feedback from our organizing of education, and experiences with conversation theory as part of this. The theoretical discussion of the case that makes the contexts for examination for this study is oriented about systemic leadership and pedagogy and on theory on systemic design, conversations, systemic leadership, and systems thinking.

2.1 Case, International Weeks

The ESDL collaboration involves, among other things, conducting a joint event that we call International Week, that spans a week, where students from all partaking Universities work with systemic design in cooperation with businesses, public agencies, and researchers. The international week is conducted annually over three years as part of the Erasmus+ program. The case utilized for the theoretical discussion in this article is the International Week. When attending this course, the students have different experiences with systemic design in advance, and their diverse cultural backgrounds and pedagogical experience create a framework for cultural learning and practicing systemic design in a complex international context. In short, the international week in systemic design is structured as follows: students meet, are divided into groups, are presented with a problem from business or research projects, are introduced to a method by a PhD student researching the area, this year's theory was "soft systems methodology" (Checkland & Poulter, 2020), receive guidance from instructors from the three universities, are interviewed and guided by two PhD students working in the field, with a fundamental factor for sharing being based on conversation theory (Glanville, 2007; Pangaro, 2017; Pask, 1978; Sweeting, 2019) and conclude with sharing their results.

During these international weeks the students from these diverse cultural and educational backgrounds work together on systemic design projects confronted with unfamiliar contexts and working with new peers. Due to the coupling of these factors the students meet other perspectives and thus encounter other viewpoints which in turn often elicit critical thinking about personal and

external perspectives. We as educators in this setting seek to create learning environments by adopting *a systemic leadership* role by tutoring students going through these challenges, that involves balancing the demands of the projects, (Robinson et al., 2008) discussions on how reflecting on these issues benefit learning, as well as urging them to always be in the position of seeing the full picture while simultaneously considering the details that make the whole. (Ackoff, 1999; Glanville, 2007; Pask, 1978)

At the end of the international week, students were asked to write about their learning experiences and critically reflect on the pedagogical setup compared to what they were accustomed to. These reflections were utilized as means for discussing how Conversation Theory and systemic leadership can play a role in the attaining of critical thinking at different levels—students, facilitators, and educators—by challenging traditional pedagogical structures and promoting reflective learning beyond comfort zones.

2.2 Systemic leadership

In today's organizational and societal landscapes, leaders and accordingly educators are thus increasingly confronted with complex and interconnected challenges. Issues such as climate change, economic inequality and technological disruptions are not effectively addressed through linear thinking or traditional leadership models – neither in business nor in academic contexts. Authors such as (Beerel, 2020) argue that leadership has to enter into new relationships with nature, society and individuals in order to be able to make a sustainable, trust-based impact on solving problems. The new approach for leadership develops towards an ethical approach as (Beerel, 2020) formulated

> "ethically sensitive managers need to engage in self-examination and develop their own self-awareness. They need to reflect on the kinds of people they are, their value system and the types of decisions they make. They need to be open to self-development and change and should seek out opportunities for personal growth and challenge". (Beehner, 2020)

Also Mugadza et al. (2019) explain how leadership has changed since the Pre-Industrial Age - from the born leader in industrial times towards innovative leadership with a Systemic Design perspective. Leadership in the context of the global poly-crisis is shifting towards a more holistic and adaptive approach, which can be understood as a systemic leadership framework. Systemic leadership integrates principles of systems thinking with leadership practices, a practice that optimally benefit individuals and organizations to learn how to navigate complexity and drive sustainable change. Systemic leadership is rooted in understanding and addressing the dynamic, interconnected nature of complex systems within and beyond organizations. Moving beyond traditional hierarchical models, it emphasizes a holistic perspective that involves collaboration, adaptability- dimensions meant to elicit shared purposes and values such as sustainable transformation. Systemic leadership involves the recognizing of organizations as components of broader, complex systems. This requires leaders to connect people and resources across these interdependent networks. (Beehner, 2020, p. 2) Senge et al. (Senge et al., 2019) identify three defining features of systemic leadership:

- "Systemic leaders are not extraordinary individuals but facilitators who create the conditions for effective social change.
- Leadership in this context is not limited to formal authority; any individual within an organization can act as a systemic leader.

- Key systemic leadership capabilities include the ability to view the larger system, encourage reflective and innovative dialogue and shift the collective focus from reactive problem-solving to proactive co-creation of the future." (Senge et al., 2019)

Systemic leaders perceive polarized situations and seemingly wicked challenges as opportunities for innovation (Senge et al., 2019) They are adept at balancing short-term reactive problem-solving with long-term, proactive value creation. Their commitment to the overall well-being of the system may fosters transparency, openness and alignment within teams and organizations (Beerel, 2020; Brown & Treviño, 2006). A fundamental strength of systemic leaders lies in their ability to build collaborative networks. This practice promotes transparent communication to cultivate an environment where innovative solutions can emerge. Moreover, systemic leaders embrace the unknown, asking exploratory questions and demonstrating a dedication to continuous learning, which inspires broader change efforts. (Senge et al., 2019) Brown & Treviño, (2006) highlight the importance of adopting a more structured and integrated social scientific approach to understanding leadership as it is practiced in real-world business contexts. Drawing on social learning theory, they explore the influence leaders have on the behaviors and perceptions of those they engage with. Social learning theory suggests that individuals are inclined to observe and imitate role models they perceive as credible and appealing. Based on this framework, Brown and Trevino define ethical leadership as

> "the demonstration of normatively appropriate conduct through personal actions and interpersonal relationships, and the promotion of such conduct to followers through two-way communication, reinforcement and decision-making." (Brown & Treviño, 2006)

In university contexts, ethical leadership might be relevant, as professors often serve as role models whose actions and communication might influence students' learning and ethical development.

In this research however we consider systemic leadership a complex functioning that involves understanding communication as cyclic. (Bateson, 2000) Cyclic communication involves the conception of feedback, a primary term of cybernetics, that can be explained as when observed outcomes of a system's action is taken as input for further action (Sweeting, 2015). Cybernetics thus, involves the examination of how systems outputs, change the actions, that again change the outputs, in circuits. Cyclic communication thus, when described can help understand the different logical levels of communication that happens in a system. (Meadows & Wright, 2015) When discussing or conversing however it is difficult to get an overview throughout these levels of communication. Hence, the complexity of the communication represents a context of uncertainty in which the systemic leader, the systemic designer, or service designer must operate.

2.3 Certainty and uncertainty

Systemic design approaches are exceedingly complex situations and builds on the concept of richness of data and the visualization of these, cooperative processes, openness to exploration, and thus uncertainty as basis for practical application of methods.

Certainty in systems theory and learning can be linked to the question of how do you know that you know? (Coombs, 1987; Maturana, 1988) or how do you know what you know? Certainty from a teacher's perspective is often connected to instructional pedagogics as well as to autonomous oriented or problem-based pedagogics. In both situations one could say that the professor meta-communicates "I know this therefore I can instruct" or "I know this therefore I can let you come to a conclusion that I can evaluate". However, understanding these two situations in relation to critical thinking can somewhat help disconnect the pedagogics from the understanding of knowing and not knowing. For students approaching exceedingly complex situations with certainty may involve

changing the situation by design interventions with confidence, that they do not know the effect of, even though the teleological perspective. Uncertainty, however, may represent the ability to operate in such situations without initially understanding them nor methods for how to handle them. However, with skills and knowledge about *how* to gain understanding one may generate insights that will lead to the emergence of how to approach the complexity and thus increased possibilities to analyze the effects of suggested interventions towards change. The same can be said for the educational planning. To be uncertain and trying to understand uncertainty and complexity can thus be understood as a systemic skill both on educational level and practitioner level that may be described as learning to learn.

2.1 Conversation theory and learning to learn

We are therefore studying how conversations work in a pedagogical setting and how they may facilitate processes of concentration, thinking of various perspectives for understanding, thinking on the basis of the thoughts of others. That is, practicing on being critical towards personal and external critical thinking.

Conversation theory, as described by Pask (1978) involves a situation that sets the "stage for shared language" based on "interactions that may build … [sufficiently] shared understanding … that may lead to … action or (trans)action—a coordinated interaction in domains other than language" (Pangaro, 2017). Reactions, in this view, refer to a priori knowledge, while communication that builds on other communication refers to relations that create a continuing whole. Conversation theory grew out of the early development of cybernetics. Gordon Pask, a pioneer in the field, described in the mid 1970's the Conversation theory, which is referred to by Paul Pangaro (2017), with the words of Pask: "Conversations are the things we study", and such they facilitate "learning to learn. (Pask in: Pangaro, 2017) In a conversation a student or teacher or others, build on or utilize communication to create the subsequent communication. Counter to what typically happens in a dialog or two way communication, where people react to a statement based on existing personal meanings or knowledge, conversations thus build on communication to create new meanings and knowledge (Pangaro, 2017; Pask, 1978; Scott, 2015; Sweeting, 2015, 2019).

A conversation can be organized by the framing of that an individual utters something, the next person will build on this thought by adding something to it, taking it into a new sphere or paradigm, and so forth. The uttering of the second individual is thus externally initiated by the first. The third individual builds on the argumentation of the second with the first in mind. That is as the utterings build on each other and the conversation will respectively and gradually distance the discussion from prior thinking by the partaking individuals and create new thinking. The conversation itself thus starts with the thinking of others and creates the examination of uncertainty with and without the support of theory or practice. It is an interesting distinction between communication and conversations, and that is:

> " that for conversation to have occurred, something must have changed for one or more of the participants – understandings, concepts, intent, values. That is, something has evolved. Otherwise, it is merely the exchange of messages (Pask (1981) in: Pangaro, 2017)

The concept of conversation is not far from how Schön (1995) later described how practitioners reflects in their work processes and how for example a change in a conversation performed drawing in design changes the conversation, which in turn changes the drawing—a process that subsequently has a direct influence on the properties of something other than the conversation, such as a service or product.

Conversation theory then expands the complexity of a situation, by individuals studying the effect of change, being forced to take the standpoint of- or build on arguments that might be in conflict with personal thoughts or values, and allows for the remaining in uncertainty by the certainty of the frame or rules for the activity.

3. Exercising capacities of uncertainty by conversations

Examining the educational planning in the context of systemic leadership and conversation theory we discuss how the context of the international week can influence the ability to think critically about one's own learning, and how this teaching format has pushed levels of pedagogy in systemic design education. Practice of methods and learning processes at one university might not immerse automatically into another cultural environment. One institution might be focused more on methodology and frameworks, some on reflections and learning, and others might prioritize creativity and holistic reflections. International week as a project is designed to question these practices and give ideas on new implementations for systemic design leaders on several levels. The systemic reflections about study environments happen for systemic design leaders, while different kinds of personal reflections on learning, as an impact of experiencing the event, happen at the level of students.

Feedback from the students' individual reflection notes after experiencing the international week outlined that the local environment for learning creates different viewpoints on how to handle the assignment. Different institutions have diverse viewpoints on how the event should be organized and what are the expectations of outcomes for students. This is mainly due to the distinction between cultural backgrounds of each university and their local approach to teaching. Throughout the process of facilitation, their viewpoints are shared and discussed. Levels of involvement, and the choice of stakeholders depend on the hosting university and the organization team, but the overall goal of the international week, contents and process to a certain extent involves contribution of each university. This way, the ability of each university to reflect on their local practice is initiated already in the organization phase. There might be various depths in which teachers, or also leaders, evaluate their own environment.

What was specific for the international week in Oslo in 2024, is the encouragement of students to focus on the learning process, reflections and discussions, rather than the deliveries at the end of the week. This has created different kinds of dynamics, where their personal space, and how the whole groups of students were collectively processing this learning, was uplifted from the end result. Another approach was to teach a method through encouraging students to experience, reflect on and handle the uncertainty of the studied context. For example, the emphasis was placed on the exploration of the applied method, and it’s possible modification, or a reflection on groups' understanding of how the method works. Due to this framework, the practice of what students are used to from their traditional program was challenged at the same time, as well as the approach on how to teach a certain method, or how each leader perceives the method.

Teaching to operate, stay and work with uncertainty could be a relevant practice for future systemic designers. Several students in their individual reflection notes mentioned that this experience was uncomfortable, and some found it very explorative and exciting. This is the example where the practice they are used to might play a role in the facilitation of their learning process.

One of the first traces of reflection for students starts when they enter a different environment. In autumn 2024 the event of international week was held at the Kjeller campus of Oslo Metropolitan University, where the lectures, discussions, teamwork and tutoring took place. The university plays an

important role on the flow of the event, and on the facilitation, such as if students have access to food, good working space, and technology. Hosting universities have a great influence on how the students operate, often challenging their learning process, in what way their project thinking is developed, and their capabilities to work in teams. This environment also determines the way students perceive their leaders and the kind of communication settings they are used to. They also experienced how leaders discuss their viewpoints on methodology. For some students it was perhaps natural to see their leaders involved in conversation about methodology, while some were somewhat surprised by the fact that this is even possible. That is, the thought of that leaders can develop thinking by conversing in front of students which represents uncertainty by the leaders to some students and staff and a certainty of being able to learn by discussions for others.

What students perhaps often do not realize, but what was obvious from the setting of the week, was that students are often not aware that their own practice and learning process can teach their own leaders. International week can likely be giving them space to do so. It would be interesting to see the dynamics of the international week, if students would be aware of this fact from the beginning. This, as a result, brings dimensions to the pedagogical setting, where teaching systemic design requires openness to different views on theory, methods and context to be examined. Systemic leadership perhaps involves conversing leaders who can develop thinking in front of students.

3.1 Organizing uncertainty by international meetups

The systemic leadership processes implemented during the international week produced reactions from the students who described the leadership roles as uncertain, unknowledgeable, disorganized and unfocused i.a. Specifically, students appeared to struggle with the transition from the teaching processes they were accustomed towards collaborative and participatory dynamics of teaching and learning with a systemic leadership mindset. This understanding was proven in the student's feedback evaluation, where they expressed a preference or expectation for more conventional approaches to teaching and leadership. Such feedback suggests a gap between the intended goals of systemic leadership in teaching and the students' existing perceptions of what effective leadership and teaching should look like. It seems thus that the educational planning could have included information about- or tasks in which the students could consider collaborative learning contexts and critical thinking as a first step of the project. Bridging this gap may give the students the potential of becoming certain in the context of uncertainty of systemic design approaches and processes.

The different learning traditions that the students and teachers convey from their respective educations, will be, at some point, confronted with a way of working that they are not used to. Hence, the international meetups blend traditions on student and teacher levels and the *potential of uncertainty* emerges. Accordingly, all partakers have to question their doxa, that is, the deeply engraved learning, perspectives, or established paradigms that are expressed and unexpressed. This could for example involve discussing different approaches and will or coping to persist uncertainty involving levels of synthesizing work to create an outcome and framing what an outcome means.

Furthermore, it can involve questioning different levels of hierarchy, guidelines and objectives or instructions in relation to learning and thus the consideration of how a leadership model allows for student and teacher agency.

Systemic leadership perhaps as mentioned above may involve conversing leaders who can develop thinking by such questioning by conversation in front of students. Such thinking may involve conversing about other ends of the doxas as in the above examples. In this setting where the students

take part in the conversation agency may emerge for all partakers learning to learn on different levels. These considerations represent similar functions of what Senge describes as systemic leadership. If the international meetups produce all these investigations of doxas, the teachers are no longer extraordinary individuals but perhaps facilitators for exactly providing the discussions of them. As the teachers take part in the discussions close to the role of the student, leadership is shared with the student and no longer limited to a formal authority. Another way to understand this is that the conception of performance, knowledge, insight, and learning is contextualized by uncertainty and made possible by conversation theory in a diverse group.

Integrating Digital Technology with Traditional Craftsmanship: Sustainable Clothing Design Inspired by Song Brocade Patterns

Mengyue Wei, Yingchun Zang,
552436112@qq.com

1 Abstract

This study focuses on **Song Brocade**, a significant representative of China's intangible cultural heritage, and explores how **interdisciplinary design methods** can be employed to digitally transform its intricate patterns. By applying **Shape Grammar** rules, the basic forms of the patterns are analyzed, and artificial intelligence-generated content (**AIGC**) is integrated to optimize the evolution of the designs, which is ultimately applied to fashion design practice. The aim of this research is to **promote the sustainable development of cultural heritage in the modern context**. Furthermore, this study addresses the ethical challenges posed by technological advancements in the digital era, particularly how designers can balance aesthetics, cultural preservation, and social responsibility, while exercising ethical leadership to ensure that their designs have a positive societal impact. Ultimately, this research proposes a sustainable fashion design approach that **combines technological development with ethical leadership**, contributing to the protection of intangible cultural heritage and the harmonious integration of tradition and modernity, with significant cultural and social value.

2 Research objectives

1. Digitization of Song brocade patterns using interdisciplinary design methodology, shape grammar and AIGC technology for garment design practice.
2. Assess the contribution of digital transformation to cultural heritage protection and sustainability.
3. Explore ethical challenges in the digital era, focusing on how designers can balance aesthetics, cultural preservation, and social responsibility.
4. Propose a sustainable fashion design approach that integrates digital technologies and ethical leadership, fostering the integration of tradition and modern design.

3 Research process

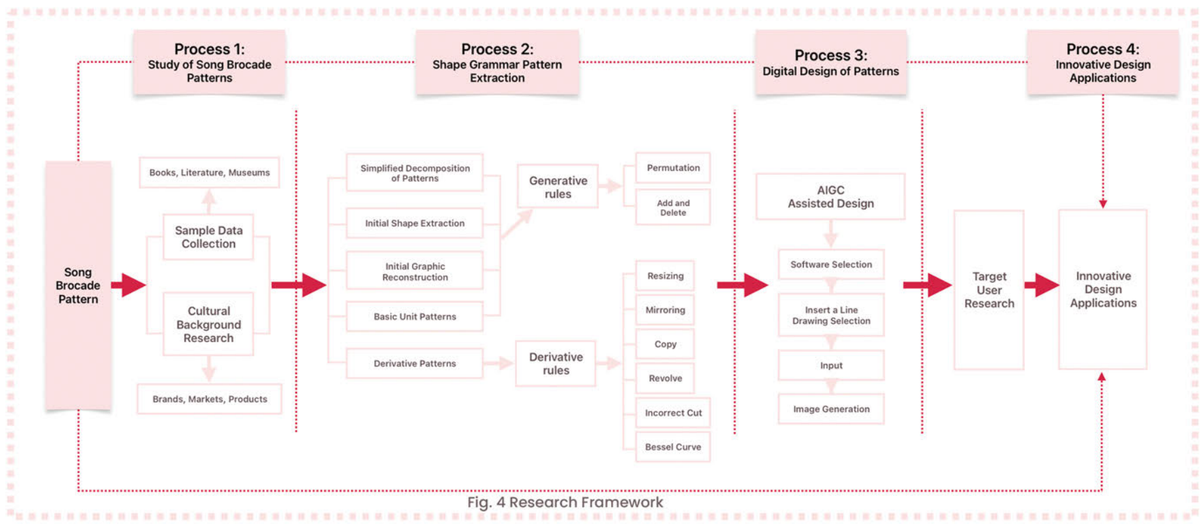

Fig. 4 Research Framework

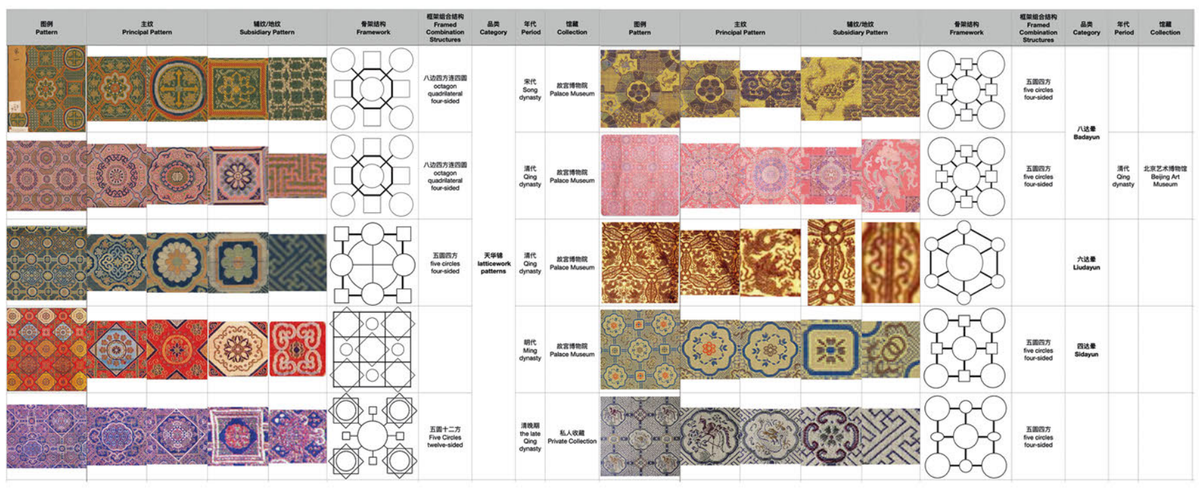

Fig. 1 Research on Representative Patterns of Song Brocade

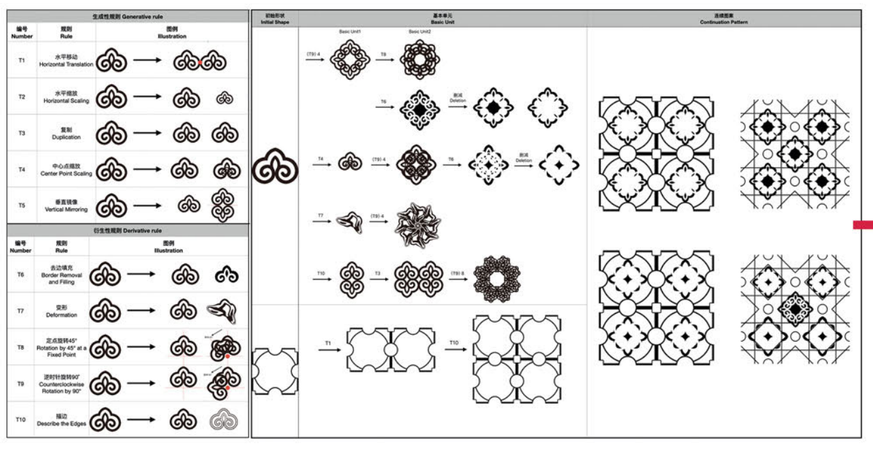

Fig. 2 Shape Grammar Pattern Evolution Process

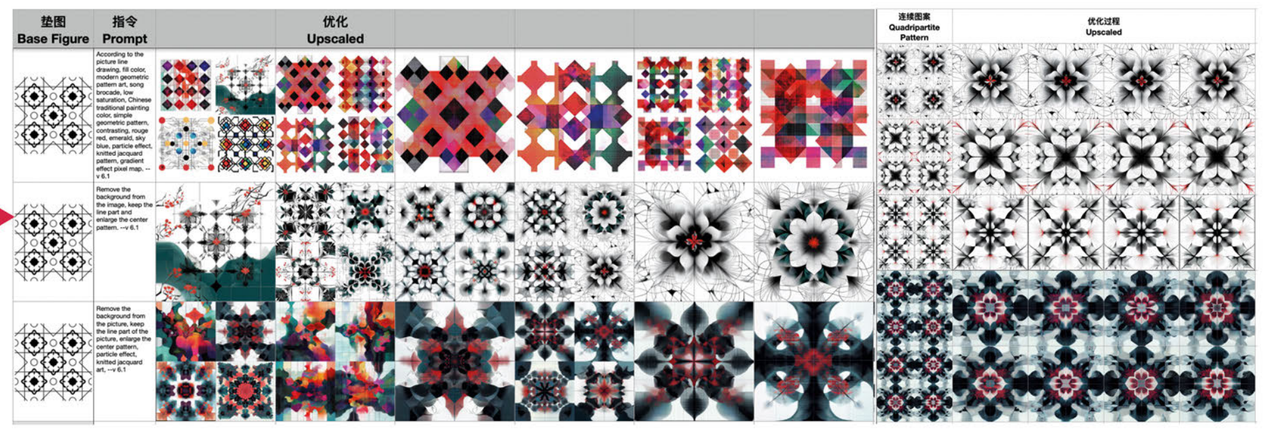

Fig. 3 AIGC Technology Aids in the Contemporary Transformation of Song Brocade Patterns

1. **Shape Grammar Analysis:**
   - The study begins by analyzing Song Brocade patterns using Shape Grammar, which systematically extracts the core geometric principles from the traditional designs.
   - Shape Grammar enables the design process to identify and replicate key motifs, structures, and transformations found in the patterns, establishing a clear and rule-based framework for further innovation.
2. **AIGC Optimization:**
   - Midjourney, an AIGC tool, is used to optimize and evolve the analyzed Song Brocade patterns.
   - The patterns are translated into a "skeleton structure" that serves as the base for AI-driven optimization. The skeleton structure retains the core geometry and cultural essence, while AIGC generates refined patterns that fit contemporary fashion requirements.
   - This method allows the incorporation of modern design trends while maintaining traditional aesthetics.
3. **Cultural Heritage Preservation:**
   - The study investigates how digital tools such as Shape Grammar and AIGC can ensure that Song Brocade patterns are preserved for future generations.
   - The integration of these technologies aids in safeguarding the intricate patterns of Song Brocade from being lost to time, while adapting them for new uses in fashion and design.
4. **Ethical Leadership in Design:**
   - Ethical challenges in digital design are addressed, with a focus on ensuring that the use of AI and digital tools does not compromise cultural authenticity.
   - The study advocates for designers to lead with social responsibility, creating fashion designs that balance innovation with cultural preservation.
5. **Fashion Design Application:**
   - The final stage of the process involves applying the optimized patterns to garment design, blending traditional Song Brocade with modern fashion sensibilities.
   - This application demonstrates how digital technologies can bridge the gap between cultural heritage and contemporary fashion trends.

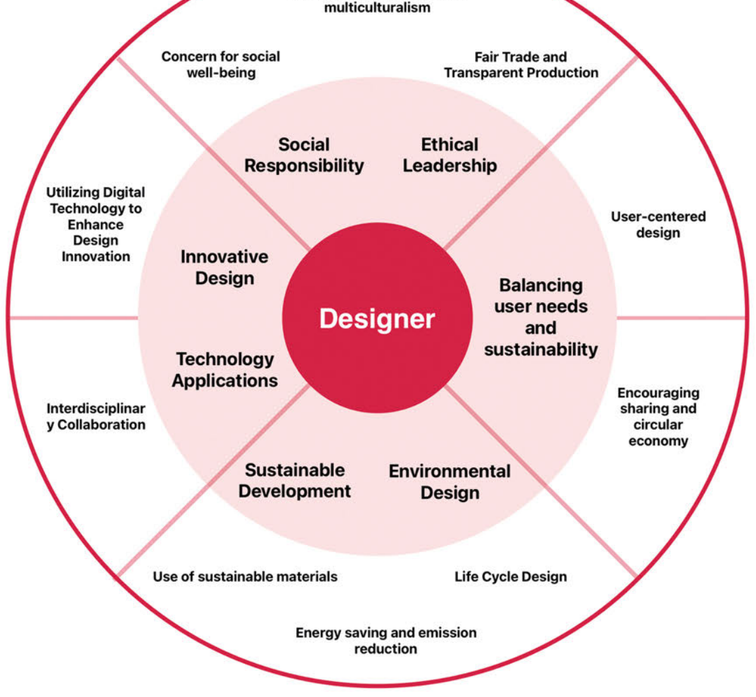

Fig. 5 Ethical Leadership for Designers

4 Contributions

1. **Cultural Heritage Preservation:** Demonstrates how digital tools like Shape Grammar and AIGC contribute to the long-term protection and sustainability of Song Brocade, preserving an important aspect of Chinese cultural heritage.
2. **Fusion of Technology and Tradition:** Highlights how traditional design elements can be successfully merged with modern digital technologies, showcasing a new approach to fashion design that respects both tradition and innovation.
3. **Ethical Leadership in Fashion Design:** Proposes a framework for integrating ethical considerations in the use of digital technologies, ensuring that designers lead with social responsibility and cultural sensitivity.
4. **Sustainable Fashion Design:** Provides a new pathway for sustainable fashion design by combining traditional craftsmanship with cutting-edge digital technologies, promoting both ecological and cultural sustainability.

5 Conclusion

This research not only contributes to the sustainable protection of cultural heritage but also provides a framework for the fashion industry to merge tradition and modernity responsibly. The integration of digital technologies with ethical leadership leads to the creation of culturally inclusive and socially responsible designs, offering long-term cultural and societal benefits.

Narrative Metaphor and Cultural Embedding: Constructing Cross-Cultural Co-Creation Paths through Journey to the West

Xu Zhang, Gao Fei, Peng Ji, Keke Li
Corresponding Author Peng Ji
E-mail Corresponding Author jipengdesign@hnu.edu.cn

01 Abstract

In the context of globalization, designers are increasingly becoming ethical coordinators in intercultural networks, striking a balance between national characteristics (collective values) and self-patterns (individual cultural interpretations). Taking Journey to the West as a cultural prototype, this study introduces an ethically-driven cross-cultural collaborative creative design method. By deconstructing its narrative metaphor, we extract the essential behavior pattern of Chinese society and construct a framework of national character. Establish a participatory ethical consultation mechanism to engage designers, users, businesses, and AI actors in a multi-dimensional cultural dialogue. The virtual scene theater is created in the form of cooperative card model, and the game income between different characters in different scenes is calculated to determine the optimal design strategy.

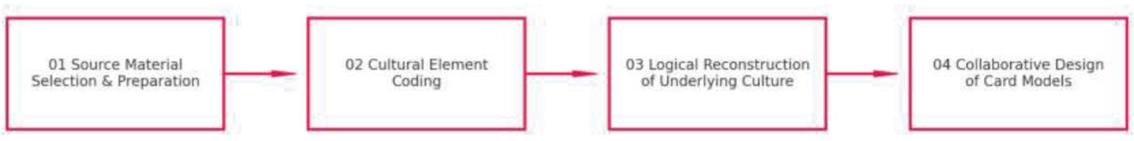
Keywords: Cross-cultural co-creation; Ethical negotiation; National character; Cultural respect; Algorithmic transparency

02 Research objectives

 # Objective:
Develop an ethical mediation framework for cross-cultural design, harmonizing national character (collective values) and self-schema (individual interpretations).

 # Core Issues:
Mapping collective behaviors via cultural archetype deconstruction;
Multi-agent ethical negotiations (designers/users/AI);
Stereotype reduction through algorithmic transparency & cultural traceability.

03 Research process



01 Cultural archetype deconstruction

Source material selection and preparation

#We analyzed Journey to the West and 20 multimedia adaptations (1950-2025), establishing a structured framework. Through text/video analysis, 162 concepts emerged, categorized by these criteria:

Observation Dimension	Specific Indicators	Recording Example
Physical Characteristics	Material/Morphology/Sound Effect	Metal ring-shaped/Engraved with Sanskrit
Usage Context	Trigger/Object/Temporal and Spatial Location	Tang Seng recites the spell during the pilgrimage to obtain scriptures
Functional Performance	Physical Reaction/Psychological Change/Relationship Evolution	Headache → Behavioral restraint → Integration among the master and disciples

Cultural element coding

We conduct a deep disaggregation at the sentence level of the original Journey to the West in the 14th "Heart-ape Correction".

"三藏却才信真...把那针儿幌一幌，碗来粗细..."

It is defined as a metal ring of variable size from the physical form, and exists as a prop with a specific function; At the same time, sorting out the conferring ceremony presents a clear power transfer chain of Guanyin → Tang Monk → Wukong, which lays a micro foundation for subsequent analysis.

Comparative analysis of the film Journey to the West: Conquering Demons and the original work reveals differences in cultural interpretation across media through key dimensions.

Contrast dimension	Original presentation	Film and television adaptation
Wearing process	Deceptive wearing	Voluntary acceptance
Pain presentation	Simple physical pain	Flashback with memory (Flower and Fruit Mountain scene)
Discharge method	It disappears automatically after becoming a Buddha	Emotional resonance trigger failure

#Based on the results of micro-deconstruction and cross-media comparison, conceptualization was carried out to generate the initial concept matrix (part of which is shown below).

Observation phenomenon	Abstract dimension	Initial concept	Theoretical annotation
The secret language is taught when Guan Yin gives the ring	Concealment of power	Implicit discipline	Foucault's Discipline and Punishment
Wukong obeyed the precepts independently in his later years	Subjectivity construction	Cognitive internalization	Bandura's social cognitive theory
The hesitation of the Tang monk when he recited the mantra	Power legitimacy anxiety	Authority vulnerability	Giddens' modernity theory

To ensure accuracy and reliability, this study uses triangulation to verify concepts from multiple perspectives, and then constructs a concept evolution map.

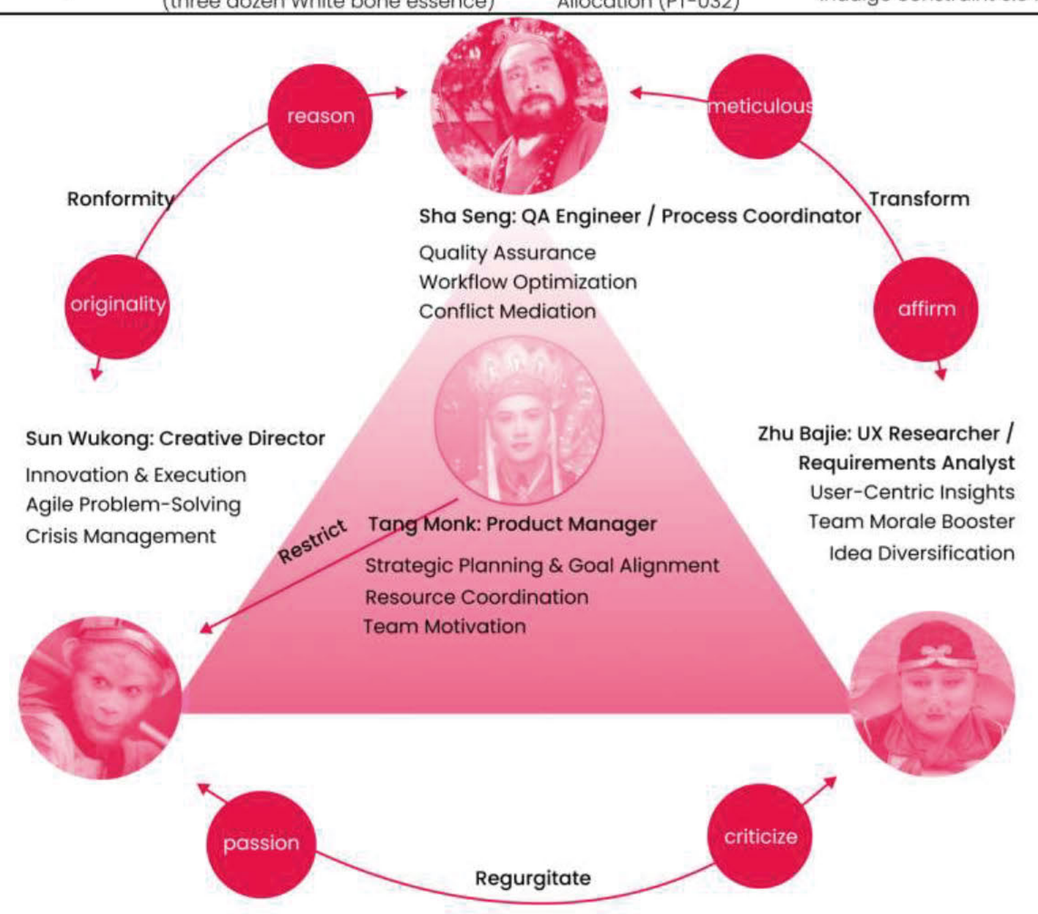
A[Original image: Metal headband]	B1(Religious Instruments)
A	B2(Instruments of Torture)
B1	C1(Practice symbol)
B2	C2(Power Device)
C1	D1(Rule Internalization)
C2	D2(Discipline Technology)

We used the Delphi Method with 6 experts from various fields to rank and weight 162 initial concepts.
Provide experts with the initial concept matrix and theoretical notes generated by qualitative analysis, Experts were asked to give 1-5 ratings on five dimensions: applicability of cross-cultural design (weight 30%), cultural universality (weight 25%), potential for ethical coordination (weight 20%), user perception intensity (weight 15%), and narrative plasticity (weight 10%).

02 Scene dramatization experiment

Logical reconstruction of the underlying culture

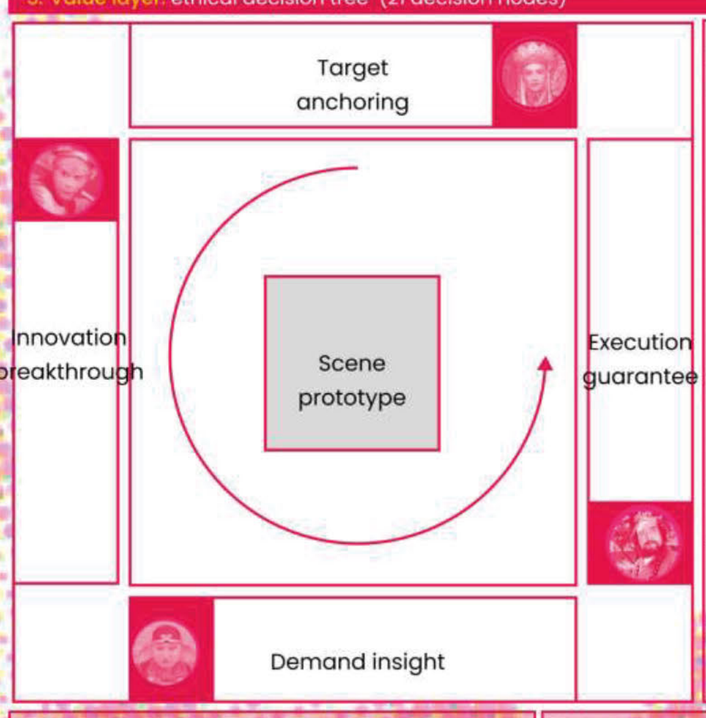
dimensionality	subcategory	Sample example	Cultural parameter
Role symbol	Breakthrough type (Sun Wukong)	Straitjacket - Discipline Mechanism (GZ-008)	Power distance 0.82
Artifact symbol	Regulatory Tools (Customs Documents)	Golden Cudgel - Innovation Breakthrough (JG-015)	Uncertainty avoidance 0.67
Spatial symbol	Test Scene (Flaming Mountain)	Liusha River - Team Run-in (LS-023)	Long-term orientation 0.78
Behavior symbol	Ethical conflict (three dozen White bone essence)	Flat Peach Banquet - Resource Allocation (PT-032)	Indulge constraint 0.54



Collaborative design of card models

Cultural gene decoding (feature library) → Conflict scenario inference (theater) → Ethical path selection (decision tree) → Strategy utility verification (game matrix)

1. Symbol layer: "Journey to the West" element feature database (162 mark samples have been included)
2. Behavior layer: Situational simulation theater based on cards (48 subdivided scenes in 4 categories)
3. Value layer: ethical decision tree (21 decision nodes)



Four Core Conflict Types

Ethical Hierarchy (12 scenarios)
Bajie's Feast: Team Trust Crisis
Key: Collectivism vs Self-Interest

Regulation-Innovation (12 scenarios)
Golden Cudgel: Code Compliance Debate
Goal: Innovation vs Regulation Balance

Identity Authentication (12 scenarios)
Twin Monkeys: IP Ownership
Solution: Blockchain + DNA Auth

Resource Ethics (12 scenarios)
Alms Distribution: Design Ethics
Model: Maslow × Circular Economy

Ethical decision tree system
Three-level judgment system

Examination of cultural legitimacy: Hofstede's six-dimensional assessment
Technical feasibility verification: TRIZ contradiction matrix analysis
Value consensus: Delphi - Game hybrid algorithm

Four-element game model
Construct a Nash equilibrium oriented return matrix:

strategy mix	cultural adaptation benefit	innovation benefit	sustainable benefit	comprehensive utility
Regulation + innovation				
Demand + execution				
Collaborative innovation

NAVIGATING ETHICS IN A CULTURAL EXHIBITION: BIODESIGN MEETS TRADITION

Andrea Bandoni*[a], Alanna Vinhas*[b]

a Universidade de Lisboa, Faculdade de Belas-Artes, Centro de Investigação e de Estudos em Belas-Artes (CIEBA), Largo da Academia Nacional de Belas-Artes, 1249-058 Lisbon, Portugal
b Universidade do Estado do Pará, Centro de Ciências Naturais e Tecnologia, Departamento de Desenho Industrial, Belém, Brazil.
*andreabandoni@gmail.com

DESCRIPTION | The exhibition "Objects that Grow on Trees: The Amazonian Cuias and Biodesign" opened in Lisbon in October 2024 as part of a practice-based Design PhD project. Preparations for the exhibition began a year earlier with the aim of presenting contemporary Biodesign experiments alongside the traditional craft of Cuias de Santarém—a type of container produced by riverine craftswomen in the Brazilian Amazon.

The exhibition drew a parallel between the traditional craftsmanship of Amazonian cuias and Biodesign, an emerging design approach that involves collaboration with living organisms. This connection offered a powerful opportunity to highlight ecological approaches in design, innovation, and cultural heritage. However, the convergence of these distinct realms also raised important ethical concerns. Careful consideration was necessary to prevent the exploitation, misrepresentation, or harm to the communities whose knowledge and contributions were central to the exhibition. Furthermore, it was essential to acknowledge the ecological and cultural significance of the *Crescentia cujete* (commonly known as the Cuieira tree), underscoring the role of non-human actors in both Biodesign and the traditional craft processes involving cuias.

Ethical Considerations
The exhibition adhered to the following ethical principles:

1. Informed Consent: Securing consent from artisans to research their techniques as part of the PhD studies.
2. Research Registration: Registering the study with the Brazilian Research System

SisGen, in compliance with regulations.
3. Review of Relevant References: Studying references related to other exhibitions on topics such as the Global South, decolonial approaches, and the acknowledgment of non-human agency.
4. In-Person Consultation: Engaging artisans in direct consultations regarding the exhibition.
5. Artisan Commissioning: Commissioning craftswomen to create specific works for the exhibition.
6. Contextual Representation: Ensuring accurate and respectful representation of the craftswomen and the Cuieira tree.
7. Profit Redistribution: Selling artisanal works after the exhibition and redirecting profits back to the artisans.

Central to this process was ensuring the craftswomen's voices were authentically represented; they were engaged in conversations around their participation and collaboration. As a result, the exhibition was richly contextualized, showcasing not only the artisans' territory and craft processes but also featuring a video with interviews of the artisans themselves. Traditional cuias crafted exclusively by the artisans for the show were curated in collaboration with them, and these works were made available for purchase after the exhibition.

Exhibition Content
In addition to traditional cuias, their history and fabrication processes, the exhibition presented experimental Biodesign objects developed as part of the Cuia Colab project (see Bandoni et al., 2023, 2024; Falco et al., 2024). This project investigates diverse possibilities of biofabrication using cuias. The exhibition emphasized the differences between industrial design and working with living organisms, highlighting a slower process, non-uniform results, and a deeper connection with the territory and the Cuieira trees, proposing new perspectives in the design field.

Broader Impacts
The exhibition "Objects that Grow on Trees" not only demonstrated the ethical potential of integrating biodesign with ancestral knowledge, but also fostered meaningful engagement with the artisan community. By providing financial benefits to the artisans and highlighting their cultural contributions, the exhibition serves as a potential model for bridging scientific and traditional knowledge in the context of design.

Research on Undergraduates' Entrepreneurship Model Led by User-centered Design: Insights from User Research and Service Design Courses.

RUORAN GUAN[a],

DONGXIAO CHU[b]

aWuhan Qingchuan University

bWuhan University

*guanruoran@163.com

ABSTRACT | This paper investigates an innovative entrepreneurship education model for undergraduates, grounded in User – Centered Design (UCD), and explores its effectiveness through empirical research and course integration. The study highlights the significance of design thinking in fostering students' ability to develop market – viable products and redefines the traditional approach to entrepreneurship education.

The research adopts an empirical methodology, focusing on 109 junior – year Digital Media Art students who participated in an 8 – week course structured around the Double Diamond model. The course integrated product design, business models, and user research, emphasizing iterative prototyping and multidisciplinary collaboration. The teaching framework comprised four stages: Needs Exploration, Problem Definition, Solution Development, and Testing and Optimization. Through mixed – method research, including market research, in – depth interviews, and behavioral observations, students identified user needs and market gaps. The course employed tools such as the Lean Canvas, Jobs – to – be – Done framework, and System Usability Scale (SUS) to enhance the students' design and entrepreneurial skills.

The results demonstrate a significant shift in students' cognitive approaches. Initially, students struggled with user conceptualization and demand deconstruction, often focusing on technology – driven solutions. However, through UCD training, they transitioned to a needs – driven design philosophy. For instance, Student A's project evolved from a general medical rehabilitation device to a precision service for "Butterfly Children" with Epidermolysis Bullosa, while Student B's project shifted from a technology – centric "Blind – friendly Smart Kitchen System" to a demand – driven "Multimodal Guide Dog Collaboration System." Student C's "Child Speech Disorder Training System" was transformed into the gamified "Voice Adventure Island," integrating gamification and developmental feedback to enhance usability and commercial potential.

The study concludes that UCD training significantly enhances students' ability to identify latent user needs and integrate commercial value into their designs. The multidisciplinary approach and iterative process fostered innovative solutions that address real – world problems. Future research should focus on longitudinal tracking of high – performing projects to assess their market performance and commercialization pathways, as well as optimizing competition mechanisms and entrepreneurship support systems to further leverage the potential of UCD in education and industry.

KEYWORDS | User - Centered Design, Entrepreneurship Education, Design Thinking, Innovation, Commercial Value Integration

1. Introduction

In the era of innovation – driven development, the design discipline plays a crucial role as a bridge connecting professional education with innovation and entrepreneurship practices. This significance is mainly attributed to its innate ability to solve problems creatively(Ding et al., 2020).

User – Centered Design (UCD) approach, with its iterative prototyping process and emphasis on deeply understanding user empathy, effectively enables students to develop innovative products that meet real – market demands. Methodologically, it aligns with the "Build – Measure – Learn" cycle of the Lean Startup concept(Al Amin et al., 2024; Kepper et al., 2024; Tolle, 2019).

Currently, although 87% of Chinese universities offer entrepreneurship courses, only 23% manage to effectively integrate academic majors with business incubation5. This situation highlights the urgent need to transform UCD from just a set of design tools into an innovative thinking framework(Han, 2024).

To address this, we can create courses that integrate "product design – business model – user research" into a unified whole. By doing so, a replicable interdisciplinary training model can be established. Design thinking, with its practice – centric characteristics such as collaborative innovation, risk – taking, and continuous iteration, not only enhances the market competitiveness of products but also redefines the model of entrepreneurship education(Bocken et al., 2016; Dauletova, 2016; Stoehr et al., 2024).

This transformation shifts the focus of education from simply disseminating knowledge to developing practical skills, thus opening a new path of "learning entrepreneurship through practice." The integration of design thinking and entrepreneurship education, as an integrative systemic innovation, is the fundamental driving force for achieving the cyclical process of "professional education – innovation awareness – commercial transformation(Baranova, 2024; Tuzlukova & Heckadon, 2020)."

2.Literature review

The theoretical origins of User – Centered Design (UCD) can be traced back to the cognitive engineering put forward by Norman in 1986(D. Norman, 2013; D. A. Norman, 1986). Since then, its development has witnessed three significant paradigm shifts:

During the usability era of the 1990s, the focus was on task efficiency. The approach aimed to enhance operational effectiveness by streamlining processes. This was a time when making

products easier and more efficient to use was the primary goal(Gould et al., 1991).

As we entered the experience economy era at the start of the 21st century, the concept of emotional design was introduced. Here, the emphasis shifted towards users' sense of pleasure and personalized experiences, as noted by Pine and Gilmore in 1999(Pine & Gilmore, 2011). Designers began to realize the importance of creating products that not only functioned well but also evoked positive emotions and provided unique experiences for the users.

In the 2010s, the value – co – creation era emerged. This era emphasized user – participatory design(Prahalad & Ramaswamy, 2004). Through community collaboration, product iterative optimization was achieved. Users were no longer just passive consumers but active participants in the design process, contributing to the continuous improvement of products(Raghunathan, 2024).

Modern UCD has further evolved by integrating the theories of behavioral economics. It utilizes a multi – dimensional tool system(Nuske et al., 2022). Empathy maps are employed to delve into users' deep – seated needs. The Jobs – to – be – Done framework helps identify unmet scenarios, and behavioral prototyping is used to verify the feasibility of design concepts(Graham et al., 2021).

In the domain of design education, the intersection of UCD and business innovation is manifested in several aspects:

- C Curriculum integration: For instance, MIT's “Design for Entrepreneurship” course combines the Lean Canvas with sprint prototyping. This integration shows how UCD principles can be effectively incorporated into business – related curricula(Karwowski & Ahram, 2012).
- Ability cultivation: UCD practice has been shown to increase entrepreneurial self – efficacy by 42%. This statistic highlights the positive impact of UCD on developing students' confidence and capabilities in an entrepreneurial context(Eraslan Taşpınar, 2022).
- Industry verification: IDEO's design thinking can significantly shorten product market cycles(Lo et al., 2019). This demonstrates the practical benefits of UCD in the industry, improving the efficiency of bringing products to market.

Case studies consistently demonstrate the significant value of user–centered design (UCD) in fostering successful entrepreneurial ventures(Jones & Thoma, 2019; Kohno et al., 2013; Trilar et al., 2021). The results highlight the strong correlation between deep user involvement and substantial business success.

In conclusion, through continuous theoretical iteration and method innovation, UCD has not only optimized the user experience but has also become the central link connecting design thinking and entrepreneurial practice. It plays a crucial role in promoting a user – centered sustainable innovation ecosystem, where the needs of users are at the heart of all innovation and business activities(Dopp et al., 2020; Nebe et al., 2011; Ponciano et al., 2021).

3.Research methodology

3.1. Research background

This research adopts an empirical research method, selecting 109 junior – year students majoring in Digital Media Art as the sample group. This group has completed the study of basic professional courses and is at a crucial cognitive development stage of transitioning from theory to practice. They are ideal subjects for observing the effectiveness of the User – Centered Design (UCD) teaching method in cultivating innovation and entrepreneurship abilities(Ni et al., 2022; Wang et al., 2022).

The course uses the Double Diamond model to construct the teaching framework, which lasts for 8 weeks (64 class hours) and is divided into four stages:
Needs Exploration Stage: The target users are constructed through mixed research methods (market research, in – depth interviews, behavioral observations) to identify potential needs and market gaps.

Problem Definition Stage: The affinity diagram method is used to conduct thematic clustering of qualitative data, and the core design problems and target user characteristics are established.

Solution Development Stage: Design thinking tools (mind maps, storyboards) are used to carry out creative divergence, and the design concept is visualized through low – fidelity prototypes.

Testing and Optimization Stage: Based on the System Usability Scale (SUS), the solution is optimized and iterated to form an iterative design optimization mechanism(Hasani et al., 2022).

3.2. Teaching Implementation Process

The course adopts a project – driven teaching model:

The teacher establishes a project evaluation matrix through case discussions, covering multi – dimensional criteria such as innovation, commercial value, and user experience.

Students propose initial project proposals based on their own observations and conduct a structured analysis of needs using the Jobs – to – be – Done framework. The teacher evaluates the proposals from three perspectives: design goals, innovation goals, and commercial value goals, and provides improvement suggestions to form a two – way feedback

mechanism(Baluarte–Araya, 2020a).

Students iterate the proposals according to the teacher's review comments and can enter the in – depth design stage only after several rounds of reviews.

For the results, a mixed – assessment method is adopted, integrating the teacher's rubric scores and user satisfaction data to ensure the validity of the evaluation(Zhang & Chen, 2021).

4.Teaching research results and evaluation

4.1. Paradigm Shift in Teaching Outcomes

Through systematic training in User–Centered Design (UCD), learners exhibit significant cognitive restructuring across dimensions such as demand modeling, iterative prototyping, and value integration. Cross–case analysis reveals that the intervention of UCD methodology fundamentally transforms design thinking from technology–driven to needs–driven(Baluarte–Araya, 2020b).

Evolutionary Trajectory of User Positioning: Baseline data shows that learners initially suffer from fuzzy user conceptualization, manifesting as coarse–grained user segmentation based on demographic features (e.g., "elderly/children"). Through ethnographic research and stakeholder mapping training, learners successfully achieve granular user persona construction(Seregni et al., 2021).

In a typical case, Student A's initial scheme focused on "medical rehabilitation devices," suffering from scenario generalization and value positioning deficiencies(Seregni et al., 2021). Guided by teachers, through in–depth interviews with 12 burn rehabilitation patients and 6 medical practitioners, the team identified the high–demand, low–service "Epidermolysis Bullosa (Butterfly Children)" group using the contextual immersion method. This led to the design theme "Biomedical Sensing–Based Wearable Wound Management System," marking a paradigm shift from medical products to precision services(Lawani et al., 2021; Pallot et al., 2021) — Figure 1.

监测层由多种微小的传感器和与之相连的柔性线路组成，内含温度、湿度、渗液率、皮肤压力与张力传感器
产品盒包装
IP形象设计
护创精灵，集智能敷料与监测设备于一体，超柔敷料，亲肤贴合伤口，防感染促愈合；内置微型监测器，实时捕捉温度、湿度、渗液变化，数据秒传至手机端。医护可远程追踪，患者能自主管理，为伤口护理带来更高效精准的新体验。
蝴蝶护理助手APP

Figure 1. Student A's design project: Release - Wearable product design for wound rehabilitation for butterfly babies.

Structured Upgrading of Demand Analysis: Diagnostic testing shows that 68% of learners struggle with demand deconstruction, characterized by imbalances between technical feasibility and user needs. By introducing UCD's Double Diamond Model and Requirements Engineering framework, learners progressively master systematic methods from contextual inquiry to requirements specification(Aulia, 2020).

Student B's case illustrates this transformation: the initial prototype "Blind-friendly Smart Kitchen System" centered on technological innovation. Through participatory observation, it was found that target users valued guide dog service gaps (70%) over kitchen assistance (30%). After Kano Model analysis(Z. Hu et al., 2024), the scheme evolved into "Multimodal Guide Dog Collaboration System," achieving a cognitive leap from technology-centricity to demand-centricity — Figure 2.

PILOT 引航

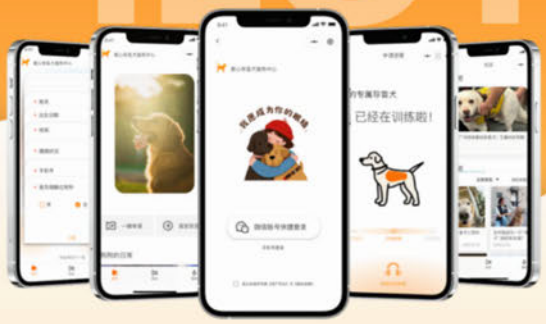
—— 线上导盲犬申请平台

PILOT

项目简介 | object background

“导盲犬与视障人士联系平台”是一个创新的微信小程序，专为视障人士设计，以提供一站式的导盲犬服务。该平台通过无障碍界面设计，使得视障用户能够轻松访问和操作，提供从导盲犬申请、训练进度跟踪到社区交流的全方位服务。它不仅简化了导盲犬的申请流程，还增强了视障人士的自主出行能力，同时构建了一个支持网络，让视障人士能够分享经验、获取信息和相互帮助。通过这个平台，我们致力于提升视障人士的生活质量，并促进社会对导盲犬重要性的认识。

主要页面



据中国盲人协会2024年5月的数据，全国共有1731万视力残疾人士，其中约800万人完全失明. 导盲犬的数量非常稀少，2019年全国现存导盲犬仅为400只左右。

服务蓝图

三方服务

爱心导盲犬小程序实现用户互通，将三方联系起来帮助视障人士。

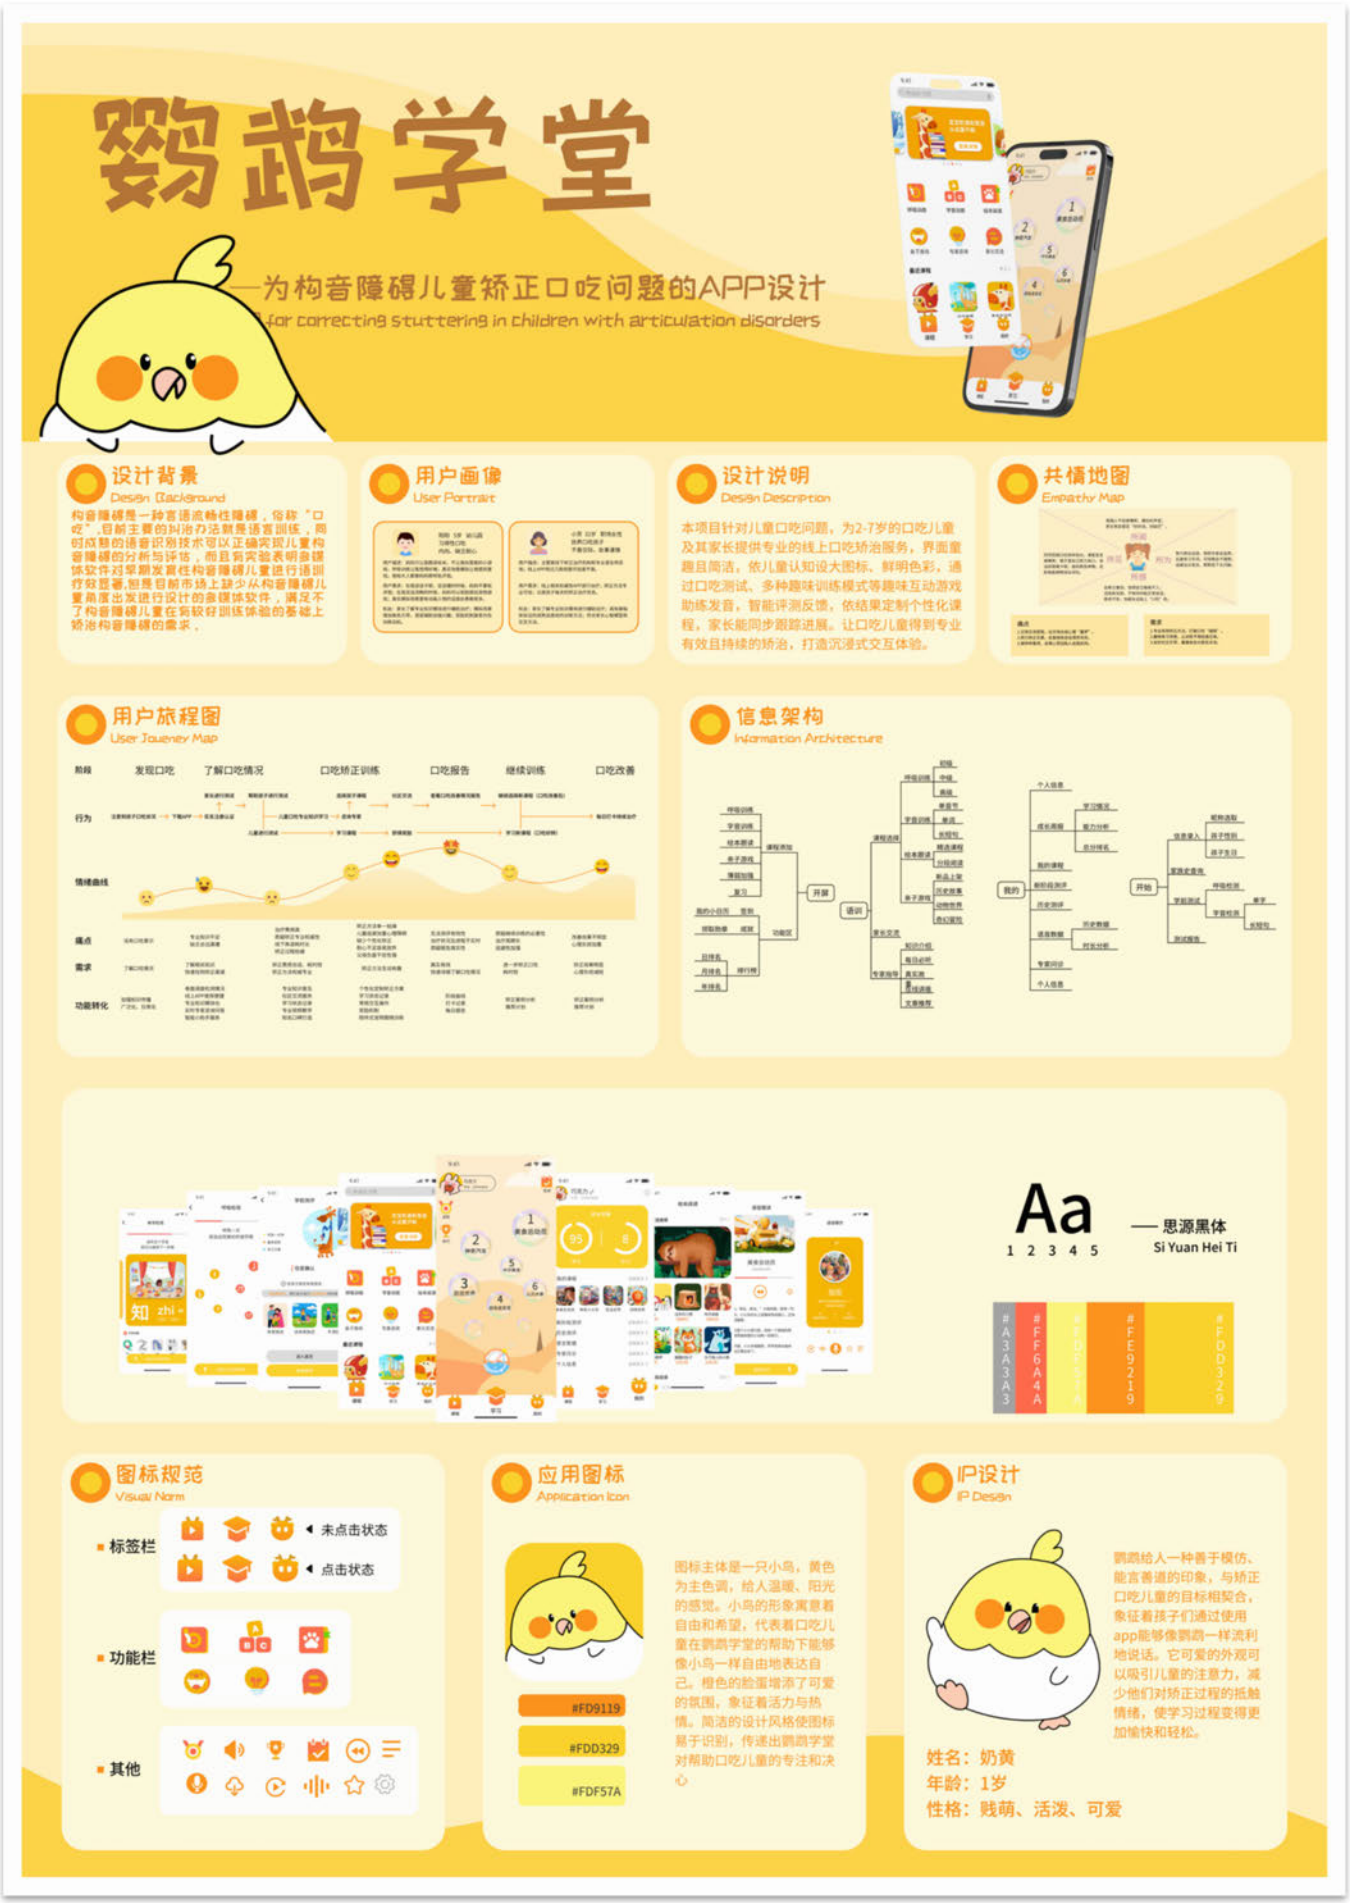
story board | 概念故事版

明明从小就希望拥有一只自己的导盲犬，偶然听朋友说有一个平台可以线上申请爱心导盲犬并且用过的朋友们评价都不错，我抱着试一试的心态用语音搜索PILOT引航这个小程序，他发现这个平台居然可以语音导览，需要帮助时能随时联系志愿者，我开始在志愿者的辅助下申请一只自己的狗狗，一段时间后导盲犬训练好了，我接收狗狗，开始与它的故事

Figure 2. Student b's design project: Pilot - Design of a guide dog retrieval service for the blind community.

Hierarchical Optimization of Value Integration: Post-assessment of high-fidelity prototypes indicates that UCD training significantly enhances business scalability. By integrating Business Model Canvas and Value Proposition Design tools, learners effectively balance user experience (UX) and business viability(Hartono & Ramadhan, 2022).

Student C's "Child Speech Disorder Training System" demonstrates this process: Initial adoption of traditional educational app architectures led to interaction mode standardization issues. By incorporating gamification design, narrative learning mechanisms, and developmental acoustic feedback systems, the scheme evolved into the IP-potential "Voice Adventure Island." Usability tests and TAM model adoption forecasts validate this transformation's efficacy(Ary, 2022; Van Der Walt et al., 2021) — Figure 3.



鹦鹉学堂
—为构音障碍儿童矫正口吃问题的APP设计
for correcting stuttering in children with articulation disorders
设计背景
Design Background
构音障碍是一种言语流畅性障碍，俗称“口吃”，目前主要的纠治办法就是语言训练，同时成熟的语音识别技术可以正确实现儿童构音障碍的分析与评估，而且有实验表明多媒体软件对早期发育性构音障碍儿童进行语训疗效显著，鉴于目前市场上缺少从构音障碍儿童角度出发进行设计的多媒体软件，满足不了构音障碍儿童在有较好训练体验的基础上矫治构音障碍的需求。
用户画像
User Portrait
设计说明
Design Description
本项目针对儿童口吃问题，为2-7岁的口吃儿童及其家长提供专业的线上口吃矫治服务，界面童趣且简洁，依儿童认知设大图标、鲜明色彩，通过口吃测试、多种趣味训练模式等趣味互动游戏助练发音，智能评测反馈，依结果定制个性化课程，家长能同步跟踪进展。让口吃儿童得到专业有效且持续的矫治，打造沉浸式交互体验。

4.2. Teaching Guidance and Evaluation Mechanism

The goal – setting framework: Based on the analysis of the design context, teachers should systematically deconstruct the project elements, clarify the technological constraints and the core demands of the users, and accurately define the boundaries of the design challenges(Lang, 2021). In this process, it is necessary to integrate the T – shaped knowledge structure, establish a dual – track analysis model of "technical feasibility – commercial value", deconstruct the market dynamics through the business model canvas tool, and guide students to build solutions with technological innovation and commercial feasibility(Pardo–Garcia & Barac, 2020).

The evaluation system innovation pathway: Build a four – dimensional evaluation matrix (innovation index, demand fit, technology realization, and commercial value potential), and adopt Rubric tools to realize the operationalization of evaluation indexes. Implement a staged evaluation mechanism: focus on feasibility simulation in the proof – of – concept stage, technical and economic analysis in the prototype development stage, and market sensitivity testing in the commercialization stage. Form the "Trinity" feedback mechanism: Peer Review for cognitive conflict, Teacher Diagnostic Evaluation for professional calibration, and Reflection Journal for metacognitive development(Galvez et al., 2018; T. Hu et al., 2023; Хоменко & Решетняк, 2024).

To address the problems of discrete innovations or lack of value in the project, teachers need to use the Gap Analysis tool to locate the specific weaknesses, such as the deviation in the identification of user pain points, the deviation of technical parameters from the application scenarios, and the inaccurate prediction of market trends. Develop differentiated enhancement plans: introduce industry mentorship to strengthen business thinking, optimize business models through Design Sprint, and carry out interdisciplinary workshops to stimulate innovation potential. Eventually, a spiral mechanism of "assessment–feedback–iteration" will be formed, so that students can realize theme optimization in the synergistic evolution of design thinking and business insights(G. Gonio & M. Bauyot, 2024; Khan et al., 2023; Nab et al., 2014).

5.conclusion

5.1. Main Findings

UCD Training Significantly Enhances User Needs Insight: Students receiving UCD training systematically learn user research methods (e.g., behavioral observation, emotional analysis), enabling them to identify latent user needs more accurately and translate these into design directions. This improvement stems from UCD's "user–focus" principle, which refines design goals through iterative testing and feedback. However, students' understanding of user knowledge is not instantaneous; it develops gradually through design activities, with solutions

often adjusted even during high-fidelity prototyping stages, reflecting UCD's non-linear nature(Ferran et al., 2009).

Pain Points and Opportunity-Driven Innovation: In UCD practice, deep user interactions (e.g., interviews, testing) allow students to uncover pain points and opportunities while redefining problem boundaries from the user's perspective. For instance, in healthcare, interdisciplinary collaboration under UCD transforms user needs into technical requirements, offering innovative solutions to complex issues. However, overreliance on user feedback may lead to conservative designs, necessitating a balance between designer-led hypothesis extrapolation and practicality(Dopp et al., 2019, 2020b).

Commercial Value Requires Multidisciplinary Integration: UCD's "market-opportunity-oriented" teaching methods (e.g., commercial feasibility analysis) help students focus on a product's commercialization potential(Hoffenson & Fay, 2021). For example, formal UCD implementation in automotive manufacturing unifies cross-disciplinary team goals, avoiding self-referential design biases and enhancing commercial competitiveness. However, insufficient training in business logic (e.g., cost-benefit analysis) may weaken the practical value of designs(Li & Hai-chao, 2018; Liem & Sanders, 2011).

5.2. Future Research Directions

Long-Term Tracking of High-Performing Projects: It is recommended to conduct longitudinal studies on outstanding course projects to observe their market performance (e.g., user retention, conversion rates) and commercialization pathways. For instance, integrating the "UCD Sprint" framework could assess the impact of structured methodologies on project sustainability while analyzing challenges in interdisciplinary collaboration (e.g., conflicting stakeholder goals)(Jeeva Mohana Chandran & M. Reyasudin Basir Khan, 2024; Lake et al., 2021; Smith et al., 2023).

Optimizing Competition Mechanisms and Entrepreneurship Support: Further research is needed to align competition evaluation criteria with UCD core competencies. Drawing from the ISO 13407 standard(Siricharoen, 2010), an assessment system centered on user-need fulfillment could be established, alongside pathways for translating competition outcomes into entrepreneurship. Additionally, continuous tracking of post-course entrepreneurial intentions and behaviors is critical to understanding UCD's long-term impact on student innovation.

This conclusion integrates UCD's educational benefits, innovation dynamics, and commercial implications, while proposing actionable future research agendas grounded in empirical and methodological evidence.

THE DESIGN MINDSET: challenging short course formats in design thinking

Mudita Pasari[a]

a The Design Village, NCR, India

*mudita@thedesignvillage.org

ABSTRACT | What is the key difference between teaching design thinking in business school v/s entrepreneurial skills in design school? This is a question pertaining to the growth and pedagogy at the design school the author represents. This experiment uses insight from the current learner community for unpacking as well as proposing a future focused entrepreneurship-led design learning model.

As design has evolved over the past decades, from artefacts to systems, to services, to policy and much more, our models of articulation and pedagogical dissemination do not yet reflect this evolution. Vestiges of industrially defined service theories continue to appear in how the design discipline is currently viewed, despite our evolution outside of artefacts as design output. As designers continue to be entrepreneurs against the grain of our education, our B-school counterparts seem to dominate leadership roles.

Tools like design thinking, critical thinking, and journey maps are being pedalled in short 40-hour bursts, disregarding the mindset which is built through a creative education towards the penchants of problem-solving. This ongoing research aims to create a pedagogical framework keeping the design mindset at the centre, challenging and realigning the current rise in short course formats, claiming otherwise.

KEYWORDS | collective creating, care and profit, pedagogical design

1. Introduction

As part of an international experiment, the consortium of students, designers and educators joining the X-Format session, use an experimental methodology of moving building blocks over a pre-determined structure to ideate on models of imparting design and entrepreneurial skill combined.

Starting with a controversial question:
Should designers with entrepreneurial skills be leaders or business graduates with design thinking skills?

We delve into unravelling this mystery and collectively ideating on a value-centric approach. This experiment is made public and invites results from groups and individuals across the world.

2. Designed Experiment

By collective agreement, we divide into two teams of 5-7 (or more) participants, where the core principles of care and profit are at the centre for two different groups.

This experiment intends to unravel whether it is the nature of the people designing the pedagogical framework or the content itself that takes us away from a balanced approach.
As part of multiple planned sessions, the collective qualitative data will share insight into the perspective of designers. If provided the opportunity, the same would be conducted with business experts to derive a qualitative understanding of the future potential landscape that resides and flourishes between the learning paradigms of design and business.

2.1. Participation

Each group would have the first 5 minutes to quickly discuss their principles, the direction they want to move in, and how they would consider providing care or profit as the central theme of their pedagogical frameworks.

There would be prompts introduced to the group every 60-90 seconds, which would allow them to place one building block above or below, to the side, between the others, around them, etc. Once placed, the blocks cannot be moved.

Examples of prompts are below:

- What would you build the foundation out of?
- What would this framework use as its bone structure?
- What is the key skill you want to impart? the beating heart
- I am sure you had many, add 2 more skills
- Would you want to add some muscle/ tendons?
- What ideal role would this individual take in the world?
- Do they need to repeat-learn any particular skill?
- and a few more...

Finally, once they have responded to each prompt rapidly (yet as a group), they have another 3 minutes to quickly make any final changes, adjustments and movements. This is the only time when the movement of framework components is possible.

Once complete, we look at the two models and bring forth questions, observations and insights to the table. To be recorded for future possibilities and as a directory of responses to draw parallels from and to build insights out of.

2.2. What do we take away?

Each team quickly takes us through their structure, the foundation, the building blocks and the output. Including their suggestions, their unresolved bits and their future potential.

There is no way that we can solve this concern in one workshop, but it is possible to look beyond our approach of pitting design schools against business schools. Both schools bring value, and if only the in-between of the design entrepreneur or a creative businessperson were given a chance.

ABSTRACT | This paper revisits the emerging field of Everyday Design History by identifying its structural limitations and proposing an analytical framework that addresses ethical, methodological, and representational concerns. While the field has expanded its focus from elite authorship to mundane artifacts, it remains shaped by implicit boundaries—geographical, representational, and ethical—that constrain whose practices are visible, whose voices are legitimated, and how design is interpreted. Through a critical review of existing literature and methodological debates, the study maps these intersecting boundaries and explores how digital platforms and AI tools complicate traditional research approaches. To respond, it introduces a multi-layered framework that analyzes everyday design across three levels: individual (personal adaptation and agency), community (relational design and cultural resistance), and global (platform aesthetics and algorithmic power). This structure reveals how different scales of practice encode power, visibility, and epistemic hierarchies. By aligning design history with multi-scalar ethics and critical inquiry, the paper offers a methodological and conceptual tool for interrogating design's social embeddedness. It contributes to the development of more inclusive, reflexive, and ethically attuned approaches in both historical research and contemporary design analysis. The proposed framework not only clarifies analytical categories, but also enables researchers to navigate the complexities of everyday design in a platform-mediated, globally uneven world.

KEYWORDS | everyday design history, material culture, design methodology, social culture, globalization in design

1. Introduction: Why Revisit Everyday Design History Now?

For much of the twentieth century, design history prioritized aesthetic innovation, industrial progress, and iconic designers—largely reflecting Western modernist ideals. These narratives often overlooked the social, cultural, and material dimensions of design embedded in everyday life. In response, scholars began drawing on material culture, design anthropology, and user-centered approaches to examine how ordinary objects—household tools, furniture, digital devices—shape identity, behavior, and lived experience (Attfield, 2000; Heskett, 2002; Miller, 2010). This transition has contributed to the rise of Everyday Design History, which emphasizes the cultural significance of mundane artifacts.

Yet, as the field expands to encompass everyday practices, it faces new conceptual and ethical challenges. Everyday design is now increasingly mediated by platforms, algorithms, and global cultural flows—raising critical questions about visibility, authorship, and exclusion. Issues such as sustainability, algorithmic bias, and representation underscore the need to revisit the field's ethical foundations.

This study critically reviews the development of Everyday Design History and examines its unresolved boundaries—particularly in geography, representation, and methodology. It introduces a Multi-Layered Everyday Design Framework addressing individual, community, and global levels. By connecting past design responses to contemporary dilemmas, the paper positions Everyday Design History as a key perspective for engaging ethical tensions and power dynamics in today's design discourse.

2. From Canon to Commons: Paradigm Shifts in Everyday Design

The rise of Everyday Design History signals not only a shift in subject matter but a deeper transformation in how design history is theorized and written. Departing from the long-standing emphasis on named designers and aesthetic movements, scholars increasingly examine how ordinary artifacts shape social life. This shift stems from critical historiographical reflection—questioning whose stories are told, what is archived, and how authority is distributed among users and makers. As such, Everyday Design History becomes not an extension of tradition but a methodological and epistemological intervention.

The first phase of this intervention emerged in the mid-20th century through "anonymous" design histories. Pioneers like Sigfried Giedion and Reyner Banham redirected attention from iconic figures to mass-produced technologies—elevators, kitchens, infrastructures—that silently transformed modern life. Giedion emphasized the social function of standardization, while Banham saw consumer goods as culturally generative. These works destabilized designer-centric narratives and legitimized the material environment as a subject of historical scrutiny.

In the 1990s and 2000s, scholars like Attfield (2000), Forty (2012), and Julier (2007) expanded the field by linking objects to identity, class, and domesticity. Attfield affirmed the significance of banal objects; Forty highlighted how material choices express ideology; Julier framed "design culture" as an ecosystem connecting products, media, and markets. This phase institutionalized everyday design as central to understanding how material culture mediates modern life.

A third and ongoing phase engages global inequality, decolonial critique, and ethics. Tunstall (2020), Akama and Yee (2024), and Zhang (2024) critique Western-centric frames and call for plural epistemologies. Tunstall foregrounds Indigenous knowledge; Akama and

Yee emphasize participatory frameworks in Asia-Pacific contexts; Zhang conceptualizes everyday design history as both subject and historiographical method. These perspectives shift focus from canonical subjects to ethical responsibility and positionality.
Together, these phases redefine design historiography—moving from authorship to practice, aesthetics to meaning, and canon to plurality. This repositioning frames everyday design as a site of cultural insight and political relevance, and urges renewed reflection on how histories are constructed and whose lives are archived.

3. Research Boundaries and Blind Spots: Geography, Representation, Ethics

Although Everyday Design History has expanded the scope of design studies, it remains shaped by underlying research boundaries—structural constraints that govern what is studied, whose voices are legitimized, and how interpretation occurs. These boundaries—geographical, representational, and ethical—are not just omissions but systems of knowledge regulation that condition academic focus, shape epistemology, and structure authority.
This chapter introduces a framework organized around three interrelated boundary regimes: (1) Geographical boundaries, which determine where design is studied and which regions are marginalized; (2) Representational boundaries, which influence whose practices and perspectives are included; and (3) Ethical boundaries, which shape how researchers engage with subjects, platforms, and data. Together, these boundaries diagnose exclusion and illuminate how design knowledge is policed.
Geographical boundaries are visible in the field's concentration on urban, Western, and Anglophone contexts (Fallan, 2010). Practices in China, Southeast Asia, and Latin America are often analyzed through Western frames, reinforcing hierarchies. Indigenous and diasporic knowledge systems are largely absent from dominant methodologies (Escobar, 2018). Overcoming these biases requires embracing local, multilingual, and transregional perspectives (Clarke, 2011).
Representational boundaries shape which social actors are visible. While claiming inclusivity, the field has focused on middle-class consumer-citizens, underrepresenting laborers, caregivers, informal workers, and marginalized gender and racial groups. Shove et al. (2007) show how maintenance labor shapes design, yet it is rarely acknowledged as historical agency. Pérez-Bustos (2021) describes such exclusions as epistemic injustice. Addressing them requires inclusive narratives and collaboration with communities beyond academia.
Ethical boundaries arise as the field increasingly intersects with digital platforms and AI tools. Techniques like social media archaeology or algorithmic image analysis offer insights but raise concerns over ownership, visibility, and platform bias. Platforms such as Xiaohongshu and TikTok curate aesthetics that marginalize vernacular styles. Researchers risk reproducing these hierarchies if they ignore positionality or consent (Doordan, 1996). Ethical leadership must therefore embrace reflexivity, transparency, and accountability.
These boundary regimes overlap in regulating visibility, legitimacy, and power. As both diagnostic and critical tools, they provide a foundation for more inclusive and ethically attuned research in Everyday Design History.

4. Everyday Methods, Digital Platforms, and Ethical Dilemmas

As everyday design increasingly unfolds within digital and algorithmic infrastructures, traditional research methods must adapt. This evolution requires more than technological upgrades—it also demands ethical reflection. This chapter explores how digital mediation reshapes methods in Everyday Design History and calls for a reflexive, ethically grounded research paradigm responsive to representation, responsibility, and power.

Historically, everyday design research has relied on qualitative and interpretive tools rooted in material culture, ethnography, and visual analysis. Techniques like domestic observation, object-centered interviews, and archival work highlight how artifacts shape social life (Woodward, 2007; Pink, 2012). These approaches emphasize thick description and everyday experience. Yet, they struggle to address the dynamic, platform-based temporality and algorithmic filtering that increasingly define everyday design. This gap requires methodological renewal.

Emerging tools—social media archaeology, AI image recognition, data scraping—enable real-time, large-scale analysis. For example, Scholars have shown how AI image recognition and algorithmic curation construct aesthetic norms that marginalize clutter, improvisation, and vernacular expressions. Manovich (2017) explains how platforms automate aesthetic judgment, while Donnarumma (2022) analyzes how algorithmic systems reproduce cultural bias and visual hierarchies in the name of efficiency and neutrality.

In response, scholars call for reflexivity and methodological ethics. Akama and Yee (2024) advocate for participatory research entangled with local contexts and socio-political complexity, emphasizing relational accountability over extractive knowledge. Winschiers-Theophilus, Smith, and Botero (2024) propose decolonial design approaches that redistribute narrative authority and challenge Western epistemic dominance in participatory design. Studying digital traces demands interpretive care: extracting data without context risks instrumentalizing users. Ethical leadership thus involves not only consent and transparency, but also responsibility for narrative representation and power awareness. Research methods, like design itself, are shaped by history and values.

5. Multi-Layered Framework: From Classification to Critical Engagement

Previous chapters have outlined the boundaries and ethical dilemmas shaping how everyday design is studied. These issues—geographical exclusions, representational gaps, and platform biases—highlight the need for a scalable framework. This chapter introduces a multi-layered model that analyzes everyday design across individual, community, and global levels. Rather than merely classifying practice, the model reveals how power, agency, and ethics unfold at different scales, showing how micro-decisions, collective traditions, and global infrastructures interact to shape meanings and exclusions.
The individual level focuses on personal adaptation and micro-level decisions. Influenced by De Certeau (1984), it examines how users repurpose, modify, or reinterpret objects in daily life. Such “vernacular creativity” (Burgess & Green, 2009) includes reusing packaging, customizing furniture, or adjusting interfaces—often shaped by gendered labor, economic constraint, and embodied care. These practices reflect resistance and situated agency, not just consumption.

At the community level, design emerges as a shared cultural process. In Indigenous, postcolonial, or rural contexts, collective making often bypasses institutional norms, relying on reciprocity, ecological values, and intergenerational knowledge. Design is co-produced through ritual, storytelling, and place-making, becoming a medium of cultural resistance and socio-political identity. From Latin American cooperative housing initiatives—such as the FUCVAM model in Uruguay or grassroots experiments in Colombia and El Salvador—to Chinese repair collectives, communities use design to assert autonomy and challenge dominant norms (Bredenoord, 2017; Barenstein & Sanjinés, 2019; Zhong & Leung, 2019).

Globally, design practices are shaped by algorithmic platforms and aesthetic regimes. Platforms like TikTok, Xiaohongshu, and Instagram curate desirability through opaque algorithms. Yu, Xu, & Sun,（2022） notes that they privilege minimalism, order, and commercial aesthetics while marginalizing cluttered or localized styles. Vernacular practices become decontextualized and commodified. The global layer exposes how platforms structure not only taste and visibility, but also design's cultural legitimacy.

This multi-layered framework clarifies how design operates across intersecting systems of power. It reveals how global logic reconfigures personal aesthetics, and how communities resist digital homogenization. Beyond analysis, it supports ethical leadership by surfacing design's epistemic hierarchies and advancing multi-scalar sensitivity in research and pedagogy. As both an analytic and critical tool, it enables Everyday Design History to confront its blind spots and engage more reflexively with cultural power.

6. Conclusion: Revisiting the Field through Boundary and Scale

This study critically examined how Everyday Design History has developed as a field of inquiry, identifying key tensions and structural limitations. It mapped out three intersecting research boundaries—geographical, representational, and ethical—and explored how recent methodological transformations intersect with the ethical dilemmas introduced by digital platforms and AI-driven tools. In response, a multi-layered analytical framework was introduced to situate everyday design across individual, community, and global levels. This structure demonstrates how different scales of design activity are shaped by power, agency, and visibility. Rather than positioning Everyday Design History as a peripheral perspective, the framework reframes it as a critical lens for interrogating design's cultural embeddedness, knowledge hierarchies, and ethical responsibilities. In doing so, the study contributes to building more inclusive, reflexive, and socially attuned approaches in contemporary design research.

A Technology-Based Taxonomy for Smart Home-Use Medical Devices

Matteo Orsini[a]

a Sapienza Università di Roma, Department of Planning, Design, Technology of Architecture

ABSTRACT | In the context of Digital Transformation, Smart Products are emerging as pivotal means to deliver complex services to end users across many industries. Thanks to the integration of many advanced technologies, they acquire innovative functionalities and connectivity features, factors that have been used to classify their typologies. The technologies that enable such innovations have been defined as Key Enabling Technologies (KETs), examples of which include Artificial Intelligence, Life-Science technologies, and IoT systems.
Specifically in the Healthcare field, these technologies have driven innovation by enabling the development of advanced smart medical devices, with the aim of improving the fulfillment of their medical purposes while ensuring the safety of their users.
This phenomenon strongly emerges in the Home Care sector, where medical services delivered within domestic environments have become a viable alternative to other forms of care for an increasing number of patients, due to the COVID-19 pandemic experience. Although the Home Care sector is expected to experience significant growth in the coming decade, there remains, to the best of our knowledge, a gap in the literature concerning the categorization of Smart Home-Use Medical Devices (Smart HUMDs).
This study is part of a research project whose general objective is to investigate how the integration of KETs influences the design process of Smart HUMDs. In particular, this study aims (i) to identify an effective taxonomy for the classification of Smart HUMDs and (ii) to investigate how the KETs are deployed by these products.
The results show that a reinterpretation of the existing taxonomy for Smart Product Typologies was needed to effectively describe Smart HUMDs and their technological capabilities.

KEYWORDS | HOME CARE, HEALTHCARE DESIGN, MEDICAL DEVICE, DIGITAL TECHNOLOGY

1. Introduction: Smart Products in Home Care

Thanks to the technological advancements introduced during the years of Digital Transformation in developed countries, the industrial sector has access to a variety of new technologies that can improve product development and service delivery.
The document entitled "Key Enabling Technologies for Europe's Technological Sovereignty," published in 2021 by the European Parliamentary Research Service (Batura et al., 2021), provides a list of Key Enabling Technologies (KETs) that can be integrated into products to “enable” the implementation of innovative functionalities. Examples of these technologies include Artificial Intelligence, Life-Science technologies, and IoT systems, which have been categorized based on their industrial applications.
Products that integrate KETs to provide users with advanced functionalities have the potential to be regarded as Smart Products. However, to be classifiable with this denomination, the following key attributes must also be possessed: thickness, depth, and transformativeness (Pardo et al., 2020). The first attribute refers to Smart Products being constituted by both a physical and an informational dimension. The second attribute pertains to Smart Products serving as gateways or receivers, facilitating the transfer of information between various entities, including humans. The last attribute refers to the capability of a smart product to transform any user into data, ultimately expanding the classical user-product relationship in which the user only “uses” the product to a relationship of reciprocal usage.
The authors also propose 4 typologies of Smart Products, namely More Efficient Product (MEP), Advanced Product (AP), Product-as-a-Node (PN), and Products-as-a-Hub (PH). MEPs are products that become more efficient thanks to the acquired capability to communicate information to one or a few other entities without, however, featuring substantial improvements in their functions; APs are products that have additional functional features while remaining independent from other entities in their system; PNs are products that do not feature additional functions, but collect information from or send information to a large number of entities at the same time; PHs are products that become central in a system, not only by offering innovative functions but also by sharing information with a multitude of different entities. Finally, the authors define “Dumb” Products (DP) those products that do not present the prerequisites to be defined as “Smart”.
In the domain of Smart Products, many technological advancements have also been made in the Healthcare sector. Due to the COVID-19 pandemic global experience, Home Care services have become a viable alternative to other forms of care for an increasing number of patients (Stepick & Tran, 2022). Indeed, benefits like fewer hospital readmissions, minor exposure to infectious diseases, minor health costs, more accurate patient assessment, and higher patient autonomy (Stapleton & Bossie, 2024) pushed the sector to provide increasingly capable medical services, delivered through Home-Use Medical Devices (HUMDs). These products often integrate KETs to provide users with advanced services. For instance, the Internet of Things (IoT) can be used to create a system of interconnected devices to enhance patient monitoring and management (Muneer et al., 2020). However, although the Home Care sector is expected to experience significant growth in the coming decade (Precedence Research, 2024), there remains, to the best of our knowledge, a gap in the literature concerning the categorization of Smart HUMDs.
This study aims (i) to identify an effective taxonomy for the classification of Smart HUMDs and (ii) to investigate how the KETs are deployed by these products.

2. Methods: Collection and Analysis of Case Studies

To achieve the aims of this study, case studies of Smart HUMDs will be collected. Their selection will be guided by the decision to cover all medical purposes (MDR 745/2017) and all categories of HUMDs (Olson, 2010) with at least one case study.
Moreover, the case studies will be considered valid for inclusion only if they are characterized by the 3 aforementioned key attributes for a product to be smart, namely Thick, Deep, and Transformative (Pardo et al., 2020).
The case studies will be further examined in their respective product instances, i.e. the components that constitute the Smart HUMD. This evaluation will be conducted by considering the functionally integrated Key Enabling Technologies (KETs) (Batura et al., 2021) and the typologies of Smart Products to which they belong (Pardo et al., 2020) as key parameters for assessment. Finally, the Product instances will be graphically represented with a benchmarking to highlight the relation between product instances, KETs, and the typologies of Smart Products, to also evaluate the effectiveness of the taxonomy adopted.
This study is part of a research project whose general objective is to investigate how the integration of KETs influences the design process of Smart HUMDs. In particular, it is part of the first specific objective, which is to define the concept of Smart HUMD, identifying which KETs are responsible for the innovative features that make these products “Smart”, followed by the identification of the design opportunities and limitations introduced by these technologies.

3. Results and Discussion: A New Taxonomy for Smart HUMDs

To conduct this analysis, a total of 9 case studies of Smart HUMDs have been collected and reviewed. Table 1 details the Smart HUMDs analyzed by differentiating them between the systems (9) and the instances that compose them (19). The systems have been described in the medical purposes they fulfill. Their instances have been then inspected in the KETs they integrate and classified according to both the taxonomy proposed by Pardo et al. (2020) and the one proposed in this study.

Table 1. Case studies analyzed.

Smart HUMD (system)	Medical Purposes	HUMD Type	Smart HUMD (instance)	KETs adopted	Smart Product Typology (Pardo et al., 2020)	Smart Product Typology (Proposed Taxonomy)

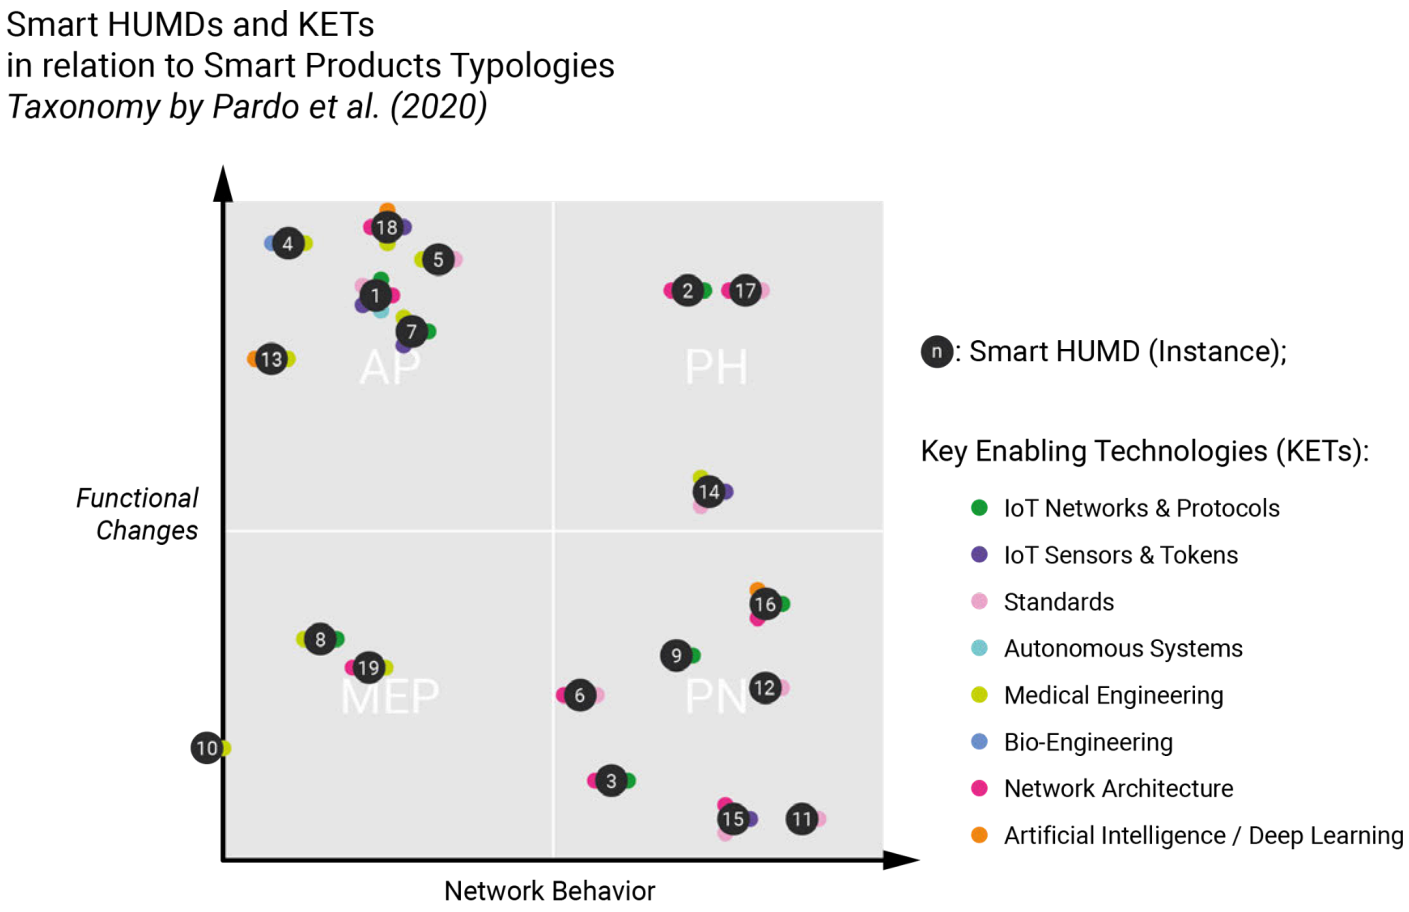

Figure 1. Benchmarking of Smart HUMDs (instances) and Key Enabling Technologies (KETs) in relation to Smart Product Typologies, utilizing the taxonomy proposed by Pardo et al. (2020).

The Typologies of Smart Products proposed by Pardo et al. (2020), i.e. MEP, AP, PN, and PH, have been valuable in achieving the objectives of this study. However, the benchmarking presented in Figure 1, which is based on these typologies, raised concerns regarding the effectiveness of this taxonomy to accurately characterize Smart HUMDs for many reasons. The first notable point is that it was originally conceived for categorizing Smart Business Products, which greatly differ from Smart HUMDs. Indeed, according to the Medical Device Regulation 745/2017, every product instance that composes a medical device must also be considered a medical device. It has thus been necessary to evaluate the instances with a certain degree of autonomy, and this required assigning Smart Product Typologies to every Smart HUMD (instance) that composes a Smart HUMD (system). For instance, the Owlet Smart Sock (Dangerfield et al., 2017) has not been categorized as a system, but rather in its instances, i.e. the sensorized sock, the smart base, and the smart app. Because of this approach, some of the Smart HUMDs (instances) did not perfectly fit into any of the 4 categories of Smart Products. A second reason is that this taxonomy was originally proposed for categorizing "Dumb" Products that become Smart. The parameters adopted by Pardo et al. (2020) for defining product typologies are relative, and not absolute: the parameter that represents the functionalities is indeed defined as "Functional changes".

This detail is critical in this study because it makes it impossible to define those products that started existing to serve their system. For instance, smart applications specifically designed for managing a specific Smart HUMD and accessing its data do not have any "dumb" versions to be compared with. However, they still have to be classified as medical devices. Additionally, another type of product emerged during the analysis of the case studies. It is the case of those products that have enhanced functionalities and are highly interconnected without occupying a central position in the system, e.g. the smart toilet (Bhatia et al., 2020). Due to these issues, the need to adapt the taxonomy proposed by Pardo et al. (2020) emerged. In particular, a new typology of Smart Product called "Smart Extension" (SE) has been conceived to describe the products that started existing only to extend the functions and connectivity of other products in the same system. Moreover, a new typology called "Advanced Node" (AN) could be used to refer to products with advanced features and strong network behavior that are not central in a system, making it necessary to rename the typology "Products-as-a-Node" (PN) as "Simple Node" (SN). Both the PN typology and the PH typology do not seem to represent what can be deemed as AN. Indeed, the KETs distribution across product typologies, as shown in Figure 1, highlights the limitations of these two typologies when it comes to distinguishing between simple and advanced solutions. For instance, the KETs "IoT Networks & Protocols" and "Network Architecture" are concentrated in PN, making distinguishing between simple and advanced systems rather complex. Another example is that the KET "Deep Learning" was misassigned to PN, despite its role in data interpretation and decision-making within smart medical device pipelines.

The new proposed taxonomy of the typologies of Smart HUMDs can be organized as shown in Figure 2b. The "Dumb Product" typology (dp) has been included in the proposed taxonomy for the capability of dumb products to become smart if coupled with SEs, as happens in the case study of the smart nebulizer (Zhou et al., 2018). However, to remark that they are not Smart Products, their acronym is written using letters in lowercase.

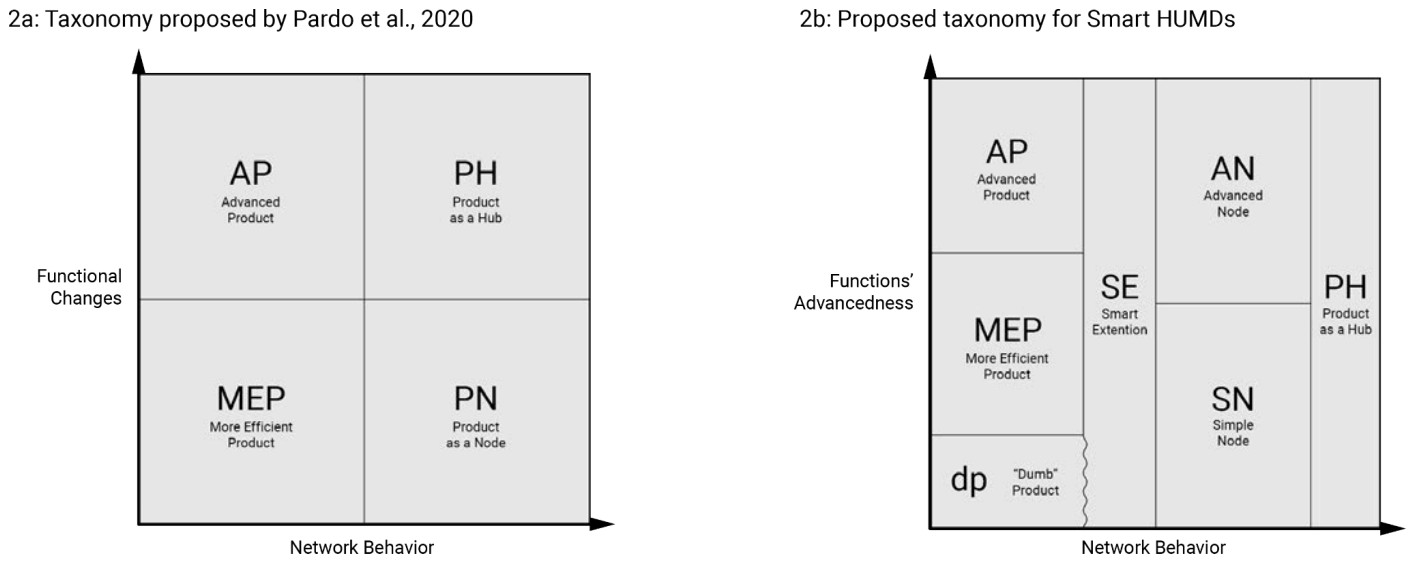

Figure 2. The taxonomy proposed by Pardo et al. (2020) (2a) compared to the taxonomy proposed by this study (2b).

Figure 3 shows the benchmarking of the same case studies built using the proposed taxonomy. The Smart HUMDs (instances) appear more evenly distributed and are more significantly described concerning the advancedness of their functionalities and network behavior. This taxonomy is also meaningful in describing the KETs' capabilities to determine certain levels of functionalities and connectivity. For instance, "Deep Learning" appears only in products with more advanced functionalities, like APs and ANs. At the same time, the KET "Medical Engineering", for the fact that it is also adopted in instances with less technologically-advanced characteristics, emerges as a base, yet fundamental, KET in the definition of a Smart HUMD.

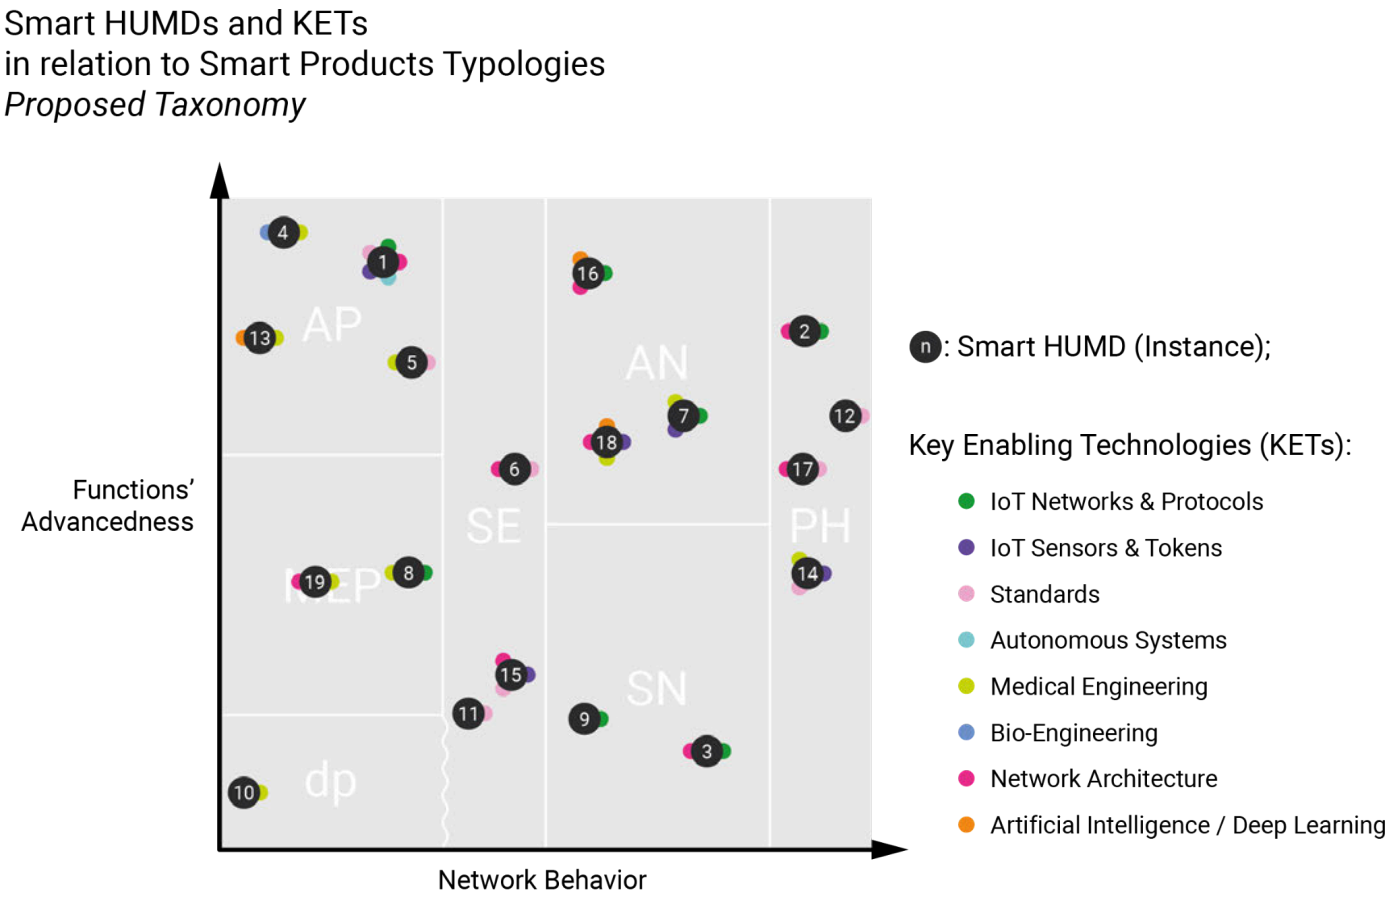

Figure 3. Benchmarking of Smart HUMDs (instances) and KETs in relation to Smart Product Typologies, utilizing the taxonomy proposed in this study.

4. Conclusions and Future Research

This study explored the domain of Smart HUMDs by understanding the relationship between KETs and Smart Product Typologies. The results show that, although the forward-thinking taxonomy provided by Pardo et al. (2020) was successfully adopted in the Smart Business Product domain, it needed to be readapted to describe Smart HUMDs due to factors like regulation, technological involvement, and the taxonomy's aim itself. Thanks to the new taxonomy, it has been possible to map the adoption of KETs in different types of Smart HUMDs, categorizing them into technology-based typologies. Future research could be conducted to evaluate the applicability of the classification model proposed in this study in other Smart Product domains.

ABSTRACT | Design is a plural domain with a notable emphasis on mediation and collaboration where professionals excel through co-creating with experts from diverse areas of knowledge. Thus, expanding the repertoire of resources and creative methods is highly desirable, as it enables designers to explore new experiences and innovative approaches for addressing complex projects that have the potential to contribute to sustainability, ecological awareness, and regeneration. In this context, investigating natural inspiration, namely, biomimicry, is particularly pertinent, as this domain consists of critically and ethically transposing biological analogies to the societal context, drawing inspiration from natural forms, processes, and ecosystems. The present descriptive, exploratory, and experimental investigation was undertaken to identify and analyze the adoption of biomimicry-thinking methods and tools in developing design projects. The Research-Through-Design was oriented by the following methods: a literature review; a parametric analysis of 40 pre-existing bioinspired products; an application of the Biomimicry Thinking Challenge-to-Biology method; brainstorming sessions; the use of a biological concept matrix and SWOT matrix; and multiple experimentations with physical and digital prototypes. These procedures resulted in the development of a bioinspired and dynamic visual identity system, a multisensory installation in Processing and Arduino that allows for

interaction with the brand, and a biomimetic furniture collection. In the parametric evaluation of existing bioinspired products, it was possible to establish relevant criteria for further exploration in biomimetic product design. For the development of the design alternatives (visual identity, interactive system, and furniture design), specific organisms were explored and selected for their structural modular resistance, biomorphic patterns, and compatibility with contextual and sustainable requirements. These inspiring natural elements corresponded to the following set: *Hippocampus reidi*; *Phycodurus eques*; and *Victoria amazonica*. The biomimetic process facilitated extensive experimentation with biological and biomimetic databases, employing various visual representation techniques and prototyping resources. The significance of the interdisciplinary approach for fostering innovation in design was also discussed, with particular emphasis on the contributions of natural knowledge, where specificities and adaptations were tested throughout evolution. The biomimicry resources contributed to integrating sustainable and ecological requirements, organic and biophilic volumetry, and multifunctional elements. Further investigation is recommended on more experiments in design projects applying other biomimetic methods (notably, the Biology-to-Design method) and with different inspiring biological elements in creative sessions, particularly involving design students and professionals. Including biologists as part of the creative team is essential for future experimentation, especially when investigating higher levels of abstraction and complexity, encompassing natural processes and ecosystems. Finally, designers ought to cultivate and exercise interdisciplinary critical thinking as a resource for innovation within their field. Therefore, biomimicry, with its significant potential to stimulate creativity, offers a valuable expansion of the methodological toolbox available to designers. Its integration promotes ecological awareness, stimulates the exploration of complex geometries, and the inclusion of sustainability requirements at the core of design projects. Mastering the ability to interpret and apply insights from natural analogies rooted in biological knowledge is an essential skill for designers aiming to enhance human well-being while fostering harmony with the natural environment.

KEYWORDS | BIOMIMETIC DESIGN, BIOMIMETIC TOOL, BIOMIMICRY THINKING, DESIGN METHOD, SUSTAINABLE DESIGN

1. Introduction

Design encompasses a broad repertoire of methods and tools to address diverse requirements. Adopting new multidisciplinary and exploratory approaches is highly desirable, as it enriches education and professional practice, fostering innovative and context-sensitive solutions (Bonsiepe, 2011; Cardoso, 2016). Examining the designers' associative capacities, by investigating natural analogies and bioinspiration, expands available creative possibilities, supporting sustainable and regenerative projects (Chayaamor-Heil, 2023; MacKinnon et al., 2020; Papanek, 2011).

Biomimicry offers a biologically grounded approach to complex societal and environmental challenges, emphasizing ethical responsibility, and sustainability, ultimately resignifying and fostering reconnection with the biosphere (Delannoy, 2021; Pawlyn, 2011). Through the abstraction of natural forms, processes, and ecosystems, biomimicry enables design activities without the direct exploitation of nature (Cohen & Reich, 2016; Vincent et al., 2006, Arruda, 2018; Chayaamor-Heil, 2023; International Organization for Standardization, 2015). Given the profusion of potentially inspiring natural elements, it is complex to successfully conceive innovative designs, particularly considering the intrinsic higher levels of abstraction within the process (Figure 1) (Aish & Sun, 2020; Graeff et al. 2021). Thus, several resources were developed to support the biomimetic design process (Badarnah, 2012; Vincent et al., 2006; Wanieck et al., 2017).

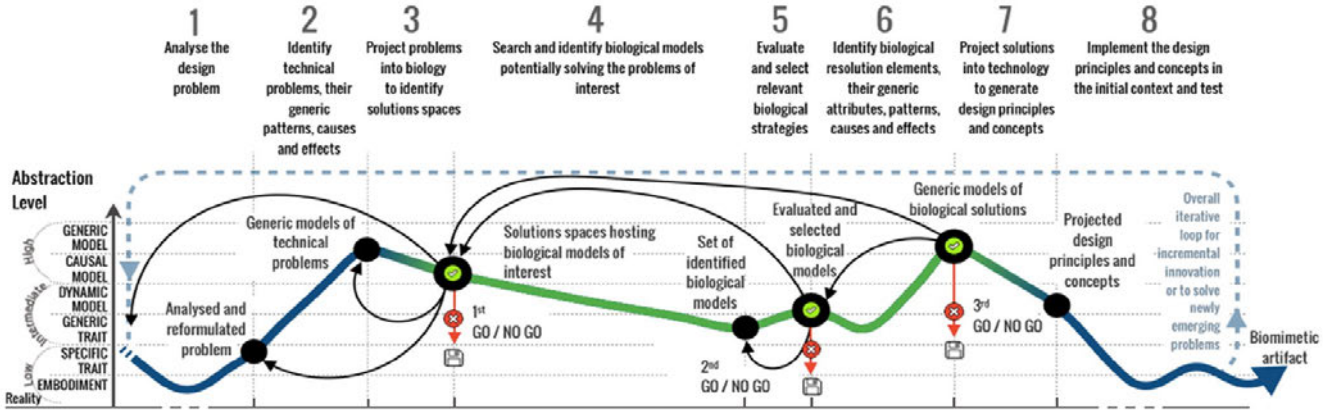

Figure 1. The Technology-Pull-Interdisciplinary-Biomimetic-Process is similar to the Challenge-to-Biology method. It highlights the complexity of transitioning between stages of rising levels in abstraction (Graeff et al., 2021).

Engaging with the biosphere as a knowledge source requires robust ethical alignment, with design outcomes aiming to contribute to human well-being and health. The capacity to integrate biophilic resources, within design education and practice, is increasingly recognized as fundamental (Browning et al., 2024; Pollini & Rognoli, 2024). Biomimicry thus emerges as a strategic approach and investment for creativity, sustainability, and quality of life (Vitalis & Chayaamor-Heil, 2023).

Therefore, the present descriptive, exploratory, and experimental research investigated and analyzed the adoption of the Biomimicry-Thinking Challenge-to-Biology method in design projects. For graphic design, the objective consisted of developing a dynamic brand and an interactive system responsive to light, heat, sound, and presence. The product design project focused on developing nature-inspired modular furniture.

2. Method

A multi-methodological approach was adopted. A literature review and a parametric analysis of 40 pre-existing bioinspired products informed the definition of biomimetic and biophilic design criteria for conducting the Research-Through-Design (Benyus, 2002; Browning et al., 2024; Hanington & Martin, 2019; Sá & Viana, 2023). Then, the application of the Biomimicry-Thinking Challenge-to-Biology approach (Figure 2) allowed orienting the creation of the visual identity, the interactive system, and the furniture design (Biomimicry 3.8, 2025). The Life's Principles Diagram (Figure 3) supported the integration and monitoring of biomimetic and sustainability principles throughout the process (Baumeister et al., 2014). A Matrix of Organisms and Natural Strategies, based on the literature review and the AskNature database, was created to select pertinent biological knowledge (Biomimicry Institute, 2025). Ideation was supported through brainstorming and sketches (Stickdorn & Schneider, 2012). Concepts were evaluated using SWOT matrix analysis. Arduino hardware and Processing software were employed to create the brand design and interactive installation. The product design furniture collection was developed using Fusion 360° software and 3D printing technologies (Hanington & Martin, 2019; Sá, 2018; Stickdorn & Schneider, 2012).

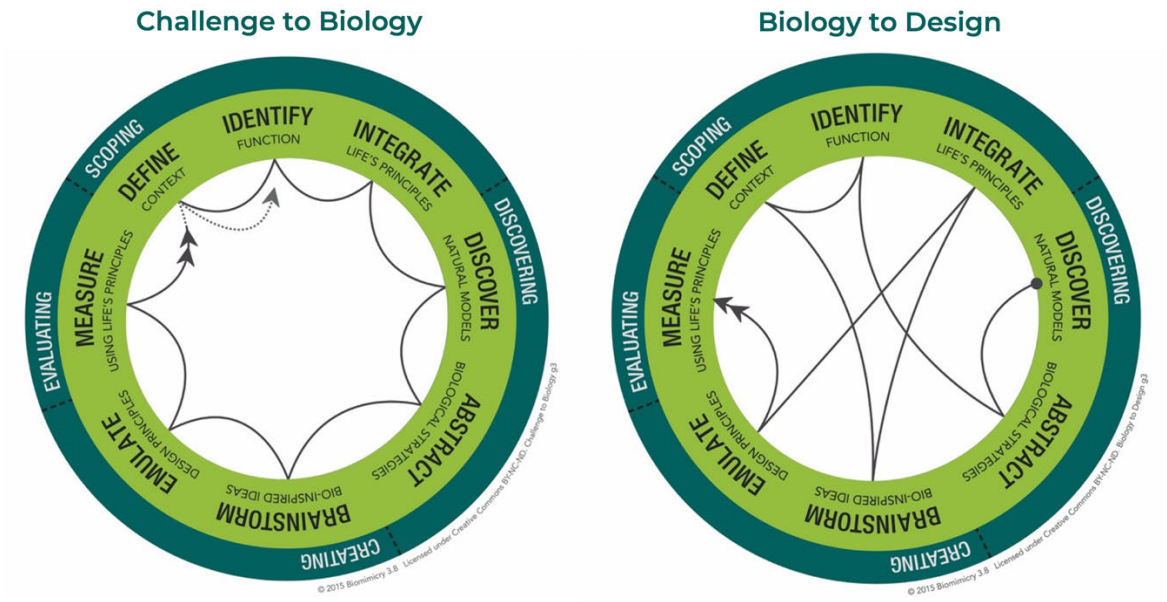

Figure 2. Biomimicry Thinking encompasses two main approaches: Challenge-to-Biology, and Biology-to-Design. The first pathway begins with the formulation of a design brief and the identification of desired functions. Then, the Life's Principles Diagram is applied to guide the search for biological inspiration, whose characteristics are abstracted and translated into conceptual-level design requirements. During prototyping, these emulated biological elements are integrated into design solutions. The final step involves reapplying the Life's Principles Diagram to assess and refine the results, according to biomimetic and sustainable principles. The Biology-to-Design approach follows a similar structure but begins with exploratory biological research that can later be subsequently reframed into viable design projects (Baumeister et al., 2014; Biomimicry 3.8, 2025).

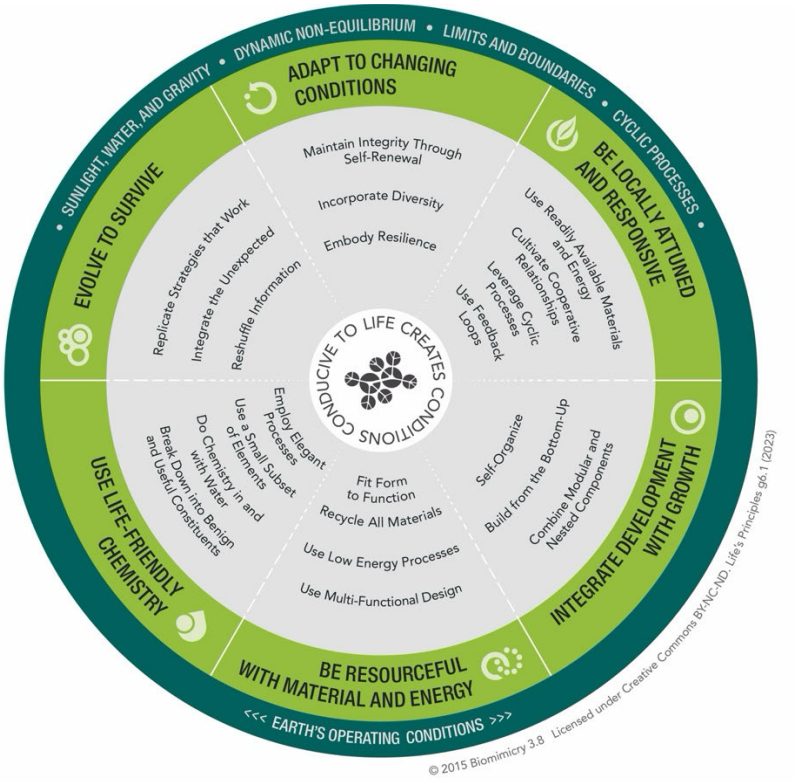

Figure 3. The Life's Principles Diagram is a complementary tool within Biomimicry-Thinking. It provides a set of nature-inspired patterns, that serve as a guiding framework and an evaluation tool for assessing the sustainability and biomimetic relevance of design alternatives throughout the creative process (Baumeister et al., 2014; Biomimicry 3.8, 2025).

3. Results and Discussion

A literature review and a parametric analysis of 40 bioinspired products established the foundation for the multiple design sessions (Sá, 2018; Sá & Viana, 2023). Each product was assessed using four qualitative criteria (biomimicry, biophilia, sustainability, and functionality) and categorized from 0 to 5 (Baumeister et al., 2014; Biomimicry 3.8, 2025; Browning et al., 2024). There was a predominance of biomimicry and functionality, followed by biophilia and sustainability. Probably, the biophilic aspect was considered as "less explored" comparatively to biomimicry, given that only six of its 14 guiding principles could be applied to a single product (Browning et al., 2024).

Guided by Baumeister et al. (2014) approach, the following biologically based guiding design question was set: "How does nature produce modules?". Such question converges with the Life's Principles Diagram, as it emphasizes system optimization and the use of multifunctionality and nested components.

Through searching literature and the AskNature database (Ball, 2016; Delannoy, 2021; Dumont, 2014; Fournier & Fourié, 2011; Thiery & Breton, 2017), and also by applying analytical tools (Biological Concept Matrix and SWOT Matrix), it was possible to select inspiring organisms for biomimetic analogies (Figure 4). The following set was considered the most suitable for the present product and graphic design projects: Hippocampus reidi (long snout seahorse), Victoria amazonica (giant water lily), Phycodurus eques (leafy sea dragon). Brainstorming and sketches supported the elaboration of alternatives and prototypes.

Figure 4. The selection of the multi-biological inspiration set was grounded on specific functional attributes: the seahorse's caudal flexibility enabling multidirectional movement; the structural resilience of the seahorse and leafy sea dragon modular skeletal elements; the giant water lily underside leaf architecture, which supports high load-bearing capacity; and the leafy sea dragon organic forms and appendages, relevant to biophilic design (Box et al., 2022; Browne et al., 2008; Porter & Ravikumar, 2017). Image sources: Clode, 2018; Short et al., 2020; Suguri, 2008; Stiller, et al., 2015; Kutleša, 2024; Taveneaux, 2011.

In the first creative session, a dynamic logo and visual identity system were developed based on biological knowledge (Figure 4). Figurative alternatives were sketched and informed vector-based development and experimentation. Further development was carried out in Processing code language where mathematical functions (e.g., sine and cosine) controlled shape dynamics (Figure 5).

Figure 5. Logo alternatives generated in Processing code, inspired by botanical and marine organisms (Sá, 2018).

By adjusting parameters, the final brand and animation were created (Figure 6). The final alternative was selected for its applicability and for its emphasis on biomimetic and biophilic attributes (including aspects of complexity and order, biomorphic patterns, and modularity). A bioinspired visual identity manual was created to establish guidelines for graphic communication.

Figure 6. The dynamic and animated logo was programmed with a range of parameters correlated to environmental data that could be captured through sensors, allowing it to be "responsive" to variations in: a) luminosity - positive/negative color inversion of the brand; b) temperature and humidity - color and transparency variations; and c) presence and sound intensity - brand animation and speed of motion. Such dynamic reactions were proposed, given the following planned creative session, focused on making an object for a multisensory interactive installation (Sá, 2018).

The second design session resulted in an interactive visual system responsive to environmental stimuli (Figure 7). Changes in form and motion of the graphic components were nature-inspired, and oriented by principles such as adaptability, sensory variability (light and non-rhythmic stimuli), and responsivity to place (Baumeister et al., 2014; Browning et al., 2024). Designed to enhance site-specific engagement, the system mimics biological behavior. Each location of exhibition of the interactive system could have a unique visual configuration. Therefore, the brand would "react" and "adapt" to user presence and environmental conditions to optimize visual configuration, just like an organism seeking the best conditions for survival.

Figure 7. Prototyping was conducted using Arduino-Uno board and Processing code. The set of sensors included: Passive Infrared (PIR) for detecting presence; Light Dependent Resistor (LDR) for recording luminosity; LM393 for extracting sound data; and DHT11 for detecting temperature and humidity. A packaging was designed to protect the hardware (Sá, 2018).

The third session involved the development of a furniture collection inspired by the same organisms (Figure 4). Sketches were followed by prototyping with scale models to study necessary components and mechanisms (Figure 8). A digital prototyping stage was carried out in Fusion 360° to specify furniture modules and test fitting systems. Multiple configurations were proposed, based on different rotations and piece positioning. The resulting designs included module size variations and allowed for vertical and horizontal fittings enabling flexible spatial arrangements, ultimately creating a biophilic ambience (Figure 9).

Figure 8. Concept sketches and 1:8 scale prototypes (Sá, 2018).

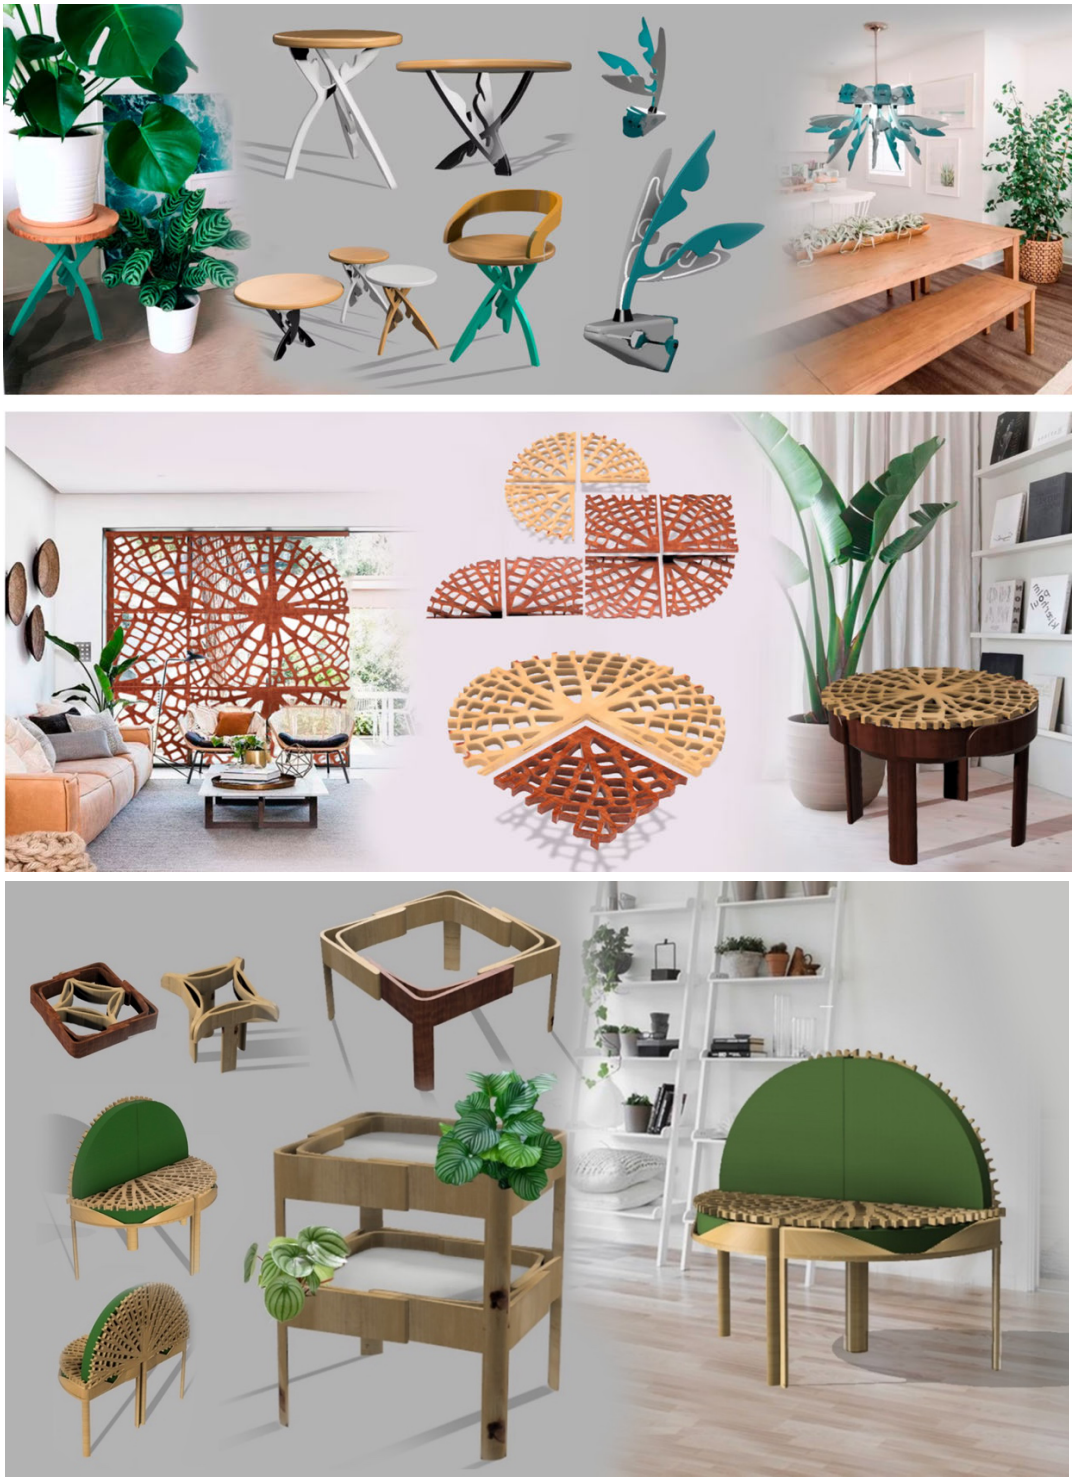

Figure 9. Resulting biomimetic furniture collection: claw lamp and stool inspired by seahorse and leafy sea dragon skeletal structures. Chairs, floor modules, and room dividers based on the giant water lily. Tables and modular shelving units inspired by seahorse tail structure (Sá, 2018).

Each design session addressed different abstraction and complexity levels of biomimicry. The visual identity system was considered highly abstract and predominantly biomorphic, the interactive installation centered on mimicking natural behaviors, requiring further prototyping in different sites to observe how the results differ from place to place. The furniture collection was considered the most robust morphological biomimetic analogy, given that it focused on optimizing functionality in tangible and multifunctional product design. Morphological and structural analogies were predominant, though deeper exploration of micro and nanoscale functions, as well as process and ecosystem level biomimetic analogies, remains a future opportunity. All the design propositions need to be further evaluated according to their real sustainability (LCA, material specifications, supply chain, etc.).

The multiple creative design sessions allowed for experimenting and analyzing the application of the Challenge-to-Biology approach. The results converge with what was emphasized by Andrade et al. (2021); Arruda (2018; 2019) and Myers (2018), that highlight the importance of exploring interdisciplinary knowledge to foster collaboration and innovation in design. Researching within the scientific field and exchanging knowledge with biologists, expands the creative horizons in many different areas of design education and practice and allows for adequately exploring the inspiring vastness of the natural repository where specificities and adaptations were tested throughout evolution.

The Challenge-to-Biology approach facilitated extensive experimentation with the scientific and biomimetic databases which was fundamental for deep understanding of the inspiring organisms. The Life's Principles and the 14 Biophilic Design Patterns (Biomimicry 3.8, 2025; Browning et al., 2024) provided essential frameworks for embedding bioinspired, functional, and ecological aspects across all sessions.

4. Conclusions

The research achieved the proposed objectives, allowing experimentation with biological knowledge and specialized databases, and contributing to analyzing the application the Biomimicry-Thinking Challenge-to-Biology method across diverse design contexts. This approach supported the integration of multi-biological inspiration and sustainable requirements, resulting in multifunctional, biophilic, modular solutions. The findings underscore the designer's pivotal role as a mediator within interdisciplinary teams advancing sustainable, regenerative, and biomimetic practices. Collaboration with biologists is essential for future experimentation, especially engaging with higher abstraction levels and ecological complexity. Conducting biomimetic design projects with different approaches is recommended (e.g., service design, participatory design). Including the application of additional biomimetic methods (e.g., Biology-to-Design, or BioGen) and involving design students and professionals is also pertinent (Badarnah, 2012; Biomimicry 3.8., 2025). Incorporating emerging technologies and quantitatively assessing sustainability criteria of the design developments are also essential aspects for advancing this research (e.g., Life Cycle Analysis).

Ultimately, biomimicry significantly contributes to design education and practice by fostering creativity, stimulating engagement with complex systems and geometries, and broadening ecologically responsible design solutions. Mastering the ability to design from biological analogies is vital for enhancing well-being while cultivating harmonious, symbiotic co-existence with the natural environment (Blanco et al., 2021; Chayaamor-Heil et al., 2024; Zari & Hecht, 2020).

About the Authors:

Alice Araujo Marques de Sá PhD Design student at the Architecture School of Lisbon University. Master's in Design, Specialization in Architectural-Urbanistic Sustainable Environmental Rehabilitation, and Bachelor's in Product and Graphic Design, all from the University of Brasília, Brazil. Interested in bioinspiration, biomimicry, biodesign and sustainability.

Fátima Aparecida dos Santos Director of the Arts Institute and Design Professor at the University of Brasília, Brazil. Graduated in Design (São-Paulo-State-University), Master and PhD in Communication and Semiotics (Pontifical-Catholic-University-of-São-Paulo). Her research encompasses web design and graphic design languages in urban spaces.

Nayara Moreno de Siqueira Design Professor at University of Brasília (UnB), Brazil. PhD in Architecture and Urbanism, Art History and Theory Master's (UnB), and Bachelor's in Product Design (Federal University Rio de Janeiro). Her research focuses on design systems (human/environment/artefact relationships) and everyday activities.

COEXISTENCE DESIGN. BRIDGING PUBLIC ADMINISTRATION AND VULNERABLE COMMUNITIES.

Miriam Saviano

Sapienza University of Rome
Miriam.saviano@uniroma1.it

ABSTRACT | Public Administration (PA) services often fail to meet the needs of marginalized communities due to systemic barriers and standardized service models that overlook diversity. This research proposes a value-oriented and participatory approach to service design, aimed at fostering "coexistive services" that accommodate a plurality of needs rather than striving for mere inclusion. Grounded in theories of intersectionality, Design Justice, and Value-Sensitive Design, the study introduces a three-phase methodology. The first phase focuses on identifying communication frictions between PA, service providers, and vulnerable users. Fieldwork currently underway explores these dynamics through stakeholder interviews and field observation. The second phase will involve participatory co-design workshops to prototype tools and interventions that improve mutual understanding and accessibility. The third phase shifts to a systemic level, examining how institutional structures within PA can be reoriented to support equitable and responsive service delivery. Preliminary findings reveal both the potential of relational pedagogical practices and the limitations of current institutional communication, particularly in decision-making and inter-organizational collaboration. The outcome of the research will include a heat map of stakeholder frictions, a participatory design toolkit, and strategic policy recommendations. Ultimately, this study advocates for a structural transformation in PA by embedding design practices that promote equity, accessibility, and the coexistence of differences within public service ecosystems.

KEYWORDS | INTERSECTIONALITY, SERVICE DESIGN, PARTICIPATORY DESIGN, PUBLIC SERVICE INNOVATION

1. Introduction

The present Western society model results from centuries of colonialism, capitalism, Eurocentrism, heteronormativity, and androcentrism, heavily pushing a binary view of individuals. Today, as attentive members of society, we can discern the discriminations across public and social sphere, mainly brought to light by activist movements such as transfeminism, Black right, Indigenous rights, and Disability rights groups, LGBTQIA+ organizations, and many others. Nevertheless, the concept of intersectionality of these discriminations is often ignored.
Intersectionality refers to the overlapping of oppressions, such as race and gender, or sexuality and nationality (Crenshaw, 1991). Academic and sociologist Patricia Hill Collins' Matrix of domination offers a representation of this phenomenon, highlighting how "structural, disciplinary, hegemonic, and interpersonal domains of power reappear across quite different forms of oppression" (Collins, 1990, p.228), reinforcing inequalities.
Recognizing intersectionality necessitates questioning societal norms and the perception of what—or rather who—is "other" and why it is different from the standard. And, above all, why is there a standard? As linguist and activist Vera Gheno (2023) argues, inclusion should not represent the goal of society but rather the first step to equity. Instead of a paternalistic act by a dominant group to "include", we should embrace Acanfora's (2021) concept of "coexistence of differences", which differs from coexistence with differences. For this reason, we should not speak of inclusive but rather of broad approach, vision, and language (Acanfora, 2021).
Public Administration (PA) often neglects these perspectives, failing to distribute attention and resources equitably. This research argues that public services must shift from a one-size-fits-all model to an equity-driven approach that redistributes the "attention economy" (Davenport & Beck, 2001) to marginalized communities.

2. Scientific Framework: Design as a Tool for Institutional Transformation

In this social and cultural context, institutions and therefore public services are mainly designed with an implicit assumption that the average user is male, wealthy, local (urbanized), cis-straight, atheist or follower of the main religion, unburdened by domestic labor.
Why is this conception so clearly biased and yet so diffused, the standard? Centuries of patriarchal vision have led, among other things, to a flawed collection of statistical aggregated data, erasing marginalized identities. The "anomaly" is excluded because of the risk of fallacy (Criado Perez, 2019). The result is a great discrepancy between the services offered and the needs of marginalized groups, which often represent a large part of the population that must face systemic and systematic barriers to achieve the same rights as the above-mentioned standard-user. These barriers, compounded by systemic inequities, can have psychological and physical repercussions, as illustrated by Meyers' Minority Stress Model (2003).
Concerning the PA, vulnerable citizens and marginalized communities often face significant barriers and exclusion in accessing and using services. Activists have long argued that inaccessible environments, such as workplaces without childcare and buildings without ramps, make oppressed people less visible and, therefore, less likely to receive legislative protections (Steinfeld and Maisel, 2012).
PA systems, much like other aspects of the built and social environment, are too often

designed with a one-size-fits-all approach. This overlooks the unique experiences of individuals with disabilities, non-normative identities, or socioeconomic disadvantages, leading to systemic exclusion and marginalization.
This context sets the stage for exploring how Design can challenge and reshape these inequities. To do so, it is necessary to inquire about who historically and typically participates in design processes and, thus, what is the relationship between design and power (Braman, 2020; Costanza-Chock, 2020). As Winner (2009) notes, “artifacts have politics," and Design is inherently tied to power structures, playing a critical role in shaping societal norms and dynamics. This highlights the need to examine the diversity, inclusivity, and equity of design practices from the beginning of the process, as they can have a very direct influence on the technologies, methods, and context of the project (Grönvall and Lundberg, 2022).
In the digital environment, this connection becomes even more pronounced. Designers work in a "sociotechnical" world, where the “code is law,” and provide an infrastructure of constraints and affordances that shape processes and perceptions (Braman, 2020). For example, security full-body scanners force operators to select M/F options, creating discrimination and barriers for queer, trans*, intersex, and gender non-conforming people, posing barriers for disabled people with non-normative body shapes and/or prostheses as well (Costanza-Chock, 2020). Similarly, biases are presented against Sikh men, Muslim women, and individuals wearing headwraps (Browne, 2015), as machines are trained through “lenses tinted by the optics of white supremacy” (Buolamwini, 2017). Such cases demonstrate how norms and values embedded in sociotechnical systems reproduce biases structured by the Matrix of Domination, further marginalizing vulnerable communities. Ensuring design justice in PA systems requires innovation on both the technical and the social side, through the development of new communal formations and processes (Braman, 2020). Addressing the systemic barriers faced by vulnerable citizens calls for a focus on equity-driven, Diverse, Equitable, Inclusive (DEI) design approaches.

3. Research Approach: Designing for Coexistive Public Services

3.1. Scientific Objectives of the Research

The research aims to address the systemic barriers and exclusion faced by vulnerable communities in accessing and using PA services. It builds on DEI principles and frameworks such as Design Justice, Value Sensitive Design, and Participatory Design (Costanza-Chock, 2020; Flanagan et al, 2008; Friedman et al., 2013; Simonsen & Robertson, 2013) to challenge these inequities by reshaping service delivery to be equitable and promoting a plurality of values among the stakeholders (Grönvall et al., 2016).
The general objective of the research is to assist the PA in the provision of “Coexistive Services”, intersectional and equitably accessible to all users regardless of their vulnerability.
The study contributes to two key areas:

1. On an analytical and operational level, the research observes the relations among stakeholders and designs targeted interventions, by focusing on where the friction happens (SO1) and how to intervene through participatory practices of service design (SO2).
2. On a strategic and systemic level, it asks how the PA can enable a new way of doing public service, wondering how the system itself (the PA) can evolve to accommodate plurality of needs and visions and design services for the coexistence of differences.

3.2. Methodology and Phases

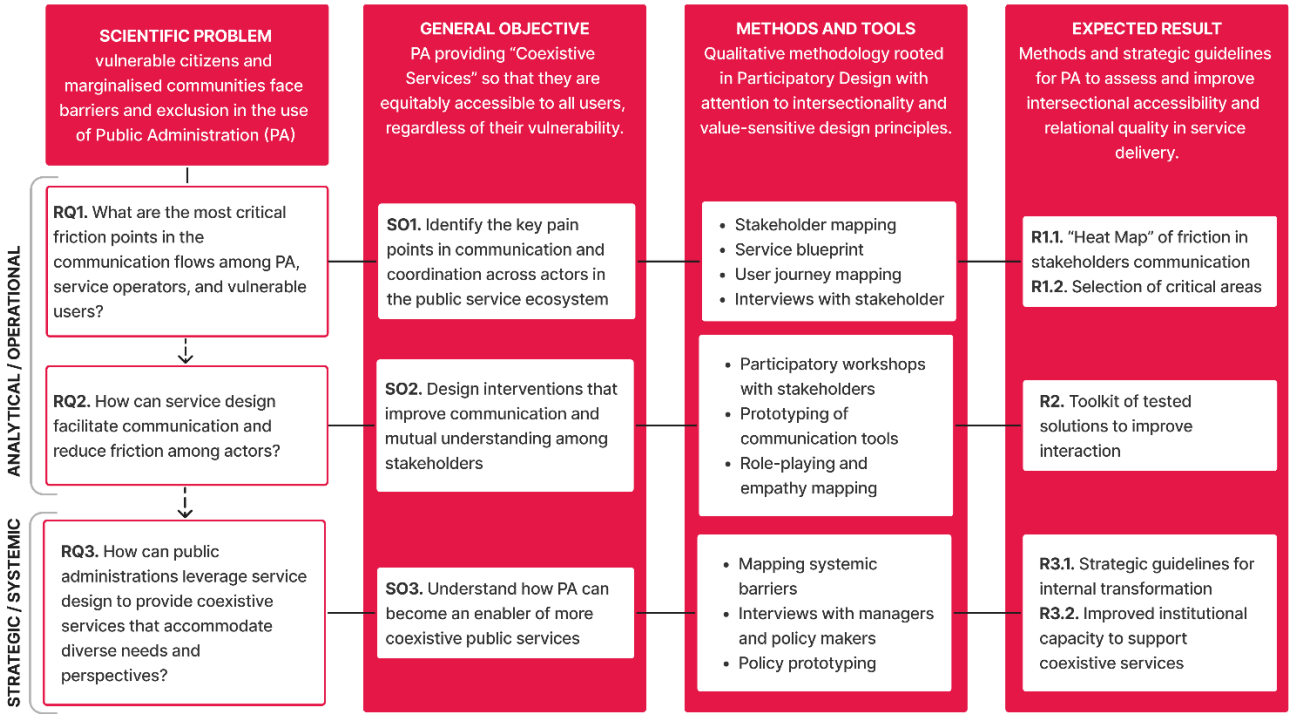

Figure 1. The research is divided into three phases, each stemming from a research question, posing a specific objective and aiming at one or more expected results. The first two phases contribute to an analytical/operational level of the research; the third phase constitutes a strategic/systemic level.

The research methodology, as shown in Fig.1, is divided into three phases that start from a research question (RQ) to achieve a specific objective (SO) thanks to the expected results (R).

1. Asking "What are the most critical friction points in the communication flows among PA, service operators, and vulnerable users?" (RQ1), the first phase aims to identify key pain points in communication and coordination across actors in the public service ecosystem (SO1). The analysis of the relations through stakeholders maps, interviews with stakeholders and customers journey maps, will define a "heat map" of frictions in the stakeholder communication (R1.1), allowing to select the most appropriate area of intervention (R1.2).
2. To design interventions that improve communication and mutual understanding among stakeholders (SO2), phase two inquires on "how can service design facilitate communication and reduce friction among actors?" (RQ2). The results of tools such as participatory workshops with stakeholders, prototypes of communication tools and empathy maps from role-playing, will produce a toolkit of tested solutions to improve the interactions (R2).
3. Finally, on a wider systemic level, the third phase inquires on "how can PA leverage service design to provide coexistive services that accommodate diverse needs and perspective?" (RQ3). To understand how PA can become an enabler of more intersectional services (SO3), tools such as map of systemic barriers, interviews with managers and policy makers, and policy prototyping, will provide a set of strategic guidelines for internal transformation (R3.1) to improve institutional capacity to support coexistive services (R3.2).

4. Exploring Service Relations in a Danish PA Context

At the time of writing this short paper, a visiting research period is ongoing at the IT University in Copenhagen, hosted by Prof. Grönvall, to acquire best practices and insights on Participatory Design and local inclusive initiatives. In this context, desk research has

been conducted to identify public organizations working with vulnerable users, vocational schools offering programs in social work and PA, and local administrations operating in the areas of social housing and health and care.
To date, an interview has been conducted with a social worker at the Elmehuset facility. Provided by the Municipality of Copenhagen, it is a residential and temporary accommodation institution dedicated to children and young people with autism spectrum disorders. During the visit, it emerged that the residents have constant access to the support of pedagogical social workers. In addition to housing, meals are provided in common dining rooms, along with community activities aimed at promoting social interaction. The goal of the facility is to make residents autonomous in preparation for moving into their own housing, through the assessment of Activities of Daily Living (ADL). These are activities that people engage in on a routine basis, such as brushing their teeth and preparing a meal, and are associated with better outcomes in independent living, education, employment, relationships, and mental health (Krempley & Schmidt 2021).
It was learned that the relationship between social workers and young residents is daily and relatively egalitarian: there is no power imbalance imposed by the staff, and the young people are encouraged to participate in activities on a voluntary basis, without pressure or obligation. When asked about the residents' involvement in the facility's decision-making, for example, concerning the weekly menu or collective activities, it emerged that while the young people are invited to participate in meetings, in practice very few attend.
On the medical-administrative side, each resident has a medical file compiled by the clinical staff at the time of admission, and a specific program to follow for rehabilitation or health maintenance. The facility itself does not maintain relationships with similar organizations but hosts internships from pedagogical programs to train future social workers.
On the relational level, some insights emerged from the visit to Elmehuset:

- Service workers and residents: communication between vulnerable users and service workers is direct; for the pedagogues, "the aim is to create a relation to the kids and the youth who lives here, […] to do relational work." However, the young residents tend to participate little in the meetings proposed by the staff. Internal communication within the facility also takes place via a software system indicating the daily and weekly menu, staff shifts, planned activities, etc.
- Service workers and administration: the facility does not communicate with other similar organizations and mainly refers to health and care institutions regarding the residents' conditions. In this case too, communication takes place primarily through forms and digital platforms.
- Administration and vulnerable users: no insights emerged on this point.

It should be noted that the interview took place during an early stage of familiarization with the facility, when the research focus on relationships had not yet been established, and thus the information emerged from questions of a different nature.

5. Conclusion: Institutional Pathways to Equity

The research is currently in Phase One, which focuses on mapping the friction points among PA, service operators, and vulnerable users. This stage involves interviews with stakeholders from public institutions, vocational schools, service providers for vulnerable people, and the users themselves. Initial fieldwork conducted in Copenhagen through desk research and a preliminary interview with a social worker at Elmehuset, has highlighted the relational dynamics within an inclusive public care structure. While the staff's pedagogical methods demonstrate a commitment to fostering egalitarian interactions, gaps in participatory decision-making and institutional communication emerged, offering valuable insights into existing limitations.
The next steps involve applying the same methodological framework in a second

European country and in Italy. This comparative approach aims to generate a broader understanding of the state of PA across diverse contexts, ultimately resulting in a "Heat Map" of communication frictions (R1.1) and the identification of critical areas for intervention (R1.2). These insights will form the basis for co-designing participatory solutions in Phase Two (R2), and later developing strategic guidelines for institutional change in Phase Three (R3).

This research begins from a core societal challenge: the persistent exclusion of marginalized communities from equitable access to PA services. These systems are still predominantly designed for a normative user profile, thus systematically excluding those whose needs fall outside the "standard". Through a conceptual shift from inclusion to coexistence of differences, the study builds on DEI principles, Participatory Design, and Design Justice frameworks to redefine how PA services are conceived and delivered. The three-phase methodology provides both analytical and systemic insights. By mapping communication breakdowns, developing participatory toolkits, and co-creating institutional strategies, the research lays the foundation for PA systems to embrace a plurality of values and needs.

Ultimately, this research advocates for a new paradigm of "coexistive services" that are not only accessible but also affirm the agency and dignity of all users. By embedding participatory and value-sensitive design practices into the DNA of public institutions, this project contributes to a more equitable, inclusive, and socially just future for Public Administration.

CONTROVERSO: A DIGITAL EDUCATIONAL MODEL FOR TRANSMITTING HISTORICAL MEMORY AND CONTROVERSIAL HERITAGE IN CIVIC EDUCATION

Agnese Rullo

ISIA Roma Design and Tor Vergata University
*agnese.rullo@edu.isiaroma.it

ABSTRACT | Historical memory is essential in forming both individual and collective identities, serving not only as a means to recall the past but also as an active resource for interpreting the present and shaping the future (Halbwachs, 1992; Jedlowski, 2000). Traditional civic education has historically emphasized the transmission of knowledge, and there is an increasing emphasis on incorporating interactive methods to foster critical engagement and reflective discussion. In response to this evolving perspective, the ControVerso project emerges as an innovative digital educational system that integrates the concepts of historical memory and controversial heritage within civic education.

Drawing on landmark research in memory studies—including works by Halbwachs (1992), Assmann (2011), and Ricoeur (2004)—the project is grounded in the idea that memory is a dynamic process influenced by social contexts and collective experiences. Moreover, contemporary investigations have underscored the potential of controversial heritage—those aspects of history that generate debate and divergence—as a catalyst for critical discussion (Delgado-Algarra & Estepa-Giménez, 2016). By embedding these theoretical insights within a practical framework, ControVerso aims to transcend conventional pedagogical models through active, student-centered learning.

The methodology is structured in three phases. First, the normative and theoretical context of civic education in Italy is examined, tracing its evolution from the introduction of D.P.R. no. 585 in 1958 to the guidelines established by Law no. 92/2019. Second, the project operationalizes these concepts by focusing on the Italian Resistance; testimonies sourced from *NOI Partigiani. Memoriale della Resistenza italiana* (2020) are qualitatively

analyzed and integrated into a narrative module that emphasizes the role of controversial heritage in promoting critical reflection. Third, a pilot simulation was conducted with 16 students, during which both qualitative and quantitative data were collected through anonymous questionnaires to assess levels of involvement.

Preliminary findings indicate that the ControVerso platform effectively engages students, prompting a range of emotional and reflective responses, and supports the hypothesis that digital pedagogical tools can enrich civic education. These results provide a promising foundation for further research and broader implementation within classroom settings, with potential benefits including increased student participation, improved critical analysis, and a more profound understanding of history's complexities.

KEYWORDS | HISTORICAL MEMORY, CONTROVERSIAL HERITAGE, CIVIC EDUCATION, CRITICAL THINKING, INTERACTIVE LEARNING

1. Introduction

Historical memory plays a crucial role in shaping both individual and collective identity, serving not only as a recollection of the past but also as an active resource for understanding the present and planning for the future (Halbwachs, 2007; Jedlowski, 2000). In recent decades, the so-called memory studies have demonstrated that memory is not merely a passive record of events; rather, it is a dynamic process laden with emotional and political significance that contributes to forming the social and cultural fabric of a community (Jedlowski, 2000). In this context, the ability to develop a critical memory becomes fundamental to fostering informed citizenship and critical thinking—elements that are indispensable in a rapidly changing society.

Civic education and the cultivation of critical thinking represent relevant challenges for the contemporary educational system, especially in an era when historical narratives and information can be easily distorted or manipulated. Traditionally, the teaching of history has favored a linear, often one-way transmission of knowledge, leaving little room for active discussion and critical reflection among students. However, innovative pedagogical methodologies—such as cooperative learning, debate, flipped classroom and situated learning—offer new perspectives for engaging students in a process of shared knowledge construction (Paul & Elder, 2019).

In response to these needs, ControVerso emerges as an integrated educational system designed to connect historical events, personal experiences, and contemporary issues through an interactive digital platform. The system aspires to stimulate discussion and dialogue among students, promote critical reflection on historical and cultural content, and thereby foster the development of essential competencies for civic education. In particular, ControVerso seeks to overcome the traditional "teacher-knowledge-learning" model by embracing a student-centered methodology that prioritizes active participation and problem solving (Castoldi, 2011).

This paper aims to present ControVerso and its experimental implementation. First, the theoretical framework supporting the importance of historical memory and controversial heritage as tools for developing critical awareness will be examined. Next, the methodology adopted for designing the system will be described, highlighting the development phases, the pedagogical techniques employed, and the validation process

conducted through a simulation. Finally, the preliminary results and the implications of the project will be discussed in light of the current challenges in civic education and the development of critical thinking.

The central question guiding this study is: how can the use of digital tools and active pedagogical methodologies foster the transmission of historical memory and the development of critical thinking among students? In response to this inquiry, the paper intends to offer a critical reflection on the potential and limitations of an innovative educational approach, providing insights for future applications and further research in the field.

2. Theoretical Framework

Memory represents a dynamic process that transcends the mere recording of past events, shaping meanings and influencing the construction of both individual and collective identities (Halbwachs, 1992; Assmann, 2011). It operates through empathy, connecting individuals and facilitating recognition of the emotional, social, and cultural dimensions inherent to human experiences (Connerton, 1989). Historical memory specifically plays a crucial role, encompassing events not necessarily directly experienced but integral to the shared heritage of communities (Ricoeur, 2004; Olick & Robbins, 1998).

Within memory studies, an important theoretical discourse revolves around the tension between objective historiography and subjective memory. While historiography seeks to establish objective truth through rigorous source analysis, memory inherently responds to subjective and identity-oriented needs. This tension highlights memory's role in identity formation, emphasizing the significance of personal and collective roots, culturally and socially mediated. The historian Hobsbawm (2014) warns of the dangers associated with the loss of a meaningful connection to the past, as this can trap younger generations in a continuous present, severed from their historical awareness.

Collective memory further illustrates the interplay between individual experiences and social contexts. Halbwachs (1992) demonstrated that individual recollection is profoundly influenced by collective narratives, shaping experiences and forging communal identities. Collective memory, therefore, emerges not merely as an aggregate of individual memories but as a socially mediated construct that solidifies communal bonds and shared identities (Olick & Robbins, 1998).

Another critical aspect of memory studies involves controversial heritage, referring to historical elements that provoke debate and divergence. The selective nature of memory—what is remembered or forgotten—is a deliberate and often contentious choice with significant educational implications. Recent paradigms proposed by Delgado-Algarra and Estepa-Giménez (2016) underscore controversial heritage's educational value in fostering critical reflection. Addressing controversial heritage in educational settings encourages learners to move beyond passive recollection towards active, autonomous, and critical engagement with historical narratives.

The pedagogical integration of historical memory aligns closely with contemporary educational imperatives, particularly the cultivation of critical thinking and civic competencies. Historical memory, serving as a carrier of shared meanings and values, can be strategically utilized in civic education to foster active participation and informed

debate on historical and contemporary issues. Critical thinking, widely recognized as a key competency for the twenty-first century (World Economic Forum, 2015), involves analyzing, evaluating, and reconstructing information to draw informed conclusions. Paul and Elder (2019) describe critical thinking as essential for fostering reflective judgment, motivating problem-solving, and enabling independent interpretation of historical contexts to shape informed decisions for the future.

Thus, integrating historical memory and controversial heritage into civic education emerges as a powerful methodological approach to stimulate critical awareness, facilitate reflective engagement, and support the formation of conscientious citizens capable of navigating complex historical and social landscapes.

3. Methodology

The methodological framework of this research is structured around a comprehensive desk research approach, intended to create a robust foundation for the development of the ControVerso digital educational model. Initially, an extensive literature review was conducted to understand theoretical principles underlying historical memory, controversial heritage, and their role in civic education.

This review was supplemented by an in-depth analysis of the legislative and normative frameworks governing civic education in Italy.
Civic education in Italy has historically played a transversal role, although it has often been relegated to a marginal subject—commonly referred to as the "Cinderella subject." Since 1958, the year in which D.P.R. no. 585 introduced civic education in middle and high schools, up to the provisions of Law no. 92/2019, the goal has consistently been to form informed and critical citizens.
The guidelines set forth by Law no. 92/2019 are based on three pillars:

- The Constitution, law (both national and international), legality, and solidarity;
- Active and digital citizenship;
- Sustainable development, environmental education, and the knowledge and protection of heritage and territory.

Given the research's innovative nature, it was considered essential to incorporate a divergent analytical phase to establish a broader reference framework. Thus, a targeted desk research on existing digital platforms for participatory processes and civic engagement was carried out. This analysis explored systems not strictly related to educational contexts but relevant due to their methodological and operational insights, specifically examining platforms such as SessionLab (in collaboration with the International Association of Facilitators - IAF), Participedia, CitizenLab, Consul, and Pol.is. Although these platforms focus on diverse thematic areas, their analysis provided valuable insights regarding the participatory mechanics, digital interaction techniques, and operational methodologies applicable to the ControVerso project.

Building on these methodological insights and to concretely apply theoretical concepts to a controversial historical context, the research focused on the Italian Resistance as a pivotal case study. The complexity and controversial nature of the Resistance's collective memory made it particularly suitable as an educational resource for fostering critical debate among students. The primary source used was *NOI Partigiani. Memoriale della Resistenza italiana* (Lerner & Gnocchi, 2020). The testimonies contained therein were archived and qualitatively analyzed, revealing many common points regarding

interpersonal dynamics, shared emotions, and the challenges of decision-making in crisis situations. These elements were then interwoven into a common narrative that serves as the foundation for the educational module.

Finally, the developed model underwent a pilot validation phase aimed at assessing student engagement and the effectiveness of the interactive approach.
A simulation was conducted with a group of 16 students aged between 12 and 15, belonging to the AGESCI Roma70 scout group. Due to bureaucratic constraints, a classroom-based implementation was temporarily unavailable, and thus this preliminary pilot provided essential qualitative and quantitative feedback through anonymous questionnaires. The team consisted of the author and a psychologist, supported by the scout group's staff and the overall activity lasted approximately 40 minutes.

In summary, this methodological approach aimed at building a solid theoretical and operational structure by blending traditional literature review, normative context analysis, and insights derived from relevant participatory digital platforms, thereby offering both robustness and practical relevance to the ControVerso digital educational model.

4. The ControVerso project

The ControVerso digital educational system represents a concrete application of the theoretical and methodological insights outlined in previous chapters. At the core of this initiative is the integration of active learning methodologies—such as cooperative learning, debate, flipped classroom, and situated learning—selected for their effectiveness in stimulating critical thought, problem-solving skills, and interactive participation (Galofaro & Cagol, 2021). ControVerso thus embodies a student-centered educational approach, emphasizing the collaborative exploration of complex societal and historical issues.

Specifically, ControVerso aims to actively engage students in reflective processes regarding controversial historical heritage, fostering their capacity to critically analyze and discuss sensitive topics. By connecting personal experiences, historical testimonies, and contemporary issues, the platform seeks to bridge the gap between classroom contexts and broader societal realities, facilitating meaningful dialogue and collective reflection. Furthermore, the initiative aims to support teachers in managing civic education hours effectively, ensuring active student participation and the transmission of historical memory as a cornerstone for civic awareness.

Operationally, the ControVerso system is implemented through an interactive digital platform designed specifically for classroom use and compatible with interactive whiteboards. The platform organizes students into working groups, illustrates the rules of the activities, initiates the educational sessions (Figure 1), and manages the narrative timeline and interactions among participants.

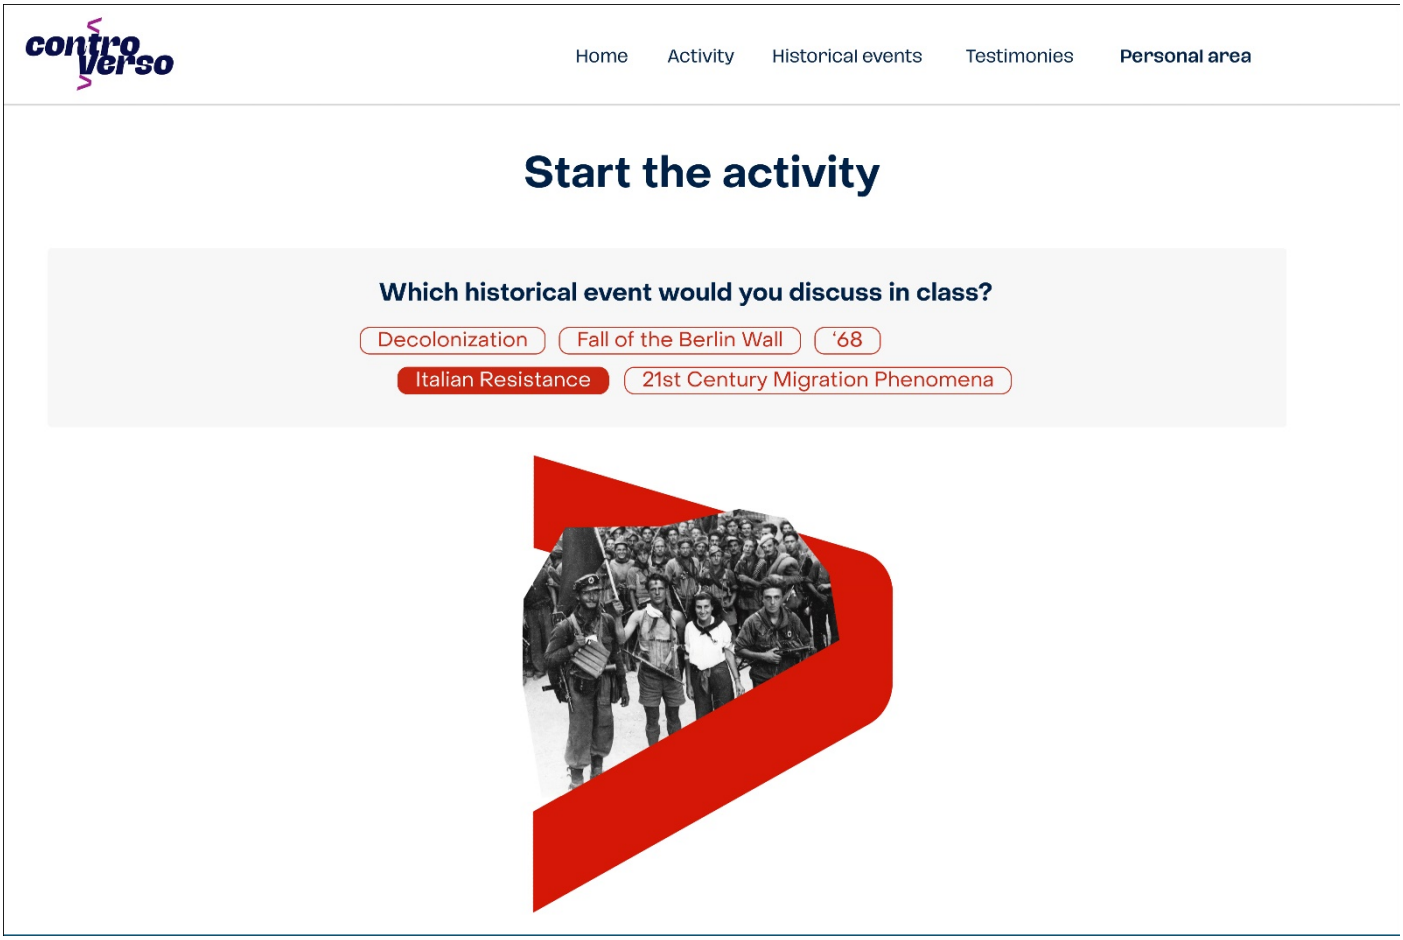

Figure 1. Start the activity.

The core component of the project consists of authentic testimonies, collected, categorized, and integrated into a structured narrative flow. These real stories intertwine to create a cohesive and meaningful narrative experience. The graphic stories are structured with branching points, where the active participation of students, previously divided into groups by the "headmaster" platform, comes into play. The questions and ensuing choices determine a change of character in the narrative, and the story continues accordingly (Figure 2).

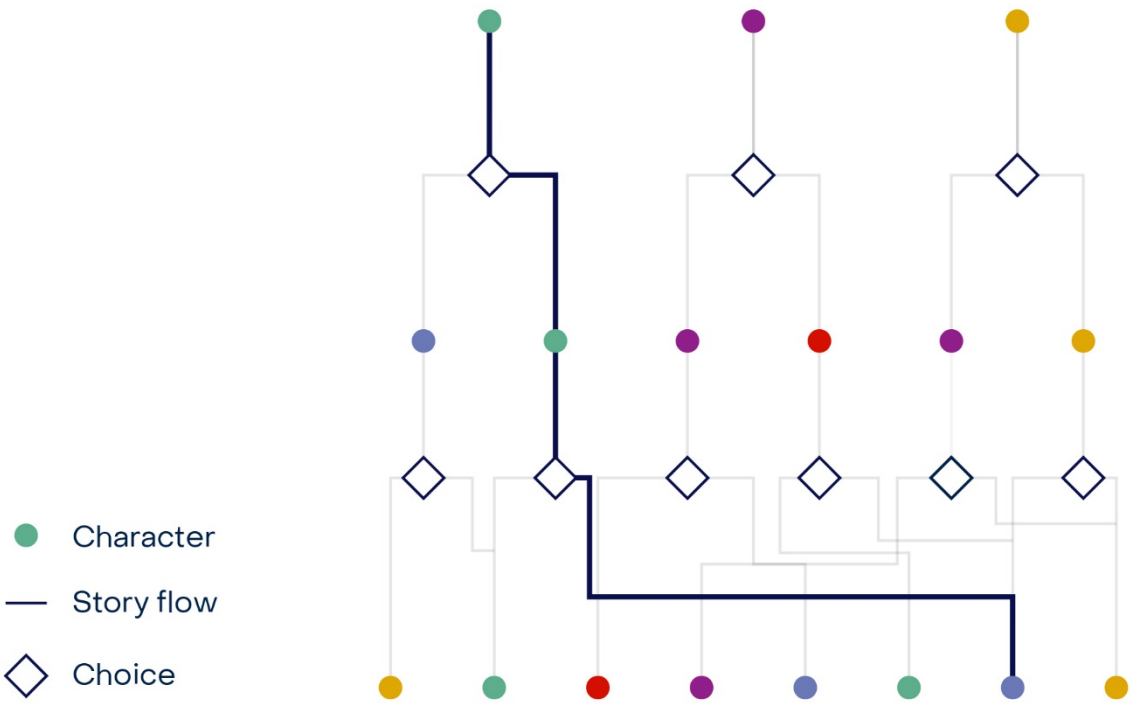

Figure 2. Story structure.

At various points in the storytelling process, the students encounter critical "crossroads"—situations presenting dilemmas that require thoughtful deliberation and collaborative decision-making. This binary choice structure initiates dynamic discussions within groups, prompting students to carefully evaluate historical contexts, narrative scenarios, and character motivations, thus actively shaping the continuation of the story (Figure 3).

Figure 3. Crossroads choice.

In a second phase, linked thematically to the previous dilemma, the platform invites students to engage in further reflection. At this stage, the narrative shifts from external historical scenarios to introspective contexts closer to students' own experiences. This reflective exercise, identified as the "In your shoes" phase, encourages learners to articulate their thoughts and emotions, fostering empathetic understanding and critical reflection on the controversial themes explored (Figure 4).

Figure 4. "In your shoes" analysis.

At the conclusion of the interactive session, the platform provides additional resources and materials for further exploration of individual testimonies and their broader historical context, enabling deeper inquiry and ongoing reflection beyond the immediate activity (Figure 5). Additionally, the platform features a dedicated teacher's personal area, allowing educators to select specific historical events and thematic areas of interest, and directly connect them with external associations actively involved in collecting testimonies and promoting historical memory (Figure 6).

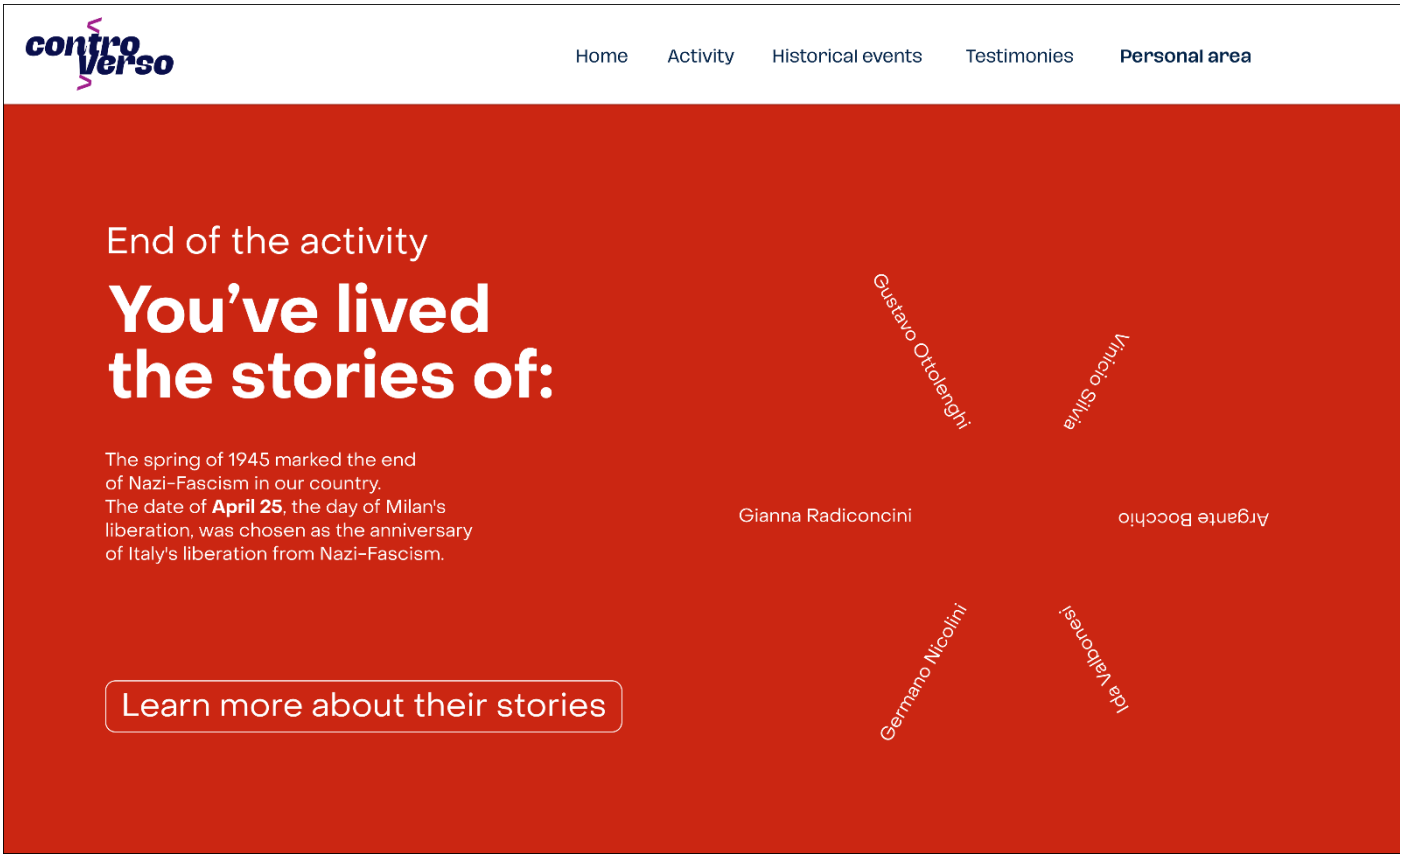

Figure 5. End of the activity.

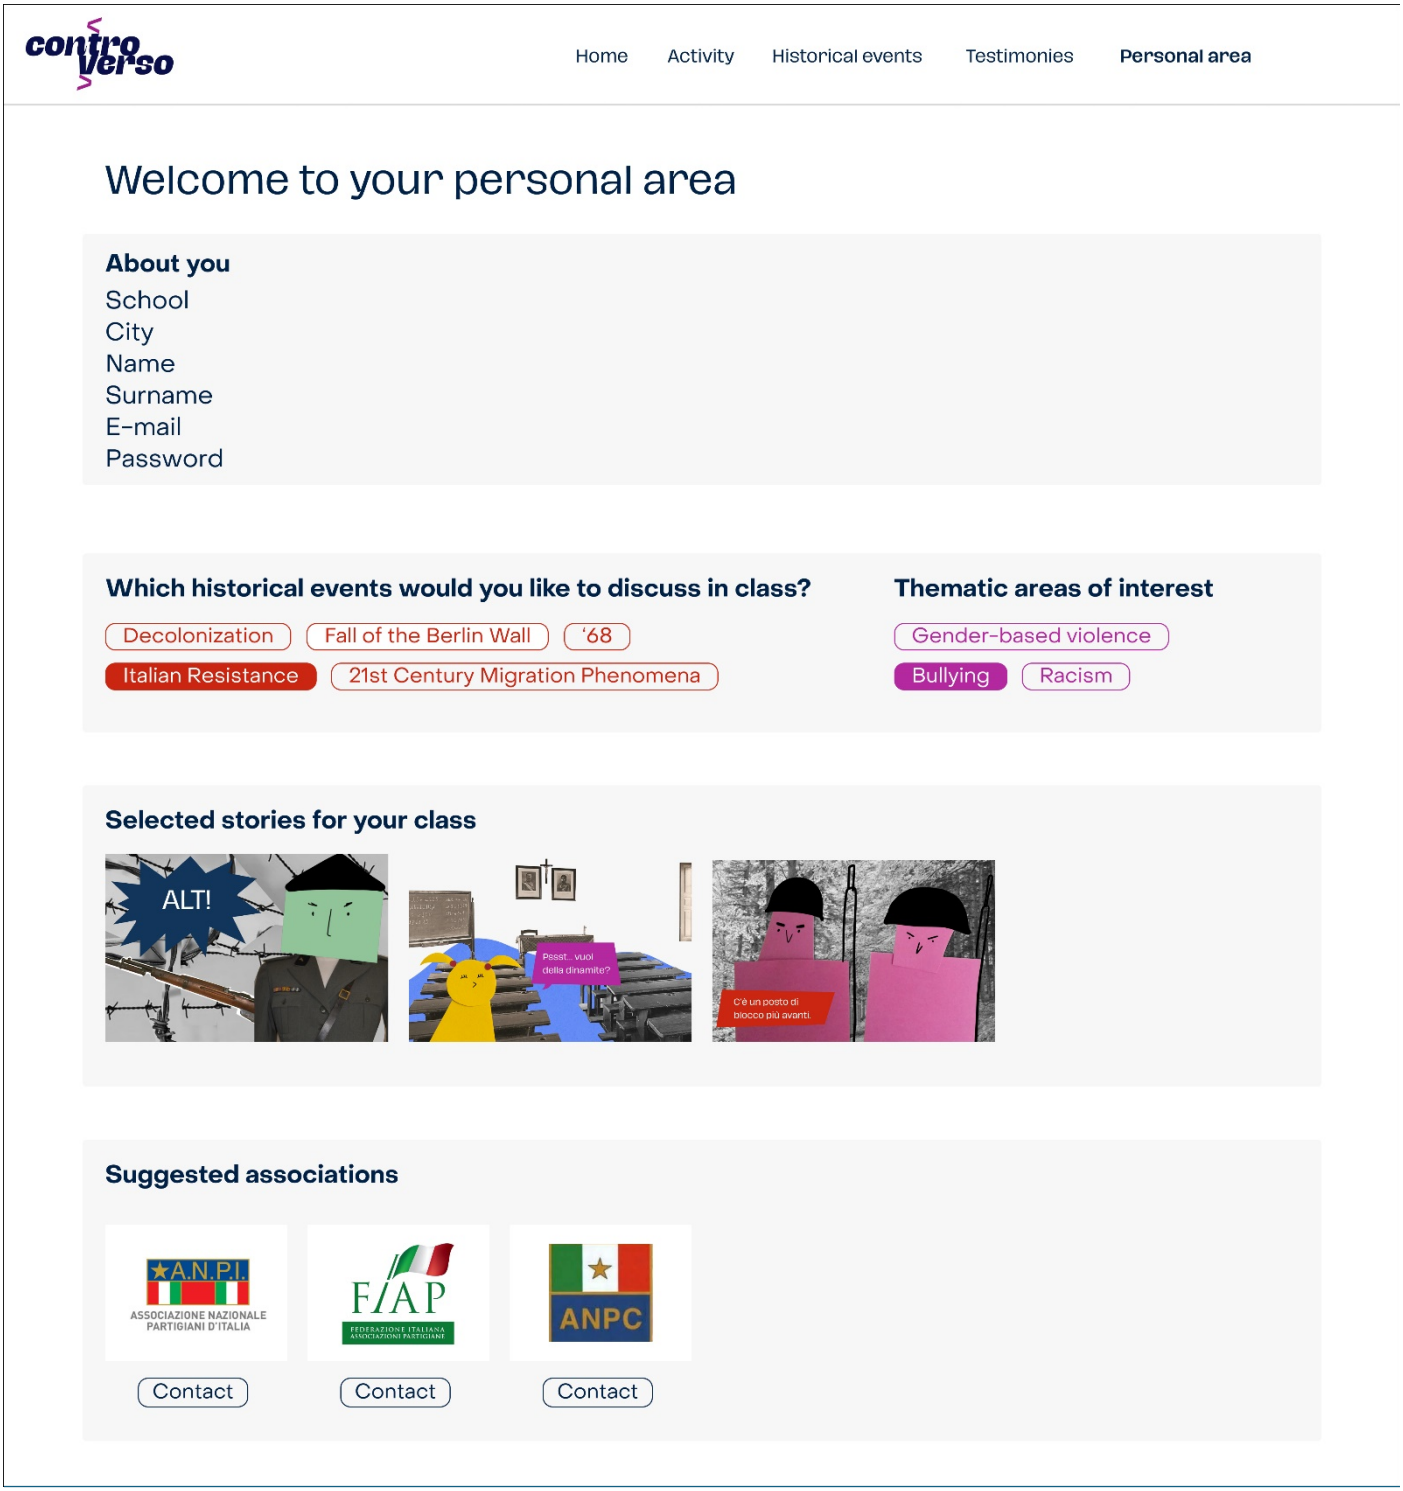

Figure 6. Personal area.

In conclusion, the ControVerso platform embodies an innovative approach to addressing contemporary challenges in civic education. By leveraging digital interactivity and participatory storytelling methods, it represents a practical and experimental effort to cultivate informed, critically aware, and socially engaged students. Furthermore, it provides operational insights into the potential of integrating digital pedagogical tools within existing civic education curricula.

5. Results and conclusions

At the end of the activity, students completed an anonymous questionnaire that included both closed and open-ended questions. From a quantitative perspective, preliminary feedback from students was broadly positive, with the majority indicating that the activity was engaging, stimulating, and conducive to free and open discussions. Most students expressed a strong interest in repeating similar experiences in classroom settings.

The qualitative feedback offers insight into the emotional and cognitive impact of the experience. When asked to indicate an emotion elicited by the activity, students mentioned responses such as “a bit of depression,” “empathy,” “fun,” “reflection,” “adrenaline,” and “a sense of peace.” In response to the prompt, “If you liked this activity, explain why,” some students stated that it “made them think about historical events they already knew from a different perspective,” that it allowed them “to socialize with peers they had not met before,” and that it provided an opportunity to “freely express their opinions.” Additionally, when asked if there were other topics that could be discussed in class, answers included suggestions like “the environment,” “all topics,” “the 21st century in general,” and “violence against women.”

These preliminary results suggest that the interactive platform successfully engages students and stimulates a range of emotional and reflective responses. The feedback indicates that the project not only fosters critical thinking and social interaction but also encourages students to reconsider historical narratives from new perspectives. This supports the hypothesis that innovative digital pedagogical tools can play a significant role in enhancing civic education. However, there is a need for further testing within an actual school setting—specifically, in a middle school classroom. Future implementations should ideally include the presence of a historical witness or expert on the event discussed, to deepen the subject matter and better integrate the platform with the official curriculum.

In conclusion, the initial evaluation of the ControVerso project demonstrates promising potential for the use of digital platforms in promoting historical memory and critical thinking within civic education. While the pilot test yielded positive responses regarding student engagement and the development of reflective skills, further research is necessary to fully assess the impact and to refine the integration of such innovative tools into everyday educational practices.

DESIGNING PUBLIC SERVICES THROUGH DIGITAL TWINS: A MULTI-SCALE PERSPECTIVE

Mariia Ershova[a]

aSapienza University of Rome
*mariia.ershova@uniroma1.it

ABSTRACT | Governments face increasing pressure to optimize public services under constrained budgets and rising citizen expectations for accessible, high-quality services. Digital Twins (DTs)—virtual representations of physical systems—offer new possibilities for resource optimization and decision-making.
This research explores how Service Design (SD) can enhance DT integration in the Public Sector across different levels. The goal is to ensure that DTs do not function solely as technological solutions but actively support service transformation, aligning with public needs and institutional objectives.
For public administrations, Digital Twins enhance strategic planning, service efficiency, and civic engagement. Examples include supporting local governments in forecasting urban development, managing utilities in innovation districts, simulating mobility scenarios, and collecting citizen input on infrastructure projects via digital platforms. The variety of these projects can obstruct the understanding of what tangible assets are twinned, underlining the first research gap, and engaging in the creation of the first framework.
Simultaneously, Service Design, as an interdisciplinary field, can provide skills of User Research, Strategic and Operations Management, Interaction, and Graphic Design. However, SD's application in DT projects has often been limited to economic models, such as service-dominant logic. Thus, the second research gap is the lack of knowledge on the role of Service Design in Digital Twin projects, covered by the creation of a second framework.
This study employs an integrative literature review to identify key challenges, best practices, and opportunities for DTs in Public Sector and Service Design methodologies.

As a result, the study describes two interconnected frameworks: Digital Twin Levels According to Physical Entities Twinned and Service Design role in Digital Twin projects. The first introduces a classification of Digital Twin levels based on the physical scale of twinned entities, distinguishing between Human, Populations, Equipment, Building, Living organisms, Non-living components, and Urban Digital Twins.
The second framework accomplishes the previous one by explaining the Service Design role in Digital Twin projects through Service Design thinking phases (exploration, creation, reflection, and implementation), describing Service Design fields impact: User Research (empathising through immersion), Strategic Management (creating sense of urgency and desire for the future, building trust, and managing complexity), Operations Management (mapping service systems, orchestrating feasible concepts, balancing efficiency and experience, and managing service transitions), Interaction Design (enhancing usability, and humanising technology), and Graphic Design (visualising complexity, reducing cognitive load, and promoting visual reliability).
To connect two frameworks, the article describes what relevant Service Design disciplines can be activated for different DT levels. Starting from Human, Population, and Equipment DT, the main suitable fields can be User Research and Interaction Design, while for Living organisms, Non-living components, Building and Urban DTs, the main field may be Strategic Management. Additionally, the study outlines the PhD research plan, which explores DT integration across public services.
This research reinforces the role of Service Design in making Digital Twins across different levels more human-centered, usable, and understandable to public services.

KEYWORDS | DIGITAL TRANSFORMATION, PUBLIC SECTOR, PUBLIC ADMINISTRATION, HUMAN-CENTERED DESIGN, USER EXPERIENCE

1. Introduction

Governments are increasingly challenged to make cuts in public spending due to economic crises, risking the quality of services delivered to citizens. Simultaneously, there is a growing demand for sophisticated and affordable public services (Mager et al., 2016). This dual challenge highlights the urgent need for innovative solutions to optimize service delivery.
Digital transformation is critical for addressing these challenges; however, its full potential remains largely untapped in the Public Sector (Alvarenga et al., 2020). Policymakers and service designers are urged to leverage data and digital platforms to create more responsive public services (Mager et al., 2016).
Among transformative technologies, Digital Twins — virtual representations of physical systems — have proven effective in planning, optimizing, and monitoring processes (Kaivo-oja et al., 2020). Could it be beneficial in advancing the Public Sector, and at what level? What is the Service Design role in this process?
To address these questions, the research presents two scientific frameworks derived from an integrative literature review that analyzes, critiques, and synthesizes literature (Torraco, 2005), using as keywords Digital Twin, Service Design, and Public Sector.

2. Digital Twins and Service Design in the Public Sector

In industries, For government agencies, some research already highlights the need to

initiate feasibility studies on the use of DTs in their areas (Rasheed, San and Kvamsdal, 2020). The main examples of using DT in the Public Sector are:

- The Digital Twin bureaucracy demonstrates autonomous decision-making to manage government affairs (Eom, 2022).
- The Rome Technopole develops a building DT for managing energy and the water cycle as part of a regional innovation hub (Rome Technopole, n.d.). As a contributor to this initiative, the author is involved in creating Service Design strategies to support its implementation as described in another article (Ershova et al., 2024).
- Interactive DT platforms enable citizens to give feedback on urban developments, enhancing transparency and engagement (White et al., 2021).
- DT simulation models optimize public policies, such as improving bike-sharing systems (Hwang & Choi, 2023).
- The Digital Twin of Bologna supports local government forecasting, strategic decisions, and civic innovation (Gemello Digitale di Bologna, n.d.).
- The variety of these projects can obstruct the understanding of what tangible assets are twinned, underlining the first research gap, and engaging in the creation of Digital Twin Levels According to Physical Entities Twinned Framework.

At the same time, Service Design (SD), as an interdisciplinary field, can provide skills in User Research, Strategic and Operations Management, Interaction, and Graphic Design (Stickdorn and Schneider, 2012). By shifting from supply-oriented to demand-oriented models, SD supports decision-making and accessibility, while aligning solutions with citizen needs (Mager et al., 2016).
While Service Design has been introduced in DT projects, its application has often been confined to economic frameworks, such as value creation through service-dominant logic. Additionally, Interaction Design, a discipline within SD, has been studied in DT projects but mostly in relation to interface development rather than broader systemic applications (Lyu, 2024).
Merging the DT approach and SD is promising for the Public Sector. While DTs provide data-driven insights into ‘what’ is happening, SD explains ‘why’, ensuring solutions are effective and meaningful.
However, it is not entirely clear what SD can do for DT initiatives, that is the second research gap, addressed with the development of the Service Design role in Digital Twin projects Framework.

3. Digital Twin Levels According to Physical Entities Twinned Framework

The first research gap is a lack of systemic thinking in analysing DT projects, as it is not always clear what the physical asset is twinned. This gap can be especially crucial for Service Designers as one of their principles is Evidencing (making the intangible tangible) and to do so, there is a need to understand what physical assets already exist.
As Digital Twin technology advances, its applications extend across various domains, each corresponding to different physical levels of twinned entities. These levels range from Human Digital Twins that replicate individual human characteristics to Urban Digital Twins that model entire cities (Lyu, 2024). While existing classifications of DTs often focus solely on application fields, such as urban planning (Figure 1), this article proposes a classification (Figure 2) based on the physical scale of the twinned entity, offering a more structured framework for understanding their diverse applications in public services.

A Personal Digital Twin or Human DT represents a virtual version of an individual, constructed from their digital footprint (Nativi et al., 2022). In healthcare, Human DTs merge real-time health data, offering capabilities such as simulation, visualization, and predictive analysis (Shengli, 2021). Similarly, in retail and digital marketing, Human DTs analyze consumer behavior to enhance personalized recommendations (Vijayakumar, 2020). Beyond individual representations, populations of Human DTs can be aggregated to form a "family" of Digital Twins, enabling urban planning applications such as population density mapping or agent-based simulations. By combining individual DTs, cities can generate more flexible and dynamic data sources for policy planning and public administration (Lyu, 2024).

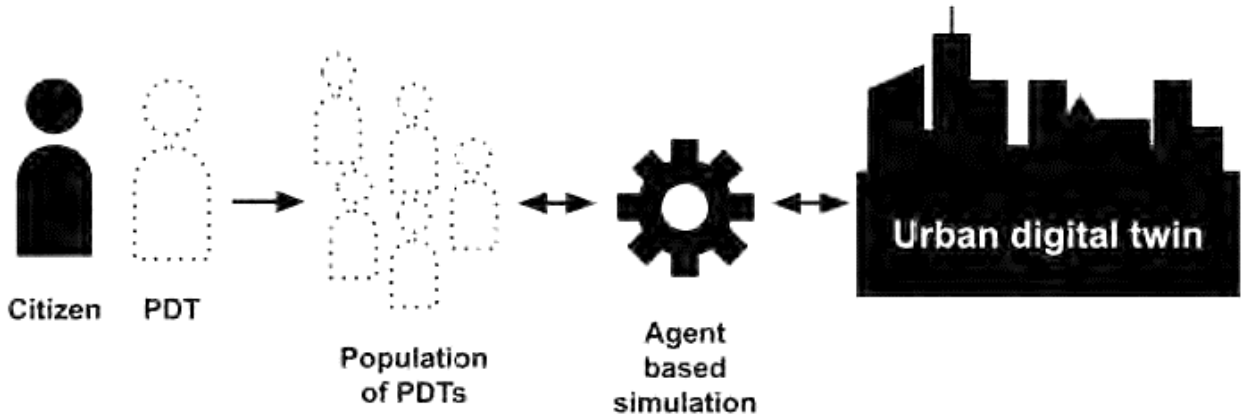

Figure 1 - The conceptual link between Personal Digital Twins and Urban Digital Twins, formed by populations and agent-based simulation

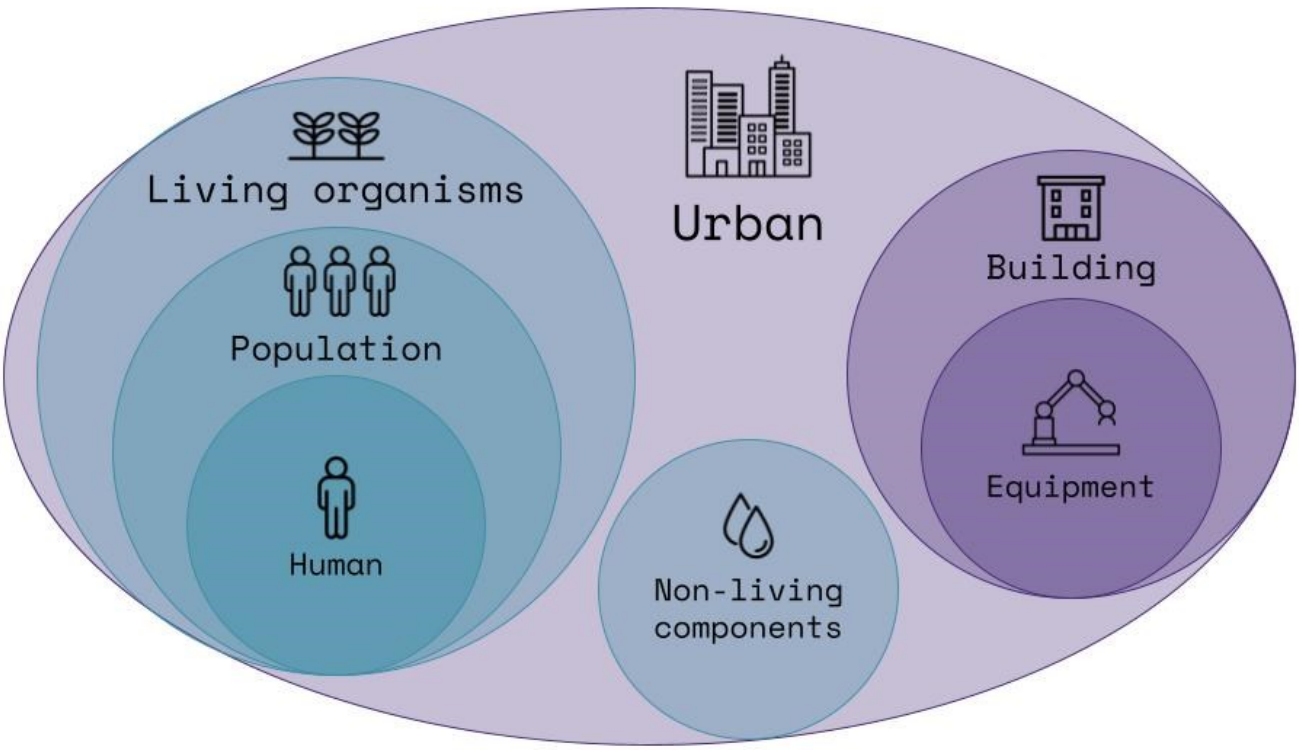

Figure 2 - DT Levels According to Physical Entities Twinned (in blue: ecosystem components; in violet: artificial assets)

At a more infrastructure-focused level, the Equipment Digital Twins model includes machines, tools, and industrial devices. They are widely used in healthcare and manufacturing, where they facilitate predictive maintenance and optimize operations through real-time monitoring. Similarly, Building Digital Twins integrates construction and urban planning by simulating the performance of physical structures, enabling better resource management, energy efficiency, and facility operations (Lyu, 2024), e.g., Rome Technopole. Expanding beyond individual buildings, Urban Digital Twins model entire cityscapes, incorporating aspects such as mobility, energy consumption, and environmental conditions. These models enable planners to analyze infrastructure interactions, simulate transportation flows, and optimize public services (Lyu, 2024), e.g., the Digital Twin of Bologna.
This article proposes additional groups: the Living organisms - biotic and the Non-living components - abiotic (Liu et al., 2021). The Living organisms represent creatures within an ecosystem, like plants, animals, and bacteria, while Non-living components are entities, such as water, soil, and atmosphere. The need to insert this group is in the existence of Digital Twins of such type, for example, for the Living organisms there is Forest DT (Buonocore, Yates and Valentini, 2022), while for the Non-living components there is the DT of an atmospheric environment (Abutalip, Al-Lahham and Saddik, 2023).
While previous classifications of DTs often categorize them by application fields, such as urban planning (Figure 1), this classification emphasizes the physical scale of the twinned entity, allowing for a more systematic approach to integrating DTs across sectors (Figure 2). Beyond these physical levels, DTs can also focus on specific characteristics of entities or model interactions and processes between them. For instance, in supply chains, DTs track logistics, optimize workflows, and enhance decision-making by linking multiple entities into a unified digital system. This broader perspective highlights the need for integrating human-centered and systemic approaches in DT development to maximize their potential across different scales.

4. Service Design role in Digital Twin projects Framework

As The second research gap is the lack of knowledge on the role of Service Design in Digital Twin projects. To cover this gap, the Service Design and Engineering roles are described in the form of a framework (Figure 3).
The framework puts the Digital Twins projects within Service Design thinking phases (Stickdorn and Schneider, 2012): exploration (understanding of situation), creation (exploring possibilities), reflection (testing ideas), and implementation (realization and engagement).
Service Design as an interdisciplinary field for DT projects can be subdivided into: User Research, Strategic Management, Interaction Design, Operations Management, and Graphic Design (Stickdorn and Schneider, 2012).
Each of these disciplines is described by the impact that they have on DT projects.

- The User Research is useful, especially in the exploration phase, as an impact can provide empathising through immersion (understanding of stakeholders' everyday lives).
- The Strategic Management initially can be needed for creating sense of urgency and desire for the Future (highlighting risks of inertia), building trust (creating confident relationships with stakeholders), and then managing complexity (translating ambiguous strategic tensions into design opportunities).
- The Interaction Design discipline can be especially useful in creation and reflection phases for enhancing usability (ensuring ease of service use), and then humanising technology (bridging digital touchpoints with emotional and

sensorial experience).

- The Operations Management should be used for all phases to mapping service systems (revealing inefficiencies and hidden interdependencies), orchestrating feasible concepts (aligning emerging service ideas with real institutional capabilities), balancing efficiency and experience (testing operational viability while maintaining quality and emotional resonance), and then managing service transitions (supporting role clarity across front- and backstage).
- The Graphic Design is also needed across all phases, initially to visualising complexity (making intangible systems understandable), reducing cognitive load (enhancing accessibility of information), and then promoting visual reliability (ensuring consistent visual content) (Stickdorn and Schneider, 2012).

After the Service Design impact, there is a need to describe the Engineering role to align responsibilities during project development.
The Engineering role can be described by enabling data-driven understanding (ensuring that all required data is accessible, e.g. using Internet of Things), creation developing predictive models and intelligent systems (creating models, analyses, and functions using Big Data analytics and Machine Learning), and then reflection translating system feedback into meaningful interactions (creation of user-specific applications, which provide important information to the user, contributing value to them) (Lyu, 2024).

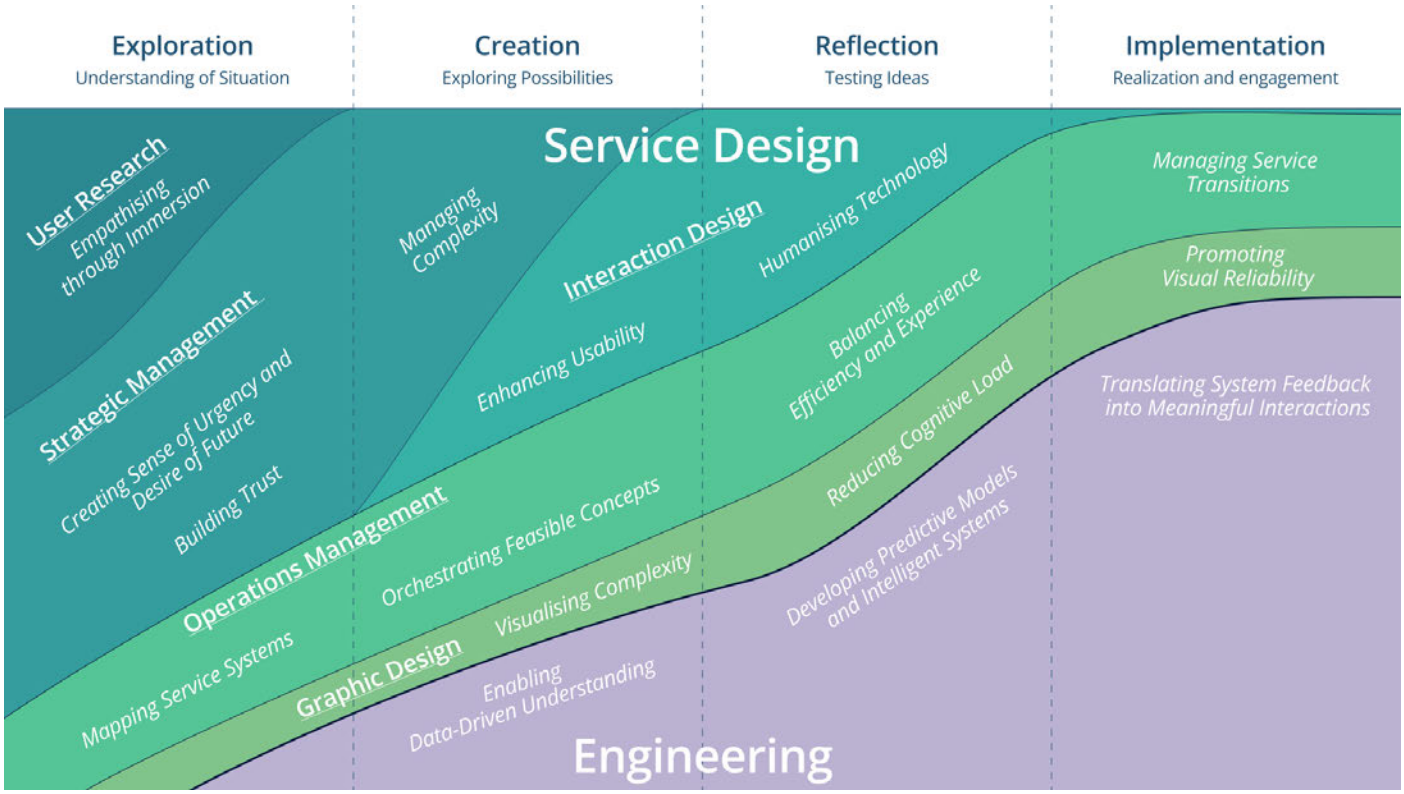

Figure 3 - Service Design role in Digital Twin projects Framework (in green: Service design impact, divided by SD disceplines; in violet: Engineering impact)

To bridge the two frameworks, this study identifies which Service Design disciplines can be strategically activated at different levels of Digital Twin (DT) implementation. For Human, Population, and Equipment DTs, disciplines such as User Research and Interaction Design are most relevant, as human-centricity is central to these applications (Lyu, 2024). In contrast, Living Organisms, Non-living Components, Building, and Urban DTs demand a focus on Strategic Management, given the complexity and risk associated with large-

scale infrastructure and environmental systems (Gemello Digitale di Bologna, n.d.). Additionally, Operations Management and Graphic Design consistently play a critical supporting role across all DT projects, ensuring both efficiency and clear communication.

To test and enrich these frameworks, the PhD research (Figure 4) will apply them across different public projects. In particular, these frameworks are the result of the first phase, Desk research, and will be explored and experimented with during the second and third phases. On a broader scale, PhD research is devoted to exploring the integration of the Digital Twin approach into the Italian Public Sector, to improve the quality and efficiency of public services through different DT levels.

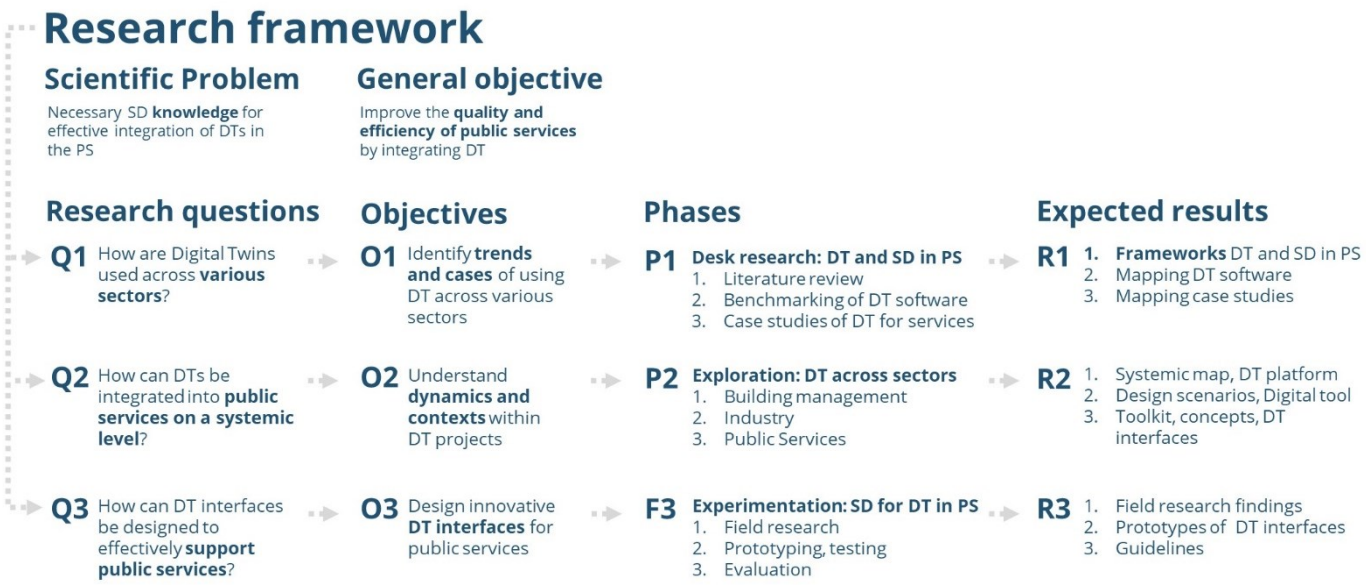

Figure 3 - PhD research framework

5. Conclusion

The The study describes two interconnected frameworks: Digital Twin Levels According to Physical Entities Twinned and the Service Design role in Digital Twin projects.
The first framework can be limited in the sense of requiring physical assets, for example, the case of Digital Twin bureaucracy may concentrate more on the process rather than physical entities, in this case, paperwork. During the description of the levels, no Equipment DT example for the Public Sector was found that can be an opportunity for further investigation.
The second framework about the Service Design role in Digital Twin projects can be limited in the sense of practical investigation, as so far, there are only a few projects found that apply SD thinking in DT projects.
Moreover, the integration of Digital Twins into public services offers benefits but raises technical, ethical, and governance risks, especially around AI, IoT, and Big Data (Jones et al., 2020). DTs risk reinforcing bias, particularly when based on discriminatory datasets (O'Neill, 2016). Privacy concerns grow as datafication quantifies citizens (Vesnic-Alujevic et al., 2019), like China's social credit score (Creemers, 2018). Algorithmic decision-making can decrease transparency and democratic engagement (Zuboff, 2019). Without clear governance and ethical regulation (Nemitz, 2018), DTs may amplify institutional control rather than empower citizens. Further investigation of technical, ethical, and governance risks for different DT levels may be the future topic of research.

ABSTRACT | The level of design in rural areas affects the quality of life of villagers, but the effectiveness of design intervention has long been unable to be quantitatively assessed, resulting in uneven design participation. This paper explores the role of scenario-based design evaluation in addressing fragmented design participation in rural China, offering a structured model that connects stakeholder needs with strategic design interventions. By integrating scene theory with a hybrid AHP–FCE–SWDM evaluation model, and using Qianjiadian Town in Beijing's Yanqing District as an empirical case study, the study offers a rigorous and context-sensitive approach to prioritizing rural design strategies. AHP extracted criterion weights, and FCE yielded scenario scores, and embedding these outputs into SWDM produced prioritized, context-sensitive strategies: farmer–designer co-creation workshops, cross-regional design alliances, culturally embedded infrastructure upgrades, phased digitalization, and AI-powered governance toolkits. Our framework links grassroots needs to national policy, offering an evidence-based toolkit for practitioners and policymakers. At the same time, it also has reference significance for other regions facing challenges of rural transformation and policy localization

KEYWORDS | Rural design, Analytic Hierarchy Process(AHP), Fuzzy comprehensive evaluation, Scene theory, Decision support model

1. Introduction

Design participation in rural construction activities encompasses a spectrum of processes, from needs assessment (HUA.Y et al., 2023; WANG.Y and YOU.L., 2019) and scenario analysis (WANG.H et al., 2023) to functional planning (SUN.L and WANG.J., 2020), digital transformation (RUI.G and HU.W., 2023; ZENG and HU.Y., 2024), ecological design (Lafortezza and Brown, 2004), and cultural transmission (LIU.Q et al., 2024; LAN.J et al., 2024; WANG.C and CHEN.Z., 2024). These design interventions directly influence the sustainability and livability of the Chinese countryside. From an evaluation perspective, previous evaluation methods—from SWOT analysis (Roos, 2016) to single-case AHP applications (HE.X et al., 2020) (LI.X et al., 2022)—tend to address individual villages or dimensions in isolation. Meanwhile, scene theory offers a robust qualitative lens for socio-spatial understanding (Wollenberg et al., 2000; Meyrowitz, 1994) but lacks a clear mechanism for operationalization in design decision-making. To bridge these gaps, this study poses two questions:

1. Which rural design scenarios manifest the greatest unmet needs according to multi-stakeholder priorities?
2. How can qualitative scene theory insights be quantified and aligned with national policy mandates to guide practical design interventions?

2. Methodology and Data sources

2.1. Constructing rural design scenarios and indicators within the framework of scene theory

Figure 1 describes how to construct the elements of Chinese rural design scenarios. First, typical elements of scenario theory from a broad perspective are extracted, such as: "community"(Wollenberg et al., 2000) "material structure"(Silver et al., 2007) and "diverse populations"(Silver et al., 2007), and the cultural value of scenarios created by the combination of these three elements and their activities.

In combination with the policy guidance of comprehensive revitalization, the twenty-character policy and the five-in-one policy in China's rural revitalization strategy, we extracted keywords: talent revitalization, industrial revitalization, economic construction, cultural construction, effective governance, etc., integrated them into the concepts of the word frequency matrix, and corresponded them to the elements of the scenario theory to form the rural design scenario elements suitable for China's national conditions, namely life and communication - community neighbors, environmental infrastructure - material structure, participants - diverse people, management and construction - activities and combinations, and cultural elements - cultural values.

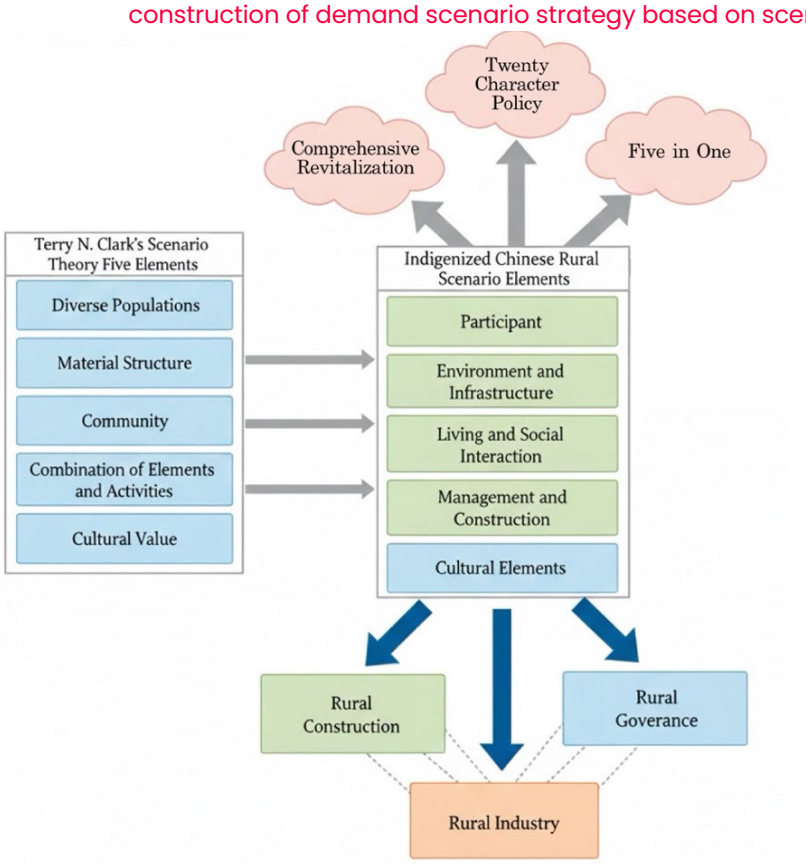

Figure 1. Logic of constructing rural design scenarios within the framework of scene theory

Figure 2 depicts the relationship between scene elements, scenario types, and evaluation indicators. T The 2024 and 2025 No. 1 Central Document refocuses on rural industries, construction, and governance, elevating "harmonious countryside" goals (State Council, 2024 and 2025). Each of the five scene elements connects to specific scenario types (e.g. "Rural Industry," "Rural Construction," "Rural Governance"), which in turn correspond to measurable indicators in AHP–FCE hierarchy. This mapping underpins how we weight qualitative scene constructs into quantitative evaluation criteria.

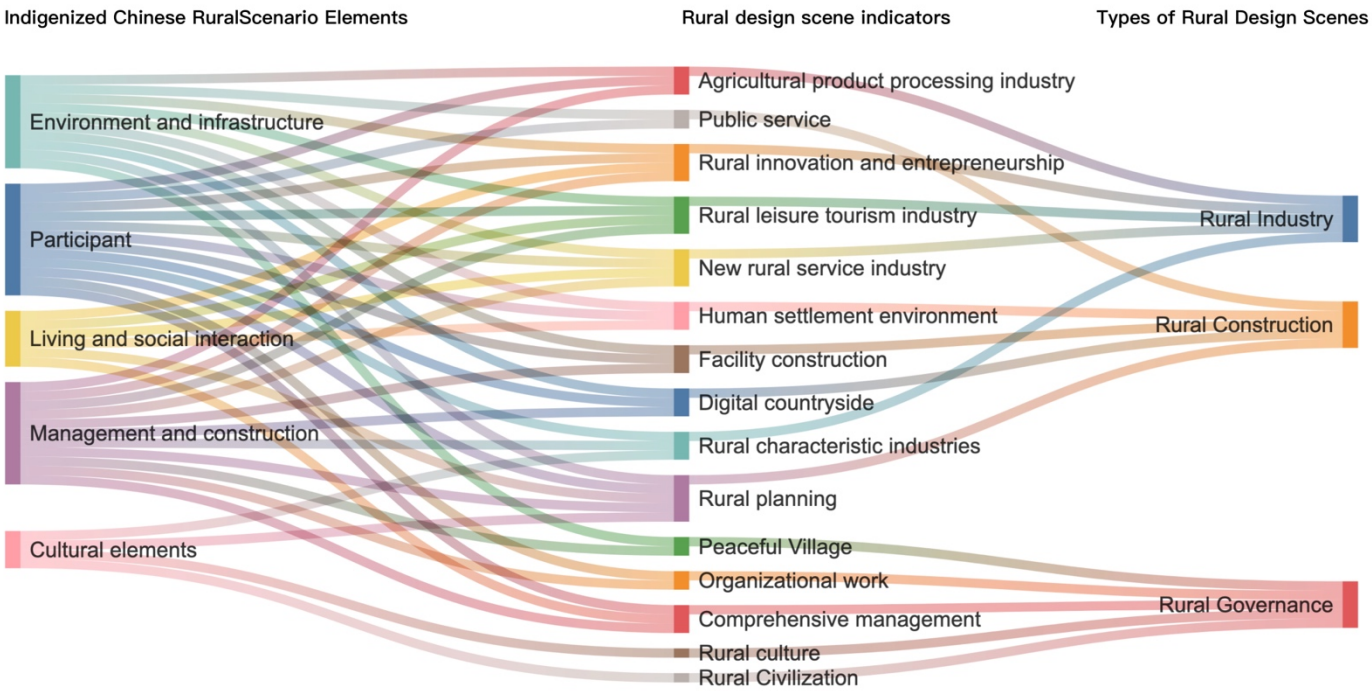

Figure 2. China rural design scene relationship diagram

2.2. Methodology and Data sources

We begin by defining four criterion dimensions (Commercial, Social, Cultural, Functional) and their sub-dimensions (Table 1)through AHP: experts perform pairwise comparisons to build judgment matrices and compute weights via the product-sum method (Sun et al., 2023). Next, We have established a three-level indicator system (3 criteria, 15 elements, 57 schemes) (Table 2), four criterion evaluation dimensions and sub-dimensions are used as evaluation elements to capture industry, construction, and governance scenarios. We then apply a fuzzy comprehensive evaluation using the weighted-average operator M(·,⊕) to aggregate expert ratings at the target, criterion, and factor layers (Zhu, 2022).

Table 1. Evaluation dimension

Evaluation dimension	Secondary evaluation dimension	Dimension Description
Commercial Value F_1	Rural demandF_{11}	Whether it directly meets the specific needs of rural areas, such as agricultural production, healthcare, education, infrastructure, etc.
	Cost effectivenessF_{12}	Is the development, deployment, and maintenance costs and commercial benefits affordable
	Universality of the planF_{13}	Does the underlying data or technical model have the ability to migrate scenarios
Social Value F_2	Policy alignmentF_{21}	Is it consistent with the rural revitalization development strategy and national policies
	Community participationF_{22}	Can it promote community participation and sharing, ensure better integration of solutions into rural areas, and meet practical needs
Cultural Value F_3	Cultural inheritance and innovationF_{31}	Is it conducive to the protection and dissemination of cultural characteristics
Functional Value F_4	Technical feasibilityF_{41}	Is the required hardware, software, and technical support feasible
	Resource availabilityF_{42}	Whether the resources required for the demand scenario match the existing resources, including technical talents, training, data collection and maintenance, etc.
	System scalabilityF_{43}	Can we better respond to changes in rural development and demand

3. Results

3.1. AHP Weight Results

Before conducting the evaluation, all experts were familiar with the specific socio-economic and cultural background of Qianjiadian Town, as well as the current development and appearance of each village. The questionnaire, completed by 21 experts (13 design professors and 8 rural practitioners), yielded the pairwise comparison data necessary for AHP analysis. The results of the expert scores were collated and statistically analyzed. The weight values of each dimension in the importance evaluation of the rural design scenarios were calculated(Table 3).

Table 3. Evaluation dimension weight values

Evaluation dimension	WeightSort value	Secondary evaluation dimension	Weight value	Comprehensive weight value	Sort
Commercial	0.45641	Rural demandF_{11}	0.4013	0.1831	2

3.2. Fuzzy comprehensive evaluation results

Using the weights derived from AHP and applying the fuzzy comprehensive evaluation (FCE) model, we assessed three primary rural design scenarios—Governance, Industry, and Construction—based on 57 evaluation indicators.The collected data were organized and calculated via the fuzzy mathematical model to establish the fuzzy comprehensive evaluation judgment matrix R. Fuzzy synthesis was performed on the evaluation vectors of each layer to obtain the evaluation scores for each indicator (Table 4).

Table 4. Comprehensive evaluation of the importance of rural design scenarios

Code	Target layer score	Level	Code	Criterion layer score	Level	Code	Factor layer score	Level	Total ranking
A	3.3143	V4	B_1	3.1408	V4	C_1	3.390	V4	8

						C_{14}	3.635	V4	3
						C_{15}	3.673	V4	2

4. Discussion

4.1. Interpretation of AHP Results

The primacy of Commercial Value reflects China’s emphasis on creating self-sustaining rural economies. This finding is consistent with literature emphasizing the role of rural industries and agricultural development in driving economic prosperity (Ngan et al., 2019). Under the 2024 No. 1 Central Document, rural industry enhancement and market integration are government priorities, which likely influenced expert judgments either. Social Value ranks second, underscoring the necessity of policy alignment and community participation to legitimize and sustain design interventions. The emphasis on social value reflects the growing awareness of rural communities' needs for participatory governance, social cohesion, and alignment with national development policies (Wang et al., 2024). The relatively lower weight of Cultural Value suggests a potential trade-off

between rapid economic growth and heritage preservation—a tension common in developing contexts. Finally, Functional Value (technical feasibility, resource availability, scalability) plays a supportive but less urgent role, indicating that stakeholders expect design solutions to be innovative yet grounded in existing capacities.

4.2. Analysis of Fuzzy Comprehensive Evaluation Results

Based on the results of rural industry B_1 (3.1408 points) in the comprehensive evaluation of the importance of rural design scenarios, targeted support is prioritized for the lowest-scoring innovation and entrepreneurship dimension C_5 (2.548 points), give full play to the participation perspective and role of design in rural industry management and operation, cultivating new rural business forms, and innovating new entrepreneurial models.

In the field of rural construction, infrastructure construction C_8 (3.786 points) scored the highest, indicating an urgent need for hardware facilities in rural development. At the same time, digital villages C_{10} (2.560 points) scored the lowest, reflecting the relatively lagging rural informatization construction.

The study shows that rural governance B_3 (3.5967 points) scored the highest, especially Peaceful Village C_{15} (3.673 points) and rural civilization C_{14} (3.635 points), reflecting that the current governance system is relatively complete. However, there is still room for improvement in organizational work C_{11} (3.479 points) and cultural protection C_{13} (3.585 points). Therefore, this study proposes to optimize governance transparency with digital technology and enhance villagers' sense of participation in cultural activities.

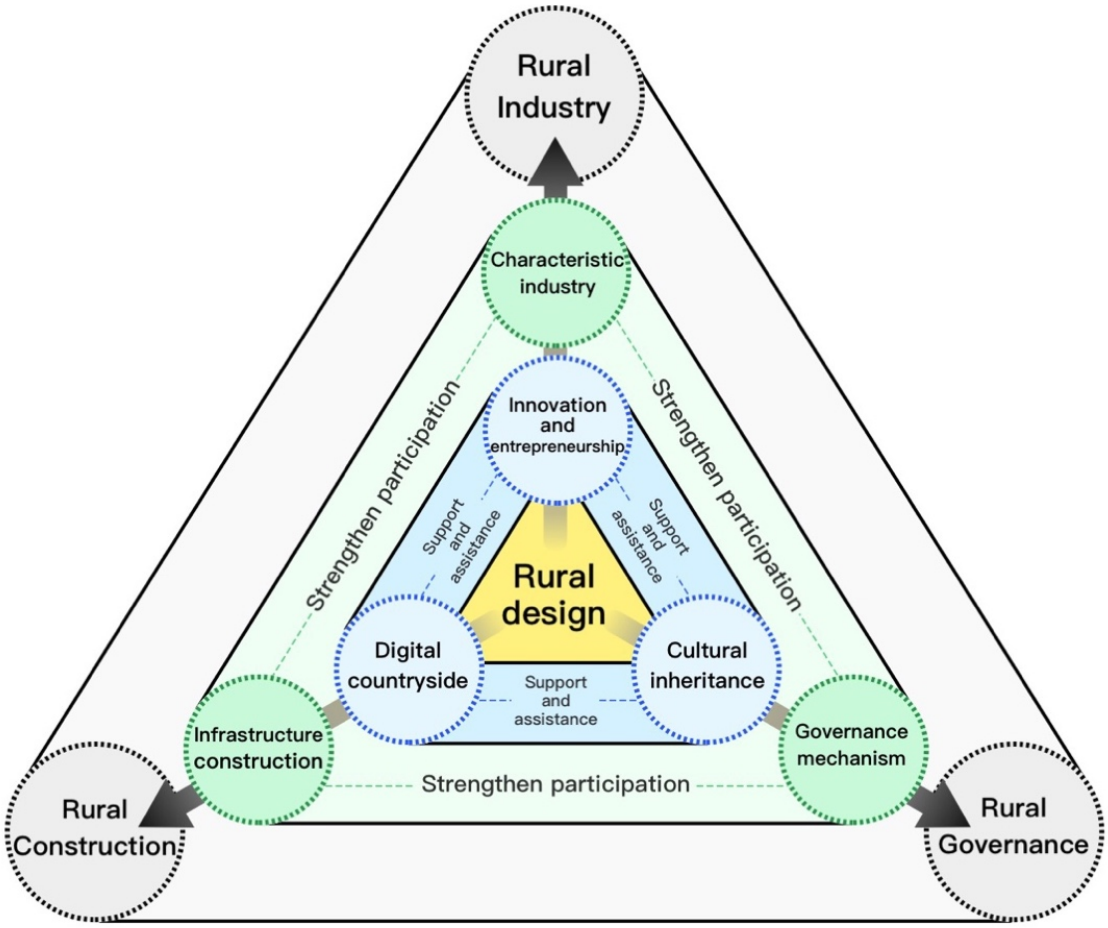

Figure 3. Development strategy of China's rural design demand scenarios

4.3. Design Strategies via SWDM

A: Industrial Revitalization: Commerce-Driven Multi-Stakeholder Synergy

Demand-Driven Industrial Scenario Design: Combined with the weight of the rural demand sub-dimension F_{11} (0.1831), a "farmer-designer" co-creation mechanism is implanted in rural industries to ensure that design proposals originate from the pain points of local producers.

Cross-Regional Innovation Systems: Relying on the universality of the plan F_{13} (0.1540), establish a cross-regional industrial design alliance to promote technology sharing and resource integration. For example, learn from Japan's "local creation" policy system, explore the design cooperation mechanism between rural and urban areas, and promote regional industrial linkage.

B: Construction Optimization: Upgrading the Functional Scenarios with Cultural Embedding

Infrastructure Optimization Based on Cultural Value: Under the interactive framework of "cultural elements-rural design scenes" in scenario theory, for cultural inheritance and innovation F_{31} (0.1642), optimize infrastructure on the basis of protecting traditional skills and enhance the cultural display in facility construction.

Rural Digitalization Promotion in Stages: Combined with technical feasibility F_{41} (0.5234), digital village construction is promoted in stages. Priority will be given to piloting smart agriculture and digital public services in regions with higher governance capabilities (governance score > 3.5) to ensure the feasibility of technology implementation.

C: Governance Innovation: Mechanism-Based Participatory Scenario Design

Intelligent Rural Governance Toolkit: Targeting community participation F_22 (0.0598), develop a "rural affairs design toolkit" to use artificial intelligence and big data to improve governance transparency. For example, learn from the Dutch "smart village" model and establish an online village affairs management system to enable villagers to participate in policy discussions and supervision.

Co-Creation Mechanism Based on Cultural Identity: Relying on cultural inheritance and innovation F_31 (0.1642), introduce design innovation in traditional festivals, such as holding "traditional craft workshops", and enhance the market value of intangible cultural heritage products through branded operations to promote rural cultural development.

5. Conclusions and Future Outlook

In this study, we have demonstrated how a scenario-theory-based AHP–FCE–SWDM framework can quantitatively translate qualitative rural design insights into prioritized, context-sensitive strategies. By operationalizing four weighted dimensions (Commercial, Social, Cultural, Functional) across three core scenarios (Industry, Construction, Governance), our approach revealed both strengths—such as robust governance mechanisms—and critical gaps, notably in rural digitalization and innovation participation. The resulting strategies (e.g. farmer–designer co-creation, phased digital pilots, AI-driven governance toolkits) offer actionable roadmaps for linking grassroots

needs with national “harmonious countryside” policies.

Looking ahead, several avenues warrant further exploration. First, longitudinal field trials of the proposed strategies will be essential to validate their real-world effectiveness and refine model weights over time. Second, integrating emergent technologies (digital twins, IoT sensor networks, AI for participatory design) could deepen the precision and adaptability of scenario interventions. Third, expanding the framework across diverse cultural regions—beyond the 12 provinces sampled here—will test its replicability and uncover region-specific scene elements. Finally, engaging a broader range of stakeholders, including village committees, private enterprises, and civil-society NGOs, can enhance co-creation mechanisms and ensure sustainable, equitable rural transformation.

EXPANDING THE SENSITIVE POSSIBILITIES OF THE SEMIOTIC RELATIONSHIP BETWEEN OBJECT AND RECEIVER THROUGH IMMERSIVE INFOGRAPHICS.

Mario Alberto Arias Valencia,

Université Toulouse Jean Jaurès, École Doctorale Allpha, Lara-Seppia
mario.arias-valencia@univ-tlse2.fr

ABSTRACT | This article presents the research advances of the doctoral thesis in progress entitled *Interweaving Design, Art, and Technology to Explore the Semiotic Dimension of Objects in Hybrid Spaces*. The study integrates the fields of design, art, and technology to propose the development of an immersive infographic as a hybrid environment, utilizing mixed reality to examine the functional, aesthetic, and semantic dimensions of a specific technological product. The primary aim of this research is to highlight both the intrinsic functionalities and the sensitive and perceptual aspects involved in the conception of everyday objects through the use of immersive technologies. It is argued that objects created through design transcend their purely practical function, embodying aesthetic and symbolic values that grant them enduring recognition over time.
This research is theoretically grounded in the works of Frechin (the challenges design faces in the context of emerging technologies), Vial (a critique of contemporary design), Quarante (design theory), Norman (the emotional aspects of objects), Simondon (the relationship between objects and art), Fischer (metadesign), among others. Collectively, these theoretical frameworks provide a comprehensive foundation for understanding the multifaceted nature of objects and the transformative potential of design when integrated with emerging technologies.
The concept of immersive infographics is subsequently examined, drawing on the theories of Krum, and Liu et al., who propose augmented infographics within hybrid environments for enhanced data visualization. As sources of inspiration, the artistic installations *Cosmic Things* by Damián Ortega—which dissects iconic objects projected into the art world—and

Tate Sensorium—a multisensory experience based on artistic works—are analyzed. Finally, the methodology and preliminary results of the co-creation project *IN CORPUS: Un Rhizome Immersif*, developed in collaboration with the artist and doctoral researcher Juliana Marin—an immersive video art and virtual reality experience—are presented. The project was implemented during *La Nuit des Chercheurs* 2024 in Toulouse and the *Recherche-Création* seminar 2025 at the University of Toulouse Jean Jaurès. The methodological approach involved unstructured observation and the administration of 10 surveys during the second session.
The results showed a dynamic participation, although the interpretation considers people's lack of familiarity with virtual reality, technical challenges and spatial limitations. Nevertheless, a positive intention towards virtual reality and a remarkable interaction with the rhizome —study by Juliana Marin— was observed, which allows a possible approach to the concept of *metadesign*, as it was evidenced that people are motivated in experiences where they are participants to come up with ideas. These preliminary findings guide the next phase, focused on a mixed reality experience that addresses the identified challenges.

KEYWORDS | ART, DESIGN, INDUSTRIAL DESIGN, MIXED REALITY, IMMERSIVE TECHNOLOGIES

1. Introduction

Historically, the human being has conceived objects with a diversity of applications, which have acquired a representative significance at a cultural and social level, by virtue of the emotional charge that they accumulate and transmit through time.
However, in contemporary society, marked by mass production and accelerated consumption, there is a tendency to reduce the value of objects to their purely utilitarian function. As Simondon points out : “culture has a contradictory attitude towards technical objects: it treats them as pure assemblages of matter, devoid of any real meaning and with a single useful purpose.” (Simondon, 2012, p.11).

This perspective raises a question of crucial relevance to the field of design in the current era of technological adoption within the discipline: How can immersive technologies enhance users' perception of the functional, aesthetic and semantic values of objects?
In this context, Frechin's assertion becomes particularly relevant: “objects possess a cultural, symbolic, aesthetic and heritage dimension as powerful as a film, a book or a work of art” (Frechin, 2019, p.79).

This idea challenges the merely instrumental vision in which objects are perceived, inviting us to explore the true essence that gives them meaning. The present research is inscribed in this line of thought, seeking to unravel the potential of immersive technologies to revitalize the appreciation of these dimensions intrinsic to design objects.
To understand the origin of this problem and the role that design has played in shaping the relationship between humans and objects, it is relevant to consider its historical evolution. From a first generation centered on art and craft production as a meaning of social progress and artistic quality, design moved towards a second phase marked by the convergence of art, technique, science and industrial aesthetics, responding to a purpose oriented towards the human being, beauty and mass production, generations that Vial (2024) calls the philosophical model of design.
This development, exemplified by the emergence of the Bauhaus in 1919 and the

consolidation of industrial design in 1929 as “a discipline originating from the encounter between the arts and industry” (Vial, 2024, p.17), laid the foundations for a large-scale production that, while democratizing access to objects, may also have contributed to a certain homogenization and less attention to their deeper meanings.
In this scenario, various theorists have approached the complexity of objects from multiple dimensions. Quarante, based on Peirce's theory of signs, describes four main functions: “the referential function, the technical function, the utilitarian function and the semantic function” (Quarante, 2001, p.303).
These categories highlight the multifaceted nature of objects, beyond their simple practical use. In line with this vision, the overall objective of this research is to develop an immersive experience, inspired by the works 'Cosmic Things' by Damián Ortega and 'Tate Sensorium', that facilitates the semiotic analysis of a design object in a hybrid environment through mixed reality.
In this sense, Damián Ortega's work, by dissecting products through reverse engineering and exhibiting the intricate relationship of their components in artistic installations, offers a fundamental perspective for this research, which seeks to rescue the perceptive and sensitive values inherent to each constitutive element of an object.
In a complementary way, the 'Tate Sensorium' installation explores multisensory stimulation to experience static paintings, an approach that raises reflection on its potential application in everyday objects with the intention of highlighting their sensitive and symbolic value.
In this context, artistic installations conceived as hybrid experiences that link the real and digital dimensions can facilitate a rich experience in sensations and discoveries, expanding the possibilities of communication and perception of physical objects and, therefore, enhancing their intrinsic values to the viewer's perception.

2. Towards a convergence between technology and design

According to Frechin (2019), technologies exert a significant influence on design responses. This statement aligns with the various stages of the design process, which are consistently mediated by the use of technologies, ranging from three-dimensional modeling software and 3D printing for prototyping or large-scale production, to the more recent application of virtual reality in collaborative design.
In addition, the discipline is immersed in a continuous technological revolution, characterized by the emergence of new materials and the advancement of industrial processes. This includes the development of software progressively integrated with AI, which makes it possible to determine increasingly innovative design responses, overcoming the technological limitations that in the past might have restricted them.
This dynamic drives contemporary designers to adopt emerging practices with the aim of conceiving progressively innovative designs, optimizing the time and economic efficiency of production.
In this sense, the implementation and use of technologies such as virtual and mixed reality are based on this purpose. Following the perspective of Robledo et al. (2024) on their potential in co-design and participatory design to evaluate and modify designs efficiently, transforming individual perceptions into tangible results, it is highlighted that “the use of virtual and augmented reality have been proven to be more successful with respect to less immersive methods, especially by less expert people.” (cited in Elvezio et al., 2017).
In this context, these technologies emerge as an opportunity and a resource that, when used effectively, can enhance the perception of attributes usually neglected in objects, revaluing every detail of their composition. This approach can, in turn, boost participatory design processes, actively involving users in the appreciation of design objects.
Drawing upon these theoretical perspectives and synthesizing elements derived from the aforementioned artistic installations, the concept of immersive infographics is proposed. This is posited as a novel format, aligning with the classification of six existing formats elucidated by Randy Krum (2013), and also drawing inspiration from the concept of augmented infographics as described by Liu et al. (2022) in their research entitled 'Interactive Extended Reality Techniques in Information Visualization'.
Additionally, Goncalves (2017) points out that these advances make it possible to design experiences and devices capable of altering sensory perception and expanding our perceptual capabilities, redefining immersive experiences by representing hybrid environments where the digital becomes increasingly perceptible and sensitive in our reality.
In this sense, Frechin's idea is taken up: “new design could be defined as both an innovative design activity and an engaged creative activity that focuses on developing, creating and producing the link between technologies and objects for people and their environment.” (Frechin, 2019, p.134).
It is postulated that, as Fisher & Giaccardi point out that “the challenge of design is not a matter of getting rid of the emergent, but rather of including it and making it an opportunity for more creative and more adequate solutions to problems” (Fisher & Giaccardi, 2006, p.1), this integration will contribute to revalue the perception of objects through sensitive and immersive experiences inspired by art.

3. Methodology and results

Within the framework of this study, two initial experiences were carried out with the objective of evaluating virtual reality technology. The first experience focused on the

development of an immersive infographic (proposed as a new format involving virtual reality) entitled 'Infogverse', designed to explain the aesthetic value of a product conceived under the concept of biomimicry. This initiative was carried out with the intention of laying the foundations for future stages of this research, incorporating subsequently an analysis covering the functional, aesthetic and semantic dimensions of the objects.

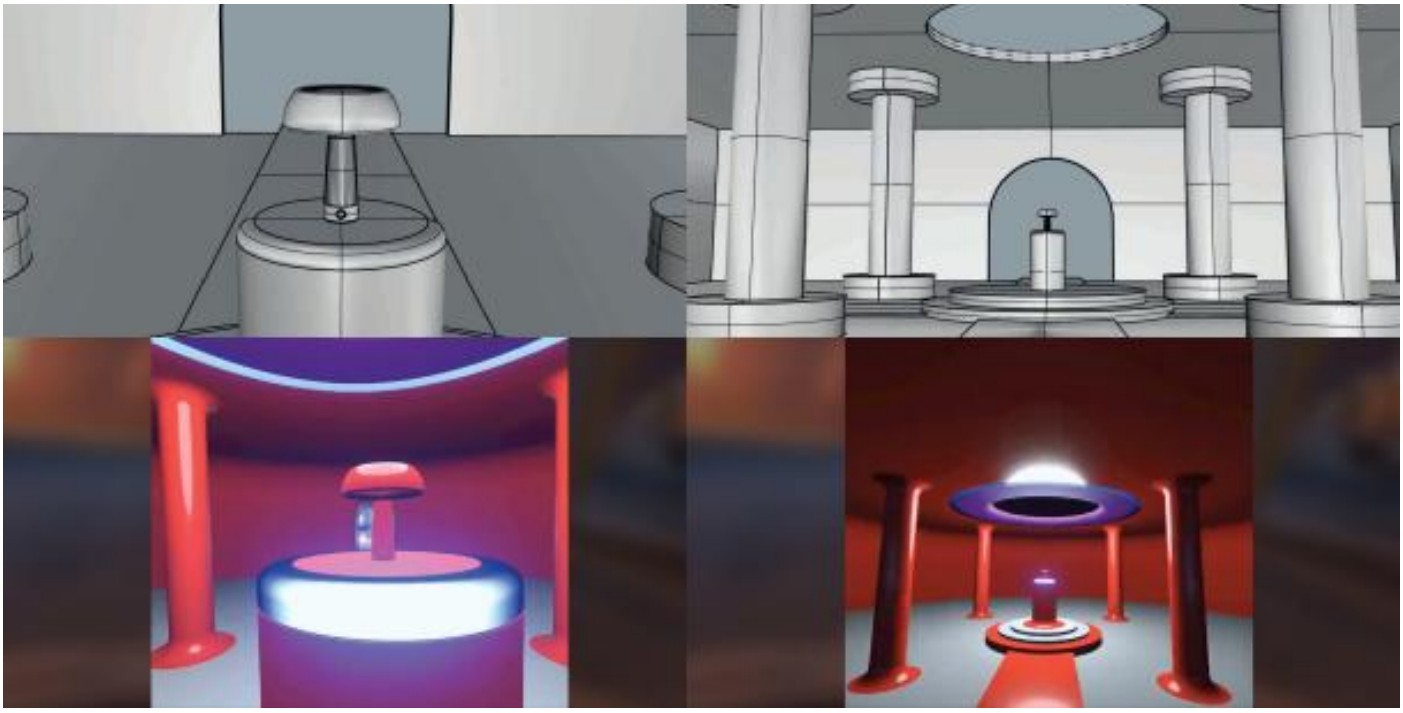

Figure 2. Virtual reality experience*: Infogverse*, an immersive infographic to explore the aesthetics of a product designed under the concept of biomimicry and inspired by the fungus *Rhodotus Palmatus*. The object is a lamp entitled *Rhodo Lamp*.

To continue the evaluation of virtual reality, a second experience was carried out, divided into two sessions: the first in the framework of the *Nuit des Chercheurs 2024* at the *Cité de l'Espace* in Toulouse, France, and the second at the seminar de *recherche-création 2025* at the Université Toulouse Jean Jaurès. This experience was developed in collaboration with artist and PhD student Juliana Marin, which allowed the intersection of two doctoral researches and the combination of perspectives from art, philosophy, design and technology.

In both experiences, the Meta Quest 2 virtual reality helmet was used. For the creation of the 3D environment, Blender 4.0 and Unreal Engine 5.5 software were used.

The first session of this second experience gathered around 60 participants (divided into two 45-minute experiences and 30 participants per session), who alternated between the immersion of the proposed video-art and the exploration of virtual reality. Given the nature of the event, the limited duration and the number of participants, an unstructured observation methodology was used.

General observations revealed active participation and curiosity towards the virtual reality experience, although technical challenges were identified that limited immersion related to internet connection (limiting spatial movement), lack of light (affecting the helmet's recognition of the environment) and users' inexperience with the technology, which prevented optimal fluency.

Although these factors could not be controlled due to the conditions of the experience, they did not impede the interaction of the participants with the technology. In this sense, the observations revealed an active participation and curiosity on the part of the attendees as they explored the virtual reality and interacted with the space designed in 3D, which represented the images projected through the video-art.

Figure 3. Virtual reality and immersive video art: exhibition *IN CORPUS : Un Rhizome Immersif* realized by Juliana Marin and Mario Arias at the *Nuit des Chercheurs 2024* at the *Cité de l'Espace* in Toulouse, France. Photo taken by Juliana Marin.

For the second session, with about 25 participants (10 immersed in virtual reality), the technological aspects mentioned above were taken into consideration. On this occasion, in addition to unstructured observation, a quantitative methodology was implemented to evaluate the experience through surveys using the Google Forms tool.
To evaluate experience and technology, eight multiple-choice questions were asked. The questions and their respective results are presented in the following table (table 1.) :

Table 1. Survey: Perception of experience through virtual reality

Question	Totally agree	Neutre	Not at all
1. Did this virtual experience allow you to feel or explore your senses, such as sight, hearing, touch, smell or taste?	90%	10%	-
2. Has this virtual experience transported you to another environment as if it were reality?	60%	40%	-
3. Do you think this experience lacks elements that allow you to feel through touch or smell to make it more immersive or make it seem much more real?	70%	30%	-
4. Do you think this technology, combined with other haptic technologies (technologies that allow us to feel virtual objects as if they were real), could have a positive impact on this virtual experience?	70%	30%	-
5. Would you explore an experience combining real and virtual reality (mixed reality)?	70%	20%	10%
6. Do you think that hybrid experiences combining real and virtual environments would make the immersive experience more realistic (for example, navigating in a virtual space while interacting with virtual objects and environments)?	70%	20%	10%
7. Do you think these technologies will enable us to explore all our senses beyond sight and sound, as we do in the real world?	30%	60%	10%
8. Did you enjoy the experience?	80%	20%	-

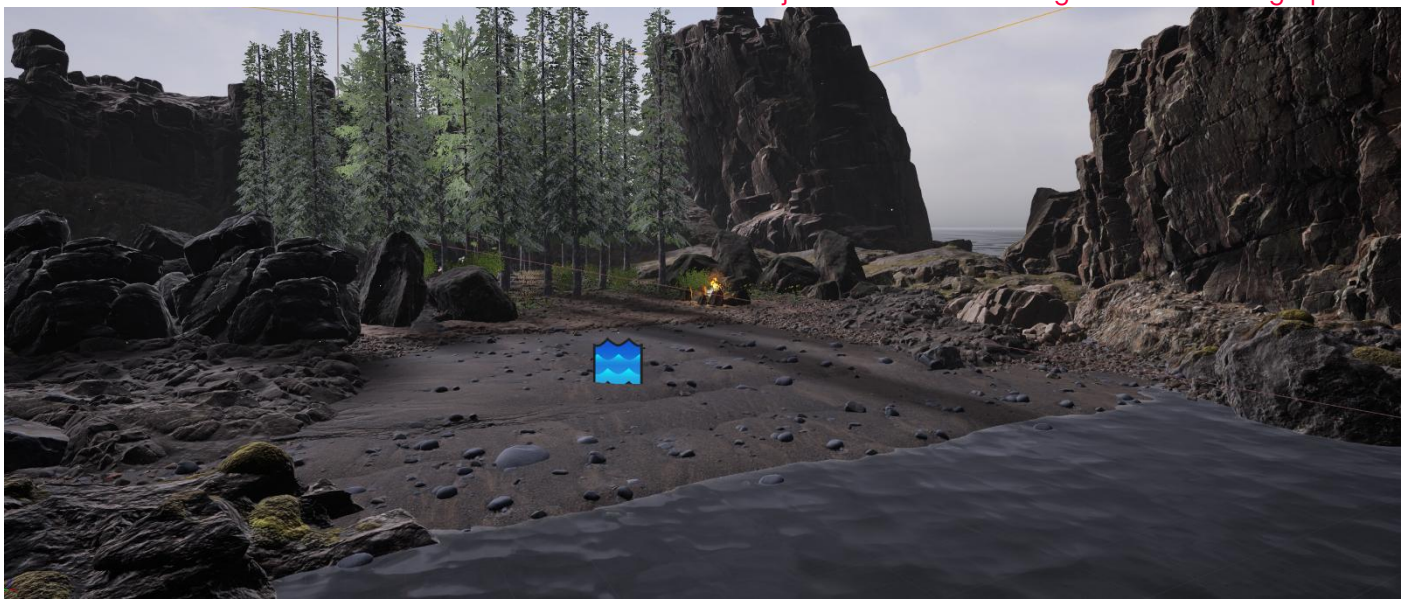

Figure 4. Virtual reality experience: immersion in a natural environment simulating part of the scenes projected in the video-art of *IN CORPUS : Un Rhizome Immersif* realized by Juliana Marin and Mario Arias at the *Nuit des Chercheurs 2024* and the *recherche-création 2025* seminar in Toulouse, France.

4. Conclusions

This research formulates a critique, from a design perspective, towards those objects conceived with an intention limited to their utilitarian value, which leads to a devaluation of objects in contemporary design. In contrast, it seeks to revalue designed objects through the integral consideration of their constitutive dimensions and the recognition of their sensorial and perceptive attributes, with the aim of generating a collective consciousness that encourages people to reflect and understand the intrinsic meaning of everyday objects through emerging technologies.

Regarding the tests conducted, the predominantly positive response of participants in previous experiences motivates the exploration of a new proposal that integrates physical and virtual spaces, ideally involving the totality of the senses and comprehensively addressing the technical challenges previously identified to ensure a more fluid experience. This crucial aspect is also recognized in studies such as Robledo et al. (2024), where the requirement of specific knowledge and skills for the interaction of participants with immersive technologies is pointed out.

In this sense, the experiences designed through the implementation of such technologies must, in turn, allow participants the time necessary to analyze and propose ideas in a reflective manner. Likewise, the space should be designed to actively invite and motivate participants, fostering a dynamic that is conducive to obtaining the desired results.

This conclusion is derived from the interaction of the participants at the end of the experience, through the rhizome proposed in the work of Juliana Marin, where a significant participation of the attendees was evidenced, who contributed ideas, showing their capacity for analysis and creativity.

Furthermore, this orients the research towards a potential participatory design, where users who analyze and interact with the object to understand its functional values can, in turn, become involved in the development of a design idea, contributing to the improvement and/or creation of the object focused on their needs. This approach allows to deepen Frechin's proposals and the concept of metadesign explored by Gerhard Fischer, in order to generate more innovative design processes through the active

participation of people.
In this sense, through these analyses, the objective does not lie in an intrinsic defense of technology, whose disadvantages are recognized, but in the conscious use of available resources to explore its advantages and possibilities for social benefit. Although this study focuses on objects created in the field of design, its findings can serve as a starting point for implementations in other contexts such as social design, education and art, among other disciplines.

Fostering Responsible Design by Enhancing Entrepreneurial Competencies in Graphic Design Education

Geneviève Raîche-Savoie

Université Laval
Genevieve.Raiche-Savoie@design.ulaval.ca

ABSTRACT | As the role of graphic designers expands beyond aesthetics and execution, design education must equip students with skills to navigate complex challenges and foster responsibility in their practice. This paper examines gaps in traditional graphic design education as revealed through students' perceptions of their entrepreneurial competencies and explores the potential of an immersive learning experience to support their development. Traditional graphic design programs primarily focus on responding to client briefs, limiting students' ability to identify and define complex problems. To address this, a creative retreat was designed as an immersive learning experience, combining theoretical knowledge, hands-on workshops, and student self-directed projects. Held in January 2025, the retreat brought together 12 students, supported by a facilitator and a technician, to explore Responsible Entrepreneurship, which integrates social, environmental and economic considerations into design practice. Students participated in self-paced online modules, Design Thinking exercises, and practical experimentation using craft-based production techniques. At the start of the creative retreat, students completed a self-evaluation questionnaire to assess their entrepreneurial skills. The results indicated that they felt most confident in *Learning from Experience* and *Expressing Creativity*. However, they identified *Thinking Ethically and Sustainably*, *Planning and Managing a Project*, and *Possessing Financial and Economic Knowledge* as their weakest areas, reflecting broader educational gaps in business acumen and strategic project management. In parallel, the retreat incorporated four key learning modules: Social Responsibility, prompting students to reflect on issues such as race, gender, and social mobility in design; Environmental Responsibility, introducing sustainable materials and eco-conscious production techniques; Economic Responsibility, emphasizing financial viability of their project; and Awareness and Decision-Making, utilizing a tool to help

students balance social, environmental, and economic priorities in their projects. The findings emphasize that while students excel in creative expression and adaptability, financial literacy, project planning, and sustainability remain critical areas for development. These results suggest that integrating Responsible Entrepreneurship into graphic design education may help prepare future designers to think critically, act responsibly, and navigate an increasingly complex and AI-influenced design landscape.

KEYWORDS | ENTREPRENEURIAL COMPETENCIES, GRAPHIC DESIGN EDUCATION, RESPONSIBLE ENTREPRENEURSHIP, EXPERIENTIAL LEARNING, SUSTAINABLE DESIGN

1. Introduction

As graphic design evolves within the context of artificial intelligence, designers' roles increasingly extend beyond aesthetic concerns, calling for critical thinking, adaptability, and meaningful engagement with current societal challenges (IcoD, 2020; Muratovski & Handford, 2025). This transition emphasizes the increasing need to equip students with the skills required to navigate the complexities of a rapidly evolving world (Noel, 2020).

Recognizing this need, the author's doctoral research explored how design education can cultivate entrepreneurial skills among graphic design students, while fostering a stronger sense of responsibility in their professional practice. Integrating an entrepreneurial mindset into educational practices can also lead to positive outcomes, such as greater perseverance, improved career direction, and enhanced motivation and self-confidence (Surlemont & Kearney, 2009). Moreover, Entrepreneurship extends beyond the classroom, fostering lifelong learning by equipping students with key competencies essential for personal growth, social inclusion, active citizenship, and employability (Bacigalupo et al., 2016).

Traditional graphic design education tends to focus on responding to client briefs, which may limit students' ability to develop the autonomy and strategic thinking required to independently identify and define complex problems (Haylock, 2020). This paper examines gaps in graphic design education as revealed through students' perceptions of their entrepreneurial competencies, and explores how a tailored, reflective, and hands-on learning experience can address these gaps by strengthening students' agency and their capacity to design sustainable solutions.

2. Context

As part of the author's doctoral research, a learning experience was designed using a mixed methods research approach to investigate how graphic design students can be supported in developing their agency by integrating social and environmental considerations into their design projects (Raîche-Savoie et al., 2025). This experience took the form of a creative retreat for graphic design students at Cégep de Sainte-Foy, co-designed with the stakeholders to reflect their preference for an immersive learning environment beyond the traditional classroom setting (Raîche-Savoie, 2024). Held from January 6–10, 2025, at a cultural organization in Québec City, Canada, the retreat brought together 12 students from first to third year, and was led by the author in the role of facilitator, alongside a recreational activities technician specializing in Entrepreneurship. The activity blended theoretical and practical components, focusing on Responsible Entrepreneurship—addressing social, environmental, and economic responsibility, as well as ethical decision-making. Responsible Entrepreneurship integrates social, environmental and economic considerations into value creation, whether for business ventures, one-time projects, or civic initiatives (Pepin et al., 2017). Students participated in self-paced online modules, integrating multimedia content and case studies. Practical workshops encouraged hands-on exploration, with individual work sessions following the Pomodoro technique and collaborative team activities structured around the Design Thinking process. Participants developed their personal projects while benefiting from structured guidance and access to specialized tools, such as a risograph, screen-printing equipment, and bookbinding tools. With a participation fee of $100 CAD, financial support from institutional contributors ensured accessibility. The retreat aimed to cultivate entrepreneurial competencies, empowering students to create sustainable and ethical design projects while fostering creativity, self-reflection, and responsible design practices.

3. Methodology

On the first day of the creative retreat, students engaged in a self-evaluation of their entrepreneurial competencies and identified the ones they aimed to develop throughout the week (Table 1). These competencies and their descriptions were provided by the institution's Entrepreneurship office (BIE, 2022) and are grounded in the EntreComp – Entrepreneurship Competence Framework (Bacigalupo et al., 2016). This framework defines Entrepreneurship as a key lifelong learning competence and organizes it into three interrelated areas, each encompassing five competencies, for a total of 15.

Table 1. The 15 entrepreneurial competencies inspired by the EntreComp – Entrepreneurship Competence Framework (BIE, 2022).

Areas	Competencies	Descriptions
Ideas and Opportunities:	1. Identifying Opportunities	I know how to identify opportunities to create new products, services, or projects to meet the needs of my environment.
	2. Expressing Creativity	I am able to develop new ideas. For example, I find it easy to come up with original solutions to new or existing challenges.
	3. Demonstrating Vision	I find it easy to visualize ideas that could turn into potential actions.
	4. Leveraging Ideas	I am able to recognize the potential of an idea and identify the best ways to leverage it.
	5. Thinking Ethically and Sustainably	I know how to assess the social, economic, and environmental impacts of my ideas and actions.
Resources:	6. Being Able to Mobilize Resources	I am able to seek out the resources and skills I need (e.g., material, technological, financial, human) and ensure their effective management.
	7. Demonstrating Motivation and Perseverance	I know how to demonstrate patience and perseverance when facing pressure, unexpected situations, and challenges.
	8. Having Strong Self-Awareness and Self-Efficacy	I recognize my strengths and know how to leverage them. I am also aware of my limitations and strive for continuous development.
	9. Possessing Financial and Economic Knowledge	I know how to evaluate costs, plan, and manage the financial aspects of a project.
	10. Inspiring and Mobilizing Others	I know how to present my ideas enthusiastically and encourage others to engage in my project.
Into Action:	11. Taking Initiative	I am responsible and autonomous. I know how to take on challenges and take action.
	12. Planning and Managing a Project	I find it easy to set priorities, organize tasks, and ensure follow-ups.
	13. Adapting to Ambiguity, Uncertainty, and Risks	I know how to make decisions and take action despite the ambiguity, uncertainty, and risks associated with my project.
	14. Collaborating with Others	I know how to work in a team despite differing perspectives and develop my professional network.
	15. Learning from Experience	I find it easy to learn from others, as well as from my successes and failures.

As part of a quantitative data collection, students completed an interactive PDF questionnaire outlining 15 entrepreneurial competencies and their descriptions. They rated their alignment with each competency on a scale from 1 to 4: 1 meaning "not at all," 2 "a little bit," 3 "moderately," and 4 "a lot" (Figure 1). These PDFs were collected at the end of the week, with 11 out of 12 students submitting their completed questionnaires to the author.

Habiletés pour entreprendre

Échelle : *Ça ne me ressemble...* / *1- pas du tout* / *2- un peu* / *3- modérément* / *4- beaucoup*

Idées et opportunités	1	2	3	4
1- Identifier les opportunités *Je sais cibler des occasions pour créer de nouveaux produits, services ou projets afin de répondre à des besoins de mon environnement.*	○	○	●	○
2- Exprimer sa créativité *Je suis en mesure de développer des idées nouvelles. Par exemple, j'ai de la facilité à trouver des solutions originales à des nouveaux défis ou à des défis déjà existants.*	○	○	○	●
3- Faire preuve de vision *J'ai de la facilité à visualiser des idées qui pourraient se transformer en actions potentielles.*	○	○	●	○
4- Exploiter ses idées *Je suis en mesure de reconnaître le potentiel d'une idée et d'identifier les meilleures façons d'en tirer profit.*	○	○	●	○
5- Avoir une pensée éthique et durable *Je sais évaluer les impacts sociaux, économiques et environnementaux de mes idées et de mes actions.*	○	●	○	○

Ressources	1	2	3	4
6- Être en mesure de mobiliser des ressources *Je suis en mesure d'aller chercher les ressources et les compétences dont j'ai besoin (ex. matérielles, technologiques, financières, humaines) et d'en assurer une bonne gestion.*	○	○	●	○
7- Manifester de la motivation et de la persévérance *Je sais faire preuve de patience et de persévérance face à la pression, aux imprévues et aux difficultés.*	○	○	●	○
8- Avoir une bonne connaissance de soi et de son auto-efficacité *Je sais reconnaître mes forces et en tirer profit. Je connais aussi mes limites et aspire à continuer de me développer.*	○	○	○	●
9-Détenir des connaissances financières et économiques *Je sais évaluer les coûts et effectuer la planification et la gestion financière d'un projet.*	○	●	○	○
10- Inspirer et mobiliser les autres *Je sais présenter avec enthousiasme le contenu de mes idées et amener les autres à s'engager dans mon projet.*	○	○	●	○

Mise en action	1	2	3	4
11- Prendre des initiatives *Je suis responsable et autonome. Je sais relever des défis et me mettre en action.*	○	○	○	●
12- Savoir planifier et gérer un projet *J'ai de la facilité à déterminer les priorités, à organiser le travail et à en assurer le suivi.*	○	○	●	○
13- S'adapter face à l'ambiguïté, l'incertitude et les risques *Je sais prendre des décisions et passer à l'action malgré l'ambiguïté, l'incertitude et les risques associés à mon projet.*	○	○	●	○
14- Travailler en collaboration avec les autres *Je sais travailler en équipe malgré les divergences de vision et développer mon réseau de relations professionnelles.*	○	○	○	●
15- Apprendre de son expérience *Il est facile pour moi d'apprendre des autres, de mes succès et de mes échecs.*	○	○	○	●

Note : *Cette auto-évaluation a été développée en collaboration avec l'équipe des conseillers et conseillères d'orientation du Cégep de Sainte-Foy, à partir du modèle EntreComp (Bacigalupo, Kampylis, Punie et Van den Brande, 2016).*

Figure 1. Example of the interactive PDF questionnaire that was filled by one of the students.

4. Results and Analysis

The data collected from each student's questionnaire, detailing their self-assessed competency ratings, was systematically compiled and organized into the following table (Table 2). This table provides a clear overview of how students ranked their proficiency in each of the 15 entrepreneurial competencies, allowing for a comparative analysis of their strengths and areas for growth. By aggregating these individual responses, patterns and trends emerged, offering valuable insights into which competencies students felt most confident in and which ones required further development.

Table 2. Students' self-evaluations of each of the 15 entrepreneurial competencies.

Competencies	P1	P2	P3	P4	P5	P6	P7	P8	P9	P10	P11
1. Identifying Opportunities	4	3	2	3	2	2	4	3	3	3	1
2. Expressing Creativity	4	4	3	3	3	4	2	2	3	4	4
3. Demonstrating Vision	4	3	3	4	2	2	3	2	4	3	2
4. Leveraging Ideas	3	4	3	4	3	3	2	2	2	3	4
5. Thinking Ethically and Sustainably	2	1	2	3	3	2	4	2	2	2	2
6. Being Able to Mobilize Resources	3	3	2	3	1	2	3	3	1	3	2
7. Demonstrating Motivation and Perseverance	4	4	3	3	3	3	3	3	2	3	3
8. Having Strong Self-Awareness and Self-Efficacy	4	4	1	4	3	3	1	3	4	4	3
9. Possessing Financial and Economic Knowledge	2	1	1	2	1	2	2	1	1	2	1
10. Inspiring and Mobilizing Others	4	2	2	4	2	1	4	4	3	3	3
11. Taking Initiative	4	3	2	4	2	3	3	3	1	4	3
12. Planning and Managing a Project	3	2	1	3	2	2	2	4	2	3	1
13. Adapting to Ambiguity, Uncertainty, and Risks	4	4	1	3	1	3	3	3	1	3	2
14. Collaborating with Others	4	3	3	4	3	2	3	3	1	4	2
15. Learning from Experience	4	3	4	4	3	4	4	4	3	4	4

The average score for each of the 15 entrepreneurial competencies was calculated and ranked in descending order, from the most to the least representative of students' competency levels (Table 3). The analysis of the questionnaire results shows that the competency students identified with the most was *Learning from Experience*, indicating their ease in learning from others, as well as from their successes and failures. Among the 11 students, 8 rated this competency at the highest level (4), meaning they strongly related to it. The second highest-rated competency was *Expressing Creativity*. Students felt confident in their ability to generate new ideas and develop original solutions to both new and existing challenges. However, responses varied: 5 students strongly identified with this competency (*a lot*), while 4 rated it as *moderate*, and 2 as *a little bit*.

Finally, the competencies least identified by students were *Thinking Ethically and Sustainably* and *Planning and Managing a Project*, both ranking at the same level. Before the creative retreat, students faced challenges in evaluating the social, economic, and environmental impacts of their ideas and actions. They also struggled with setting priorities, organizing tasks, and managing project follow-ups. The lowest-ranked competency was *Possessing Financial and Economic Knowledge*. Students found it particularly difficult to assess costs, create financial plans, and manage the economic aspects of a project, highlighting a key area for further development.

Table 3. From the most to the least recognized competencies by students.

Competencies	Average
15. Learning from Experience	3,72
2. Expressing Creativity	3,27
7. Demonstrating Motivation and Perseverance	3,09
8. Having Strong Self-Awareness and Self-Efficacy	3,09
4. Leveraging Ideas	3
3. Demonstrating Vision	2,9
10. Inspiring and Mobilizing Others	2,9
11. Taking Initiative	2,9
14. Collaborating with Others	2,9
1. Identifying Opportunities	2,73
13. Adapting to Ambiguity, Uncertainty, and Risks	2,54
6. Being Able to Mobilize Resources	2,36
5. Thinking Ethically and Sustainably	2,27
12. Planning and Managing a Project	2,27
9. Possessing Financial and Economic Knowledge	1,45

5. Discussion

The quantitative findings from the self-assessment questionnaire offered an initial overview of students' perceived entrepreneurial competencies; however, it is through the qualitative examination of the creative retreat that these results acquire greater depth and meaning. By analyzing the retreat as a learning environment, this section provides a more nuanced understanding of how students might have engaged with these competencies in practice.

Students' recognition of *Learning from Experience* as their strongest competency underscores the importance of immersive, hands-on learning experiences that encourage critical reflection and personal growth. By engaging in personal projects, making decisions, and facing challenges, students participating in the creative retreat could have developped a deeper understanding of their own learning processes. The creative retreat also provided an excellent opportunity for students to develop their second highest-rated competency, *Expressing Creativity*. Unlike their usual assignments in the Graphic Design program, where they often execute a client's vision, this retreat allowed them to take full ownership of their projects. Students had the freedom to work on self-initiated projects, enabling them to focus on ideas that genuinely interested them. Rather than merely responding to a predetermined brief, they identified problems and

explored innovative solutions. Haylock (2020) highlights that problem formulation is a crucial aspect of the design process, yet it has historically been overlooked in graphic design education and practice. Furthermore, traditional graphic design education does not emphasize human-centered design to the same extent as UX/UI design. This shift from task execution to proactive problem-solving, with a focus on diverse stakeholders, may have enabled students to develop their agency and to engage more critically with their design practice, thereby reinforcing the broader role of graphic designers in addressing complex challenges.

This learning experience also provided an opportunity to enhance the competencies students identified as their weakest, including *Ethical and Sustainable Thinking*, *Project Planning and Management*, and *Financial and Economic Literacy*. In relation to ethics and sustainability, Valencia et al. (2021) describe the early stage of a designer-entrepreneur's mindset, referred to as "the artisan," as one that prioritizes personal expression over the needs of users and stakeholders. At this stage, students working on personal projects are primarily driven by their curiosity to experiment with materials, technologies, forms, textures, and aesthetics. As a result, they do not naturally consider the broader social, environmental, and economic implications of their creations. Encouraging students to integrate ethical and sustainable thinking into their design process requires exposing them to real-world challenges, fostering a sense of responsibility, and equipping them with frameworks that promote conscious decision-making in their creative practice.

The gaps in competencies related to *Project Planning and Management* and *Financial and Economic Literacy* have also been highlighted by other design researchers. Anderson (2014) argues that many graphic designers lack the necessary knowledge and experience to transform their creative ideas into viable projects. She emphasizes that developing key skills—such as financial literacy, risk assessment, and project planning—is essential for designers aiming to take their concepts from ideation to execution. Successfully managing a project requires a shift in mindset, moving beyond creative exploration to incorporating strategic thinking. Without this foundation, designers may struggle to sustain their projects, secure funding, and navigate the complexities of bringing their ideas to life.

From the start, the creative retreat was designed to support students in developing and managing a personal project while incorporating ethical, sustainable, and financial considerations into their design process. Throughout the creative retreat, students were encouraged to critically assess their social, environmental, and economic responsibilities in relation to their projects. The module on *Social Responsibility* explored issues such as race, gender, sexuality, and social mobility, prompting students to reflect on how their designs influence and represent society. The *Environmental Responsibility* module provided insights into sustainable materials and methods to minimize the ecological impact of design, encouraging students to make thoughtful material choices and consider the broader environmental footprint of their work. The third module, *Economic Responsibility*, emphasized the importance of achieving a break-even point that could extend beyond financial profit, focusing on the value of fostering community relationships. Students were prompted to critically examine market potential and production costs, integrating these considerations into their projects. The final and fourth module, *Awareness and Decision-Making*, introduced the *Ethical and Sustainable Thinking Canvas*, developed by the Entrepreneurship Office at Cégep de Sainte-Foy. This tool may have helped students assess the broader impact of their decisions by balancing social, environmental, and economic priorities. It may also have guided them in selecting more sustainable solutions, prioritizing actions based on ethical considerations, and monitoring outcomes to refine their strategies, with the aim of minimizing negative

impacts while maximizing positive results.

Beyond the theoretical modules, students participated in daily team-based sessions to apply Design Thinking, following the classic process of Empathy, Definition, Ideation, Prototyping, and Testing (Brown, 2008). This hands-on approach may have fostered collaboration and problem-solving, while also enabling graphic design students to refine and articulate design problems prior to developing solutions. By prioritizing empathy, students may have gained a deeper understanding of user needs and stakeholder perspectives, potentially enhancing their ability to create more meaningful, human-centred designs.

6. Conclusion

By first identifying gaps in entrepreneurial competencies within graphic design education, this paper examines the potential of an immersive learning experience to support the development of these competencies among graphic design students. The creative retreat offered a distinctive context in which students could engage in self-directed projects, reflect on their creative and professional practices, and develop skills extending beyond technical design execution. Through the integration of theoretical content and hands-on exploration, students were encouraged to critically consider the social, environmental, and economic implications of their work, underscoring the relevance of Responsible Entrepreneurship in contemporary design practice.

The entrepreneurial competencies identified by students as less developed—such as *Thinking Ethically and Sustainably*, *Planning and Managing a Project*, and *Possessing Financial and Economic Knowledge*—highlight areas where traditional graphic design education may benefit from additional pedagogical support and more structured learning opportunities.

Building on these findings, future research could explore how this immersive learning experiences may influence the development of entrepreneurial competencies over time. Longitudinal studies might help examine whether integrating Responsible Entrepreneurship into graphic design education is associated with sustained changes in students' competencies and professional postures. In a design landscape increasingly shaped by complexity and artificial intelligence, preparing designers to think critically, act responsibly, and frame problems rather than simply execute solutions may be essential to the future relevance of the discipline.

From binary relationships to multi-stakeholder engagement: The evolving role of design intervention in waste classification public service transition

Chengbo Li[a]

aSchool of Design, Hunan University
*cbli@hnu.edu.cn

ABSTRACT | As global urbanization accelerates, the demand for waste classification public services has risen sharply. However, traditional design interventions have struggled to resolve inefficiencies in waste classification services, mainly due to low public awareness and limited resources. In response, multi-stakeholder waste classification public services have emerged as a promising solution, aiming to improve service quality through increased participation, collaboration, and interaction among public agencies, design organizations, and the general public. While existing research has extensively examined the role and value of design interventions in conventional public services, the impact of multi-stakeholder involvement on the role of design in waste classification services remains underexplored and requires further study.

This study adopts a case study methodology, selecting three instances of waste classification public services to analyze the processes of design intervention in multi-stakeholder contexts. Based on this analysis, this research proposes the "Multi-Stakeholder Public Design Ladder," a conceptual framework defining three hierarchical roles of design: Design as Solution, Design for Empowerment, and Design for Cohesion. As design involvement deepens, its impact expands progressively, evolving from providing solutions to enhancing service capacity and ultimately strengthening stakeholder relationships.

This research contributes a theoretical framework for analyzing and defining the roles of design interventions in future waste classification public services. Additionally, it

encourages design teams and designers to reevaluate their roles and stakeholder relationships, preparing them to effectively navigate the rapid transformation of public services.

KEYWORDS | Public Design, Waste Classification, Co-production, Sustainability, Public Service Transformation

1. Introduction

The rapid growth of the global urban population has intensified urbanization, significantly increasing the volume and rate of solid waste generation. According to World Bank estimates, approximately one-third of global waste is improperly managed, resulting in serious environmental damage and substantial economic losses (Kaza & Yao, 2018). These issues have raised significant concerns, leading to the formal incorporation of waste management into institutional regulatory frameworks (Anderfuhren-Biget et al., 2010). Waste classification, as the initial stage of the waste management process, has therefore become a foundational component of modern public services.

Design has long played a central role in shaping and innovating public services. Traditional design research has mainly focused on the interaction between the public sector and design thinking (Clarke & Craft, 2019) or service design (Xin & Cao, 2014), highlighting their binary dynamics. However, traditional theories of design interventions in public services are increasingly being challenged. Rising demands from citizens and businesses, combined with governments' limited knowledge resources and shifts in urban governance, industrial progress, and environmental crises—particularly in waste classification—have driven various stakeholders (public, private, and co-production sectors) to engage in diverse forms of participation in waste management. Such involvement is essential for enhancing public service quality. Therefore, given the ongoing shift in public service delivery, it is necessary to re-evaluate the role of design interventions in multi-stakeholder public services.

This paper examines three case studies of multi-stakeholder participation in public waste management services, analyzing the role of design and the impact of such interventions across the four stages of the public service lifecycle. This analysis provides deeper insights into how design responds to challenges and transformations in public service delivery, thereby broadening the scope of design theory research in this field.

2. Background

2.1. The Evolution of Public Waste Classification Services

Waste management, governed by public authorities, constitutes a core component of contemporary public services (Simon et al., 2010). The provision of waste management services as a public function dates back to the enactment of the "Nuisance Removal and Disease Prevention Act" of 1846 by the Metropolitan Board of Works in London, and continues to evolve to the present day (Wilson, 1976). Given the changes in urban governance, sustainable industrial development, and ongoing environmental crises, there

is a growing demand for reforms in public waste management services. At the forefront of these reforms, waste classification has emerged as a pivotal method for enhancing waste management practices and acting as a catalyst for transformative change. This transformation occurs in three distinct phases: traditional governance-driven waste classification, market-driven waste classification, and social participation and co-production-driven waste classification.

In the traditional governance phase, government entities assume the primary responsibility for service provision, with policy governance as the predominant strategy. Local governments focus on "top-level design" and "pragmatic innovations" within the existing institutional framework. However, scholars have critiqued the limitations of formalization and the inconsistent implementation of policies during this phase (Teets & Hasmath, 2020).

The market-oriented phase, influenced by the New Public Management paradigm, is characterized by increased organizational participation in public services. However, the concept of "bounded rationality" may hinder innovation in cross-sector collaborations, and a narrow performance management system may struggle to adequately facilitate stakeholder dialogues (Simon, 1989; Dorst, 2015; Smith & Raven, 2012).

In the phase marked by social participation and co-production, co-production becomes a central concept. It involves the collaboration and interaction of diverse social actors, particularly non-expert participants, in the delivery of public services (Nabatchi et al., 2017). As waste classification services evolve, the roles of societal actors become increasingly distinct, underscoring the significance of social participation and co-production in transforming public waste management practices (Wang, 2019).

2.2. Innovation and Design Intervention in Waste Classification Public Services

The transition of waste classification public services from traditional governance to co-production necessitates innovation in public services. Design, recognized as a key driver of innovation, has consistently played a significant role in the public service sector. A foundational concept in this regard, introduced by Rittel and Webber, is the notion of "wicked problems," which they coined to describe complex, persistent social and environmental issues in the public domain (Rittel & Webber, 1973). This concept emphasizes the embeddedness, dynamism, interconnectedness, and complexity of such issues. Additionally, contemporary design theories focus on design's potential to empower organizations and influence strategic shifts (Design Commission, 2014), operate across disciplines and professions (Norman & Stappers, 2015; Dorst, 2015; Van der Bijl-Brouwer, 2019), drive social innovation and cultural ecosystems (Ezio, 2015), and facilitate systemic change (Jones, 2014; Irwin, 2015). These theories collectively expand the scope of design beyond its traditional boundaries, extending into the broader public sphere.

In response to wicked problems, Buchanan further developed design through his influential four-stage design theory, which has become central to design thinking. This theory addresses different levels of “placement” in solving wicked problems, ranging from fundamental elements such as symbols and visual communication to the creation of

artifacts and services, and ultimately to managing complex systems and environments (Buchanan, 1992).

Building upon this four-stage framework, the Danish Design Centre introduced the Danish Design Ladder in 2003 (Doherty et al., 2014). This model captures the diverse applications of design across varying levels in both business and public sectors (Ramlau, 2004) and has gained broader applicability within the general public domain. Extending this concept, the UK Design Council and other scholars introduced the Public Design Ladder and the Non-Profit Design Ladder, focusing specifically on the public and non-profit sectors (UK Design Council, 2013; Nusem et al., 2017). The Public Design Ladder outlines three key stages: design for discrete problems, design as capability, and design for policy (Figure 1). These stages reflect the increasing significance of design in the public sector as its engagement deepens (Design Commission, 2014).

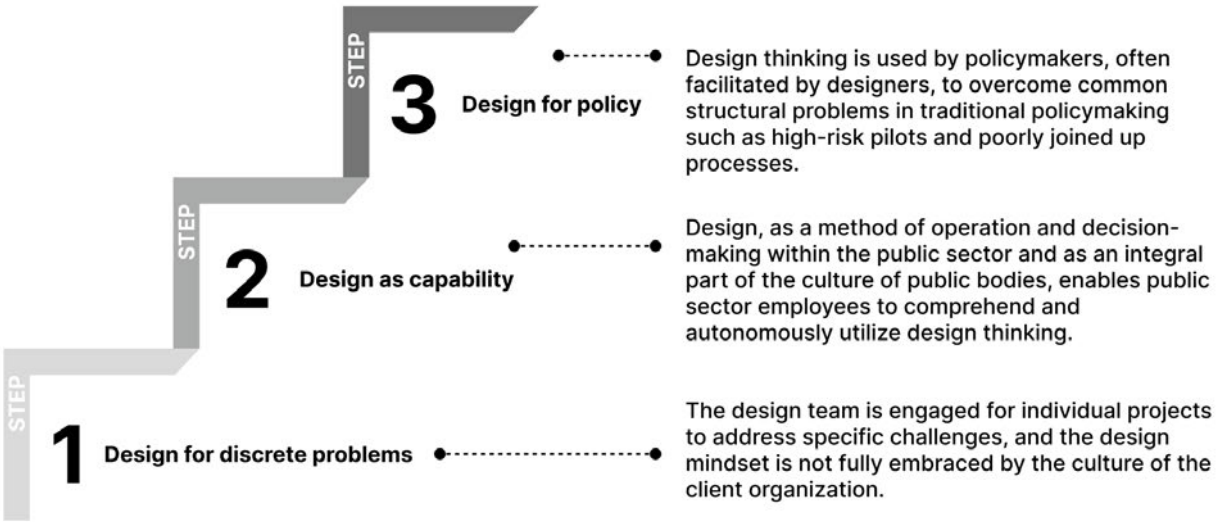

Figure 1. "The Public Design Ladder" of public services.

3. Research Methodology

This study adopts a case study approach to examine the extent of design intervention in public waste classification services and to refine the "public design ladder" within a multi-stakeholder context through an analysis of three cases in China. For confidentiality, real organizations were anonymized using pseudonyms (Company B, Company T, Company Z, Community K, Community P, Governmental Foundation H, and DT Primary School), which will be consistently referenced throughout this study.

During data collection, researchers spent ten weeks conducting 1–2 semi-structured interviews with each of the project experts and designers involved in the selected cases. The interview protocols were tailored to the characteristics of each project, resulting in approximately six hours of recorded material (Table 1). Subsequently, researchers dedicated two additional weeks to supplement case data through a review of project records and publicly available materials, further enriching the dataset.

Table 1. Case Descriptions and Interview Details.

Case	City	Stakeholders	Interviewee	Interview duration
1	Changsha, China	•Company B; •Community K; •Community Residents	Project Management	2.5h
2	Changsha, China	•Company T; •Community P; •Community Residents	Project Leader	2h
3	Shenzhen, China	•Foundation C; •Company Z; •DT Primary School	Project Designer	2h

During case analysis, the interview data were transcribed and thematically coded using NVivo 15. The coding outcomes underwent expert validation and finalization through a consensus-based process. The interview analysis revealed that all three cases demonstrated characteristics typical of public service projects. Accordingly, this section employs the four-stage public service lifecycle framework—Co-Commissioning, Co-Design, Co-Delivery, and Co-Assessment (Nabatchi et al., 2017)—to evaluate the application and impact of design interventions.

4. Case Study on Design Intervention Models in Waste Classification Public Services

4.1. Case 1: "Three-network Integration" Waste Recycling System Design

Case 1 analyzes an entrepreneurial initiative on waste classification spearheaded by technology company B, located in Hunan Province. In this project, Company B engaged designers and partnered with the district government and Community K residents to co-create, design, and implement a waste classification, collection, and recycling system. This system incorporates three interconnected networks: the "Recycling Resources Network," the "Classified Collection Network," and the "IoT Data Network" (Figure 2). To gain a comprehensive understanding of the process, this study conducted an in-depth interview with the project manager.

Figure 2. Waste classification, disposal and recycling system.

4.2. Case 2: Self-Service Waste Classification System

In Case 2, the T Company team, leveraging its expertise in product development, integrated design thinking principles, including user experience, into the project. They designed a community-based waste classification and disposal system to foster residents' waste classification behaviour and improve the operational efficiency of Community P's staff. The study interviewed a project team member responsible for project advancement, possessing expertise in development and product management.

4.3. Case 3: Zero Waste Campus Design

Case 3 examines a project commissioned by the H Governmental Foundation, wherein design consultancy firm Z was tasked with promoting waste-free behaviour among students at DT Elementary School in Shenzhen (Figure 3). This study interviewed the lead designer overseeing the project at Z Consultancy.

Figure 3. Guidance design for waste classification behaviour and supportive devices for waste classification behaviour are provided to students.

5. Result

This study examines three cases of multi-stakeholder participation in waste classification public services, introducing a public design ladder distinct from traditional public service models. The proposed design ladder illustrates different levels of design influence in public services involving multiple stakeholders. Table 2 presents the public design ladder for multi-stakeholder participation in public services, delineating three stages of design influence.

Table 2. Design interventions in the four stages of the public service lifecycle across three cases.

Case	Co-commissioning	Co-Design	Co-Delivery	Co-Assessment	Public Design Ladder of Multi-stakeholder
1	Less Design Participation	•Design requirements clarity •Preliminary work by other departments •Passive design role •Solving specific needs	Less Design Participation	Less Design Participation	**Design as solution**
2	•Internal capacity building through design thinking •Recognizing and enabling active user roles	•Final design output •Improving systems and tech •Enhancing user engagement through accessible tools	Less Design Participation	Less Design Participation	**Design for empowerment**
3	•Collaboration with public and private actors •Design as a bridge	•Design inspiration from other regions •Behavior change through guidance	•Interactive feedback with users •Iterative design process •Bringing stakeholders together	Less Design Participation	**Design for cohesion**

Through an analysis of multi-stakeholder waste classification cases, the original "Public Design Ladder" has been revised and extended to encompass services with multiple stakeholders (Figure 4).

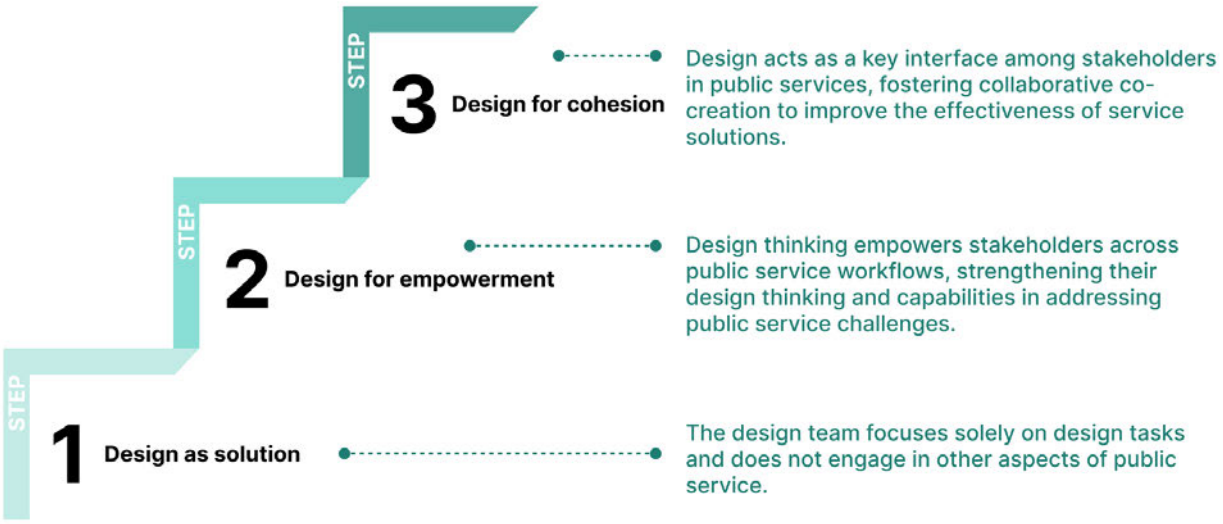

Figure 4. "The Public Design Ladder" of multi-stakeholder public services.

In the original ladder, each tier signifies the extent to which design is integrated within public institutions, demonstrating its growing adoption across different levels. The progression follows a trajectory from "Design Thinking Not Embedded in Commissioning Organizations" to "Design Becoming Part of Public Institutional Culture" and ultimately to "Design Utilized by Policymakers." In the revised framework, design has been recognized for its value to various stakeholders, evolving from "Problem-Solving Solutions" to "Empowering Stakeholders" and finally to "Enhancing Cohesion Among Stakeholders." This shift highlights that, with the engagement of multiple stakeholders, the impact of design on waste classification public services goes beyond service solutions and public institutions. Furthermore, it plays a key role in empowering stakeholders and fostering collaboration, thereby driving the systemic transformation of waste classification public services.

6. Conclusion and Further Steps

This PhD study investigates multi-stakeholder participation in waste classification public services to advance the "Public Design Ladder" framework. T The revised framework delineates three tiers: "Design as solution," "Design for empowerment," and "Design for Cohesion." As design interventions become increasingly integrated into multi-stakeholder public services,, the role expands beyond the development of design solutions, focusing on stakeholder capacity building, strengthening relationships, and ultimately contributing to the transformation of public services.

However, this study also highlights several challenges associated with design interventions in multi-stakeholder public services, including the dependence on policymakers' acceptance of design recommendations and the practical constraints designers encounter in addressing complex social issues. To overcome these challenges, future research should explore the following areas:

- First, analyzing the challenges and limitations at each stage of multi-stakeholder public service design to refine and enhance the theoretical framework.
- Second, creating specialized design tools informed by the framework to support designers in managing the complexities of multi-stakeholder public services.

HYBRID BODIES AND DIGITAL IDENTITIES: EXPLORING TRANSHUMAN FASHION AT THE INTERSECTION OF TECHNOLOGY AND SELF.

Michela Musto*

Università degli Studi della Campania "Luigi Vanvitelli"

*michela.musto@unicampania.it

ABSTRACT | In a rapidly evolving landscape, fashion, through the hybridization of technology and biomechanical integration, emerges as a preeminent investigative medium, capable of questioning the understanding of what it means to be human in the postdigital era, investigating the ethical and cultural implications of this development. Thanks to advances in the design of smart materials and wearable technologies, fashion today, and even more so tomorrow, promises unique pathways for human enhancement and self-expression that transcend physical limitations, creating a context in which technology increasingly configures itself as a defining element of identity. Following the thought of transhumanist theorists, this ongoing study explores the potential of fashion, in association with wearable technologies, as a medium to augment and extend the human body, establishing a hybrid dimension where digital and biomechanical elements become integral to both personal and collective aesthetics. Through the analysis of contemporary case studies and pioneering experiments that respect the boundaries of the cyborg essence, as defined by Donna Haraway, who urges us to consider the cyborg as an icon of human-machine hybridization, this research focuses on emerging aesthetics that emphasize the application of transhumanist principles. From cyberpunk motifs, embodying the fusion of human and technological, to synthetic-organic constructs, we witness a redefinition of the complex interplay

between natural and artificial elements, compelling us to examine whether and how these aesthetics might represent a new vision of identity and corporeality.

This “beyond human” approach increasingly positions fashion as a privileged investigative tool capable of questioning our understanding of what it means to be human in the post-digital era. The ethical and cultural implications of these developments, as highlighted by Stiegler in his concept of *pharmakon*—an ambivalent symbol of both cure and poison that underscores both potential and risk—are profound.

By integrating fashion with wearable devices and biomechanical technologies, this study critically engages with themes of identity construction, inclusivity, and sustainability, probing how the fusion of natural and artificial within fashion influences our perceptions of identity and potentially redefines inclusivity in a world where technologically mediated appearances might either diminish social divides or, conversely, risk excluding those who cannot access such advancements. This investigation positions the redefinition of the hybrid body as an essential theme through which to argue the role of clothing as a true artificial second skin, thus radically redefining the very role of fashion in delineating the boundaries between natural and augmented bodies. By analyzing the application of transhumanist principles within fashion, this study explores both the promises Braidotti identifies in her posthumanist writings regarding self-expression, as well as the infinite possibilities that technologies, in their most direct influence on the human body, may offer.

KEYWORDS | HYBRID BODIES, POSTHUMAN FASHION, EMERGING AESTHETICS, WEARABLE TECHNOLOGIES, TECHNO-AESTHETIC

1. Introduction

In an era marked by rapid technological integration and ontological reconfigurations, fashion, as a material articulation of embodied discourse, emerges as a privileged conduit to interrogate the porous boundaries and onto-political metamorphoses of the human subject in the postdigital age.
As an ontological site par excellence, fashion facilitates the exploration of subjectivity's contingency, plasticity, and technogenetic transformation,

materializing what Parisi defines as *techno-aesthetics*: a sensorial regime wherein matters and code, embodiment and algorithmic abstraction, co-compose in a field of indeterminacy and modulation (Simondon, 1958; Parisi, 2013). The integration with wearable technologies reinforces the role of garments as catalysts for reconfiguring corporeality and subjectivity, aligning with postuman paradigms that envisage the body as a becoming-entity, open to expansion, hybridization, and ontological discontinuity (Sloterdijk, 2009; Barad, 2007).

The posthuman body, heralded by its closer relation with technologies, transcends formal materialization, permeating the ontological and experiential *strata* of existence. These progressive transformation let new form of aesthetics emerge and, as Wolfgang Welsch posits, they surpass passive contemplation, embracing corporeal and technological participation (Welsch, 1997). Similarly, Nicolas Bourriaud's concept of relational and *post-productive aesthetics* underscores hybridization, manipulation, and interaction as its defining characteristics (Bourriaud, 2009). The incorporation of smart technologies into garments amplifies this discourse, engendering novel aesthetic paradigms that manifest as functional and political synesthesias of the body (Deleuze & Guattari, 1980; Flanagan et al., 2020). In this light, the *augmented body* emerges as a further articulation of fashion's techno-aesthetic agency, embracing thus a trashuman dimension, able to intensify its capacity to enhance and augment the human body, his potential and his modes of experience.

In the transition from human to transhuman, fashion assumes the role of a critical techno-epistemology that interrogates the dichotomy between nature and technics, as well as the ontological status of being itself (Barad, 2007; Derrida, 1989). This study examines the emergence of hybrid, and augmented bodies in contemporary fashion production as aesthetic and political vehicles of emerging subjectivities and digital identities. Employing a transdisciplinary approach, the analysis focuses on selected case studies to elucidate the intersection of corporeality and technology within transhumanist and postdigital paradigms.

2. Wearable Technologies: The Body as an Augmented Surface

The concept of the hybrid body is rooted in the speculative trajectories of contemporary critical theory, among which Donna Haraway's vision emerges as paradigmatic for the present inquiry. In her *Cyborg Manifesto*, Haraway dislocates the binary ontology of human/machine by envisioning the cyborg as a liminal, figure: a politically charged, ontologically hybrid entity that resists essentialist constructions and opens space for transformative becoming (Haraway, 1991). Fashion, in its deep-seated complicity with the body, emerges as an epistemic interface capable of interrogating the mutability of embodied subjectivity (Cranny-Francis, 2008). However, the transhumanist project, as formulated by Max More and Natasha Vita-More, radicalizes this vision toward a techno-teleological horizon of perpetual enhancement in which the human embodies an

open-ended vector of potentiality, calibrated toward optimization and cognitive surplus (More & Vita-More, 2013).

It is in this speculative tension that Dani Clode's project "Third Thumb" finds resonance as a paradigmatic case of design informed by transhumanist logic. The project introduces a robotic, opposable sixth digit to the human hand, expanding its operative range. Not a reparative prosthesis, but an additive organon, the "Third Thumb" materializes the conceptual transition from the biologically given to the technologically sculpted, exemplifying what Simondon would call a "concretization of the technical object" in which the technical and the organic co-evolve (Simondon, 1958, p.92). The hand ceases to be an anatomical given and becomes a semiotic terrain where gesture, functionality, and identity are renegotiated. The six-fingered hand no longer signifies anatomical anomaly, but instead inaugurates a new potential morphology: the device becomes a site of ontological disobedience, destabilizing the boundaries of normativity toward what Braidotti terms a "posthuman subjectivity", embodied, relational, and ontologically incomplete (Braidotti, 2013).

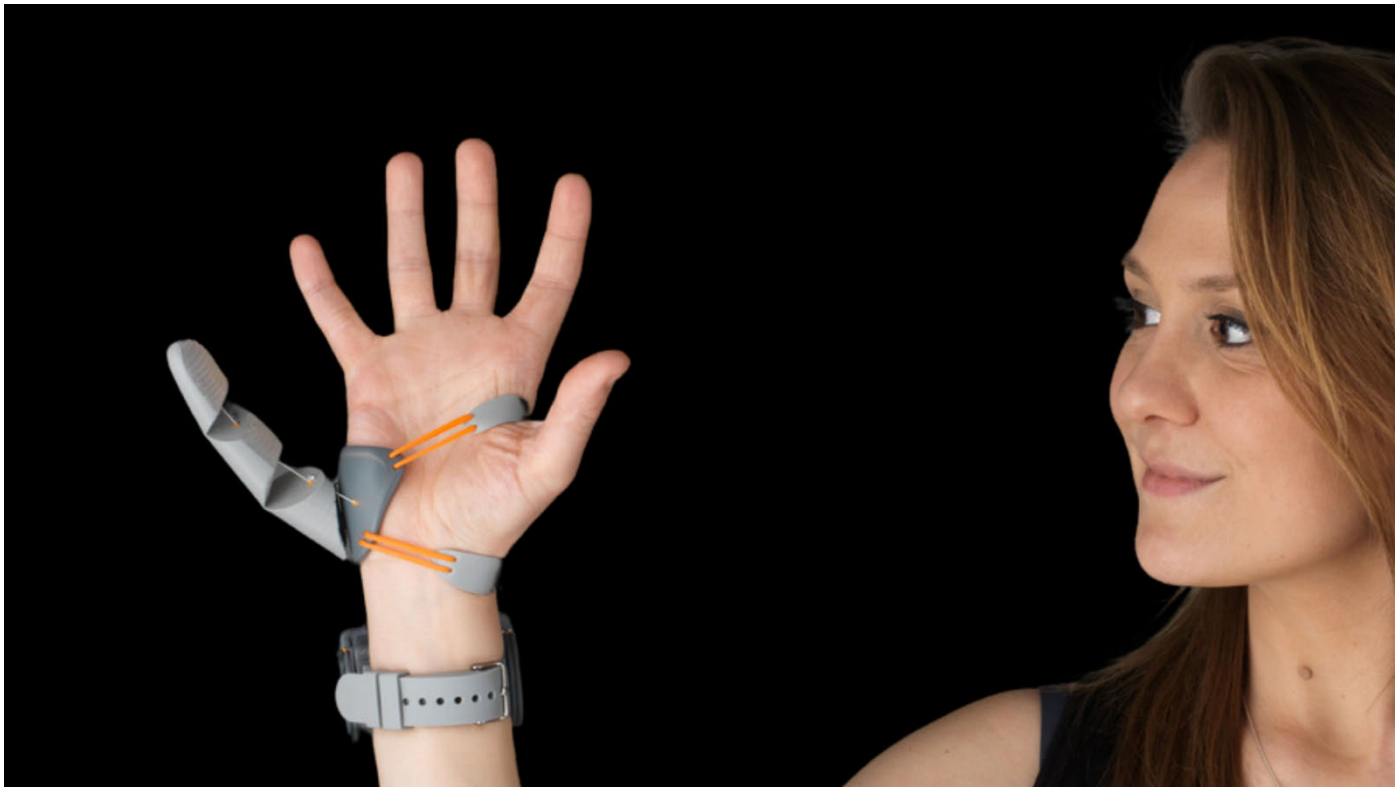

Figure 1. "Third Thumb", Dani Clode, (2017). Master's studies in Design Products at the Royal College of Art in London. The motorized thumb enables enhanced gestures, challenging anatomical norms and embodying a transhuman aesthetic of functional and morphological augmentation.

The "Third Thumb" contributes indeed to the emergence of a transhumanist aesthetics of the *non-finis*, where the body is exposed as a mutable, relational matter, open to engineering, recoding, and aesthetic appropriation (Murray, 2008; Featherstone, 2010). As Shilling notes, the contemporary body increasingly operates as an unfinished project subject to technogenesis, autopoietic design, and tactical augmentation (Shilling, 2012).

Within this continuum, Anouk Wipprecht's project "Spider Dress" stands as a singular case of wearable ontology, staging the convergence of machinic agency, somatic presence, and aesthetic semiotics. Conceived as a responsive exoskeleton equipped with biofeedback sensors and robotic appendages, the dress activates in proximity to others, mapping an affective cartography around the wearer's body (Wipprecht, 2015). The corporeal becomes a site of pre-reflective agency, wherein the garment functions as a machinic membrane, simultaneously protective and expressive, encoding affect, threat, and response without recourse to conscious deliberation. Yet Wipprecht's work departs from transhumanism: rather than celebrating technological control over the body, it invites a critical reframing of embodiment as mediated, unstable, and machinically co-constituted, generating an ontological realignment wherein the body is re-configured as an informational and semiotic field, a porous entity that is continuously shaped by its cultural milieu (Hayles, 1999).

This techno-aesthetic apparatus echoes the concept of *embodiment relation*, where technology becomes a co-actor in the constitution of experience (Don Ihde, 1990). The "Spider Dress" intervenes in perception, reframing bodily presence, grounded in relational emergence and distributed cognition. In this sense, the project resonates with the *New Aesthetic* (Bridle, 2012), a visual and material regime in which the subjectivity is co-produced in entanglements between visible bodies and opaque algorithms.

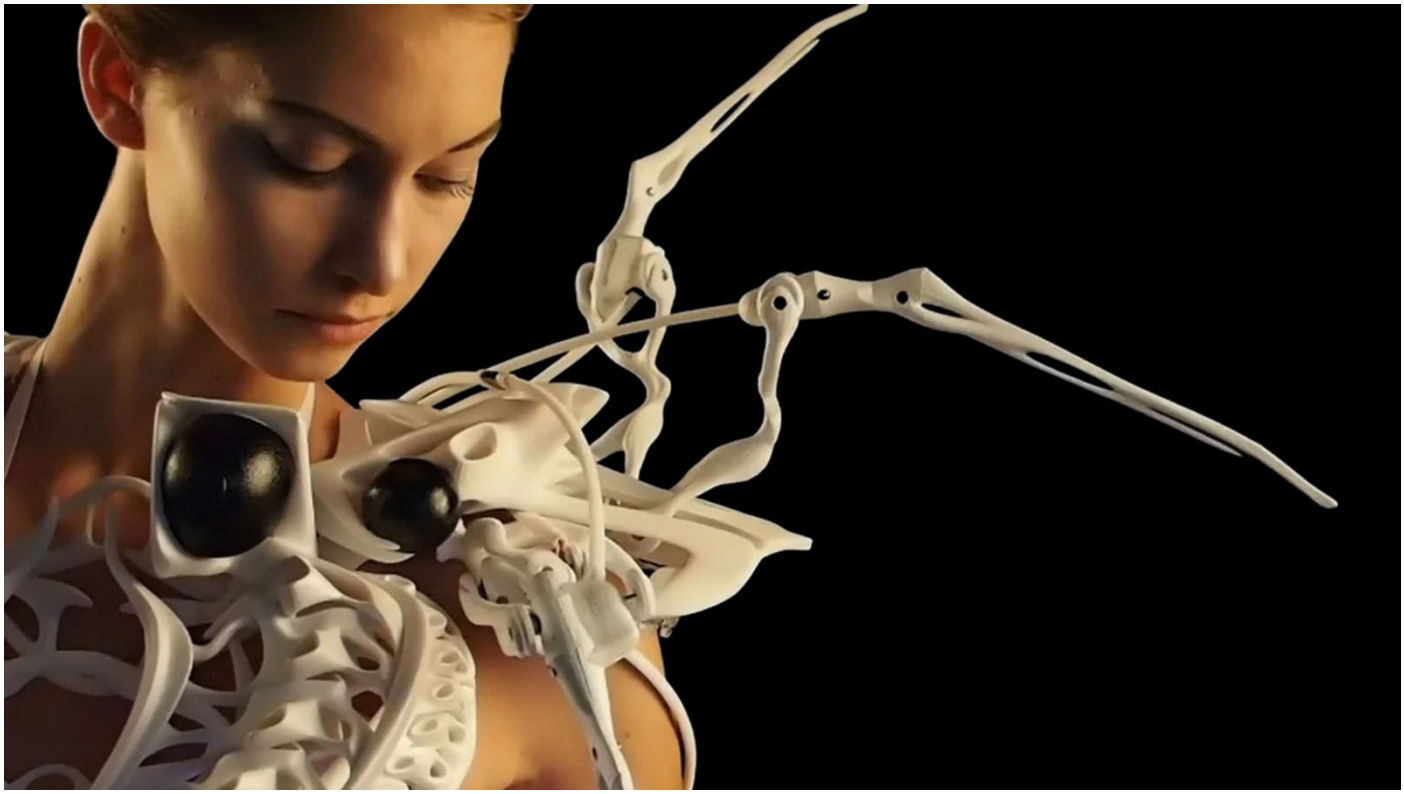

Figure 2. *"Spider Dress", Anouk Wipprecht (2015).* This robotic garment, characterized by its biomimetic aesthetics and skeletal architecture, integrates proximity sensors and kinetic structures that respond to environmental stimuli. The design visualizes a wearable defense system, where moving appendages regulate personal space.

The observed cases study substantiate the idea of rewriting the body beyond the humanist model (Barthes, 1967; Skinner, 2016): the classical canon of corporeal integrity, symmetry, proportion, and natural closure, gives way to a logic of excess, morphogenesis, and hybridization (Pugliese, 2010; Nancy, 2008). In this speculative space, fashion becomes a philosophy-in-action, staging the future of embodiment not as a given destiny, but as design.

3. **Postdigital Aesthetics**

The postdigital aesthetic landscape reveals a plurality of trajectories that reflect the increasing integration between body and technology, challenging the traditional categories of beauty, nature, and humans. Transhuman theories conceive the body as part of the project focus where computational artefacts, biotech textiles, and algorithms interact, transforming clothing into a political platform that articulates a fluid, decentered, and connective subjectivity (Musto, 2022).

Numerous projects embrace this vision: Behnaz Farahi's "Caress of the Gaze" is a reactive garment that responds to gaze, reflecting a sentient mode of wearability; Studio XO's interfaces for Björk's Biophilia Tour turn the body into a media surface, translating gesture into light and sound (Snibbe, 2011); CuteCircuit's "Hug Shirt" explores instead wearable intimacy through remote haptic feedback (CuteCircuit, 2002). Mapping the complex array of emerging fashion morphologies is a challenging endeavor that can only be approached through a radical synthesis, one that bears the risk of omitting peripheral trends or overgeneralizing inherently polyvalent forms. Acknowledging these limitations, a provisional taxonomy is proposed, aimed at identifying key traits among the most widespread emerging aesthetic paradigms.

The *cyberpunk aesthetic*, with its dystopian and hyper-technological iconography, has played a decisive role in shaping the imaginary of human-machine fusion. Thinkers such as Bukatman have emphasized its ability to mediate subjectivity within digital environments, portraying the body as a threshold between material and virtual, between individual identity and informational flux (Bukatman, 1993). In fashion, this approach translates into synthetic materials, modular structures, and designs inspired by cyber-organic contamination, as seen in the collections of Alexander McQueen and Gareth Pugh.

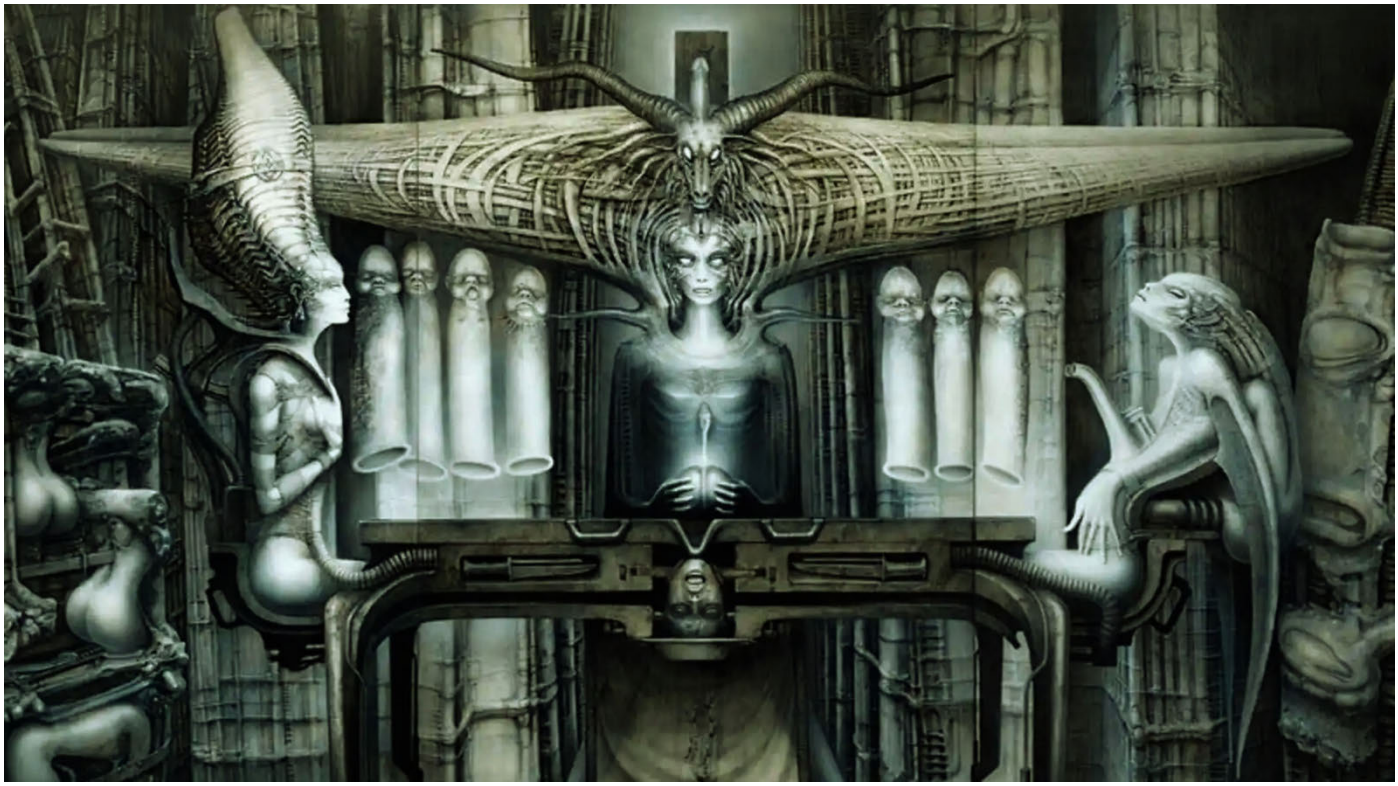

Figure 3. *Biomechanical artwork, H.R. Giger (1977).* This painting synthetised Giger's dark posthuman imaginary: a fusion of organic and mechanical forms arranged in techno-gothic symmetry. The central figure, fused with tubular prosthetics and machinic organisms, suggests the dissolution of boundaries between humans and machines. The work anticipates aesthetic tropes later explored in transhuman visual culture.

Aligned with the transhuman imaginary is the *biomechanical* paradigm, influenced by the works of H.R. Giger and critically reinterpreted in both artistic and theoretical terms (Giger, 1994). This aesthetics fuses organic and artificial elements into hybrid forms, mirroring a body increasingly colonized by technological devices. Beloff investigates analogous dynamics through the conceptual figure of the 'Hybronaut',a liminal entity navigating the interstice between the human and hybrid environments (Beloff, 2012). This figure resonates with Jean-Luc Nancy's theorization of the body as a site of ontological openness, shaped by the interplay of alterity and technē. In this framework, the body emerges as a porous interface, whose boundaries are continually negotiated and destabilized by technological mediation boundaries (Nancy, 2000).

Another aesthetic trajectory worth to menion is the *organic-digital,* perfectly expressed in the work of Iris van Herpen, who employs 3D printing, parametric simulations, and fluid materials to translate biological patterns into artificial morphologies. Van Herpen, in her collection "Biopiracy", proposes a new topology of the body, wherein surfaces become the material expression of visual algorithms, materialising Flusser's view on speculating practices in which design constitutes the grammar of technology and the language through which the post-industrial human shapes the world (Flusser, 1993).

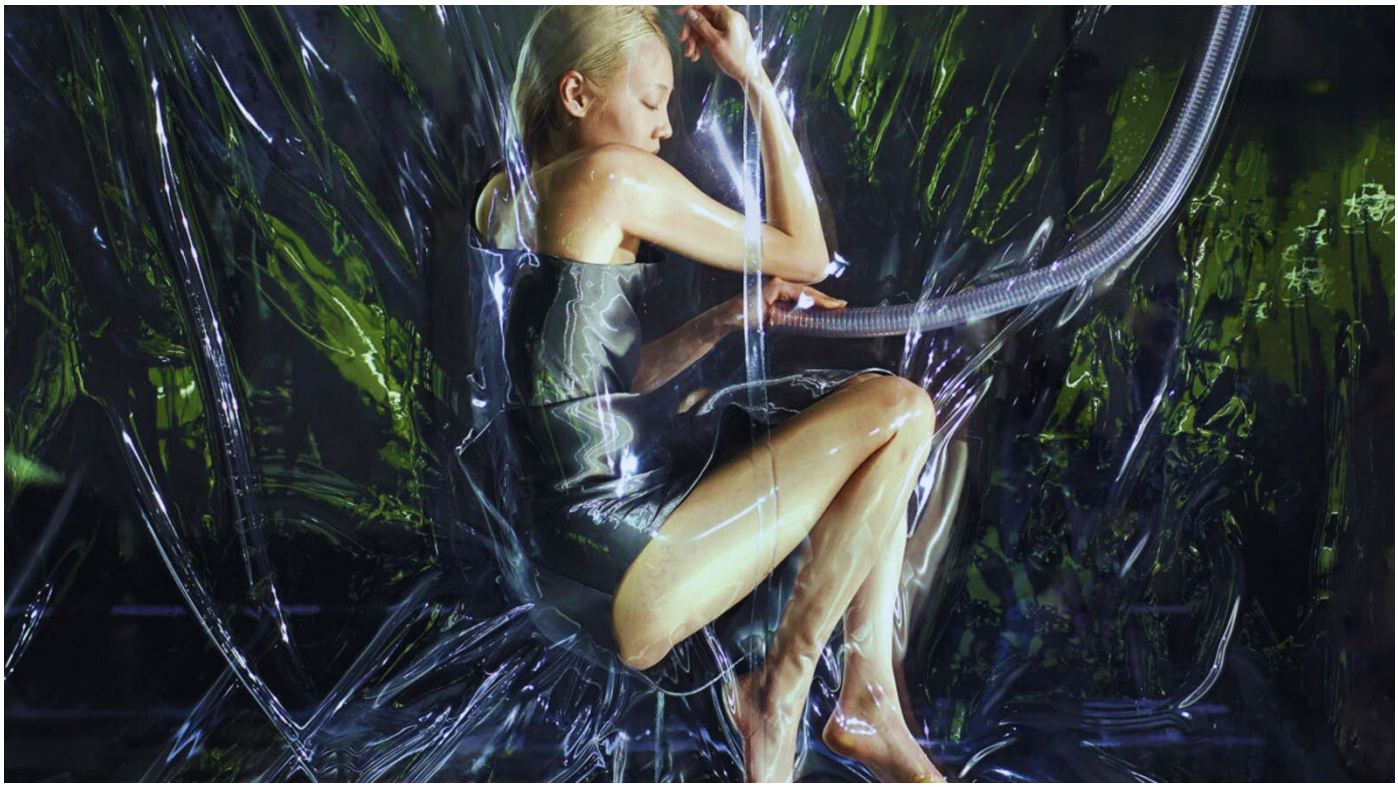

Figure 4. Iris van Herpen, "Biopiracy" Haute Couture Autumn/Winter 2014, Paris. In this collection, models were suspended in vacuum-sealed plastic membranes, visualizing the body as subject to biotechnological control and aesthetic manipulation.

A more subtle, yet equally radical, approach is that of *sensory transparency* where fashion matter is designed by biometric parameteres. In Behnaz Farahi's "Caress of the Gaze" (Farahi, 2015), the textile becomes a dialogic interface, capable of reacting to gaze of the people looking at the wearer. This aesthetic dimension occupies a space of intersection between relational aesthetics and neurodesign, wherein datas emerged from proximity emerge as design materials, reconfiguring sensori-motor perception into an embodied aesthetic of interfaces (Hansen, 2006).

These emerging design paradigms extend beyond the confines of transhumanist thought alone, and may be more aptly situated within the broader framework of posthumanist aesthetics. In this perspective, informed by Braidotti's philosophical stance, subjectivity is reconceived as inherently multiple, hybrid, nomadic, and constituted through relational processes (Braidotti, 2013). In this sense, emerging aesthetics operate as dispositifs for subject projection and production, they become the visible expression of a philosophical mutation that, as Deleuze and Guattari suggest, functions through the dismantling of the organic body and the proliferation of incorporeal potentialities (Deleuze & Guattari, 1980). Within this framework, fashion contribute propels human body into becoming.

4. Conclusions

As Bernard Stiegler states, technics is always a *pharmakon*: at once remedy and poison, instrument of individuation and vector of systemic entropy (Stiegler, 2010). Wearable technologies, inscribed within this ambivalence, oscillate between the promise of embodied empowerment and the latent risks of dataveillance, algorithmic capture, and ontological asymmetry (Flanagan et al., 2020; Maragiannis & Ashford, 2019). In this tension, fashion, understood as both medium and mode of posthuman figuration, becomes a privileged terrain for the unfolding of aesthetic-ethical critique. Through wearable apparatuses, the body becomes a liminal topology in between the organic and the machinic. As technologies infiltrate textiles, smart materials, and even the dermal thresholds of the flesh, a profound reconfiguration of corporeality emerges as a mutable relay of forces. (van Dongen et al., 2019; Cranny-Francis, 2008).

The emergent aesthetics of this technocultural milieu enact transformations of subjectivity itself. Within the horizon of postphenomenology, the technological actively participates in its becoming, mediating its temporalities and modulating its perceptual rhythms (Ihde, 1990; Ramoğlu, 2019). Fashion assume the role of a *techno-aesthesis*: a sensible regime through which cyborgian potentialities materialize. The increasing aestheticization of the wearable, evident in the reactive garments of Behnaz Farahi or the bioinspired *body-architectures* of Iris van Herpen, suggests a recursive hybridization: an entanglement of data, skin, code, and form. The body is no longer “worn” but computed, rewritten, folded into non-binary and queer epistemologies of sensibility.

Within this polyvalent landscape, contemporary aesthetics realigns itself with a revised *mimesis*, not as imitation, but as ontogenetic force: the generative *différance* of new natures and new subjectivities (Urpeth, 2001; Deleuze & Guattari, 1980). In this perspective fashion becomes a dispositif that prototypes modalities of being, prefigures unstable identities, and choreographs affective singularities. This is the task of a *sapient* fashion: not merely *smart*, but capable of critical sensation, of touching the becoming-matter of living flesh (Flusser, 1993; Hansen, 2006).

INFORMATION AS AN EXPERIENCE: A VISUAL DESIGN APPROACH TO ETHICS FOR BUILDING MUTUAL AND RECIPROCAL RELATIONSHIPS BETWEEN RESEARCHERS AND PARTICIPANTS.

Alessandra Fasoli[a]

a Kingston University London
*a.fasoli@kingston.ac.uk

ABSTRACT | Design and social innovation research can be defined as a relational practice that is concerned with the emergence, through applied design strategies, of new social and material relationships within a group. Establishing a relationship between the design researcher and the community based on reciprocity and mutuality is then fundamental for successful research.
This paper interrogates how this relationship is built during the recruitment phase by analysing how reciprocity and mutuality can be reached through an information design approach to ethical procedures. It focuses on the principle of *informed consent* and its role in defining the relationship between the researcher and the (potential) participants within the context of my PhD, which is a graphic ethnography exploration on how cultures of sustainability emerge in craft communities in Southwest England.
Drawing upon the original meaning of the Latin verb *informare*, "to give a shape", and defining 'consent' as a continuous conversation, I used my expertise as a visual design practitioner to create an integrated information experience that 'gives a shape to the research' to allow potential participants to have a comprehensive understanding of the project while creating the conditions for a dynamic conversation to take place.
Initial exploration showed local maker communities as heterogeneous and dynamic groups with shifting hierarchies and demographics where roles, meanings, and values are renegotiated over time, hence the necessity for an integrated information approach flexible enough to both address ethical challenges and function as a tool for constructive relationships.
The paper discusses the way this approach incorporates three fundamental elements of

the research project, the methodology (graphic ethnography), the research object (craft), and the research ethos (sustainability and accessibility) by designing ad-hoc print and web versions of participant information sheets for different audiences, accompanied by an online showcase that gives a recognisable shape to the overall project.
It concludes with preliminary observations collected through the first year of field work, and it engages with the limits and issues of creating ad-hoc information experiences to obtain consent.
As the research is ongoing, this paper does not yet give a full assessment but is meant to start a conversation on creative approaches to ethical procedures. The aim is for these to become a tool to generate solid and informed relationships between researchers and participants.

KEYWORDS | RESEARCHER-PARTICIPANT RELATIONSHIP, ETHICS, INFORMED CONSENT, PARTICIPANT INFORMATION, INFORMATION EXPERIENCE

1. Design research as a relational practice

Design and Social Innovation research is a growing field that studies whether the creation of "new ideas" such as "products, services, or models" addresses the needs of a community while allowing for new relationships and collaborations to emerge (Murray et al., 2010, p. 3), sometimes redefining those relationships by disrupting the "power relations that characterise them" (Manzini, 2019, p. 10). This approach embeds the practice of design within social structures where the design outcomes are influenced by existing cultural, economic, and political conditions. Within this framework, establishing a mutual and reciprocal relationship between the researcher and the participants in a social design project becomes essential for the project's success (Petrella et al., 2020).
This paper interrogates how a design approach to the production of participant information (PI) documents can help building a reciprocal and mutual relationship between the designer and community members during the process of recruiting and obtaining informed consent. It discusses the information experience designed in the context of my PhD, where the necessity of building a relationship from scratch with the members of maker communities in Devon, UK, and the demographic and cultural heterogeneity of these communities required a creative, flexible, and accessible approach to the design of PI materials.

2. Ethics: principles, protocols, and design

Navigating ethics in research settings requires a balance between regulations to assure the integrity and legality of the study, and the unique context-dependent issues related to societal and personal moral values (Association of Social Anthropologists of the UK, 2022). Design and social innovation research presents a third layer of challenges that are associated with the creation and deployment of design artefacts. In design ethics, current discussions are centred around principles of inclusivity, accessibility, and plurality that call for a more reflexive design practice (Costanza-Chock, 2020; Escobar, 2018; Place, 2023; Tunstall, 2023) where design is criticised when it fails to recognise limits and biases embedded in its process, but is also framed as a tool to navigate and solve social and environmental issues.

This paper positions itself at the intersection of three aspects of ethics in design research: governance, context-dependent issues, and design ethics. It considers them intertwined, as they influence how the research is designed and conducted. I argue the production of PI materials for obtaining informed consent can be described as a design process that can take advantage from design practices to negotiate between academic and legal requirements, be consistent with local cultural values and norms, and initiate and nurture relationships and conversations between researchers and participants.

3. About the research and the researcher

My PhD investigates how sustainability cultures can emerge through social craft. It focuses on craft communities in Devon and, more generally, Southwest England. Before moving to the area in 2020 I had no prior knowledge of local craft ecologies, so the need to establish reciprocal and mutual relationships is both personal and professional: as a visual designer and illustrator, I can be perceived as a new member of the local creative community; and as my home institution is in London, I can be considered an external doctoral researcher who is there to observe and gather information. Therefore, my approach tries to find a balance between these two identities to avoid jeopardising newly established relationships.

3.1. Initial exploration

Preliminary exploration showed local craft ecologies' configuration varies and adapts depending on whether they organise within an institution, a place, or an event. Members come from different socio-cultural backgrounds and from various parts of Southwest England. The variety of demographics and the continual reconfiguration of these communities creates shifting hierarchies and social organisations, where roles between members are rearranged over time. The mixture of experience and professionalism contributes to a plurality of meanings assigned to 'craft' and 'sustainability' which are continually renegotiated.

3.2. On the methodology

The study uses a graphic ethnography (Theodossopoulos, 2022) where observational sketching (Heath et al., 2018) serves both as notetaking for data collection and as a mediating object in spontaneous dialogues and oral history interviews (figure 1). Since drawing is a cultural practice (Geismar, 2014) akin to craft, its use as a research tool resonates with craftspeople, allowing for trust building between researchers and participants through a common 'craft' language.
When working with children, graphic ethnography is expected to help establishing trust as drawing is perceived as a 'childish activity' which casts the adult researcher as a 'different adult' (Spray, 2021). The correspondence between the researcher's creative action of drawing and the participants' creative action of making characterises this study as participatory research carried out "about" and "with" participants (Shier, 2021), which demands flexibility in addressing anonymity and recognition.
Additionally, the creation of an online collection of drawings and interviews resonates with craft and art people, who value exposing their works in galleries and collections.

Figure 1. Conducting graphic ethnography: sketching at the 'Corn Flax Doll' workshop at MAKE Southwest, March 2024.

4. Designing the participant information experience

4.1. On *Informed Consent*

Informed consent (IC) is a codified practice (Cocanour, 2017) establishing that "information can be collected from or about people only if they have understood the purpose of the research and what their participation entails, and have freely agreed to participate in it" (Social Research Association, 2021). *Consent* is better understood as a negotiation process throughout the research (Social Research Association, 2021) and as a conversation (Cocanour, 2017) that is influenced, among other factors, by the type of relationships established between researchers and participants. IC is generally reached through PI sheets, which are comprehensive documents that outline the research goals and methodology, risks and tasks involved, and the conditions for participation.
Universities often offer a text-based template prefilled with the required legal information about data, privacy and details of the university office overseeing this process. In the case of my research, however, the shifting hierarchies, the plurality of demographics, and the ever-changing configuration of the local communities, paired with the necessity to use the recruiting phase for relationship building and strengthening, required an ad-hoc, integrated, flexible, and responsive approach.

4.2. To inform as 'giving a shape' to the research

Drawing on the original meaning of the Latin word *informare*, "to give a shape", I applied my expertise as a visual designer to create engaging PI materials where the act of *getting informed* is conceived as an experience.
The creation of a website that 'gives a defined and recognisable shape' to the project takes advantages of the ubiquity of digital information technologies and represents a virtual space for people to access the information they need about the research.
The PI sheets have been designed to incorporate and represent, through the combination of visual and textual elements, three key aspects of the project (figure 2):

- The methodology, i.e. graphic ethnography, with drawings included in all versions of the documents;
- The research object, i.e. craft, reflected in the binding of the hard print or in the making of the responsive webpages;
- The research ethos, i.e. sustainability and accessibility, which focus on having both physical and digital versions of the materials, offering people different channels to access information, while minimising waste.

Figure 2. Printed versions of the PI sheets for children being stitched together in a booklet

4.3. The design of participant information sheets

I divided participants into two macro groups, adults and children, which served as guidance for structuring documents using age-appropriate language and storytelling (figure 3). All PI sheets are structured as interviews, where the reader is the interviewer and the researcher the interviewee, mirroring interview dynamics taking place in the study, though with inverted roles. Mimicking popular visual language in newspapers and magazines, paragraph headings are direct questions typed in bold while answers are the body text of the paragraph. The printed copies of the documents have been bound using saddle stitching, giving the documents a 'crafted' aesthetic.

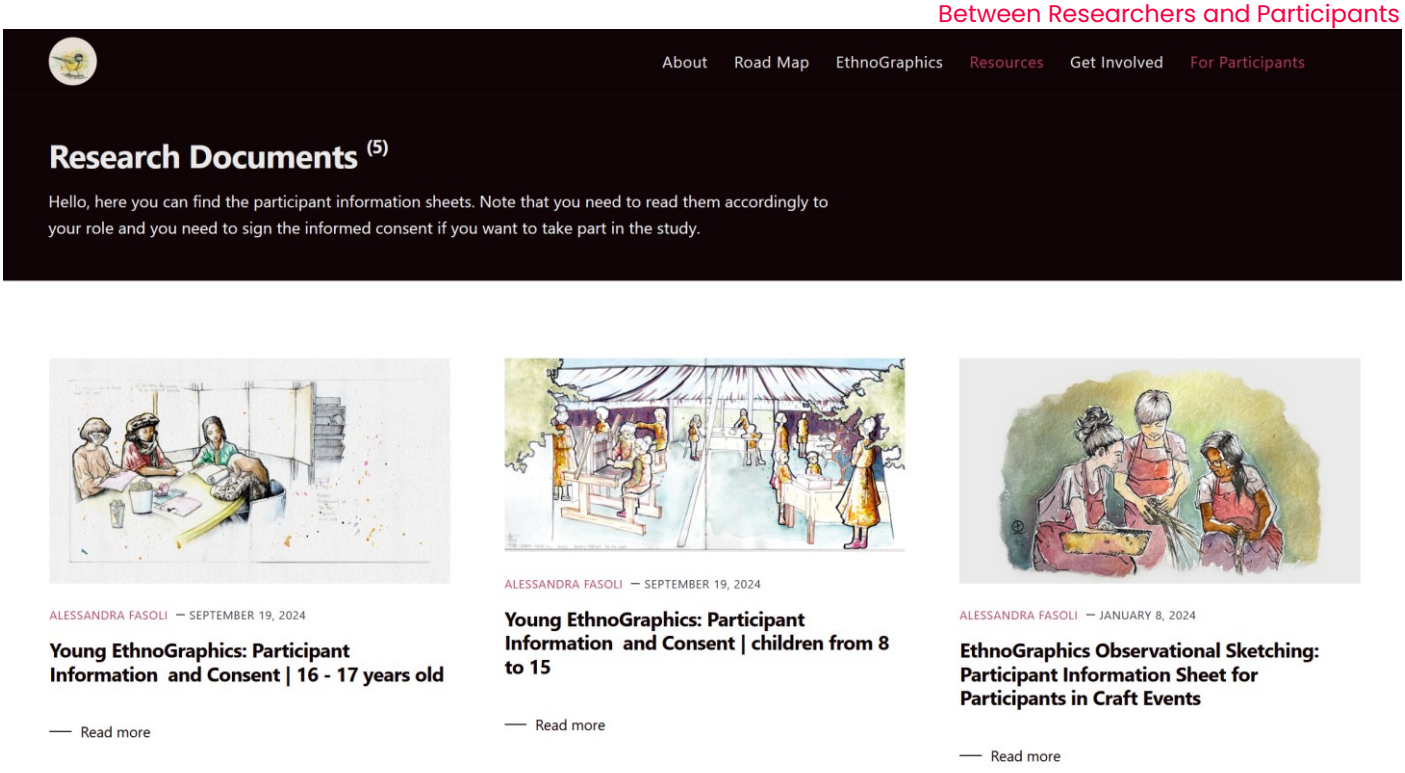

Figure 3. A screenshot of the research website page containing the different online versions of the participant information sheets divided by age and category.

Adults are divided into three categories: makers for long interviews, event and workshop facilitators that I join during their social activities and briefly interview, and the attendees of craft events. PI sheets have been adapted to each group selecting the necessary information while considering the hierarchies inherent to the specific context where the study takes place. Each PI sheet has a corresponding webpage within the project's website to be accessed from different devices.
Attendees to craft events are generally approached on the day of the event, where I am introduced by the facilitator. I inform attendees at the beginning of the session and use printed versions of the PI sheets to visually support my explanation (figure 4). In this case, consent is negotiated before and during the event.

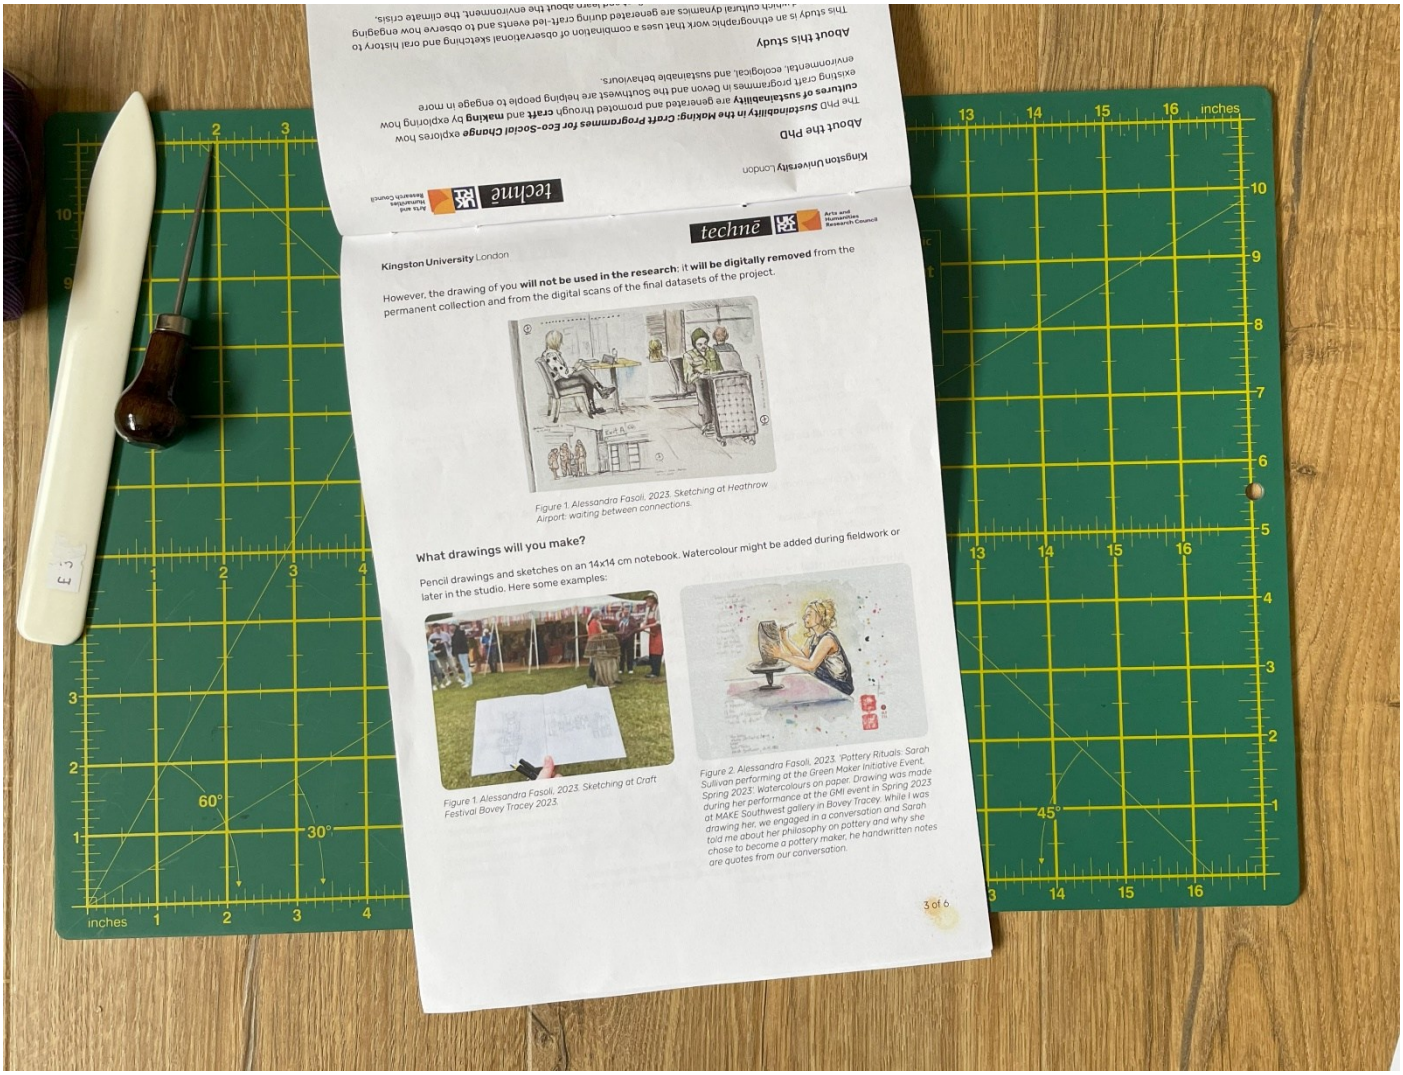

Figure 4. Visual participant information sheets for adults.

Children are divided into three age groups (National Society for the Prevention of Cruelty to Children, 2023) to create age-appropriate accessible and readable PI documents, framed as a dialogue in the form of comics. Children's PI sheets have been designed as illustrated booklets (print), presentations (pdfs), and web comics (responsive webpages), and the use of graphic storytelling mirrors the research methodology. Language is simplified and concepts like 'sustainability' and 'craft' have been replaced by simpler words like 'nature' and 'making things'. While parental consent is required for children between 5 and 15 years old, these documents are designed primarily for children to exert their agency and decide themselves whether to participate in the study. The web comic (figure 5) is designed to be read together by parents/guardians and children and is useful when event organisers can contact parents/guardians in advance via email, giving them time to reflect and discuss with their children about taking part.

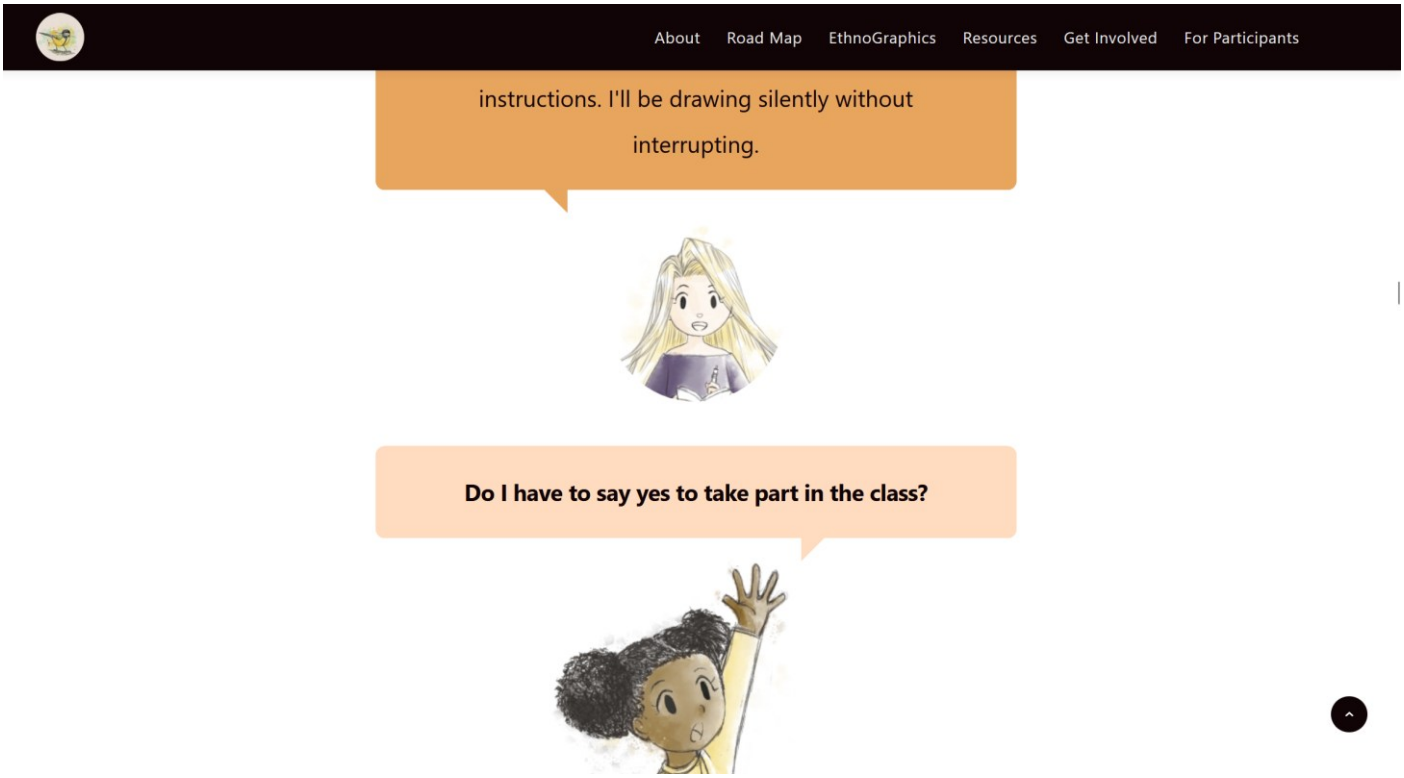

Figure 5. A screenshot of the online participant information sheet for children designed as a web comic.

5. Observations and discussion

5.1. Reciprocity and Mutuality

The project is still ongoing: field work with adults has started in February 2024, while the work with children has started in the beginning of 2025.
The first year of field work with adults has shown a generally positive response, due to the existing local interest in sustainability and a cultural appreciation of artistic projects. Trust between me and participants is built and maintained over time through constant conversations facilitated by the research website that I regularly update with field drawings, small writings, and news. Trust between me and the attendees is mediated by facilitators or organisers, and though attendees have the option to contact me further, none have done so thus far. A small number of craftspeople that I have sketched during public events have written to me afterwards making them available for long interviews. Digital scans of the drawings are sent to participants, who in some cases have shared them on their social media profiles. In one case, a craftsperson used it to promote their own activities and work, demonstrating illustrations also have material value for advertising and promotion .
The printed version of children's PI sheet is designed as a colouring book. Trust between me, them, and their parents/guardians is mediated by the facilitator or teacher, although on some occasions, I run 'icebreaking activities' in the form of observational drawing workshops. These workshops are not meant for data collection but designed to introduce young people to observational drawing and journaling.

5.2. Issues and considerations

Despite the effort to produce engaging materials and build reciprocal relationships, some people still refused to participate, so consent is not guaranteed. Considering the time and effort required for designing ad-hoc information experiences, benefits and drawbacks should be carefully evaluated. Moreover, university ethical protocols might not allow for a creative approach in producing research materials.
The absence of pre-existing skills for engaging in such approaches could also be a barrier for researcher to pursue such approach.
Finally, illustration approaches need to carefully consider issues of representation and local visual cultures, to avoid designing biased and/or misleading information experiences.

6. Conclusions

Approaching the issue of IC from a design perspective allowed me to frame the act of 'getting informed' as an experience through which I am building reciprocal and mutual relationships and navigating my dual role as a new member of the local creative community and as an external researcher. It also allowed for creative engagement and relationship building when seeking consent, without dismissing the ethical obligations researchers have towards participants.
This paper opens a conversation about unconventional and creative approaches to ethics procedures, arguing they can become a tool for building reciprocity and mutuality in community-based projects.

INNOVATION IN INTEGRATD PUBLIC SERVICES: A PILOT PROJECT WITH GSI S.r.l. USING SYSTEMIC DESIGN, BLOCKCHAIN AND AI.

Martina Liboni [a *]

a Politecnico di Torino
*martina.liboni@polito.it

ABSTRACT | Addressing the challenges in integrated public services requires innovation that promotes sustainability, efficiency, and transparency. This pilot project, in collaboration with GSI S.r.l., explores how the integration of systemic design, blockchain technology, and artificial intelligence (AI) can revolutionize facility management, setting new standards for ethical and responsible governance.
GSI S.r.l., active in sectors such as sanitation, social healthcare, and catering, manages complex services that demand sophisticated coordination. The systemic design approach at GSI leverages advanced AI models, such as Large Language Models (LLMs), to dynamically and adaptively map and analyze interactions across services. AI automatically identifies inefficiencies and suggests solutions to optimize user experience, increase operational sustainability, and reduce costs.
Simultaneously, blockchain ensures data integrity and traceability. Within the project, blockchain technology validates sanitation certifications, tracks personnel credentials, and secures sensitive information related to healthcare services. This technology guarantees data remains secure and immutable, strengthening stakeholder trust. Furthermore, AI employs General Linear Models (GLM) to analyze large datasets, offering detailed insights and supporting evidence-based decision-making. The synergistic integration of systemic design, blockchain, and AI not only enhances efficiency and transparency but also creates a new governance paradigm rooted in care. This approach allows for the customization of services to meet user needs and promotes proactive resource management, ultimately improving overall service quality. The pilot project with GSI S.r.l. serves as a replicable example for other public organizations, demonstrating that adopting advanced technologies and holistic design strategies can transform public action into a more ethical, efficient, and community-focused direction.

KEYWORDS | Systemic Design, Blockchain, Artificial Intelligence, Public Integrated Services, Sustainability

1. Introduction: Why Rethinking Public Services Matters Today

In the contemporary context, public services and the organizations operating within them are at the forefront of a new revolution, one that sees technology working in parallel with human labor. On the one hand, citizens' expectations are rising: they demand more efficient, personalized, transparent, and responsive services capable of addressing continuously evolving needs (Schmidt & Rüther, 2018). On the other hand, public administrations face structural constraints, limited resources, organizational complexity, and environmental challenges that render traditional management models obsolete. In addition, demographic ageing and emerging social vulnerabilities necessitate a radical rethinking of how services are delivered (Osterwalder & Pigneur, 2010). Within this scenario, innovation can no longer be understood as mere technological upgrading or incremental efficiency. What is needed is a paradigm shift, one that places at its core the complexity of systems, interconnection among stakeholders, public ethics, and long-term sustainability. This is the foundational premise of the pilot project developed in collaboration with the facility management company Gestione Servizi Integrati S.r.l. (GSI), based in the province of Turin but operating across Italy in key sectors such as facility management, social and healthcare services, and collective catering (GSI, 2025). Over the course of three years, the project aims to experimentally explore how systemic design, artificial intelligence (AI), and blockchain technologies can be integrated to radically transform the ways services are planned, managed, and experienced. The objective is not merely to improve performance and processes, but to rebuild trust, ensure transparency, and foster a more ethical, responsive, and human-centered approach to public management. GSI S.r.l. provides an ideal experimental ground: it manages highly complex, interconnected services requiring constant coordination between operators, public entities, regulatory standards, and citizen expectations across various public procurement contexts throughout Italy. In this framework, the adoption of intelligent and traceable tools allows for proactive management of issues that would otherwise remain invisible or poorly handled. This initiative aspires to become a replicable model for reimagining public action as a living, adaptive system based on care. The present article reconstructs its rationale, employed technologies, and ethical implications, illustrating how the synergy between technological innovation and systemic thinking can represent a turning point in envisioning the public services of the future.

2. Systemic Integration: Design, AI, and Blockchain as an Ecosystem

Addressing the complexity of public services requires an approach capable of discerning the connections among diverse elements: people, processes, data, regulations, and needs, while simultaneously designing systems that are both flexible and sustainable. It is in this sense that systemic design serves as the methodological cornerstone of the project (Bistagnino, 2009). Systemic design is not merely a design technique but a structural vision that enables the mapping of relationships among services, stakeholders, and resources (Jones, 2014). Within this framework, digital technologies do not operate in silos but are integrated as components of a unified system (Sevaldson, 2013). AI, blockchain, and organizational processes are interconnected through a continuous codesign logic, in which each component functions in service of the equilibrium of the overall system (Jones & Van Ael, 2022).

This integration is not only technical but also cultural and organizational: it requires a

redefinition of roles, responsibilities, and interactions between personnel and technology. The focus shifts from merely managing operational issues within public tenders to designing sustainable relationships among all involved actors. Within this framework, innovation becomes truly transformative, capable of generating long-term public value.

2.1 AI Applied to Public and Facility Services

In the GSI S.r.l. project, AI is not conceived as a mere tool for automation, but as an adaptive engine capable of supporting complex decision-making in dynamic operational environments (Susskind, 2020). By leveraging advanced models such as Large Language Models (LLMs) and General Linear Models (GLMs), AI can analyze vast and heterogeneous datasets, detect hidden patterns, propose customized solutions, and generate reliable forecasts (Brown et al., 2020). In practical terms, LLMs can learn organizational activities and dynamics from limited data, enabling real-time optimization of staff scheduling based on workload and specific operator needs. AI also facilitates rapid assessments of food supply volumes and waste levels at cooking points, thereby improving waste reduction strategies. Thus, AI becomes an invisible ally, enhancing service quality without overburdening human staff.

However, implementing AI in public services raises significant ethical concerns. It is essential to ensure that automated decisions are fair, transparent, and explainable, and that algorithms do not replicate or exacerbate existing inequalities (Floridi et al., 2018; Mittelstadt et al., 2016). These considerations are not sidestepped but are integral to the project's systemic design. All models are transparently validated, with documented sources, logic, and limitations (Burrell, 2016). The principle of algorithmic accountability is applied, ensuring AI decisions can be explained and contested (Diakopoulos, 2016). Moreover, AI is designed to collaborate with, not replace, human operators, preserving human agency in final decision, making processes (Wang et al., 2021). This promotes a form of augmented intelligence, where technology amplifies human care, attention, and responsibility (Shneiderman, 2020).

2.2 Blockchain and Public Trust: Traceability, Integrity, and Privacy

Originating in the world of cryptocurrencies, blockchain technology is emerging as a critical tool for ensuring integrity, traceability, and decentralization in public service contexts (Zhang & Huang, 2020). Its potential extends far beyond digital currencies: in complex systems such as those managed by GSI S.r.l., blockchain enables the transparent and tamper-resistant certification of actions and data through notarization (Gipp, Meuschke, & Gernandt, 2015). In the pilot project, blockchain is used to notarize operational certifications. For example, sanitation activities in healthcare or educational settings can be verifiably recorded and made accessible only to authorized individuals (De Meijer, 2018). Similarly, training certificates, health authorizations, and professional accreditations can be securely archived and shared in digital form, reducing processing time and manipulation risks, resulting in a "digest" or verification certificate. In the social and healthcare domains, blockchain safeguards the confidentiality of sensitive data while ensuring secure, compliant traceability (Esposito et al., 2018). Nevertheless, blockchain implementation in public contexts raises ethical and environmental concerns. The permanence of recorded data and access management require careful oversight by both the company and public contractors (de Filippi & Wright, 2018).

Ethically, blockchain is employed to ensure process transparency and trust, avoiding centralization and opacity (Tapscott & Tapscott, 2016). The system adopts a permissioned architecture that ensures regulated and documented access while protecting sensitive information. Interfaces are designed for clarity and accessibility, and data management adheres to the principle of minimization: only essential data is stored, in full

compliance with the General Data Protection Regulation (GDPR) (European Union, 2016; Finck, 2018). From an environmental standpoint, the project utilizes low-energy blockchain technologies, avoiding high-consumption models like proof-of-work, known for their substantial ecological footprint (Truby, 2018). The chosen infrastructure is lightweight and scalable, aligned with principles of energy efficiency and technological sustainability (Sedlmeir et al., 2020). In this light, blockchain is not merely a technical instrument but part of a broader design ecosystem that integrates social justice, environmental sustainability, and institutional accountability.

3. Transversality and Replicability of the Model

The pilot project implemented with GSI S.r.l. represents not only a virtuous case of technological innovation in public services, but above all a transformative model that integrates efficiency, ethics, and sustainability. At the heart of this model lies a concept often absent in discussions of technological innovation: the ethics of care. To care, in the public domain, means to recognize human vulnerability and the complexity of needs, and to design services that are empathetic, responsive, and personalized. This does not entail rejecting technology but rather using it to enhance relational capacities rather than replace them. A concrete example is the adaptation of social and healthcare services based on feedback from users and staff. Data, analyzed through interpretive as well as statistical methods, make it possible to listen to the most marginalized voices, often excluded from traditional decision-making processes. In this context, AI does not act as a filter but as an amplifier of listening. Similarly, blockchain's traceability returns power and transparency to those historically deprived of it. This "governance of care" values the human and relational dimensions of public service and demonstrates how technology can be designed to strengthen trust, inclusion, and accountability. The goal is not simply to do better, but to do differently: to build services that learn, adapt, and care (Bason, 2014).

4. Conclusions and Future Developments

Although still in progress, the research yields promising signs: greater process transparency, reduced operational inefficiencies, improved perceived service quality, and increased accountability among operators and institutions. More importantly, it signals the emergence of a new cultural paradigm in which innovation is measured not only by performance, but by the value it generates for the community.
Can this approach be replicated? While the answer is still under investigation, it is essential to understand from the outset that this is not a "technological package to be installed," but a continuous process of learning and co-design. Every context has its own specificity, yet core principles, transparency, adaptability, and ethics of care, can guide any public or private organization in its evolution. Challenges remain: from system interoperability to workforce training, from data protection to fostering a culture of people-centered innovation. Nevertheless, the experience gained thus far at GSI shows that it is possible to activate collaborative ecosystems in which institutions, companies, citizens, and technologies work together to build more just, intelligent, and resilient public services (Mazzucato, 2018). Looking ahead, we can envision a regenerative public administration, one that not only delivers services but nurtures territories, relationships, and trust. A public sector that not only reacts to emergencies but anticipates, listens, and adapts. In this future, technology is not an end in itself but a means of empowerment, equity, and democratic regeneration. True innovation today is that which unites efficiency with meaning, impact with dignity, and design with the common good. The GSI pilot project offers one possible path, yet it is up to us to choose whether to follow it.

LEVERAGING DESIGN STRATEGIES TO ENHANCE AGRIFOOD SYSTEMS IN THE GLOBAL SOUTH

Daniela Passa

ABSTRACT | This paper explores the transformative potential of digital technologies and transdisciplinary design strategies to improve feedback mechanisms between smallholder farmers and institutional actors in the Global South. Despite growing interest in digital tools, adoption remains limited due to persistent challenges such as inadequate infrastructure, limited digital literacy, and trust deficits. Drawing on participatory agricultural initiatives and digital innovation pilots across multiple countries, this research identifies recurring barriers to digital adoption and emphasizes the importance of aligning technological solutions with local communication practices and user capabilities.
The study demonstrates how participatory design can foster trust and usability through co-creation with farmers, while systemic thinking reveals leverage points for scalable, long-term impact. Key recommendations include investment in rural infrastructure, tailored digital literacy efforts, inclusive co-design approaches, and policy frameworks that support transparent, two-way feedback systems. By integrating local knowledge into the development of digital tools and fostering collaboration across sectors, these strategies can help strengthen agrifood systems, empower smallholder farmers, and contribute to more inclusive and resilient approaches to food security.

KEYWORDS | PARTICIPATORY DESIGN, SYSTEMIC THINKING, AGRIFOOD SYSTEMS, DIGITAL INCLUSION, SMALLHOLDER FARMERS

1. Introduction

Sustainable food security remains a critical challenge in the Global South, where smallholder farmers produce approximately 80% of the region's food supply (Massari, 2021). Despite their pivotal role, these farmers face significant barriers to adopting digital tools that could improve productivity and resilience. Structural obstacles, including inadequate infrastructure, limited digital literacy, and mistrust, hinder access to technological innovations. At the same time, agribusinesses and other stakeholders struggle to collect timely, accurate feedback due to fragmented communication systems and poor interoperability (Burke & Sewake, 2008; McKinsey & Company, 2023).

An agrifood system, as defined by FAO & CIRAD (2024), encompasses a wide range of actors, including farmers and farmer organizations, public and private extension services, policy and decision-makers, research and academia, civil society, and the private sector, whose interactions shape how food is produced, distributed, and consumed within specific environmental, economic, and social contexts. This paper focuses on the interaction between farmers and three key groups: extension and advisory services, research and academia, and policy-makers. These relationships are central to understanding the potential, and current limitations, of participatory and systemic design strategies for improving digital feedback mechanisms in agrifood systems.

This study focuses on the primary production level, applying a Design Thinking lens to explore the experiences of smallholder farmers as end users of digital tools. At the same time, it adopts a systemic perspective to examine enabling conditions shaped by upstream actors and identify where broader ecosystem-level changes are needed.

Mobile-based digital platforms offer strong potential to bridge communication gaps through real-time data exchange. However, their effectiveness depends not only on technical functionality but also on social acceptability and user capability (Deichmann, Goyal, & Mishra, 2016). Misaligned, top-down interventions, often developed without sufficient local input, have historically undermined trust and engagement.
To address these barriers, this paper explores how participatory design and systemic thinking can jointly enhance feedback loops and foster inclusive innovation. Participatory design promotes trust, ownership, and contextual relevance by involving farmers in shaping solutions (Smith & Iversen, 2018), while systemic thinking identifies upstream leverage points for long-term, sustainable change.

Drawing on secondary case studies, including a digital readiness assessment from Syria, Farmer Field Schools in Togo and Burkina Faso, and the GeoFarmer pilot, the study identifies recurring enablers and constraints to digital adoption. It concludes with actionable design and policy recommendations to strengthen feedback mechanisms between farmers and institutions in the Global South.

2. Participatory Approaches in Agrifood Systems

As agrifood systems are composed of intricate networks of farmers, agribusinesses, consumers, and policymakers, effective collaboration among these stakeholders is essential to achieving food security and sustainability (FAO & CIRAD 2024). Yet in the Global South, systemic barriers such as limited technological infrastructure, underdeveloped markets, and weak institutional support often hinder such collaboration (Deichmann, Goyal, & Mishra, 2016).

In response, participatory approaches have emerged as a compelling alternative to conventional top-down strategies. These methods directly involve farmers in the design, implementation, and evaluation of interventions, fostering trust, local ownership, and alignment with community needs (Massari, 2021). When local knowledge is integrated through participatory design, solutions are typically more relevant to context and more likely to be adopted and sustained over time (Smith & Iversen, 2018).

This perspective is reinforced by Duncombe, who argues that mobile agricultural services are most effective when farmers are actively involved in shaping the tools and information systems they use, emphasizing their role as learning communities rather than passive recipients (Duncombe, 2016). To illustrate this, participatory workshops in West Africa facilitated co-design efforts between farmers and mobile service providers, resulting in platforms that were better aligned with local realities and more widely adopted (Duncombe, 2016). As farmers become familiar with digital systems through hands-on involvement, they may gain the confidence and capacity to sustain and adapt these tools independently. This, in turn, can strengthen innovation and collaboration at the community level.

However, despite these advantages, participatory strategies face significant challenges, particularly in establishing effective feedback mechanisms between farmers and institutional actors. One illustrative example is the experience of Farmer Field Schools (FFS), a group-based learning approach developed by the FAO to support smallholder experimentation and peer-to-peer knowledge exchange. In Togo and

Burkina Faso, FFS enabled farmers to adopt agroecological practices such as composting, integrated pest management, and soil conservation through co-designed, experiential learning processes. Yet these innovations largely remained confined to the farm level and did not translate into broader structural shifts within institutional or market systems. As Bakker et al. (2021) emphasize, while participatory approaches like FFS can be powerful tools for agroecological transition, supporting farmer autonomy, adaptation, and innovation, their effectiveness depends on genuine power-sharing, skilled facilitation, and institutional environments that are receptive to farmer-led change. When participation is superficial or poorly implemented, such approaches risk losing their transformative potential.

Addressing these limitations requires more than technical solutions. Sustainable collaboration demands long-term investment in training, infrastructure, and institutional capacity. As evidenced by these cases, even well-intentioned participatory initiatives risk remaining fragmented or symbolic without the necessary support structures. However, when adequately resourced and embedded within inclusive governance frameworks, participatory approaches offer a promising pathway to align technological innovation with local knowledge, especially when anchored by sustained, two-way feedback mechanisms.

3. Challenges in Feedback Mechanisms

While digital platforms have improved data collection and communication between farmers and agribusinesses, several persistent challenges continue to limit their scalability and effectiveness. These barriers can be grouped into three main areas: technological infrastructure, digital literacy, and trust.

3.1. Technological Infrastructure

Many rural areas in the Global South suffer from unreliable internet connectivity and limited access to digital devices, restricting farmers' ability to engage with digital platforms (Deichmann, Goyal, & Mishra, 2016). Without sustained investment in communication infrastructure and device availability, these regions risk exclusion from emerging technological ecosystems. Infrastructure development programs must prioritize expanding mobile coverage and ensuring the affordability and availability of tools adapted to local conditions.

3.2. Digital Literacy

Even where technology is physically available, limited digital literacy constrains its meaningful use. Many farmers report difficulty with tasks such as navigating mobile applications, entering data, or interpreting visual outputs (Salemink, Strijker, & Bosworth, 2017). Tailored training and long-term capacity-building programs are necessary to bridge this gap and ensure inclusive digital participation.

3.3. Trust Deficits

Historical mistrust of development initiatives remains a significant barrier to technology adoption. Concerns over data privacy, surveillance, and lack of transparency persist, particularly in contexts where previous projects lacked follow-up or failed to meet expectations (Burke & Sewake, 2008). Building trust requires ongoing dialogue, responsiveness, and policies that protect users while demonstrating value in the technology provided.

These three categories of challenges, technological infrastructure, digital literacy, and trust, are strongly reflected in recent field data. A Syria Digital Readiness Assessment conducted with 230 FFS facilitators revealed that while a majority were confident using WhatsApp, fewer than 20 percent felt comfortable using Excel, or PowerPoint, particularly in governorates such as Deir-ez-Zor and Aleppo. Facilitators also reported unstable internet connections during training sessions, which disrupted data sharing and limited real-time communication. In addition, many noted that while they regularly submitted reports via WhatsApp, they rarely received any response, leading to frustration and a perceived lack of institutional follow-up. This absence of two-way engagement signals not only weak feedback mechanisms but also contributes to declining trust in digital processes and project continuity (Syria Digital Readiness Assessment, FAO, unpublished data, 2025).

Additional evidence highlights both the promise and the limitations of digital feedback tools in low-connectivity environments. For example, the GeoFarmer system, developed by CGIAR and partners, enabled near real-time communication between farmers and experts through mobile apps and IVR systems in several countries. However, despite its modular architecture and participatory design approach, the platform faced ongoing challenges related to usability, digital literacy, and trust-building (Eitzinger et al., 2019). In a related study focused on Tanzania, IVR-based feedback systems saw participation rates drop below 40%, while in-person facilitation yielded response rates as high as 89, underscoring the importance of context-specific engagement methods and sustained capacity-building (Ortiz-Crespo et al., 2021).

4. Systemic and Design Thinking in Agrifood Systems

Addressing these challenges requires coordinated efforts to strengthen infrastructure, enhance digital skills, and foster trust. When combined with participatory engagement, digital inclusion strategies can help establish more effective and sustainable feedback mechanisms between farmers and institutions.

In addition to participatory and design approaches, a systemic perspective is essential for understanding and addressing the broader structural dynamics that shape agrifood systems. Systemic and design thinking offer complementary frameworks for navigating the complexity of digital transformation in the Global South. Both prioritize collaboration, contextual sensitivity, and iterative learning, making them particularly suitable for addressing interconnected technical and socio-cultural barriers.

Systemic thinking focuses on mapping interdependencies within complex systems to identify key intervention points. In agrifood systems, this involves considering environmental variability, market dynamics, policy constraints, and social relationships to design holistic, multi-layered solutions (Massari, 2021).

Design thinking, by contrast, emphasizes empathy, co-creation, and iterative problem-solving. Engaging farmers directly in identifying challenges and testing solutions ensures that innovations are user-centered and context-appropriate (Smith & Iversen, 2018). This methodology enables continuous feedback and solution refinement, increasing the likelihood of adoption and sustained use.

Digital interventions that include farmers in early testing phases, and therefore adopt a more co-creative approach, are more likely to be adapted, trusted, and sustained (Duncombe, 2016). However, scaling these approaches requires long-term investment not only in infrastructure but also in institutional readiness and cross-sector collaboration (McKinsey & Company, 2023). An integrated approach that combines both systemic thinking and design thinking, supported by public-private partnerships and regional knowledge hubs, can help ensure that these strategies are not isolated experiments but embedded tools for inclusive transformation (FAO & CIRAD, 2024).

5. Conclusion

Participatory design and digital technologies offer significant potential to enhance feedback mechanisms in agrifood systems across the Global South. Yet this potential is often undermined by persistent structural barriers such as limited digital literacy, inadequate infrastructure, and trust deficits. To be effective, digital interventions must balance technical functionality with social acceptability and user capability.

Case study evidence reinforces this point. For example, Farmer Field Schools in West Africa show that while participatory approaches can successfully drive farm-level innovation, they often fail to scale without institutional engagement. Similarly, a digital readiness assessment in Syria found that only 20% of facilitators felt confident using structured digital tools, despite widespread use of WhatsApp, highlighting the importance of aligning solutions with existing communication habits and infrastructure realities.

This research confirms that participatory design and systemic thinking offer complementary frameworks for addressing these challenges: the former fosters trust and contextual relevance through co-creation, while the latter helps identify leverage points for long-term, structural change. Field observations consistently demonstrate that tools aligned with farmers' everyday practices achieve higher uptake than those requiring significant training or behavioral shifts.

Investments in rural digital infrastructure, targeted capacity-building, and inclusive policy frameworks remain essential foundations for success. Future research should focus on how participatory and systemic approaches can be integrated and scaled, through regional collaboration, public–private partnerships, and innovative financing models. Interdisciplinary studies are also needed to explore how these strategies interact in diverse agricultural contexts.

By adopting these strategies and centering local voices in the design of digital tools, stakeholders can empower smallholder farmers, strengthen feedback loops, and contribute to more inclusive, resilient, and just agrifood systems across the Global South.

Multidimensional health-oriented development used to formulate design guidelines for improving the child-friendliness of urban community play facilities in China

Huiying Gu, Linghao Zhang

Nanjing University of the Arts
770251779@qq.com

ABSTRACT | In global urban planning, the construction of child-friendly cities has become a key issue, especially in the context of rapid urbanization in China. Community play facilities have become a vital avenue for promoting the holistic health and overall well-being of children. The systematic coordination of facilities addressing diverse health needs, including physical activity, psychological development, and social interaction, has become increasingly important. Professor Engel's "Physiological-Psychological-Social" multidimensional health theory model, as a systematic approach, offers a scientifically grounded and specific focus on the multidimensional health needs of children. This model provides a new perspective for promoting child-friendly and health-oriented urban community public play facilities. This study applies grounded theory, the Delphi method, and the Analytic Hierarchy Process (AHP) to propose a framework of design guidelines for multidimensional health-oriented community play facilities and demonstrates how this framework can be used to improve the child-friendliness of play facilities in Chinese communities. The empirical research was conducted in Wuxi, a designated child-friendly city in China, to identify key issues requiring design intervention and propose improvement strategies. The results will provide theoretical support and practical guidance for urban facility designers, urban planners, and policymakers in China, offering a replicable framework for building more comprehensive, healthy, inclusive, and sustainable urban environments.

KEYWORDS | Community play facilities design, Urban sustainability, Multidimensional health, Design guidelines, Child-friendly design

1. Introduction

The UNICEF Innocenti Research Centre defines "play and leisure" as well as "health and social services" as key dimensions for assessing child-friendly communities (UNICEF, 2011). As one of the key expressions of child-friendliness in urban communities, play facilities have become a primary focus in urban planning. In recent years, with increasing attention to child-friendliness and inclusivity, many studies have explored how facility design can promote children's health and well-being. In this process, children are often considered as a vulnerable group requiring special protection, and research has typically concentrated on physical safety, accessibility (Shackell et al., 2008; CCYP, 2011), and other physical safeguarding elements. However, in the face of rapid urbanization, the problems arising from a singular development focus have become evident, failing to promote comprehensive growth in children's physical, perceptual, cognitive, emotional, and social development.

Although research has gradually focused on improving children's motor skills (Giraldi et al., 2017), social skills (Afsharlahoori, 2007), place-based interactive learning (Ramezaani & Said, 2013), and children's participation in decision-making processes (Haider, 2007; Freeman, 2011; Agarwal, 2021), these studies have not systematically and comprehensively considered the synergistic development of children across multiple health dimensions. Therefore, this study introduces the multidimensional health theory model, which was first proposed by Professor George Engel in 1977. It is one of the most influential theories in the human health field. In recent years, the model has been widely applied in urban spaces (Santi, 2019), architectural environments (Angelucci, 2024), and other design fields, providing theoretical support for human-centered health, well-being, and sustainable development. This model integrates health impact factors into three interrelated systems: physiological, psychological, and social health. It promotes health through process interventions, focusing on problem-solving (Card, 2023). The introduction of this model conceptualizes health conditions and their determinants as a multi-layered nested system, effectively integrating development goals, play content, and interaction modes in facility design to achieve more systematic solutions that align with children's health and well-being.

2.Methodology

Based on the multidimensional health theory framework, this study identifies three key dimensions for the community play facility design guidelines: physiological health, psychological health, and social health. First, qualitative research methods such as literature review, case studies, and field surveys were used to extract relevant textual elements under each dimension. Grounded theory was then applied, using NVivo software for coding to preliminarily form the design guidelines framework. Subsequently, the Delphi method and Analytic Hierarchy Process (AHP) were used for model calibration and weight analysis of the multidimensional health-oriented child-friendly community play facility design guidelines framework. Finally, the study conducted an empirical investigation in Wuxi, China, evaluating representative community play facility design practices and analyzing influencing factors to propose targeted improvement strategies.

Regarding data collection, the study employed both desktop research and field surveys to gather original data. First, through literature research, 110 valid articles related to multidimensional health needs and child-friendly facility design elements were identified from Web of Science and China National Knowledge Infrastructure (CNKI). Then, case studies were conducted, selecting four influential international child-friendly community play facility examples, considering their representativeness, historical development, and constructive impact on the times. Third, non-interventional user behavior observation was conducted in 16 typical community cases in Wuxi (including neighborhoods, squares, streets, parks, etc.), objectively collecting issues and focal points from users of community play facilities. Through a bottom-up approach, the study synthesized elements from literature, case studies, and field surveys, coding and analyzing 2/3 of the sample and using the remaining 1/3 for theoretical saturation testing of the final conceptual framework, thus forming a preliminary design guidelines framework.

To enhance the scientific and rational nature of the indicator system, the Delphi method and AHP were used to construct the indicator system and calculate its weights. These methods are widely used for determining evaluation factors, assigning weights, and scoring. Through multiple rounds of anonymous expert feedback and structured hierarchical processing, the methods effectively addressed complex issues, ensuring broad applicability, professional rigor, and practical relevance. A total of 25 experts from five related fields participated in the scoring and judgment matrix construction, including child-friendly urban design and planning, environmental facility product design, child development and education, public health and health, and environmental psychology. This systematic approach facilitated the formation of the multidimensional health-oriented child-friendly community play facility design guidelines framework, encompassing the definition, standards, and value explanation of each indicator.

3.Results

3.1 Guidelines

This study proposes a multidimensional health-oriented child-friendly community play facility design guidelines framework, consisting of three primary indicators and nine secondary indicators. The final indicator system and its detailed explanations are presented in Table 1. Each indicator is assigned a specific weight to guide designers and planners in prioritizing the most critical design elements in practice (Figure 1).

Table 1. Multidimensional Health-Oriented Child-Friendly Community Play Facility Design Guidelines Framework

Target Layer	Dimension Layer	Guideline Layer	Description of Guideline
Multidimensional Health-Oriented Child-Friendly Community Play Facility Design	P1 Biological Health Support	PH1 Space Accessibility and Safety (Weight: 0.441)	The facility should have good visibility, convenient path accessibility, and basic environmental safety to support children's free and safe entry and use.
		PH2 Motor Development and Physical Support (Weight: 0.234)	The facility should provide age-appropriate challenging activities to support the development of children's muscles, bones, and cardiovascular health, promoting coordination and physical fitness.
		PH3 Age-Appropriate Design and Ergonomics (Weight: 0.325)	The facility should fully consider the physical differences and usage abilities of children of different ages, genders, and backgrounds in terms of scale, height, and force requirements.
	M1 Psychological Health Support	MH1 Sensory Activation and Exploratory Experience (Weight: 0.366)	The facility should provide multi-sensory stimulation through visual, auditory, tactile experiences to activate brain activity, enhance focus, and emotional comfort.
		MH2 Self-Building and Imaginative Play (Weight: 0.331)	The facility should encourage children to define play activities, create rules, and engage in creative and symbolic play, satisfying their desire for exploration and personal expression.
		MH3 Emotional Safety and Psychological Healing (Weight: 0.303)	The facility should create an art therapeutic and sensory comfortable environment to stimulate positive emotions, alleviate anxiety, and strengthen psychological resilience.
	S1 Social Health Support	SH1 Diverse Social Interaction Support (Weight: 0.367)	The facility should encourage children of different ages, abilities, and backgrounds to naturally interact and collaborate, supporting mixed-age socializing and community belonging.
		SH2 Family and Intergenerational Emotional Integration (Weight: 0.331)	The facility should provide opportunities for parent-child and grandparent-child interactions to strengthen emotional bonds between children and family members.
		SH3 Community Participation and Co-Creation (Weight: 0.302)	The facility should encourage children and caregivers to participate in the design, expression, and co-creation of the facility, enhancing children's participation rights, expressiveness, and sense of community belonging.

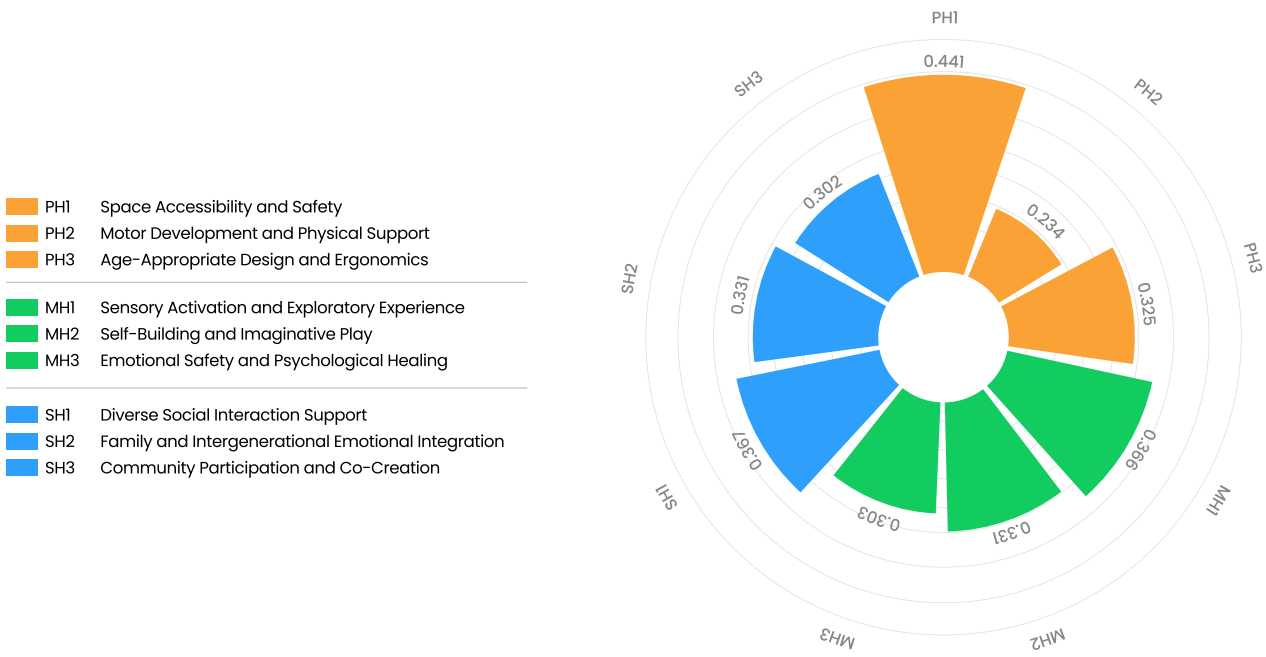

Figure 1. Weight Distribution of Multidimensional Health-Oriented Design Guidelines for Child-Friendly Community Play Facilities

In terms of physiological health support (P1), space accessibility and safety (PH1), with a weight of 0.441, is considered the most critical design factor. This indicator ensures that play facilities possess good visibility, convenient pathway access, and basic environmental safety, providing a solid biological foundation for other design elements. Motor development and physical support (PH2), weighted at 0.234, focuses on offering age-appropriate and challenging physical activities that promote the development of children's gross motor skills, skeletal strength, and cardiovascular function, which are essential for improving coordination and biological fitness. Age-appropriate design and ergonomics (PH3), with a weight of 0.325, emphasizes that physical attributes such as scale, height, and force requirements must be adapted to suit children of different ages, genders, and physical conditions, thereby enhancing the usability and inclusiveness of the facilities.

Regarding psychological health support (M1), sensory activation and exploratory experience (MH1), with a weight of 0.366, is identified as the most essential element in promoting psychological well-being. It stimulates children's cerebral cortex through multisensory engagement, improving focus and emotional comfort. Self-building and imaginative play (MH2), with a weight of 0.331, provides opportunities for children to engage in creative expression and personal rule-making, supporting psychological development aligned with children's innate autonomy. Emotional healing and psychological safety (MH3), weighted at 0.303, aims to alleviate anxiety and strengthen resilience by creating a comfortable and inclusive sensory environment that fosters positive emotional responses.

In the dimension of social health support (S1), diverse social interaction support (SH1) carries the highest weight of 0.367. It emphasizes promoting interaction and collaboration among children of various ages, abilities, and backgrounds through inclusive design, thus enhancing social skills and a sense of community belonging. Family and intergenerational emotional integration (SH2), weighted at 0.331, strengthens emotional bonds between children and their family members by providing opportunities for parent-

child and grandparent-child interaction. Lastly, community participation and co-creation (SH3), with a weight of 0.302, encourages children and their caregivers to participate in the design and co-creation of play spaces, thereby enhancing children's right to participation, expressive capacity, and sense of belonging within the community, contributing to a stronger sense of social identity.

3.2 Application

Through the application of the above model, this study conducted an evaluation of community play facilities in Wuxi, China. The results revealed key issues in the current facilities from a multidimensional health-oriented perspective. The key criteria of this empirical study indicate how the preliminary multidimensional health-oriented community play facility design guidelines framework effectively facilitated design interventions, as outlined below:

1. Questionnaire Survey: A field-based questionnaire survey was conducted to collect user ratings on the three dimensions (physiological health support, psychological health support, social health support) and their associated nine guidelines.
2. Score Calculation: The scores for each guideline were calculated based on their respective weights.
3. Weighted Average of Dimension Scores: The scores for each dimension were weighted and averaged to obtain the overall score for each dimension.
4. Identification of Gaps and Improvement Opportunities: Based on the evaluation results and field-based user behavior observations, gaps and opportunities for improvement in the facility design were identified.
5. Design Intervention Transformation: Based on the design guidelines and evaluation results, specific design interventions were derived, providing practical guidance for the design and improvement of child-friendly community play facilities.

Due to space limitations, two illustrative cases are provided below: The first example highlights critical issues related to physiological health support (P1), specifically space accessibility and safety (PH1). Field observations revealed several problems at the entrances of play spaces, including underutilized areas, unclear directional signage, and insufficient ground safety features, which hinder accessibility and pose safety risks. Design interventions can be implemented on two levels: First, underused but spacious and safe pathways can be redesigned by integrating visual cues such as numbers and playful graphics on the ground, encouraging children to walk or ride scooters to the destination, thereby enhancing spatial accessibility. Second, the existing cement ground can be replaced with soft rubber surfacing to improve safety for running, jumping, and other physical activities. Additionally, small-scale climbing structures can be installed along the route to provide children with engaging, interactive play experiences during their movement between areas (Figure 2).

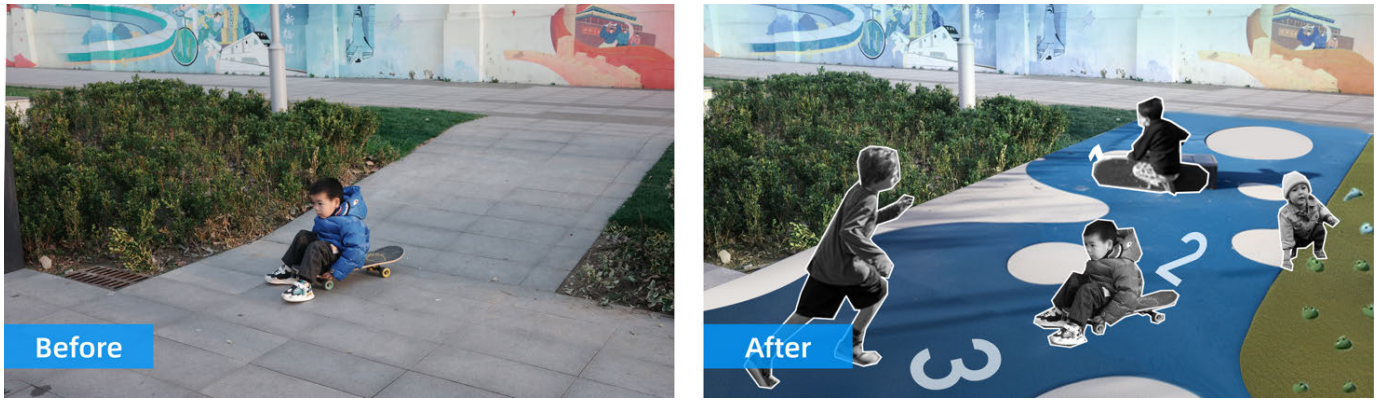

Figure 2. Conceptual Design Sketch for the Redevelopment of Wuxi Wanxin Children's Playground

The second example focuses on a solution addressing the core issue within social health support (S1), specifically family and intergenerational emotional integration (SH2). Field observations found that existing facilities primarily serve basic rest functions for children and parents, but neglect the emotional and interactive aspects of play between generations. To address this gap, design interventions can enhance the interactive and shared experience by enriching the functionality of existing features (Figure 3). For instance, a mushroom-shaped canopy structure can be redesigned to include climbing frames, light installations, and musical components. During the day, children can climb and play in the shaded area, while parents or caregivers engage in close-range interaction. At night, the lighting and music components can transform the canopy into an intergenerational interactive space, allowing families to dance together under ambient lighting, creating new opportunities for parent-child bonding and grandparent-child interaction. This promotes stronger emotional integration within families and contributes to broader social health enhancement.

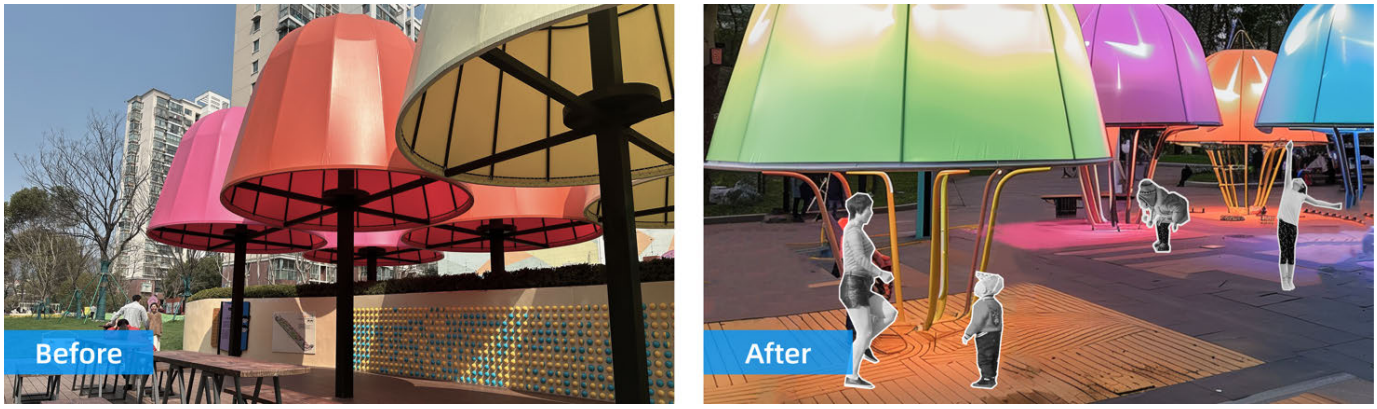

Figure 3. Conceptual Design Sketch for the Enhancement of Wuxi Dading Child-Friendly Park

4. Conclusion

As urbanization accelerates in China, promoting children's health and well-being has become a key issue in community play facility design research. This study, based on Engel's multidimensional health theory, proposes a framework for child-friendly community play facility design, focusing on physiological, psychological, and social health, including three primary dimensions and nine secondary guidelines. Through grounded theory, expert evaluation, and AHP, this study establishes a multidimensional health-oriented design guidelines framework and weights, and conducts an empirical

study in Wuxi. The results highlight that space accessibility and safety (PH1) in physiological health support is considered the most critical design element. In psychological health support, sensory activation and exploratory experience (MH1) received high weight, emphasizing the importance of multi-sensory stimulation in promoting cognitive development and emotional growth. Additionally, in social health support, diverse social interaction support (SH1) was prioritized, highlighting the positive impact of social interactions on children's social skills and sense of community.

Despite the initial results of this study in the multidimensional health framework for child-friendly community play facility design, some limitations exist. First, the empirical survey was limited to Wuxi city. Future studies could expand the sample to include more cities and regions to validate the generalizability and operability of the proposed model. Second, as the child-friendly design concept evolves, balancing the multidimensional health needs of children across different age groups and better incorporating children's participation and autonomy into facility design remain important future research directions. Future studies should refine design guidelines and explore how to comprehensively implement child-friendly design principles in urban planning and community development. With the continued advancement of child-friendly cities, integrating these design principles with sustainable development goals to achieve healthier, more inclusive, and sustainable urban environments will be a long-term research focus.

RETHINKING USABILITY HEURISTICS FROM A FEMINIST PERSPECTIVE: A CALL FOR PLURAL PRACTICES IN HUMAN-CENTERED DESIGN

ABSTRACT | Usability heuristics shape digital interactions, yet their assumed universality raises critical questions: whose standards define consistency in UX design, and whose perspectives remain excluded? When interfaces are designed to 'match the real world,' which world is being represented, and whose lived experiences are overlooked? This paper critically examines these foundational assumptions by applying a feminist perspective to key interaction design principles. Usability heuristics, particularly those established by Jakob Nielsen, have long guided UX design by prioritising principles such as simplicity, efficiency, and consistency. However, these heuristics assume a universal user whose needs align with dominant norms, marginalising diverse lived experiences. This paper challenges the presumed neutrality of usability heuristics by applying a feminist perspective, specifically drawing on feminist standpoint theory (Harding, 1986) and Donna Haraway's concept of situated knowledge (1988). These theoretical frameworks critique the implicit biases in design standards and advocate for pluralistic, context-sensitive approaches that acknowledge systemic inequities embedded in digital systems. Through a feminist critical analysis, this study interrogates two core usability heuristics—"Consistency and standards" and "Match between the system and the real world"—demonstrating how their conventional interpretations reinforce exclusionary norms. We propose alternative definitions: adaptive consistency, which prioritises flexibility over rigid adherence to industry standards, and context-sensitive language, which emphasises inclusivity and accessibility rather than defaulting to dominant cultural conventions. These new conceptualisations challenge the hegemonic structures of UX design and advocate for a human-centered design approach that actively incorporates underrepresented perspectives to overcome the unjust epistemic vacuum they have always faced within

historically white, Western-centric, and colonial foundations of design knowledge and user research. By bridging feminist theory with practical design principles, this research contributes to the growing discourse on feminist UX and interaction design. It calls for a paradigm shift in usability evaluation—one that moves beyond a singular, universal standard toward a pluralistic framework that reflects the complexities of human experience. The implications of this study extend to UX practitioners, researchers, and policymakers, urging a reconsideration of design ethics and the role of power in shaping digital interactions. This research lays the groundwork for future explorations of inclusive usability heuristics and the deeper integration of feminist perspectives in technology design, so that human-centered design fulfils its promise, not as a selective vision, but as a holistic recognition of humanity in all its diversity and depth.

KEYWORDS | FEMINIST UX DESIGN, STANDPOINT THEORY, USABILITY HEURISTICS INTERSECTIONAL TECHNOFEMINISM, SITUATED KNOWLEDGE

1. INTRODUCTION. BEYOND NEUTRALITY: THE CASE FOR A FEMINIST UX FRAMEWORK

The field of UX design operates at the intersection of technology, human interaction, and societal norms. While traditionally framed as a value-neutral practice, critical scholarship reveals UX design as a deeply political endeavour, as technologies and the systems they encompass are never objective. They embed the values, decisions, and power dynamics of their creators, actively shaping human behaviour and societal interactions (Winner, 1980). Digital systems and their interfaces—such as applications, websites, and platforms—do more than merely facilitate interaction. They encode and perpetuate social hierarchies, cultural assumptions, and systemic inequities. As Judy Wajcman (1991) argues, technology is not an independent force but is shaped by existing social relationships, often reinforcing power imbalances rather than dismantling them. For instance, conflicts and negotiations over technological change frequently foreclose opportunities to challenge entrenched divisions of labor, particularly along gendered lines. Similarly, in UX design, the dominant frameworks often reflect the perspectives and priorities of those in power rather than a universal human experience. This recognition has prompted growing calls for more inclusive, ethical approaches to design, yet the foundational principles guiding UX practice remain largely unexamined. Usability heuristics, such as Jakob Nielsen's widely influential guidelines (1994), have long shaped the interaction design process by prioritising principles like simplicity, efficiency, and consistency. These interaction design principles, however, often assume a universal user whose needs and contexts are implicitly aligned with dominant norms. This assumption echoes Don Norman's notion that "people are the same and so the design principles are the same."(2013). While Norman acknowledges the consistency in the brain's structure, this principle fails to account for the cultural and social variations in how individuals engage with technology. Human behaviour, though shaped by universal cognitive structures, is deeply influenced by cultural, social, and historical contexts, which evolve over time. Anthropometric data, for example, has historically privileged male bodies, while cultural norms embedded in design decisions frequently marginalise those who do not conform to dominant frameworks (Criado Perez, 2019). These gaps highlight an urgent need to interrogate the universality and neutrality of

usability heuristics and to reimagine them in ways that center diverse lived experiences instead of the imperative to adhere to standardised norms. This paper aims to address this critical gap by rethinking Nielsen's heuristics from a feminist perspective, focusing on the principles: "Consistency and standards" and "Match between the system and the real world." Feminist theories, particularly feminist standpoint theory (Harding, 1986) and Donna Haraway's concept of situated knowledge (1988), offer a critical lens through which to examine the implicit assumptions underlying these heuristics. By foregrounding the knowledge and experiences of marginalised groups, this paper advocates for plural, context-sensitive design practices that challenge exclusionary norms and foster more equitable outcomes. The significance of this study lies in its dual ethical and practical contributions. Ethically, it underscores the responsibility of designers to address systemic inequities by questioning the values embedded in their tools and practices. Practically, it argues that inclusive design is not only just but also beneficial, as systems that reflect diverse perspectives are more innovative, engaging, and effective. This research pushes beyond traditional Human-Centered Design (HCD), challenging the narrow boundaries of who counts as "human" in design. It calls for a shift from merely catering to those who meet conventional standards to embracing the full spectrum of human experiences through a radically pluralistic lens.

2. STATE OF THE ART IN FEMINIST UX AND INTERACTION DESIGN

In recent scholarship, feminist frameworks are being applied to UX design to address social justice issues, especially those related to underrepresented communities. A key contribution is an intersectional techno feminist approach to community-driven technology innovation, as detailed by Shivers-McNair, Gonzales, and Zhyvotovska (2018). Their work emphasises how community-based mentorship and collaboration with marginalised linguistic and ethnic communities can inform the development of accessible and equitable technology. Further expanding on feminist theory's role in design, D'Ignazio and Klein (2020) outline feminist principles for data visualisation. Their framework challenges dominant epistemologies by centering marginalised perspectives in data practices. They propose six key principles—such as rethinking binaries, embracing pluralism, and making labor visible—intended to influence both the design process and the output of data visualisations. Garcia (2020) also advance feminist data practices by introducing "critical refusal," a concept that critiques harmful data practices and promotes alternatives. This approach involves rejecting practices that exploit or harm marginalised communities and imagining new, equitable data practices that respect community rights. The Design Justice framework, as outlined by Costanza-Chock (2018), offers another feminist critique of design processes. This framework argues that design is a key tool in shaping societal inequalities and proposes that designers prioritise underrepresented voices to ensure more equitable outcomes. Costanza-Chock advocates for collaborative, community-driven design practices that recognise the expertise of those most affected by design decisions, focusing on sustaining and empowering communities rather than reinforcing existing power structures. Additionally, Dombrowski, Harmon, and Fox (2016) propose social justice-oriented interaction design as a necessary response to complex social challenges. Their work argues that design should engage with systemic issues like inequality, focusing on the distribution of risks, harms, and benefits across different groups. By advocating for an explicit engagement with social justice, their approach seeks to prevent the entrenchment of existing inequalities and to foster more inclusive,

accountable design practices. This body of work collectively calls for a shift in design practices—whether in UX, data visualisation, or broader technology development—toward inclusive, intersectional, and community-centered approaches.

3. METHODOLOGY

This research adopts a feminist critical analysis methodology grounded in feminist standpoint theory (Harding, 1986) and Donna Haraway's concept of situated knowledge (1988), forming a robust foundation for critiquing traditional usability heuristics. These feminist frameworks challenge the assumptions underlying mainstream usability principles, particularly those established by Jakob Nielsen, and argue for the inclusion of marginalised perspectives to enhance the inclusivity and relevance of design.

At the core of this methodology is the acknowledgment that knowledge production is inherently socially situated, challenging the universality of dominant design principles. This insight emphasises the necessity of integrating a variety of perspectives to gain a fuller understanding of the systemic inequities often overlooked in conventional UX design. By incorporating these perspectives, the methodology critiques traditional practices while simultaneously advocating for a more participatory and inclusive approach to design that fosters social equity. Informed by feminist epistemology's post-positivist stance, this study emphasises research principles that prioritise the needs of disadvantaged groups, positioning feminist methodologies not only as a critique of existing practices but also as a framework for social transformation. These methodologies promote design practices that confront and dismantle power dynamics embedded in traditional UX design, striving for more just and equitable outcomes.

3.1. Feminist standpoint theory and situated knowledge: a framework for rethinking usability

Feminist standpoint theory asserts that knowledge is not neutral but socially situated, with marginalised perspectives often uncovering systemic inequities that dominant viewpoints obscure (Harding, 1986). In the context of UX design, this framework directly challenges the assumption that design principles are universally applicable. Usability heuristics are grounded in the experiences and priorities of dominant user groups, typically excluding those whose lived experiences do not align with mainstream norms. Because those in dominant positions often struggle to recognise the oppressive dimensions of their own beliefs and practices (Harding, 2004), mainstream usability heuristics risk reinforcing exclusionary standards rather than addressing the needs of marginalised users. Socially engaged design research, grounded in feminist, antiracist, postcolonial, antibourgeois, and anti heterosexist perspectives, has the capacity to disrupt the historically White, Western-centric, and colonial foundations of design knowledge and user research (Sun, 2012; Zantjer, 2015).By integrating these critical perspectives, design research can move beyond exclusionary norms and advance a more equitable understanding of usability, accessibility, and human-centered design. Haraway's concept of situated knowledge and the principle of partial perspective deepens this critique by emphasising that all knowledge is partial and shaped by the specific social positions of its producers (Haraway,

1988). In UX design, this critique targets the assumption of "neutrality" in usability heuristics which claims that consistency in design universally benefits all users. Haraway's critique of the "God trick" is particularly powerful here—this concept exposes the false claim of an objective, all-seeing perspective that, in reality, privileges dominant positions while rendering marginalised experiences invisible. By questioning who has the power to see and whose experiences are erased in the process, Haraway urges us to recognise the ideological forces that shape claims of neutrality. What she terms "the God's trick" exposes how supposedly objective perspectives are often rooted in dominant, unmarked positions that dictate what is seen and whose realities are ignored. In the context of UX design, this critique reveals that so-called universal principles—such as the belief that consistency and standards benefit all users—frequently reinforce exclusion rather than inclusion. The assumption that uniformity in interface design serves everyone equally ignores the diverse needs and contexts of users, ultimately upholding systemic inequities rather than dismantling them.

4. RESULTS

4.1. REDEFINING "CONSISTENCY AND STANDARDS"

Whose standards are we invoking when discussing consistency and standards in UX design, and which groups are these standards systematically excluding? Nielsen's heuristic asserts that maintaining consistency reduces cognitive load by aligning with familiar patterns. But familiar to whom? Jakob's Law assumes that users benefit most from interfaces that mirror existing industry conventions, but this assumption ignores the fact that these conventions have been shaped by particular cultural and historical contexts. Rather than adhering to a rigid, one-size-fits-all notion of consistency, we advocate for adaptive consistency—an approach that allows interfaces to flexibly respond to diverse user contexts, epistemologies, computer literacy levels, and modes of interaction. This means designing not for an imagined "universal" user but for a plurality of users whose experiences, knowledge systems, and ways of navigating digital spaces are equally valid and worthy of consideration.

Proposed Redefinition:
From: "Design should maintain consistency with platform and industry standards to align with users' existing experiences."

To: "Design should maintain adaptive consistency, accommodating diverse user contexts, lived experiences, and epistemologies to reduce barriers to engagement and foster inclusive interactions."

4.2. REDEFINING "MATCH BETWEEN THE SYSTEM AND THE REAL WORLD"

When we say that system interfaces should match the real world, which world are we referring to, and whose perspective defines this reality? The usability principle that system language should align with what is familiar to users assumes that familiarity enhances intuitiveness. But familiarity is never neutral—it is shaped by dominant cultural norms that determine whose experiences are centered and whose are erased. Language itself is a socio-cultural construct, reflecting the biases and hierarchies of the societies that produce it. In patriarchal systems, women's knowledge and lived experiences have been systematically devalued, leading to design practices that unconsciously replicate these exclusions through the language and structures they employ. This is not just a theoretical issue—it has direct, tangible consequences on how different users navigate digital spaces, how they see themselves reflected (or not) in interfaces, and how accessible information truly is.

Proposed Redefinition:
From: “Design should use words, phrases, and concepts familiar to the user.
Follow real-world conventions, making information appear in a natural and logical order.”

To: “Design should employ context-sensitive language that reflects and respects diverse user perspectives, literacy levels, and experiences. Rather than defaulting to dominant cultural conventions that may alienate or marginaliSe certain groups, interfaces should adopt terminology that fosters accessibility, inclusivity, and equitable engagement.”

5. CONCLUSION

This paper highlights the need to reconsider traditional usability heuristics through feminist lens. By applying feminist standpoint theory and situated knowledge, we challenge the universal assumptions embedded in existing design principles, advocating for adaptive consistency and context-sensitive language that prioritise diverse user experiences. This study contributes to the literature by bridging feminist theory with practical design principles, pushing for a more inclusive, equitable UX practice. Moving forward, it is essential to explore other interaction design principles through this perspective and continue to create digital spaces that empower marginalised voices.

SENSE AND PRODUCT INNOVATION IN THE UPHOLSTERY SYSTEM: TOWARDS A SUSTAINABLE PARADIGM

Piera Losciale*[a],

aDepartment of Architecture, Construction and Design, Polytechnic University of Bari, Italy
*p.losciale1@phd.poliba.it

ABSTRACT | This paper is part of the PNRR macro-project 'Circular and Sustainable Made in Italy', and presents the structure and first results of the doctoral research in progress. The research, with the aim of proposing a new paradigm of sustainability, is oriented towards one that considers in the culture of product design the value dimension of the relationship between things, people and context made up of socio-cultural meanings that connect them in a lasting and sustainable way. The research is divided into two main phases, the desk phase of theoretical-critical construction of the state of the art and the field phase, with an experimental focus. In the desk phase, considering it fundamental to also substantiate the product design with a value dimension, a review of the transdiscplinary literature on the theme of value is conducted, considering the main contributions proposed by the economic areas to those belonging to the social sciences, as well as those specific to the design discipline. This is followed by an analysis of the case study of the Made in Italy upholstered product, understood as an extended phenomenon and a cultural macro-system, and considered emblematic for the study of the 'added' value that has made its products iconic and durable. In the field phase, the research defines the *Semantic Value-Driven Design Approach*, in which it proposes sense-making as the driver for the durability of product-systems, whose design, through the cultural chain of the good, is not merely linked to competitiveness strategies but conceives valuable goods as part of people's life context. In this phase, an original value system of reading, interpretation and design is developed, composed of a dual taxonomy (technical-historical and value-design), implemented in an interactive tool for the benefit of the design community for the identification of relations between technical-functional, productive, formal aspects, approaches to use and symbolic meanings. In this way, the social and value dimension is introduced into the world of product design, which

becomes a metric in the modalities of use and visualisation. The experimentation phase, in the first instance, critically re-reads some of MII's upholstered products through the determinants identified by the value system, attesting to the significant presence of semantic value in the products considered iconic, which therefore embody the principle of durability; in the second instance, it reports both the entire design methodology of the interactive tool and the constructed working prototype. It is configured as an original qualitative tool for the investigation and in-depth study of technical-historical and value-related themes related to an original method of literature comparison. A conclusive experimental phase of a quantitative nature is in progress, which aims to verify the recognisability of the socio-cultural determinants defined by the system within upholstered products and to assess the effectiveness of the same determinants in orienting towards an informed purchase choice.

The paper adheres to the same structure as the doctoral research, starting with an introduction and contextualisation, sets out the desk and field phase, describes the first results and the research perspectives.

KEYWORDS | SEMANTIC VALUE-DRIVEN DESIGN APPROACH, SENSE-MAKING, VALUE SYSTEM, UPHOLSTERED PRODUCT, MADE IN ITALY

1. Introduction and context

This paper concerns the doctoral research in progress, which is part of the 'Circular and Sustainable Made in Italy' macro-project, financed by the PNRR, and aims to define a new paradigm of sustainability, assumed in the concept of durability of artefacts, attributed to them through the recognition of a value, understood not only in material and functional terms, but connected to socio-cultural relational dynamics; research considers essential to substantiate even product design with this value dimension.

Since the origins of the human species, the evolution of transformative capacities has progressively accentuated the distance between man and nature, culminating in the current model of unsustainable development based on capitalist logic. The entire scientific community highlights the urgency of a transition towards more responsible consumption models, calling for a sustainability revolution (Vezzoli & Manzini, 2007; Meadows et al., 2004). Faced with the insufficiency of technological innovation in solving systemic and complex crises, there is a need for a new design paradigm capable of breaking with deterministic approaches and promoting a dynamic balance with the environment (Maiolini, 2015; Tagliagambe, 1998). In this scenario, design assumes a transformative role, called upon to respond to social needs and orient cultural change towards sustainability (Dilnot, 1982; Maldonado, 1970; Papanek, 1971; Manzini, 2015). In this context, an attempt is made to concretely contextualise the design discipline with a social character, applying it to the world of product design, on objects and experiences, shifting the focus towards a line of valorisation, identified by what are the cultural meanings of objects, advancing possible models of sustainable design. Product design is

also endowed with a socio-cultural relationship dimension linked to the interpretation, by end users, of a *semantic value*, which goes beyond the economic and technological one, identified in the production reference contexts.

2. Research desk phase

The desk phase of the research represents an analytical and theoretical moment, aimed at constructing the cultural and design context within which the Made in Italy (MII) upholstered product case study is set. It is articulated in two main directions: on the one hand, a review of the transdisciplinary literature on the concept of value, useful to theoretically ground the research hypothesis; on the other, an in-depth analysis of the Italian upholstered product-system, with particular attention to its productive, symbolic and cultural dynamics. This dual level makes it possible to frame the product as a bearer of values that cross time, contexts and practices of use, outlining the need for a new design approach oriented towards durability.

2.1 Transdisciplinary literature review

The research, through an extensive review of transdisciplinary literature (Losciale, 2024), reconstructs the concept of 'value' both from economic theories (Porter, 1985), which establish the dynamics of consumption and the rules of duration, and from the social sciences, which study the socio-cultural relations between people and things (Latour, 2008; Bodei, 2009), and, in the light of design theories, proposes this new approach to project culture. The creation of value is considered to be based on immaterial elements, linked to symbolic and relational contents, which are as important as economic ones (Addis, 2007).

2.2 The Made in Italy Upholstered Product Case Study

To support this paradigm, the research reinterprets the MII upholstered product and the phenomenon associated with it, enhancing the product within a broad notion of good, as an expression of symbolic values. This product system is enriched by that cultural value chain that incorporates and expresses specific cultures, knowledge, traditions of the territory of origin, which is affirmed thanks to an 'identity', and is responsible for creating value for the user in terms of meaning, experience, participation. Although the literature often links these products to the cultural values of MII from a managerial perspective, associated with corporate and historical values, the study identifies them as an effective case for examining the construction of meaning and 'added' value that has made them iconic and durable; MII upholstered products suggest a new design paradigm that starts from the values recognised in them in relation to current trends in use and consumption and to the product's production systems.

3. Research field phase

The field phase constitutes the research experimental heart, in which the *Semantic Value-Driven Design Approach* is proposed, an original design paradigm aimed at favouring the products' durability through the attribution of meaning. This phase is divided into two parts: a first methodological, dedicated to the construction of the value framework based on the proposed approach through the definition of two taxonomies (technical-historical and value-driven); a second applicative, which envisages the recognition of the value determinants in MII products through their critical re-reading, the

development of the value system in an interactive tool and the quantitative experimentation with users.

3.1. Semantic Value-Driven Design Approach

With the desire to make design as a socially oriented discipline concrete (Manzini, 2015; Papanek, 1971), within product design, the research presents a methodological approach, the *Semantic Value-Driven Design Approach*, aimed at the updating of design practices that focuses on the analysis of individual and collective use practices that contribute to substantiating the biography of things. The approach is characterised by a socio-cultural relationship dimension linked to the interpretation of a *semantic value*, which goes beyond the economic and technological one, identified in the socio-cultural reference contexts. The approach addresses the relational dimension that is structured between objects, people and contexts, focusing on the socio-cultural meanings that sustain durable connections. For this approach, design gives objects not only an exterior form and functionality, an *aesthetic and use value*, but above all an intimate dimension: *semantic value*, thus intersecting material culture with the meaning dimension that the product takes on in relation to user's values. The acquisition of new meanings through experience is a vector of product added value, in which design conceives goods as part of the context of people's lives and not only linked to competitive strategies: the traditional theories of sense-making (Verganti, 2009; Rampino, 2012), bring out the concrete absence of a design reading of the possible attributions of meaning in artefacts, and an interpretation is proposed.

3.2. The value system of reading, interpretation and design

For this paradigm, a value system of reading, interpretation and design is concretely proposed: a taxonomic system for recognising and mastering the technical characteristics of products that, alongside a design tool, systematises the established part of 'requirements and performance' with variants that escape a technical definition but are of a socio-cultural nature. It consists of a dual taxonomy. The first technical-historical, aims at the knowledge of the product system by operating a complex and critical classification on about 100 MII upholstered products (Losciale et al., in press). The detailed analysis carried out on the selected product models constituted a strong structured cognitive base: the careful analysis, guided by the definition of the physical-material, historical and language categories, critically supported the reflection towards a cultural reading of the product-good, allowing the identification of value aspects of a representative-symbolic nature. The artefact is assumed to be a cultural asset and a relational, symbolic and affective medium, elevating the contribution to a form of analysis inspired by the world of humanistic literature and taxonomically crystallising the intangible value aspects useful for product reading and design. The value-design taxonomy, downstream of an extensive semantic investigation of the literature pertaining to socio-cultural disciplines (with an original visual form), is composed of conceptually defined categories and determinants (Figure 1). These determinants, for the benefit of the design community, serve as guiding elements for analysis and design, as they make tangible the values that products must take on and communicate within their context.

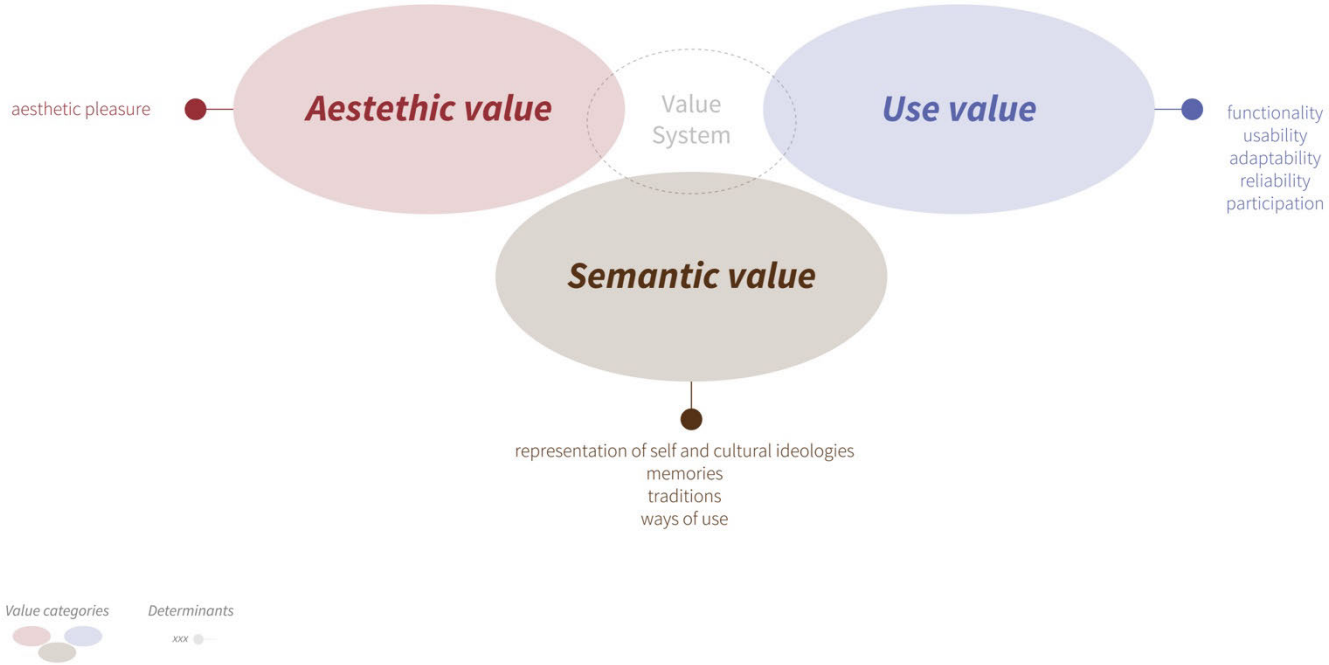

Figure 1. Value system: categories and determinants

3.3. Qualitative-experimental reading of determinants on iconic MII product

Downstream of the construction of the value system, the experimental phase of the research is constituted, in the first instance, by a critical-interpretative analysis aimed at assessing whether the determinants identified in the value system are present and how they characterise the objects of application. It is quantitative in nature and concerns a sample of 15 MII upholstered products, selected from those present in the taxonomy with appropriate criteria and is summarised by original graphical representations (Figure 2). Amongst the various possible deductions, the significant presence of semantic value in products considered iconic, which embody the principle of durability, stands out.

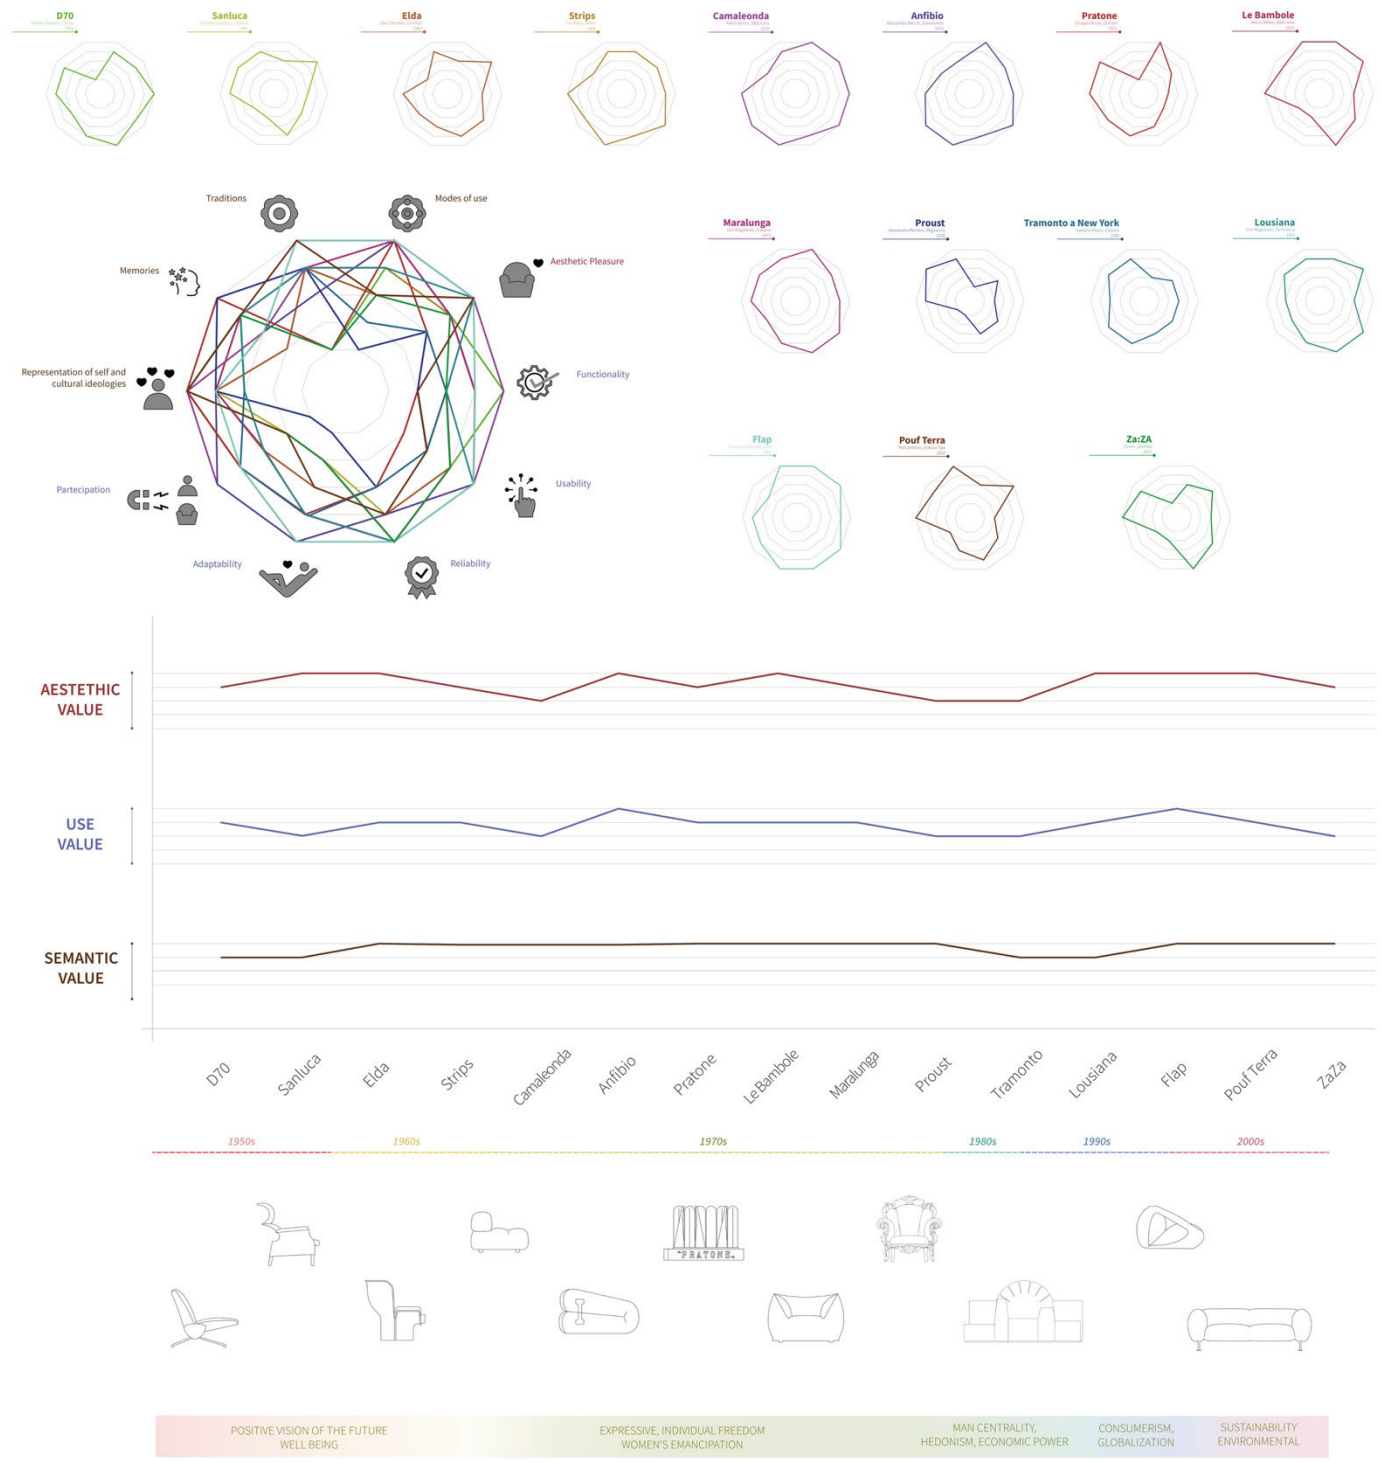

Figure 2. Qualitative reading on iconic MII products

3.4. The tool

The integration of the two taxonomies has led to the construction of a interactive tool, in Italian, which is useful to the entire design community in identifying new and transversal relationships between technical-functional, production, formal aspects, approaches to use and semantic meanings. This tool integrates technical characteristics of products with socio-cultural dimensions and systematically combines established requirements and performance criteria with variables that escape objective and technical definition. In this analysis there is an attempt to hold together the 'hard' dimensions inherent to the

technical nature of industrial design with the 'soft' ones of a socio-humanistic and sociolinguistic nature, which has led to the development of a reference metric system supported by an original, interactive, accessible and implementable visual system. Starting from a synthetic and traditional data collection method, a critical synthesis was achieved: it is not a simple database with visual access, but an intuitive support for analytical exploration, which adopts qualitative rather than quantitative tools and metrics. On the one hand, the tool highlights the value of the product in relation to the entire supply chain and the socio-cultural context of development by a critical model capable of adapting to the new sustainability requirements, which serves as an instrumental support to the mapping of the sector, revealing the interconnections between technical, production and historical aspects. On the other hand, drawing inspiration from a scientific working environment akin to the socio-humanistic area, it aims to connect qualitative variants with technical-functional and formal ones.

The preview in Figure 3 shows the original form of interactive visual use that, starting from the graphic restitution of the complex relationships between the technical-historical data, supports the value metric system of a critical-qualitative nature (Figure 4).

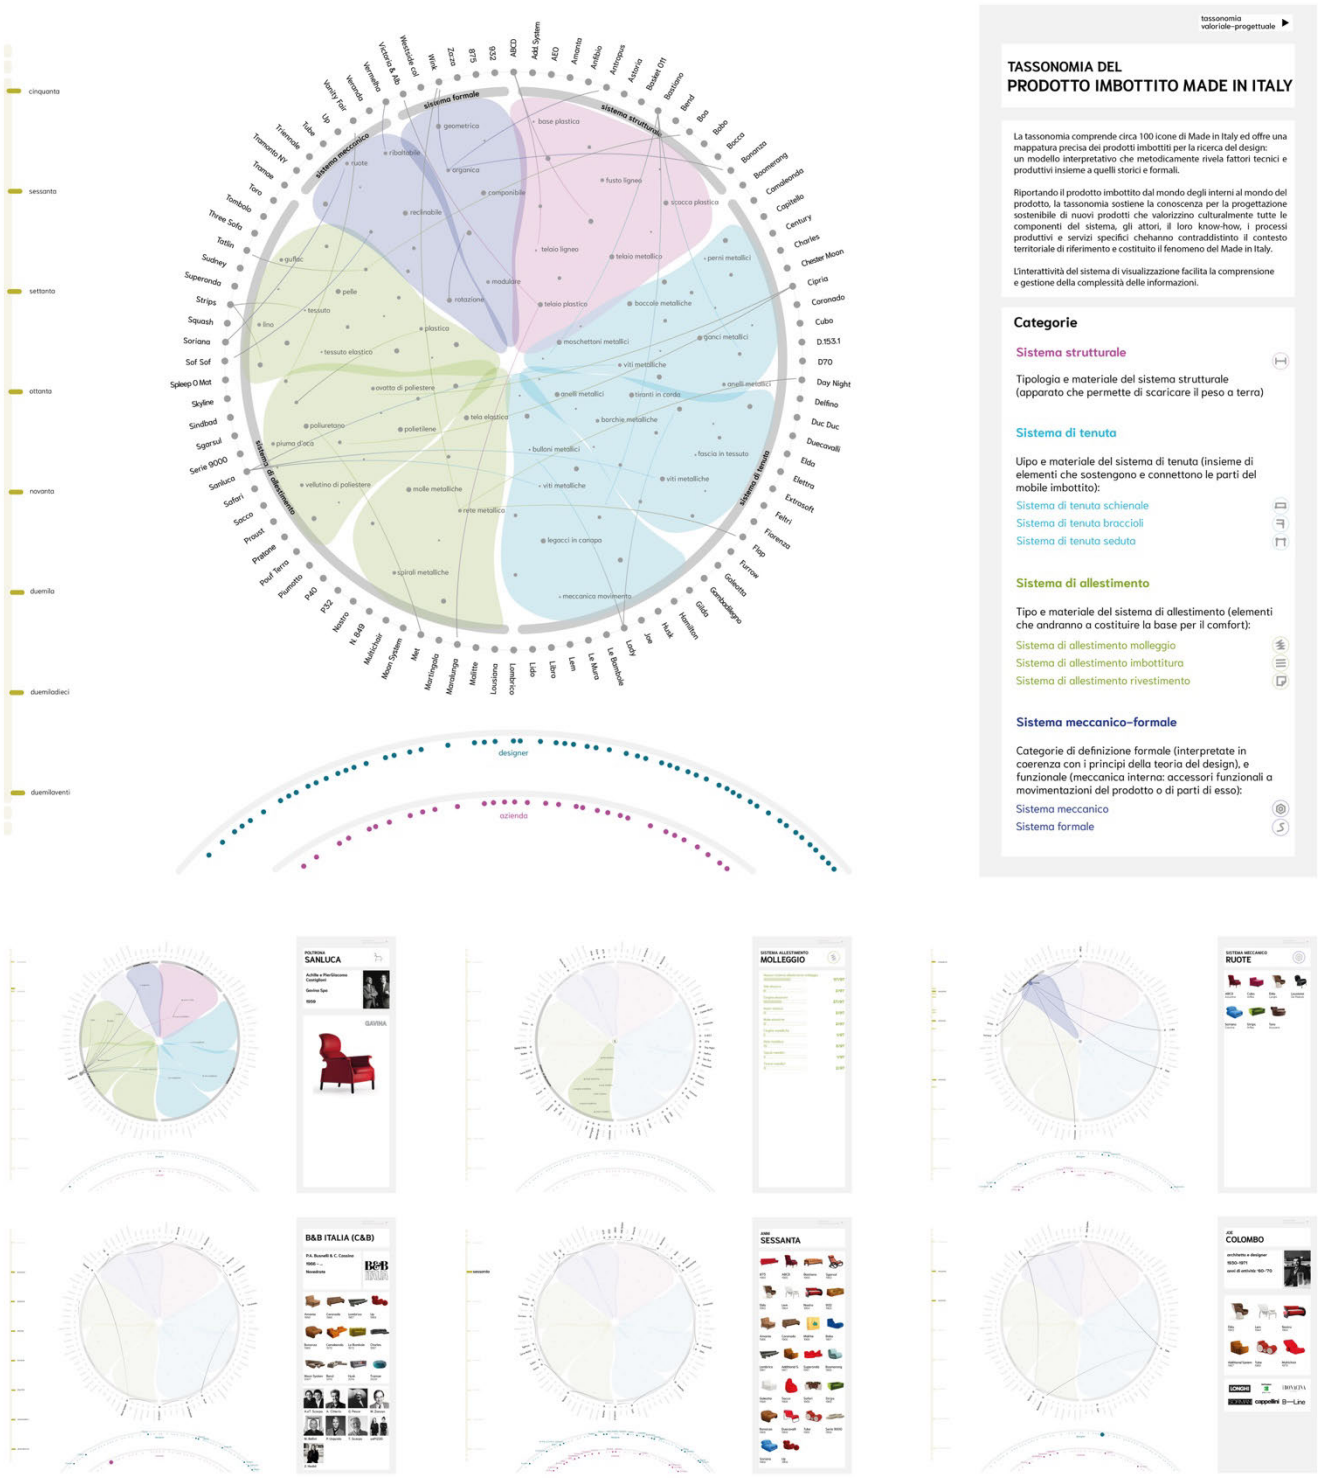

Figure 3. Preview of the interactive tool (technical-historical)

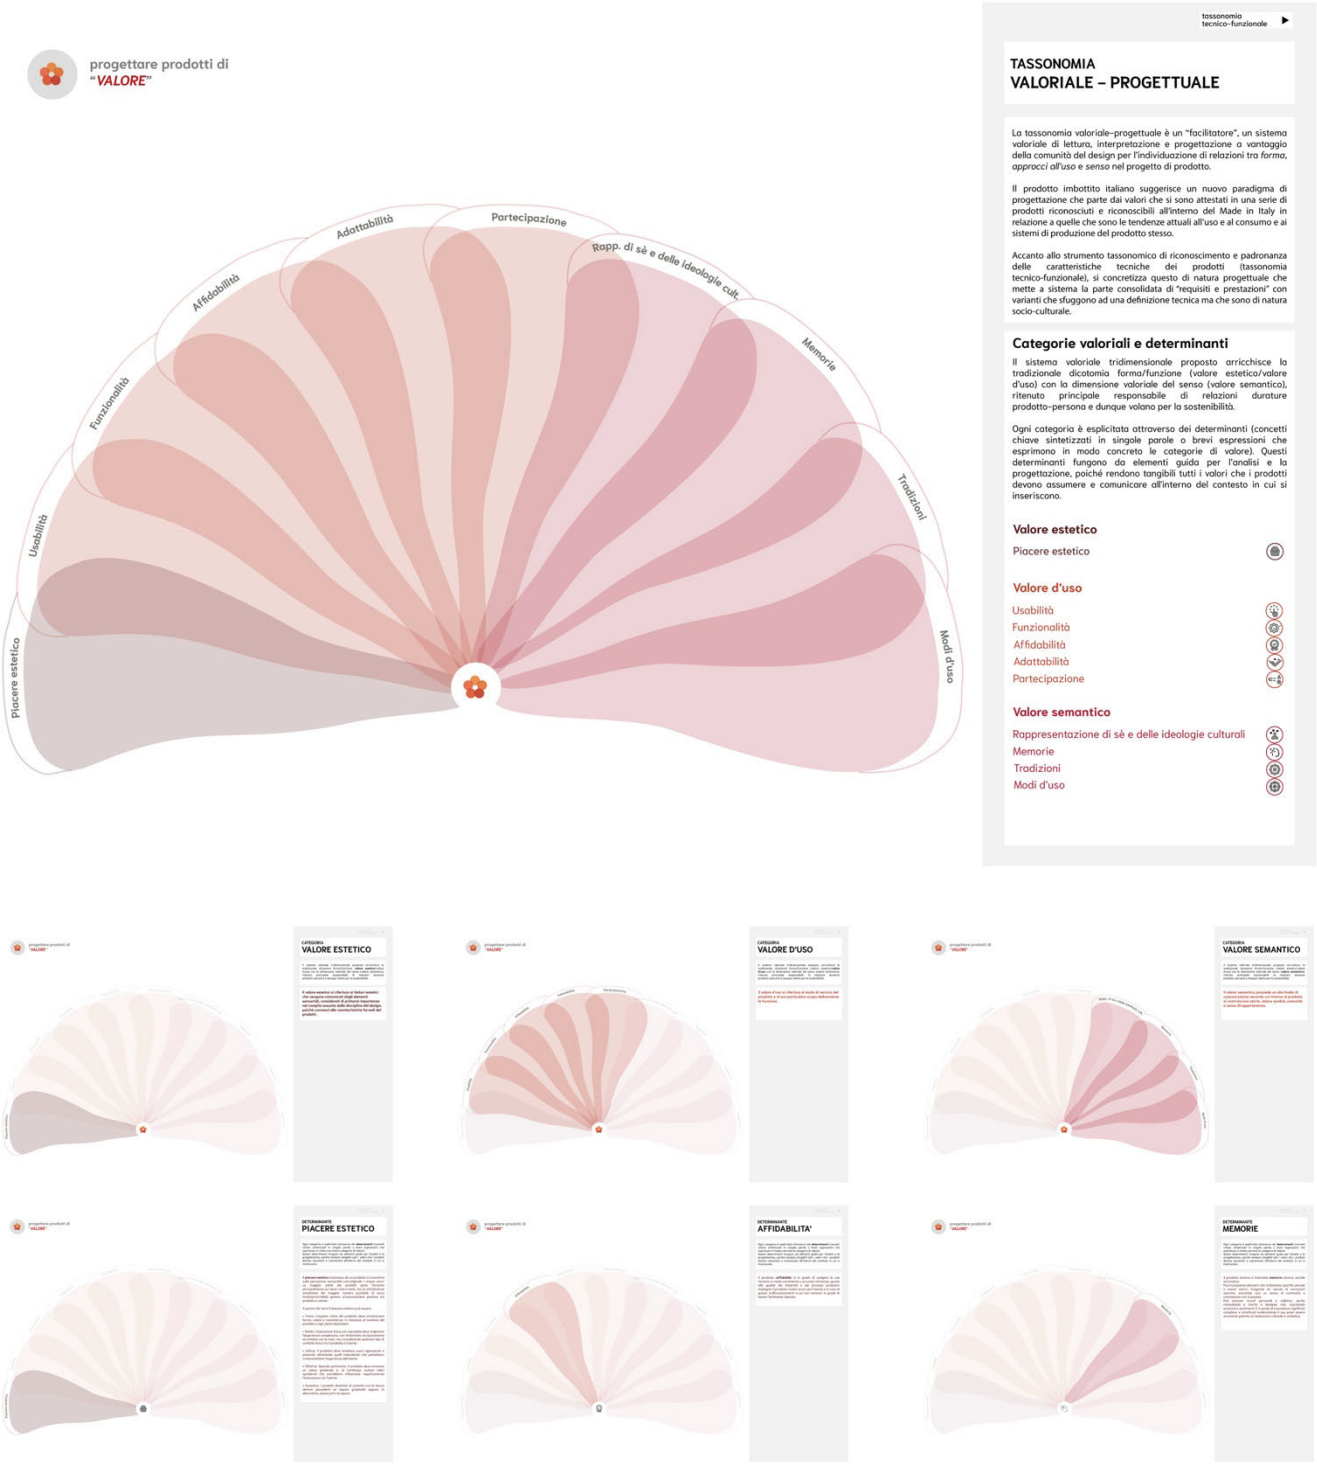

Figure 4. Preview of the interactive tool (value-design)

Furthermore, Figure 5 shows the original literature use model used to define the value framework that allows for a more accessible data comparison.

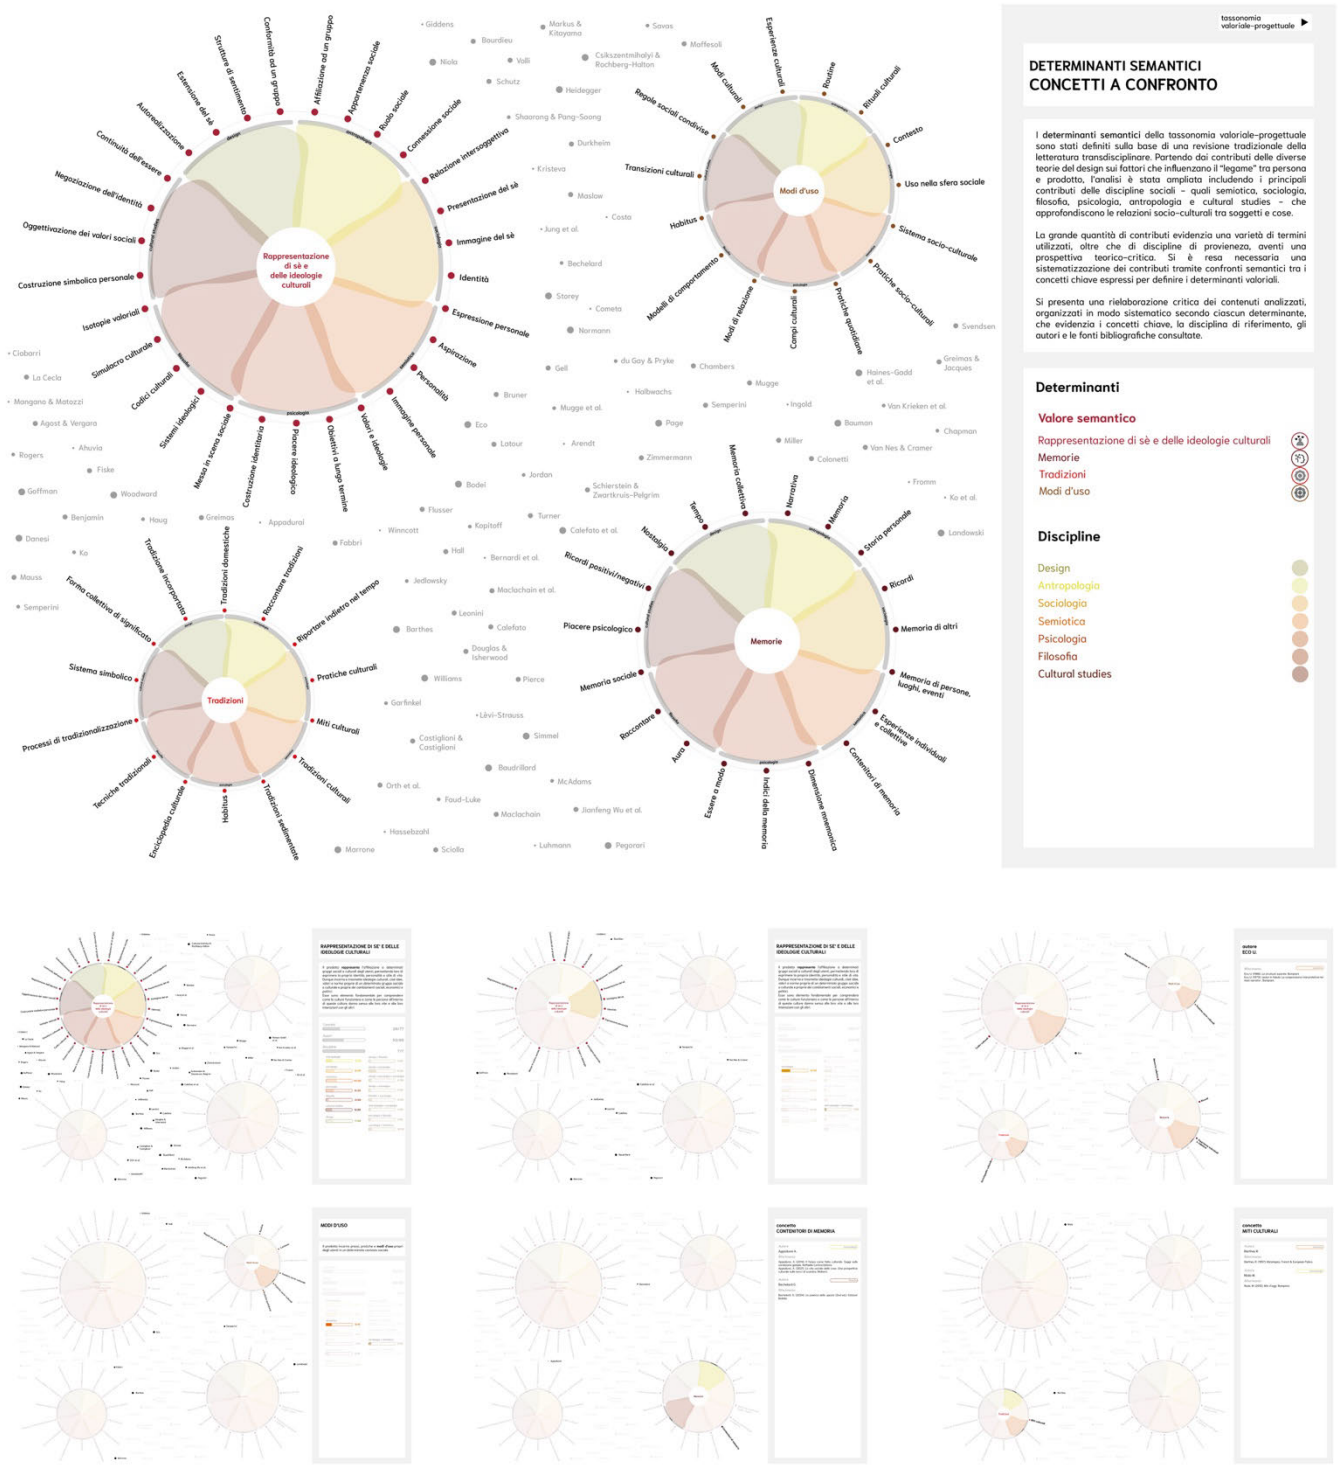

Figure 5. Interactive preview tool (literature comparison)

4. First results and future developments

The PhD research, through an original reinterpretation of the upholstered cultural asset MII, impacts the sustainable dimension with originality. By integrating a technical-historical taxonomy with a value-design metric system in an original and interactive visual tool, through the connection between technical, socio-cultural and symbolic dimensions, it not only enhances the heritage of Italian design, in a format that can also become an archive of this heritage, but also provides a critical approach to the analysis,

interpretation and design of upholstered products. The adoption of this system contributes to rethinking the value of products as a socio-cultural and relational expression, opening up new perspectives in response to complex contemporary needs for which design is called upon to offer new interpretative scenarios.

The first results of the experimental phase emphasise how durability depends not only on the technical or formal products' quality, but on the ability of products, among which MII upholstered products are emblematic, to embody recognisable and shared values. Moreover, the critical reinterpretation suggests that the value system, made interactive and the child of the *Semantic Value-Driven Design Approach*, can be an effective tool for integrating socio-cultural dimensions into the product design world useful for analysis and design. This deduction is being validated by a test with real users, which is in progress. Its objective is to assess the effectiveness of the framework of socio-cultural value determinants in the perception/recognition within upholstered products and to evaluate the extent to which these determinants direct towards a more conscious buying choice. Using the typical tools of service design, this experimentation aims to quantitatively demonstrate the potential of the methodological model constructed.

Serious Games with AI for Education: Ethical Issues and Educational Challenges.

Lorenza Ambrogi

Università La Sapienza di Roma
lorenza.ambrogi@uniroma1.it

ABSTRACT | The landscape of learning and training is expanding to include new types of learning methods, among which the introduction of serious games integrated with Artificial Intelligence (AI) stands out. These games, designed with educational rather than entertainment purposes, have the potential to personalize the learning experience and enhance student engagement. By adapting content and difficulty levels to individual student needs, AI fosters a more effective educational environment that promotes the development of critical skills such as problem-solving, collaboration, and critical thinking. However, the intersection of AI and serious games in education presents significant ethical challenges, including algorithmic opacity, biases, privacy concerns, and cognitive impacts. This paper examines these ethical issues and proposes a framework for their responsible use, integrating Service Design methodologies to ensure fairness, inclusivity, and transparency in the design and implementation of AI-powered serious games. The proposed approach emphasizes participatory design, iterative prototyping, and the integration of Explainable AI (XAI) to address biases, promote transparency, and ensure data privacy. By actively involving educators, students, and ethics experts in the co-design process, this framework aims to create educational tools that adhere to ethical standards and provide equitable learning experiences.

KEYWORDS | SERIUS GAME, EDUCATION, SERVICE INNOVATION, ETHICAL DESIGN.

1. Introduction

The integration of artificial intelligence (AI) into various fields has transformed numerous sectors, including education and training. Among emerging applications, AI-powered serious games are gaining attention as innovative tools for enhancing learning.

These games, designed for educational purposes rather than pure entertainment, offer unique opportunities to personalize the learning experience and increase student engagement. They represent interactive digital environments created for educational and training purposes (Narayanan et al., 2023; Sharifzadeh et al., 2020).

AI integration enables personalized learning by dynamically adapting content to individual student needs, thus fostering a more effective educational experience. The ability to adjust the game's difficulty and content based on the student's capabilities ensures a smoother and more targeted learning process. Moreover, maintaining a balance between challenge and skill enhances focus and participation. This approach also supports the development of complex skills such as problem-solving, critical thinking, and collaboration-key elements of modern and inclusive learning. (Kiili, K., 2005).

However, the combined use of AI and serious games in education and training also presents challenges and ethical concerns. How transparent are the algorithms? Are there risks of bias in AI systems? How can we protect student privacy and ensure that technology does not diminish their sense of responsibility?

The goal of this research is to provide an in-depth analysis of the ethical implications of these tools and propose solutions for their responsible and equitable use through Service Design.

2. Ethical problem of integrating Serius Game with AI in the Education

The integration of Artificial Intelligence (AI) in research and development highlights the need to ensure that human values guide technological progress. It is essential that AI be designed for the benefit of humanity while simultaneously reducing potential risks. Promoting an ethical approach to design that guarantees transparency and accountability (Adamson, Havens, Chatila, 2019) is a methodology that can also be applied to the development of serious games for education and training.

This raises a series of ethical issues that must be addressed to ensure the responsible and inclusive use of these technologies. One of the main concerns is the opacity of deep learning systems, which often function as "black boxes." This means that, while they generate results and make decisions, their internal workings remain largely incomprehensible to both developers and end users: Improving the interpretability of AI models can help reduce the risks associated with bias. However, researchers warn that such improvements may lead to a decrease in prediction accuracy. Despite progress in explainability techniques, such as LIME (Local Interpretable Model-agnostic Explanations) and SHAP (Shapley Additive exPlanations),

finding a balance between transparency and accuracy remains a significant challenge (Ronald Yu, Gabriele Spina Alì, 2019).

This lack of transparency undermines the trust of students and educators, as it makes it difficult to assess the reliability of the system or to correct potential errors. In this context, Explainable AI (XAI) (Doshi-Velez & Kim, 2017) — a set of processes and methods that enable human users to understand and consider the outputs generated by machine learning algorithms as reliable—emerges as a crucial element in making AI decisions more interpretable and understandable.

Another significant issue is bias and discrimination. Since AI learns from the data it is trained on, unbalanced or non-representative datasets can lead to distorted outcomes, disadvantaging certain groups of students. For example, an educational serious game based on non-inclusive data may generate less accurate responses for students from different cultural or socio-economic backgrounds, thereby compromising equity and inclusion (Mehrabi et al., 2021). At the same time, the collection and management of student data raise critical concerns about privacy and surveillance. These games gather sensitive information on users' performance, behaviors, and even emotions—data that, while valuable for personalized learning, could be exploited for intrusive monitoring. The risk is that educational environments turn into spaces of constant surveillance, infringing on students' right to privacy. Therefore, it is crucial that data collection and usage comply with privacy protection regulations, with clear and transparent oversight mechanisms (Dwork & Mulligan, 2013).

Beyond technical and ethical aspects, cognitive and psychological implications must also be considered. Excessive reliance on AI in serious games can diminish students' ability to develop independent critical thinking. If the system constantly provides recommendations on strategies to adopt, students may simply follow AI-generated guidance without developing their own reasoning. This is particularly problematic in education, where fostering intellectual independence should be a primary goal. Additionally, the digital divide presents another challenge. Not all students have access to the same technological resources, and the adoption of advanced serious games could benefit only those with adequate devices and digital skills, thereby widening educational inequalities (Adamson, Havens, Chatila, 2019).

It is important to consider how game dynamics influence students' ethical decision-making. Many serious games reward goal achievement through points and incentives, which may encourage students to make decisions not based on genuine ethical reflection but rather on maximizing their scores. This risk of the "gamification of morality" could oversimplify ethical choices into mere optimization strategies, limiting students' ability to develop critical and conscious thinking.

Addressing these challenges is essential to ensuring the fair and responsible use of AI in educational serious games. Adopting a Service Design approach can help create more transparent, inclusive, and privacy-respecting tools, ensuring that technology remains a means of enhancing learning and human development.

3. Proposal for an Ethical Service Design Framework for Serious Games

To address ethical issues related to serious games in education, the goal is to create an advanced design framework that integrates participatory approaches and service design principles and is based on five. pillars:

- Co-Design with Educators and Students: Actively involve end users in the design process to integrate their needs and concerns.
- Iterative Development and Participatory Testing: Use prototyping and testing cycles to ensure continuous adaptation to educational and ethical requirements.
- AI Transparency and Control: Implement Explainable AI tools and interactive dashboards to enable users to understand and monitor AI behavior.
- Inclusivity and Diversity in Content: Ensure balanced and representative datasets to prevent discrimination.
- Continuous Ethical Monitoring: Establish regular audit mechanisms to uphold ethical principles over time.

Additionally, Service design focuses on the design and management of complex services, placing the user experience at the center and promoting co-creation. In the field of education, methodologies such as Double Diamond and Service Blueprint provide a structured framework to discover, define, develop, and deploy a new version of a serious game that uses AI to contribute to training:

- 4.1 Discovery Phase

In this initial phase, particular attention is given to gaining a deep understanding of the key stakeholders involved. Stakeholders such as educators, students, developers, and ethics experts are actively engaged to identify needs, expectations, and potential challenges. The educational journey is also mapped, using tools like customer journey maps and service blueprints to visualize the entire experience and identify critical moments of interaction with the service. This allows for a focus on improving the critical touchpoints to ensure a smoother and more effective experience.

- 4.2 Definition Phase

Once a clear understanding of the context has been gained, the key aspects of the project are defined. A thorough analysis of potential ethical issues is conducted, such as the risks related to algorithmic opacity, bias, privacy, and the cognitive impact of AI on users. The aim is to address these concerns from the outset by setting clear objectives. Defining measurable indicators ensures that equity, inclusivity, and transparency are prioritized throughout the process.

- 4.3 Development Phase

During this phase, prototypes of the serious game are created and refined. Iterative prototyping and participatory testing approaches are adopted, collaborating with end users and gathering feedback to improve the interface, AI system, and overall experience. The goal is to develop a solution that effectively meets users' needs while addressing any concerns

that arise. Additionally, interactive dashboards are developed to allow users to monitor and, if necessary, adjust the AI's personalization criteria, providing greater control and transparency over the system's operation.

- 4.4 Delivery Phase

In the final phase, the project's sustainability is ensured through training activities on AI ethics and digital responsibility, aimed at both students and teachers. The objective is to provide the necessary skills for a conscious and ethical use of the technology. Furthermore, a continuous monitoring and ethical auditing system is established to ensure that the serious game consistently meets equity and transparency standards over time, with regular reviews of its performance and interventions to maintain ethical integrity.

4. Conclusion

The adoption of AI-driven serious games in education presents significant opportunities but requires a careful and responsible design approach. By integrating service design principles, it is possible to develop educational tools that are:

- Transparent and inclusive: Leveraging technologies such as XAI and interactive dashboards.

- Participatory: Engaging all stakeholders through co-design processes.

- Iterative and adaptable: Ensuring continuous prototyping and constant feedback to support product evolution.

The next steps include real-world experimentation, the establishment of shared ethical standards, and the development of auditing methodologies to continuously monitor the impact of serious games on learning and students' ethical behavior.

The Evolution of Everyday Life: Investigating the ‘Object-Space’ Order Evolution via Computer Vision Model

Ziyuan Yang*[a]

a Academy of Arts & Design, Tsinghua University
*yangziyu23@mails.tsinghua.edu.cn

ABSTRACT | Design studies frequently concentrate on grand narratives, while common objects in daily life and their cultural meanings are often oversimplified or disregarded. In the face of these challenges, this study offers an intellectual fulcrum for designers and researchers, assisting us in re-examining the meaning of design from an alternative perspective. This research centers on the evolution of the "object-space" order in everyday life by leveraging the computer vision model. Through utilizing this technology to process image data from different time periods, the category, location, and spatial layout of objects are identified. At the micro level, the placement rules and dynamic changes of objects in space are unveiled, and at the macro level, the shaping effects of spatial functions and social culture on the "object-space" order are explored. By investigating the evolution of everyday objects and their correlation with interior space, it is beneficial for designers to comprehend the spatial relationship between occupants' behavior and objects. Theoretically, this study contributes to understanding the influence of computer technology on the domain of design research. Practically, it aids designers in creating suitable living spaces from the perspective of residents' behavior and activities.
Therefore, this study focuses on the Chinese contemporary residential interior space, combining traditional design history research methods with computer vision models. In the research process, a combination of qualitative and quantitative research is adopted. Residential interior scene photos are collected through interviews and investigations, and Multimodal Large Language Models (MLLMs) are employed as tools to explore the evolution of the “object-space” order in China since the 1980s. With the assistance of intelligent technology, the sorting, extraction, and induction of the spatial form pedigree are completed, thereby addressing issues such as subjective bias and low efficiency in traditional historical research data processing. It has been found that the "object-space"

order is significantly influenced by the development of science and technology, the transformation of lifestyle, and the shift in cultural concepts, demonstrating a trend of evolution from being dominated by functionality and practicality towards aesthetic and personalized expression. This, in turn, offers a novel perspective for understanding the changes in human lifestyle. The methodology employed in this study enables the analysis of the correlation among the three flow factors of "object-resident-space" within domestic space and can present the evolutionary trajectory of object locations. This research will put forward a new methodology aimed at exploring the correlation between objects and spatial forms in interior spaces. By taking the daily behaviors of both objects and people as the research theme, a better understanding of the impact of indoor spatial forms on daily life can be achieved.

KEYWORDS | EVOLUTION OF INTERIOR SPACE; THE "OBJECT-SPACE" ORDER; COMPUTER VISION MODEL; MULTIMODAL LARGE LANGUAGE MODELS (MLLMS).

1. Introduction

The evolution trajectory of contemporary Chinese residential space is an all-round and multilevel process, serving as a microcosmic snapshot of the national development journey since the founding of New China. In this study, the implementation of China's opening-up policy in the 1980s is regarded as a crucial turning point in time. The renewal of Chinese people's cultural concepts has emerged as a vital component of New China's modernization transformation (Xu, 2018). Western cultural concepts and ways of life have continuously streamed in, colliding with and integrating into Chinese culture. Technological advancements and applications have revolutionized the interior design approaches of modern Chinese residential buildings. The development and popularization of electronic media technology in China have given rise to a corresponding electronic media culture, which has also exerted an impact on people's daily lives, consumer culture, mass media forms, and the political system (Yang, 2024).

As commodities, objects play a pivotal role in the economic, social, and cultural elements of the capitalist system (Baudrillard, 1970). Lawrence(1982) argued that as the carriers of material things, changes in interior spaces directly mirror the shifts in lifestyle across different periods. The evolution of “object-space” order is both the outcome and the driving force behind the transformation of residential space. Meanwhile, the change in interior space is a consequence of external factors such as social, economic, and cultural changes; while the evolution of objects, in turn, influences the evolution process of interior space. Amidst the development of the social structure and cultural background, this study analyzes the continuous temporal changes in objects. The evolution process of objects clarifies the motives and mechanisms of lifestyle changes in the course of time, thus revealing the subtle changes in the daily lives and family cultures of the Chinese people since the 1980s.

During the research process, a question raised: how to efficiently integrate the complex relationships of object placement and extract object(s) that are most closely related to the evolution of interior space forms? Therefore, the research attempts to explain the elements that have the most significant impact on the material culture of the daily lives of the Chinese people. It focuses on the interior design of urban residences since the 1980s, taking the trajectory of the spatial position changes of objects within residential interiors. It explores the evolution of the living space forms of the Chinese people over the past 45 years and the impact of changes in household items such as electrical appliances and furniture on family life. By leveraging computer vision models (Dai et al., 2017), it probes into the correlative impact of objects on spatial forms in interior spaces. Taking the dynamic correlation between objects and daily behaviors as the research theme, it attempts to understand the two-way influence between interior space forms and daily life. The micro-level daily life is used to reflect the living conditions of the Chinese resident and the residential interior design during this period.

2. Methodology

2.1. Collecting Image Data through Semi-structured Interviews

Through qualitative research followed by quantitative research, this study completed the discussion on the spatial location evolution of objects in residential interior space from 1980s to 2020s (Figure 1).

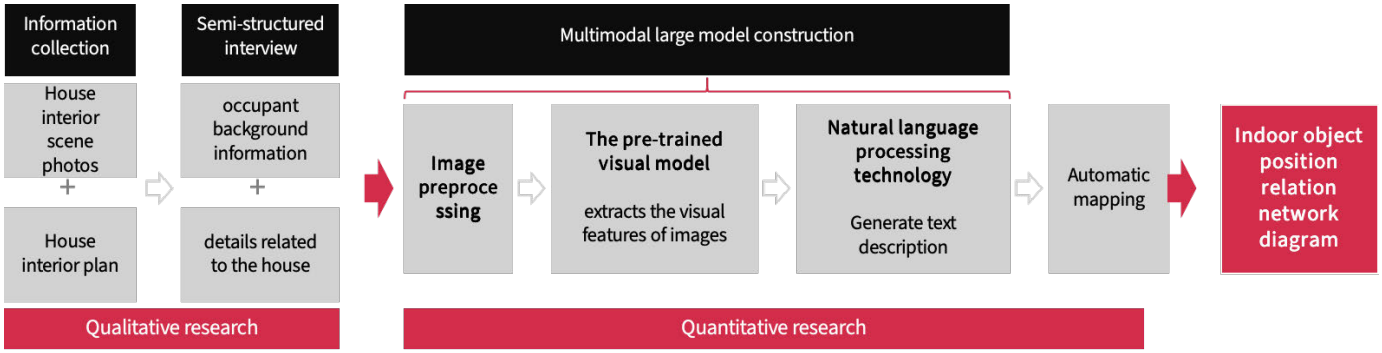

Figure 1. Research framework combining qualitative research and quantitative research.

Regarding the qualitative research stage, this study explores the transformation of the form of residential interior space and the way objects are arranged in each space. The in-depth interview subjects are families with more than three housing relocation experiences. The study recruited 45 volunteer interviewees through social platforms, social connections, and the dissemination of recruitment information. A total of 30 valid samples were selected for qualitative analysis. The number of 30 cases was determined according to the social science research method by Bhattacherjee (2012): the number should be greater than 20 but less than 50.

The information collection process asks respondents to provide three types of information: floor plans (by measuring or by recalling), detailed descriptions of living details, and photos of residential house scenes, as Table 1 (below). Among them, the photos of residential indoor scenes show the overall layout of the living environment, furniture arrangement, and decoration style, etc.; while the detailed descriptions provide information about the residents' background, such as age, gender, occupation, education level, etc.

Table 1. Respondents were asked to provide three types of information, including floor plans, detailed descriptions of living details, and photos of residential indoor scenes.

Time period	floor plans	detail drawings	House photos	
1980 -1991				
1992 -2009				

2010-2020    
Following the completion of information and data collection, semi-structured interviews were conducted with residents to examine their domestic practices, material choices, and spatial behaviors. The interviews focused on three key dimensions: (1) daily routines and lifestyle patterns, (2) selection criteria and perceptions of decoration materials, and (3) familial narratives embedded in domestic spaces. To enhance recall accuracy, the picture-induction method (Soaita & McKee, 2021) was employed, prompting participants to reconstruct past living scenarios with granular detail. Additionally, spatial usage patterns were systematically documented, including frequency of occupancy and functional differentiation among household members across distinct zones. Each piece of picture information was labeled with time and space categories according to the respondents' descriptions and sorted in chronological order from old to new. The study synthesized the time division of relevant books on the history of Chinese housing (Lv, 2003; Chen, 2013; Wang, 2022), dividing the nearly 45-year period into four stages: 1980-1991, 1992-2009, 2010-2020.

2.2. Analyzing the “Object-Space” order via Computer Vision Model

The quantitative research stage is carried out using the indoor scene pictures collected in the interview research. To improve the accuracy of subsequent analysis, the collected image data are preprocessed. This step mainly includes operations such as image denoising, contrast enhancement, brightness and saturation adjustment to ensure that the quality of each picture meets the standard. Subsequently, computer vision models were experimentally evaluated to extract visual features from the image dataset, with performance metrics systematically compared across architectures. Results indicated that ResNet demonstrated superior accuracy and computational efficiency relative to alternative models, leading to its adoption for subsequent object recognition tasks. In parallel, textual data were analyzed using natural language processing (NLP) techniques to extract semantic patterns and contextual relationships. Recurrent neural networks (RNNs) were used to process sequential data. These networks can capture the sequential dependencies in the text and generate coherent sentences. By leveraging the pre-trained word embedding technology, words were converted into continuous vector representations, and the relationships between objects in the pictures were generated into text descriptions.

The results obtained from the multimodal model were integrated through automated mapping to form a complete network diagram of the positional relationships of indoor objects. This network diagram can not only clearly display the distribution of items in the room in the provided images, but also reflect the classic combination patterns between object-object and object-space in different time periods, thus helping researchers better understand the correlations among the three flow factors of "object-occupant-space" (Figure 2).

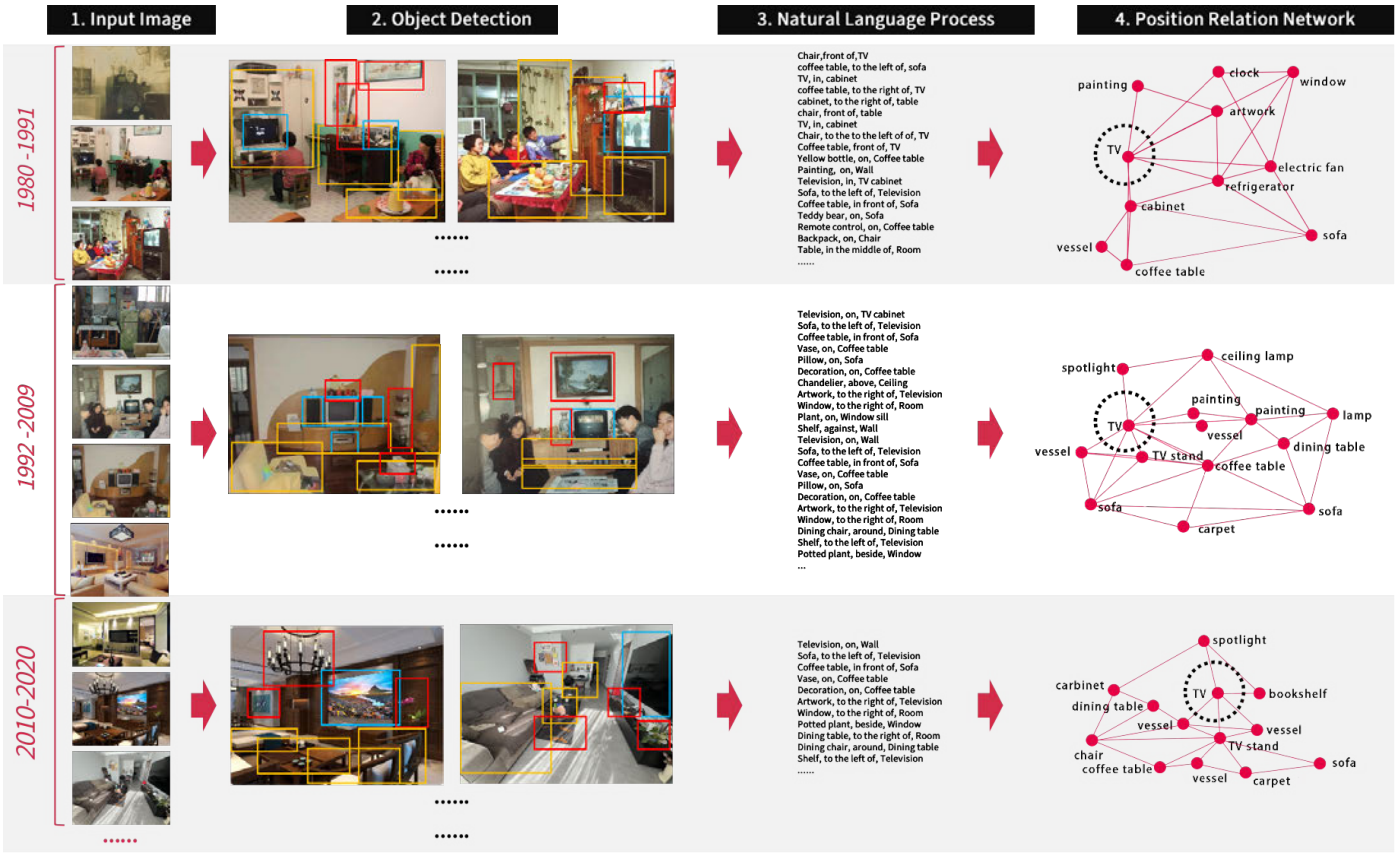

Figure 2. understand the correlations among the three flow factors of “object-occupant-space” through computer vision model.

3. Discussion

The images labeled as living-room spaces in the data, it can be observed that the combination of living-room items centered around "television-coffee table-sofa" exhibited a certain stable relationship from the 1980s to the 2010s. This classic combination of "television-coffee table-sofa" is a modern classic arrangement that transcends factors such as the occupations of Chinese people and the types of housing, and it still holds true today. This reflects the important position that color televisions play in the daily lives of the Chinese people. Moreover, with the increase in housing area, this spatial organizational relationship has been further strengthened.

In recent years, although the emerging interior design trends of "LDK" (Living-Dining-Kitchen) and "De-living-room-ization" have provided another possibility for the organizational order of family public spaces and have been applied in some families, the spatial combination centered around the television remains a model for the family spaces of modern Chinese residences. It has not been replaced by the popularity of electronic devices such as smartphones and tablets. At the same time, the latest samples of surveyed family spaces also show that the increasing use of projector equipment is gradually replacing traditional screen televisions. Based on an analysis of literature and design industry trends, as another form of audio-visual equipment, the projector makes the object-organizational relationship in the living-room space more flexible, causing the "television-coffee table-sofa" combination to evolve into combinations such as "bookcase-coffee table-sofa" and "display cabinet-coffee table-sofa".

On the other hand, through the images of dining spaces and analyzing the relationship network between furniture and objects, it can be concluded that the furniture in this space has shown an "inverse" evolution from mobile to fixed. In traditional spaces, the way of arranging furniture reflects a faithful image of the family and social structure of an era. For example, the typical bourgeois interior furnishings express the patriarchal system (Baudrillard, 1968). In previous design concepts, it was believed that the transformation from fixed furniture to movable furniture was a manifestation of design modernity (Curtis, 1996). However, in modern China, this difference from the Western development trajectory indicates that the organizational relationship of Chinese family spaces has transformed from disorder to order, forming its own unique style characteristics. The hierarchical relationship of the space is an important factor influencing the frequency of appearance of different types of objects in the space. Since the per capita housing area in China was only 15 square meters in the 1980s (Man, 2011), the functional distribution in the living-room space was chaotic, including functions such as receiving guests, dining, storage, and display. The personalization of the space makes the objects in the family not only the physical structure itself but also a symbol of the self (Marcus, 1995). With the expansion of housing area and the increase in the number of rooms, the network structure of objects in family spaces has been gradually constructed, and it has formed distinct characteristics of the times against the backdrop of the economic, political, and cultural context of the era.

4. Conclusion

This study has sparked further contemplation: Can the application of computer deep-learning technology in design history research assist people in better understanding residential space design and family culture? This paper conducts research on the evolution of interior space objects in sample families. From the current research, the characteristics of family culture and daily life of these families from the 1980s to the present can be discerned. Despite differences in their occupations and social backgrounds, overall, the indoor objects and their spatial organizational relationships within the interior show varying degrees of similarity. Based on the identification of interior space objects by computer vision and the construction of relationship networks, this study interprets the two-level change trajectories of the physical indoor environment of daily life and the implicit family culture.

In future, research will focus on the impact of housing area on living behaviors. On the other hand, the trailing nature of behaviors after an increase in housing area also reflects the reverse impact of past behavioral habits on new residential spaces. It will also broaden the research perspective on objects, paying attention to whether small objects that have been overlooked in the past have a significant impact on the form of interior space. For the growing number of indoor designs that develop spatial design strategies around the topic of lifestyle, it is recommended to adopt a bottom-up approach to truly understand and plan family culture and living behaviors. This also requires future designers to possess a more comprehensive multi-disciplinary knowledge framework. This study provides designers with a new research method and vision, offering a more traceable basis for future daily-life designs.

The Material Culture of Lace: An Overlooked Heritage in Chinese Everyday Design

Hongying Jia[a b]

a College of Design and innovation, Tongji University, shanghai 200092, China
b University of California Berkeley, Berkeley, CA 94720-2318, United States

ABSTRACT | This paper examines the overlooked material culture of lace within Republican-era (1912–1949) Chinese domestic interiors, offering a critical reassessment of its significance in the development of everyday design practices. While traditionally dismissed as a gendered craft or minor decorative art, lace functioned as a key element in shaping the aesthetic sensibilities and material routines of urban middle-class households. Drawing on archival photographs, period advertisements, and craft manuals, this study investigates the dual role of lace as both a visual embellishment and a utilitarian object embedded in domestic labor. In the Republican household, lace enhanced spatial harmony, visual softness, and symbolic refinement, while simultaneously protecting surfaces and materializing women's economic and affective contributions through handwork. These layered functions are analyzed through the lens of material culture theory and feminist design history, which situate soft textiles as active agents in the negotiation of modern domesticity. By focusing on household lacework as a hybrid design practice—situated at the intersection of gender, class, and evolving aesthetics—this paper argues for an expanded understanding of Chinese design history. It calls attention to the significance of soft materials, the underexplored domestic sphere, and the largely invisible labor that sustains everyday beauty and order. In doing so, the study repositions lace not as ornamental excess, but as a culturally encoded and socially meaningful design artifact.

KEYWORDS | Lace, domestic design, Republican China, material culture, gendered labor, textile aesthetics

1. Introduction

Lace, a delicately patterned ornamental textile long associated with femininity and refinement, occupies an ambiguous and often overlooked place in Chinese design history. Despite its widespread presence in fashion, home décor, and social rituals throughout the twentieth century, lace has been consistently marginalized in academic narratives—frequently dismissed as a gendered craft or decorative excess. This marginalization reflects broader biases in design historiography, which, as Adrian Forty (2012) argues, tend to privilege monumental architecture and industrial materials over the vernacular and domestic. Similarly, Judy Attfield (2000) and Daniel Miller (1991) have emphasized the cultural significance of everyday objects, arguing that material culture constitutes an essential interface between personal identity and social structure—especially within the home.

This paper contributes to this growing field of material culture studies by investigating the design and social meanings of lace in modern China. While the larger research project examines the historical trajectory of lace from the late Qing dynasty to contemporary digital craft revival, the present study focuses specifically on the Republican era (1912–1949), a period of rapid modernization, shifting gender roles, and middle-class expansion. Within this context, lace emerged as both an aesthetic and utilitarian feature of domestic interiors. It was not merely decorative, but actively shaped how households performed ideals of refinement, propriety, and modern domesticity.

By concentrating on lace in the home—rather than in fashion, export trade, or institutional settings—this study addresses how everyday materials functioned as agents of meaning-making within Republican society. Domestic space, as Attfield (2000) notes, is a gendered and emotionally charged environment, where soft objects such as curtains, cushions, and lacework encode systems of value. Lace played a subtle yet vital role in negotiating visual order, moral economy, and social aspiration. Often handmade by women, it embodied affective labor and taste-making, and served as a means of participation in the aesthetic configuration of middle-class modernity.

This inquiry draws on a range of interdisciplinary sources, including archival photographs, newspaper advertisements, missionary-led domestic education manuals, and household handcraft guides. Works such as Earnshaw's Lace in Fashion (1988) provide crucial historical grounding for understanding lace's evolution as a textile genre, while contemporary scholarship (Miao, 2022) has begun to chart its understudied trajectory in the Chinese context. Through this empirical and theoretical synthesis, the paper argues that lace in the Republican Chinese home was not a passive embellishment, but a dynamic and multifunctional material—central to the visual and practical experience of modern domestic life.

2. Theoretical Framework and Methodology

Judy Attfield's work further informs the study's conceptual grounding. In Wild Things (2000), she argues that domestic objects—sofa cushions, curtains, and other "soft things"—convey social identity and cultural values, often through gendered codes. Lace, in this sense, operates as a medium of "feminized material culture," situated in spaces traditionally associated with women's responsibilities and creativity. This paper extends Attfield's insight to the Republican Chinese context, where lace emerged as a flexible material for navigating shifting ideas of modernity, respectability, and aesthetic propriety.

Methodologically, the research adopts a qualitative, multi-modal approach:

Archival visual analysis: Republican-era pictorials such as Liangyou (The Young Companion) and Linglong frequently featured staged photographs of model homes and middle-class lifestyles. These images serve as primary visual evidence of lace in situ—draped over furniture, layered on windows, and arranged in still-life compositions that blend decor and domestic symbolism.

Textual analysis of advertisements and consumer materials: Newspaper ads (e.g., Shen

Bao) and home service catalogs often promoted lace as part of a modern, tasteful lifestyle. These texts reveal how lace was marketed to urban consumers, with an emphasis on cleanliness, softness, and moral domesticity.

Publications such as The Complete Biography of Pastor Guo Xiande (Lian, 1940) and missionary-led domestic education curricula provided instructions on making and using lace. These sources illuminate how lace-making was embedded in gendered practices of labor and self-improvement.

Contextual reading of secondary literature: Studies on gender, material culture, and modernity in Chinese design history offer the broader interpretive frame for situating lace in its social and historical milieu.

Throughout, the study maintains a critical attention to the tension between visibility and invisibility: lace is both a visible design object and a sign of hidden labor; a visual symbol of refinement and an index of women's affective and practical labor. By foregrounding these dynamics, this research seeks to elevate lace as a serious object of study—one that bridges aesthetics, utility, and the politics of domestic space.

3. Aesthetic Functions of Lace in Republican Household Design

The aesthetic deployment of lace in Republican-era households was a direct reflection of urban China's emerging middle-class aspirations, especially as they intersected with ideals of modernity, refinement, and feminine respectability. Far from being a mere decorative indulgence, lace was a critical component of what Judy Attfield has termed "gendered aesthetics"—where women's contributions to the visual and affective shaping of domestic space were central to the cultural production of modern life (Attfield, 2000).

In this period, domestic interiors became sites of performance. Women curated home environments as a reflection of both inner moral order and outward social standing. Lace, with its intricate patterns and soft visual appeal, was a flexible material for achieving a look of civility, cleanliness, and gentle modernity. In Liangyou pictorials from the 1930s, lace consistently appears draped over dining tables, dressers, armchairs, piano tops, and mantelpieces. It was not placed randomly—it softened architectural hard lines, added visual rhythm to furniture arrangements, and subtly diffused natural light when hung as curtains. Photographs often paired lace with polished wood, porcelain, and cut flowers, reinforcing a domestic aesthetic rooted in both nature and refinement （Figure 1）.

（a） （b） （c）

Figure 1. Lace in interior space （a）Lace on the dining table； （b）Lace on the table； （c）Living room of wealthy and wealthy people in Peking (Beijing) of the Republic of China

This visual culture resonated strongly with Confucian-inflected ideals of womanhood, where the well-managed household was an extension of feminine virtue. Lace enabled a

new mode of expression for urban women, offering them low-cost access to a decorative material that signified taste, care, and cultivation. Unlike furniture or architectural modifications, lace textiles could be easily changed, handmade, or customized—giving women control over their environments without requiring structural changes. In this way, lace was part of a larger feminized materiality, allowing for the assertion of visual agency within constraints.

Furthermore, lace aesthetics signaled a hybrid modernity. Though lace originated in Europe and was initially viewed as foreign or elite, by the 1920s–30s it had been absorbed into Chinese sensibilities through localized styles and domestic production. Shanghai workshops produced lace with both Western floral motifs and Chinese iconography—bamboo, plum blossoms, phoenixes—integrating aesthetic traditions. These hybrid designs adorned qipao collars and dressing-table skirts, exemplifying how lace was recontextualized within Chinese domestic visual codes（Figure 2）.

（a） （b） （c）

Figure 2. Chinese localized lace（a）Western floral lace；（b）Chinese floral lace；（c）Chinese floral lace

Finally, aesthetic choices in lace were never entirely about decoration—they were about cultural values. A lace-draped table suggested refinement and order; lace-trimmed collars on qipao exemplified a feminine ideal that fused elegance with modernity. These choices did not merely reflect taste, but actively produced it—embedding design aesthetics within social codes of respectability and gendered identity. To remove lace would be to diminish the visual narrative of "good taste." Thus, aesthetic function was not superficial: it was deeply implicated in processes of class identity formation, gender roles, and the vernacular language of everyday design.

4. Practical Dimensions: Lace in Domestic Labor, Maintenance, and Social Use

While lace served clear aesthetic purposes, its functionality within the Republican home was equally crucial—and often overlooked in historical narratives. Lace was not just to be admired; it was to be used, washed, repaired, and remade. In this way, lace illustrates how design objects often operate on both symbolic and practical registers simultaneously.

One of the most obvious practical functions of lace was surface protection. In household

management guides like Funu yu Jiating (《妇女与家庭》, "Women and the Home") lace coverings were recommended for wooden furniture, mirror tops, dressers, and even food trays to prevent dust, moisture, and oil stains（Figure 3-a）. These were not just decor but part of a regimen of care. Armrest doilies and sofa backs protected fabrics from wear caused by daily use. White or ivory lace made dirt visible—prompting regular cleaning, reinforcing household hygiene, and performing "visible cleanliness," a critical ideal for the modern housewife.

Lace also intersected with women's domestic labor in both unpaid and income-generating forms. In vocational education and missionary-led domestic science programs during the Republican era, lace-making was commonly taught alongside embroidery, knitting, and sewing. These handcrafts were promoted not only as practical household skills, but also as moral and aesthetic disciplines. Making lace at home was widely encouraged as a way to reduce household expenses, decorate living spaces, and fill leisure time with productive, virtuous activity aligned with ideals of feminine refinement and thrift.

More than just self-sufficiency, lace also entered the informal economy. Oral histories from regions such as Suzhou and Guangzhou recount how women made lace for local markets, boutiques, and middlemen who exported decorative textiles abroad. These tasks, performed in the home, blurred the lines between labor and leisure. Lace-making was part of what feminist scholars call the "shadow economy"—unrecorded but essential to the household and local economic system.

The social utility of lace was also significant. Lace table runners and doilies were common items in wedding dowries, birthday gifts, and housewarming presents（Figure 3-b）. Their presence symbolized a woman's domestic skill, refinement, and preparedness for married life. Giving lace was giving care—both materially and symbolically. In this sense, lace became a vector of emotional labor and social continuity.

（a） （b）

Figure 3. （a）Lace in home decoration；（b）Lace veil in wedding photos

Advertising further reflected lace's dual functionality. In 1930s newspaper ads, lace was often marketed alongside everyday household goods such as soap, starch, and linen—emphasizing its role not as a luxury, but as a modern domestic necessity. These advertisements promoted lace as affordable, practical, and morally aligned with ideals of cleanliness and feminine care. It functioned as a visual shorthand for the well-managed home, embodying both aesthetic appeal and domestic virtue.

In sum, lace's practical roles were deeply gendered and embodied. They reflect how women navigated domestic expectations by transforming mundane labor into beauty and necessity into culture. Far from being frivolous, lace was an efficient, multifunctional, and deeply social material—quietly structuring the everyday life of modern households.

5. Conclusion

This paper has examined lace as a dual-purpose material—decorative and practical—within Republican Chinese domestic interiors. It has argued that lace was more than mere ornament: it functioned as an active agent in shaping household aesthetics, labor practices, and social relations. Its role in beautifying space, preserving objects, structuring gendered labor, and reinforcing social ties reveals the complex functions of soft materials in everyday design history.

The study also challenges traditional boundaries between "design" and "craft," suggesting that household textiles like lace should be reintegrated into the narrative of Chinese design modernity. Through their ubiquity, accessibility, and adaptability, lace objects participated in building modern domestic life—one not defined by monumental buildings or iconic objects, but by the subtler texture of daily existence.

Contemporary interest in lace has re-emerged through digital craft platforms, e-commerce, and cultural heritage preservation programs. The revival of handmade lace in cities like Chengdu and Suzhou speaks to a renewed appreciation for craft-based aesthetics and sustainable design. These trends echo the Republican-era use of lace: personal, local, gendered, and situated within evolving domestic values.

By uncovering the material and cultural history of lace in Chinese homes, this study contributes to a broader understanding of how design, labor, and everyday life intersect through textiles. Lace, as a medium of care, labor, and meaning, offers an intimate entry point into the design history of modern China.

THE UNTAPPED POTENTIAL OF EDIBLE WILD PLANTS IN SUSTAINABLE FOOD SYSTEMS.

Zsófia Márta Németh

MOHOLY-NAGY UNIVERSITY OF ART AND DESIGN BUDAPEST

nemeth@mome.hu

ABSTRACT | Ensuring global food security amidst climate change and environmental degradation necessitates a shift towards sustainable and resilient food systems. Edible wild plants, often dismissed as weeds, represent a largely untapped resource with significant potential to diversify and strengthen food supplies. These plants thrive without intensive agricultural inputs, offering rich nutritional profiles with higher concentrations of essential vitamins, minerals, and bioactive compounds compared to many conventional crops. Their resilience to environmental stressors, such as drought and soil degradation, makes them particularly valuable in mitigating the adverse effects of climate change while promoting biodiversity and ecosystem services.

This study synthesizes existing literature and case studies to assess the role of wild edible plants in sustainable food systems. Findings indicate that integrating these plants into mainstream food production can enhance food security, particularly in vulnerable communities where access to conventional crops is limited. Their inclusion supports biodiversity, ecosystem resilience, and cultural heritage preservation, as traditional knowledge surrounding their identification, preparation, and medicinal uses holds immense value.

Despite their advantages, challenges remain in their wider adoption. Key barriers include a lack of awareness, potential toxicity concerns, and the risk of overharvesting. Addressing these challenges requires comprehensive education initiatives, scientific research on nutritional properties and safety, and the development of sustainable harvesting practices.

European case studies, such as those in Sicily, highlight successful integration into local

diets and economies. The commercial potential of wild edible plants, through sustainable harvesting and market inclusion, can provide economic opportunities, particularly for rural communities. To unlock their full potential, a coordinated effort involving policymakers, researchers, and local communities is essential. By promoting the sustainable utilization of edible wild plants, food systems can become more diverse, resilient, and ecologically responsible, ensuring long-term food security and environmental sustainability.

KEYWORDS | EDIBLE WILD PLANTS, SUSTAINABLE FOOD SYSTEMS, ECOLOGICAL RESILIENCE, COMMUNITY EMPOWERMENT

1. Introduction

The imperative to ensure global food security in the face of accelerating climate change and escalating environmental degradation necessitates a critical re-evaluation of contemporary food systems and the exploration of alternative, sustainable food sources. While conventional agriculture has undeniably augmented food production, its reliance on monoculture, synthetic fertilizers and pesticides, and intensive irrigation has precipitated biodiversity loss, soil erosion, and water pollution (Knorr et al., 2020). Given these challenges, a transition towards more resilient and sustainable food systems is paramount, with a key element being the diversification of food sources and the embracing of ecologically sound agricultural practices (Marchetti et al., 2020). Edible wild plants, especially those commonly thought of as weeds are, in my opinion, a significantly under-utilised resource that could make a significant contribution to sustainable food systems.

2. Methodology

This paper employs a qualitative synthesis of existing literature including peer-reviewed scientific articles, ethnobotanical surveys, and applied case studies. Key areas of focus include nutritional composition, ecological benefits, traditional knowledge systems, and the ethical and design-related implications of integrating edible wild plants into contemporary food systems. Special attention is given to how design research, ethical leadership, and systemic innovation can facilitate such integration.

3. Discussion

3.1 Nutritional and Ecological Advantages

Edible wild plants, often overlooked in modern agricultural practices, possess immense potential to diversify and strengthen sustainable food supplies (Ebert, 2022). The integration of wild edible plants into existing food systems offers multifaceted benefits, stemming from their intrinsic nutritional profiles and remarkable ecological resilience. Many wild edible plants exhibit nutritional compositions that rival, and in some cases surpass, those of conventional crops, often boasting higher concentrations of vitamins, minerals, antioxidants, and fiber. Furthermore, incorporating a wider variety of edible plants into diets can serve as a potent strategy to combat nutritional deficiencies, especially for vulnerable populations in developing countries where the intertwined challenges of poverty and climate change exacerbate the precariousness of food security (Nakano et al. 2024).

Ecologically, wild edible plants are often better adapted to local environmental conditions than domesticated crops, demonstrating enhanced resistance to pests, diseases, and climate-related stresses such as drought and flooding (Tahir et al., 2023). Their ability to thrive without intensive inputs like fertilizers and pesticides reduces the environmental footprint associated with food production, promoting biodiversity and fostering

ecosystem resilience. For vulnerable populations, wild edible plants can be critical in ensuring food availability during periods of crop scarcity, enhancing food sovereignty and security, and providing essential nutrients (Nakano et al., 2024). Beyond their direct contribution to human nutrition, the inclusion of wild plants in agricultural landscapes can bolster ecosystem services by providing essential food and nesting resources for pollinators and natural enemies of pests (Schroeder et al., 2024). Wild edible plants, which are native plant species, grow naturally in their environment without being cultivated. They have been integrated into human diets and traditional food systems since ancient times, representing a reservoir of botanical knowledge accumulated over generations. The conservation of wild edible plants is a crucial step in preserving indigenous knowledge, investigating nutritional values, understanding potential side effects, and ultimately contributing to their sustainable utilization.

Edible wild plants often possess nutrient profiles that rival or surpass conventional crops, being rich in essential vitamins, minerals, fiber, and antioxidants (Zhang et al., 2021). For example, species like purslane (*Portulaca oleracea*) offer high levels of omega-3 fatty acids and and nettle (*Urtica dioica*) in iron, respectively. These nutritional benefits are particularly significant for marginalized populations facing food insecurity and malnutrition (Nakano et al., 2024).

Ecologically, wild edible plants are adapted to thrive without chemical fertilizers or pesticides, making them highly sustainable. Their ability to grow in marginal environments supports biodiversity and enhances ecosystem services such as pollination and soil fertility (Tahir et al., 2023; Schroeder et al., 2024). As climate change increasingly threatens conventional crop yields, the resilience of wild species provides a viable alternative for both rural and urban food systems.

Wild edible plants present a diverse palette of culinary possibilities, characterized by unique flavors, textures, and nutritional profiles that can enrich and diversify modern diets. The culinary attributes of wild edible plants are as diverse as the ecosystems they inhabit, offering a spectrum of flavors and textures that can be creatively integrated into both traditional and contemporary dishes. For instance, the succulent leaves of purslane (*Portulaca oleracea*), a ubiquitous weed in many global regions, offer a refreshing, slightly acidic and saline flavor profile, rendering them a versatile addition to salads, soups, and even pickled preparations. The tender shoots of stinging nettle (*Urtica dioica*), once properly blanched or cooked to deactivate their stinging trichomes, transform into a palatable vegetable with a flavor profile reminiscent of spinach, lending themselves to culinary applications such as creamy soups, savory pies, and vibrant pesto sauces. In many cultures, wild edible plants are deeply interwoven with traditional culinary practices, serving as defining ingredients in regional dishes and holding a pivotal position in cultural festivities and food traditions. The accumulated knowledge regarding the identification, sustainable harvesting, and culinary preparation of wild edible plants represents an invaluable form of cultural heritage, intricately linked to local ecosystems and foodways (Dénes et al., 2012), thereby necessitating dedicated efforts towards its preservation, transmission to future generations, and sensitive integration into contemporary food systems.

3.2 Design Research Applications

The integration of edible wild plants presents new frontiers for design research. Food design and urban agriculture can utilize wild species to diversify edible landscapes, from rooftop gardens to public foraging zones. For example, design practitioners can collaborate with ecologists to create edible trails or school gardens that include native wild plants, blending ecological education with food justice goals.

Furthermore, incorporating wild plants into culinary education can elevate their cultural

and gastronomic status. Design-led interventions such as community-based workshops, recipe co-creation, and multimedia storytelling can help reframe perceptions of wild plants from "weeds" to valuable food resources. Such approaches also support ethical leadership by promoting inclusivity, local empowerment, and cultural preservation (Marelli et al., 2020; Dénes et al., 2012).

3.3 Ethical Considerations and Traditional Knowledge

Incorporating wild edible plants into modern food systems also raises crucial ethical considerations. First, the sustainable use of these plants must be rooted in the preservation of traditional ecological knowledge, often held by Indigenous and rural communities. Ethical leadership in food systems should prioritize the respectful inclusion of this knowledge while safeguarding community rights (Tahir et al., 2023; Maroyi, 2011). Second, harvesting and commercialization must adhere to responsible and transparent practices that avoid overexploitation. As some species may be slow-growing or endemic to specific regions, unregulated foraging could threaten biodiversity. Ethical frameworks must therefore include clear guidelines for sustainable harvesting, equitable benefit-sharing, and community-led conservation initiatives (Salvatore et al., 2020).

3.4 Challenges and Future Directions

Despite their promise, several barriers hinder the broader adoption of edible wild plants. One major challenge is public perception; many people associate wild plants with poverty or survival foods, which reduces their market appeal. Educational and design initiatives must therefore address these stigmas through positive framing and experiential learning.

Policy and regulatory gaps also impede progress. There is often little to no legal framework governing the collection, sale, or use of wild edible plants. Policymakers must work alongside researchers and communities to develop standards for sustainable harvesting, labeling, and food safety (Marchetti et al., 2020).

Commercial viability is another concern. While niche markets exist for wild foods, scaling these practices requires investment in value chains, processing infrastructure, and market access. Social enterprises and cooperatives can play a pivotal role here, particularly by empowering women and local communities who traditionally collect and use these plants (Maroyi, 2011).

Finally, more interdisciplinary research is needed to document species, assess their nutritional and ecological contributions, and evaluate their socio-economic impact. Such research should be participatory and inclusive, ensuring that the voices of traditional knowledge holders are central.

3.5 Overcoming Challenges and Fostering Sustainable Integration

Realizing the full potential of edible wild plants requires proactively addressing existing obstacles and strategically promoting their sustainable integration into mainstream food systems. A significant impediment to wider adoption lies in the prevailing lack of awareness and established knowledge surrounding the accurate identification of these plants, as well as the implementation of safe harvesting techniques and appropriate culinary preparation methods. Additionally, some wild edible plants may contain naturally occurring toxins or allergens that necessitate specific processing or cooking to render them safe for consumption. Overexploitation poses another potential threat, particularly for slow-growing or geographically restricted species, underscoring the critical importance of implementing sustainable harvesting practices that prioritize the long-term health and resilience of plant populations and their associated ecosystems.

In some regions, the use of wild plants for culinary purposes has been well-rooted, especially in the Mediterranean (Marelli et al., 2020). The island of Sicily, with its rich

ethnobotanical heritage, exemplifies a region where wild edible plants are not only integral to the local gastronomy but also contribute to the perceived well-being of its inhabitants. The natural and cultural inheritance of Sicily makes it wealthy and diversified for several reasons (Salvatore et al. 2020). Throughout Europe, a multitude of wild edible plants, often considered weeds, hold significant nutritional and culinary value. Dandelion serves as a prime example, showcasing the versatility of wild edibles with its leaves, flowers, and roots all being edible and suitable for distinct culinary applications. Similarly, the widespread common chickweed offers tender shoots and leaves that can be incorporated into salads or cooked as a leafy green.

Beyond Europe, diverse cultures worldwide have long embraced wild edible plants as integral components of their traditional diets and food systems. From the fertile landscapes of Southeast Asia to the arid regions of Africa and the Americas, a wealth of indigenous knowledge surrounds the identification, sustainable harvesting, and utilization of local wild plants for sustenance and medicinal purposes.

Successfully navigating these challenges necessitates a multifaceted approach encompassing comprehensive education and awareness campaigns, rigorous scientific research, the establishment of robust regulatory frameworks, and the active engagement of local communities. Targeted educational programs, leveraging diverse formats such as workshops, field guided walks, and digital resources, are essential to equip individuals with the ability to confidently and safely identify, harvest, and prepare edible wild plants, fostering a deeper understanding of their ecological significance and nutritional value. To provide consumers and producers with reliable guidance, detailed scientific investigations are essential to thoroughly assess the nutritional profiles, potential toxicities, and possible medicinal properties of various wild edible plants.

4. Conclusion

Edible wild plants, especially those often dismissed as weeds, offer a largely untapped yet highly promising resource for building more sustainable, ethical, and inclusive food systems. Their rich nutritional profiles, ecological resilience, and cultural significance make them vital assets in addressing climate change, biodiversity loss, and food insecurity—particularly for vulnerable populations (Nakano et al., 2024). These plants thrive in marginal environments without intensive inputs, diversify diets, and offer unique culinary potential, while their collection and processing can create crucial income-generating opportunities, especially for women and local communities (Maroyi, 2011). To fully harness their potential, we must adopt interdisciplinary and participatory approaches grounded in design research, ethical frameworks, and Indigenous knowledge. A coordinated effort among researchers, policymakers, educators, designers, and communities is essential to reintegrate these undervalued botanical treasures in ways that respect both people and the planet, ultimately fostering resilient ecosystems and human well-being.

User Experience Design for BlockChain Technology based Application in Italian Logistics SMEs

Eva Loprieno[a]

[a] ISIA Firenze

ABSTRACT | **This research explores how blockchain technology can be made more accessible and usable for small and medium-sized enterprises (SMEs) in the logistics sector, especially in Italy. While large global companies like Amazon and Walmart have already integrated blockchain into their operations, many smaller businesses struggle to adopt it. This is often due to complex infrastructure, limited digital skills, and a lack of user-friendly tools. Blockchain is a type of digital technology that allows for secure, transparent, and tamper-proof data sharing. One of its key features is the use of Smart Contracts—self-executing agreements that automate tasks and ensure that rules are followed without needing a central authority. In logistics, this could mean better tracking of shipments, more efficient processes, and stronger trust among partners. However, these technologies can be hard to understand and use—especially for workers who are not trained in digital tools. This project aims to bridge that gap by applying User Experience (UX) Design, a discipline that focuses on creating intuitive and human-centered tools. Through design thinking methods such as interviews, workshops, and prototype testing, the research will explore how blockchain can be adapted to the real needs of logistics workers. The approach is grounded in the idea that decentralized technologies, like blockchain, should be matched with decentralized design. Inspired by the economist Friedrich von Hayek's concept of "Spontaneous Order," the research views logistics systems as complex and evolving—best supported by flexible, bottom-up tools rather than rigid, top-down solutions. The research uses a "Research through Design" methodology, which means it develops theory and practical tools at the same time through real-world experimentation. A key part of the project is a collaboration with Speedy srl, a logistics SME based in Florence. By working directly with their staff—warehouse workers, dispatchers, and managers—the project tests how blockchain tools can be designed and improved based on real feedback and workplace challenges. Ultimately, the goal is to create a practical, user-friendly approach to implementing blockchain in logistics. This includes developing a toolbox of best practices and**

prototypes that can be reused by other companies. While the focus is on Italian SMEs, the outcomes of this research may help similar businesses in other countries adopt blockchain more smoothly, with workers—not just technology—at the center of innovation.

KEYWORDS | UX Design; Blockchain Technology; Systemic Design; Italian SMEs; Logistics

1. Introduction

Blockchain Technology (BCT), a structured form of Distributed Ledger Technology (DLT) that organizes data into sequential blocks secured through cryptographic mechanisms, is a highly versatile technology, enabling its application across various fields, including logistics. This technology can automate workflows through the implementation of Smart Contracts (SCs), self-executing programs based on BCT that automatically enforce agreements between parties, while simultaneously promoting data management and the decentralization of decision-making processes, enhancing transparency, security, and efficiency. In the logistics sector, BCT and SC can be used to improve Supply Chain traceability, streamline operations, and foster trust among stakeholders by providing an immutable and accessible record of transactions, thus revolutionizing traditional logistical processes.

Major global logistics corporations, such as Amazon and Walmart, have successfully implemented advanced technologies like BCT and SC into their workflows. However, in Italy, and particularly among Small and Medium-sized Enterprises (SMEs) in the logistics sector, technological transition is progressing more slowly and faces significant challenges in achieving seamless human-machine integration, mainly due to bureaucratic and infrastructural barriers (Bianchini & Kwon, 2020) (Figure 1).

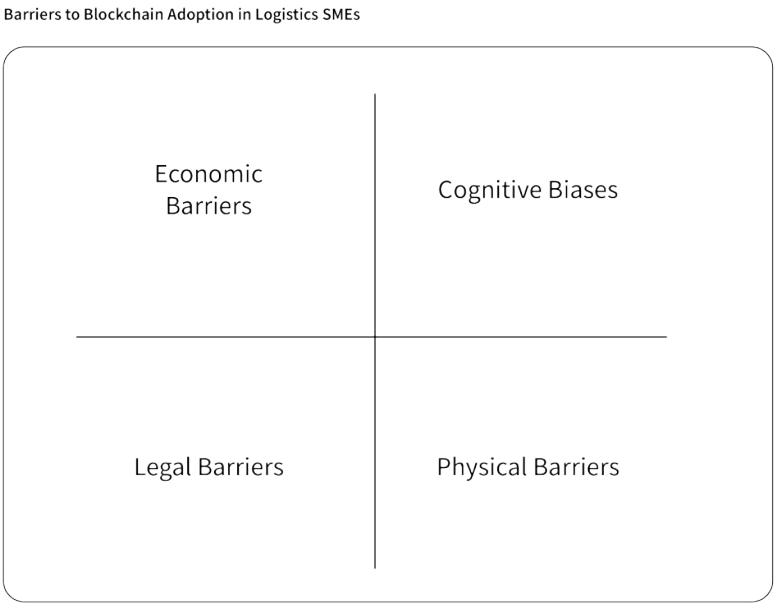

Figure 1. Barriers to BCT in Logistics SMEs (Loprieno, 2025)

A 2020 report by the OECD (Organisation for Economic Co-operation and Development) highlights opportunities and potential challenges related to the adoption of BCT within the Italian entrepreneurial landscape. Italian SMEs, which are highly active in international markets, accounting for nearly 40% of the country's total exports (equivalent to USD 153 billion out of a total of USD 379 billion in 2017), could represent a significant avenue for the development of DLT based solutions (Bianchini & Kwon, 2020).

The present research aims to investigate, through the lens of User Experience (UX) Design, the most effective applications and interfaces for a blockchain-based logistics workflow. UX Design methodologies are particularly well-suited for integrating BCT into the logistics framework, either by offering tailored solutions for specific use cases or serving as a versatile toolbox for businesses (Chen et al., 2022). The objective is to ensure that BCT is not only accessible but also effectively integrated with the existing expertise of workers in the logistics sector, fostering a smooth transition and maximizing its practical applicability.

2. Scientific Framework

Before applying BCT to logistics, we explore its potential as a model for decentralized design, establishing the theoretical basis for developing worker-centered solutions tailored to Italian SMEs (Figure 2).

BCT enables a decentralized system based on transparency and efficient peer-to-peer interactions. Friedrich von Hayek, a prominent figure in evolutionary economics and sociology, emphasized the concept of "Spontaneous Order," whereby complex economic systems emerge organically from individual actions, rather than from centralized planning. He argued that this system is a result of human actions but not of human design, highlighting the limitations of top-down control in economic affairs (Von Hayek's Legacy of the Spontaneous Order | Federal Reserve Bank of Minneapolis, s.d.). Therefore, this perspective aligns with the decentralized nature of BCT, which operates without a central authority, relying on a distributed network of participants to validate and record transactions. This decentralized mechanism mirrors von Hayek's idea of "Spontaneous Order", as it allows for the emergence of trust and coordination among parties without centralized oversight.

The nature of decentralization in BCT could have other possible applications besides the rearrangement of control and power in the Supply Chain. By incorporating this aspect into design, decentralization can be seen as co-designing systems that actively encourage user participation. At the center of the discussion on new technologies and Industry 5.0, the human-centered aspect is crucial for promoting technological change that better serves the needs of workers, enhancing their productivity and efficiency.

The principles and processes of Design Thinking (DT), a discipline increasingly adopted in business innovation, are key to providing human-centered solutions that support the digital transition of Italian logistics SMEs towards BCT-based applications. Therefore, emphasizing the importance of involving stakeholders and workers in decisions-making processes is crucial to develop solutions that meet their needs and promote innovation (Saldivar et al., 2023).

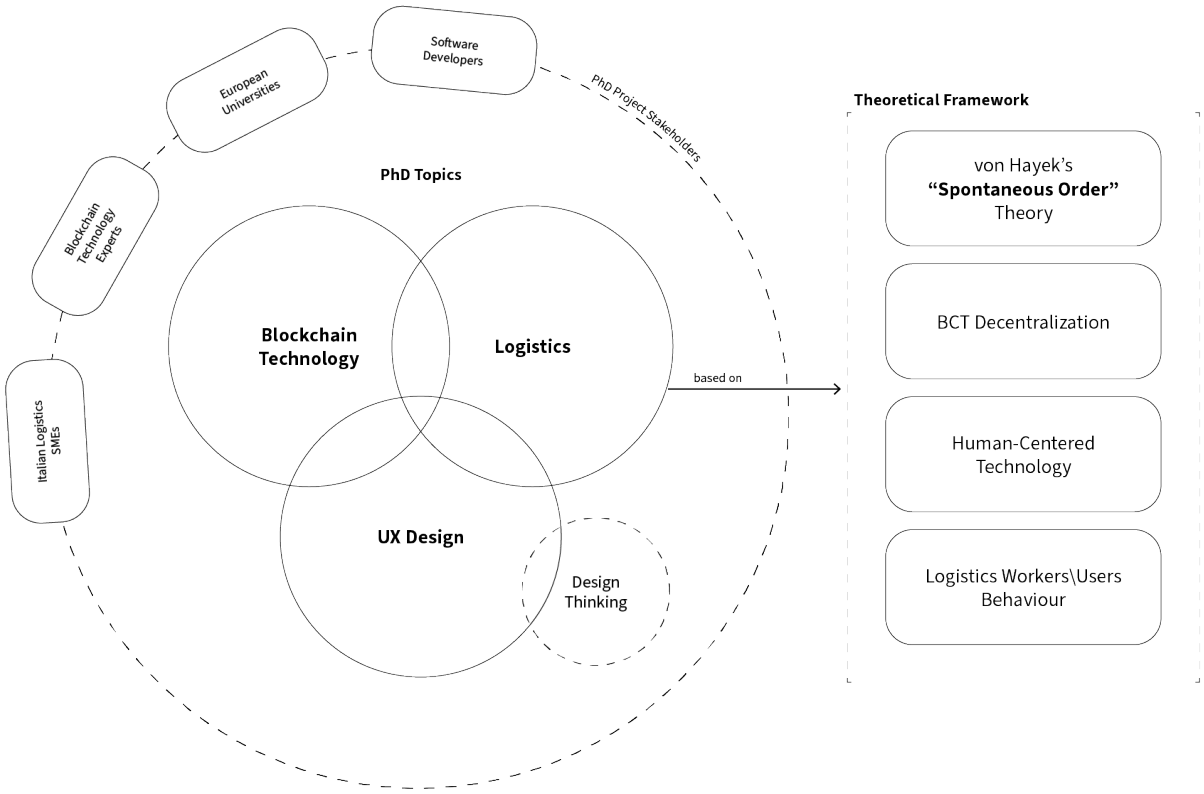

Figure 2. PhD Topics (Loprieno, 2025)

Based on DT principles and the centrality of the human, it is possible to identify a discipline that, more than others, channels this focus: UX Design. UX Design is a holistic discipline widely used in Product Research and Development, both for physical and digital products, based on the observation of final users behavioural patterns. In order to study user behaviour, the most common methodologies are rooted in Ethnographic Research to provide qualitative data. Participant observation and semi-structured interviews can lead to meaningful insights on what logistics workers and SMEs need.

Researchers from the Netherlands and Scotland proposed GeoPact, a geolocation system developed to enhance the services of local logistics companies using DLT, Internet of Things (IoT), and SC. GeoPact enables location-aware SCs, offering adaptable and sustainable logistics solutions. By engaging participants in courier roleplays governed by SCs, the project connects complex technological infrastructure to relatable activities, fostering public input, reflection, and greater accessibility (Tallyn et al., 2020).

With this study, the authors make an effort to demystify BCT and make it more intuitive and accessible to the wider public, and to accentuate its great, yet relatively untapped, potential in logistics.

3. Blockchain UX challenges for Logistic Workers

One of the main challenges of this project, from a UX Design point of view, is to develop an intuitive system that enables a seamless work experience while simplifying and concealing the complexity of the underlying BCT (Figure 3) . A well-designed User Interface (UI) and UX Design can effectively guide and educate workers, empowering them to fully leverage the benefits of BCT to achieve their objectives in an efficient, effective, and satisfying manner (Chen et al., 2022).

The development of these tools, particularly from a UX Design perspective, must prioritize the needs and existing skillsets of logistics workers. This requires more intuitive and "natural" interfaces that prioritize the needs of workers to foster seamless adaptation between them and the technology. The design process should focus on creating an Information Architecture that aligns with the real-world needs of users, ensuring the interface is tailored to their workflows and requirements.

Implementing BCT in the logistics sector requires a collaborative approach, with both business owners and software providers playing pivotal roles. A key consideration is whether the software provider dictates the workflow or if the company develops its own software and technology. Currently, there are instances where software providers act as distributors and service providers for blockchain and SCs. Conversely, larger companies often develop proprietary software and technologies for their employees and stakeholders, streamlining processes. The most desirable solution is to foster synergy between tool providers and service users, taking into account the needs of the company and its workers, thereby placing technology at the service of people.

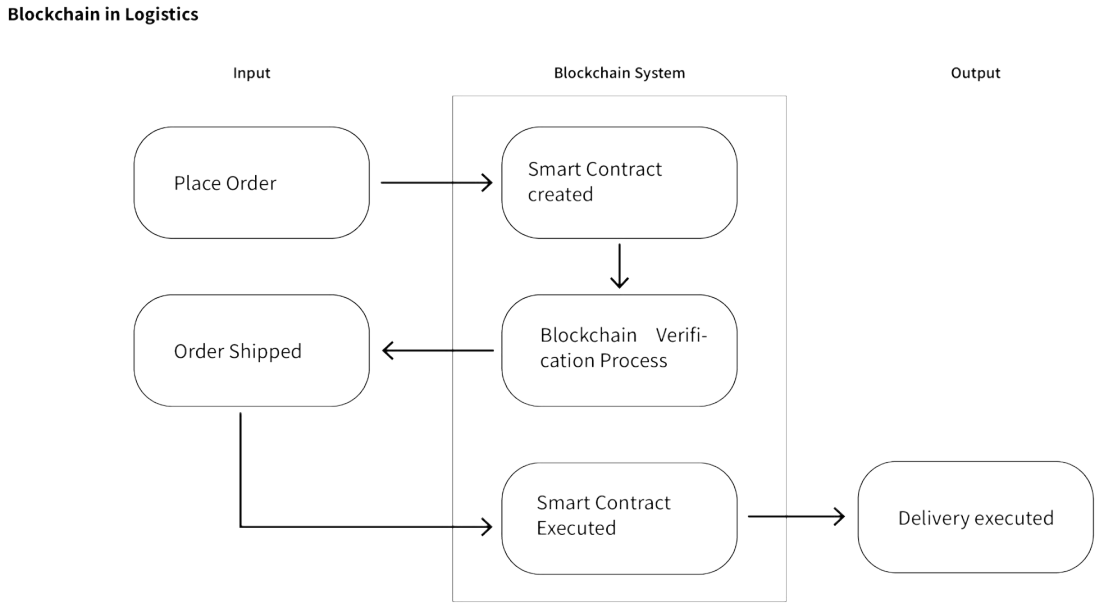

Figure 3. BCT in Logistics (Loprieno, 2025)

4. Research Questions

In particular, the research questions driving the study are the following:

- **RQ1:** How can the challenges faced by designers when integrating BCT into logistics SMEs be identified and systematically organized?
- **RQ2:** What information architecture can ensure that BCT is accessible, easy to understand, and user-friendly for workers in the logistics sector?
- **RQ3:** How can the existing skills of logistics workers be effectively harnessed to facilitate the adoption of BCT?

5. Methodology and Phases

The PhD research employs the Research through Design (RtD) approach as its primary methodology, since it enables an iterative, practice-based exploration of BCT applications within logistics SMEs. This approach fosters an ongoing dialogue between theory and practice, allowing for the co-evolution of design solutions and conceptual insights. To ensure the methodology is aligned with the specific needs of the logistics company co-funding the project, an additional tailored methodological framework will be identified during the research process. This framework will be developed through continuous engagement with industry stakeholders, ensuring that the research remains responsive to real-world challenges and opportunities.

The project is structured into 3 key phases (Fig. 4):

- Foundational Research and Benchmarking;
- Co-Design and Data Collection;
- Prototyping and Iterative Testing.

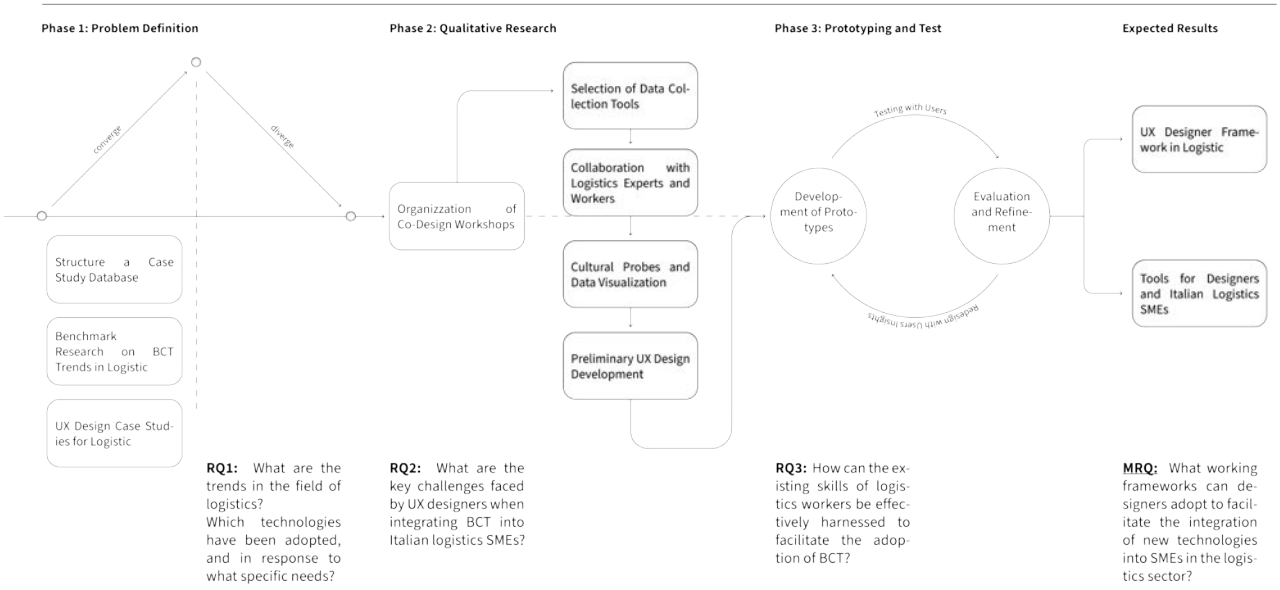

Figure 4. Phases and Methology (Loprieno, 2025)

To better illustrate the methodology and highlight the interrelationship between methods, a visual representation of the research process will be developed (Figure 5). This process map will connect key UX and DT methods—such as co-design workshops, cultural probes, and iterative prototyping—showing how they are integrated throughout the research phases. This diagram will also clarify how user input is gathered, interpreted, and translated into actionable design outcomes. Furthermore, detailed documentation of at least two case studies will be provided to concretely show how these methods were applied in real-world logistics scenarios, offering insight into the practicalities and challenges of UX design in blockchain implementations.

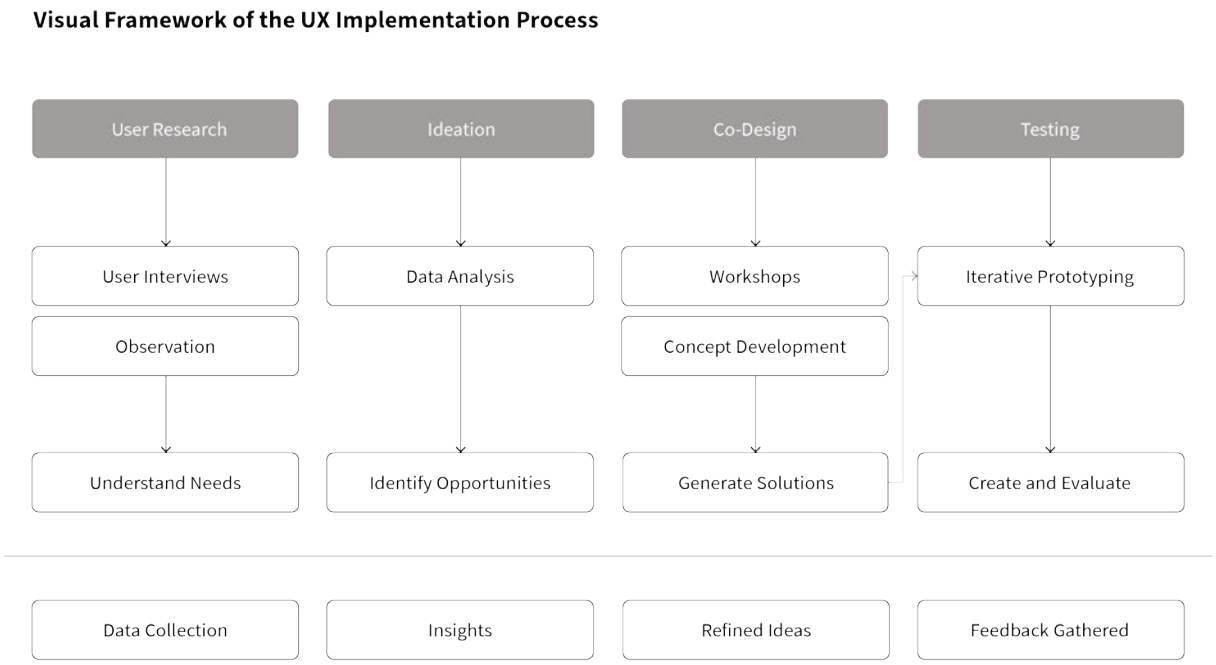

Figure 5. Visual Framework of UX Implementation Process (Loprieno, 2025)

To provide a clearer understanding of the methodological flow, a visual framework will be created to map the integration of UX design tools throughout the project. This will include stages of user research, ideation, co-design, prototyping, and testing. Each phase will be annotated with the corresponding activities and their objectives, as well as the data collected and how it feeds into subsequent steps. This graphical representation will help bridge the gap between abstract methodology and practical implementation, highlighting the cyclical and participatory nature of the RtD approach.

To ground this methodology in a real-world scenario, the research includes an ongoing case study involving Speedy srl, a mid-sized logistics SME based in Florence, Italy. Operating in freight and last-mile delivery, Speedy reflects the typical digital challenges of Italian SMEs: fragmented infrastructure, limited blockchain literacy, and constrained innovation resources. As the industrial partner supporting this research, Speedy offers access to live logistics settings where user research can be conducted. Ethnographic methods such as field observations and interviews have been carried out with warehouse staff, dispatchers, and managers to explore pain points and workflows. These findings informed the design of low-fidelity blockchain-enabled tools, later tested in co-design workshops focused on Smart Contract interfaces and usability. This collaboration provides a concrete testing ground for evaluating how blockchain tools can be made usable and accessible for non-technical users. The Speedy case study thus supports the broader goal of this research: to develop a UX-based methodology that fosters the adoption of blockchain systems within small, decentralized logistics contexts.

6. Conclusions and Outlook

In conclusion, this research aims to support the integration of UX Design and Research within Italian SMEs in the logistics sector, emphasizing the role of user-centered design methodologies in the adoption of BCT-based applications.

The immediate next step is the creation of a case study database, to build a theoretical and practical basis from which the remainder of the project may stem. Next, the research will focus on benchmarking BCT-based applications to provide an up-to-date overview of this rapidly evolving field. Through the initial literature review, two project gaps have been identified that will guide the next phases of investigation. These include: exploring how decentralized design approaches can foster new disciplinary perspectives within design practice and investigating how user-centered methodologies can be adapted to make BCT applications more accessible and intuitive for non-expert users, particularly within the operational contexts of Italian logistics SMEs.

This preparation will allow us to focus on Italian logistics SMEs, organizing workshops and collaborating with multiple interested partners in order to build a toolbox of “good practices” which we will then apply to build a first prototype of the thesis project.

The research outputs from this PhD project will hopefully pave the way for a wider and more straightforward application of BCT technology in Italian SMEs. We believe that our work towards this goal will naturally generate ideas and strategies for the application of BCT in other areas which could greatly benefit from it, and we will strive for generality in the creation of our toolbox.

In particular, the detailed case studies will not only provide evidence of the research's relevance and feasibility but will also act as examples for future applications. These cases will document the UX methods used, the feedback from logistics workers, and the resulting prototypes. By visually mapping the process and documenting outcomes, the research aims to offer a replicable model for decentralizing design within logistics SMEs.

What if Service Design meets Deep Ecology? Implications on Ecosystemic Services Opportunities in Urban Systems

Lorenzo Brunello

La Sapienza, University of Roma. Department of Planning, Design, Technology of Architecture
Lorenzo.brunello@uniroma1.it

ABSTRACT
The latest research is exploring the connection between service design and systemic approaches to addressing contemporary urban challenges. In particular, systems thinking inspired by deep ecology (Session & Devall, 1985; Naess, 1988) provides a critical lens for analyzing transition processes, helping to define priorities, identify areas of intervention, and develop more effective solutions through an incremental evolution oriented toward change. The design of ecosystemic services (ES) represents a strategy for making urban services more sustainable and inclusive, emphasizing participatory processes and an interconnected vision of systems (Villari, 2022). This approach seeks to rebalance the relationship between human-altered environments and the social and environmental impacts they produce. It shifts the focus of service design beyond the creation of isolated solutions, fostering structural and lasting changes within service systems (Vink et al., 2020). The integration of systemic and ecosystemic perspectives into service design can also provide more effective tools for addressing complexity and future uncertainty, supporting a progressive and informed adaptation to emerging challenges (Lin & Villari, 2023). Ecosystemic services embody the challenge for design to promote well-being and social justice without compromising natural resources and environmental contexts (Alexander et al., 2016). This research highlights the intersections between *service design* and *deep ecological thinking*, aiming to contribute to the development of methodological approaches that foster solutions capable of generating radical change. This is particularly relevant in light of the widespread tendency to rely on empty or oversimplified narratives, which often undermine the impact of concrete action. This study further explores specific

points of convergence between deep ecology and design cultures. The first reflection focuses on Institutional Learning as an example of the autopoietic behavior of socio-technical systems. The second examines the conceptualization of the Three Pillars Model of sustainability, arguing for its reconsideration due to the hierarchical relationships between economic, social, and environmental spheres. This reconsideration aligns with the principles of deep ecology, as it places the environment as the foundation of socio-economic systems rather than treating them as equals. These two in-depth analyses serve to exemplify the alignment between the opportunities for developing ES and the characteristics of systems thinking (Capra & Luisi, 2013), which should be understood as a guiding framework for design cultures oriented toward social and environmental justice.

This paper contributes to the current discourse on systemic and sustainable design by proposing a novel integration of Deep Ecology principles into Service Design methodologies. Through the dual analytical focus on Institutional Learning as autopoietic behaviour of social systems (SS), and the reframing of the sustainability paradigm from intersecting to nested systems, it offers a renewed conceptual and methodological lens for designing ES that respond to complex socio-environmental challenges in urban contexts.

1. Research Framework

The relationship between Design and Nature cannot be reduced to the historical dichotomy between anthropized contexts and natural systems. Consistent with a systemic and ecosystemic view of the relationship between nature and anthropization, it is no longer sufficient to consider the human-centered perspective as external to natural systems. Since humans are seen within the systemic perspective as integral parts and agents of nature, systemic approaches directs its action and research with the awareness that human beings and the objects of their actions in the world are not external entities to nature, but rather part of it, while simultaneously contaminating and conditioning it.

> "In modernity's Anthropocene, the loss of earth is coupled with the loss of the diversity of relational worlds. The distinction between 'earth' and 'worlds' is crucial. While 'worlds' are anthropological social and historical realities, 'earth' names our living planet, the grounding precedence of every world." (Vazquez, 2017: 79)

Aware of being part of the planetary system from which we extract resources and upon which we impose the consequences of our actions, within Design Cultures it is increasingly crucial to critically rethink design models and develop tools capable of addressing environmental crises in a systemic and responsible manner. In particular, the effects of Climate Change become especially evident in urban contexts. The density of both human populations and architectural structures is a primary factor in resource depletion (food, energy, social, etc.), as well as a direct contributor to climate impacts. In tackling the challenges posed by these increasingly severe crises, the design of ES emerges as a strategy aimed at simultaneously improving social well-being and climatic conditions. Scientific research has made it increasingly clear that many of today's major wicked problems (Buchanan, 1992) are now inevitable and inherently unsolvable in a definitive manner. This awareness requires design not only to acknowledge complexity as a fundamental premise of the discipline but also to accept the continuous emergence of new crises as an ontological condition of the field. Within this scenario, design must evolve by adopting a flexible and adaptive approach, capable of addressing complex systems and emerging crises as structural elements of its scope of action.

> "On one hand, climate change drives the search for information to build forecasts and simulations of future scenarios that can guide decision-making. On the other hand, it necessitates the acceptance of a heightened level of uncertainty, urging us to envision and embrace a state of 'constructive instability' from the early stages of planning and ideation to its impacts on the territory." (Manigrasso, 2022: 348 - free translation from Italian)

Precisely due to the unpredictability and uncertainty of disasters, crises, and catastrophes, Lakoff (2007, 2017) refers to preparedness as a mature attitude aimed at creating the conditions for making both present and future emergencies as manageable as possible. Within this framework of challenges posed by climate change and environmental and social crisis, there are two main approaches to preventing impacts: acting on its causes through *mitigation measures*, and acting on its effects through *adaptation strategies* (Gianfrate & Longo, 2017: 45). Both of these approaches influence the designing of strategies based on ES (Heal, 2000; Lele et al., 2013). *Ecosystem services*, defined as "the benefits people obtain from ecosystems," representing the full range of social, ecological, and economic benefits that people derive from nature, according with four clusters: *provisioning services*, *regulating services*, *cultural services* and *supporting services* (Millennium Ecosystem Assessment, 2005a). While the concept has catalyzed significant research, it also risks oversimplifying the complex relationships between nature and society, potentially obscuring critical ecological and cultural dynamics (Lele et al., 2013). Its widespread appeal is also due to its function as a *boundary object,* adaptable to different disciplinary languages and agendas, generating tensions and misunderstandings in practical applications (Kull et al., 2015). Moreover, a persistent lack of interdisciplinarity in policy and empirical studies continues to hinder the effectiveness and transformative potential of ecosystem service-based interventions (Seppelt et al., 2011).

From this perspective, the designing of ES sets the study of the relationships between the parts of systems, and the structural effects that changes generate on the system and between systems, as a design condition. The methodological culture of *Systemic Design*[i] is based precisely on the relational nature of its action, within and between systems.

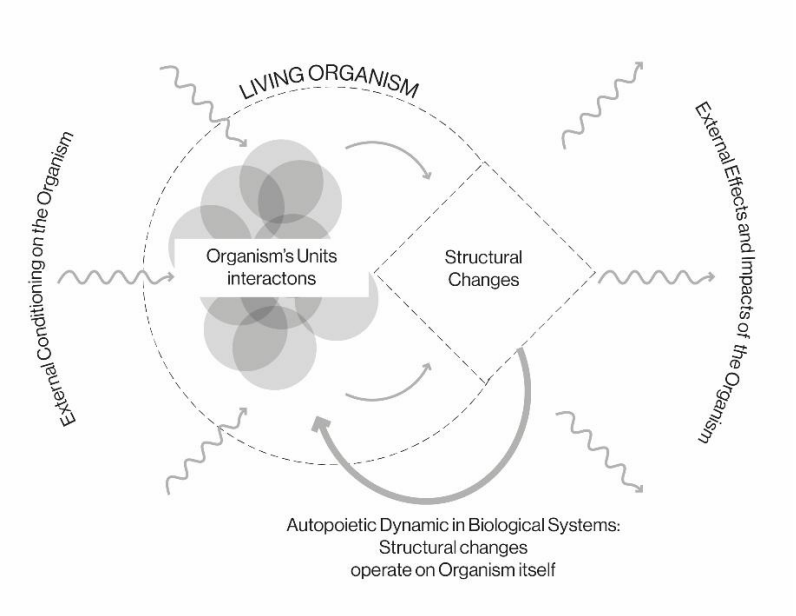
The intrinsically ecological nature of both systemic design and ES is twofold: on one hand, it approaches the analysis of contexts and design in ecological terms, meaning in terms of interdependent and co determining relationships; on the other hand, it is ecological because it assumes as its ontology the fact that humans are constituent units of natural systems, not external agents to them. Devall and Sessions distinguished between a 'shallow' ecology, centered on humans with anthropocentric perspective, and a 'deep' ecology (Devall and Sessions, 1985), which "does not separate humans – or anything else – from the natural environment and sees the world not as a collection of isolated objects but as a network of fundamentally interconnected and interdependent phenomena." (Capra and Luisi, 2014 – p. 31 free translation from Italian).

This awareness serves as an important starting point for a broader research framework exploring the intersections between *design*, *ecosystemic services*, *ecological thinking*, and *philosophical holism*. Just as contemporary design processes and cultural approaches recognize collaboration and transdisciplinarity as generative conditions, intersectionality (Tironi, Albornoz, & Chilet, 2022) characterizes the struggles for social and environmental justice within our societies (capable to influences institutions), highlighting the deep connection between cooperation and impact capacity. This perspective invites reflection on the need to forge new alliances and synergies across different fields of research and design, situating this discussion within the broader debate on the decolonization of design thinking and *post-anthropocentric design*[ii].

2. Convergences: bringing Deep Ecology in Design approaches

2.1. Social Systems, Autopoiesis and the example of Institutional Learning

Systems thinking gained increased relevance as scholars began to emphasize the dynamic interdependence between micro-level interactions and macro-level structures, highlighting their mutual influence in processes of complex coevolution and self-organization (Lundvall, 2007). In systems studies, the aspect of interdependence and mutual conditioning between units and the system – thus between humans and nature too – was introduced by the Santiago School with the term autopoiesis (Varela and Maturana, 1980/1973). Autopoiesis describes, starting from biological analysis, how systemic units of an organism are not only in relation to each other within a given system. It is precisely the relationship between the internal units of the system that generates interference and conditioning on the system, in a no-ending cycle that generates continuous forms of mutual learning between the system as a conditioning and regulating context and its interconnected units, in turn generators of altering impacts on the system as a whole [figure 01/a]. However, it is the analogy between micro and macro levels on which all systemic thinking is based that allows us to identify this type of relationship on different scales. If we start from the urban context as an analytical and practical field, we can recognize that it is also a SS within which dynamics between subjects, relationships and practices lead to an impact on the social system itself. this is the case of the relationship between SI practices and forms of Institutional Learning. [figure 01/b]



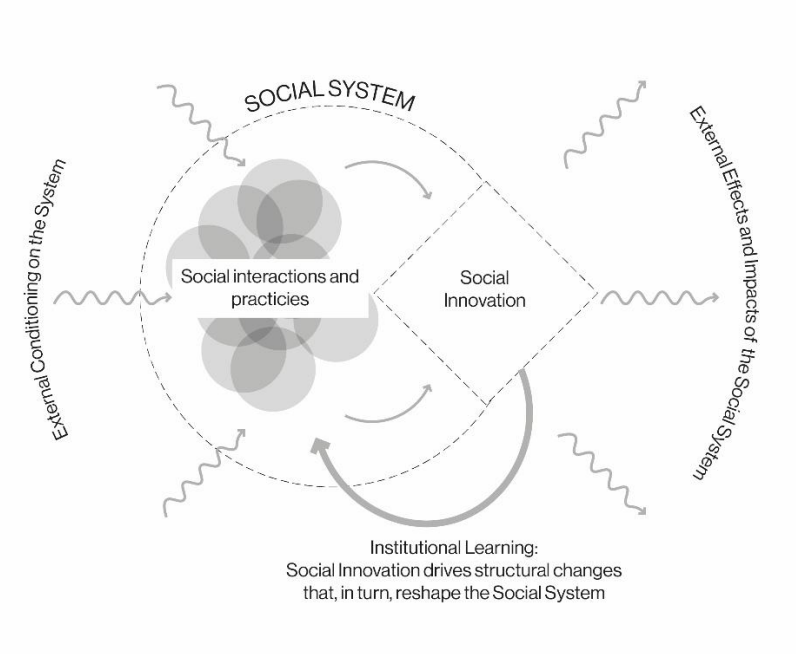


Figure 01a / 01b

Autopoietic dynamics in Systems - Analogy between autopoiesis dynamic in organisms (01a) and institutional Learning dynamic in SS (01b) (Personal elaboration)

Practices of SI rise to continuous reconfigurations of physical spaces, relational infrastructures and social imaginaries that SS produce and feed. From this perspective, ES can offer an innovative opportunity not only for the management and distribution of natural resources, but also and above all for the conception of their use in compliance with the natural systems to which SS belong, according with the deep ecology hierarchy of priorities in ecosystems: environmental, than social, and finally economical. According to Capra and Luisi, for autopoiesis,

> "a living system is coupled with its environment in a structural way, that is, through recurrent interactions, each of which triggers structural changes in

> the system. Nevertheless, living systems are autonomous. The environment merely triggers structural changes but neither specifies nor directs them" (Capra and Luisi, 2014 – p. 323 free translation from Italian).

The success of this insight within systemic thinking in Design is that biological systems can be interchanged with other types of systems, while maintaining the conditioning structural relationship between the parts and the whole. For instance, there is a profound analogy between autopoiesis in biology and what Ezio Manzini defines as 'Politics of the Everyday.':

> "The expression 'Politics of the Everyday' indicates a sequence of actions that influence the sociotechnical systems (and therefore also economic, political, and cultural) in which one operates and with which one interacts: actions on the world, related to everyday life, carried out from where one is, that is, from one's own point of observation and action. In other words: a politics of the everyday is the systemic effect of a life project" (Manzini, 2018 - free translation from Italian). [figure 02]

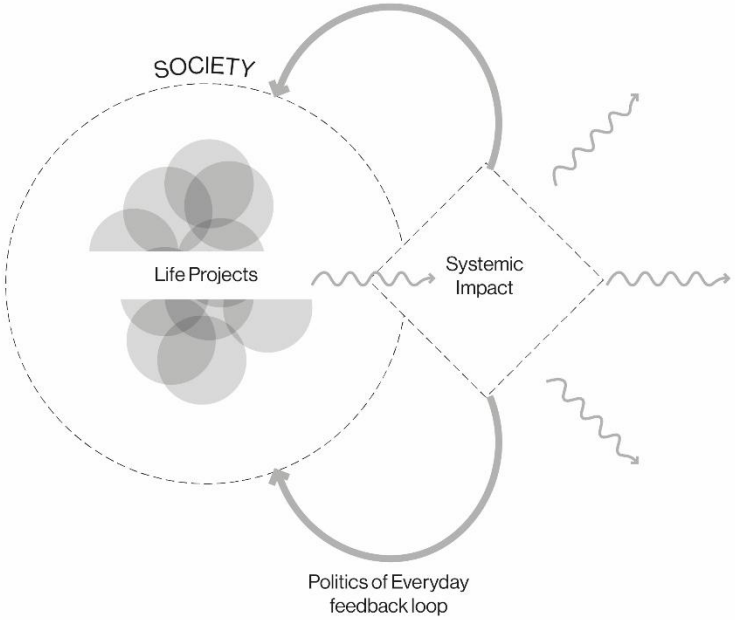

Figure 2.

How Life Projects generates Systemic Impact according with the Manzini's idea of 'Politics of everyday'. (Personal elaboration of Manzini 'politics of everyday' concept)

The relationships between system units and the system as a whole define the autopoietic dynamics, which can be found in both SS and biological systems. Social innovation (SI) is widely recognized in research as a fundamental driver for advancing social justice (Joel & Nel-Sanders, 2021) and facilitating climate transition processes (Bresciani, Rizzo & Deserti, 2022). For this reason, the literature on SI acknowledges its potential as a strategic direction for influencing both behavioral and cognitive changes at the individual level (units of systems) and for reconfiguring and reorganizing socio-technical systems (entire systems) (Bresciani et al., 2022).

An example of the autopoietic behavior of SS is, for instance, Institutional Learning (Stein, 1997; Watts et al., 2007). This refers to the ability of technical, political, and legal systems to adapt to the evolution of society. This can happen mainly in two ways: the anticipation of future directions and emerging needs, both in social organization and in the management of resources and opportunities by those who hold governance; or through a deductive process of producing change. In the second case, it involves exactly what systemic thinking describes as autopoiesis. When behaviors, expectations, and social desires lead to forms of SI, the political-administrative system, recognizing the strategic value of these innovative practices, mobilizes to create the conditions for these change-oriented behaviors to become structural. In this case, Institutional Learning follows an incremental logic and dynamic, leading from initial experiments on a medium-small scale to complex processes aimed at producing and sustaining structural changes (Watts et al., 2007). This type of learning is driven by SI, but at the same time, it adopts SI strategies to fuel change. In this case, SI takes shape through cooperative and collaborative dynamics of relational networks (Ziegler, 2017).

> "[…] At the collaborative levels, the characteristics of networks (both physical and immaterial) become very important for the design dimension. They therefore serve as support for the circulation of knowledge and are necessary mechanisms to initiate and sustain processes of territorial development. As such, they represent resources available for the design activity." (Villari, 2012: 34 – free translation from Italian)

Finally, due to the recognition of complexity as an ontological condition of systems, institutional learning cannot overlook or evade the tensions and conflicts that run through society and urban phenomena (Ostanel, 2023). For this reason, institutional adaptation and learning processes cannot ignore the inequalities and emerging challenges, but are expected to acknowledge and support the value of SI practices that arise from the grassroots and informality, and which over time are capable of spreading new sensibilities, guiding change and transition processes towards fairer and more sustainable societies, following an autopoietic dynamic. In this case, *Institutional Learning* aligns with what Manzini describes as the *Politics of the Everyday*: the sum of different life projects guides the reorganization of social structures in order to produce a structural, systemic change. At the same time, the system changes to generate and distribute benefits within itself. Institutional learning can be understood as the capacity of social systems to structurally incorporate improvements emerging from forms of social innovation; than, *Institutional Learning*, when viewed through the lens of systemic thinking, is an example of an autopoietic process.

Precisely with regard to the debate around ES, moving from conceptual frameworks to operational implementation requires radical change, including learning organizations, adaptive governance, stakeholder engagement, and user-driven research, within an integrated and systemic approach that goes beyond sectoral conservation and addresses the complex social, ecological, and economic interdependencies involved: "Radical transformations will be required to move from conceptual frameworks and theory to practical integration of ES into decision-making, in a way that is credible, replicable, scalable, and sustainable" (Daily & Matson, 2008, p. 9456).

2.2 Hierarchies and priorities in sustainable ecosystems

Despite the inflating forces that absorb sustainability rhetoric, leading in some cases to a partial dilution of its meaning in common discourse, sustainability remains one of the main fields of investigation and action in research. The 'Three Pillar Diagram' visualization commonly used to represent the idea of sustainability (Fig. 3) as the balance between the environmental, social, and economic dimensions is challenged by the notion of 'deep ecology.' The idea of 'deep ecology,' since it reconceptualizes the human dimension (thus social and economic) as an integral unit of the natural world within a systemic perspective, raises a hierarchy issue that will influence systemic design thinking and action. The Three Pillar Diagram with intersecting spheres tends to be replaced by a logical/conceptual model of concentric spheres. In their recent work, Vezzoli, Macrì, Takacs, and Yang (2022) reaffirm the vision of the three interlinked dimensions:

> "It is common to schematize sustainability with three interlinked dimensions (United Nations, 2015): Environmental protection […], Social equity and inclusion […], Economic prosperity […]" (Vezzoli et al., 2022 – p. 16)

While the framing of environmental, social, and economic sustainability concepts is correct, it is the idea of parity between the dimensions that is challenged by the deep ecology vision. For instance, with the reflection on Systemic Innovation, Midgley and Lindhult (2021) acknowledge the nested nature of sustainability orders:

> "[…] an innovation is 'systemic' when its purpose is to change societal laws and norms to place new enablers and constraints on innovation in the interests of ecological sustainability. What makes this systemic is the acknowledgment of the existence of nested systems: innovation systems are parts of economic systems, which are parts of societal systems, and all societies exist on a single planetary ecosystem" (Midgley & Lindhult, 2021: 635).

They assert that what makes a reflection systemic is precisely the ability to recognize that the various systems have in common—and must ultimately account for—the belonging to a single planetary ecosystem. In this direction, also Osti (2013) give us a perspective on urban contexts according with a hierarchical envisioning of sustainability challenges:

> "Let's immediately clear the field of the widespread practice of dividing sustainability into three areas— social, economic, and environmental—and representing it with three partially overlapping circles. This representation is misleading because it aligns three phenomena that are too different and ends up neglecting the relationships between them, which are by far the real issue. Instead, three concentric circles are preferred, where the largest represents the environment, the intermediate one represents society, and the innermost one represents the economy. It is the natural environment, or rather the entire world, that physically contains and allows for the survival of human beings aggregated in

societies, who in turn perform specific productive and distributive activities (economy)." (Osti, 2013, p. 68 – free translation from Italian).

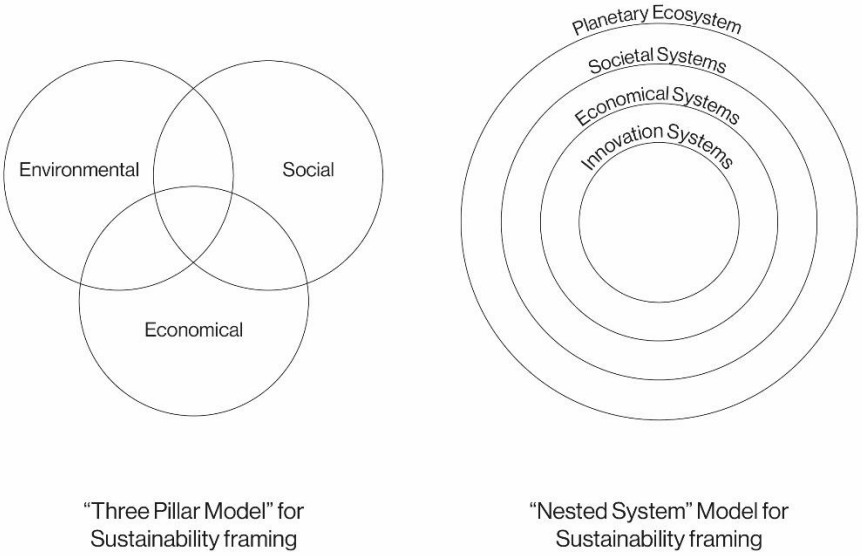

Figure 3.
Comparison of Sustainability framing (Personal elaboration)

This common coexistence, which places all beings in relation to planetary life, has also been discussed by authors from other disciplines who have nevertheless influenced systemic thinking to some extent. For example, landscape architect Gilles Clément spoke of the Planetary Garden to describe Earth as a unique and global garden, requiring sustainable and conscious management to preserve biodiversity and ecological balance (Clément, 2004). Already in 1974, Lovelock identified self-regulation as the key to the balance of planets and astrophysical systems (Capra & Luisi, 2014). His idea marked a departure from conventional science, which considered Earth as a body composed of inanimate natural elements. Lovelock's proposal was to consider Earth as a complex system "comprising all aspects of life and its environment, so closely linked as to form a self regulating entity" (Lovelock, 1991: 12). This formulation followed reflections on feedback loops as drivers of the self-regulation of complex systems. What in Systemic approaches corresponds to the idea of Feedback loops, iterative processes and Assessment mechanisms equates to the intuition and demonstration of the complex network of feedback loops determining the self-regulation of the planetary system (Lovelock & Margulis, 1974).

Although systems thinking has historically developed from the recognition of a hierarchy among systems – commonly referred to as Systems Hierarchy (Midgley & Lindhult, 2021: 642) – it is still common, even within design approaches explicitly informed by ecological awareness, to treat the three dimensions of sustainability (environmental, social, and economic) as

equivalent domains, overlooking their nested and interdependent structure. We can therefore distinguish between approaches based on the equivalence of systems (characteristic of shallow ecology / Three Pillar Model) and those that consciously acknowledge the nested and hierarchical nature of the systems within which change is pursued, in alignment with the deep ecology perspective.

3. Ecosystemic Services and System Thinking: future challenges

Although widely explored in the scientific literature, the convergence between Systemic Thinking and Design Cultures still has significant room for development in the construction of methodologies and practical application. This brief compendium, only briefly outlined here, represents a further field of theoretical and methodological exploration for the conception and operational translation of ES as a mitigation and adaptation solution to the *cyclical* and *nested crises* (Mohandesi, 2020) shaping the present.

This research aims to contribute to enhancing and strengthening the radical nature of ecological thinking within the transformation and transition processes that our society is called to face. In this context, the 'characteristics of systemic thinking' (Capra & Luisi, 2013: 107-111) represent, for example, an opportunity to develop and experiment with innovative practices in urban contexts, providing, rather than principles, actual logical and methodological frameworks for conceiving and developing projects.

In essence, the paper argues for institutional learning from everyday practices and for recognizing the nested hierarchy of systems as a way to foster deeper and faster ecological transitions.

The fields of design application can strengthen the regenerative credibility of the discipline, provided that the perspective of 'quality of complexity' (Tassinari & Manzini, 2023) is capable of triggering changes both at the individual and social level, and therefore systemic, in a truly autopoietic relationship. Preserving the radical nature of the principles underlying ecological thinking, is today one of the main challenges of processes that aim to promote change. However, this objective must be pursued while avoiding the risk of diluting these principles into vague and indistinct rhetoric. In fact, the abuse of certain rhetorical discourses, invoked in both public and academic debates as umbrella-concepts (Massari & Orioli, 2023), is responsible for the partial loss of credibility of certain practices. When empty and sweetened discourses (Marchigiani & Bonfantini, 2022) are repeated redundantly, without genuine critical awareness, their impact diminishes, as does their ability to affect imaginaries and generate convergences and behavioral changes in society, sometimes compromising the possibility of promoting truly radical changes. For this reason, the development of ES can represent a significant opportunity when there is a genuine orientation toward radical and systemic change. On the contrary, it risks becoming a waste of resources and little more than a cosmetic operation if used merely as a rhetorical tool to perpetuate inertia and boast about change, without generating structural, effective, and long-lasting transformations.

About the Authors:

Lorenzo Brunello is a service designer with expertise in co-creation processes within urban contexts. He is PhD student in the program Service Design for Public Sector. The doctoral research focuses on the development of ecosystem services for urban climate resilience, co-creation processes, and methodologies for assessing territorial impacts toward social and environmental justice.

[i] Particularly relevant from this perspective is the research work carried out on Systemic Design, in particular the contributions of several authors belonging to the research areas of System Oriented Design (SOD) and Relating Systems Thinking and Design (RSD). Among the main contributors to the application of systemic thinking in design cultures are Birgit Sevaldson (2014, 2019), Peter Jones (2014, 2022), Richard Buchanan (1992, 2019) Bela H. Banathy (2009, 2013), et al.

[ii] See in this regard the work of Arturo Escobar (2011, 2018, 2020), Tony Fry (2009, 2017, 2020), Rolando Vázquez (2012, 2017), Madina Tsolonova (2017), Martin Tironi (2022, 2022, 2023), et al.
